Description	15
Parameters	15
Examples	15
Related Links	16
cluster add-node	16
Description	16
Parameters	16
Examples	17
Related Links	17
cluster create	17
Description	18
Parameters	18
Examples	19
cluster join	19
Description	19
Parameters	19
Examples	20
Related Links	20
cluster modify	20
Description	20
Parameters	20
Examples	21
cluster ping-cluster	21
Description	21
Parameters	21
Examples	22
cluster remove-node	22
Description	22
Parameters	23
Examples	23
cluster setup	23
Description	23
Parameters	24
Examples	24
Related Links	33
cluster show	33
Description	33
Parameters	33
Examples	34
cluster agent commands	34
cluster agent connection create	34
cluster agent connection delete	35
cluster agent connection modify	36
cluster agent connection show	37
cluster contact-info commands	41

cluster contact-info modify	41
cluster contact-info show	42
cluster controller-replacement commands	43
cluster controller-replacement network displaced-interface delete	43
cluster controller-replacement network displaced-interface restore-home-node	44
cluster controller-replacement network displaced-interface show	44
cluster controller-replacement network displaced-vlans delete	45
cluster controller-replacement network displaced-vlans restore	46
cluster controller-replacement network displaced-vlans show	47
cluster date commands	47
cluster date modify	47
cluster date show	49
cluster date zoneinfo load-from-uri	50
cluster date zoneinfo show	51
cluster ha commands	52
cluster ha modify	52
cluster ha show	52
cluster identity commands	53
cluster identity modify	53
cluster identity show	53
cluster image commands	54
cluster image cancel-update	54
cluster image pause-update	55
cluster image resume-update	55
cluster image show-update-history	56
cluster image show-update-log-detail	57
cluster image show-update-log	59
cluster image show-update-progress	62
cluster image show	74
cluster image update	75
cluster image validate	78
cluster image package delete	81
cluster image package get	82
cluster image package show-repository	82
cluster kernel-service commands	83
cluster kernel-service show	83
cluster kernel-service config modify	85
cluster kernel-service config show	86
cluster log-forwarding commands	87
cluster log-forwarding create	87
cluster log-forwarding delete	90
cluster log-forwarding modify	90
cluster log-forwarding show	91
cluster peer commands	93
cluster peer create	93

cluster peer delete	103
cluster peer modify-local-name	103
cluster peer modify	104
cluster peer ping	108
cluster peer show	110
cluster peer connection show	119
cluster peer health show	121
cluster peer offer cancel	124
cluster peer offer modify	124
cluster peer offer show	125
cluster peer policy modify	126
cluster peer policy show	128
cluster quorum-service commands	128
cluster quorum-service options modify	128
cluster quorum-service options show	129
cluster ring commands	130
cluster ring show	130
cluster statistics commands	131
cluster statistics show	132
cluster time-service commands	133
cluster time-service ntp key create	133
cluster time-service ntp key delete	134
cluster time-service ntp key modify	135
cluster time-service ntp key show	136
cluster time-service ntp security modify	136
cluster time-service ntp security show	137
cluster time-service ntp server create	137
cluster time-service ntp server delete	139
cluster time-service ntp server modify	139
cluster time-service ntp server reset	141
cluster time-service ntp server show	141
cluster time-service ntp status show	142
debug commands	146
debug hwpmc commands	146
debug hwpmc create	146
debug hwpmc delete	146
debug hwpmc show	147
debug nvme commands	148
debug nvme upgrade bypass-lif-state-check	148
event commands	149
event catalog commands	149
event catalog show	149
event config commands	152
event config force-sync	152
event config modify	152

event config set-mail-server-password	154
event config set-proxy-password	155
event config show	155
event filter commands	157
event filter copy	157
event filter create	158
event filter delete	160
event filter prepare-for-revert	162
event filter rename	164
event filter show-summary	165
event filter show	166
event filter test	170
event filter update-access-control-role	172
event filter rule add	173
event filter rule delete	178
event filter rule reorder	180
event log commands	182
event log show	182
event notification commands	186
event notification create	186
event notification delete	187
event notification modify	188
event notification show	189
event notification destination create	190
event notification destination delete	193
event notification destination modify	194
event notification destination prepare-for-revert	197
event notification destination show	199
event notification history show	201
event role-config commands	204
event role-config create	204
event role-config delete	205
event role-config modify	206
event role-config show	207
event status commands	209
event status show	209
job commands	213
job delete	213
Description	213
Parameters	213
Examples	213
Related Links	213
job pause	213
Description	213
Parameters	213

Examples	214
Related Links	214
job resume	214
Description	214
Parameters	214
Examples	214
Related Links	214
job show-bynode	215
Description	215
Parameters	215
Examples	216
job show-cluster	216
Description	216
Parameters	216
Examples	218
job show-completed	219
Description	219
Parameters	219
Examples	220
job show	221
Description	221
Parameters	221
Examples	223
job stop	224
Description	224
Parameters	224
Examples	224
Related Links	225
job unclaim	225
Description	225
Parameters	225
Examples	225
Related Links	225
job watch-progress	225
Description	226
Parameters	226
Examples	226
job history commands	226
job history show	226
job initstate commands	229
job initstate show	229
job private commands	231
job private delete	231
job private pause	232
job private resume	233

job private show-completed	234
job private show	236
job private stop	238
job private watch-progress	239
job schedule commands	240
job schedule delete	240
job schedule show-jobs	241
job schedule show	242
job schedule cron create	243
job schedule cron delete	244
job schedule cron modify	245
job schedule cron show	246
job schedule interval create	248
job schedule interval delete	249
job schedule interval modify	250
job schedule interval show	251
lun commands	253
lun convert-from-namespace	253
Description	253
Parameters	253
Examples	253
lun create	253
Description	253
Parameters	254
Examples	257
lun delete	257
Description	257
Parameters	257
Examples	258
Related Links	258
lun maxsize	258
Description	258
Parameters	258
Examples	260
Related Links	261
lun modify	261
Description	261
Parameters	261
Examples	264
Related Links	264
lun move-in-volume	264
Description	265
Parameters	265
Examples	265
Related Links	266

lun resize	266
Description	266
Parameters	267
Examples	267
lun show	268
Description	268
Parameters	268
Examples	273
Related Links	275
lun bind commands	275
lun bind create	275
lun bind destroy	276
lun bind show	276
lun copy commands	278
lun copy cancel	278
lun copy modify	279
lun copy pause	280
lun copy resume	280
lun copy show	281
lun copy start	283
lun igroup commands	285
lun igroup add	285
lun igroup bind	286
lun igroup create	287
lun igroup delete	289
lun igroup disable-aix-support	289
lun igroup modify	290
lun igroup remove	291
lun igroup rename	292
lun igroup show	293
lun igroup unbind	295
lun igroup initiator add-proximal-vserver	296
lun igroup initiator modify	297
lun igroup initiator remove-proximal-vserver	297
lun igroup initiator show	298
lun igroup initiator upgrade show-partially-connected	299
lun igroup initiator upgrade missing-logins delete	300
lun igroup initiator upgrade missing-logins show	301
lun import commands	302
lun import create	302
lun import delete	303
lun import pause	304
lun import prepare-to-downgrade	305
lun import resume	305
lun import show	306

lun import start	310
lun import stop	310
lun import throttle	311
lun import verify start	312
lun import verify stop	312
lun mapping commands	313
lun mapping add-reporting-nodes	313
lun mapping create	314
lun mapping delete	316
lun mapping remove-reporting-nodes	317
lun mapping show-initiator	317
lun mapping show	319
lun move commands	321
lun move cancel	321
lun move modify	322
lun move pause	322
lun move resume	323
lun move show	323
lun move start	326
lun persistent-reservation commands	327
lun persistent-reservation clear	327
lun persistent-reservation show	328
lun portset commands	330
lun portset add	330
lun portset create	331
lun portset delete	332
lun portset remove	333
lun portset show	333
lun transition commands	335
lun transition show	335
lun transition start	336
lun transition 7-mode delete	337
lun transition 7-mode show	338
metrocluster commands	341
metrocluster configure	341
Description	341
Parameters	342
Examples	342
Related Links	345
metrocluster heal	345
Description	345
Parameters	345
Examples	345
metrocluster modify	345
Description	346

Parameters	346
Examples	347
metrocluster remove-dr-group	347
Description	347
Parameters	348
Examples	348
metrocluster show	348
Description	348
Parameters	349
Examples	349
metrocluster switchback	351
Description	351
Parameters	351
Examples	352
Related Links	352
metrocluster switchover	352
Description	352
Parameters	352
Examples	353
metrocluster check commands	354
metrocluster check disable-periodic-check	354
metrocluster check enable-periodic-check	355
metrocluster check run	355
metrocluster check show	357
metrocluster check aggregate show	359
metrocluster check cluster show	363
metrocluster check config-replication show-aggregate-eligibility	367
metrocluster check config-replication show-capture-status	368
metrocluster check config-replication show	369
metrocluster check connection show	370
metrocluster check lif repair-placement	374
metrocluster check lif show	375
metrocluster check node show	377
metrocluster check volume show	384
metrocluster config-replication commands	386
metrocluster config-replication cluster-storage-configuration modify	386
metrocluster config-replication cluster-storage-configuration show	387
metrocluster config-replication resync-status show	388
metrocluster configuration-settings commands	389
metrocluster configuration-settings show-status	389
metrocluster configuration-settings calibration measure	392
metrocluster configuration-settings calibration show	392
metrocluster configuration-settings connection check	394
metrocluster configuration-settings connection connect	396
metrocluster configuration-settings connection disconnect	399

metrocluster configuration-settings connection show	402
metrocluster configuration-settings dr-group create	408
metrocluster configuration-settings dr-group delete	409
metrocluster configuration-settings dr-group show	411
metrocluster configuration-settings interface create	412
metrocluster configuration-settings interface delete	417
metrocluster configuration-settings interface modify	419
metrocluster configuration-settings interface show	420
metrocluster configuration-settings mediator add	422
metrocluster configuration-settings mediator remove	423
metrocluster configuration-settings mediator show	424
metrocluster interconnect commands	425
metrocluster interconnect adapter modify	425
metrocluster interconnect adapter show	426
metrocluster interconnect mirror show	431
metrocluster interconnect mirror multipath show	434
metrocluster node commands	435
metrocluster node show	435
metrocluster operation commands	440
metrocluster operation show	440
metrocluster operation history show	441
metrocluster transition commands	443
metrocluster transition disable	443
metrocluster transition enable	443
metrocluster transition show-mode	444
metrocluster vservers commands	445
metrocluster vservers recover-from-partial-switchback	445
metrocluster vservers recover-from-partial-switchover	445
metrocluster vservers resync	446
metrocluster vservers show	446
network commands	449
network ping	449
Description	449
Parameters	449
Examples	450
network ping6	450
Description	450
Parameters	451
Examples	452
network test-path	452
Description	452
Parameters	452
Examples	453
network traceroute	453
Description	453

Parameters	454
Examples	454
network traceroute6	455
Description	455
Parameters	455
Examples	456
network arp commands	457
network arp create	457
network arp delete	457
network arp show	458
network arp active-entry delete	459
network arp active-entry show	460
network bgp commands	461
network bgp config create	461
network bgp config delete	462
network bgp config modify	462
network bgp config show	463
network bgp defaults modify	464
network bgp defaults show	464
network bgp peer-group create	464
network bgp peer-group delete	466
network bgp peer-group modify	467
network bgp peer-group rename	468
network bgp peer-group show	468
network bgp vserver-status show	470
network cloud commands	471
network cloud routing-table create	471
network cloud routing-table delete	471
network cloud routing-table show	472
network connections commands	473
network connections active show-clients	473
network connections active show-lifs	474
network connections active show-protocols	476
network connections active show-services	477
network connections active show	478
network connections listening show	481
network device-discovery commands	484
network device-discovery show	484
network fcp commands	486
network fcp adapter modify	486
network fcp adapter show	488
network fcp topology show	493
network fcp zone show	495
network interface commands	497
network interface create	497

network interface delete	502
network interface migrate-all	502
network interface migrate	503
network interface modify	504
network interface rename	507
network interface revert	508
network interface show	509
network interface start-cluster-check	515
network interface capacity show	516
network interface capacity details show	517
network interface check cluster-connectivity show	518
network interface check cluster-connectivity start	519
network interface check failover show	520
network interface dns-lb-stats show	523
network interface failover-groups add-targets	524
network interface failover-groups create	525
network interface failover-groups delete	525
network interface failover-groups modify	526
network interface failover-groups remove-targets	527
network interface failover-groups rename	527
network interface failover-groups show	528
network interface lif-weights show	529
network interface service show	530
network interface service-policy add-service	531
network interface service-policy clone	533
network interface service-policy create	535
network interface service-policy delete	537
network interface service-policy modify-service	538
network interface service-policy remove-service	540
network interface service-policy rename	542
network interface service-policy restore-defaults	543
network interface service-policy show	545
network ipspace commands	546
network ipspace create	546
network ipspace delete	547
network ipspace rename	548
network ipspace show	548
network ndp commands	549
network ndp default-router delete-all	549
network ndp default-router show	550
network ndp neighbor create	551
network ndp neighbor delete	552
network ndp neighbor show	552
network ndp neighbor active-entry delete	553
network ndp neighbor active-entry show	554

network ndp prefix delete-all	555
network ndp prefix show	556
network options commands	557
network options cluster-health-notifications modify	557
network options cluster-health-notifications show	558
network options cluster-network-overlay-enabled show	559
network options detect-switchless-cluster modify	559
network options detect-switchless-cluster show	559
network options ipv6 modify	560
network options ipv6 show	560
network options load-balancing modify	561
network options load-balancing show	561
network options multipath-routing modify	562
network options multipath-routing show	562
network options port-health-monitor disable-monitors	562
network options port-health-monitor enable-monitors	563
network options port-health-monitor modify	565
network options port-health-monitor show	566
network options send-soa modify	567
network options send-soa show	567
network options switchless-cluster modify	568
network options switchless-cluster show	568
network port commands	569
network port delete	569
network port modify	569
network port show-address-filter-info	571
network port show	572
network port broadcast-domain add-ports	576
network port broadcast-domain create	577
network port broadcast-domain delete	578
network port broadcast-domain merge	578
network port broadcast-domain modify	579
network port broadcast-domain move	579
network port broadcast-domain remove-ports	580
network port broadcast-domain rename	580
network port broadcast-domain show	581
network port broadcast-domain split	582
network port ifgrp add-port	583
network port ifgrp create	585
network port ifgrp delete	586
network port ifgrp remove-port	586
network port ifgrp show	587
network port reachability repair	588
network port reachability scan	589
network port reachability show	589

network port vip create	592
network port vip delete	592
network port vip show	593
network port vlan create	594
network port vlan delete	594
network port vlan show	595
network qos-marking commands	596
network qos-marking modify	596
network qos-marking show	597
network route commands	598
network route create	598
network route delete	599
network route show-lifs	599
network route show	600
network route active-entry show	601
network subnet commands	604
network subnet add-ranges	604
network subnet create	605
network subnet delete	606
network subnet modify	606
network subnet remove-ranges	607
network subnet rename	608
network subnet show	609
network test-link commands	610
network test-link run-test	610
network test-link show	611
network test-link start-server	613
network test-link stop-server	614
network tuning commands	614
network tuning icmp modify	614
network tuning icmp show	615
network tuning icmp6 modify	616
network tuning icmp6 show	616
network tuning tcp modify	617
network tuning tcp show	618
protection-type commands	620
protection-type show	620
Description	620
Parameters	620
Examples	620
qos commands	622
qos adaptive-policy-group commands	622
qos adaptive-policy-group create	622
qos adaptive-policy-group delete	623
qos adaptive-policy-group modify	624

qos adaptive-policy-group rename	626
qos adaptive-policy-group show	626
qos policy-group commands	628
qos policy-group create	628
qos policy-group delete	630
qos policy-group modify	630
qos policy-group rename	631
qos policy-group show	632
qos settings commands	634
qos settings nested-qos-svm-vol	634
qos settings throughput-floors-v2	634
qos settings cache modify	635
qos settings cache show	635
qos statistics commands	637
qos statistics characteristics show	637
qos statistics latency show	640
qos statistics performance show	643
qos statistics resource cpu show	645
qos statistics resource disk show	647
qos statistics volume characteristics show	649
qos statistics volume latency show	652
qos statistics volume performance show	657
qos statistics volume resource cpu show	658
qos statistics volume resource disk show	660
qos statistics workload characteristics show	662
qos statistics workload latency show	666
qos statistics workload performance show	671
qos statistics workload resource cpu show	674
qos statistics workload resource disk show	676
qos workload commands	679
qos workload delete	679
qos workload show	679
san commands	682
san config commands	682
san config show	682
security commands	683
security snmpusers	683
Description	683
Parameters	683
Examples	684
security anti-ransomware commands	684
security anti-ransomware show	684
security anti-ransomware update-package-from-uri	685
security anti-ransomware auto-enable modify	686
security anti-ransomware auto-enable show	687

security anti-ransomware volume disable	688
security anti-ransomware volume dry-run	688
security anti-ransomware volume enable	689
security anti-ransomware volume pause	689
security anti-ransomware volume resume	689
security anti-ransomware volume show	690
security anti-ransomware volume attack clear-suspect	692
security anti-ransomware volume attack generate-report	693
security anti-ransomware volume attack-detection-parameters modify	694
security anti-ransomware volume attack-detection-parameters show	697
security anti-ransomware volume auto-switch-to-enable-mode show	700
security anti-ransomware volume entropy-stat show-encryption-percentage-histogram	701
security anti-ransomware volume entropy-stat show-recent-daily-stat	703
security anti-ransomware volume entropy-stat show-recent-high-encryption-stat	704
security anti-ransomware volume entropy-stat show-recent-hourly-stat	706
security anti-ransomware volume entropy-stat show-recent-sub-hourly-stat	707
security anti-ransomware volume event-log modify	708
security anti-ransomware volume event-log show	709
security anti-ransomware volume space show	710
security anti-ransomware volume workload-behavior clear-surge	711
security anti-ransomware volume workload-behavior show	713
security anti-ransomware volume workload-behavior update-baseline-from-surge	715
security anti-ransomware vserver event-log modify	717
security anti-ransomware vserver event-log show	717
security audit commands	718
security audit modify	718
security audit show	719
security audit log show	719
security certificate commands	722
security certificate azure-install	722
security certificate create	724
security certificate delete	726
security certificate generate-csr	728
security certificate install	732
security certificate print	735
security certificate rename	738
security certificate show-generated	739
security certificate show-truststore	742
security certificate show-user-installed	746
security certificate show	750
security certificate sign	754
security certificate ca-issued revoke	758
security certificate ca-issued show	758
security certificate config modify	761
security certificate config show	762

security certificate truststore check	762
security certificate truststore clear	763
security certificate truststore load	764
security cluster-network commands	764
security cluster-network modify	764
security cluster-network show	765
security cluster-network certificate create	765
security cluster-network certificate delete	766
security cluster-network certificate modify	766
security cluster-network certificate renew	767
security cluster-network certificate show	767
security config commands	768
security config modify	768
security config show	771
security config ocsp disable	777
security config ocsp enable	778
security config ocsp show	780
security config status show	781
security cryptomod-fips commands	783
security cryptomod-fips show	783
security dynamic-authorization commands	784
security dynamic-authorization modify	784
security dynamic-authorization show	786

ONTAP 9.18.1 commands

exit

Quit the CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `exit` command ends the current CLI session.

Examples

The following example ends the current CLI session:

```
cluster1::> exit  
Goodbye
```

history

Show the history of commands for this CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `history` command displays the command history of the current CLI session. A numeric ID precedes each command. Use this number with the [redo](#) command to re-execute that history item.

Examples

The following example displays the command history of the current CLI session:

```
cluster1::> history
 1  vserver show
 2  man volume show
 3  volume delete -vserver vs0 -volume temporary2
 4  volume modify { -volume temp* } -state offline
cluster1::> redo 3
```

Related Links

- [redo](#)

man

Display the online manual pages

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `man` command displays the manual page of the command you specify. If you do not specify a command, the command displays the man page index.

Parameters

[<text>] - Valid CLI command

The command for which you'd like to see the manual page. The syntax of the command is the same as the command itself. The `man` command supports abbreviations and tab completion of the command name.

Examples

The following example displays the manual page for the *storage aggregate create* command.

```
cluster1::> man sto aggr cre
```

That example could also have been fully specified as:

```
cluster1::> man storage aggregate create
```

redo

Execute a previous command

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `redo` command re-executes a command that has been executed previously in the current CLI session. Specify a previously run command using:

- A string that matches part of a previous command. For example, if the only `volume` command you have run is `volume show`, enter `redo ``vol` to re-execute the command.
- The numeric ID of a previous command, as listed by the [history](#) command. For example, enter `redo ``4` to re-execute the fourth command in the history list.
- A negative offset from the end of the history list. For example, enter `redo ``-2` to re-execute the command that you ran two commands ago.

Parameters

[<text>] - String, Event Number, or Negative Offset

Use this parameter to specify a string, a numeric ID from the command history, or a negative number that identifies the command to be re-executed.

Examples

The following example re-executes command number 10 in the command history:

```
cluster1::> redo 10
```

Related Links

- [history](#)

rows

Show/Set the rows for the CLI session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `rows` command displays the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Specify a number to set the number of rows that can be displayed. Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.

You can also set this value using the [set -rows](#) command.

Parameters

[<integer>] - Number of Rows the Screen Can Display

Use this parameter to specify the number of rows your terminal can display.

Examples

The following example displays the current number of rows, then resets the number of rows to 48:

```
cluster1::> rows
36

cluster1::> rows 48
```

Related Links

- [set](#)

set

Display/Set CLI session settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `set` command changes attributes of the user interface.

Parameters

[`-privilege <PrivilegeLevel>`] - Privilege Level

Use this parameter to specify the privilege level of the command session. Possible values are

- `admin` - Used for routine system management commands
- `advanced` - Used for infrequent, dangerous, or complicated commands
- `diagnostic` - Used for detailed diagnostic commands that are used only by support personnel

[`-confirmations {on|off}`] - Confirmation Messages

Use this parameter with the value `on` to specify that the interface prompt for confirmation before executing potentially dangerous commands. Use this parameter with the value `off` to specify that the interface not prompt for confirmation, even before potentially dangerous commands execute. The default setting is `on`.

[`-showallfields {true|false}`] - Show All Fields

Use this parameter with the value `true` to specify that the interface display all field columns when displaying tabular output. Use this parameter with the value `false` to specify that the interface display only selected columns. The default setting is `false`.

[`-showseparator <text>`] - Show Separator

Use this parameter to specify the characters to use as the field separator. The field separator is used between field columns when `-showallfields` is set to "true". The separator can be from one to three characters in length. When specifying the separator, enclose it in quotation marks ("). Set the separator to one or more spaces to disable this feature.

[`-active-help {true|false}`] - Active Help

Use this parameter with the value `true` to specify that pressing the question mark (?) key is sufficient to execute a help request. Use this parameter with the value `false` to specify that you must press the Return key after the question mark key to execute a help request. The default setting is `true`.

[`-units {auto|raw|B|KB|MB|GB|TB|PB}`] - Data Units

Use this parameter to specify the default units used when reporting data sizes. Possible values are:

- `auto` - Auto-scale data size for human-readable output
- `raw` - Bytes without unit designation
- `B` - Bytes

- KB - Kilobytes (1024 bytes, aka kibibytes)
- MB - Megabytes (KB x 1024, aka mebibytes)
- GB - Gigabytes (MB x 1024, aka gibibytes)
- TB - Terabytes (GB x 1024, aka tebibytes)
- PB - Petabytes (TB x 1024, aka pebibytes)

The default setting is `auto`.

[`-rows <integer>`] - Pagination Rows ('0' disables)

Use this parameter to specify the number of rows that can be displayed in the current CLI session before the interface pauses output. If you do not set this value, it adjusts automatically based on the actual height of your terminal. If the actual height is undefined, the default number of rows is 24.

Setting this value manually disables auto-adjustment. Specify zero (0) to disable pausing.

You can also set this value using the `rows` command.

[`-vserver <text>`] - Default Vserver

Use this parameter to specify the name of the Vserver to use as the default value for the `-vserver` parameter of commands.

Vserverized commands that only have a single required parameter, which is the `<userinput>-vserver<userinput>`, allow the Vserver to be specified positionally, without `<userinput>-vserver<userinput>` preceding it. Due to this, care must be taken when using CLI commands that do not require the `<userinput>-vserver<userinput>` parameter. For example, using the `"vserver nfs delete "` **command will ignore the "set -vserver" value as the parser considers the "" to be the Vserver.**

[`-node <text>`] - Default Node

Use this parameter to specify the name of the node to use as the default value for the `-node` parameter of commands.

[`-stop-on-error {true|false}`] - Stop On Error

Use this parameter with the value `true` to specify that continuing commands should stop if they encounter an error. Use this parameter with the value `false` to specify that continuing commands should continue if they encounter an error.

[`-prompt-timestamp {above|inline|none}`] - Display Prompt Timestamp

Print the current date and time as a part of the prompt. The possible values are

- *above* - print the timestamp using the system timestamp format on the line above the remainder of the prompt.
- *inline* - print the timestamp using the system timestamp format at the beginning of the line with the remainder of the prompt.
- *none* - do not print the timestamp.

The default value is `none`.

Examples

The following example sets the privilege level to advanced.

```
cluster1::> set -privilege advanced
```

```
Warning: These advanced commands are potentially dangerous; use them only  
when
```

```
    directed to do so by NetApp personnel.
```

```
Do you wish to continue? (y or n): y
```

```
cluster1::*>
```

The following examples cause all columns to be shown in output rows, with a comma used as the field separator.

```

cluster1::> set -showallfields true

cluster1::> set -showseparator ","

cluster1::> network port show

```

The following example shows how to create a prompt with a timestamp.

```

cluster1::> set -prompt-timestamp above
[2/25/2016 16:38:38]
cluster1::>

```

Related Links

- [rows](#)

top

Go to the top-level directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `top` command changes the current working directory of the command prompt to the top-level command directory.

Examples

The following example returns the command prompt from the `storage aggregate` directory to the top-level directory:

```
cluster1::storage aggregate> top  
  
cluster1::>
```

up

Go up one directory

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `up` command, which can also be specified as two dots (`..`), changes the current working directory of the command prompt to the directory that is up one level in the command hierarchy.

Examples

The following example takes the command prompt up one level from the `storage aggregate` directory:

```
cluster1::storage aggregate> up  
  
cluster1::storage>
```

application commands

application provisioning commands

application provisioning config modify

Modify options for application provisioning

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the options for application provisioning operations.

Parameters

`[-is-mixed-storage-services-allowed {true|false}] - Is Mixed Storage Services Allowed`
(privilege: advanced)

Specifies whether mixed cost storage services are allowed for provisioning placement. If the value of this parameter is *false*, only the aggregates closest to the performance requirements of the storage service are used. If the value of this parameter is *true*, all aggregates with sufficient performance are considered. The initial value for option is *false*.

Examples

```
cluster1::*> application provisioning config modify -is-mixed-storage  
-services-allowed true
```

Enables the use of mixed storage services for provisioning placement.

application provisioning config show

Display options for application provisioning

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays options for application provisioning.

Examples

```
cluster1::*> application provisioning config show  
Is Mixed Storage Services Allowed: false
```

cluster commands

cluster add-node-status-clear-failed

Remove failed nodes from the status list

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster add-node-status-clear-failed` command removes failed entries from the status list displayed by the `cluster add-node-status` command.

Examples

The following example removes failed entries:

```
clus1::> cluster add-node-status
Node Name      Cluster IP      Status      Error
Reason
-----
-              2.2.2.2        failure     The
cluster port MTU                               values do
not match.                                     Retry

cluster add-node-status

Show cluster expansion progress

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster add-node-status` command displays the progress of the node joining a cluster initiated by using the [cluster create](#) command or the [cluster add-node](#) command

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node-uuid <UUID>] - Node UUID

Select the node that match the specified node UUID.

[-node-name <text>] - Node Name

Select the nodes that match the specified node name.

[-cluster-ip <IP Address>] - IP Address of a Cluster Interface of Node

Select the nodes that match the specified cluster IP.

[-status <Cluster Operation Status>] - The Status of Current Task Being Performed

Select the nodes that match the specified status. This status shows whether the operation is ongoing or complete with success or failure. The various phases that a node goes through are node-initialization, joining-cluster, service-startup, post-cluster-setup and success or failure.

[-failure-msg <text>] - Error Reason

Select the nodes that match the specified error string.

[-last-updated <MM/DD/YYYY HH:MM:SS>] - Last Updated

The date/time stamp of the last update to the status.

Examples

The following example shows the progress of a node add operation:

```
clus1::> cluster add-node-status
```

Node Name	Node IP	Status	Error Reason
node1	1.1.1.1	success	-

cluster add-node

Expand the cluster by discovering and adding new nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster add-node` command discovers and adds new nodes to the cluster. When the `-node-count` parameter is specified, the command attempts to add that many nodes to the cluster. The `-node-ip` parameter can be specified to directly add a node. The `-cluster-ips` parameter can be specified to directly add one or more nodes in parallel. Only one of the `-node-count`, `-node-ip` and `-cluster-ips` parameters can be provided. The [system node show-discovered](#) command displays all the nodes discovered on the local network.

The `node-count` parameter is deprecated and may be removed in a future release of ONTAP. Use the `-cluster-ips` parameter instead.

The `node-ip` parameter is deprecated and may be removed in a future release of ONTAP. Use the `-cluster-ips` parameter instead.

Parameters

{ -cluster-ips <IP Address>, ... - List of Cluster Interface IP Addresses of the Nodes Being Added

This parameter contains a comma separated list of cluster interface IP addresses of the nodes in the cluster you are creating. All the nodes specified in the list will be added to the cluster.

| -retry <true> - Retry a failed cluster add-node operation

Use this parameter to retry the most recently failed `cluster add-node` command with the originally specified parameters. Retry is not supported if the `cluster add-node` command was originally run with either the `-node-count` or `-node-ip` parameters.

| -node-count <integer> - (DEPRECATED)-Number of Nodes Being Added

Number of nodes to be added to the cluster. If fewer nodes are discovered, all the discovered nodes are added to the cluster and the command will fail since there are fewer nodes than specified. If more nodes are found than the number specified, the command will fail because there is no way to determine which

nodes you intend to add to the cluster.

The `-node-count` parameter is supported on non-shared architecture platforms only.

| `-node-ip <IP Address>` - (DEPRECATED)-Cluster IP Address of Node }

Cluster IP address of the node to add. When this parameter is provided, the command directly adds the node.

[`-node-names <text>,...`] - List of Node Names

This parameter contains a comma separated list of node names of all the nodes in the cluster you are creating. The node names must have an one to one correspondence with `-cluster-ips` parameter. The names provided will be used to rename the nodes once they are added to the cluster.

[`-foreground {true|false}`] - Foreground Process

When set to *false* the command runs in the background as a job. The default is *true* , which causes the command to return after the operation completes.

[`-allow-mixed-version-join <true>`] - Allow a Node At a Different Version to Join Cluster

This parameter allows nodes with different, but compatible versions of ONTAP to be added to the cluster. A ONTAP best practice is to add nodes to the cluster that are of the same ONTAP version as the nodes in the cluster, but that may not always be possible.

Examples

The following example adds a node using `-cluster-ips` :

```
cluster1::> cluster add-node -cluster-ips 1.1.1.1, 2.2.2.2
      Use the 'cluster add-node-status' command to see the progress of the
add-node operation.
```

The following example adds 3 nodes using `-node-count` .

```
cluster1::> cluster add-node -node-count 3
      [Job 22] Job succeeded.
```

cluster create

Create a cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster create` command creates a cluster with one or more nodes. When the `-node-count` parameter is specified, the command attempts to add that many nodes to the cluster. The `-cluster-ips` parameter can be specified to add one or more nodes in parallel. Only one of the `-node-count` and `-cluster-ips` parameters can be provided.

Note that single-node clusters do not require configuring the cluster network. A cluster network interface must be configured before other nodes can join the cluster.

The `node-count` parameter is deprecated and may be removed in a future release of ONTAP. Use the `-cluster-ips` parameter instead.

Parameters

[`-license <License Code v2>`] - (DEPRECATED)-Base License

This parameter is deprecated and may be removed in a future release of ONTAP.

Use this optional parameter to specify the base license for the cluster. Obtain this value from your sales or support representative.

`-clustername <text>` - Cluster Name

Use this parameter to specify the name of the cluster you are creating.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "_".
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 44 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

[`-cluster-ips <IP Address>,...`] - List of Cluster Interface IP Addresses of the Nodes Being Added

This parameter contains a comma separated list of cluster interface IP addresses of the nodes in the cluster you are creating. All the nodes specified in the list will be added to the cluster.

[`-node-count <integer>`] - (DEPRECATED)-Node Count

Use this parameter to specify the number of nodes in the cluster you are creating.

- `-node-count` parameter is supported on non-shared architecture platforms only.

[`-node-names <text>,...`] - List of Node Names

This parameter contains a comma separated list of node names of all the nodes in the cluster you are creating. The node names must have an one to one correspondence with `-cluster-ips` parameter. The names provided will be used to rename the nodes once they are added to the cluster.

[`-retry <true>`] - Retry a failed cluster create operation }

Use this parameter to retry the most recently failed `cluster create` command with the originally specified parameters. Retry is not supported if the `cluster create` command was originally run with either the `-node-count` or `-node-ip` parameters.

Examples

The following example creates a cluster named cluster1

```
cluster1::> cluster create -clustername cluster1
```

The following example creates a cluster named cluster1 with node-count 4 on a non-shared architecture platform.

```
cluster1::> cluster create -clustername cluster1 -node-count 4
```

cluster join

(DEPRECATED)-Join an existing cluster using the specified member's IP address or by cluster name

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command is deprecated and may be removed in a future release of ONTAP. Use [cluster add-node](#) from a node in the cluster instead.

The `cluster join` command adds a node to an existing cluster. Use the [cluster create](#) command to create a cluster if one does not already exist.

Note that a cluster network interface must be configured for the cluster before other nodes can join the cluster.

Parameters

{ -clusteripaddr <IP Address> - IP Address of a Cluster Interface from a Node in the Cluster

Use this parameter to specify the IP address of a cluster interface. This must be the IP address of a cluster interface of a node that is already in the cluster. This parameter is mutually exclusive with the `-cluster -name` parameter.

| -cluster-name <text> - (DEPRECATED)-Cluster Name of the Cluster to Join }

Deprecated. Use this parameter to specify the name of an existing cluster to join.

[-allow-mixed-version-join <true>] - Allow a Node at a Different Version to Join Cluster

This parameter allows nodes with different, but compatible versions of ONTAP to join the cluster. A ONTAP best practice is to join nodes to the cluster that are of the same ONTAP version as the nodes in the cluster, but that may not always be possible.

[-node-name <text>] - Name to Use for the Node in the Cluster

This parameter specifies the name that the node will have when we join it to the cluster.

-cluster-admin-user <text> - Cluster Admin User on the Cluster to Join

Use this parameter to specify the username of a user with the "admin" role, for example the user "admin".

Examples

The following example joins the local node to a cluster. The IP address 192.0.2.66 is the address of a cluster interface of a node that already belongs to the cluster.

```
node::> cluster join -clusteripaddr 192.0.2.66
```

cluster modify

Modify cluster node membership attributes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster modify` command modifies the cluster attributes of a node, including its eligibility to participate in the cluster.

At the advanced privilege level, you can use the command to specify whether a node holds epsilon. Epsilon is an extra fractional vote that enables quorum to form using slightly weaker requirements. For example, two out of four eligible nodes are sufficient to form quorum if one of those two nodes holds epsilon.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the name of the node to modify. If you do not specify a node, the command runs on the local node.

[-epsilon {true|false}] - Epsilon (privilege: advanced)

Use this parameter with the value `true` to specify that the node holds Epsilon in the cluster. Use this parameter with the value `false` to specify that the node does not hold Epsilon in the cluster. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-eligibility {true|false}] - Eligibility (privilege: advanced)

Use this parameter with the value `true` to specify that the node is eligible to participate in the cluster. Use this parameter with the value `false` to specify that the node is not eligible to participate in the cluster.

If you modify a node as ineligible to participate in the cluster, the command prompts you for confirmation before it runs.

`[-skip-quorum-check-before-eligible <true>]` - Skip Quorum Check Before Setting Node Eligible (privilege: advanced)

If this parameter is specified, quorum checks will be skipped prior to setting a node eligible. When setting a node to eligible, the operation will continue even if there is a possible data outage due to a quorum issue.

`[-skip-quorum-check-before-ineligible <true>]` - Skip Quorum Check Before Setting Node Ineligible (privilege: advanced)

If this parameter is specified, quorum checks will be skipped prior to setting a node ineligible. When setting a node to ineligible, the operation will continue even if there is a possible data outage due to a quorum issue.

Examples

This example modifies a node to make it eligible to participate in the cluster.

```
cluster1::*> cluster modify -node node3 -eligibility true
```

The following example removes epsilon from the node named node0 and adds it to the node named node1:

```
cluster1::*> cluster modify -node node0 -epsilon false
cluster1::*> cluster modify -node node1 -epsilon true
```

cluster ping-cluster

Ping remote cluster interfaces and perform RPC server check

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster ping-cluster` command probes network connectivity to remote cluster interfaces, and performs an RPC server check.

Parameters

`-node <nodename>` - Node (privilege: advanced)

Use this parameter to send the ping from the node you specify.

`[-use-sitelist {true|false}]` - Use Sitelist for Cluster Interfaces (privilege: advanced)

Use this parameter with the value `true` to specify that the command use the sitelist to determine any incomplete cluster IP information. Use this parameter with the value `false` to specify that the command not use the sitelist.

`[-skip-rpccheck {true|false}]` - Skip RPC Server Check (privilege: advanced)

Use this parameter with the value `true` to specify that the command not perform the `rpcinfo` check of remote hosts. Use this parameter with the value `false` to specify that the command perform the `rpcinfo` check. The `rpcinfo` check checks the status of the RPC servers on the remote hosts. By default, the `rpcinfo`

check runs on the program number of the portmapper. Use the `-rpc-prognum` parameter to override this default.

`[-rpc-prognum <integer>]` - RPC Server to Check (privilege: advanced)

Use this parameter to override default behavior and run the `rpcinfo` check on the program number you specify. By default, the `rpcinfo` check runs on the program number of the portmapper.

Examples

The following example shows typical output for this command.

```
cluster1::*> cluster ping-cluster -node node1
Host is node1
Getting addresses from network interface table...
Local = 10.254.231.102  10.254.91.42
Remote = 10.254.42.25   10.254.16.228
Ping status:
....
Basic connectivity succeeds on 4 path(s)
Basic connectivity fails on 0 path(s)
.....
Detected 1500 byte MTU on 4 path(s):
    Local 10.254.231.102 to Remote 10.254.16.228
    Local 10.254.231.102 to Remote 10.254.42.25
    Local 10.254.91.42 to Remote 10.254.16.228
    Local 10.254.91.42 to Remote 10.254.42.25
Larger than PMTU communication succeeds on 4 path(s)
RPC status:
2 paths up, 0 paths down (tcp check)
2 paths up, 0 paths down (udp check)
```

cluster remove-node

Remove a node from the cluster

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster remove-node` command removes a node from a cluster.

Before you can remove a node from a cluster, you must shut down all of the node's shared resources, such as virtual interfaces to clients. If any of a node's shared resources are still active, the command fails. The failure message will display which active resources must be shut down before the node can be removed from the cluster.

Parameters

{ -node <nodename> - Node to Unjoin (privilege: advanced)

Use this parameter to specify the name of the node to remove from the cluster.

| -cluster-ip <IP Address> - IP Address of a Cluster Interface of Node to Unjoin (privilege: advanced) }

Use this parameter to specify the cluster IP of the node to remove from the cluster.

[-skip-quorum-check-before-unjoin <true>] - Skip Quorum Check before Unjoin (privilege: advanced)

If this parameter is specified, quorum checks will be skipped prior to the remove-node command. The operation will continue even if there is a possible data outage due to a quorum issue.

[-skip-last-low-version-node-check <true>] - Skip the Check That Prevents Unjoining the Last Low Versioned Node (privilege: advanced)

This parameter allows the node with lowest version of ONTAP to be removed from the cluster.

Examples

The following example shows how to remove the node named `node4` from the cluster.

```
cluster1::*> cluster remove-node -node node4
```

cluster setup

Setup wizard

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use of this command to join a node to an existing cluster is deprecated and might be removed in a future release of ONTAP. From a node in the cluster use the [system node show-discovered](#) command and then use the [cluster add-node](#) command.

The `cluster setup` command runs the cluster setup wizard, which can be used to either create a cluster or join a node to an existing cluster. When you run the cluster setup wizard, enter the appropriate information at the prompts. You will be asked to provide the following information to create a cluster:

- Node management interface port, IP address, netmask, default gateway
- Cluster name
- Cluster base license key

This parameter has been deprecated. It may be removed from a future release of ONTAP.

- Feature license keys

- Cluster administrator's password
- Cluster management interface port, IP address, netmask, default gateway
- DNS domain names
- Name server IP addresses
- Location

You will be asked to provide the following information to join a cluster:

- Node management interface port, IP address, netmask, default gateway
- Cluster IP address

The cluster management interface is used for managing the cluster. It provides one IP address to manage the cluster and will fail over to another node, if necessary. This is the preferred IP address for managing the cluster, but you can also manage the cluster by logging in to the node management IP address of a node in the cluster. Since the cluster management interface must be able to fail over, the port role for the interface must be "data" and typically the best choice for an IP address is one on the data network. The node management interface will not fail over, so an IP address on the management network and a port with the role "node management" is the best choice. Alternatively, you can assign an IP address on the data network to the cluster management interface - if that is better in your network topology - but the port must be a data port. The two examples below illustrate the cluster create and cluster join operations, respectively.

Parameters

Examples

An example of using `cluster setup` to create a cluster with IPv4 addresses is shown below.

```
node::> cluster setup
Welcome to the cluster setup wizard.

You can enter the following commands at any time:
  "help" or "?" - if you want to have a question clarified,
  "back" - if you want to change previously answered questions, and
  "exit" or "quit" - if you want to quit the cluster setup wizard.
  Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp
Technical
Support. To disable this feature, enter
autosupport modify -support disable
within 24 hours.

Enabling AutoSupport can significantly speed problem determination and
resolution should a problem occur on your system.
```

For further information on AutoSupport, see:
<http://support.netapp.com/autosupport/>

Type yes to confirm and continue {yes}: yes

Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.66
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
The node management interface has been modified to use port e0c with IP address 192.0.2.66.
Use your web browser to complete cluster setup by accessing
<https://192.0.2.66>

Otherwise, press Enter to complete cluster setup using the command line interface:

Do you want to create a new cluster or join an existing cluster? {create, join}:

create

Do you intend for this node to be used as a single node cluster? {yes, no} [no]:

Existing cluster interface configuration found:

Port	MTU	IP	Netmask
e0a	9000	169.254.21.189	255.255.0.0
e0b	9000	169.254.29.73	255.255.0.0

Do you want to use this configuration? {yes, no} [yes]:

Enter the cluster administrator's (username "admin") password:

Retype the password:

Step 1 of 5: Create a Cluster

You can type "back", "exit", or "help" at any question.

Enter the cluster name: cluster1

Creating cluster cluster1

Starting cluster support services .

Cluster cluster1 has been created.

Step 2 of 5: Add Feature License Keys

You can type "back", "exit", or "help" at any question.

Enter an additional license key []:

Step 3 of 5: Set Up a Vserver for Cluster Administration

You can type "back", "exit", or "help" at any question.

Enter the cluster management interface port [e0d]:

Enter the cluster management interface IP address: 192.0.2.60

Enter the cluster management interface netmask: 255.255.255.192

Enter the cluster management interface default gateway [192.0.2.1]:

A cluster management interface on port e0d with IP address 192.0.2.60 has been created. You can use this address to connect to and manage the cluster.

Enter the DNS domain names: data.example.com

Enter the name server IP addresses: 192.0.2.147

DNS lookup for the admin Vserver will use the data.example.com domain.

Step 4 of 5: Configure Storage Failover (SFO)

You can type "back", "exit", or "help" at any question.

SFO is licensed.

SFO will be enabled when the partner joins the cluster.

Step 5 of 5: Set Up the Node

You can type "back", "exit", or "help" at any question.

Where is the controller located []: Sunnyvale

Cluster "cluster1" has been created.

To complete cluster setup, you must join each additional node to the cluster

by running "system node show-discovered" and "cluster add-node" from a node in the cluster.

To complete system configuration, you can use either OnCommand System Manager

or the ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster management IP address (<https://192.0.2.60>).

To access the command-line interface, connect to the cluster management IP address (for example, `ssh admin@192.0.2.60`).

cluster1::>

An example of using `cluster setup` to join a cluster with IPv4 addresses is shown below.

```
node::> cluster setup
```

Welcome to the cluster setup wizard.

You can enter the following commands at any time:

"help" or "?" - if you want to have a question clarified,
"back" - if you want to change previously answered questions, and
"exit" or "quit" - if you want to quit the cluster setup wizard.
Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup".
To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp
Technical
Support. To disable this feature, enter
autosupport modify -support disable
within 24 hours.

Enabling AutoSupport can significantly speed problem determination and
resolution should a problem occur on your system.

Type yes to confirm and continue {yes}: yes

Enter the node management interface port [e0c]:
Enter the node management interface IP address: 192.0.2.67
Enter the node management interface netmask: 255.255.255.192
Enter the node management interface default gateway: 192.0.2.1
A node management interface on port e0c with IP address 192.0.2.67 has
been created.

Use your web browser to complete cluster setup by accessing
<https://192.0.2.67>

Otherwise, press Enter to complete cluster setup using the command line
interface:

Do you want to create a new cluster or join an existing cluster? {create,
join}:

join

Existing cluster interface configuration found:

Port	MTU	IP	Netmask
e0a	9000	169.254.31.170	255.255.0.0
e0b	9000	169.254.115.61	255.255.0.0

Do you want to use this configuration? {yes, no} [yes]:

Step 1 of 3: Join an Existing Cluster

You can type "back", "exit", or "help" at any question.

Enter the IP address of an interface on the private cluster network from

```
the
cluster you want to join: 169.254.115.8

Joining cluster at address 169.254.115.8

This node has joined the cluster cluster1.
Step 2 of 3: Configure Storage Failover (SFO)
You can type "back", "exit", or "help" at any question.
SFO is licensed.
SFO will be enabled when the partner joins the cluster.
Step 3 of 3: Set Up the Node
You can type "back", "exit", or "help" at any question.
This node has been joined to cluster "cluster1".

To complete cluster setup, you must join each additional node to the
cluster
by running "system node show-discovered" and "cluster add-node" from a
node in the cluster.
To complete system configuration, you can use either OnCommand System
Manager
or the ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster
management IP address (https://192.0.2.60).

To access the command-line interface, connect to the cluster management
IP address (for example, ssh admin@192.0.2.60).

cluster1::>
```

Enter an additional license key []:

Step 3 of 5: Set Up a Vserver for Cluster Administration

You can type "back", "exit", or "help" at any question.

Enter the cluster management interface port [e0d]:

Enter the cluster management interface IP address:

FD20:8B1E:B255:814E:4827:F558:6150:8D5F

Enter the cluster management interface prefix length: 64

Enter the cluster management interface default gateway

[fd20:8b1e:b255:814e::1]:

A cluster management interface on port e0d with IP address

fd20:8b1e:b255:814e:4827:f558:6150:8d5f has been created. You can use this address to connect to and manage the cluster.

Enter the DNS domain names: data.example.com

Enter the name server IP addresses:

FD20:8B1E:B255:814E:8F99:721C:5471:FC1E

DNS lookup for the admin Vserver will use the data.example.com domain.

Step 4 of 5: Configure Storage Failover (SFO)

You can type "back", "exit", or "help" at any question.

SFO will not be enabled on a non-HA system.

Step 5 of 5: Set Up the Node

You can type "back", "exit", or "help" at any question.

Where is the controller located []:

Cluster "cluster1" has been created.

To complete cluster setup, you must join each additional node to the cluster

by running "system node show-discovered" and "cluster add-node" from a node in the cluster.

To complete system configuration, you can use either OnCommand System Manager

or the ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster management IP address (`https://[fd20:8b1e:b255:814e:4827:f558:6150:8d5f]`).

To access the command-line interface, connect to the cluster management IP address (for example, `ssh admin@fd20:8b1e:b255:814e:4827:f558:6150:8d5f`).

```
cluster1::>
```

An example of using `cluster setup` to join a cluster with IPv6 addresses is shown below.

```
node::> cluster setup
Welcome to the cluster setup wizard.
```

You can enter the following commands at any time:

- "help" or "?" - if you want to have a question clarified,
- "back" - if you want to change previously answered questions, and
- "exit" or "quit" - if you want to quit the cluster setup wizard.

Any changes you made before quitting will be saved.

You can return to cluster setup at any time by typing "cluster setup". To accept a default or omit a question, do not enter a value.

This system will send event messages and periodic reports to NetApp Technical Support. To disable this feature, enter `autosupport modify -support disable` within 24 hours.

Enabling AutoSupport can significantly speed problem determination and resolution, should a problem occur on your system. For further information on AutoSupport, see: <http://support.netapp.com/autosupport/>

```
Type yes to confirm and continue {yes}: yes
```

```
Enter the node management interface port [e0c]:
Enter the node management interface IP address:
FD20:8B1E:B255:814E:3A9F:9EBC:BF57:7A89
You are trying to create an IPv6 address. Creating an IPv6 address will
enable
IPv6 on this node.
```

```
Type yes to confirm and continue {yes, no}: yes
Enter the node management interface prefix length: 64
Enter the node management interface default gateway:
```

FD20:8B1E:B255:814E:0000:0000:0000:0001

A node management interface on port e0c with IP address
fd20:8b1e:b255:814e:3a9f:9ebc:bf57:7a89 has been created.

Use your web browser to complete cluster setup by accessing
[https://\[fd20:8b1e:b255:814e:3a9f:9ebc:bf57:7a89\]](https://[fd20:8b1e:b255:814e:3a9f:9ebc:bf57:7a89])

Otherwise, press Enter to complete cluster setup using the command line
interface:

Do you want to create a new cluster or join an existing cluster? {create,
join}:

join

Existing cluster interface configuration found:

Port	MTU	IP	Netmask
e0a	9000	172.31.6.251	255.255.192.0
e0b	9000	172.31.6.252	255.255.192.0

Do you want to use this configuration? {yes, no} [yes]:

Step 1 of 3: Join an Existing Cluster

You can type "back", "exit", or "help" at any question.

Enter the IP address of an interface on the private cluster network from
the

cluster you want to join: 172.31.6.130

Joining cluster at address 172.31.6.130

Starting cluster support services

This node has joined the cluster cluster1.

Step 2 of 3: Configure Storage Failover (SFO)

You can type "back", "exit", or "help" at any question.

SFO will not be enabled on a non-HA system.

Step 3 of 3: Set Up the Node

You can type "back", "exit", or "help" at any question.

This node has been joined to cluster "cluster1".

To complete cluster setup, you must join each additional node to the
cluster

by running "system node show-discovered" and "cluster add-node" from a
node in the cluster.

To complete system configuration, you can use either OnCommand System
Manager

or the ONTAP command-line interface.

To access OnCommand System Manager, point your web browser to the cluster

```
management IP address (https://[fd20:8b1e:b255:814e:4827:f558:6150:8d5f]).
```

```
To access the command-line interface, connect to the cluster management  
IP address (for example, ssh  
admin@fd20:8b1e:b255:814e:4827:f558:6150:8d5f).  
cluster1::>
```

- [cluster add-node](#)

cluster show

Display cluster node members

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster show` command displays information about the nodes in a cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value.

[-node-uuid <UUID>] - UUID (privilege: advanced)

Selects the nodes that match this parameter value.

[-epsilon {true|false}] - Epsilon (privilege: advanced)

Selects the nodes that match this parameter value. In a cluster, only one node can be designated as Epsilon at any given time. You can designate a node as Epsilon to add weight to its voting in a cluster with an even number of nodes.

[-eligibility {true|false}] - Eligibility

Selects the nodes that match this parameter value (true means eligible to participate in the cluster).

[-health {true|false}] - Health

Selects the nodes that match this parameter value (true means online).

Examples

The following example displays information about all nodes in the cluster:

```
cluster1::> cluster show
Node                Health  Eligibility
-----
node0               true   true
node1               true   true
node2               true   true
node3               true   true
```

The following example displays information about the node named node1:

```
cluster1::> cluster show -node node1
Node: node1
Eligibility: true
Health: true
```

cluster agent commands

cluster agent connection create

Create Cloud Agent connection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Create a websocket connection to an external manager that will be used to monitor this cluster. The external manager will have access to REST APIs and CCMA counters based upon the privilege of the user creating the connection.

Parameters

-name <text> - Name (privilege: advanced)

Specify connection name.

-destination <text> - Destination URL (privilege: advanced)

Specify destination URL. For secure WebSocket, this should be amqpws://<host[:port]>.

[-use-proxy {true|false}] - Use Proxy (privilege: advanced)

Establish this connection through the HTTP proxy server associated with this connection's IPspace.

[-subscribe-address <text>] - Subscribe Address (privilege: advanced)

AMQP address to which ONTAP will subscribe. Defaults to "ontap.agent.manager".

[-publish-address <text>] - Publish Address (privilege: advanced)

AMQP address to which ONTAP will publish. Defaults to "ontap.agent.cluster".

[-certificate-uuid <UUID>] - Authentication Certificate UUID (privilege: advanced)

Specify UUID of an existing certificate to use for authentication to the destination.

[-csr-url <text>] - Authentication CSR URL (privilege: advanced)

URL to send certificate signing request (CSR) that will be used for authenticating with the destination.

[-csr-token <text>] - Authentication CSR Token (privilege: advanced)

Token for authenticating with CSR URL. Not audited.

[-manager-token <text>] - Manager Token (privilege: advanced)

Specify token supplied by manager application to correlate the connection setup back to the workflow that initiated it.

[-ipspace <IPspace>] - IPspace for Connection (privilege: advanced)

The IPspace to use for the connection.

[-idle-timeout <integer>] - Idle Timeout (in seconds) (privilege: advanced)

AMQP idle timeout. Defaults to 0. If set, the local peer will disconnect if it does not receive AMQP frames within the timeout.

[-address-family {unknown|ipv4|ipv6}] - Address Family (privilege: advanced)

Specify address family.

[-auto-delete-error-minutes {<integer>|-}] - Time to Auto-delete when disconnected (in minutes) (privilege: advanced)

Specify time to live in minutes for cloud agent connection in error state. Connection will be deleted if it stays in error state beyond this time.

Examples

```
cluster-1::> cluster agent connection create -name cloud_agent
               -destination amqpws://manager.example.com
```

cluster agent connection delete

Delete Cloud Agent connection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Delete the connection to an external manager.

Parameters

-name <text> - Name (privilege: advanced)

Specify connection name.

Examples

```
cluster-1::> cluster agent connection delete -name cloud_agent
```

cluster agent connection modify

Modify Cloud Agent connection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Modify agent connection properties.

Parameters

-name <text> - Name (privilege: advanced)

Specify connection name.

[-destination <text>] - Destination URL (privilege: advanced)

Specify destination URL. For secure WebSocket, this should be amqpws://<host[:port]>.

[-use-proxy {true|false}] - Use Proxy (privilege: advanced)

Establish this connection through the HTTP proxy server associated with this connection's IPspace.

[-subscribe-address <text>] - Subscribe Address (privilege: advanced)

AMQP address to which ONTAP will subscribe. Defaults to "ontap.agent.manager".

[-publish-address <text>] - Publish Address (privilege: advanced)

AMQP address to which ONTAP will publish. Defaults to "ontap.agent.cluster".

[-certificate-uuid <UUID>] - Authentication Certificate UUID (privilege: advanced)

Specify UUID of an existing certificate to use for authentication to the destination.

[-csr-token <text>] - Authentication CSR Token (privilege: advanced)

Token for authenticating with CSR URL. Not audited.

[-idle-timeout <integer>] - Idle Timeout (in seconds) (privilege: advanced)

AMQP idle timeout. Defaults to 0. If set, the local peer will disconnect if it does not receive AMQP frames within the timeout.

[-address-family {unknown|ipv4|ipv6}] - Address Family (privilege: advanced)

Specify address family.

`[-auto-delete-error-minutes {<integer>|-}]` - Time to Auto-delete when disconnected (in minutes) (privilege: advanced)

Specify time to live in minutes for cloud agent connection in error state. Connection will be deleted if it stays in error state beyond this time.

Examples

```
cluster-1::> cluster agent connection modify -name cloud_agent
               -destination amqpws://new-manager.example.com
```

cluster agent connection show

Display Cloud Agent connections

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the connections that have been established to help external managers manage the cluster.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ]` (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-name <text>]` - Name (privilege: advanced)

Selects the connections that match the supplied name.

`[-uuid <UUID>]` - UUID (privilege: advanced)

Selects the connections that match the supplied UUID.

`[-destination <text>]` - Destination URL (privilege: advanced)

Selects the connections that match the supplied destination.

`[-state {connecting|connected|error|disabled|partial|static}]` - State (privilege: advanced)

Selects the connections that match the supplied state. The state can have one of the following values:

- `connecting` - The agent is in the process of establishing the connection.
- `connected` - The connection is up and active.
- `error` - The connection is down due to a problem. See error-message and error-time for details.
- `disabled` - The connection has been administratively disabled.

- partial - The connection has been partially established and is not ready to deliver messages.
- static - The agent is of static instance type and does not require an external connection.

[-use-proxy {true|false}] - Use Proxy (privilege: advanced)

Establish this connection through an HTTP proxy server associated with this connection's IPspace

[-subscribe-address <text>] - Subscribe Address (privilege: advanced)

AMQP address to which ONTAP will subscribe. Defaults to "ontap.agent.manager".

[-publish-address <text>] - Publish Address (privilege: advanced)

AMQP address to which ONTAP will publish. Defaults to "ontap.agent.cluster".

[-certificate-uuid <UUID>] - Authentication Certificate UUID (privilege: advanced)

Selects the connections that match the supplied certificate UUID.

[-csr-url <text>] - Authentication CSR URL (privilege: advanced)

URL to send certificate signing request (CSR) that will be used for authenticating with the destination.

[-manager-token <text>] - Manager Token (privilege: advanced)

Selects the connections that match the supplied manager token.

[-ipspace <IPspace>] - IPspace for Connection (privilege: advanced)

The IPspace to use for the connection

[-error-code <integer>] - Last Error Code (privilege: advanced)

Selects the connections that match the supplied error code.

[-error-message <text>] - Last Error Message (privilege: advanced)

Selects the connections that match the supplied error message.

[-error-time <MM/DD/YYYY HH:MM:SS>] - Last Error Time (privilege: advanced)

Selects the connections that match the supplied error time.

[-node <nodename>] - Node Owning the Connection (privilege: advanced)

The node owning the connection

[-msg-recv-total <integer>] - Total Messages Received from Manager (privilege: advanced)

Total messages received from manager

[-msg-recv-manifest <integer>] - Total Manifest Messages Received from Manager (privilege: advanced)

Total manifest messages received from manager

[-msg-recv-baseline-request <integer>] - Total baseline.request Messages Received from Manager (privilege: advanced)

Total baseline.request messages received from manager

[-msg-recv-counters-request <integer>] - Total counters.request Messages Received from Manager (privilege: advanced)

Total counters.request messages received from manager

[-msg-recv-connection-status <integer>] - Total Connection Status Messages Received from Manager (privilege: advanced)

Total connection status messages received from manager

[-msg-recv-connection-modify <integer>] - Total Connection Modify Messages Received from Manager (privilege: advanced)

Total connection modify messages received from manager

[-msg-recv-agent-status <integer>] - Total agent.status.request Messages Received from Manager (privilege: advanced)

Total agent.status.request Messages received from Manager

[-msg-recv-subscription-create <integer>] - Total Subscription Create Messages Received from Manager (privilege: advanced)

Total subscription create messages received from manager

[-msg-recv-subscription-delete <integer>] - Total Subscription Delete Messages Received from Manager (privilege: advanced)

Total subscription delete messages received from manager

[-msg-recv-unknown <integer>] - Total Unknown Messages Received from Manager (privilege: advanced)

Total unknown messages received from manager

[-msg-send-total <integer>] - Total Messages Sent to Manager (privilege: advanced)

Total messages sent to manager

[-msg-send-manifest-request <integer>] - Total manifest.request Messages Sent to Manager (privilege: advanced)

Total manifest.request messages sent to manager

[-msg-send-baseline <integer>] - Total Baseline Messages Sent to Manager (privilege: advanced)

Total baseline messages sent to manager

[-msg-send-counters <integer>] - Total Counters Messages Sent to Manager (privilege: advanced)

Total counters messages sent to manager

[-msg-send-connection-status <integer>] - Total Connection Status Messages Sent to Manager (privilege: advanced)

Total connection status messages sent to manager

[-msg-send-subscription-status <integer>] - Total Subscription Status Messages Sent to Manager (privilege: advanced)

Total subscription status messages received from manager

[-msg-send-errors <integer>] - Total Error Messages Sent to Manager (privilege: advanced)

Total error messages sent to manager

[-msg-delivery-errors <integer>] - Total Errors Encountered Attempting to Send/receive (privilege: advanced)

Total errors encountered attempting to send/receive

[-msg-send-topicrelay <integer>] - Total ONTAP PubSub Topic Messages Sent to Manager (privilege: advanced)

Total ONTAP PubSub Topic messages sent to manager

[-msg-send-agent-status-details <integer>] - Total agent.status Messages Sent to Manager (privilege: advanced)

Total agent.status Messages sent to Manager

[-msg-connection-total <integer>] - Total Connection Attempts (privilege: advanced)

Total connection attempts

[-msg-connection-errors <integer>] - Total Connection Errors (privilege: advanced)

Total connection errors

[-msg-transport-errors <integer>] - Total Transport Errors (privilege: advanced)

Total transport errors

[-application <text>] - Client Application (privilege: advanced)

Selects the connections that match the supplied application.

[-application-url <text>] - Application URL (privilege: advanced)

Selects the connections that match the supplied application URL.

[-idle-timeout <integer>] - Idle Timeout (in seconds) (privilege: advanced)

AMQP idle timeout. Defaults to 0. If set, the local peer will disconnect if it does not receive AMQP frames within the timeout.

[-address-family {unknown|ipv4|ipv6}] - Address Family (privilege: advanced)

Specify address family.

[-auto-delete-error-minutes {<integer>|-}] - Time to Auto-delete when disconnected (in minutes) (privilege: advanced)

Specify time to live in minutes for cloud agent connection in error state. Connection will be deleted if it stays in error state beyond this time.

Examples

```
cluster-1::> cluster agent connection show
Name           Destination                               State      Application      Use
Proxy
-----
cloudinsights  amqpws://172.31.50.251                    connected  Cloud Insights
false
```

cluster contact-info commands

cluster contact-info modify

Modify contact information for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster contact-info modify` command modifies contact information for the cluster administrators. If any values contain spaces, you must enclose those values in quotes.

Use the [cluster contact-info show](#) command to display contact information for the cluster administrators.

Parameters

[-primary-name <text>] - Name of Primary Contact

Use this parameter to specify the name of the primary contact.

[-primary-phone <text>] - Phone Number of Primary Contact

Use this parameter to specify the phone number of the primary contact.

[-primary-alt-phone <text>] - Alternate Phone Number of Primary Contact

Use this parameter to specify the alternate phone number of the primary contact.

[-primary-email <text>] - Email Address or User ID of Primary Contact

Use this parameter to specify the email address of the primary contact.

[-secondary-name <text>] - Name of Secondary Contact

Use this parameter to specify the name of the secondary contact.

[-secondary-phone <text>] - Phone Number of Secondary Contact

Use this parameter to specify the phone number of the secondary contact.

[-secondary-alt-phone <text>] - Alternate Phone Number of Secondary Contact

Use this parameter to specify the alternate phone number of the secondary contact.

[-secondary-email <text>] - Email Address or User ID of Secondary Contact

Use this parameter to specify the email address of the secondary contact.

[-business-name <text>] - Business Name

Use this parameter to specify the name of the business responsible for this cluster.

[-address <text>] - Business Address

Use this parameter to specify the street address of the business responsible for this cluster.

[-city <text>] - City Where Business Resides

Use this parameter to specify the name of the city in which the business is located.

[-state <text>] - State Where Business Resides

Use this parameter to specify the name of the state or province in which the business is located.

[-country <Country Code>] - 2-Character Country Code

Use this parameter to specify the 2-character country code of the country in which the business is located.

[-zip-code <text>] - Postal Code Where Business Resides

Use this parameter to specify the postal or ZIP code area in which the business is located.

Examples

The following example changes the name and phone numbers of the secondary contact person for the cluster.

```
cluster1::> cluster contact-info modify -secondary-name "John Doe"
-secondary-phone 123.555.0156 -secondary-alt-phone 123.555.0178
```

The following example changes the mailing address of the business responsible for the cluster.

```
cluster1::> cluster contact-info modify -address "123 Example Avenue"
-city Exampleville -state "New Example" -zip-code 99999 -country US
```

Related Links

- [cluster contact-info show](#)

cluster contact-info show

Display contact information for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster contact-info show` command displays contact information for the cluster administrators.

Examples

The following example shows example output for this command.

```
cluster1::> cluster contact-info show
Name of Primary Contact : Richard Roe
      Phone Number of Primary Contact : 123.555.0123
      Alternate Phone Number of Primary Contact : 123.555.0145
      Email Address or User Id of Primary Contact : roe@example.com
      Name of Secondary Contact : John Doe
      Phone Number of Secondary Contact : 123.555.0167
      Alternate Phone Number of Secondary Contact : 123.555.0189
      Email Address or User Id of Secondary Contact : doe@example.com
      Business Name : Example Dot Com
      Business Address : 123 Example Avenue
      City Where Business Resides : Exampleville
      State Where Business Resides : New Example
      2-Character Country Code : US
      Postal Code Where Business Resides : 99999
```

cluster controller-replacement commands

cluster controller-replacement network displaced-interface delete

Delete network interfaces displaced away from this node by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete references to logical interfaces that were displaced to another node due to a controller-replacement. A LIF that has been displaced to another node has had its home-node modified to another node because no network ports were available in the same broadcast domain on the original home-node. Deleting this entry does not delete the LIF, it only deletes the entry from the displaced-lifs table indicating that the LIF's current home-node is considered restored.

Parameters

-node <nodename> - Node

Selects the node from which the LIF was displaced.

-vserver <vserver> - Vserver

Selects the vservers on which the LIF resides.

-lif-name <text> - Lif Name

Selects the name of the LIF for which to display displaced information.

Examples

The following example deletes displaced LIF information.

```
cluster1::> cluster controller-replacement network displaced-interface  
delete -vserver vs0 -lif lif1
```

cluster controller-replacement network displaced-interface restore-home-node

Restore home node for networked interfaces displaced by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Restore the original home node of logical interfaces that were displaced to another node due to a controller-replacement. A LIF that has been displaced to another node has had its home-node modified to another node because no network ports were available in the same broadcast domain on the original home-node. Restoring the home-node attempts to find a home-port on the original home node if a suitable port exists.

Parameters

-node <nodename> - Node

Selects the node from which the LIF was displaced.

-vserver <vserver> - Vserver

Selects the vservers on which the LIF resides.

-lif-name <text> - Lif Name

Selects the name of the displaced LIF to be restored.

Examples

The following example restores the home-node of a displaced LIF.

```
cluster1::> cluster controller-replacement network displaced-interface  
restore-home-node -vserver vs0 -lif lif1
```

cluster controller-replacement network displaced-interface show

Display network interfaces displaced away from this node by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display logical interfaces that were displaced to another node due to a controller-replacement. A LIF that has been displaced to another node has had its home-node modified to another node because no network ports were available in the same broadcast domain on the original home-node.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node from which the LIF was displaced.

[-vserver <vserver>] - Vserver

Selects the vservers on which the LIF resides.

[-lif-name <text>] - Lif Name

Selects the name of the LIF for which to display displaced information.

[-original-home-node <nodename>] - Original Home Node

The original home-node that was assigned to the LIF prior to controller-replacement.

[-current-home-node <nodename>] - Current Home Node

The current home-node assigned to the LIF after controller-replacement.

Examples

The following example displays the displaced LIF information.

```
cluster1::> cluster controller-replacement network displaced-interface
show
cluster controller-replacement network displaced-interface show)
original          Current
server            LIF Name          Home Node          Home Node
-----
s0                lif1                node1              node2
1 entry was displayed.
```

cluster controller-replacement network displaced-vlans delete

Remove VLANs displaced by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete VLAN tags that were displaced due to a controller-replacement. A VLAN tag that has been displaced is a tag that was based on a network port that either no longer exists, or was moved to a new broadcast domain.

Restoring the vlan-tags re-creates them on the specified network port.

Parameters

-node <nodename> - Node

Selects the node on which the displaced vlans reside.

-port <netport> - Original Base Port

The original base port where the vlans existed prior to controller-replacement.

Examples

The following example deletes the displaced vlan-tag information.

```
cluster1::> cluster controller-replacement network displaced-vlans delete
-node local -port e0c
```

cluster controller-replacement network displaced-vlans restore

Delete VLANs displaced by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Restore VLAN tags that were displaced due to a controller-replacement. A VLAN tag that has been displaced is a tag that was based on a network port that either no longer exists, or was moved to a new broadcast domain. Restoring the vlan-tags re-creates them on the specified network port.

Parameters

-node <nodename> - Node

Selects the node on which the displaced vlans reside.

-port <netport> - Original Base Port

The original base port where the vlans existed prior to controller-replacement.

-destination-port <netport> - Destination Port

The destination port where the vlan-tags will be restored.

Examples

The following example restores vlan-tags displaced from port e0c onto port e0d.

```
cluster1::> cluster controller-replacement network displaced-vlans restore
-node node1 -port e0c -destination-port e0d
```

cluster controller-replacement network displaced-vlans show

Display VLANs displaced by controller-replacement

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display VLAN tags that were displaced due to a controller-replacement. A VLAN tag that has been displaced is a tag that was based on a network port that either no longer exists, or was moved to a new broadcast domain. Restoring the vlan-tags re-creates them on the specified network port.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node

Selects the node on which the displaced vlans reside.

[-port <netport>] - Original Base Port

The original base port where the vlans existed prior to controller-replacement.

[-vlan-tags <integer>,...] - Displaced VLANs

The vlan-tags that were assigned to the network port prior to controller-replacement.

Examples

The following example displays the displaced vlan-tag information.

```
cluster1::> cluster controller-replacement network displaced-vlans show
cluster controller-replacement network displaced-vlans show)
riginal
ode      Base Port VLANs
-----
-----
ode1     e0c          100,110,120,300,310,320
1 entry was displayed.
```

cluster date commands

cluster date modify

Modify the current date and time for the nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date modify` command sets the time zone, date, and time on every node in the cluster.

Parameters

`[-timezone <Area/Location Timezone>] - Time Zone`

This parameter sets the timezone, specified in the Olson format.

`{ [-date {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Date and Time`

This parameter sets the date and time, in the format MM/DD/YYYY HH:MM:SS.

`| [-dateandtime <[[[[cc]yy]mm]dd]hhmm[.ss]]>] - Date and Time`

This parameter sets the date and time information, in the format `[[[[cc]yy]mm]dd]hhmm[.ss]]`. The argument for setting the date and time is interpreted as follows:

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 10 for 2010).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the seconds are omitted, the default is set to 00. The system automatically handles the time changes for Daylight Saving and Standard time, and for leap seconds and years.

`| [-u, -utcdateandtime <[[[[cc]yy]mm]dd]hhmm[.ss]]>] - UTC Date and Time }`

This parameter sets the date and time information in Coordinated Universal Time (UTC), in the format `[[[[cc]yy]mm]dd]hhmm[.ss]]`. `-u` is an alias for `-utcdateandtime`. The argument for setting the date and time is interpreted as follows:

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 10 for 2010).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

If the first two digits of the year are omitted, and the last two digits are greater than 68, a date in the 1900s is used. Otherwise, a date in the 2000s is used. If all four digits of the year are omitted, the default is the current year. If the month or day is omitted, the default is the current month or day, respectively. If the

seconds are omitted, the default is set to 00. Time changes for Daylight Saving and Standard time, and for leap seconds and years, are handled automatically.

Examples

The following example sets the date and time to January 1 2011, at 1:00 a.m.:

```
cluster1::> cluster date modify -date "01/01/2011 01:00:00"
```

The following example sets the date and time in the UTC format to May 22, 2011, at 09:25:00 a.m.:

```
cluster1::> cluster date modify -u 201105220925.00.
```

cluster date show

Display the current date and time for the nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date show` command displays the time zone, date, and time settings for one or more nodes in the cluster. By default, the command displays date and time settings for all nodes in the cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-utc]

Displays date and time information in Coordinated Universal Time (UTC).

| [-utcdate]

Displays date and time information in UTC.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value.

[-timezone <Area/Location Timezone>] - Time Zone

Selects the nodes that match this parameter value (specified in the Olson format).

[-date {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}] - Date and Time

Selects the nodes that match this parameter value.

`[-utc-date <MM/DD/YYYY HH:MM:SS>]` - UTC Date and Time

Selects the nodes that match this parameter value.

`[-dateandtime <[[[[[cc]yy]mm]dd]hhmm[.ss]]>]` - Date and Time

Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

`[-u, -utcdatetime <[[[[[cc]yy]mm]dd]hhmm[.ss]]>]` - UTC Date and Time

-u is used as an alias for -utcdatetime. Selects the nodes that match this parameter value (interpreted as follows):

- cc First 2 digits of the year (e.g., 20 for 2011).
- yy Last 2 digits of year (e.g., 11 for 2011).
- mm Numeric month, a number from 01 to 12.
- dd Day, a number from 01 to 31.
- hh Hour, a number from 00 to 23.
- mm Minute, a number from 00 to 59.
- ss Second, a number from 00 to 59.

Examples

The following example displays the date and time settings for all nodes in the cluster:

```
cluster1:> cluster date show
Node      Date              Timezone
-----
node0     10/06/2011 09:35:15 America/New_York
node1     10/06/2011 09:35:15 America/New_York
node2     10/06/2011 09:35:15 America/New_York
node3     10/06/2011 09:35:15 America/New_York
4 entries were displayed.
```

cluster date zoneinfo load-from-uri

Load timezone zoneinfo data

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster date zoneinfo load-from-uri` command loads a new set of timezone zoneinfo data to replace the version installed in the cluster. Releases of ONTAP software contain the timezone data that is current at the time of release. If a change is made to the timezone between ONTAP releases, then an update can be made to the release data. For instance, if a change is made to when daylight saving time is observed for a country then an update to cluster zoneinfo data may be required.

Only zoneinfo files provided by NetApp for use in ONTAP should be used with this command.

To update the zoneinfo database do the following:

- Download the required zoneinfo file from the NetApp support website.
- Place the file on a local web server accessible without password from the cluster.
- Execute the `cluster date zoneinfo load-from-uri` command, passing the Universal Resource Identifier (URI) of the file as parameter.

The command need only be executed once for the cluster. The data will be distributed to each node of the cluster.

Parameters

-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - URI of Timezone Zoneinfo Data

URI of the new zoneinfo file.

Examples

The following example loads a new version of the timezone zoneinfo database to the cluster:

```
cluster1::> cluster date zoneinfo load-from-uri  
http://www.example.com/ontap_zoneinfo.zip
```

cluster date zoneinfo show

Display cluster timezone zoneinfo information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display information about the current timezone zoneinfo data.

Examples

The following example shows the zoneinfo information for a cluster:

```
cluster1::> cluster date zoneinfo show
Cluster Zoneinfo Version: 2016f
```

cluster ha commands

cluster ha modify

Modify high-availability configuration of cluster management services

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster ha modify` command enables or disables cluster high availability in a two-node cluster. Enable high availability when performing some procedures, such as replacing hardware.

This command is required to enable high availability if the cluster only has two nodes. Do not run this command in a cluster that has three or more nodes.

Cluster high availability for two-node clusters differs from the storage failover technology used between two nodes for storage high availability.

Parameters

[`-configured {true|false}`] - HA Configured

Use this parameter with the value `true` to enable high availability mode in the cluster. Use this parameter with the value `false` to disable high availability mode in the cluster.

Examples

The following example enables cluster high availability in a cluster.

```
cluster1::> cluster ha modify -configured true
```

cluster ha show

Show high-availability configuration status for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster ha show` command displays the high-availability status of the cluster. Cluster high-availability mode applies only to two-node clusters.

Examples

The following example displays the high-availability status for a two-node cluster :

```
cluster1::> cluster ha show
High-Availability Configured: true
```

cluster identity commands

cluster identity modify

Modify the cluster's attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster identity modify` command changes a cluster's identity information.

Parameters

[`-name <Cluster name>`] - Cluster Name

Use this parameter to specify a new name for the cluster.

- The name must contain only the following characters: A-Z, a-z, 0-9, "-" or "_" .
- The first character must be one of the following characters: A-Z or a-z.
- The last character must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 44 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

[`-location <text>`] - Cluster Location

Use this parameter to specify the physical location of the cluster. For example, "Lab 5".

[`-contact <text>`] - Cluster Contact

Use this parameter to specify contact information for the cluster, such as a name or e-mail address.

Examples

The following example renames the current cluster to *cluster2* :

```
cluster1::> cluster identity modify -name cluster2
```

cluster identity show

Display the cluster's attributes including Name, Serial Number, Cluster UUID, Location and Contact

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster identity show` command displays the identity information of the cluster.

Examples

The following example displays the cluster's UUID, name, serial number, location, and contact information:

```
cluster1::> cluster identity show
Cluster UUID: 1cd8a442-86d1-11e0-ae1c-123478563412
      Cluster Name: cluster1
Cluster Serial Number: 1-80-123456
      Cluster Location: Lab2
      Cluster Contact: jsmith@example.com

cluster1::>
```

cluster image commands

cluster image cancel-update

Cancel an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image cancel-update` command is used to cancel an update that is in either paused-by-user or paused-on-error state. An update can only be canceled if it is in a paused state.

Examples

The following example displays a cancel-update operation:

```
cluster1::> cluster image cancel-update

Warning: The cancel operation can result in a mixed version
cluster and/or mixed version HA pair. The cancel
operation can take several minutes to complete.
Do you want to proceed with the cancel operation? {y|n}: y

Info: Canceling update. It may take a few minutes to finish canceling the
update
```

cluster image pause-update

Pause an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image pause-update` command is used to pause a currently running update. The update pauses at the next predefined pause point (for example, after validation, download to the boot device, takeover completion, or giveback completion) which might take some time to reach. When the update reaches the pause point, it transitions into the pause-by-user state.

Examples

The following example displays pause-update operation:

```
cluster1::> cluster image pause-update
```

```
Info: Pausing update. It may take a few minutes to finish pausing the  
update
```

cluster image resume-update

Resume an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image resume-update` command is used to resume an update that is currently paused in paused-by-user or paused-on-error state. If the update is not paused then an error is returned.

Parameters

`[-ignore-post-update-checks-failures {true|false}]` - Ignore Post-update-checks Phase Failures (privilege: advanced)

Specifies whether the post update checks phase warnings and/or errors should be ignored. The default value is false.

`[-skip-firmware-update-checks {true|false}]` - Skip Firmware Update Status Checks

Specifies whether firmware update status check will be skipped or not. By default, firmware update status check will not be skipped.

Examples

The following example shows an resume-update operation:

```
cluster1::> cluster image resume-update
```

```
Info: Resuming update...
```

cluster image show-update-history

Display the update history

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show-update-history` command displays the update history for each node. By default, the command displays the following information:

- Status
- Package version
- Start time
- Completion time
- Component ID
- Previous version
- Updated version

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-component-id <text>] - Component ID

Displays updates for the specified component.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

Displays updates with the specified start time.

[-package-version <text>] - Package Version

Displays updates for the specified package version.

[-status {successful|canceled|back-out|skip-upgrade}] - Status

Displays updates that completed with the specified status.

[-completion-time <MM/DD/YYYY HH:MM:SS>] - Completion Time

Displays updates with the specified completion time.

[-previous-version <text>] - Previous Version

Displays updates with the specified previous version.

[-updated-version <text>] - Updated Version

Displays updates with the specified updated version.

Examples

The following example displays history of automated nondisruptive updates:

```
cluster1::> cluster image show-update-history
```

Package	Start	Completion	Previous			
Updated						
Status	Version	Time	Time	Component ID	Version	Version
Version						
-----	-----	-----	-----	-----	-----	-----
canceled	8.3	2/11/2014	2/11/2014	ssan-3240-	8.3	8.3

8 entries were displayed.

cluster image show-update-log-detail

Display detailed information about nondisruptive update events

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster image show-update-log-detail` command displays detailed information about the currently running and previously run nondisruptive update events. By default, the command displays the following information:

- Node
- Transaction ID
- Time stamp
- Destination node
- Task phase
- Task name
- Task status
- Message

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node (privilege: advanced)`

Displays information only for the specified node.

`[-task-id <integer>] - Task Id (privilege: advanced)`

Displays information only for the specified task ID.

`[-posted-time <MM/DD/YYYY HH:MM:SS>] - Posted Time (privilege: advanced)`

Displays information that occurred at the specified time.

`[-msg-seq-no <integer>] - Message Sequence (privilege: advanced)`

Displays information only for the specified message sequence number.

`[-current-pid <integer>] - Process ID (privilege: advanced)`

Displays information only for the specified process ID.

`[-destination <text>] - Task Target node (privilege: advanced)`

Displays information only for the specified destination node.

`[-ndu-phase {validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks}] - Update phase (privilege: advanced)`

Displays information only for the specified phase.

`[-task-name {initialize|mount-image|restart-hm|get-health|run-scripts|unmount-image|clear-alert|post-restart-hm|cleanup-rd|synch-image|do-download-job|do-failover-job|do-giveback-job|check-progress|complete-validation|invalid-task|default-task|do-postupdate-checks-task}] - Task Name (privilege: advanced)`

Displays information only for the specified task name.

[-status {created|ready-to-run|running|completed|failed|pause_req|paused|paused-error|cancel_req|canceled|resume_req|default_status}] - Status Of Task (privilege: advanced)

Displays information only for items with the specified status.

[-message <text>] - Update Log Message (privilege: advanced)

Displays information only for items with the specified message.

[-msg-type <text>] - Type of Message (privilege: advanced)

Displays information only for items with the specified message type.

[-src-info <text>] - Source Information (privilege: advanced)

Displays information only for items for the specified source.

Examples

The following example displays detailed information automated nondisruptive updates:

```
cluster1::*> cluster image show-update-log-detail
```

Node	TID	Time Stamp	Dest Node	Task Phase	Task Name	Task Status	Message
node1	15	3/19/2014 13:52:38	MUM	ontap-update s	initia lize	ready-to-run	Created Task
node1	15	3/19/2014 13:52:38	MUM	ontap-update s	initia lize	runnin g	Updated Task Status
node1	16	3/19/2014 13:52:38	node1	ontap-update s	do-downlo ad-job	ready-to-run	Created Task
node1	16	3/19/2014 13:52:39	node1	ontap-update s	do-downlo ad-job	runnin g	Updated Task Status
node1	17	3/19/2014 13:52:38	node2	ontap-update s	do-downlo ad-job	ready-to-run	Created Task
node2	17	3/19/2014 13:52:38	node2	ontap-update s	do-downlo ad-job	runnin g	Updated Task Status

6 entries were displayed.

cluster image show-update-log

Display the update transaction log

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster image show-update-log` command displays detailed information about the currently running, or previously run nondisruptive updates. By default, the command displays the following information:

- Phase
- Transaction
- Transaction ID
- Component ID
- Time stamp
- Status

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-trans-id <integer>] - Transaction ID (privilege: advanced)`

Displays information for the step associated with the specified transaction ID.

`[-component-id {<nodename>|local}] - Component ID (privilege: advanced)`

Displays information for steps associated with the specified component.

`[-phase {validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks}] - Transaction Phase (privilege: advanced)`

Displays information for steps associated with the specified update phase.

`[-trans-name {initialize|mount-image|restart-hm|get-health|run-scripts|unmount-image|clear-alert|post-restart-hm|cleanup-rd|synch-image|do-download-job|do-failover-job|do-giveback-job|check-progress|complete-validation|invalid-task|default-task|do-postupdate-checks-task}] - Transaction Name (privilege: advanced)`

Displays information for steps associated with the specified transaction.

`[-timestamp <MM/DD/YYYY HH:MM:SS>] - Timestamp (privilege: advanced)`

Displays information for steps associated with the specified timestamp.

`[-status {waiting|started|completed|paused-on-error|paused-by-user|pause-pending|cancel-pending|canceled|failed}] - Status (privilege: advanced)`

Displays information for steps matching the specified status.

Examples

The following example displays information about automated nondisruptive update events:

```
cluster1::*> cluster image show-update-log
```

Phase	Transaction	Trans Id	Component Id	Time Stamp	Status
-----	-----	----	-----	-----	
validation	initialize	50	MUM	2/18/2014 10:32:57	completed

cluster image show-update-progress

Display the update progress

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show-update-progress` command displays information about the current state of an update. By default, the command displays the following information:

- Update phase
- Status
- Estimated Duration
- Elapsed Duration

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ndu-phase {validation|prereq-updates|ontap-updates|package-management|default-phase|post-update-checks}] - Update Phase

Displays information about the specified update phase.

[-phase-status {in-progress|waiting|paused-by-user|paused-on-error|completed|canceled|failed|pause-pending|cancel-pending}] - Phase Status

Displays information about progress matching the specified phase status.

[-phase-duration <text>] - Phase Duration

Displays information about progress matching the specified phase duration.

[-phase-comments <text>] - Phase Comments

Displays information about progress matching the specified phase comments.

[-elapsed-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Elapsed duration of the phase

Displays information about progress matching the specified elapsed duration.

[-estimated-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}] - Estimated duration of the phase

Displays information about progress matching the specified estimated duration.

[-phase-description <text>] - Phase Description

Displays information about progress matching the specified phase description.

[-subsystem-name <text>] - Subsystem Name

Displays information about progress matching the specified subsystem name.

[-subsystem-status <text>] - Subsystem Status

Displays information about progress matching the specified subsystem status.

[-subsystem-details <text>] - Subsystem Details

Displays information about progress matching the specified subsystem details. The "firmware update" status is reflected in the following states: - not started: The firmware update process has not been initiated. - no change: The firmware update was completed without any changes. - pending: The firmware update is pending. - in progress: The firmware update is currently in progress. - completed: The firmware update is completed with changes. - error: An error occurred during the firmware update process. - aborted: The firmware update process was aborted.

[-subsystem-action <text>] - Subsystem Action

Displays information about progress matching the specified subsystem action.

Examples

The following example shows the cluster image validate progress of two nodes, nodeA and nodeB after executing the cluster image validation command. On the first screen it shows when the pre-update check status is *in-progress* and on the second screen it shows the pre-update checks status changed to *completed*.

```
cluster1::> cluster image show-update-progress
```

update Phase	Status	Estimated Duration	Elapsed Duration
re-update checks	in-progress	00:10:00	00:00:13

etails:

re-update Check	Status	Error-Action
-----	-----	-----

```
cluster1::> cluster image show-update-progress
```

update Phase	Status	Duration	Duration
re-update checks	completed	00:10:00	00:01:09

etails:

re-update Check	Status	Error-Action

cluster1::>

```

The following example shows the automated nondisruptive update of two nodes, nodeA and nodeB. In this case, automated nondisruptive update is paused-on-error in "Data ONTAP updates" phase. nodeA's update is waiting, nodeB's update is failed. "Status Description" show nodeB's error and action.

```
cluster1:> cluster image show-update-progress
```

Estimated Update Phase	Elapsed Status	Duration	Duration
Pre-update checks	completed	00:10:00	00:00:02
Data ONTAP updates	paused-on-error	00:49:00	00:05:21

Details:

Node name	Status	Status Description
nodeA	waiting	
nodeB	failed	Error: Takeover of node "nodeB" is not possible. Action: Use the "storage failover show" command to view the cause of the failure.

2 entries were displayed.

Status: Paused - An error occurred in "Data ONTAP updates" phase. The non-disruptive update cannot continue until the error has been resolved. Resolve all issues, then use the "cluster image resume-update" command to resume the update.

```
cluster1:>
```

The following example shows that the automated nondisruptive update is paused-on-error in "Post-update checks" update phase and "Status Description" shows the error and action.

```
cluster1::> cluster image show-update-progress
```

Estimated Update Phase	Elapsed Status	Duration	Duration
Data ONTAP updates	completed	02:19:00	00:00:03
Post-update checks	paused-on-error	00:10:00	00:00:02

Details:

Post-update Check	Status	Error-Action
Cluster Quorum Status	Error	Error: Cluster is not in quorum. Action: Use the (privilege: advanced) "cluster ring show" command to verify all replication unit details.

5 entries were displayed.

Status: Paused - An error occurred in "Post-update checks" phase. The non-disruptive update cannot continue until the error has been resolved. Resolve all issues, then use the "cluster image resume-update" command to resume the update.

```
cluster1::>
```

The following example shows that the automated nondisruptive update is completed on nodeA and nodeB.

```
cluster1::> cluster image show-update-progress
```

Estimated Update Phase	Elapsed Status	Duration	Duration
Pre-update checks	completed	00:10:00	00:00:13
Data ONTAP updates	completed	01:23:00	01:15:11
Post-update checks	completed	00:10:00	00:00:02

3 entries were displayed.

Updated nodes: nodeA, nodeB.

```
cluster1:>
```

The following example shows the automated update of two-node MetroCluster configuration having clusters cluster_A and cluster_B. In this case, cluster_A's update is waiting and cluster_B's update is in progress. cluster_B's switchback operation is in progress.

```
cluster_A::> cluster image show-update-progress
Estimated      Elapsed
Cluster                Duration      Duration      Status
-----
cluster_A                00:00:00      00:00:00      waiting
cluster_B                00:00:00      00:06:42      in-
progress

Details: Switchback in progress.

Waiting for partner cluster "sti60-vsim-ucs134f_siteB" to be up.

cluster_A::>
```

The following example shows that the automated update is completed on both cluster_A and cluster_B in two-node MetroCluster configuration.

```
cluster_A::> cluster image show-update-progress
Estimated      Elapsed
Cluster                Duration      Duration      Status

cluster_A                00:00:00      00:20:44
completed
cluster_B                00:00:00      00:10:43
completed

Details: MetroCluster updated successfully.
cluster_A::>
```

cluster image show

Display currently running image information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image show` command displays information about the version of ONTAP that is running on each node and the date/time when it was installed. By default, the command displays the following information:

- Node name
- Current version
- Installation date and time

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Displays information about the specified node.

[-version <text>] - Current Version

Displays information about the nodes running the specified version.

[-date <MM/DD/YYYY HH:MM:SS>] - Date Installed

Displays information about the nodes with the specified installation date.

Examples

The following example displays information about currently running images on all nodes of the cluster:

```
cluster1::> cluster image show
```

Node	Current Version	Installation Date
node1	8.3	-
node2	8.3	-

2 entries were displayed.

cluster image update

Manage an update

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image update` command is used to initiate a ONTAP update. The update is preceded by a validation of the cluster to ensure that any issues that might affect the update are identified. There are two types of updates of a cluster. A rolling update updates ONTAP one HA pair at a time. This type of update is performed for clusters with fewer than eight nodes or when the `-force-rolling` option is specified for clusters with eight or more nodes. A batch update is used for clusters of eight or more nodes, and performs updates of multiple HA pairs at the same time.

There are predefined points in the update when the update can be paused (either by the user or by an error). These pause points occur after validation, after download to the boot device, after takeover has completed, and after giveback has completed.

Parameters

-version <text> - Update Version

Specifies the ONTAP version to use to update the cluster.

[-nodes {<nodename>|local}] - Node

Specifies the nodes that are to be updated. This parameter is not supported for MetroCluster configurations updates or two-stage upgrades. The node upgrade sequence does not follow the node order entered in `cluster image update command`

[-estimate-only <true>] - Estimate Only

Creates a report of the steps that occur during the update without performing them precisely.

[-pause-after {none|takeover-giveback|all}] - Update Pause

Specifies that the update should pause at each predefined pause points (for example, after validation, after download to the boot device, after takeover, and after giveback) during the update.

[-ignore-validation-warning {true|false}] - Ignore Validation

Specifies that the update should proceed even if the validation reports warnings.

[-skip-confirmation {true|false}] - Skip Confirmation

Specifies that a validation that does not detect any error issues should not ask the user to confirm the update but simply proceed with the update.

[-force-rolling <true>] - Force Rolling Update

This option is used for clusters with eight or more nodes to specify that a rolling update (one HA pair at a time) should be done. This parameter is not supported for single-node cluster and two-node MetroCluster.

[-stabilize-minutes <integer>] - Minutes to stabilize

Specifies the number of minutes that the update should wait after a takeover or giveback is completed. This allows time for the clients to recover from the pause in I/O that occurs during takeover and giveback. This parameter is not supported for single-node cluster.

[-show-validation-details <true>] - Shows All Validation Details

Specify to display all validation details. Default: do not display all details.

[-skip-nodes-at-target-version <true>] - Skip Nodes at Target Version (privilege: advanced)

When this parameter is *true*, only the nodes which are not running the target version are upgraded. Nodes which are currently running the target version are skipped. The default value is *true*. This parameter cannot be set to true in MetroCluster configurations.

Examples

The following example shows the cluster image update operation. configuration having node nodeA and nodeB.

```
cluster1::> cluster image update -version 9.16.1
```

```
Starting validation for this update...
```

It can take several minutes to complete validation...

WARNING: There are additional manual upgrade validation checks that must be performed after these automated validation checks have completed successfully.

Refer to the Upgrade Advisor Plan or the "What should I verify before I upgrade with or without Upgrade Advisor" section in the "Upgrade ONTAP" documentation for the remaining manual validation checks that need to be performed before update.

During ONTAP upgrade, the system firmware (BIOS and LOADER firmware) in the boot media will be replaced with the system firmware in the target ONTAP package, only if the ONTAP package contains later versions.

Prior to 9.17.1, system firmware in the boot media was always replaced with the system firmware in the target ONTAP package.

Upgrade ONTAP documentation available at: <https://docs.netapp.com/us-en/ontap/upgrade/index.html>

The list of checks are available at: https://docs.netapp.com/us-en/ontap/upgrade/task_what_to_check_before_upgrade.html

Failing to do so can result in an update failure or an I/O disruption.

Please use Interoperability Matrix Tool (IMT

<http://mysupport.netapp.com/matrix>)

to verify host system supportability configuration information.

Pre-update Check	Status	Error-Action
-----	-----	-----
Boot Menu Status	Warning	Warning: bootarg.init.bootmenu is enabled on nodes: nodeA, nodeB. The boot process of the nodes will be delayed. Action: Set the bootarg.init.bootmenu bootarg to false before proceeding with the upgrade.
Manual checks	Warning	Warning: Manual validation need to be performed. Refer to the Upgrade Advisor Plan or the "What should I verify before I upgrade with or without Upgrade Advisor" section in the "Upgrade ONTAP" documentation for the remaining validation checks that need to be performed before update. Failing to do so can result in

		an update failure or an I/O disruption. Action: Refer to the Upgrade Advisor Plan or the "What should I verify before I upgrade with or without Upgrade Advisor" section in the "Upgrade ONTAP" documentation for the remaining validation checks that need to be performed before update.
NFS mounts	Warning	Warning: This cluster is serving NFS clients. If NFS soft mounts are used, there is a possibility of frequent NFS timeouts and race conditions that can lead to data corruption during the upgrade. Action: Use NFS hard mounts, if possible. To list Vservers running NFS, run the following command: <code>vserver nfs show</code>
Nodes to update list	Warning	Warning: List of nodes to be upgraded: "nodeA, nodeB." Action: To upgrade all selected nodes, regardless of their current version, set the (privilege: advanced) <code>"-skip-nodes-at-target-version"</code> parameter to "false".
Overall Status	Warning	5 entries were displayed. Warning: Validation has reported warnings.
Do you want to continue? {y n}:		
Starting update...		
Info: Run the "cluster image show-update-progress" command to check update status.		

cluster image validate

Validates the cluster’s update eligibility

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image validate` command checks for issues within the cluster that might lead to problems during the update.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-version <text>] - Update Version`

Specifies the ONTAP version to use to validate the cluster.

`[-rolling <true>] - Rolling Update`

Specify this optional parameter on a cluster with eight or more nodes to perform a rolling-update check. The default is to perform a batch-update check.

This parameter is only supported on a cluster with eight or more nodes, and is not supported for two-node MetroCluster.

`[-nodes {<nodename>|local}] - Nodes`

Specifies the nodes that are to be validated. This parameter is not supported for MetroCluster configurations and for two-stage upgrades.

`[-show-validation-details <true>] - Shows All Validation Details`

Specify to display all validation details. Default: do not display all details.

`[-skip-nodes-at-target-version <true>] - Skip Nodes at Target Version (privilege: advanced)`

Specifies that the validation will skip the nodes which are already running target version. Default: true.

Examples

The following example shows the validate operation:

```
cluster1::> cluster image validate -version 9.16.1
```

It can take several minutes to complete validation...

WARNING: There are additional manual upgrade validation checks that must be performed after these automated validation checks have completed successfully. Refer to the Upgrade Advisor Plan or the "What should I verify before I upgrade with or without Upgrade Advisor" section in the "Upgrade ONTAP" documentation for the remaining manual validation checks that need to be performed before update.

Upgrade ONTAP documentation available at: <https://docs.netapp.com/us-en/ontap/upgrade/index.html>

The list of checks are available at: https://docs.netapp.com/us-en/ontap/upgrade/task_what_to_check_before_upgrade.html

Failing to do so can result in an update failure or an I/O disruption.

Please use Interoperability Matrix Tool

(IMT <http://mysupport.netapp.com/matrix>) to verify host system supportability configuration information.

Validation checks started. Run the "cluster image show-update-progress" command to check validation status.

The following example shows the validate operation with validation details:

```
cluster1::> cluster image validate -version 9.16.1 -show-validation  
-details
```

It can take several minutes to complete validation...

WARNING: There are additional manual upgrade validation checks that must be performed after these automated validation checks have completed successfully.

Refer to the Upgrade Advisor Plan or the "What should I verify before I upgrade with or without Upgrade Advisor" section in the "Upgrade ONTAP" documentation for the remaining manual validation checks that need to be performed before update.

Upgrade ONTAP documentation available at: <https://docs.netapp.com/us-en/ontap/upgrade/index.html>

The list of checks are available at: https://docs.netapp.com/us-en/ontap/upgrade/task_what_to_check_before_upgrade.html

Failing to do so can result in an update failure or an I/O disruption.

Please use Interoperability Matrix Tool

(IMT <http://mysupport.netapp.com/matrix>) to verify host system supportability configuration information.

Validation checks started. Run the "cluster image show-update-progress" command to check validation status.

cluster image package delete

Remove a package from the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package delete` command deletes the specified version of the package from the package repository. The associated information about the package is also deleted from the update database.

Parameters

-version <text> - Version To Be Deleted

Specifies the package version that is to be deleted.

Examples

The following example deletes the package with version 8.3:

```
cluster1::> cluster image package delete -version 8.3
```

```
Package Delete Operation Completed Successfully
```

cluster image package get

Fetch a package file from a URL into the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package get` command fetches an ONTAP package file specified by the URL into the cluster. The package is stored in the cluster package repository and the information from the package is stored in the update database.

Parameters

-url <text> - Package URL

Specifies the URL from which to get the package.

Examples

The following example displays how to get a package from a URL:

```
cluster1::> cluster image package get -url http://example.com/image.tgz
```

cluster image package show-repository

Display information about packages available in the cluster image package repository

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster image package show-repository` command displays the package versions that are in the cluster package repository. By default, the command displays the following information:

- Package version

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-detail]

This parameter specifies that detailed information should be displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-download-ver <text>] - Downloaded Version

Displays packages with the specified download version.

[-component-name <text>,...] - Component Name

Displays packages for the specified component.

[-component-version <text>,...] - Component Version

Displays packages with the specified component version.

[-package-build-time <MM/DD/YYYY HH:MM:SS>] - Package Build Time

Displays packages with the specified build time.

Examples

The following example displays the packages in the cluster package repository:

```
cluster1:> cluster image package show-repository
Package Version Package Build Time
-----
8.3          9/12/2014 10:27:33
```

cluster kernel-service commands

cluster kernel-service show

Display cluster service state in the kernel

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The ``cluster kernel-service show`` command displays the following information from the master node for each node in the cluster:

- Node name
- The quorum status of that node
- The availability status of that node
- The operational status of that node

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-master-node {<nodename>|local}`] - Node (privilege: advanced)

The node in the cluster where the information be being reported from. If this parameter is not specified, the command displays information about all nodes in the cluster.

[`-cluster-node <text>`] - Cluster Node (privilege: advanced)

The node in the cluster that the information listed is regarding. If this parameter is specified, the command displays information only about the nodes with the specified state value.

[`-status-quorum {out-of-quorum|in-quorum}`] - Quorum Status (privilege: advanced)

The quorum status of the node specified by `-cluster-node` . If this parameter is specified, the command displays information only about the nodes with the specified state value.

[`-status-avail {false|true|unknown}`] - Availability Status (privilege: advanced)

The availability status of the node specified by `-cluster-node` . If this parameter is specified, the command displays information only about the nodes with the specified state value.

[`-status-oper {unknown|operational|not-operational}`] - Operational Status (privilege: advanced)

The operational status of the node specified by `-cluster-node` . If this parameter is specified, the command displays information only about the nodes with the specified state value.

Examples

The following example displays information about all nodes in the cluster:

```

cluster1::*> cluster kernel-service show
Master          Cluster          Quorum          Availability
Operational
Node            Node            Status           Status           Status
-----
cluster1-01     cluster1-01     in-quorum        true
operational
                cluster1-02     in-quorum        true
operational
2 entries were displayed.

cluster1::*> cluster kernel-service show -instance
Master Node: cluster1-01
      Cluster Node: cluster1-01
      Quorum Status: in-quorum
Availability Status: true
Operational Status: operational
Master Node: cluster1-01
      Cluster Node: cluster1-02
      Quorum Status: in-quorum
Availability Status: true
Operational Status: operational
2 entries were displayed.

```

cluster kernel-service config modify

Modify cluster service state in the kernel

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster kernel-service config modify` used to manage the cluster kernel-service subsystem for a node.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

The node in the cluster where the configuration is being modified.

[-kcs-enable-takeover {true|false}] - Initiated Takeover Enabled (privilege: advanced)

This indicates whether the kernel service subsystem for this node will initiate a takeover of any node determined to be *out of quorum* if allowed by the HA subsystem.

Examples

```
cluster1::*> cluster kernel-service config modify -node cluster1-01 -kcs
-enable-core false
```

cluster kernel-service config show

Display cluster service state in the kernel

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster kernel-service config show` is used to display the configuration of the cluster kernel service subsystem for one or more nodes.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node (privilege: advanced)`

The node in the cluster where the information be being reported from. If this parameter is not specified, the command displays information about all nodes in the cluster.

`[-clam-master-id <integer>] - CLAM Master Node ID (privilege: advanced)`

The node ID of the master node for the cluster. If this parameter is specified, the command displays information only about the nodes with the specified state value.

`[-kcs-enable-takeover {true|false}] - Initiated Takeover Enabled (privilege: advanced)`

Indicates if the distributed kernel service subsystem will initiate a takeover of any node determined to be *out of quorum* if the HA subsystem allows it. If this parameter is specified, the command displays information only about the nodes with the specified state value.

`[-kcs-enabled {true|false}] - KCS Enabled (privilege: advanced)`

The state of the kernel service subsystem on the specified node. If this parameter is specified, the command displays information only about the nodes with the specified state value.

`[-quorum-epoch <integer>] - Quorum Epoch (privilege: advanced)`

The number of quorum changes for this node.

Examples

```

cluster1::*> cluster kernel-service config show
Node                               Failover Core   Master          FSM
          Enabled   Enabled   Enabled   Node          State
-----
cluster1-01      true     false    false    cluster1-01    Master:
Waiting for heartbeat timeout
cluster1-02      true     false    false    cluster1-01    Non-Master:
Waiting for backoff timeout
2 entries were displayed.

cluster1::*> cluster kernel-service config show -instance
Node: cluster1-01
          Master Node: cluster1-01
          Master Node ID: 1000
          Enabled: true
          Initiated Takeover Enabled: false
Initiated Core on Takeover Enabled: false
          Current FSM State: Master: Waiting for heartbeat timeout
          Running Version: 1
          Quorum Epoch: 115
          Voting Status: false
          CHAAQ Enabled: true

Node: cluster1-02
          Master Node: cluster1-01
          Master Node ID: 1000
          Enabled: true
          Initiated Takeover Enabled: false
Initiated Core on Takeover Enabled: false
          Current FSM State: Non-Master: Waiting for backoff
timeout
          Running Version: 1
          Quorum Epoch: 115
          Voting Status: false
          CHAAQ Enabled: true

2 entries were displayed.

```

cluster log-forwarding commands

cluster log-forwarding create

Create a log forwarding destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding create` command creates log forwarding destinations for remote logging.

Parameters

-destination <Remote InetAddress> - Destination Host

Host name or IPv4 or IPv6 address of the server to forward the logs to.

[-port <integer>] - Destination Port

The port that the destination server listen on.

[-protocol {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Log Forwarding Protocol

The protocols are used for sending messages to the destination. The protocols can be one of the following values:

- *udp-unencrypted* - User Datagram Protocol with no security
- *tcp-unencrypted* - Transmission Control Protocol with no security
- *tcp-encrypted* - Transmission Control Protocol with Transport Layer Security (TLS)

[-ipspace <IPspace>] - IPspace of Destination

The IPspace of the destination server.

[-verify-server {true|false}] - Verify Destination Server Identity

When this parameter is set to `true`, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to `true` only when the *tcp-encrypted* value is selected in the protocol field. When this value is `true` the remote server might be validated by OCSP. The OCSP validation for cluster logs is controlled with the [security config ocsp enable -app audit_log](#) and [security config ocsp disable -app audit_log](#).

[-facility <Syslog Facility>] - Syslog Facility

The Syslog facility to use for the forwarded logs.

[-force <true>] - Skip the Connectivity Test

Normally, the `cluster log-forwarding create` command checks that the destination is reachable via an ICMP ping, and fails if it is not reachable. Setting this value to `true` bypasses the ping check so that the destination can be configured when it is unreachable.

[-message-format {legacy-netapp|rfc-5424}] - Syslog Message Format

Use this parameter to specify the message format to be used for Syslog messages.

The `message-format` can be one of the following values:

- *legacy-netapp* - A variation of the RFC-3164 Syslog format (format: <PRIVAL>TIMESTAMP HOSTNAME: MSG)
- *rfc-5424* - Syslog format as per RFC-5424 (format: <PRIVAL>VERSION TIMESTAMP HOSTNAME: MSG)

Refer to the respective RFCs for detailed information regarding the Syslog message formats. + The default message format is *legacy-netapp*.

`[-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}]` - Syslog Timestamp Format Override

Use this parameter to override the default timestamp format (based on the `message-format` parameter) used for Syslog messages.

The `timestamp-format-override` can be one of the following values:

- *no-override* - Timestamp format based on the `message-format` parameter (*rfc-3164* if the message format is *legacy-netapp*, *iso-8601-local-time* if message format is *rfc-5424*)
- *rfc-3164* - Timestamp format as per RFC-3164 (format: Mmm dd hh:mm:ss)
- *iso-8601-utc* - Timestamp format as per ISO-8601 in UTC (format: YYYY-MM-DDThh:mm:ssZ)
- *iso-8601-local-time* - Timestamp format as per ISO-8601 in local time (format: YYYY-MM-DDThh:mm:ss+/-hh:mm)

The default value is *no-override*. When this parameter is modified, its value persists even when `message-format` is updated. +

`[-hostname-format-override {no-override|fqdn|hostname-only}]` - Syslog Hostname Format Override

Use this parameter to override the default hostname format (based on the `message-format` parameter) used for Syslog messages.

The `hostname-format-override` can be one of the following values:

- *no-override* - Hostname format based on the `message-format` parameter (*fqdn* if the message format is *rfc-5424*, *hostname-only* if message format is *legacy-netapp*)
- *fqdn* - Fully Qualified Domain Name (e.g., myhost.example.com)
- *hostname-only* - Hostname only, without the domain name (e.g., myhost)

The default value is *no-override*. When this parameter is modified, its value persists even when `message-format` is updated. +

Examples

This example causes audit logs to be forwarded to a server at address 192.168.0.1, port 514 with USER facility.

```
cluster1::> cluster log-forwarding create -destination 192.168.0.1 -port 514 -facility user
```

- [security config ocsf enable](#)
- [security config ocsf disable](#)

cluster log-forwarding delete

Delete a log forwarding destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding delete` command deletes log forwarding destinations for remote logging.

Parameters

-destination <Remote InetAddress> - Destination Host

Host name or IPv4 or IPv6 address of the server to delete the forwarding entry for.

-port <integer> - Destination Port

The port that the destination server listen on.

Examples

This example deletes the forwarding of all logs to the server at address 1.1.1.1, port 514.

```
cluster1::> cluster log-forwarding delete -destination 1.1.1.1 -port 514
```

cluster log-forwarding modify

Modify log forwarding destination settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding modify` command modifies log forwarding destinations for remote logging.

Parameters

-destination <Remote InetAddress> - Destination Host

The host name or IPv4 or IPv6 address of the server to be modified.

-port <integer> - Destination Port

The port that the destinations servers listen on.

[-ipspace <IPspace>] - IPspace of Destination

The IPspace of the destination server.

[-verify-server {true|false}] - Verify Destination Server Identity

When this parameter is set to `true`, the identity of the log forwarding destination is verified by validating its certificate. The value can be set to `true` only when the `tcp-encrypted` value is selected in the `protocol` field. When this value is `true` the remote server might be validated by OCSP. The OCSP validation for

cluster logs is controlled with the [security config ocsd enable -app audit_log](#) and [security config ocsd disable -app audit_log](#) .

[`-facility <Syslog Facility>`] - Syslog Facility

The Syslog facility to use for the forwarded logs.

[`-message-format {legacy-netapp|rfc-5424}`] - Syslog Message Format

Use this parameter to specify a new Syslog message format to replace the current message format.

[`-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}`] - Syslog Timestamp Format Override

Use this parameter to override the default Syslog timestamp format (based on the `message-format` parameter).

[`-hostname-format-override {no-override|fqdn|hostname-only}`] - Syslog Hostname Format Override

Use this parameter to override the default Syslog hostname format (based on the `message-format` parameter).

Examples

This example modifies the facility of audit logs that are forwarded to the destination server at address 192.168.0.1, port 514.

```
cluster1::> cluster log-forwarding modify -destination 192.168.0.1 -port 514 -facility local1
```

cluster log-forwarding show

Display log forwarding destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster log-forwarding show` command displays log forwarding information:

- Destination (IPv4/IPv6/hostname)
- Port number
- List of log classes
- Facility

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-destination <Remote InetAddress>] - Destination Host

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified host name, IPv4 or IPv6 address.

[-port <integer>] - Destination Port

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified ports.

[-protocol {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Log Forwarding Protocol

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified protocols.

[-ipSpace <IPspace>] - IPspace of Destination

If this optional parameter is specified, the command displays information about the IPspace to which the forwarding destinations belong.

[-verify-server {true|false}] - Verify Destination Server Identity

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified `verify-server` values.

[-facility <Syslog Facility>] - Syslog Facility

If this optional parameter is specified, the command displays information about the forwarding destinations with the specified facility.

[-message-format {legacy-netapp|rfc-5424}] - Syslog Message Format

Use this optional parameter to display information about the Syslog destination that has the specified Syslog message format.

[-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}] - Syslog Timestamp Format Override

Use this optional parameter to display information about the Syslog destination that has the specified Syslog timestamp format override.

[-hostname-format-override {no-override|fqdn|hostname-only}] - Syslog Hostname Format Override

Use this optional parameter to display information about the Syslog destination that has the specified Syslog hostname format override.

Examples

The following example displays information about the log forwarding cluster-1::> cluster log-forwarding show

Verify Syslog

Destination Host	Port	Protocol	Server	Facility
192.168.0.1	514	udp-unencrypted	false	user

cluster-1::> cluster log-forwarding show -instance

Destination Host: 192.168.0.1
Destination Port: 514
Log Forwarding Protocol: udp-unencrypted
IPspace of Destination: Default
Verify Destination Server Identity: false
Syslog Facility: user
Syslog Message Format: legacy-netapp
Syslog Timestamp Format Override: no-override
Syslog Hostname Format Override: no-override

cluster peer commands

cluster peer create

Create a new cluster peer relationship

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer create` command establishes a peer relationship between two clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Before creating a new cluster peer relationship, make sure that both clusters are individually healthy and that there are no other peer relationships between the two clusters that might interfere with the new relationship.

You can create a cluster peer relationship using the IPv4 or IPv6 protocol. You may not use both protocols within a single relationship.

Use the [cluster show](#) and [cluster peer show](#) commands on each cluster to display health, peering eligibility, and peering information about the two clusters.

Parameters

[`-peer-addr` <Remote InetAddress>,...] - Remote Intercluster Addresses

Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas.

The addresses you provide here are associated with the remote cluster until you modify or delete the relationship, regardless of whether the addresses are valid. Make sure to provide addresses which you

know will remain available on the remote cluster. You can use the hostnames of the remote cluster's intercluster addresses, the IP addresses of the remote cluster's intercluster LIFs or both.

[`-username <text>`] - Remote User Name

Use this optional parameter to specify a username that runs a `reciprocal cluster peer create` command on the peered cluster. If you choose not to use the reciprocal creation option, by not supplying a username for reciprocal creation, you must run `cluster peer create` again on the remote cluster to complete the peering relationship.

If you specify the username for the remote cluster, you will be prompted to enter the associated remote password. These credentials are not stored, they are used only during creation to authenticate with the remote cluster and to enable the remote cluster to authorize the peering request. The provided username's profile must have access to the console application in the remote cluster.

Use the [security login role show](#) and [security login show](#) commands on each cluster to find user names and their privilege levels.

[`-no-authentication <true>`] - Do Not Use Authentication

Use this optional parameter when omitting the `-username` parameter to indicate that you will create an unauthenticated peering relationship.

[`-timeout <integer>`] - Operation Timeout (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for peer communications. Specify the value in seconds. The default timeout value is 60 seconds.

[`-address-family {ipv4|ipv6}`] - Address Family of Relationship

Use this optional parameter to specify the address family of the cluster peer relationship. The default is based on existing relationships, existing local intercluster LIFs belonging to a particular address-family, and the addresses supplied to the `cluster peer create` command.

[`-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}`] - Passphrase Match Deadline

Specifying `cluster peer create` normally creates an offer to establish authentication with a cluster that is a potential cluster peer to this cluster. Such offers expire unless they are accepted within some definite time. Use this optional parameter to specify the date and time at which this offer should expire, the time after which the offer will no longer be accepted.

[`-rpc-connect-timeout <integer>`] - Timeout for RPC Connect (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds. The default timeout value is 10 seconds.

[`-update-ping-timeout <integer>`] - Timeout for Update Pings (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. The default timeout value is 5 seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

[`-ipspace <IPspace>`] - IPspace for the Relationship

Use this optional parameter to specify the IPspace within which the cluster peering relationship is to operate. The default is to use the 'Default' IPspace.

[-local-name <Cluster name>] - Peer Cluster Local Name

Use this optional parameter to specify a unique local name to identify the remote cluster that is being peered. The local name must conform to the same rules as a cluster name. The default value is the remote cluster name.

[-generate-passphrase <true>] - Use System-Generated passphrase

Use this optional parameter alone to create cluster peer offer for the unidentified clusters or use it along with `-peer-addr` option to automatically generate the passphrase for the cluster peer operation with the peer cluster.

[-initial-allowed-vserver-peers <Vserver Name>,...] - Vservers allowed for auto peering

Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled. Upon the time of successful peering, Vserver peer permission entries will be created for the peer cluster for the specified list of Vservers.

[-encryption-protocol-proposed {none|tls-psk}] - Encryption Protocol To Be Used In Inter-Cluster Communication

Use this optional parameter to specify how this cluster should use encryption in data connections to the other cluster. Specify 'tls-psk' to specify that TLS should be used with a Pre-Shared Key. Specify 'none' to use no encryption. Where authentication is used, the default is 'tls-psk'. Where authentication is not used, the default is 'none'.

[-applications {snapmirror|flexcache}] - Peering Applications

List of peering applications for initially allowed vservers.

Examples

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the create command on both the local cluster and the remote cluster. The cluster peer create command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIFs, or both. Note that the admin user's password was typed at the prompt, but was not displayed.

```

cluster1::> cluster peer create -peer-addr cluster2-d2,10.98.234.246
-username admin

Remote Password:

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Available
        Remote Cluster Name: cluster2
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: 1-80-123456
    Address Family of Relationship: ipv4
    Authentication Status Administrative: no-authentication
    Authentication Status Operational: absent
        Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

This example shows coordinated peer creation. The `cluster peer create` command was issued locally on each cluster. This does not require you to provide the username and password for the remote cluster. There is a password prompt, but if you are logged in as the admin user, you may simply press enter.

```

cluster1::> cluster peer create -peer-addr cluster2-d2, 10.98.234.246 -no
-authentication

Remote Password:
NOTICE: Addition of the local cluster information to the remote cluster
has
failed with the following error: not authorized for that command. You may
need to repeat this command on the remote cluster.

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Available      absent

```

```

cluster2::> cluster peer create -peer-addr cluster1-d2 -no-authentication

Remote Password:
NOTICE: Addition of the local cluster information to the remote cluster
has
failed with the following error: not authorized for that command. You may
need to repeat this command on the remote cluster.

cluster2::> cluster peer show
Peer Cluster Name          Cluster Serial Number Availability
Authentication
-----
cluster1                    1-80-654321          Available          absent

```

This example shows a reciprocal cluster peer create over IPv6 addresses, that establishes a cluster peer relationship with an IPv6 address family.

```

cluster1::> cluster peer create -peer-addr
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523 -username admin

Remote Password:

cluster1::> cluster peer show -instance
Address Family of Relationship: ipv6
Peer Cluster Name: cluster2
Remote Intercluster Addresses:
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523
Availability of the Remote Cluster: Available
Remote Cluster Name: cluster2
Active IP Addresses:
FD20:8B1E:B255:C222:6A17:0BBD:E92C:4523
Cluster Serial Number: 1-80-123456
Address Family of Relationship: ipv6
Authentication Status Administrative: no-authentication
Authentication Status Operational: absent
Last Update Time: 02/05 21:05:41
IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

This example shows creation of an authenticated peering relationship. It is an example of using the coordinated method to create a cluster peer relationship. The `cluster peer create` command is issued locally on each cluster. Before executing this pair of commands, a passphrase to be used with the commands is chosen and given at the prompts. The passphrase can be any text; it is prompted for twice on each cluster, and all four copies of the passphrase must agree. The passphrase does not echo on the screen. The

passphrase must be longer than the minimum length as specified by the cluster peer policy on both clusters.

```
cluster1::> cluster peer create -peer-addr cluster2-d2, 10.98.234.246
```

Enter the passphrase:

Enter the passphrase again:

Notice: Now use the same passphrase in the "cluster peer create" command in the
other cluster.

```
cluster1::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster2	-	Unavailable	pending

```
cluster2::> cluster peer create -peer-addr cluster1-d2
```

Enter the passphrase:

Enter the passphrase again:

```
cluster2::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster1	1-80-654321	Available	ok

This example creates a peer relationship between cluster1 and cluster2. This reciprocal create executes the create command on both the local cluster and the remote cluster. The cluster peer create command can use the hostnames of cluster2's intercluster addresses, the IP addresses of cluster2's intercluster LIFs or both. Note that the admin user's password was typed at the prompt, but was not displayed. The `-local-name` parameter is specified to create a local name used to identify the peer cluster in cases where the name of the peer cluster is not unique or not descriptive.

```

cluster1::> create -peer-addr 10.98.191.193 -username admin -local-name
locallyUniqueName

cluster1::> cluster peer show
Peer Cluster Name          Cluster Serial Number Availability
Authentication
-----
-----
locallyUniqueName          1-80-000011          Available
absent

cluster1::> cluster peer show -instance
Peer Cluster Name: locallyUniqueName
    Remote Intercluster Addresses: 10.98.191.193
    Availability of the Remote Cluster: Available
    Remote Cluster Name: cluster2
    Active IP Addresses: 10.98.191.193
    Cluster Serial Number: 1-80-000011
    Address Family of Relationship: ipv4
    Authentication Status Administrative: no-authentication
    Authentication Status Operational: absent
    Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

The following example create a peer relationship between cluster1 and cluster2 using system-generated passphrases:

```
cluster1::> cluster peer create -peer-addr 10.98.191.193 -generate
-passphrase
Passphrase: UCa+6lRVICXeL/gq1WrK7ShR
Peer Cluster Name: cluster2
Initial Allowed Vserver Peers: -
Expiration Time: 6/7/2017 09:16:10 +5:30
Intercluster LIF IP: 10.140.106.185
Warning: make a note of the passphrase - it cannot be displayed again.
```

```
cluster1::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster2	-	Unavailable	pending

```
cluster2::> cluster peer create -peer-addr 10.140.106.185
```

Enter the passphrase:

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
```

Peer Cluster Name	Cluster Serial Number	Availability	Authentication
cluster1	1-80-654321	Available	ok

The following example creates a cluster peer offer from cluster1 for an anonymous cluster using system-generated passphrase with offer expiration period of two days and the cluster2 uses the offer from cluster2 with the system-generated passphrase:

```
cluster1::> cluster peer create -generate-passphrase -offer-expiration
2days
Passphrase: UCa+6lRVICXeL/gq1WrK7ShR
      Peer Cluster Name: Clus_7ShR (temporary generated)
      Initial Allowed Vserver Peers: -
      Expiration Time: 6/9/2017 08:16:10 +5:30
      Intercluster LIF IP: 10.140.106.185
Warning: make a note of the passphrase - it cannot be displayed again.
```

```
cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
-----
Clus_7ShR              -                  Unidentified    pending
cluster2::> cluster peer create -peer-addr 10.140.106.185
```

Enter the passphrase:

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
-----
cluster1               1-80-654321          Available      ok
```

Cluster "cluster1" creates an offer with `initial-allowed-vserver-peers` option set to Vservers "vs1" and "vs2". And the peer cluster "cluster2" uses the offer and creates peer relationship with cluster1, upon the successful peer relationship establishment, Vserver peer permission entries are created for the Vservers "vs1" and "vs2" in cluster "cluster1" for the peer cluster "cluster2". The following example describes the usage of `initial-allowed-vserver-peers` option in the cluster peer creation workflow:

```
cluster1::> cluster peer create -generate-passphrase -initial-allowed
-vserver-peers vs1,vs2
Passphrase: UCa+6lRVICXeL/gq1WrK7ShR
    Peer Cluster Name: Clus_7ShR (temporary generated)
    Initial Allowed Vserver Peers: vs1,vs2
    Expiration Time: 6/7/2017 09:16:10 +5:30
    Intercluster LIF IP: 10.140.106.185
Warning: make a note of the passphrase - it cannot be displayed again.
```

```
cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
-----
Clus_7ShR              -                Unidentified    pending
cluster2::> cluster peer create -peer-addr 10.140.106.185
```

Enter the passphrase:

Clusters cluster1 and cluster2 are peered.

```
cluster2::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
-----
cluster1              1-80-654321          Available      ok
```

```
cluster1::> vserver peer permission show
```

Peer Cluster	Vserver	Applications
cluster2	vs1	snapmirror
	vs2	snapmirror

2 entries were displayed.

cluster peer delete

Delete a cluster peer relationship

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer delete` command removes a peering relationship. It removes the relationship records, state data, and all associated jobs.

Before removing the relationship, the command verifies that no resources depend on the relationship. For example, if any SnapMirror relationships exist, the command denies the request to delete the peering relationship. You must remove all dependencies for the deletion to succeed. The `cluster peer delete` command removes only the local instance of the peer relationship. An administrator in the peer cluster must use the `cluster peer delete` command there as well to completely remove the relationship.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify the peering relationship to delete by specifying the name of the peered cluster.

Examples

This example shows a failed deletion due to a SnapMirror dependency.

```
cluster2::> cluster peer delete -cluster cluster1
Error: command failed: Unable to delete peer relationship. Reason: A
SnapMirror source exists in this cluster
```

cluster peer modify-local-name

Modify the local name for a cluster peer

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer modify-local-name` command modifies the local name for a remote cluster. The new local name must be unique among all the local names for the remote clusters with which this cluster is peered.

Parameters

-name <text> - Cluster Peer Name

Use this parameter to specify the existing local name for a peer cluster.

-new-name <Cluster name> - Cluster Peer Local Name

Use this parameter to specify the new local name of the peer cluster. The new local name must conform to the same rules as a cluster name.

Examples

```
cluster2::> cluster peer modify-local-name -name cluster1 -new-name
cluster1A
```

cluster peer modify

Modify cluster peer relationships

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer modify` command modifies the attributes of a peering relationship. When you modify a peer relationship and specify `-peer-addr`s, all of the remote addresses must respond, must be intercluster addresses, and must belong to the remote cluster that is being modified; or the modification request is denied.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify the peering relationship to modify by specifying the name of the peered cluster.

[-peer-addr <Remote InetAddress>,...] - Remote Intercluster Addresses

Use this parameter to specify the names or IP addresses of the logical interfaces used for intercluster communication. Separate the addresses with commas. The list of addresses you provide replaces the existing list of addresses.

[-address-family {ipv4|ipv6}] - Address Family of Relationship

Use this parameter to specify the address family of the names specified with the `peer-addr`s parameter.

[-timeout <integer>] - Operation Timeout (seconds) (privilege: advanced)

Use this parameter to specify a timeout value for peer communications. Specify the value in seconds.

[-auth-status-admin {no-authentication|revoked|use-authentication}] - Authentication Status Administrative

Use this parameter to adjust the authentication in use for the peer relationship. The defined values for this field are as follows.

- `no-authentication` - The cluster peer relationship uses no authentication.
- `use-authentication` - The cluster peer relationship is to be authenticated. After you use this value, you will be prompted for a passphrase to be used in determining a new authentication key, just as in the authenticated `cluster peer create` command or you can use the option `generate-passphrase` to automatically generate the passphrase.
- `revoked` - The cluster peer relationship is no longer to be trusted. Peering communication with this cluster peer is suspended until the two clusters set their `auth-status-admin` attributes either both to `no-authentication` or both to `use-authentication`.

Changes should be reflected on both clusters involved in a peering relationship.

`[-rpc-connect-timeout <integer>]` - Timeout for RPC Connect (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for the RPC connect during peer communications. Specify the value in seconds.

`[-update-ping-timeout <integer>]` - Timeout for Update Pings (seconds) (privilege: advanced)

Use this optional parameter to specify a timeout value for pings while updating remote cluster information. Specify the value in seconds. This parameter applies only to cluster peer relationships using the IPv4 protocol.

`[-ipspace <IPspace>]` - IPspace for the Relationship

Use this optional parameter to specify that cluster peering communication for this remote cluster is to be done using local intercluster LIFs that are on ports in the named IPspace.

`[-generate-passphrase <true>]` - Use System-Generated passphrase

Use this optional parameter along with `-auth-status-admin` option's `use-authentication` to automatically generate the passphrase which can be used for cluster peer operation.

`[-encryption-protocol-proposed {none|tls-psk}]` - Encryption For Inter-Cluster Communication

Use this parameter to adjust the encryption of connections in use for the peer relationship. The defined values for this field are as follows.

- `tls-psk` - Use TLS with a Pre-Shared Key.
- `none` - Use no encryption.

Examples

This example modifies the peering relationship to use a new IP address in the remote cluster for intercluster communications and revoke authentication.

View existing cluster peer configuration using following command :

```
cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Available
    Remote Cluster Name: cluster2
    Active IP Addresses: 10.98.234.246, 10.98.234.243
    Cluster Serial Number: 1-80-123456
    Remote Cluster Nodes: cluster2-01, cluster2-02
    Remote Cluster Health: true
    Unreachable Local Nodes: -
    Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
    Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: tls-psk
```

Modify the cluster peer configuration using following command :

```
cluster1::> cluster peer modify -cluster cluster2 -peer-addr cluster2-  
d2,10.98.234.264 -auth-status-admin revoked  
Warning: This will discard the authentication key.
```

Warning: You are removing authentication from the peering relationship with

cluster "cluster2". Use the "cluster peer modify" command on cluster "cluster2" with the "-auth-status-admin no-authentication" parameter to complete authentication removal from the peering relationship.

```
Do you want to continue?{y|n}:y
```

The following example modifies the peering relationship to use authentication with `-generate-passphrase` option.

```
cluster1::> cluster peer modify -cluster cluster2
-auth-status-admin use-authentication -generate-passphrase
```

Notice: Use the below system-generated passphrase in the "cluster peer modify"

command in the other cluster.

Passphrase: UCa+6lRVICXeL/gq1WrK7ShR

Expiration Time: 6/7/2017 09:16:10 +5:30

Peer Cluster Name: cluster2

Warning: make a note of the passphrase - it cannot be displayed again.

Until then, the operational authentication state of the relationship remains as "pending".

```
cluster1::> cluster peer offer show
```

Allowed

Peer Cluster Name	Authentication	Creation	Expiration
cluster2	ok-and-offer	6/7/2017 08:16:10	6/7/2017 09:16:10

Modify cluster peer relationship in cluster2 with use-authentication option and use the auto-generated passphrase.

```
cluster2::> cluster peer modify -cluster cluster2 -auth-status-admin use-
authentication
```

Notice: Use a auto-generated passphrase or choose a passphrase of 8 or more characters.

To ensure the authenticity of the peering relationship, use a phrase or sequence of characters that would be hard to guess.

Enter the passphrase:

Confirm the passphrase:

cluster peer ping

Initiate intercluster connectivity test

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer ping` command displays the status of the network mesh used by the peering relationship. The command checks the network connection to each remote IP address known by the cluster. This includes all intercluster addresses. It is possible for a known address to be not present during the ping. These addresses are not checked, but the absence is temporary.

The most useful parameters for diagnosing problems are `-count` and `-packet-size`. Use the `-count` and `-packet-size` parameters to diagnose problems similarly to how you use them with the standard ping utility.

To display network connection status within a cluster, use the [network ping](#) command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-originating-node {<nodename>|local}] - Node that Initiates Ping

Use this parameter to send the ping from the node you specify.

[-destination-cluster <Cluster name>] - Cluster to Ping

Use this parameter to specify the peer cluster you want to ping.

[-destination-node <Peer Node Name>] - Node to Ping in Destination Cluster

Use this parameter to specify a specific node in the destination cluster to ping.

[-ip-address <IP Address>] - Active IP Address

Use this parameter to specify the active IP address you want to ping.

[-count <integer>] - Ping Count

Use this parameter to specify the number of requests to be sent to the destination.

[-status

{unknown_node|internal_error|unreachable|session_reachable|interface_reachable}] - Status of Ping Operation

Use this parameter to display only ping results that have the status you specify.

[-timeout <integer>] - Ping Timeout in Seconds

Use this parameter to specify a timeout value in seconds for the ping operation.

[-packet-size <integer>] - Size of Packet

Use this parameter to specify the number of data bytes to be sent in the ping packet.

[-ttl <integer>] - Time to Live/ Number of Hops

Use this parameter to specify the maximum number of network hops a packet may make before it is considered a failure.

[-response-time <double>] - Response Time (ms)

Use this parameter to display only nodes that have the response time (in milliseconds) that you specify. This parameter is most useful when specified with a range of values, such as >500

[-destination-node-uuid <UUID>] - Node to Ping in Destination Cluster

Use this parameter to specify a specific node's dblade UUID in the destination cluster to ping.

Examples

This example shows a ping of cluster1 and cluster2 from cluster2. All nodes are reachable.

```
cluster2::> cluster peer ping
Node: node1                Destination Cluster: cluster2
Destination Node IP Address      Count  TTL  RTT(ms)  Status
-----
node1                10.98.228.230      1  255    0.209 interface_reachable
node2                10.98.228.234      1  255    0.42 interface_reachable
Node: node2                Destination Cluster: cluster2
Destination Node IP Address      Count  TTL  RTT(ms)  Status
-----
node1                10.98.228.230      1  255    0.358 interface_reachable
node2                10.98.228.234      1  255    0.17 interface_reachable
Node: node1                Destination Cluster: cluster1
Destination Node IP Address      Count  TTL  RTT(ms)  Status
-----
node3                10.98.229.22       1  255    0.336 interface_reachable
node4                10.98.229.29       1  255    0.354 interface_reachable
Node: node2                Destination Cluster: cluster1
Destination Node IP Address      Count  TTL  RTT(ms)  Status
-----
node3                10.98.229.22       1  255    0.354 interface_reachable
node4                10.98.229.29       1  255    0.336 interface_reachable
6 entries were displayed.

cluster peer show

Display peer cluster information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer show` command displays information about the peering relationships between the current cluster and other clusters. Cluster peering enables independent clusters to coordinate and exchange data.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <text>] - Peer Cluster Name

Selects the peered clusters that match this parameter value.

[-cluster-uuid <UUID>] - Cluster UUID (privilege: advanced)

Selects the peered clusters that match this parameter value.

[-peer-addr <Remote InetAddress>,...] - Remote Intercluster Addresses

Selects the peered clusters that match this parameter value (remote-host name or IP address).

[-availability <availability>] - Availability of the Remote Cluster

Selects the peered clusters that match this parameter value. This parameter can have four different values:

- Available - The peer cluster availability status will be *Available* only if all the nodes in the local cluster are able to contact all the nodes in the remote cluster.
- Partial - The peer cluster availability status will be *Partial* only if some nodes in the local cluster are not able to contact some or all nodes in the peer cluster.
- Unavailable - The peer cluster availability status will be *Unavailable* only if all the nodes in the local cluster are not able to contact any node in the peer cluster.
- Pending - The peer cluster availability status will be *Pending* while the system is creating in-memory health data.
- Unidentified - The peer cluster availability status will be *Unidentified* if the cluster peer offer is created for an anonymous cluster and is unused. When the offer is used, then the availability will get changed to any of the above mentioned status.

Note: If one or more nodes in the local cluster are offline or unreachable, then those nodes are not used to determine the availability status for the remote nodes.

`[-rcluster <text>] - Remote Cluster Name`

Selects the peered clusters that match this parameter value.

`[-ip-addr <Remote InetAddress>,...] - Active IP Addresses`

Selects the peered clusters that match this parameter value.

`[-serialnumber <Cluster Serial Number>] - Cluster Serial Number`

Selects the peered clusters that match this parameter value.

`[-remote-cluster-nodes <text>,...] - Remote Cluster Nodes`

Selects the peered clusters that match this parameter value.

`[-remote-cluster-health {true|false}] - Remote Cluster Health`

Selects the peered clusters that match this parameter value.

- true - This means that there is cluster quorum in the peer cluster.
- false - This means that there is no cluster quorum in the peer cluster.

`[-unreachable-local-nodes <text>,...] - Unreachable Local Nodes`

Selects the peered clusters that match this parameter value.

`[-timeout <integer>] - Operation Timeout (seconds) (privilege: advanced)`

Selects the peered clusters that match this parameter value.

`[-address-family {ipv4|ipv6}] - Address Family of Relationship`

Selects the peered clusters that have a relationship established using this protocol.

`[-auth-status-admin {no-authentication|revoked|use-authentication}] - Authentication Status Administrative`

Selects the peered clusters that match this parameter value, which must be chosen from the following values.

- no-authentication - The cluster peer relationship uses no authentication.
- use-authentication - The cluster peer relationship is authenticated.
- revoked - The cluster peer relationship is revoked until agreement can be reached.

`[-auth-status-operational {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}] - Authentication Status Operational`

Selects the peered clusters that match this parameter value, which must be one of the following values.

- ok - The clusters both use authentication and they have agreed on an authentication key.
- absent - The clusters agree not to use authentication.
- pending - This cluster has made an outstanding offer to authenticate with the other cluster, but agreement has not yet been reached.
- expired - This cluster's offer to authenticate with the other cluster expired before agreement was reached.
- revoked - This cluster has revoked any prior authentication agreement.

- declined - The other cluster has revoked the authentication agreement and is declining to communicate with this cluster.
- refused - The other cluster actively refuses the communication attempts, perhaps because its part of the peering relationship has been deleted.
- ok-and-offer - The clusters agree on an authentication key and are using it. In addition, this cluster has made an outstanding offer to re-authenticate with the other cluster.
- absent-but-offer - The clusters currently agree that neither side requires authentication of the other, but this cluster has made an outstanding offer to authenticate.
- revoked-but-offer - This cluster has revoked any authentication agreement, but it has made an outstanding offer to authenticate.
- intent-mismatch - The two clusters disagree on whether authentication is required.
- key-mismatch - The two clusters both believe that they are authenticated, but one of the shared secrets has become corrupted.
- incapable - The other cluster is no longer running a version of ONTAP that supports authenticated cluster peering.

`[-rpc-connect-timeout <integer>]` - Timeout for RPC Connect (privilege: advanced)

Selects the peered clusters that match this parameter value.

`[-update-ping-timeout <integer>]` - Timeout for Update Pings (privilege: advanced)

Selects the peered clusters that match this parameter value.

`[-last-updated <MM/DD/YYYY HH:MM:SS>]` - Last Update Time

Selects the peered clusters that match this parameter value.

`[-ipspace <IPspace>]` - IPspace for the Relationship

Selects the peered clusters whose relationships are to cross the named local IPspace. The default value is the IPspace name "Default". In relationships created before ONTAP 8.3.1, the initial value is "-" and is not updated to "Default" until an action is taken on a cluster peer relationship, such as creating, modifying, or deleting a relationship.

`[-encryption-protocol-proposed {none|tls-psk}]` - Proposed Setting for Encryption of Inter-Cluster Communication

Selects the peered clusters that match the value of this parameter, that is, whether they are proposing to encrypt their cross-cluster communication or not.

`[-encryption-protocol {none|tls-psk}]` - Encryption Protocol For Inter-Cluster Communication

Selects the peered clusters that match the value of this parameter, that is, whether they are encrypting their cross-cluster communication or not.

`[-psk-algorithm {akep2|jpake}]` - Algorithm By Which the PSK Was Derived

Selects the peered clusters that match the value of this parameter, that is, which of the following algorithms was used to derive the Pre-Shared Key between the clusters.

- akep2 - The key was obtained through the AKEP2-and-PBKDF2 algorithm.
- jpake - The key was obtained through the J-PAKE algorithm.

Examples

This example shows the output of the `cluster peer show` command when all nodes in the local cluster are able to contact all nodes in the remote peer cluster. Additionally, the peer relationship is authenticated and operating correctly.

```
cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456         Available      ok
```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Available
    Remote Cluster Name: cluster2
    Active IP Addresses: 10.98.234.246, 10.98.234.243
    Cluster Serial Number: 1-80-123456
    Remote Cluster Nodes: cluster2-01, cluster2-02
    Remote Cluster Health: true
    Unreachable Local Nodes: -
    Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
    Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none
```

This example shows the output of the `cluster peer show` command when some nodes in the local cluster are not able to contact some or all of the nodes in the remote peer cluster.

```
cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456         Available      ok
```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Partial
        Remote Cluster Name: cluster2
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: 1-80-123456
        Remote Cluster Nodes: cluster2-01, cluster2-02
        Remote Cluster Health: false
        Unreachable Local Nodes: -
        Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
        Last Update Time: 02/05 21:05:41
        IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, but all the other nodes including node on which command is executed are able to contact all nodes in the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Available      ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
                Peer Cluster Name: cluster2
        Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
Availability of the Remote Cluster: Available
                Remote Cluster Name: cluster2
                Active IP Addresses: 10.98.234.246, 10.98.234.243
                Cluster Serial Number: 1-80-123456
                Remote Cluster Nodes: cluster2-01, cluster2-02
                Remote Cluster Health: true
                Unreachable Local Nodes: cluster1-01
                Address Family of Relationship: ipv4
Authentication Status Administrative: use-authentication
                Authentication Status Operational: ok
                Last Update Time: 02/05 21:05:41
                IPspace for the Relationship: Default
Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when some nodes in the local cluster cannot be contacted from the node where the command is executed, and the node on which command is executed is also not able to contact the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Unavailable      ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Unavailable
        Remote Cluster Name: cluster2
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: 1-80-123456
        Remote Cluster Nodes: cluster2-01, cluster2-02
        Remote Cluster Health: -
        Unreachable Local Nodes: cluster1-01
        Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
        Last Update Time: 02/05 21:05:41
        IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

This example shows the output of the cluster peer show command when all the nodes in the local cluster are not able to contact any nodes in the remote peer cluster.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Unavailable      ok

```

Detailed information for this scenario is shown below.

```

cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Unavailable
        Remote Cluster Name: cluster2
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: 1-80-123456
        Remote Cluster Nodes: cluster2-01, cluster2-02
        Remote Cluster Health: -
        Unreachable Local Nodes: -
        Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
        Last Update Time: 02/05 21:05:41
        IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

This example shows the output of the `cluster peer show` command while the system is creating in-memory health data.

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
cluster2               1-80-123456          Pending      ok

```

Detailed information for this scenario is shown below.

```
cluster1::> cluster peer show -instance
Peer Cluster Name: cluster2
    Remote Intercluster Addresses: cluster2-d2, 10.98.234.246
    Availability of the Remote Cluster: Pending
        Remote Cluster Name: cluster2
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: 1-80-123456
        Remote Cluster Nodes: -
        Remote Cluster Health: -
        Unreachable Local Nodes: -
    Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
        Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none
```

This example shows the output of the `cluster peer show` command for the offer created for an anonymous cluster:

```

cluster1::> cluster peer show
Peer Cluster Name      Cluster Serial Number Availability
Authentication
-----
-----
Clus_4gHR              -                Unidentified   pending

Detailed information for this scenario is shown below.

cluster1::> cluster peer show -instance
Peer Cluster Name: Clus_4gHR
    Remote Intercluster Addresses: -
    Availability of the Remote Cluster: Unidentified
        Remote Cluster Name: Clus_4gHR
        Active IP Addresses: 10.98.234.246, 10.98.234.243
        Cluster Serial Number: -
        Remote Cluster Nodes: -
        Remote Cluster Health: -
        Unreachable Local Nodes: -
    Address Family of Relationship: ipv4
    Authentication Status Administrative: use-authentication
    Authentication Status Operational: ok
        Last Update Time: 02/05 21:05:41
    IPspace for the Relationship: Default
    Encryption for Inter-Cluster Communication: none

```

cluster peer connection show

Show current peering connections for a cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer connection show` command displays information about the current TCP connections and how they are supporting the set of peering relationships.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-cluster-name <text>`] - Remote Cluster

Selects the connections associated with the named peered cluster.

[`-node {<nodename>|local}`] - Node

Selects the connections hosted by the given node.

[`-connection-type {mgmt-client|mgmt-server|data}`] - Cluster Peering Connection Type

Selects the connections of the named type. This parameter can have one of three different values:

- Mgmt-client - Management-plane client connections, created so that this node may make management-plane requests of other nodes.
- Mgmt-server - Management-plane server connections, over which this node services requests made by other nodes' mgmt-client connections.
- Data - Connections made between data-planes of different nodes.

[`-index <integer>`] - Index of Connection

Selects the connections with the given index value.

[`-cluster-uuid <UUID>`] - Cluster UUID (privilege: advanced)

Selects the connections to the cluster with the given cluster UUID.

[`-auth-status-admin {no-authentication|revoked|use-authentication}`] - Authentication Status Administrative

Selects connections to the peered clusters whose intended authentication matches this parameter value.

[`-auth-status-operational {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}`] - Authentication Status Operational

Selects connections to the peered clusters whose authentication state matches this parameter value.

[`-authenticated {true|false}`] - Authenticated

Selects connections that have been authenticated, or not, according to this parameter value.

[`-port <integer>`] - Network Port

Selects the connections whose port matches this parameter value.

[`-idle [<integer>d] [<integer>h] [<integer>m] [<integer>s]>`] - Idle Time

Selects the connections whose idle times match this parameter value.

[`-address <IP Address>`] - Remote Network Address

Selects the connections that have this parameter value as the remote network address.

[`-psk-algorithm {akep2|jpake}`] - PSK Algorithm

Selects the connections for clusters whose PSKs were generated by the named algorithm. This parameter can have one of two different values:

- akep2 - The original algorithm, PBKDF2 followed by AKEP2.
- jpake - Newer algorithm: J-PAKE.

Examples

This example shows the output of the cluster peer connection show command.

```
cluster1::> cluster peer connection show
Cluster Node          Connection Type  Auth  Encrypt Idle  Remote
Address
-----
cluster2
  node1
                                data  true  true  6s

                                data  true  true  37s
10.10.10.200
                                data  true  true  37s
10.10.10.200
12 entries were displayed.
```

cluster peer health show

Check peer cluster health

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer health show` command displays information about the health of the nodes in peer clusters from the perspective of the nodes in the local cluster. The command obtains health information by

performing connectivity and status probes of each peer cluster's nodes from each node in the local cluster.

To enable quick access to remote cluster health information, remote cluster health status is periodically checked and cached. These cached results enable users and system features to quickly assess the availability of remote resources. By default, this command accesses cached results. Use the *-bypass-cache* *true* option to force a current, non-cached check of remote cluster health.

Parameters

{ [-fields <fieldname>,...]

If you specify the *-fields <fieldname>*, ... parameter, the command output also includes the specified field or fields. You can use *'-fields ?'* to display the fields to specify.

| [-instance] }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-originating-node {<nodename>|local}] - Local Node

Selects the node that matches this parameter value.

[-destination-cluster <Cluster name>] - Peer Cluster

Selects the cluster that matches this parameter value.

[-destination-node <Peer Node Name>] - Peer Node

Selects the node that matches this parameter value.

[-destination-cluster-uuid <UUID>] - Peer UUID

Selects the cluster that matches this parameter value.

[-data-ping

{unknown_node|internal_error|unreachable|session_reachable|interface_reachable}] -

Status of Data Ping Operation

Selects the nodes that match this parameter value.

[-icmp-ping

{unknown_node|internal_error|unreachable|session_reachable|interface_reachable}] -

Status of ICMP Ping Operation

Selects the nodes that match this parameter value.

[-node-health {true|false}] - RDB Health of the Node

Selects the nodes that match this parameter value (*true* means healthy).

[-cluster-health {true|false}] - Cluster Health

Selects the nodes that match this parameter value (*true* means healthy).

[-availability {true|false}] - Communication Indicator

Selects the nodes that match this parameter value (*true* means communicating).

[-bypass-cache {true|false}] - Bypass Cache and Determine Health

Bypasses cached results to determine current cluster health (*true* means bypass the cache). Cached results may not be current, but they are displayed more quickly.

[-last-updated <MM/DD/YYYY HH:MM:SS>] - Last Update Time

Selects the nodes that match this parameter value.

Examples

The following example shows typical output for this command in a cluster of two nodes that has a peer cluster of two nodes.

```
cluster1::> cluster peer health show
Node          Cluster-Name          Node-Name
          Ping-Status          RDB-Health Cluster-Health
Availability
-----
node1
      cluster2          node3
      Data: interface_reachable
      ICMP: -          true      true      true
      node4
      Data: interface_reachable
      ICMP: -          true      true      true
node2
      cluster2          node3
      Data: interface_reachable
      ICMP: -          true      true      true
      node4
      Data: interface_reachable
      ICMP: -          true      true      true
4 entries were displayed.
```

The following example shows detailed health information for node3 in cluster2 from the perspective of node1 in cluster1.

```
cluster1::> cluster peer health show -originating-node node1 -destination
-cluster cluster2 -destination-node node3 -instance
Local Node: node1
      Peer Cluster: cluster2
      Peer Node: node3
      Peer UUID: 5e4befb2-1f36-11d0-98c9-123476563412
Status of Data Ping Operation: interface_reachable
Status of ICMP Ping Operation: -
      RDB health of the node: true
      Cluster Health: true
      Communication Indicator: true
      Last Update Time: 02/06 18:58:38
```

cluster peer offer cancel

Cancel the outstanding offer to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer cancel` command cancels an outstanding offer to authenticate with a potentially peered cluster. After the command completes, the given cluster can no longer establish authentication using the given authentication offer.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify which offer should be cancelled, by specifying the name of the cluster to which the offer is extended.

Examples

The following example cancels the authentication offer to cluster2.

```
cluster1::> cluster peer offer cancel -cluster cluster2
```

cluster peer offer modify

Modify an outstanding offer to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer modify` command modifies the outstanding offer to authenticate with a potentially peered cluster. Every authentication offer has an expiration time, after which the offer will no longer be honored. This command is used to change that expiration time. To cancel the offer outright, use the [cluster peer offer cancel](#) command instead.

Parameters

-cluster <text> - Peer Cluster Name

Use this parameter to specify the offer to be modified by indicating the name of the cluster to which it has been extended.

[-offer-expiration {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Authentication Offer Expiration Time

Use this parameter to specify the new expiration time for the offer.

[-initial-allowed-vserver-peers <Vserver Name>,...] - Vservers Initially Allowed for Peering

Use this optional parameter to specify the list of Vservers for which reciprocal Vserver peering with peer cluster should be enabled.

Examples

This example modifies the expiration time for the authentication offer to push it out by an hour.

```
cluster1::> cluster peer offer show
Peer Cluster Name      Authentication Creation      Expiration
-----
cluster2               absent_but_offer
                        7/23/2013 14:45:47  7/23/2013
                        15:45:47

cluster1::> cluster peer offer modify -cluster cluster2 -offer-expiration
"7/23/2013 16:45:47"

cluster1::> cluster peer offer show
Peer Cluster Name      Authentication Creation      Expiration
-----
cluster2               absent_but_offer
                        7/23/2013 14:45:47  7/23/2013
                        16:45:47
```

cluster peer offer show

Display outstanding offers to authenticate with a peer cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer offer show` command displays information about authentication offers still pending with potential peer clusters. By default, the command displays information about all unexpired offers made by the local cluster.

To display detailed information about a specific offer, run the command with the `-cluster` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*] }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-cluster* <text>] - Peer Cluster Name

Selects the offer that matches this parameter value.

[*-auth-status-operational* {ok|absent|pending|expired|revoked|declined|refused|ok-and-offer|absent-but-offer|revoked-but-offer|key-mismatch|intent-mismatch|incapable}] - Authentication Status Operational

Selects the offers that match this parameter value.

[*-offer-creation* <MM/DD/YYYY HH:MM:SS>] - Authentication Offer Creation Time

Selects the offers that match this parameter value.

[*-offer-expiration* {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Authentication Offer Expiration Time

Selects the offers that match this parameter value.

[*-initial-allowed-vserver-peers* <Vserver Name>,...] - Vservers Initially Allowed for Peering

Selects the offers that match this parameter value.

[*-offer-creator* <text>] - Authentication Offer Creator

Selects the offers that match this parameter value.

[*-encryption-protocol-proposed* {none|tls-psk}] - Encryption Protocol to Be Used For the Relationship

Selects the offers that match this parameter value.

Examples

The following example displays information about the outstanding authentication offers:

```
cluster1::> cluster peer offer show

Allowed
Peer Cluster Name      Authentication Creation      Expiration
Vserver Peers
-----
cluster2               absent_but_offer 7/11/2013 22:22:52 7/11/2013
23:22:52 vs1,vs2
```

cluster peer policy modify

Modify the policy configuration for the cluster peering service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer policy modify` command modifies the prevailing policy settings. One setting governs whether unauthenticated cluster peer relationships can exist. The other setting specifies a minimum length for passphrases.

Parameters

`[-is-unauthenticated-access-permitted {true|false}] - Is Unauthenticated Cluster Peer Access Permitted`

Use this parameter to specify whether unauthenticated peering relationships are allowed to exist. Setting the parameter value to `true` allows such relationships to exist. Setting the value to `false` prevents both the creation of unauthenticated peering relationships as well as the modification of existing peering relationships to be unauthenticated. Setting the value to `false` is not possible if the cluster currently is in any unauthenticated relationships.

`[-passphrase-minlength <integer>] - Passphrase Length Minimum`

Use this parameter to specify a minimum length for passphrases as given to the [cluster peer create](#) or [cluster peer modify](#) commands in the future. The default value for this parameter is 8.

`[-is-unencrypted-access-permitted {true|false}] - Is Unencrypted Cluster Peer Access Permitted`

Use this parameter to specify whether peering relationships that do not use encryption are allowed to exist. Setting the parameter value to `true` allows such relationships to exist. Setting the value to `false` prevents the creation of unauthenticated peering relationships and the modification of existing peering relationships to be unauthenticated, as well as preventing unencrypted peering relationships from being created and the modification of existing peering relationships to be unencrypted. Setting the value to `false` is not possible if the cluster currently is in any unauthenticated or unencrypted relationships.

Examples

This example modifies the peering policy to disallow unauthenticated intercluster communications.

```
cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted:  true
                  Minimum Length for a Passphrase:      8

cluster1::> cluster peer policy modify -is-unauthenticated-access
-permitted false

cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted:  false
                  Minimum Length for a Passphrase:      8
```

Related Links

- [cluster peer create](#)
- [cluster peer modify](#)

cluster peer policy show

Display the policy configuration for the cluster peering service

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster peer policy show` command displays the prevailing cluster peer authentication policy. There are two policies at present: one to control whether any cluster peer relationships can be unauthenticated, and one to control the minimum length for a passphrase. If the policy is set to preclude unauthenticated peering relationships, then unauthenticated relationships cannot be created inadvertently. Passphrases of less than the minimum length may not be used. By default, this minimum length is set to 8, so passphrases must be 8 characters long or longer.

Examples

This example shows the cluster peer policy when unauthenticated relationships may not be created inadvertently.

```
cluster1::> cluster peer policy show
Is Unauthenticated Cluster Peer Communication Permitted:  false
                  Minimum Length for a Passphrase:      9
Is Unencrypted Cluster Peer Communication Permitted:  true
```

cluster quorum-service commands

cluster quorum-service options modify

Modify the settings for cluster quorum-service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster quorum-service options modify` command modifies the values of cluster quorum services options.

Parameters

`[-ignore-quorum-warning-confirmations {true|false}]` - Whether or Not Warnings Are Enabled (privilege: advanced)

Specifies whether cluster quorum warnings and confirmations should be ignored when cluster operations could negatively impact cluster quorum:

- Halting a node ([system node halt](#))
- Rebooting a node ([system node reboot](#))
- Issuing a planned takeover ([storage failover takeover](#))

The default setting is false.

Examples

The following example shows the usage of this command:

```
cluster1::> set advanced
```

```
Warning: These advanced commands are potentially dangerous; use them only  
when
```

```
    directed to do so by NetApp personnel.
```

```
Do you want to continue? {y|n}: y
```

```
cluster1::*> cluster quorum-service options modify -ignore-quorum-warning  
-confirmations true
```

Related Links

- [system node reboot](#)
- [storage failover takeover](#)

cluster quorum-service options show

Display the settings for cluster quorum-service

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster quorum-service options show` command displays the values of cluster quorum services options.

Examples

The following example demonstrates showing the state of ignore-quorum-warning-confirmations when it is false and true.

```
cluster1::*> set advanced
```

```
Warning: These advanced commands are potentially dangerous; use them only  
when
```

```
    directed to do so by NetApp personnel.
```

```
Do you want to continue? {y|n}: y
```

```
cluster1::*> cluster quorum-service options show
```

```
Ignore Quorum Warning Confirmations
```

```
-----  
false
```

cluster ring commands

cluster ring show

Display cluster node member's replication rings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster ring show` command displays a cluster's ring-replication status. Support personnel might ask you to run this command to assist with troubleshooting.

Parameters

[`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Selects the rings that match this parameter value.

[`-unitname {mgmt|vldb|vifmgr|bcomd|crs|availd}`] - Unit Name (privilege: advanced)

Selects the rings that match this parameter value. Possible values are:

- `mgmt` - The management application
- `vldb` - The volume location database
- `vifmgr` - The virtual-interface manager
- `bcomd` - The SAN management daemon
- `crs` - The configuration replication service

[`-online {master|secondary|offline}`] - Status (privilege: advanced)

Selects the rings that match this parameter value.

[`-epoch <integer>`] - Epoch (privilege: advanced)

Selects the rings that match this parameter value.

[`-master <nodename>`] - Master Node (privilege: advanced)

Selects the rings that match this parameter value.

[`-local <nodename>`] - Local Node (privilege: advanced)

Selects the rings that match this parameter value.

[`-db-epoch <integer>`] - DB Epoch (privilege: advanced)

Selects the rings that match this parameter value.

[`-db-trnxs <integer>`] - DB Transaction (privilege: advanced)

Selects the rings that match this parameter value.

[`-num-online <integer>`] - Number Online (privilege: advanced)

Selects the rings that match this parameter value.

[`-rdb-uuid <UUID>`] - RDB UUID (privilege: advanced)

Selects the rings that match this parameter value.

Examples

The following example displays information about all replication rings in a two-node cluster:

```
cluster1::*> cluster ring show
```

Node	UnitName	Epoch	DB Epoch	DB Trnxs	Master	Online
node0	mgmt	1	1	1068	node0	master
node0	vldb	1	1	98	node0	master
node0	vifmgr	1	1	350	node0	master
node0	bcomd	1	1	56	node0	master
node0	crs	1	1	88	node0	master
node1	mgmt	1	1	1068	node0	secondary
node1	vldb	1	1	98	node0	secondary
node1	vifmgr	1	1	350	node0	secondary
node1	bcomd	1	1	56	node0	secondary
node1	crs	1	1	88	node0	secondary

10 entries were displayed.

cluster statistics commands

cluster statistics show

Display cluster-wide statistics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster statistics show` command displays the following information. Each item lists the current value and; if applicable, the change (delta) from the previous reported value.

- CPU busy percentage
- Average of CPU busy percentage (advanced privilege level only)
- Total number of NFS and CIFS operations
- Number of NFS operations
- Number of CIFS operations
- Number of cache operations (advanced privilege level only)
- Total amount of network data received (advanced privilege level only)
- Total amount of network data sent (advanced privilege level only)
- Number of packets received (advanced privilege level only)
- Number of packets sent (advanced privilege level only)
- Busy percentage for the data network
- Amount of data received on the data network
- Amount of data sent on the data network
- Busy percentage for the cluster network
- Amount of data received on the cluster network
- Amount of data sent on the cluster network
- Amount of data read from disk
- Amount of data written to disk

At the diagnostic privilege level, the command displays the following information:

- Average of CPU busy percentage
- CPU busy percentage
- Total number of operations
- Number of NFS operations
- Number of CIFS operations
- Number of 7M Fcache operations
- Number of SpinFS operations
- Total amount of network traffic received
- Total amount of network traffic sent
- Percentage of data-network utilization

- Amount of data-network traffic received
- Amount of data-network traffic sent
- Percentage of cluster-network utilization
- Amount of cluster-network traffic received
- Amount of cluster-network traffic sent
- Amount of data read from disk
- Amount of data written to disk
- Number of packets received
- Number of packets sent

Examples

The following example displays cluster statistics:

```
cluster1::> cluster statistics show
```

Counter	Value	Delta

CPU Busy:	84%	+27
Operations:		
Total:	951471448	7210/s:11s

Write:	53.3TB	53.5MB/s:11s

cluster time-service commands

cluster time-service ntp key create

Create an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key create` command creates a cryptographic key that can be used to verify that Network Time Protocol (NTP) packets are coming from a configured NTP server.

To use the created key it must be assigned to the required NTP server configuration using the [cluster time-service ntp server create](#) or [cluster time-service ntp server modify](#) commands.

The id, key-type and value must all be configured identically on both the ONTAP cluster and the external NTP time server for the cluster to be able to synchronize time to that server.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Uniquely identifies this key in the cluster. Must be an integer between 1 and 65535.

-type <sha1> - NTP Symmetric Authentication Key Type

The cryptographic algorithm that this key is used with. Only SHA1 is currently supported.

-value <text> - NTP Symmetric Authentication Key Value

A 40 character hexadecimal digit string that represents a cryptographic key that is shared with the NTP server.

Examples

The following example creates a new SHA-1 NTP symmetric authentication key.

```
cluster1::> cluster time-service ntp key create 1 sha1
2e874852e7d41cda65b23915aa5544838b366c51
```

Related Links

- [cluster time-service ntp server create](#)
- [cluster time-service ntp server modify](#)

cluster time-service ntp key delete

Delete an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete an NTP symmetric authentication key.

It is not possible to delete a key that is referenced in an existing NTP server configuration. Remove all references to this key using the [cluster time-service ntp server modify](#) or [cluster time-service ntp server delete](#) commands before attempting to delete the key using this command.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Unique identifier of this key in the cluster.

Examples

The following example deletes the NTP key with ID 1.

```
cluster1::> cluster time-service ntp key delete 1
```

Related Links

- [cluster time-service ntp server modify](#)
- [cluster time-service ntp server delete](#)

cluster time-service ntp key modify

Modify an NTP symmetric authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key modify` command modifies a Network Time Protocol (NTP) symmetric authentication key.

Parameters

-id <integer> - NTP Symmetric Authentication Key ID

Unique identifier of this key in the cluster.

[-type <sha1>] - NTP Symmetric Authentication Key Type

The cryptographic algorithm that this key is used with. Only SHA1 is currently supported.

[-value <text>] - NTP Symmetric Authentication Key Value

A 40 character hexadecimal digit string that represents a cryptographic key that is shared with the NTP server.

Examples

The following example modifies the NTP key with ID 1 to have a new value.

```
cluster1::> cluster time-service ntp key modify 1 -value  
2e874852e7d41cda65b23915aa5544838b366c51
```

cluster time-service ntp key show

Display NTP symmetric authentication keys

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp key show` command displays the configured Network Time Protocol (NTP) symmetric authentication keys.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-id <integer>] - NTP Symmetric Authentication Key ID

If this parameter is specified, the command displays the keys that match the specified key ID.

[-type <sha1>] - NTP Symmetric Authentication Key Type

If this parameter is specified, the command displays the keys that match the specified key type.

[-value <text>] - NTP Symmetric Authentication Key Value

If this parameter is specified, the command displays the keys that match the specified value.

Examples

The following example displays information about the NTP authentication keys in the cluster:

```
cluster1::> cluster time-service ntp key show
ID      Type      Value
-----
2       sha1       5a01120580b5a6ade6ebcd5bad7673fdd6db0113
10      sha1       1f48d2e6f02f17e3f8fa8798cc77af101df29642
2 entries were displayed.
```

cluster time-service ntp security modify

Modify NTP security settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp security modify` command allows setting of security parameters

related to the Network Time Protocol (NTP) subsystem.

Parameters

`[-is-query-enabled {true|false}]` - Is Querying of NTP Server Enabled? (privilege: advanced)

Setting this parameter to *true* allows querying of the NTP subsystem from systems external to the cluster. For example, querying a node using the standard "ntpq" command can be enabled by this command. The default setting is *false* to protect against possible security vulnerabilities. If querying of the NTP subsystem is disabled, the [cluster time-service ntp status show](#) command can be used to obtain similar information. Although querying of the NTP subsystem from external hosts can be disabled with this command, executing a local query to the localhost address is always enabled.

Examples

The following example enables the querying of the NTP subsystem from clients external to the cluster:

```
cluster-1::> cluster time-service ntp security modify -is-query-enabled true
```

cluster time-service ntp security show

Display NTP security settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp security show` command displays the configuration of security features related to the Network Time Protocol (NTP) subsystem.

Examples

The following example displays the NTP security configuration of the cluster:

```
cluster1::> cluster time-service ntp security show
External queries enabled?: true
```

cluster time-service ntp server create

Add a NTP Server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server create` command associates the cluster with an external network time server for time correction and adjustment by using the Network Time Protocol (NTP).

The command resolves the time server host name to an IP address and performs several validation checks. If an error is detected during validation, it is reported.

The validation checks performed by this command include the following:

- The NTP replies to an NTP query with the specified protocol version.
- The NTP reply indicates that the external time server is synchronized to another time server.
- The distance and dispersion of the NTP reply from the "root" or source clock are within the required limits.

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This parameter specifies the host name or IP address of the external NTP server that is to be associated with the cluster for time correction and adjustment.

[-version {3|4|auto}] - NTP Version for Server (default: auto)

Use this parameter to optionally specify the NTP protocol version that should be used for communicating with the external NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot take place.

The supported values for this parameter include the following:

- 3 - Use NTP protocol version 3, which is based on Internet Standard request for comments (RFC) #1305.
- 4 - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.
- auto - Have ONTAP select the NTP protocol version.

The default setting is `auto`.

[-is-preferred {true|false}] - Is Preferred NTP Server (default: false) (privilege: advanced)

Use this parameter to optionally specify whether the external NTP server is the primary time source for correcting and adjusting the cluster time. The responses from this source are used unless its time is outside the accepted selection range.

The default setting is `false`.

You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-radio based backup time servers.

[-key-id <integer>] - NTP Symmetric Authentication Key ID

Use this parameter to optionally enable NTP symmetric authentication key for communication with the specified time server. The ID must refer to a key created by the [cluster time-service ntp key create](#) command and must be a key with the same ID and value as one configured on the specified time server.

Examples

The following example associates the cluster with an NTP server named `ntp1.example.com`.

```
cluster1::> cluster time-service ntp server create -server
ntp1.example.com
```

- [cluster time-service ntp key create](#)

cluster time-service ntp server delete

Delete a NTP Server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server delete` command removes the association between the cluster and an external network time server that uses the Network Time Protocol (NTP).

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This specifies the host name or IP address of an existing external NTP server that the cluster will disassociate from.

Examples

The following example disassociates an NTP server named `ntp2.example.com` from the cluster:

```
cluster1::> cluster time-service ntp server delete -server
ntp2.example.com
```

cluster time-service ntp server modify

Modify NTP Server Options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server modify` command modifies the configuration of an existing external network time server that uses the Network Time Protocol (NTP) for time correction and adjustment.

Parameters

-server <text> - NTP Server Host Name, IPv4 or IPv6 Address

This parameter specifies the host name or IP address of an existing external NTP server that is to be modified.

[-version {3|4|auto}] - NTP Version for Server (default: auto)

Use this parameter to optionally specify the NTP protocol version that should be used for communicating with the external NTP server. If the external NTP server does not support the specified protocol version, time exchange cannot take place.

The supported values for this parameter include the following:

- 3 - Use NTP protocol version 3, which is based on Internet Standard request for comments (RFC) #1305.
- 4 - Use NTP protocol version 4, which is based on Internet Standard RFC #5905.
- auto - Have ONTAP select the NTP protocol version.

The default setting is auto.

[-is-preferred {true|false}] - Is Preferred NTP Server (default: false) (privilege: advanced)

Use this parameter to optionally specify whether the external NTP server is the primary time source for correcting and adjusting the cluster time. The responses from this source are used unless its time is outside the accepted selection range

The default setting is false .

You use this parameter when a high quality radio (or GPS) based time server is being used with a set of non-radio based backup time servers.

This parameter is available only at the advanced privilege level and higher.

[-is-authentication-enabled {true|false}] - Is NTP Symmetric Key Authentication Enabled

Use this parameter to optionally disable NTP symmetric key authentication for communication with the specified time server. Using this parameter and selecting *false* disables the NTP symmetric key authentication and clears the *key-id* parameter for the specified server. This parameter is not required to enable NTP symmetric key authentication, but if specified as *true* the NTP symmetric authentication key must also be specified using the *key-id* parameter.

[-key-id <integer>] - NTP Symmetric Authentication Key ID

Use this parameter to optionally enable NTP symmetric authentication key for communication with the specified time server. The ID must refer to a key created by the [cluster time-service ntp key create](#) command and must be a key with the same ID and value as one configured on the specified time server.

Examples

The following example modifies the NTP version of an NTP server named ntp1.example.com. The NTP version is changed to 4.

```
cluster1::> cluster time-service ntp server modify -server  
ntp1.example.com -version 4
```

- [cluster time-service ntp key create](#)

cluster time-service ntp server reset

Reset NTP server list to a default selection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp server reset` command replaces the current configuration with one of the selected configurations.

If none or more than one time service configuration is selected, the command will fail.

Parameters

`[-use-public {true|false}]` - Reset Server List to Public Identified Defaults (default: false) (privilege: advanced)

When set to true, this specifies that the public NTP server list used by ONTAP should replace the current configuration.

The default setting is `false`.

Examples

The following example replaces the current time service configuration with the default public NTP server list that is used by ONTAP.

```
cluster1::> cluster time-service ntp server reset -use-public true
```

cluster time-service ntp server show

Display a list of NTP Servers

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `cluster time-service ntp server show` command displays the association between the cluster and external network time servers that use the Network Time Protocol (NTP).

Parameters

`{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>,...` parameter, the command only displays the fields that you specify. For example: `-fields server, version`.

[`-instance`] }

If this parameter is specified, the command displays all the available field information.

[`-server <text>`] - NTP Server Host Name, IPv4 or IPv6 Address

If this parameter is specified, the command displays the external NTP servers that match the specified server name or IP address.

[`-version {3|4|auto}`] - NTP Version for Server (default: auto)

If this parameter is specified, the command displays the external NTP servers that use the specified NTP version.

[`-is-preferred {true|false}`] - Is Preferred NTP Server (default: false) (privilege: advanced)

If this parameter is specified, the command displays the external NTP server or servers that match the specified preferred server status.

[`-is-public {true|false}`] - Is Public NTP Server Default (privilege: advanced)

If this parameter is specified, the command displays the information for the external NTP servers that are either on the NTP server list defined by ONTAP (`true` ``) or not on the list (`false` ``).

[`-is-authentication-enabled {true|false}`] - Is NTP Symmetric Key Authentication Enabled

If this parameter is specified, the command displays the external NTP server or servers that require NTP symmetric key authentication for communication.

[`-key-id <integer>`] - NTP Symmetric Authentication Key ID

If this parameter is specified, the command displays the external NTP server or servers that match the specified symmetric authentication key ID.

Examples

The following example displays information about all external NTP time servers that are associated with the cluster:

```
cluster1::> cluster time-service ntp server show
```

Server	Version	Is Authentication Enabled	Key ID
ntp1.example.com	auto	false	-
ntp2.example.com	auto	true	10

cluster time-service ntp status show

Display status of the node's NTP client

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `cluster time-service ntp status show` command displays the status of the associations between the cluster and external network time servers that use the Network Time Protocol (NTP).

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ] (privilege: advanced) }`

If this parameter is specified, the command displays detailed information about all entries.

`[-node {<nodename>|local}] - Node (privilege: advanced)`

If this parameter is specified, the command displays information related to associations on the specified node.

`[-server <text>] - NTP Server Host Name, IPv4 or IPv6 Address (privilege: advanced)`

If this parameter is specified, the command displays information about the associations related to the specified NTP server. The server should be specified as it is configured in the [cluster time-service ntp server show](#) command.

`[-server-address <IP Address>] - Server IP Address (privilege: advanced)`

If this parameter is specified, the command displays information about the associations related to the NTP server with the specified IP address.

`[-is-peer-reachable {true|false}] - Is Peer Reachable and Responding to Polls? (privilege: advanced)`

If this parameter is specified as `true`, the command displays information about associations with the NTP servers that have been successfully polled.

`[-is-peer-selected {true|false}] - Is Peer Selected as Clock Source? (privilege: advanced)`

If this parameter is specified as `true`, the command displays information about associations with the NTP servers that have been selected as the current clock source.

`[-selection-state <State of NTP Peer Selection>] - State of Server Selection (privilege: advanced)`

If this parameter is specified, the command displays information about associations with the specified selection state.

`[-selection-state-text <text>] - Description of Server Selection State (privilege: advanced)`

If this parameter is specified, the command displays information about associations with the specified selection state description.

`[-poll-interval <integer>] - Poll Interval (secs) (privilege: advanced)`

If this parameter is specified, the command displays information about associations that have the specified polling interval.

[-time-last-poll <integer>] - Time from Last Poll (secs) (privilege: advanced)

If this parameter is specified, the command displays information about associations that are polled at the specified time.

[-offset <double hundredths>] - Offset from Server Time (ms) (privilege: advanced)

If this parameter is specified, the command displays information about associations with the specified offset from the NTP server.

[-delay <double hundredths>] - Delay Time to Server (ms) (privilege: advanced)

If this parameter is specified, the command displays information about associations with the specified travelling time to the NTP server.

[-jitter <double hundredths>] - Maximum Offset Error (ms) (privilege: advanced)

If this parameter is specified, the command displays information about associations with the specified offset error from the NTP server.

[-reachability <Hex String>] - Reachability of Server (privilege: advanced)

If this parameter is specified, the command displays information about associations with the specified reachability to the NTP server. Reachability is specified as a hexbyte that has a bit to represent the success of each of the last eight polls of the specified server. A set bit represents a successful poll. The least significant bit represents the most recent poll, the next most significant bit the poll before that, and so on.

[-server-stratum <integer>] - Stratum of Server Clock (privilege: advanced)

If this parameter is specified, the command displays information about associations with NTP servers with the specified clock stratum.

[-server-reference <text>] - Reference Clock at Server (privilege: advanced)

If this parameter is specified, the command displays information about associations with NTP servers using the specified clock as reference.

[-reported-errors <NTP Peer and Packet Errors>, ...] - Reported Packet and Peer Errors (privilege: advanced)

If this parameter is specified, the command displays information about associations with the specified errors.

Examples

The following example displays the status of the NTP associations of the cluster:

```
cluster-1::*>cluster time-service ntp status show
Node: node-1
Server                Reachable  Selection State          Offset
(ms)
-----
ntp1.eng.netapp.com    true    Currently Selected Server
39.122
ntp2.eng.netapp.com    true    Candidate Server
37.786
2 entries were displayed.
```

The following example displays the status of the association with the specified external NTP server:

```
cluster-1::*>cluster time-service ntp status show -instance -server
ntp1.example.com
Node: node-1
NTP Server Host Name, IPv4 or IPv6 Address: ntp1.example.com
Server IP Address: 10.56.32.33
Is Peer Reachable and Responding to Polls?: true
Is Peer Selected as Clock Source?: true
State of Server Selection: sys_peer
Description of Server Selection State: Currently Selected Server
Poll Interval (secs): 64
Time from Last Poll (secs): 1
Offset from Server Time (ms): 26.736
Delay Time to Server (ms): 61.772
Maximum Offset Error (ms): 3.064
Reachability of Server: 01
Stratum of Server Clock: 2
Reference Clock at Server: 10.56.68.21
Reported Packet and Peer Errors: -
```

debug commands

debug hwpmc commands

debug hwpmc create

Start a new HWPMC profile

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `debug hwpmc create` command is used to create a Hardware Performance Monitoring Counter profile.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

This parameter specifies the node for which the profile will be created.

-name <text> - Name of the HWPMC Profile (privilege: advanced)

This parameter specifies the name of the profile that will be created. The default name will be the date and time the profile was created, e.g. 2023_06_07-08_53_44_UTC.

-counter <text> - HWPMC Event Specification (privilege: advanced)

This parameter specifies the performance monitoring counter event to sample. The default counter is "UNHALTED-CORE-CYCLES".

[-process <text>] - Profile Specific Process (privilege: advanced)

This parameter specifies the process to sample; may be a non-negative integer denoting a specific process id, or a regular expression for selecting processes based on their names. This field is optional.

Examples

This example creates a hwpmc profile with default parameters.

```
cluster1::> debug hwpmc create -node node1
```

debug hwpmc delete

Delete or cancel a HWPMC profile

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `debug hwpmc delete` command allows the user to delete or cancel Hardware Performance Monitoring Counter profiles.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

This parameter specifies the node on which the profile was collected.

-name <text> - Name of the HWPMC Profile (privilege: advanced)

This parameter specifies the name of the profile that will be deleted.

Examples

The following example deletes a profile that was collected on node1:

```
cluster1::> debug hwpmc delete -node node1 -name 2023_06_06-08_53_44_UTC
```

debug hwpmc show

Display HWPMC profiles

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `debug hwpmc show` command displays a list of the current Hardware Performance Monitoring Counter profiles along with the state of each one.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name (privilege: advanced)

This parameter selects the node from which the profiles are displayed.

[-name <text>] - Name of the HWPMC Profile (privilege: advanced)

This parameter specifies the name of the profile.

[-date <MM/DD/YYYY HH:MM:SS>] - Date of the HWPMC Profile (privilege: advanced)

This parameter filters the results to display profiles for a specific date or a date range.

[-status <State of HWPMC Profiles>] - Current Status of HWPMC Profile (privilege: advanced)

This parameter specifies the current state of the profile. The possible states are:

- **running** - Collecting hardware profiling data. The amount of time in this state is directly related to the `-duration` parameter used when creating the HWPMC profile.
- **processing** - The hardware profiling data is being processed. This typically takes several minutes to

complete, depending on the amount of data collected in the *running* state."

- complete - The profile is complete.
- failed - Creation of the profile failed. Use `debug hwpmc show -instance` for details.

[-status-message <text>] - Current Status Message (privilege: advanced)

This parameter displays extended status messages associated with each profile.

[-counter <text>] - HWPMC Event Specification (privilege: advanced)

This parameter specifies one or more performance counters to be displayed.

[-process <text>] - Profile Specific Process (privilege: advanced)

This parameter filters the output to show profiles associated with a specific process or process identifier.

Examples

The following example displays information about the profiles on a node:

```
cluster1::> debug hwpmc show -node node1
```

Node	Profile Name	Status
node1	2023_06_06-08_53_44_UTC	collecting
node1	2023_06_06-08_54_53_UTC	complete

debug nvme commands

debug nvme upgrade bypass-lif-state-check

Bypass the pre-takeover LIF state checks during ANDU

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Before a node is taken over during an automated upgrade, there is a check to ensure each node with a mapped NVMe namespace has an online NVMe LIF. Without LIFs on each of these nodes, an outage is likely as nodes are restarted during the upgrade. If you do not care about an outage, or you know the current configuration will not cause one, use this command to bypass this check when the upgrade is resumed. This bypass is not persistent, and applies only to the node where the command is issued.

Examples

The following example disables the NVMe LIF checks during upgrade.

```
cluster1:*> debug nvme upgrade bypass-lif-state-check
```

event commands

event catalog commands

event catalog show

Display event definitions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event catalog show` command displays information about events in the catalog. By default, this command displays the following information:

- Message name of the event
- Severity of the event
- SNMP trap type of the event

To display detailed information about a specific event, run the command with the `-message-name` parameter, and specify the name of the event. The detailed view adds the following information:

- Full description of the event
- Action to be taken to address the event
- Event's deprecation status

You can specify additional parameters to limit output to the information that matches those parameters. For example, to display information only about events with an event name that begins with *raid*, enter the command with the `-message-name raid*` parameter. The parameter value can either be a specific text string or a wildcard pattern.

Alternatively, an event filter can also be specified to limit the output events.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-message-name <Message Name>] - Message Name

Selects the events that match this parameter value.

[-filter-name <text>] - Filter Name

Selects the events that match this parameter value. The parameter value indicates an existing filter name that, when applied permits the inclusion of the listed events.

[`-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}`] - Severity

Selects the events that match this parameter value.

[`-description <text>`] - Description

Selects the events that match this parameter value.

[`-action <text>`] - Corrective Action

Selects the events that match this parameter value.

[`-snmp-trap-type {Standard|Built-in|Severity-based}`] - SNMP Trap Type

Selects the events that match this parameter value. The parameter value describes the type of SNMP trap associated with the event. The value can be one of the following: *Standard* trap type events are those defined in the RFCs. *Built-in* trap types are those that are NetApp Enterprise traps specific to events. The remaining events are considered to have *Severity-based* SNMP trap types.

[`-deprecated {true|false}`] - Is Deprecated

Selects the events that match this parameter value. The parameter value indicates whether the event is deprecated or not.

Deprecated events may be removed in a future release of ONTAP.

Examples

The following example displays the event catalog:

```
cluster1::> event filter show -filter-name filter1
Filter      Rule Rule
Name       Posn Type   Message Name      Severity
Parameters
-----
filter1
          1   include zapi.*          *
          2   exclude *              *
2 entries were displayed.

cluster1::> event catalog show -filter-name filter1
Message                      Severity      SNMP Trap Type
-----

event config commands

event config force-sync

Synchronize a node's EMS configuration with the cluster wide EMS configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event config force-sync` command forces a node's EMS configuration to be synchronized with the cluster wide EMS configuration. The configuration is automatically synchronized among all nodes in the cluster, but in rare cases a node may not be updated. This command simplifies the recovery from this issue.

The following example shows where this command is useful: An email destination is configured for all CRITICAL level event occurrences. When the event is generated, all nodes generate an email except one. This command forces that node to refresh a stale configuration.

Parameters

[`-node {<nodename>|local}`}] - Node (privilege: advanced)

The node parameter specifies which controller will be synchronized.

event config modify

Modify log configuration parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `event config modify` command to configure event notification and logging for the cluster.

Parameters

`[-mail-from <mail address>]` - Mail From

Use this parameter to configure the email address from which email notifications will be sent. You can configure the cluster to send email notifications when specific events occur. Use the `event route add-destinations` and `event destination create` commands to configure email destinations for events.

`[-mail-server <text>]` - Mail Server (SMTP)

Use this parameter to configure the name or IP address of the SMTP server used by the cluster when sending email notification of events. If authentication is required to the mail-server, specify the user name for the mail-server using the `-mail-server-user` parameter. Use the [event config set-mail-server-password](#) command to set the password used for this user name.

You can optionally specify a port value for the mail server. The port specification for a mail host consists of a colon (":") and a decimal value between 1 and 65335, and follows the mailhost name (for example, *mymailhost.example.com:5678*).

`[-mail-server-user <text>]` - Mail Server User Name

If authentication is required to the mail-server, use this parameter to specify the user name for the mail-server specified by the `-mail-server` parameter. Use the [event config set-mail-server-password](#) command to set the password used for this user name.

`[-suppression {on|off}]` - Event Throttling/Suppression (privilege: advanced)

Use this parameter to configure whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle duplicate events.

`[-console {on|off}]` - Console Logging (privilege: advanced)

Use this parameter to configure whether events are displayed on the console port ("on") or not displayed("off").

`[-proxy-url <text>]` - HTTP/HTTPS Proxy URL

If your organization uses a proxy, use this parameter to specify an HTTP or HTTPS proxy for REST API type EMS notification destinations. The URL must start with an `http://` or `https://` prefix. If using an HTTPS proxy, you also need to install the correct Root CA certificates in ONTAP. To specify a URL that contains a question mark, press ESC followed by the "?". Setting this field to an empty string or '-' will clear all proxy settings including the URL, user and password.

`[-proxy-user <text>]` - User Name for HTTP/HTTPS Proxy

If authentication is required, use this parameter to specify the user name for the HTTP or HTTPS proxy server specified by the `-proxy-url` parameter. Use the [event config set-proxy-password](#) command to set the password used for this user name.

`[-is-pubsub-enabled {true|false}]` - Is Publish/Subscribe Messaging Enabled?

Use this parameter to configure whether or not events are published to the Publish/Subscribe messaging broker.

Examples

The following command sets the "Mail From" address for event notifications to "admin@example.com" and the "Mail Server" to "mail.example.com":

```
cluster1::> event config modify -mailfrom admin@example.com -mailserver  
mail.example.com
```

The following command configures a proxy that requires authentication:

```
cluster1::> event config modify -proxy-url http://proxy.example.com:8080  
-proxy-user-name admin  
cluster1::> event config set-proxy-password
```

```
Enter the password:  
Confirm the password:
```

The following example turns on event suppression and console logging:

```
cluster1::> event config modify -suppression on -console on
```

- [event config set-proxy-password](#)

event config set-mail-server-password

Modify password for mail-server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `event config set-mail-server-password` command to set the password for authenticated access to a mail-server being used for EMS notifications. This password is used with the user name you specify using the [event config modify -mail-server-user](#) command to send EMS messages to email destinations through the mail-server you specify using the [event config modify -mail-server](#) command. If you enter the command without parameters, the command prompts you for a password and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed. If you want to clear the mail-server password, use the [event config modify -mail-server-user](#) command and set the user-name to an empty string or '-'.

Parameters

Examples

The following example shows successful execution of this command:

```
cluster1::> event config set-mail-server-password

Enter the password:
Confirm the password:
```

event config set-proxy-password

Modify password for proxy server

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `event config set-proxy-password` command to set the password for authenticated access to an HTTP or HTTPS proxy being used for EMS notifications. This password is used with the user name you specify using the [event config modify -proxy-user](#) command to send EMS messages to REST API destinations through the proxy you specify using the [event config modify -proxy-url](#) command. IF you enter the command without parameters, the command prompts you for a password and for a confirmation of that password. Enter the same password at both prompts. The password is not displayed. If you want to clear the proxy password, use the [event config modify -proxy-url](#) command and set the URL to an empty string or '- '.

Parameters

Examples

The following example shows successful execution of this command:

```
cluster1::> event config set-proxy-password

Enter the password:
Confirm the password:
```

event config show

Display log configuration parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event config show` command displays information about the configuration of event notification and event logging for the cluster.

"Mail From" is the email address that the event notification system uses as the "From" address for email notifications.

"Mail Server" is the name or IP address of the SMTP server that the event notification system uses to send email notification of events.

"Mail Server User Name" is the user name for the mail-server if authentication is required.

"Proxy URL" is the HTTP or HTTPS proxy server URL used by rest-api type EMS notification destinations if your organization uses a proxy.

"Proxy User Name" is the user name for the HTTP or HTTPS proxy server if authentication is required.

"Is Publish/Subscribe Messaging Enabled?" indicates whether or not events are published to the Publish/Subscribe messaging broker.

"Suppression" indicates whether event suppression algorithms are enabled ("on") or disabled ("off"). The event processing system implements several algorithms to throttle events.

The suppression parameter can disable both autosuppression and duplicate suppression, but not timer suppression.

"Console" indicates whether events are displayed on the console port ("on") or not displayed ("off").

Examples

The following example displays the configuration of event notification for the cluster:

```
cluster1::> event config show
                        Mail From:  admin@example.com
                        Mail Server: mail.example.com
                        Proxy URL:   -
                        Proxy User Name: -
                        Publish/Subscribe Messaging Enabled: true
```

The following example displays the configuration of event notification with HTTP or HTTPS proxy:

```
cluster1::> event config show
                        Mail From:  admin@example.com
                        Mail Server: mail.example.com
                        Proxy URL:   http://proxy.example.com:3128
                        Proxy User Name: admin
                        Publish/Subscribe Messaging Enabled: true
```

event filter commands

event filter copy

Copy an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter copy` command copies an existing filter to a new filter. The new filter will be created with rules from the source filter. For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to copy.

-new-filter-name <text> - New Event Filter Name

Use this mandatory parameter to specify the name of the new event filter to create and copy the rules.

Examples

The following example copies an existing event filter named `emer-wafl-events` to a new filter named `filter1`:

```
cluster1:> event filter show
Filter      Rule Rule      SNMP Trap
Name        Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
      1      include  *                EMERGENCY, ALERT
                                     *          **
      2      include  *                *                Standard, Built-
in
                                     *          **
      3      exclude  *                *                *          **
emer-wafl-events
      1      include  wafl.*          EMERGENCY        *          **
      2      exclude  *                *                *          **
important-events
      1      include  *                EMERGENCY, ALERT
                                     *          **
      2      include  callhome.*      ERROR            *          **
      3      exclude  *                *                *          **
no-info-debug-events
      1      include  *                EMERGENCY, ALERT, ERROR, NOTICE
```

```

2      exclude  *          *          *          *==*
10 entries were displayed.

cluster1::> event filter copy -filter-name emer-wafl-events -new-filter

- [event filter create](#)

event filter create

Create a new event filter.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter create` command creates a new event filter.

- An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:
- name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical "OR" operation. So, if ``-snmp-trap-type` ``_Standard, Built-in_``` is specified, then the event must match ```_Standard_``` OR ```_Built-in_```. The wildcard matches all values for the field.

* Type - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see the `event filter rule` command.

There are three system-defined event filters provided for your use:

- default-trap-events - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- important-events - This filter matches all ALERT and EMERGENCY events.
- no-info-debug-events - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to create. An event filter name is 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, `"`, and `'`. The name must start and end with: A-Z, a-z, `"`, or 0-9.

[-access-control-role <text>] - Access Control Role (privilege: advanced)

Use this parameter to specify the access control role of the event filter. Access control role indicates the user role which created the filter and is used to control access to the filter based on RBAC rules.

This is an optional field. If not specified, the currently logged in user role is used. If created by the 'admin' user, the field is left unset.

Examples

The following example creates an event filter named filter1:

```
cluster1::> event filter create -filter-name filter1

cluster1::> event filter show
Filter      Rule Rule
Name       Posn Type   Message Name      Severity          SNMP Trap
Parameters
-----
default-trap-events
          1    include  *                EMERGENCY, ALERT
                                     *                *==*
          2    include  *                *                Standard, Built-
in                                     *                *==*
          3    exclude *                *                *                *==*
filter1
          1    exclude *                *                *                *==*
important-events
          1    include  *                EMERGENCY, ALERT
                                     *                *==*
          2    include  callhome.*      ERROR            *                *==*
          3    exclude  *                *                *                *==*
no-info-debug-events
          1    include  *                EMERGENCY, ALERT, ERROR, NOTICE
                                     *                *==*
          2    exclude  *                *                *                *==*
9 entries were displayed.
```

event filter delete

Delete existing event filters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter delete` command deletes an existing event filter, along with all its rules.

The system-defined event filters cannot be deleted.

For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to delete.

Examples

The following example deletes an event filter named filter1:

```
cluster1::> event filter show
Filter      Rule Rule      Message Name      Severity      SNMP Trap
Name       Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
      1      include  *      EMERGENCY, ALERT
      *      **
      2      include  *      *      Standard, Built-
in      **
      3      exclude *      *      *      **
filter1
      1      include  wafl.*  EMERGENCY      *      **
      2      exclude  *      *      *      **
important-events
      1      include  *      EMERGENCY, ALERT
      *      **
      2      include  callhome.*  ERROR      *      **
      3      exclude  *      *      *      **
no-info-debug-events
      1      include  *      EMERGENCY, ALERT, ERROR, NOTICE
      *      **
      2      exclude  *      *      *      **
10 entries were displayed.

cluster1::> event filter delete -filter-name filter1

cluster1::> event filter show
Filter      Rule Rule      Message Name      Severity      SNMP Trap
Name       Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
      1      include  *      EMERGENCY, ALERT
      *      **
```

```

      2      include      *              *              Standard, Built-
in
                                         *=*
      3      exclude      *              *              *              *=*
important-events
      1      include      *              EMERGENCY, ALERT
                                         *              *=*
      2      include      callhome.*      ERROR          *              *=*
      3      exclude      *              *              *              *=*
no-info-debug-events
      1      include      *              EMERGENCY, ALERT, ERROR, NOTICE

- [event filter create](#)

event filter prepare-for-revert

Deletes unsupported filter or updates unsupported parameter-criteria (parameter-criteria values other than =)

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event filter prepare-for-revert` command can be used to remove event filters or update event filter rules that are not supported when the cluster reverts to the previous release. Event filters with rules having a `parameter-criteria` value other than `*=*` are not supported.

Parameters

{ -delete-unsupported-filters {true|false} - Clear Unsupported Filters (privilege: advanced)

Use this parameter to delete the event filters that are not supported in the previous release.

| -update-unsupported-filter-param-criteria {true|false} - Update Unsupported Filter Parameter Criteria (privilege: advanced) }

Use this parameter to update the event filter rules that are not supported in the previous release to `*=*`.

Examples

The following shows examples of "event filter prepare-for-revert":

```

cluster1::> event filter show
Filter      Rule Rule                      SNMP Trap
Name        Posn Type      Message Name  Severity  Type      Parameters

```

```

event filter rename

Rename an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rename` command is used to rename an existing event filter.

There are system-defined event filters provided for your use. The system-defined event filters cannot be modified or deleted.

For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to rename.

-new-filter-name <text> - New Event Filter Name

Use this mandatory parameter to specify the new name the event filter should be renamed to.

Examples

The following example renames an existing filter named `filter1` as `emer-wafl-events`:

```
cluster1::> event filter show
Filter      Rule Rule
Name        Posn Type   Message Name      Severity          SNMP Trap
Parameters
-----
default-trap-events
      1    include  *                EMERGENCY, ALERT
                                *          *=*
      2    include  *                *                Standard, Built-
in                                *          *=*
      3    exclude  *                *                *          *=*
filter1
      1    include  wafl.*          EMERGENCY          *          *=*
      2    exclude  *                *                *          *=*
important-events
      1    include  *                EMERGENCY, ALERT
                                *          *=*
      2    include  callhome.*      ERROR              *          *=*
      3    exclude  *                *                *          *=*
no-info-debug-events
```

```

1      include  *                EMERGENCY, ALERT, ERROR, NOTICE
                                     *                *==*

2      exclude  *                *                *                *==*

10 entries were displayed.

event filter show-summary

Display event filter summary

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event filter show-summary` command displays a summary of all the event filters. For more details,

use the [event filter show](#) command.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

`[-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-filter-name <text>] - Filter Name (privilege: advanced)`

Selects the event filters that match this parameter value.

`[-rule-count <integer>] - Number of Rules (privilege: advanced)`

Selects the event filters that match this parameter value.

`[-system-defined {true|false}] - System-Defined Filter (privilege: advanced)`

Selects the event filters that match this parameter value. System-defined filters are defined by the system and cannot be modified or deleted.

`[-access-control-role <text>] - Access Control Role (privilege: advanced)`

Selects the event filters that match this parameter value. The access control role indicates the user role that created the filter and is used to control access to the filter based on RBAC rules. For filters created by 'admin', the access control role is empty (indicated by '-').

Examples

The following example displays the event filter summary:

```
cluster-1::*> event filter show-summary
Filter Name          Rule Count  System-Defined Access Control Role
-----
default-trap-events      4          true          -
important-events        3          true          -
no-info-debug-events     2          true          -
test_filter            1          false         test_role
4 entries were displayed.
```

- [event filter show](#)

event filter show

Display the list of existing event filters.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter show` command displays all the event filters which are configured. An event filter is used to select the events of interest and is made up of one or more rules, each of which contains the following three fields:

*

- name - event (message) name.
- severity - event severity.
- snmp-trap-type - event SNMP trap type.

These fields are evaluated for a match using a logical "AND" operation: name AND severity AND SNMP trap type. Within a field, the specified values are evaluated with an implicit logical "OR" operation. So, if ``-snmp-trap-type` ``_Standard, Built-in_``` is specified, then the event must match ```_Standard_``` OR ```_Built-in_```. The wildcard matches all values for the field.

* Type - include or exclude. When an event matches an include rule, it will be included into the filter, whereas it will be excluded from the filter if it matches an exclude rule.

Rules are checked in the order they are listed for a filter, until a match is found. There is an implicit rule at the end that matches every event to be excluded. For more information, see `event filter rule` command.

There are three system-defined event filters provided for your use:

- default-trap-events - This filter matches all ALERT and EMERGENCY events. It also matches all Standard, Built-in SNMP trap type events.
- important-events - This filter matches all ALERT and EMERGENCY events.
- no-info-debug-events - This filter matches all non-INFO and non-DEBUG messages (EMERGENCY, ALERT, ERROR and NOTICE).

The system-defined event filters cannot be modified or deleted.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-filter-name` <text>] - Filter Name

Selects the event filters that match this parameter value.

[`-position` <integer>] - Rule Position

Selects the event filters that match this parameter value.

[`-type` {`include`|`exclude`}] - Rule Type

Selects the event filters that match this parameter value. The rule types are as follows:

- `include` - Events matching this rule are included in the specified filter.
- `exclude` - Events matching this rule are excluded in the specified filter.

[`-message-name` <text>] - Message Name

Selects the event filters that match this parameter value.

[`-severity` <text>, ...] - Severity

Selects the events that match this parameter value. Severity levels:

- `EMERGENCY` - Disruption.
- `ALERT` - Single point of failure.
- `ERROR` - Degradation.
- `NOTICE` - Information.
- `INFORMATIONAL` - Information.
- `DEBUG` - Debug information.
- `*` - Includes all severities.

[`-snmp-trap-type` <text>, ...] - SNMP Trap Type

Selects the event filters that match this parameter value. The SNMP trap types are as follows:

- `Standard` - Traps defined in RFCs.
- `Built-in` - Enterprise traps specific to events.
- `Severity-based` - Traps specific to events that do not belong to the above two types.
- `*` - Includes all SNMP trap types.

[`-parameter-criteria` [`key`]=<value>, ...] - Parameter Criteria

Selects the event filters that match this parameter-criteria value.

[`-system-defined` {`true`|`false`}] - System-Defined Filter

Selects the event filters that match this parameter value.

[`-access-control-role` <text>] - Access Control Role (privilege: advanced)

Selects the event filters that match this parameter value.

Examples

The following example displays the event filters:

```

cluster1::> event filter show
Filter      Rule Rule      SNMP Trap
Name       Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
      1      include  *              EMERGENCY, ALERT
                                *              **
      2      include  callhome.*      ERROR          *              **
      3      include  *              *              Standard, Built-
in
                                *              **
      4      exclude  *              *              *              **
important-events
      1      include  *              EMERGENCY, ALERT
                                *              **
      2      include  callhome.*      ERROR          *              **
      3      exclude  *              *              *              **
no-info-debug-events
      1      include  *              EMERGENCY, ALERT, ERROR, NOTICE
                                *              **
      2      exclude  *              *              *              **
9 entries were displayed.

```

The following example displays the event filters queried on the SNMP trap type value "Standard":

```

cluster1::> event filter show -snmp-trap-type Standard
Filter      Rule Rule      SNMP Trap
Name       Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
      3      include  *              *              Standard, Built-
in
                                *              **

```

The following example displays the event filters with one or more rules that have no condition on the SNMP trap type. Note that the wildcard character has to be specified in double-quotes. Without double-quotes, output would be the same as not querying on the field.

```

cluster1::> event filter show -snmp-trap-type "*"
Filter      Rule Rule
Name       Posn Type   Message Name   Severity      SNMP Trap
Parameters
-----
default-trap-events
      1    include  *              EMERGENCY, ALERT
                                *              *==*
      2    include  callhome.*    ERROR         *              *==*
      4    exclude  *              *              *              *==*
important-events
      1    include  *              EMERGENCY, ALERT
                                *              *==*
      2    include  callhome.*    ERROR         *              *==*
      3    exclude  *              *              *              *==*
no-info-debug-events
      1    include  *              EMERGENCY, ALERT, ERROR, NOTICE
                                *              *==*
      2    exclude  *              *              *              *==*
8 entries were displayed.

```

event filter test

Test an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter test` command is used to test an event filter. When specified with a message name, the command displays whether the message name is included or excluded from the filter. When specified without a message name, the command displays the number of events from the catalog that match the filter. For more information, see the [event filter create](#) command.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to test.

[-message-name <Message Name>] - Message Name

Use this optional parameter to specify the message name of the event to test against the filter.

Examples

The following example tests an event filter named `err-wafl-no-scan-but-clone`:

```
cluster1::> event filter show
```

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
Parameters					

default-trap-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	*	*	Standard, Built-in
					**
	3	exclude	*	*	*
					**
err-wafl-no-scan-but-clone					
	1	include	wafl.scan.clone.*	*	*
					**
	2	exclude	wafl.scan.*	*	*
					**
	3	include	wafl.*	EMERGENCY, ALERT, ERROR	*
					**
	4	exclude	*	*	*
					**
important-events					
	1	include	*	EMERGENCY, ALERT	*
					**
	2	include	callhome.*	ERROR	*
					**
	3	exclude	*	*	*
					**
no-info-debug-events					
	1	include	*	EMERGENCY, ALERT, ERROR, NOTICE	*
					**

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
Parameters					

no-info-debug-events					
	2	exclude	*	*	*
					**

12 entries were displayed.

```
cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone
271 events will be included in the given filter.
```

```
cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone
-message-name wafl.scan.clone.split.cantLock
The message-name "wafl.scan.clone.split.cantLock" is included in the given
filter.
```

```
cluster1::> event filter test -filter-name err-wafl-no-scan-but-clone
-message-name wafl.scan.layout.cantWrite
The message-name "wafl.scan.layout.cantWrite" is excluded from the given
filter.
```

event filter update-access-control-role

Update access-control-role of an event filter

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event filter update-access-control-role` command is used to update the 'access-control-role' field of an existing event filter.

Parameters

-filter-name <text> - Filter Name (privilege: advanced)

Specify the event filter name with this mandatory parameter.

-new-access-control-role <text> - New Access Control Role (privilege: advanced)

Specify the new access control role with this mandatory parameter.

Examples

This example shows how to update the access control role of an event filter named filter1:

```

cluster1::*> event filter show-summary
Filter Name          Rule Count  System-Defined Access Control Role
-----
default-trap-events
                        4             true             -
filter1              2             false            -
important-events     3             true             -
no-info-debug-events
                        2             true             -
4 entries were displayed.

cluster1::*> event filter update-access-control-role -filter-name filter1
-new-access-control-role new_role

cluster1::*> event filter show-summary
Filter Name          Rule Count  System-Defined Access Control Role
-----
default-trap-events
                        4             true             -
filter1              2             false            new_role
important-events     3             true             -
no-info-debug-events
                        2             true             -
4 entries were displayed.

```

event filter rule add

Add a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rule add` command adds a new rule to an existing event filter. See [event filter create](#) for more information on event filters and how to create a new event filter.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter to add the rule. Rules cannot be added to system-defined event filters.

[-position <integer>] - Rule Position

Use this optional parameter to specify the position of the rule in the event filter. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule. Rules are checked in the order they are listed for a filter, until a match is found.

-type {include|exclude} - Rule Type

Use this mandatory parameter to specify the type of the rule which determines whether to include or exclude the events that match this rule.

[-message-name <text>] - Message Name

Use this parameter to specify the message name of the event to include or exclude from the filter.

[-severity <text>, ...] - Severity

Use this parameter to specify the list of severity values to match against the events. Enter multiple severities separated by a comma. To enter all severities, the wild card (*) can be used. The wild card cannot be specified with other severities. The default value is *.

[-snmp-trap-type <text>, ...] - SNMP Trap Type

Use this parameter to specify the list of the SNMP trap type values to match against the events. Enter multiple SNMP trap types separated by comma. To enter all SNMP trap types, the wild card (*) can be used. The wild card cannot be specified with other SNMP trap types. The default value is *.

[-parameter-criteria [key>=<value>], ...] - Parameter Criteria

Use this parameter to match against event parameters. Each parameter consists of a name and a value. When multiple parameter criteria are provided in a rule, they all need to match for the rule to be considered matched. A pattern can include one or more wildcard '*' characters.

Examples

The following example adds a rule to an existing event filter "emer-and-wafl": All events with severity EMERGENCY and message name starting with "wafl." **are included in the filter. Not specifying the SNMP trap type implies a default value of ""**.

```

cluster1::> event filter rule add -filter-name emer-and-wafl -type include
-message-name wafl.* -severity EMERGENCY
cluster1::> event filter show
Filter          Rule Rule                               SNMP Trap
Name           Posn Type      Message Name      Severity          Type
Parameters
-----
default-trap-events
      1      include  *                EMERGENCY, ALERT
                                     *                *==*
      2      include  *                *                Standard, Built-
in                                     *==*
      3      exclude *                *                *                *==*
emer-and-wafl
      1      include  wafl.*          EMERGENCY          *                *==*
      2      exclude  *                *                *                *==*
important-events
      1      include  *                EMERGENCY, ALERT
                                     *                *==*
      2      include  callhome.*      ERROR              *                *==*
      3      exclude  *                *                *                *==*
no-info-debug-events
      1      include  *                EMERGENCY, ALERT, ERROR, NOTICE
                                     *                *==*
      2      exclude  *                *                *                *==*
10 entries were displayed.

```

The following example adds a rule to the event filter "emer-and-wafl" at position 1: All events with severity ALERT and message name starting with "wafl.scan.*" are included in the filter.

```

cluster1::> event filter rule add -filter-name emer-and-wafl -type include
-message-name wafl.scan.* -position 1 -severity ALERT

cluster1::> event filter show
Filter      Rule Rule      SNMP Trap
Name       Posn Type      Message Name      Severity      Type
Parameters
-----
default-trap-events
          1      include  *                EMERGENCY, ALERT
                                     *          *==*
          2      include  *                *                Standard, Built-
in                                     *          *==*
          3      exclude  *                *                *          *==*
emer-and-wafl
          1      include  wafl.scan.*      ALERT           *          *==*
          2      include  wafl.*          EMERGENCY       *          *==*
          3      exclude  *                *                *          *==*
important-events
          1      include  *                EMERGENCY, ALERT
                                     *          *==*
          2      include  callhome.*      ERROR           *          *==*
          3      exclude  *                *                *          *==*
no-info-debug-events
          1      include  *                EMERGENCY, ALERT, ERROR, NOTICE
                                     *          *==*
          2      exclude  *                *                *          *==*
11 entries were displayed.

```

The following example adds a rule to the event filter "emer-and-wafl" to include all "Standard" SNMP trap type events:

```

cluster1::> event filter rule add -filter-name emer-and-wafl -type include
-snmpp-trap-type Standard

cluster1::> event filter show
Filter          Rule Rule                               SNMP Trap
Name           Posn Type      Message Name      Severity          Type
Parameters

      1      include  *                EMERGENCY, ALERT
                                     *          **
      2      include  *                *                Standard, Built-
in                                     *          **
      3      exclude  *                *                *          **
emer-and-wafl
      1      include  wafl.scan.*      ALERT            *          **
      2      include  wafl.*          EMERGENCY        *          **
      3      include  *                *                Standard    **
      4      exclude  *                *                *          **
important-events
      1      include  *                EMERGENCY, ALERT
                                     *          **
      2      include  callhome.*      ERROR            *          **
      3      exclude  *                *                *          **
no-info-debug-events
      1      include  *                EMERGENCY, ALERT, ERROR, NOTICE
                                     *          **
      2      exclude  *                *                *          **
12 entries were displayed.

```

The following example adds a rule to the event filter "emer-and-wafl" to include all "wafl" events whose parameters have a parameter named "type" and its value matches "volume":

```
cluster1::> event filter rule add -filter-name emer-and-wafl -type include
-message-name wafl.* -position 1 -parameter-criteria type=volume

cluster1::> event filter show -filter-name emer-and-wafl
Filter      Rule Rule                               SNMP Trap
Name        Posn Type      Message Name      Severity          Type
Parameters
-----
-----
emer-and-wafl
          1    include  wafl.*              *              *
type=volume
          2    include  wafl.scan.*        ALERT          *              **
          3    include  wafl.*              EMERGENCY      *              **
          4    include  *                  *              Standard    **
          5    exclude  *                  *              *              **
5 entries were displayed.
```

event filter rule delete

Delete a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rule delete` command deletes a rule from an event filter. The position of all the rules following the deleted rule is updated to maintain a contiguous sequence. Use [event filter show](#) command to view the filters and the rules associated with them.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter from which you want to delete the rule. Rules cannot be deleted from system-defined filters.

-position <integer> - Rule Position

Use this mandatory parameter to specify the position of the rule to delete from the filter. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

Examples

The following example deletes a rule at position 2 from an existing event filter "emer-and-wafl":

```
cluster1::> event filter show
```

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
default-trap-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	*	*	Standard, Built- * **
	3	exclude	*	*	* **
emer-and-wafl					
	1	include	wafl.scan.*	ALERT	* **
	2	include	wafl.*	EMERGENCY	* **
	3	include	*	*	Standard **
	4	exclude	*	*	* **
important-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	callhome.*	ERROR	* **
	3	exclude	*	*	* **
no-info-debug-events					
	1	include	*	EMERGENCY, ALERT, ERROR, NOTICE	* **
	2	exclude	*	*	* **

12 entries were displayed.

```
cluster1::> event filter rule delete -filter-name emer-and-wafl -position 2
```

```
cluster1::> event filter show
```

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
default-trap-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	*	*	Standard, Built- * **
	3	exclude	*	*	* **
emer-and-wafl					
	1	include	wafl.scan.*	ALERT	* **

```

        2      include  *              *              Standard  *=*
        3      exclude *              *              *          *=*
important-events
        1      include  *              EMERGENCY, ALERT
                                   *              *=*
        2      include  callhome.*     ERROR          *              *=*
        3      exclude *              *              *          *=*
no-info-debug-events
        1      include  *              EMERGENCY, ALERT, ERROR, NOTICE
                                   *              *=*
        2      exclude *              *              *          *=*
11 entries were displayed.

- [event filter show](#)

event filter rule reorder

Modify the index of a rule for an event filter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event filter rule reorder` command moves a rule to a new position in an existing event filter. Use [event filter show](#) command to display all the event filters and the rules associated with them.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter from which you want to change the position of the rule. Rules from system-defined event filters cannot be modified.

-position <integer> - Rule Positon

Use this mandatory parameter to specify the position of the rule you want to change. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

-to-position <integer> - New Rule Position

Use this mandatory parameter to specify the new position to move the rule. It should be in the range (1..n-1), where 'n' is the position of the last rule, which is an implicit rule.

Examples

The following example changes the position of a rule from 1 to 2 from an existing event filter "emer-and-waf1":

```

cluster1::> event filter show
Filter      Rule Rule                      SNMP Trap
Name       Posn Type      Message Name      Severity      Type

```

Parameters

```

-----
default-trap-events
      1      include  *                EMERGENCY, ALERT
                                           *                **
      2      include  *                *                Standard, Built-
in
                                           **
      3      exclude *                *                *                **
emer-and-wafl
      1      include  wafl.scan.*      ALERT            *                **
      2      include  *                *                Standard        **

event log commands

event log show

Display latest log events

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event log show` command displays the contents of the event log, which lists significant occurrences within the cluster. Use the [event catalog show](#) command to display information about events that can occur.

By default, the command displays EMERGENCY, ALERT and ERROR severity level events with the following information, with the most recent events listed first:

- The time at which the event occurred
- The node on which the event occurred
- The severity of the event
- The event's message

To display detailed information about events, use one or more of the optional parameters that affect how the command output is displayed and the amount of detail that is included. For example, to display all detailed event information, use the `-detail` parameter.

To display NOTICE, INFORMATIONAL or DEBUG severity level events, use the `-severity` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| **[-detail]**

Displays additional event information such the sequence number of the event.

| **[-detailtime]**

Displays detailed event information in reverse chronological order.

| **[-instance] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Displays a list of events for the node you specify. Use this parameter with the `-seqnum` parameter to display detailed information.

[-seqnum <Sequence Number>] - Sequence#

Selects the events that match this parameter value. Use with the `-node` parameter to display detailed information.

[-time <MM/DD/YYYY HH:MM:SS>] - Time

Selects the events that match this parameter value. Use the format: MM/DD/YYYY HH:MM:SS [+ HH:MM]. You can specify a time range by using the `".."` operator between two time statements.

```
show -time "08/13/2010 05:55:00".. "08/13/2010 06:10:00"
```

Comparative time values are relative to "now". For example, to display only events that occurred within the last minute:

```
show -time >1m
```

+

NOTE: The month and date fields of this parameter are not zero-padded. These fields can be single digits: for example, "7/1/2019 05:55:00".

+

[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity

Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

To display all events, including ones with severity levels of NOTICE, INFORMATIONAL and DEBUG, specify severity as follows:

```
show -severity <=DEBUG
```

[`-ems-severity`

{`NODE_FAULT`|`SVC_FAULT`|`NODE_ERROR`|`SVC_ERROR`|`WARNING`|`NOTICE`|`INFO`|`DEBUG`|`VAR`}] - EMS Severity (privilege: advanced)

Selects the events that match this parameter value. Severity levels:

- `NODE_FAULT` - Data corruption has been detected or the node is unable to provide client service
- `SVC_FAULT` - A temporary loss of service, typically a transient software fault, has been detected
- `NODE_ERROR` - A hardware error that is not immediately fatal has been detected
- `SVC_ERROR` - A software error that is not immediately fatal has been detected
- `WARNING` - A high-priority message that does not indicate a fault
- `NOTICE` - A normal-priority message that does not indicate a fault
- `INFO` - A low-priority message that does not indicate a fault
- `DEBUG` - A debugging message
- `VAR` - A message with variable severity, selected at runtime.

[`-source <text>`] - Source

Selects the events that match this parameter value (typically a software module).

[`-message-name <Message Name>`] - Message Name

Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.

[`-event <text>`] - Event

Selects the events that match this parameter value. The "event" field contains the full text of the event, including any parameters. For example, a `waf.vol.offline` event will contain the name of the volume taken offline.

[`-kernel-generation-num <integer>`] - Kernel Generation Number (privilege: advanced)

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel generation numbers.

[`-kernel-sequence-num <integer>`] - Kernel Sequence Number (privilege: advanced)

Selects the events that match this parameter value. Only events that emanate from the kernel have kernel sequence numbers.

[`-action <text>`] - Corrective Action

Selects the events that match this parameter value. The "action" field describes what steps, if any, you must take to remedy the situation.

[`-description <text>`] - Description

Selects the events that match this parameter value. The "description" field describes why the event was encountered and what it means.

[`-filter-name <Filter Name>`] - Filter Name

Selects the events that match this parameter value. Only events that were included by existing filters that match this value are displayed.

Examples

The following example displays the event log:

```
cluster1::> event log show
Time                Node                Severity      Event
-----
-----
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link
up event was received on node node1, port e0a.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link
up event was received on node node1, port e0d.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link
up event was received on node node1, port e0c.
11/9/2015 13:54:19  node1                NOTICE      vifmgr.portup: A link
up event was received on node node1, port e0b.
...
```

This example demonstrates how to use a range with the `-time` parameter to display all events that occurred during an extended time period. It displays all events that occurred between 1:45pm and 1:50pm on November 9, 2010.

```
cluster1::> event log show -time "11/9/2015 13:45:00".."11/9/2015 13:50:0"
```

The `-time` parameter also accepts values that are relative to "now". The following example displays events that occurred more than one hour ago:

```
cluster1::event log> show -time <1h
Time                Node                Severity      Event
-----
-----
11/9/2015 13:02:03  node1                INFORMATIONAL
monitor.globalStatus.ok: The system's global status is normal.
11/9/2015 13:02:03  node2                INFORMATIONAL
monitor.globalStatus.ok: The system's global status is normal.
...
```

Severity levels sort in the order opposite to what you might expect. The following example displays all events that have a severity level of ERROR or more severe:

```
cluster1::> event log show -severity <ERROR
```

event notification commands

event notification create

Create an event notification

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification create` command is used to create a new notification of a set of events defined by an event filter to one or more notification destinations.

Parameters

-filter-name <text> - Filter Name

Use this mandatory parameter to specify the name of the event filter. Events that are included in the event filter are forwarded to the destinations specified in the destinations parameter.

The filter name passed to this command must be an existing filter. For more information, see the [event filter create](#) command.

-destinations <text>, ... - List of Event Notification Destinations

Use this mandatory parameter to specify the list of destinations to which the notification should be forwarded. Enter multiple destinations separated by a comma.

The destination passed to this command must be an existing destination. For more information, see the `event destination create` command.

[-access-control-role <text>] - Access Control Role (privilege: advanced)

Use this parameter to specify the access control role of the event notification. Access control role indicates the user role that created the notification and is used to control access to the notification based on RBAC rules.

This is an optional field. If not specified, the currently logged in user role is used. If created by the 'admin' user, the field is left unset.

Examples

The following example creates an event notification for filter name "filter1" to destinations "email_dest, snmp-traphost and syslog_dest":

```

cluster1::> event notification destination show

```

Name	Type	Hide Params	Destination
email_dest	email	false	test@example.com
snmp-traphost	snmp	true	10.27.12.1 (from "system snmp traphost")
syslog_dest	syslog	false	10.23.12.1

3 entries were displayed.

```

cluster1::> event filter show -filter-name filter1

```

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
filter1	1	exclude	callhome.bad.ram	*	*=*
	2	include	callhome.*	ALERT, ERROR	*=*
	3	exclude	*	*	*=*

3 entries were displayed.

```

cluster1::> event notification create -filter-name filter1 -destinations
email_dest,syslog_dest,snmp-traphost

cluster1::> event notification show

```

ID	Filter Name	Destinations
1	filter1	email_dest, syslog_dest, snmp-traphost

- [event filter create](#)

event notification delete

Delete event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification delete` command deletes an existing event notification.

Parameters

-ID <integer> - Event Notification ID

Use this parameter to specify the ID of the notification to be deleted.

Examples

The following example shows the deletion of event notification with ID 1:

```
cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1            email_dest, syslog_dest, snmp-traphost

cluster1::> event notification delete -ID 1

cluster1::> event notification show
This table is currently empty.
```

event notification modify

Modify event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification modify` command is used to modify an existing notification.

Parameters

-ID <integer> - Event Notification ID

Use this mandatory parameter to specify the ID of the notification to be modified.

[-filter-name <text>] - Event Filter Name

Use this parameter to specify the filter name to be modified.

[-destinations <text>,...] - List of Event Notification Destinations

Use this parameter to specify the destinations to be modified. Enter multiple destinations separated by a comma.

Provide the complete set of destinations to be modified. Individual destinations cannot be added or removed.

Examples

The following example shows the modification of the event notification with ID 1:

```

cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest, snmp-traphost

cluster1::> event notification modify -ID 1 -destinations email_dest,
syslog_dest

cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest

```

event notification show

Display event notifications

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification show` command is used to display the list of existing event notifications.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ID <integer>] - Event Notification ID

Use this parameter to display the detailed information about the notification ID you specify.

[-filter-name <text>] - Event Filter Name

Use this parameter to display event notifications that use the filter-name you specify.

[-destinations <text>,...] - List of Event Notification Destinations

Use this parameter to display event notifications that use the destinations you specify.

[-access-control-role <text>] - Access Control Role (privilege: advanced)

Use this parameter to display event notifications that use the specified access control role.

Examples

The following example displays the event notification:

```
cluster1::> event notification show
ID      Filter Name      Destinations
-----
1       filter1          email_dest, syslog_dest, snmp-traphost
```

event notification destination create

Create an event notification destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination create` command creates a new event notification destination of either email or syslog type.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost".

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of the notification destination that is to be created. An event notification destination name must be 2 to 64 characters long. Valid characters are the following ASCII characters: A-Z, a-z, 0-9, "_", and "-". The name must start and end with: A-Z, a-z, or 0-9.

{ -email <mail address> - Email Destination

Use this parameter to specify the email address event notifications are sent to. For events to properly generate email notifications, the event system must also be configured with an address and mail server from which the mail will be sent. See [event config modify](#) command for more information.

| -syslog <text> - Syslog Destination

Use this parameter to specify the syslog server host name or IP address syslog messages are sent to.

[-syslog-port <integer>] - Syslog Port

Use this parameter to specify the syslog server port value syslog messages are sent to. The default port used depends on the `syslog-transport` value. If the `syslog-transport` is set to `tcp-encrypted`, the `syslog-port` has the default value 6514. If the `syslog-transport` is set to `tcp-unencrypted`, the `syslog-port` has the default value 601. Otherwise, the default `syslog-port` is set to 514.

[-syslog-transport {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Syslog Transport

Use this parameter to specify the transport protocol that is used to send the syslog messages.

The `syslog-transport` can be one of the following values:

- `udp-unencrypted` - User Datagram Protocol with no security
- `tcp-unencrypted` - Transmission Control Protocol with no security

- *tcp-encrypted* - Transmission Control Protocol with Transport Layer Security (TLS)

The default protocol is *udp-unencrypted*. + If *tcp-encrypted* transport is specified, then ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for Event Management System (EMS), then ONTAP uses that protocol to determine the certificate's revocation status. Use the (privilege: advanced) [security config ocsp show -application ems](#) command to determine if the OCSP-based certificate revocation status check is enabled for EMS.

[*-syslog-message-format {legacy-netapp|rfc-5424}*] - Syslog Message Format

Use this parameter to specify the message format to be used for EMS syslog messages.

The *syslog-message-format* can be one of the following values:

- *legacy-netapp* - Variation of RFC-3164 Syslog format (format: <PRIVAL>TIMESTAMP [HOSTNAME:Event-name:Event-severity]: MSG)
- *rfc-5424* - Syslog format as per RFC-5424 (format: <PRIVAL>VERSION TIMESTAMP HOSTNAME Event-source - Event-name - MSG)

Refer to the respective RFCs for detailed information on the syslog message formats. + The default message format is *legacy-netapp*.

[*-syslog-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}*] - Syslog Timestamp Format Override

Use this parameter to override the default timestamp format (based on the *syslog-message-format* parameter) used for EMS syslog messages.

The *syslog-timestamp-format-override* can be one of the following values:

- *no-override* - Timestamp format based on the *syslog-message-format* parameter (*rfc-3164* if message format is *legacy-netapp*, *iso-8601-local-time* if message format is *rfc-5424*)
- *rfc-3164* - Timestamp format as per RFC-3164 (format: Mmm dd hh:mm:ss)
- *iso-8601-utc* - Timestamp format as per ISO-8601 in UTC (format: YYYY-MM-DDThh:mm:ssZ)
- *iso-8601-local-time* - Timestamp format as per ISO-8601 in local time (format: YYYY-MM-DDThh:mm:ss+/-hh:mm)

The default value is *no-override*. When this parameter is modified, its value persists even when *syslog-message-format* is updated. +

[*-syslog-hostname-format-override {no-override|fqdn|hostname-only}*] - Syslog Hostname Format Override

Use this parameter to override the default hostname format (based on the *syslog-message-format* parameter) used for EMS syslog messages.

The *syslog-hostname-format-override* can be one of the following values:

- *no-override* - Hostname format based on the *syslog-message-format* parameter (*fqdn* if message format is *rfc-5424*, *hostname-only* if message format is *legacy-netapp*)
- *fqdn* - Fully Qualified Domain Name (e.g., myhost.example.com)

- *hostname-only* - Hostname only, without the domain name (e.g., myhost)

The default value is *no-override*. When this parameter is modified, its value persists even when *syslog-message-format* is updated. +

| **-rest-api-url <text>** - REST API Server URL

Use this parameter to specify the REST API server URL to which event notifications are sent. Enter the full URL, which must start either with an `http://` or `https://` prefix. To specify a URL that contains a question mark, press ESC followed by the `"?"`. + If a `https://` URL is specified, then ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for Event Management System (EMS), then ONTAP uses that protocol to determine the certificate's revocation status. Use the (privilege: advanced) [security config ocsp show -application ems](#) command to determine if the OCSP-based certificate revocation status check is enabled for EMS.

[**-certificate-authority <text>**] - Client Certificate Issuing CA

Use this parameter to specify the name of the certificate authority (CA) that signed the client certificate that will be sent in case mutual authentication with the REST API server is required. + There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the *certificate-serial* parameter, uniquely identifies which one. + Use the [security certificate show](#) command to see the list of certificates installed in the cluster.

[**-certificate-serial <text>**] - Client Certificate Serial Number }

Use this parameter to specify the serial number of the client certificate that will be sent in case mutual authentication with the REST API server is required.

[**-access-control-role <text>**] - Access Control Role (privilege: advanced)

Use this parameter to specify the access control role of the event notification destination. Access control role indicates the user role which created the destination and is used to control access to the destination based on RBAC rules.

This is an optional field. If not specified, the currently logged in user role is used. If created by the 'admin' user, the field is left unset.

Examples

The following example shows the creation of a new event notification destination of type email called "StorageAdminEmail":

```
cluster1::> event notification destination create -name StorageAdminEmail
-email StorageAdmin@example.com
```

```
cluster1::> event notification destination show
```

Name	Type	Destination
-----	-----	-----
StorageAdminEmail	email	StorageAdmin@example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

2 entries were displayed.

The following example shows the creation of a new event notification destination of type rest-api called "RestApi":

```
cluster1::> event notification destination create -name RestApi -rest-api
-url https://rest.example.com/rest
-certificate-authority cluster1-root-ca -certificate-serial 052213E60B7088

cluster1::> event notification destination show -name RestApi -instance
Destination Name: RestApi
      Type of Destination: rest-api
      Destination Values: https://rest.example.com/rest
      Client Certificate Issuing CA: cluster1-root-ca
Client Certificate Serial Number: 052213E60B7088
      Client Certificate Valid?: -
      Syslog Port: -
      Syslog Transport: -
      Syslog Message Format: -
Syslog Timestamp Format Override: -
      Syslog Hostname Format Override: -
      System-Defined Destination: false
```

event notification destination delete

Delete existing event destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination delete` command deletes an event notification destination.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost". To remove snmp-traphost addresses, use the `system snmp traphost` command.

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of an event destination to be removed.

Examples

The following shows the examples of deleting event notification destinations:

```
cluster1::> event notification destination show
Name              Type              Destination
-----
StorageAdminEmail
                  email              StorageAdmin@example.com
StorageAdminSyslog
                  syslog             example.com
snmp-traphost     snmp              10.30.40.10 (from "system snmp traphost")
3 entries were displayed.
cluster1::> event notification destination delete -name StorageAdminEmail

cluster1::> event notification destination show

Name              Type              Destination
-----
StorageAdminSyslog
                  syslog             example.com
snmp-traphost     snmp              10.30.40.10 (from "system snmp traphost")
2 entries were displayed.
cluster1::> event notification destination delete -name Storage*
cluster1::> event notification destination show
Name              Type              Destination
-----
snmp-traphost     snmp              10.30.40.10 (from "system snmp traphost")
1 entries were displayed.
```

event notification destination modify

Modify an event notification destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination modify` command modifies an event notification destination. More detailed information about parameters can be found in the man page for the [event notification destination create](#) command.

The following system-defined notification destination is configured for your use:

- `snmp-traphost` - This destination reflects the configuration in "system snmp traphost". To modify traphost addresses, use the `system snmp traphost` command.

Parameters

-name <text> - Destination Name

Use this mandatory parameter to specify the name of an event notification destination to be modified. The name of the destination must already exist.

{ [-email <mail address>] - Email Destination

Use this parameter to specify a new value of email address to replace the current address in the event notification destination. The parameter is specified only when the event notification destination type is already "email". It is not allowed to specify the parameter for a destination that already has another type of destination address.

| [-syslog <text>] - Syslog Destination

Use this parameter to specify a new syslog server host name or IP address to replace the current address of the event notification destination. The parameter is specified only when the event notification destination type is already "syslog". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[-syslog-port <integer>] - Syslog Port

Use this parameter to specify a new syslog server port value to replace the current port value of the event notification destination. The parameter is specified only when the event notification destination type is already "syslog". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[-syslog-transport {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Syslog Transport

Use this parameter to specify a new syslog transport to replace the current transport of the event notification destination. The parameter is specified only when the event notification destination type is already "syslog". It is not allowed to specify the parameter for a destination that already has another type of destination address.

[-syslog-message-format {legacy-netapp|rfc-5424}] - Syslog Message Format

Use this parameter to specify a new syslog message format to replace the current message format of the event notification destination.

[-syslog-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}] - Syslog Timestamp Format Override

Use this parameter to override the default syslog timestamp format (based on the `syslog-message-format` parameter) of the event notification destination.

[-syslog-hostname-format-override {no-override|fqdn|hostname-only}] - Syslog Hostname Format Override

Use this parameter to override the default syslog hostname format (based on the `syslog-message-format` parameter) of the event notification destination.

| [-rest-api-url <text>] - REST API Server URL

Use this parameter to specify a new REST API server URL to replace the current address of the event notification destination. Enter the full URL, which must start either with an `http://` or `https://` prefix. + To specify a URL that contains a question mark, press ESC followed by the "?". + If a `https://` URL is specified, then ONTAP verifies the identity of the destination host by validating its certificate. If the Online Certificate Status Protocol (OCSP) is enabled for Event Management System (EMS), then ONTAP uses that protocol

to determine the certificate's revocation status. Use the `security config oscp show -application ems` command to determine if the OCSP-based certificate revocation status check is enabled for EMS. The parameter is specified only when the event notification destination type is already "rest-api". It is not allowed to specify the parameter for a destination that already has another type of destination address.

`[-certificate-authority <text>]` - Client Certificate Issuing CA

Use this parameter to specify a new value of the certificate authority (CA) to replace the current value in the event notification destination. There can be multiple client certificates installed for the admin vserver in the cluster, and this parameter, along with the `certificate-serial` parameter, uniquely identifies which one. + Use the [security certificate show](#) command to see the list of certificates installed in the cluster.

`[-certificate-serial <text>]` - Client Certificate Serial Number }

Use this parameter to specify a new serial number of the client certificate to replace the current value in the event notification destination.

`[-access-control-role <text>]` - Access Control Role (privilege: advanced)

Use this parameter to specify a new access control role to replace the current value in the event notification destination.

Examples

The following example shows the modification of event notification destinations:

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	Storage@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

3 entries were displayed.

```
cluster1::> event notification destination modify -name StorageAdminEmail  
-email StorageAdmin@example.com
```

```
cluster1::> event notification destination show
```

Name	Type	Destination
StorageAdminEmail	email	StorageAdmin@example.com
StorageAdminSyslog	syslog	example.com
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")

3 entries were displayed.

The following example shows how to clear the client certificate configuration when mutual authentication with the REST API server is no longer required:

```
cluster1::> event notification destination show -name RestApi -instance
Destination Name: RestApi
    Type of Destination: rest-api
    Destination Values: https://rest.example.com/rest
    Client Certificate Issuing CA: cluster1-root-ca
Client Certificate Serial Number: 052213E60B7088
    Client Certificate Valid?: -
        Syslog Port: -
        Syslog Transport: -
        Syslog Message Format: -
Syslog Timestamp Format Override: -
    Syslog Hostname Format Override: -
    System-Defined Destination: false

cluster-1::> event notification destination modify -name RestApi
-certificate-authority - -certificate-serial -

cluster-1::> event notification destination show -name RestApi -instance
Destination Name: RestApi
    Type of Destination: rest-api
    Destination Values: https://rest.example.com/rest
    Client Certificate Issuing CA: -
Client Certificate Serial Number: -
    Client Certificate Valid?: -
        Syslog Port: -
        Syslog Transport: -
        Syslog Message Format: -
Syslog Timestamp Format Override: -
    Syslog Hostname Format Override: -
    System-Defined Destination: false
```

event notification destination prepare-for-revert

Deletes or updates unsupported syslog destinations (transport=TCP or transport=UDP with non-default configurations: port, message-format, timestamp-format-override, hostname-format-override)

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The event notification destination `prepare-for-revert` can be used to remove or update syslog notification destinations that are not supported when the cluster reverts to the previous release. Supported syslog destinations are ones with `udp-unencryptedsyslog-transport` using `syslog-port 514` and `legacy_netappsyslog-message-format` with `syslog-timestamp-format-override` and `syslog-hostname-format-override` both set to `no-override`. Syslog destinations with any other configurations are not supported.

Parameters

{ `-delete-unsupported-syslog-destinations {true|false}` - Clear unsupported syslog destinations (privilege: advanced)

Use this parameter to delete syslog destinations that are not supported in the previous release.

| `-update-unsupported-syslog-destinations {true|false}` - Update unsupported syslog destinations to supported (privilege: advanced) }

Use this parameter to update syslog destinations that are not supported in the previous release with supported configurations.

Examples

The following shows examples of "event notification destination prepare-for-revert":

```
cluster1::*> event notification destination show
Name                Type                Destination
-----
snmp-traphost       snmp                - (from "system snmp traphost")
tst01               syslog              test.com (port: 6514, transport: tcp-
encrypted)
tst02               syslog              test.com (port: 601, transport: tcp-
unencrypted)
tst03               syslog              test.com (port: 1234, transport: udp-
unencrypted)
tst04               syslog              test.com (port: 514, transport: udp-
unencrypted)
5 entries were displayed.

cluster1::*> event notification destination prepare-for-revert -delete
-unsupported-syslog-destinations true

cluster1::*> event notification destination show
Name                Type                Destination
-----
snmp-traphost       snmp                - (from "system snmp traphost")
tst04               syslog              test.com (port: 514, transport: udp-
unencrypted)
2 entries were displayed.
```

event notification destination show

Display event notification destinations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification destination show` command displays event notification destinations. More detailed information about parameters can be found in the man page for the [event notification destination create](#) command.

Note: In the case of a rest-api destination type or syslog destination type (with tcp-encrypted transport), Online Certificate Status Protocol (OCSP) information is not included. OCSP information is available in the [security config ocsp show -app ems](#) command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-name <text>] - Destination Name

Use this optional parameter to display information of an event notification destination that has the specified name.

[-type {snmp|email|syslog|rest-api}] - Type of Destination

Use this optional parameter to display information of event notification destinations that have the specified destination type.

[-destination <text>,...] - Destination

Use this optional parameter to display information of event notification destinations that have the specified destination address. Enter multiple addresses separated by a comma.

[-server-ca-present {true|false}] - Server CA Certificates Present?

Use this optional parameter to display information of event notification destinations that have the specified server-ca-present value. This field indicates whether there are certificates of the server-ca type exist in the system. If not, event messages will not be sent to a rest-api type destination having an HTTPS URL.

[-certificate-authority <text>] - Client Certificate Issuing CA

Use this optional parameter to display information of event notification destinations that have the specified certificate authority name.

[-certificate-serial <text>] - Client Certificate Serial Number

Use this optional parameter to display information of event notification destinations that have the specified certificate serial number.

`[-certificate-valid {true|false}] - Client Certificate Valid?`

Use this optional parameter to display information of event notification destinations that have the specified certificate-valid value. This field indicates whether the client certificate specified by the certificate-authority and certificate-serial fields is valid. If not, and if the REST API server requires client authentication, event messages are not sent to the server.

`[-syslog-port <integer>] - Syslog Port`

Use this optional parameter to display information about an event notification destination that has the specified syslog port.

`[-syslog-transport {udp-unencrypted|tcp-unencrypted|tcp-encrypted}] - Syslog Transport`

Use this optional parameter to display information about an event notification destination that has the specified syslog transport.

`[-syslog-message-format {legacy-netapp|rfc-5424}] - Syslog Message Format`

Use this optional parameter to display information about an event notification destination that has the specified syslog message format.

`[-syslog-timestamp-format-override {no-override|rfc-3164|iso-8601-utc|iso-8601-local-time}] - Syslog Timestamp Format Override`

Use this optional parameter to display information about an event notification destination that has the specified syslog timestamp format override.

`[-syslog-hostname-format-override {no-override|fqdn|hostname-only}] - Syslog Hostname Format Override`

Use this optional parameter to display information about an event notification destination that has the specified syslog hostname format override.

`[-system-defined {true|false}] - System-Defined Destination`

Use this optional parameter to display information about an event notification destination that has the specified system-defined value.

`[-access-control-role <text>] - Access Control Role (privilege: advanced)`

Use this optional parameter to display information about an event notification destination that has the specified access control role.

Examples

The following shows examples of "event notification destination show":

```
cluster1::> event notification destination show
```

Name	Type	Destination
-----	-----	-----
StorageAdminEmail	email	StorageAdmin@example.com (via "localhost" from "admin@localhost", configured in "event config")
StorageAdminSyslog	syslog	example.com (port: 514, transport: udp-unencrypted)
snmp-traphost	snmp	10.30.40.10 (from "system snmp traphost")
RestApi	rest-api	https://rest.example.com/rest

4 entries were displayed.

```
cluster1::> event notification destination show -type snmp -instance
Destination Name: snmp-traphost
```

```
    Type of Destination: snmp
```

```
    Destination: 10.30.40.10 (from "system snmp
traphost")
```

```
    Server CA Certificates Present?: -
    Client Certificate Issuing CA: -
    Client Certificate Serial Number: -
    Client Certificate Valid?: -
    Syslog Port: -
    Syslog Transport: -
    Syslog Message Format: -
    Syslog Timestamp Format Override: -
    Syslog Hostname Format Override: -
    System-Defined Destination: false
```

Related Links

- [event notification destination create](#)
- [security config ocsf show](#)

event notification history show

Display latest events sent to destination

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event notification history show` command displays a list of event messages that have been sent to a notification destination. Information displayed by the command for each event is identical to that of the `event log show` command. This command displays events sent to a notification destination while the `event log show` command displays all events that have been logged.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

-destination <text> - Destination

Specifies the destination to which event messages have been sent to be displayed.

[-node {<nodename>|local}] - Node

Displays a list of events for the node you specify. Use this parameter with the `-seqnum` parameter to display detailed information.

[-seqnum <Sequence Number>] - Sequence#

Selects the events that match this parameter value. Use with the `-node` parameter to display detailed information.

[-time <MM/DD/YYYY HH:MM:SS>] - Time

Selects the events that match this parameter value. Use the format: `MM/DD/YYYY HH:MM:SS` [`+ - HH:MM`]. You can specify a time range by using the `".."` operator between two time statements.

[-severity {EMERGENCY|ALERT|ERROR|NOTICE|INFORMATIONAL|DEBUG}] - Severity

Selects the events that match this parameter value. Severity levels are as follows:

- EMERGENCY - Disruption.
- ALERT - Single point of failure.
- ERROR - Degradation.
- NOTICE - Information.
- INFORMATIONAL - Information.
- DEBUG - Debug information.

[-message-name <Message Name>] - Message Name

Selects the events that match this parameter value (string). Message names are descriptive, so filtering output by message name displays messages of a specific type.

[-event <text>] - Event

Selects the events that match this parameter value. This parameter is useful when entered with wildcards. The "event" field contains the full text of the event, including any parameters. For example, the `wafl.vol.offline` event displays the name of the volume that is taken offline.

Examples

The following example displays all the events which match "important-events" filter and forwarded to the "snmp-traphost" destination:

```
cluster1::> event filter show
```

Filter Name	Rule Posn	Rule Type	Message Name	Severity	SNMP Trap Type
Parameters					

default-trap-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	*	*	Standard, Built-
in					**
	3	exclude	*	*	* **
important-events					
	1	include	*	EMERGENCY, ALERT	* **
	2	include	callhome.*	ERROR	* **
	3	exclude	*	*	* **
no-info-debug-events					
	1	include	*	EMERGENCY, ALERT, ERROR, NOTICE	* **
	2	exclude	*	*	* **

8 entries were displayed.

```
cluster1::> event notification destination show
```

Name	Type	Destination
snmp-traphost	snmp	192.168.10.40 (from "system snmp traphost")

```
cluster1::> event notification show
```

ID	Filter Name	Destinations
1	important-events	snmp-traphost

```
cluster1::>event notification history show -destination snmp-traphost
```

Time	Node	Severity	Event
5/14/2015 03:02:09	node1	EMERGENCY	callhome.clam.node.oog:
Call home for NODE(S) OUT OF CLUSTER QUORUM.			
5/13/2015 12:05:45	node1	ALERT	od.rdb.mbox.read.error:

2 entries were displayed.

event role-config commands

event role-config create

Create role-based event configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event role-config create` command creates an EMS role-based configuration for an access control role. It provides the ability to assign an event filter to an access control role. Once an event filter is assigned to the access control role, only a limited subset of event management system (EMS) messages that match the event filter are visible to users of that role and only those limited subset of messages are sent as notifications to them. The assigned filter is applied transparently in both cases. The command also provides the ability to limit access to global EMS configurations available with the "event config" commands. Limiting access to EMS events and configurations is typically applied for an access control role that is designed to have limited administrative capabilities.

Parameters

-access-control-role <text> - Access Control Role (privilege: advanced)

Use this mandatory parameter to specify the access control role of the EMS role-based configuration.

[-filter-name <text>] - Event Filter Name (privilege: advanced)

Use this optional parameter to specify the name of the event filter that will be assigned to the access control role.

[-limit-access-to-global-configs {true|false}] - Limit Access to Global Configs (privilege: advanced)

Use this optional parameter to limit access to the global EMS configurations available with the "event config" commands. If no value is provided this field is set to true by default.

Examples

The following examples create role-based event configurations:

```

cluster1::> event role-config create -access-control-role storage-admin
        -filter-name storage-admin-events -limit-access-to-global
-configs true

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin          storage-admin-events  true

cluster1::> event role-config create -access-control-role storage-admin
        -filter-name storage-admin-events

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin          storage-admin-events  true

cluster1::> event role-config create -access-control-role storage-admin
        -limit-access-to-global-configs false

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin          -                    false

```

event role-config delete

Delete role-based event configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event role-config delete` command deletes the EMS role-based configuration of an access control role.

Parameters

-access-control-role <text> - Access Control Role (privilege: advanced)

Use this mandatory parameter to specify the access control role for which the EMS role-based configuration needs to be deleted.

Examples

The following example shows the deletion of a role-based event configuration:

```
cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin          storage-admin-events  true

cluster1::> event role-config delete -access-control-role storage-admin

cluster1::> event role-config show
This table is currently empty.
```

event role-config modify

Modify role-based event configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event role-config modify` command updates the EMS role-based configuration of an access control role.

Parameters

-access-control-role <text> - Access Control Role (privilege: advanced)

Use this mandatory parameter to specify the access control role for which the EMS role-based configuration needs to be modified.

[-filter-name <text>] - Event Filter Name (privilege: advanced)

Use this parameter to specify the new event filter name that needs to be assigned to the access control role.

[-limit-access-to-global-configs {true|false}] - Limit Access to Global Configs (privilege: advanced)

Use this parameter to change the limited access to global EMS configurations available with the "event config" commands.

Examples

The following examples show the modification of role-based event configurations:

```

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  true

cluster1::> event role-config modify -access-control-role storage-admin
                                     -filter-name storage-admin-events2

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events2 true
cluster1::> event role-config modify -access-control-role storage-admin
                                     -filter-name storage-admin-events -limit-access-to-global
                                     -configs false

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  false
cluster1::> event role-config modify -access-control-role storage-admin
                                     -limit-access-to-global-configs true

cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  true

```

event role-config show

Display the list of existing role-based event configurations

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `event role-config show` command displays the EMS role-based configurations. It shows the list of access control roles with the event filters that are assigned to each role and the indication whether the access control role has limited access to global EMS configurations available with the "event config" commands.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-access-control-role <text>] - Access Control Role (privilege: advanced)

Use this parameter to only display the EMS role-based configurations assigned to this role.

[-filter-name <text>] - Event Filter Name (privilege: advanced)

Use this parameter to display all the access control roles that this filter is assigned to.

[-limit-access-to-global-configs {true|false}] - Limit Access to Global Configs (privilege: advanced)

Use this parameter to display all the access control roles that have this value for limited access to global EMS configurations.

Examples

The following example displays the role-based event configurations:

```
cluster1::> event role-config show
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  true
storage-admin2     storage-admin-events  false
```

The following example displays the role-based event config for a specific access control role:

```
cluster1::*> event role-config show -access-control-role storage-admin2
Access Control Role: storage-admin2
          Event Filter Name: storage-admin-events
Limit Access to Global Configs: false
```

The following example displays all the access control roles that a specific filter is assigned to:

```
cluster1::*> event role-config show -filter-name storage-admin-events
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  true
storage-admin2     storage-admin-events  false
```

2 entries were displayed.

The following example displays all the access control roles that have a specific value for limited access to EMS global configurations:

```
cluster1::*> event role-config show -limit-access-to-global-configs true
Access Control Role Filter Name          Limit Access to Global Configs
-----
storage-admin      storage-admin-events  true
```

event status commands

event status show

Display event status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `event status show` command summarizes information about occurrences of events. For detailed information about specific occurrences of events, use the [event log show](#) command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the event records that match this parameter value. Events are tracked on a node-by-node basis, rather than being rolled up cluster-wide.

[-message-name <Message Name>] - Message Name

Selects the event records that match this parameter value. The message name is a short descriptive string. Filtering output by message name displays messages of a specific type.

[-indications <integer>] - Number of Indications

Selects the event records that match this parameter value. This parameter is most useful when used with a range, such as using the range `">20"` to display only events that have been posted more than 20 times.

[-drops <integer>] - Number of Drops

Selects the event records that match this parameter value.

[-last-time-occurred <MM/DD/YYYY HH:MM:SS>] - Last Indication Time

Selects the event records that match this parameter value.

[-last-time-dropped <MM/DD/YYYY HH:MM:SS>] - Last Suppressed Indication Time

Selects the event records that match this parameter value.

[-last-time-processed <MM/DD/YYYY HH:MM:SS>] - Last Processed Indication Time

Selects the event records that match this parameter value.

[-stat-starting-time <MM/DD/YYYY HH:MM:SS>] - Stat Starting Time

Selects the event records that match this parameter value.

[`-last-hour-histogram <integer>,...`] - 60-minute Histogram (privilege: advanced)

Use this parameter with the `-fields` parameter to display the "last hour" histogram for each event type. The last hour histogram records the number of times each event occurred in the last hour. The histogram is divided into sixty buckets, and each bucket collects one minute's events. The buckets display with the most recent event first.

[`-last-day-histogram <integer>,...`] - 24-hour Histogram (privilege: advanced)

Use this parameter with the `-fields` parameter to display the "last day" histogram for each event type. The last day histogram records the number of times each event occurred in the last day. The histogram is divided into 24 buckets, and each bucket collects one hour's events. The buckets display with the most recent event first.

[`-last-week-histogram <integer>,...`] - 7-day Histogram (privilege: advanced)

Use this parameter with the `-fields` parameter to display the "last week" histogram for each event type. The last week histogram records the number of times each event occurred in the last week. The histogram is divided into 7 buckets, and each bucket collects one day's events. The buckets display with the most recent event first.

[`-severity`

{`NODE_FAULT`|`SVC_FAULT`|`NODE_ERROR`|`SVC_ERROR`|`WARNING`|`NOTICE`|`INFO`|`DEBUG`|`VAR`}] - Severity

Selects events that have the event severity you specify. Severity levels sort with the most severe levels first. Severity levels:

- `NODE_FAULT` - The node has detected data corruption, or is unable to provide client service.
- `SVC_FAULT` - The node has detected a temporary loss of service. Typically, this is caused by a transient software fault.
- `NODE_ERROR` - The node has detected a hardware error that is not immediately fatal.
- `SVC_ERROR` - The node has detected a software error that is not immediately fatal.
- `WARNING` - A high-priority message that does not indicate a fault.
- `NOTICE` - A normal-priority message that does not indicate a fault.
- `INFO` - A low-priority message that does not indicate a fault.
- `DEBUG` - A debugging message. These messages are typically suppressed.
- `VAR` - These messages have variable severity. Severity level for these messages is selected at runtime.

The examples below illustrate how to query on severity.

Examples

The following example displays recent event-occurrence status for node1:

```
cluster1::> event status show -node node1
```

Node	Message	Occurs	Drops	Last Time
node1	raid.spares.media_scrub.start	6	0	3/11/2010
15:59:00				
node1	raid.uninitialized.parity.vol	3	0	3/11/2010
15:58:28				
node1	raid.vol.state.online	3	0	3/11/2010
15:58:29				
node1	reg.defaultCommit.set.timeTaken	1	0	3/11/2010
15:58:28				
node1	scsitgt.ha.state.changed	2	0	3/11/2010
15:58:28				
node1	ses.multipath.notSupported	2	0	3/11/2010
15:58:43				
node1	shelf.config.mpha	1	0	3/11/2010
15:58:48				
node1	sk.hog.runtime	1	0	3/11/2010
15:58:28				
node1	snmp.agent.msg.access.denied	1	0	3/11/2010
15:58:28				
node1	snmp.link.up	6	0	3/11/2010
15:58:28				
node1	tar.csum.mismatch	2	0	3/11/2010
15:58:28				
node1	tar.extract.success	2	0	3/11/2010
15:58:28				
node1	vifmgr.lifsuccessfullymoved	3	0	3/11/2010
15:58:46				
node1	vifmgr.portdown	1	0	3/11/2010
15:58:48				
node1	vifmgr.portup	5	0	3/11/2010
15:58:48				
node1	vifmgr.startedsuccessfully	1	0	3/11/2010
15:58:43				

The following example displays a summary of events which are warnings or more severe:

```
cluster1::> event status show -node node1 -severity <=warning -fields
indications,drops,severity
```

node	message-name	indications	drops	severity
node1	api.output.invalidSchema	5463	840	WARNING
node1	callhome.dsk.config	1	0	WARNING
node1	callhome.sys.config	1	0	SVC_ERROR
node1	cecc_log.dropped	145	0	WARNING
node1	cecc_log.entry	5	0	WARNING
node1	cecc_log.entry_no_syslog	4540	218	WARNING
node1	cecc_log.summary	5	0	WARNING
node1	cf.fm.noPartnerVariable	5469	839	WARNING
node1	cf.fm.notkoverBadMbox	1	0	WARNING
node1	cf.fm.notkoverClusterDisable	1	0	WARNING
node1	cf.fsm.backupMailboxError	1	0	WARNING
node1	cf.takeover.disabled	23	0	WARNING
node1	cmds.sysconf.logErr	1	0	NODE_ERROR
node1	config.noPartnerDisks	1	0	NODE_ERROR
node1	fci.initialization.failed	2	0	NODE_ERROR
node1	fcg.service.adapter	1	0	WARNING
node1	fmb.BlobNotFound	1	0	WARNING
node1	ha.takeoverImpNotDef	1	0	WARNING
node1	httpd.config.mime.missing	2	0	WARNING
node1	mgr.opsmgr.autoreg.norec	1	0	WARNING
node1	monitor.globalStatus.critical	1	0	NODE_ERROR
node1	raid.mirror.vote.versionZero	1	0	SVC_ERROR
node1	ses.multipath.notSupported	2	0	NODE_ERROR
node1	snmp.agent.msg.access.denied	1	0	WARNING

24 entries were displayed.

The above example makes use of several features which are common to all `show` commands:

- A query is specified for the severity parameter. A query restricts the output of the show command; only rows matching the query will be displayed. In this case, the query indicates that only events which have a severity of "WARNING" or more severe will be displayed.
- The fields parameter selects the fields to display. Note that the severity field is not displayed in the default output.

job commands

job delete

Delete a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job delete` command deletes a job. Use the [job show](#) command to view a list of running jobs that can be deleted.

Parameters

-id <integer> - Job ID

The numeric ID of the job you want to delete. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example deletes the job that has ID 99:

```
cluster1::> job delete -id 99
```

Related Links

- [job show](#)

job pause

Pause a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job pause` command pauses a job. Use the [job resume](#) command to resume a paused job. Use the [job show](#) command to view a list of running jobs that can be paused.

Parameters

-id <integer> - Job ID

The numeric ID of the job you want to pause. A job ID is a positive integer.

`[-vserver <vserver name>]` - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example pauses the job that has ID 183:

```
cluster1::> job pause -id 183
```

Related Links

- [job resume](#)
- [job show](#)

job resume

Resume a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job resume` command resumes a job that was previously paused by using the [job pause](#) command. Use the [job show](#) command to view a list of paused jobs that can be resumed.

Parameters

`-id <integer>` - Job ID

The numeric ID of the paused job to be resumed. A job ID is a positive integer.

`[-vserver <vserver name>]` - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example resumes the paused job that has ID 183:

```
cluster1::> job resume -id 183
```

Related Links

job show-bynode

Display a list of jobs by node

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-bynode` command displays information about jobs on a per-node basis. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all jobs in the cluster that are currently owned by a node.

To display detailed information about a specific job, run the command with the `-id` parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the job name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-affinity {Cluster|Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with that user.

Examples

The following example displays information about all jobs on a per-node basis:

```
node::> job show-bynode
```

Node	Job ID	Name	Owning Vserver	Affinity
node0	1501	log-rotation	node-vserver	Cluster
		Descr:logrotation job		
node1	1498	log-rotation	node-vserver	Cluster
		Descr:logrotation job		
node2	1499	log-rotation	node-vserver	Cluster
		Descr:logrotation job		
node3	1500	log-rotation	node-vserver	Cluster
		Descr:logrotation job		

job show-cluster

Display a list of cluster jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-cluster` command displays information about cluster-affiliated jobs. The command output depends on the parameters specified with the command. If no parameters are specified, the command displays information about all cluster-affiliated jobs.

To display detailed information about a specific job, run the command with the `-id` parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

`{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-id` <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[`-vserver` <vserver name>] - Owning Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[`-name` <text>] - Name

Use this parameter to display information only about the jobs that match the job name you specify.

[`-description` <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[`-priority` {Low|Medium|High|Exclusive}] - Priority

Use this parameter to display information only about the jobs that match the priority you specify.

[`-node` <nodename>] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[`-affinity` {Cluster|Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[`-schedule` <job_schedule>] - Schedule

Use this parameter to display information only about the jobs that run on the schedule you specify.

[`-queuetime` <MM/DD HH:MM:SS>] - Queue Time

Use this parameter to display information only about the jobs that match the queue time you specify.

[`-starttime` <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about the jobs that match the start time you specify.

[`-endtime` <MM/DD HH:MM:SS>] - End Time

Use this parameter to display information only about the jobs that match the end time you specify.

[`-dropdeadtime` <MM/DD HH:MM:SS>] - Drop-dead Time

Use this parameter to display information only about the jobs that match the final timeout time you specify.

[`-restarted` {true|false}] - Restarted?

Use this parameter to display information only about the jobs that match the restart value you specify.

[`-state`

{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State

Use this parameter to display information only about the jobs that match the job state you specify.

[-code <integer>] - Status Code

Use this parameter to display information only about the jobs that match the status code you specify.

[-completion <text>] - Completion String

Use this parameter to display information only about the jobs that match the completion text you specify.

[-jobtype <text>] - Job Type

Use this parameter to display information only about the jobs that match the job type you specify.

[-category <text>] - Job Category

Use this parameter to display information only about the jobs that match the job category you specify.

[-uuid <UUID>] - UUID

Use this parameter to display information only about the jobs that match the UUID you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with the user you specify.

Examples

The following example displays information about all cluster-affiliated jobs:

```
cluster1::> job show-cluster
```

Job ID	Name	Owning Vserver	Node	State
305	Auto_Mirror	node-vserver	-	Running
6202	mirror-03_10	node-vserver	-	Queued
	Descr:Auto mirror			
6203	mirror-04_10	node-vserver	-	Queued
	Descr:Auto mirror			
6204	mirror-01_10	node-vserver	-	Queued
	Descr:Auto mirror			
6205	mirror-02_10	node-vserver	-	Queued
	Descr:Auto mirror			
6206	mirror-05_10	node-vserver	-	Queued
	Descr:Auto mirror			

job show-completed

Display a list of completed jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show-completed` command displays information about completed jobs. The command output depends on the parameters you specify with the command. If you do not use any parameters, the command displays information about all completed jobs.

To display detailed information about a specific job, run the command with the `-id` parameter. The detailed view includes all of the default information plus additional items.

You can specify additional parameters to display only information that matches those parameters. For instance, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Use this parameter to display information only about the jobs that match the ID or range of IDs you specify.

[-vserver <vserver name>] - Owing Vserver

Use this parameter with the name of a Vserver to display only jobs that are owned by that Vserver.

[-name <text>] - Name

Use this parameter to display information only about the jobs that match the name you specify.

[-description <text>] - Description

Use this parameter to display information only about the jobs that match the description you specify.

[-priority {Low|Medium|High|Exclusive}] - Priority

Use this parameter to display information only about the jobs that match the priority you specify.

[-node <nodename>] - Node

Use this parameter to display information only about the jobs that are associated with the node you specify.

[-affinity {Cluster|Node}] - Affinity

Use this parameter with an affinity value to display only jobs that match the affinity you specify.

[-schedule <job_schedule>] - Schedule

If you use this parameter, the command displays information only about the jobs that have the schedule you specify.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

If you use this parameter, the command displays information only about the jobs that have the queue time you specify.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Use this parameter to display information only about the jobs that have the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time

Use this parameter to display information only about the jobs that have the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Use this parameter to display information only about the jobs that time out at the time you specify.

[-restarted {true|false}] - Restarted?

Use this parameter to display information only about the jobs that match the restart value you specify.

[-state

{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State

Use this parameter to display information only about the jobs that match the job state you specify.

[-code <integer>] - Status Code

Use this parameter to display information only about the jobs that match the status code you specify.

[-completion <text>] - Completion String

Use this parameter to display information only about the jobs that match the completion text you specify.

[-jobtype <text>] - Job Type

Use this parameter to display information only about the jobs that match the job type you specify.

[-category <text>] - Job Category

Use this parameter to display information only about the jobs that match the job category you specify.

[-uuid <UUID>] - UUID

Use this parameter to display information only about the jobs that match the UUID you specify.

[-username <text>] - User Name

Use this parameter with a username to display only jobs that are associated with that user.

Examples

The following example displays information about all completed jobs:

```
node::> job show-completed
```

Job ID	Name	Owning Vserver	End Time	Code	Completion
305	Auto_Mirror	node-vserver	10/10 08:07:05	0	Succeeded
6202	mirror-03_10	node-vserver	10/10 11:10:07	0

job show

Display a list of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job show` command displays information about jobs. By default, the command displays information about all current jobs.

To display detailed information about a specific job, run the command with the `-id` parameter.

You can specify additional parameters to select information that matches the values you specify for those parameters. For example, to display information only about jobs running on a specific node, run the command with the `-node` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-inprogress]

Displays the job ID, the job name, the owning Vserver, and the progress of the job.

| **[-jobstate]**

Displays information about each job's state, including the queue state, whether the job was restarted, and when the job has completely timed out.

| **[-jobuuid] (privilege: advanced)**

Displays the job ID, the job name, the owning Vserver, and the job UUID.

| **[-sched]**

Displays the job ID, the job name, the owning Vserver, and the schedule on which the job runs.

| **[-times]**

Displays the job ID, the job name, the owning Vserver, the time when the job was last queued, the time when the job was last started, and the time when the job most recently ended.

| **[-type]**

Displays the job ID, the job name, the job type, and the job category.

| **[-instance] }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-id <integer>] - Job ID

Selects the jobs that match the ID or range of IDs that you specify.

[-vserver <vserver name>] - Owning Vserver

Selects jobs that are owned by the specified Vserver.

[-name <text>] - Name

Selects the jobs that match this parameter value.

[-description <text>] - Description

Selects the jobs that match this parameter value.

[-priority {Low|Medium|High|Exclusive}] - Priority

Selects the jobs that match this parameter value.

[-node <nodename>] - Node

Selects the jobs that match this parameter value.

[-affinity {Cluster|Node}] - Affinity

Selects the jobs that match this parameter value.

[-schedule <job_schedule>] - Schedule

Selects the jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time

Selects the jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects the jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time

Selects the jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time

Selects the jobs that match this parameter value.

[-restarted {true|false}] - Restarted?

Selects the jobs that match this parameter value.

[-state

{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State

Selects the jobs that match this parameter value.

[-code <integer>] - Status Code

Selects the jobs that match this parameter value.

[-completion <text>] - Completion String

Selects the jobs that match this parameter value.

[-jobtype <text>] - Job Type

Selects the jobs that match this parameter value.

[-category <text>] - Job Category

Selects the jobs that match this parameter value.

[-uuid <UUID>] - UUID (privilege: advanced)

Selects the jobs that match this parameter value.

[-progress <text>] - Execution Progress

Selects the jobs that match this parameter value.

[-username <text>] - User Name

Selects the jobs that match this parameter value.

[-restart-is-delayed-by-module <text>] - Restart Is Delayed by Module

Selects jobs which are or were delayed by the specified module during the restart. For example:
MCC_SWITCHBACK

Examples

The following example displays information about all jobs on the node named node1:

```

cluster1::> job show -node node1

```

Job ID	Name	Owning Vserver	Node	State
308114	mirror-daily-3587206	node-vserver	node1	Running
	Descr:Auto-replicate to 1 mirror(s)			
308115	mirror-daily-3618985	node-vserver	node1	Running
	Descr:Auto-replicate to 1 mirror(s)			
308116	mirror-daily-3619010	node-vserver	node1	Queued
	Descr:Auto-replicate to 1 mirror(s)			
308117	mirror-daily-3749547	node-vserver	node1	Queued
	Descr:Auto-replicate to 1 mirror(s)			

4 entries were displayed.

job stop

Stop a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job stop` command stops a running job. A stopped job cannot be resumed. Use the [job pause](#) command to pause a job so that you can later resume it. Use the [job show](#) command to view a list of running jobs.

Parameters

-id <integer> - Job ID

The numeric ID of the job to stop. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example stops the job that has ID 101:

```
cluster1::> job stop -id 101
```

Related Links

- [job pause](#)
- [job show](#)

job unclaim

Unclaim a cluster job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job unclaim` command causes a cluster-affiliated job that is owned by an unavailable node to be unclaimed by that node. Another node in the cluster can then take ownership of the job. Use the [job show-cluster](#) command to obtain a list of cluster-affiliated jobs.

Parameters

-id <integer> - Job ID (privilege: advanced)

Use this parameter to specify the ID number of the job to unclaim.

[-vserver <vserver name>] - Owning Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example shows how to unclaim the cluster-affiliated job with the ID 27 that is owned by the Vserver `vs1`:

```
cluster1::*> job unclaim -vserver vs1 -id 27
```

- [job show-cluster](#)

job watch-progress

Watch the progress of a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job watch-progress` command displays the progress of a job, and periodically updates that display. You can specify the frequency of the updates.

Parameters

-id <integer> - Job ID

Use this parameter to specify the numeric ID of the job to monitor.

[-vserver <vserver name>] - Owning Vserver

Use this parameter to specify the name of the Vserver that owns the job.

[-interval <integer>] - Refresh Interval (seconds)

Use this parameter to specify the number of seconds between updates.

Examples

The following example show how to monitor the progress of the job that has ID 222 on Vserver `vs0` . The progress display updates every 3 seconds.

```
cluster1::> job watch-progress -vserver vs0 -id 222 -interval 3
```

job history commands

job history show

Display a history of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job history show` command displays a history of completed jobs with newer entries displayed first. You can specify optional parameters to select information about job history items that match only those parameters. For example, to display information about jobs that were completed on February 27 at noon, run the command with `-endtime "02/27 12:00:00"` .

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the completed jobs that match this parameter value.

[-record <Sequence Number>] - Record ID

Selects the completed jobs that match the record ID or range of record IDs you specify. Note that record IDs are unique for each node, not for the cluster as a whole. As a result, there can be two records with the same record ID within the cluster.

[-vserver <vserver name>] - Owning Vserver

Selects the completed jobs that are owned by the Vserver you specify.

[-id <integer>] - Job ID

Selects the completed jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time

Selects jobs that completed at the time you specify. This parameter is most useful when used with a range of times.

[-starttime <MM/DD HH:MM:SS>] - Start Time

Selects completed jobs that were started at the time you specify. This parameter is most useful when used with a range of times.

[-name <text>] - Name

Selects the completed jobs that match this parameter value.

[-description <text>] - Description

Selects the completed jobs that match this parameter value.

[-code <integer>] - Status Code

Selects the completed jobs that match this parameter value. Each job defines its own status codes. The completion text is more informative, but support technicians may request this numeric code.

[-progress <text>] - Progress String

Selects the completed jobs that match this parameter value.

[-completion <text>] - Completion String

Selects the completed jobs that match this parameter value.

[-jobuuid <UUID>] - Job UUID (privilege: advanced)

Selects the completed jobs that match this parameter value.

[-event-type {Idle|Running|Succeeded|Failed|Paused|Stopped|Deleted|Error}] - Event Type

Selects the completed jobs that match this parameter value.

[-event-time <MM/DD HH:MM:SS>] - Event Time

Selects the completed jobs that match this parameter value. This parameter is most useful when used with a range of times.

[-error-code <integer>] - Job Manager Error Code

Selects the completed jobs that match this parameter value.

[-error-text <text>] - Job Manager Error Text

Selects the completed jobs that match this parameter value.

[-username <text>] - User Name

Selects the completed jobs that match this parameter value.

Examples

The following example displays information about all completed jobs:

```
cluster1::> job history show
```

Time	Node	Owning Vserver	Name	Event
Job ID				
-----	-----	-----	-----	-----
08/23 08:58:24	node1	node1-vs	Vol Create	Succeeded
76				
Description: Create testvol				
Completion: Successful				
08/23 08:58:22	node1	node1-vs	Vol Create	Running
76				
Description: Create testvol				
08/22 08:16:36	node1	node1-vs	CLUSTER BACKUP AUTO weekly	Succeeded
4				
Description: Cluster Backup Job				
08/22 08:15:49	node1	node1-vs	CLUSTER BACKUP AUTO weekly	Running
4				
Description: Cluster Backup Job				
08/22 08:15:08	node1	node1-vs	CLUSTER BACKUP AUTO weekly	Idle
4				
Description: Cluster Backup Job				
08/22 08:15:03	node1	node1-vs	CLUSTER BACKUP AUTO weekly	Running
4				
Description: Cluster Backup Job				

6 entries were displayed.

The following example shows how to use a range with the "endtime" parameter to select only the events that ended between 8:15 and 8:16 on August 22nd.

```
cluster1::> job history show -endtime "08/22 08:15:00".. "08/22 08:16:00"
Time                Node                Owing
Job ID              Vserver      Name                Event
-----
08/22 08:15:49 node1                node1-vs      CLUSTER BACKUP AUTO weekly
4                                                         Running
Description: Cluster Backup Job
08/22 08:15:08 node1                node1-vs      CLUSTER BACKUP AUTO weekly
4                                                         Idle
Description: Cluster Backup Job
08/22 08:15:03 node1                node1-vs      CLUSTER BACKUP AUTO weekly
4                                                         Running
Description: Cluster Backup Job
3 entries were displayed.
```

job initstate commands

job initstate show

Display init state for job managers

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `job initstate show` command displays information about the initialization states of job-manager processes.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Selects the nodes that match this parameter value.

`[-process <process_name>]` - Process Name (privilege: advanced)

Selects the nodes that match this parameter value.

`[-initialized {true|false}]` - Initialized? (privilege: advanced)

Selects the nodes that match this parameter value (`true` means initialized; `false` means not initialized).

`[-cache-root <text>]` - Cache Root (privilege: advanced)

Selects the nodes that match this parameter value.

`[-siteid <UUID>]` - Site ID (privilege: advanced)

Selects the nodes that match this parameter value.

`[-hp-threads <integer>]` - High Priority Threads (privilege: advanced)

Selects the nodes that have the number of high-priority threads you specify.

`[-mp-threads <integer>]` - Medium Priority Threads (privilege: advanced)

Selects the nodes that have the number of medium-priority threads you specify.

`[-lp-threads <integer>]` - Low Priority Threads (privilege: advanced)

Selects the nodes that have the number of low-priority threads you specify.

`[-tx-interval <integer>]` - Transaction Interval (privilege: advanced)

Selects the nodes that have the number of seconds you specify as their transaction interval.

`[-initmsg <text>]` - Initialization Message (privilege: advanced)

Selects the nodes that match this parameter value.

`[-thread-initmsg <text>]` - Thread Initialization Message (privilege: advanced)

Selects the nodes that match this parameter value. The thread initialization message contains information about thread status. If there is no information to communicate, this message is empty.

`[-recovery-enabled {true|false}]` - Job Failover Enabled? (privilege: advanced)

Selects the nodes that match this parameter value (`true` means enabled, `false` means not enabled).

`[-ex-threads <integer>]` - Exclusive Priority Threads (privilege: advanced)

Selects the nodes that match this parameter value.

Examples

The following example shows how to display general job-manager initialization-state information for a cluster.

```
cluster1::*> job initstate show
```

Node	Process	Init?	HP Thr	MP Thr	LP Thr	EX Thr	TX Int	Failover?
node1	mgwd	true	2	3	5	8	300	true
node2	mgwd	true	2	3	5	8	300	true

2 entries were displayed.

The following example shows how to display detailed job-manager initialization-state information for a node named node0 .

```
cluster1::*> job initstate show -instance -node node0
```

```
Node: node0
Process Name: mgwd
Initialized?: true
Cache Root: /mroot/jm_cache
Site ID: 824e8f7d-f49-1d9-84af-00423b7352
High Priority Threads: 2
Medium Priority Threads: 3
Low Priority Threads: 5
Transaction Interval: 300
Initialization Message: Initialized
Are Threads Running?: -
Job Failover Enabled?: true
Exclusive Priority Threads: 8
```

job private commands

job private delete

Delete a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private delete` command deletes a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command on a job that does not support the delete operation, the command returns an error message.

Use the [job private show](#) command to view a list of private jobs that can be deleted.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

Use this parameter to specify the node with which the private job is associated.

-id <integer> - Job ID (privilege: advanced)

Use this parameter to specify the numeric ID of the private job to be deleted. A job ID is a positive integer.

[-vserver <vserver name>] - Owing Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example shows how to delete the job that has ID 273 from the node named `node2` :

```
cluster1::*> job private delete -node node2 -id 273
```

Related Links

- [job private show](#)

job private pause

Pause a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private pause` command pauses a private job. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

If you use this command to pause a job that does not support it, the command returns an error message.

Use the [job private resume](#) command to resume a paused private job.

Use the [job private show](#) command to view a list of private jobs.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

Use this parameter to specify the node with which the private job is associated.

-id <integer> - Job ID (privilege: advanced)

Use this parameter to specify the numeric ID of the paused private job to be paused. A job ID is a positive integer.

[-vserver <vserver name>] - Owing Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example pauses the private job that has ID 99 on the node `node1` :

```
cluster1::*> jobs private pause -node node1 -id 99
```

Related Links

- [job private resume](#)
- [job private show](#)

job private resume

Resume a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private resume` command resumes a private job that was paused by using the [job private pause](#) command. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Use the [job private show](#) command to view a list of paused private jobs that can be resumed.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

Use this parameter to specify the node with which the paused private job is associated.

-id <integer> - Job ID (privilege: advanced)

Use this parameter to specify the numeric ID of the paused private job to be resumed. A job ID is a positive integer.

[-vserver <vserver name>] - Owning Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example resumes the paused private job that has ID 99 on a node named `node2` :

```
cluster1::*> job private resume -node node2 -id 99
```

Related Links

- [job private pause](#)
- [job private show](#)

job private show-completed

Display a list of completed jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private show-completed` command displays information about completed private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`](privilege: advanced**)]**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Use this parameter to display information only about completed jobs that are associated with the node you specify.

[`-id <integer>`] - Job ID (privilege: advanced)

Use this parameter to display information only about completed jobs that have the ID you specify.

[`-vserver <vserver name>`] - Owning Vserver (privilege: advanced)

Use this parameter to display only completed jobs that are owned by the Vserver you specify.

[`-name <text>`] - Name (privilege: advanced)

Use this parameter to display information only about completed jobs that have the name you specify.

[`-description <text>`] - Description (privilege: advanced)

Use this parameter to display information only about completed jobs that have the description you specify.

[`-priority {Low|Medium|High|Exclusive}`] - Priority (privilege: advanced)

Use this parameter to display information only about completed jobs that have the priority you specify.

[`-schedule <job_schedule>`] - Schedule (privilege: advanced)

Use this parameter to display information only about completed jobs that have the schedule you specify.

[`-queuetime <MM/DD HH:MM:SS>`] - Queue Time (privilege: advanced)

Use this parameter to display information only about completed jobs that have the queue time you specify.

[`-starttime <MM/DD HH:MM:SS>`] - Start Time (privilege: advanced)

Use this parameter to display information only about completed jobs that have the start time you specify.

[-endtime <MM/DD HH:MM:SS>] - End Time (privilege: advanced)

Use this parameter to display information only about completed jobs that have the end time you specify.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time (privilege: advanced)

Use this parameter to display information only about completed jobs that have the final timeout time you specify.

[-restarted {true|false}] - Restarted? (privilege: advanced)

Use this parameter to display information only about completed jobs that have the restart value you specify.

[-state

{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State (privilege: advanced)

Use this parameter to display information only about completed jobs that have the job state you specify.

[-code <integer>] - Status Code (privilege: advanced)

Use this parameter to display information only about completed jobs that have the status code you specify.

[-completion <text>] - Completion String (privilege: advanced)

Use this parameter to display information only about completed jobs that have the completion text you specify.

[-jobtype <text>] - Job Type (privilege: advanced)

Use this parameter to display information only about completed jobs that have the job type you specify.

[-category <text>] - Job Category (privilege: advanced)

Use this parameter to display information only about completed jobs that have the job category you specify.

[-uuid <UUID>] - UUID (privilege: advanced)

Use this parameter to display information only about completed jobs that have the UUID you specify.

[-username <text>] - User Name (privilege: advanced)

Use this parameter to display information only about completed jobs that are associated with the user you specify.

Examples

The following example shows how to display information about all completed private jobs on the node named node1 :

```
cluster1::*> job private show-completed -node node1
Node: node1
```

Job ID	Name	Owning Vserver	End Time	Code	Completion String
1	sync task	node1	02/17 15:03:23	0	
2	load_balancing	node1	02/17 16:29:28	0	DONE_VIF_STATS
3	snap-hourly	node1	02/17 16:05:00	0	
4	snap-daily	node1	02/17 00:10:00	0	
5	snap-weekly	node1	02/13 00:15:00	0	
8	Cross-Cluster Manager	node1	02/17 16:27:27	0	complete
9	reconcile service policy	node1	02/17 15:03:12	0	

7 entries were displayed.

job private show

Display a list of jobs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private show` command displays information about private jobs. Private jobs are affiliated with a specific node and do not use any cluster facilities, such as the replicated database.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-inprogress`] (privilege: advanced)

Displays the job ID, name, owning Vserver, and progress of each private job.

[`-jobstate`] (privilege: advanced)

Displays information about each private job's state, including the queue state, whether the job was restarted, and when the job has timed out.

[`-jobuuid`] (privilege: advanced)

Displays the ID, name, owning Vserver, and UUID of each private job.

[`-sched`] (privilege: advanced)

Displays the job ID, name, owning Vserver, and run schedule of each private job.

[`-times`] (privilege: advanced)

Displays the queue time, start time, and end time of each private job.

| [-type] (privilege: advanced)

Displays the type and category of each private job.

| [-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node (privilege: advanced)

Selects the private jobs that match this parameter value. .

[-id <integer>] - Job ID (privilege: advanced)

Selects the private jobs that match the ID or range of IDs that you specify.

[-vserver <vserver name>] - Owning Vserver (privilege: advanced)

Selects the private jobs that match this parameter value.

[-name <text>] - Name (privilege: advanced)

Selects the private jobs that match this parameter value.

[-description <text>] - Description (privilege: advanced)

Selects the private jobs that match this parameter value.

[-priority {Low|Medium|High|Exclusive}] - Priority (privilege: advanced)

Selects the private jobs that match this parameter value.

[-schedule <job_schedule>] - Schedule (privilege: advanced)

Selects the private jobs that match this parameter value.

[-queuetime <MM/DD HH:MM:SS>] - Queue Time (privilege: advanced)

Selects the private jobs that match this parameter value.

[-starttime <MM/DD HH:MM:SS>] - Start Time (privilege: advanced)

Selects the private jobs that match this parameter value.

[-endtime <MM/DD HH:MM:SS>] - End Time (privilege: advanced)

Selects the private jobs that match this parameter value.

[-dropdeadtime <MM/DD HH:MM:SS>] - Drop-dead Time (privilege: advanced)

Selects the private jobs that match this parameter value.

[-restarted {true|false}] - Restarted? (privilege: advanced)

Selects the private jobs that match this parameter value.

[-state

{Initial|Queued|Running|Waiting|Pausing|Paused|Quitting|Success|Failure|Reschedule|Error|Quit|Dead|Unknown|Restart|Dormant}] - State (privilege: advanced)

Selects the private jobs that match this parameter value.

[-code <integer>] - Status Code (privilege: advanced)

Selects the private jobs that match this parameter value.

[-completion <text>] - Completion String (privilege: advanced)

Selects the private jobs that match this parameter value.

[-jobtype <text>] - Job Type (privilege: advanced)

Selects the private jobs that match this parameter value.

[-category <text>] - Job Category (privilege: advanced)

Selects the private jobs that match this parameter value.

[-uuid <UUID>] - UUID (privilege: advanced)

Selects the private jobs that match this parameter value.

[-progress <text>] - Execution Progress (privilege: advanced)

Selects the private jobs that match this parameter value.

[-username <text>] - User Name (privilege: advanced)

Selects the private jobs that match this parameter value.

Examples

The following example displays information about all private jobs on the local node:

```
cluster1::*> job private show -node local
Node: node1

Job ID Name                                Owing
      Vserver                               State
-----
3      snap-hourly                         cluster1  Queued
      Description: Auto-Snapshot

```

job private stop

Stop a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private stop` command stops a running private job. A private job is a job that is associated with a specific node and does not use cluster facilities. A stopped job cannot be restarted.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

This specifies the node on which the job is running.

-id <integer> - Job ID (privilege: advanced)

This specifies the numeric ID of the job that is to be stopped.

[-vserver <vserver name>] - Owing Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver that owns the job.

Examples

The following example stops a private job with the ID 416 on a node named node0:

```
cluster1::*> job private stop -node node0 -id 416
```

job private watch-progress

Watch the progress of a job

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `job private watch-progress` command displays and periodically updates the progress of a private job. A private job is a job that is associated with a specific node and does not use cluster facilities. You can specify the frequency of the progress updates.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

This specifies the node on which the job is running.

-id <integer> - Job ID (privilege: advanced)

This specifies the numeric ID of the job whose progress is to be monitored.

[-vserver <vserver name>] - Owing Vserver (privilege: advanced)

Use this parameter to specify the Vserver with which the paused private job is associated.

[-interval <integer>] - Refresh Interval (seconds) (privilege: advanced)

This optionally specifies, in seconds, the frequency of the updates.

Examples

The following example monitors the progress of the private job that has ID 127 on a node named node1. The progress is updated every 2 seconds.

```
cluster1::*> job private watch-progress -node node1 -id 127 -interval 2
Queued
```

job schedule commands

job schedule delete

Delete a schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule delete` command deletes a schedule. Use the [job schedule show](#) command to display all current schedules.

You cannot delete any schedules that are in use by jobs. Use the [job schedule show-jobs](#) command to display jobs by schedule.

You cannot delete any schedules that are referenced by:

- Volume snapshot policy entries
- SnapMirror entries
- SIS policy entries
- configuration backup settings

You must remove all references to a schedule before you can delete it. If you attempt to delete a schedule that is referenced, an error message will list which entries reference the schedule you want to delete. Use the `show` command for each of the items listed by the error message to display which entries reference the schedule. You may need to use the `-instance` parameter to display more detail.

Parameters

`[-cluster <Cluster name>] - Cluster`

This parameter specifies the name of the cluster on which you want to delete a schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`[-vserver <vserver name>] - Vserver`

This parameter specifies the name of the Vserver on which you want to delete a schedule.

`-name <text> - Schedule Name`

Use this parameter with the name of an existing schedule to specify the schedule you want to delete.

Examples

The following example deletes a schedule named overnightbackup:

```
cluster1::> job schedule delete -name overnightbackup
```

job schedule show-jobs

Display the list of jobs by schedule

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `job schedule show-jobs` command displays information about jobs that are associated with schedules.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-name <text>] - Schedule Name

Use this parameter to display information only about the jobs that are associated with the schedule you specify.

[-affinity {Cluster|Node}] - Cluster / Node

Use this parameter to display information only about the jobs that match the affinity value you specify.

[-owner <text>] - Owner

Use this parameter to display information only about the jobs that are owned by the nodes you specify.

[-jobid <integer>] - ID

Use this parameter to display information only about the jobs that match the ID or range of IDs that you specify.

[-jobname <text>] - Job Name

Use this parameter to display information only about the jobs that match the name you specify.

[-scheduleuuid <UUID>] - Schedule Uuid

displays the Uuid of the specific job schedule.

Examples

The following example shows information about schedules that are associated with jobs:

```
cluster1::> job schedule show-jobs
Name          Type      Owner                               Job ID   Job Name
Schedule Uuid
-----
hourly         Cluster  -                               98644    mirror-hourly

5 entries were displayed.
```

job schedule show

Display a list of available schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule show` command displays information about schedules.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster

Selects the schedules that match this parameter value.

[-vserver <vserver name>] - Vserver

Selects the schedules that match this parameter value. These job schedules can only be used by consumers in that Vserver.

[-name <text>] - Schedule Name

Selects the schedules that match this parameter value.

[-type {cron|interval|builtin}] - Schedule Type

Selects the schedules that match this parameter value.

[-description <text>] - Description

Selects the schedules that match this parameter value.

Examples

The following example displays information about all schedules:

```
cluster1::> job schedule show
Cluster      Vserver      Name      Type      Description
-----
cluster1
      data_vs_1
            5min      cron
@:00,:05,:10,:15,:20,:25,:30,:35,:40,:45,:50,:55
            daily      cron      @0:10
            hourly      cron      @:05
            monthly      cron      1@0:20
            weekly      cron      Sun@0:15
```

job schedule cron create

Create a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron create` command creates a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule will run.

If you specify values for both days of the month and days of the week, they are considered independently. For example, a cron schedule with the day specification Friday, 13 runs every Friday and on the 13th day of each month, not just on every Friday the 13th.

Parameters

[`-cluster <Cluster name>`] - Cluster

This parameter specifies the name of the cluster on which you want to create a cron schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

[`-vserver <vserver name>`] - Vserver

This parameter specifies the name of the Vserver on which you want to create a cron schedule.

`-name <text>` - Name

Use this parameter to specify the name of the cron schedule that you want to create.

[`-month <cron_month>,...`] - Month

Use this parameter to specify months in which the schedule runs. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, and all. Specify "all" to run the schedule every month.

[`-dayofweek <cron_dayofweek>,...`] - Day of Week

Use this parameter to specify days of the week on which the schedule runs. Valid values are Sunday, Monday, Tuesday, Thursday, Friday, and Saturday, and all. Specify "all" to run the schedule every day.

[`-day <cron_dayofmonth>,...`] - Day

Use this parameter to specify days of the month on which the schedule runs. Valid values range from 1 to 31.

[`-hour <cron_hour>,...`] - Hour

Use this parameter to specify the hours value of the time of day at which the schedule runs. Valid values range from 0 (midnight) to 23 (11:00 p.m.). Specify "all" to run the schedule every hour.

`-minute <cron_minute>,...` - Minute

Use this parameter to specify the minutes portion of the time of day at which the schedule runs. Valid values range from 0 to 59.

Examples

The following example creates a cron schedule named weekendcron that runs on weekend days (Saturday and Sunday) at 3:00 a.m.

```
cluster1::> job schedule cron create -name weekendcron -dayofweek
"Saturday, Sunday" -hour 3 -minute 0
```

job schedule cron delete

Delete a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron delete` command deletes a cron schedule. Use the [job schedule cron show](#) command to display all current cron schedules.

You cannot delete any cron schedules that are associated with jobs. Use the [job schedule show-jobs](#) command to display jobs by schedule.

Parameters

`[-cluster <Cluster name>]` - Cluster

This parameter specifies the name of the cluster on which you want to delete a cron schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`[-vserver <vserver name>]` - Vserver

This parameter specifies the name of the Vserver on which you want to delete a cron schedule.

`-name <text>` - Name

Use this parameter with the name of an existing cron schedule to specify the cron schedule that you want to delete.

Examples

The following example deletes a cron schedule named `midnightcron`:

```
cluster1::> job schedule cron delete -name midnightcron
```

- [job schedule show-jobs](#)

job schedule cron modify

Modify a cron schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron modify` command modifies a cron schedule. A cron schedule, like a UNIX cron job, runs at a specified time. You can also specify months, days of the month, or days of the week on which the schedule runs. Use the [job schedule cron show](#) command to display all current cron schedules. See the documentation for [job schedule cron show](#) for more information about how cron schedules work.

Modifying one parameter of a cron schedule does not affect the other parameters. For example, if cron schedule is set to run at 3:15 AM, and you modify the "hour" parameter to 4, the schedule's new time will be 4:15am. To clear a parameter of the schedule's interval, you must explicitly set that portion to "0" or "-". Some parameters can also be set to "all".

Parameters

`[-cluster <Cluster name>] - Cluster`

Use this parameter to specify the cluster of an existing cron schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

`[-vserver <vserver name>] - Vserver`

Use this parameter to specify the Vserver of an existing cron schedule you want to modify.

`-name <text> - Name`

Use this parameter with the name of an existing cron schedule to specify the cron schedule you want to modify.

`[-month <cron_month>,...] - Month`

Use this parameter to specify a new "month" value for the cron schedule. Valid values are January, February, March, April, May, June, July, August, September, October, November, December, or all. Specify "all" to run the schedule every month.

`[-dayofweek <cron_dayofweek>,...] - Day of Week`

Use this parameter to specify a new "day of week" value for the cron schedule. Valid values include Sunday, Monday, Tuesday, Thursday, Friday, Saturday, or all. Specify "all" to run the schedule every day.

`[-day <cron_dayofmonth>,...] - Day`

Use this parameter to specify a new "day of month" value for the cron schedule. Valid values range from 1 to 31.

`[-hour <cron_hour>,...] - Hour`

Use this parameter to specify a new "hour of the day" value for the cron schedule. Valid values range from 0 (midnight) to 23 (11:00 p.m.), Specify "all" to run the schedule every hour.

`[-minute <cron_minute>,...] - Minute`

Use this parameter to specify a new "minute of the hour" value for the cron schedule. Valid values range from 0 to 59.

Examples

The following example modifies a cron schedule named weekendcron so that it runs at 3:15 a.m.:

```
cluster1::> job schedule cron modify -name weekendcron -hour 3 -minute 15
```

- [job schedule cron show](#)

job schedule cron show

Show cron schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule cron show` command displays information about cron schedules. A cron schedule runs a job at a specified time on specified days.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster

Selects the cron schedules that match this parameter value.

[-vserver <vserver name>] - Vserver

Selects the cron schedules that match this parameter value. These job schedules can only be used by consumers in that Vserver.

[-name <text>] - Name

Selects the cron schedules that match this parameter value.

[-month <cron_month>,...] - Month

Selects the cron schedules that match this parameter value. Valid values are January , February , March , April , May , June , July , August , September , October , November , December , or all .

[-dayofweek <cron_dayofweek>,...] - Day of Week

Selects the cron schedules that match this parameter value. Valid values include Sunday , Monday , Tuesday , Wednesday , Thursday , Friday , Saturday , or all .

[-day <cron_dayofmonth>,...] - Day

Selects the cron schedules that match this parameter value. Valid values range from 1 to 31 .

[-hour <cron_hour>,...] - Hour

Selects the cron schedules that match this parameter value.

[-minute <cron_minute>,...] - Minute

Selects the cron schedules that match the minute or range of minutes that you specify.

[-description <text>] - Description

Selects the cron schedules that match this parameter value.

Examples

The following example displays information about all current cron schedules:

```
cluster1::> job schedule cron show
Cluster      Vserver      Name      Description
-----
cluster1
            data_vs_1
                    5min
@:00,:05,:10,:15,:20,:25,:30,:35,:40,:45,:50,:55
                    8hour      @2:15,10:15,18:15
                    weekly      Sun@0:15
```

The following example displays information about the cron schedule named weekly:

```
cluster1::> job schedule cron show -name weekly -instance
Cluster: cluster1
      Vserver: data_vs_1
      Name: weekly
      Month: -
Day of Week: Sunday
      Day: -
      Hour: 0
      Minute: 15
Description: Sun@0:15
```

job schedule interval create

Create a schedule that runs on an interval

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval create` creates an interval schedule. An interval schedule runs jobs at specified intervals after the previous job finishes. For instance, if a job uses an interval schedule of 12 hours and takes 30 minutes to complete, the job runs at the following times:

- Day one at 8:00 a.m. (the job's initial run)
- Day one at 8:30 p.m.
- Day two at 9:00 a.m.
- Day two at 9:30 p.m.

Each of the numerical parameters of the interval must be a whole number. These parameters can be used individually, or combined to define complex time values. For example, use a value of 1 day, 12 hours to create an interval of 1.5 days.

Large parameter values are converted into larger units. For example, if you create a schedule with an interval

of 36 hours, the [job schedule interval show](#) command will display it with an interval of 1 day 12 hours.

Parameters

[-cluster <Cluster name>] - Cluster

This parameter specifies the name of the cluster on which you want to create an interval schedule. By default, the schedule is created on the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver on which you want to create an interval schedule.

-name <text> - Name

Use this parameter to specify the name of the interval schedule you want to create.

[-days <integer>] - Days

Use this parameter to specify the "days" portion of the schedule's interval. A day is one calendar day.

[-hours <integer>] - Hours

Use this parameter to specify the "hours" portion of the schedule's interval.

[-minutes <integer>] - Minutes

Use this parameter to specify the "minutes" portion of the schedule's interval.

[-seconds <integer>] - Seconds

Use this parameter to specify the "seconds" portion of the schedule's interval.

Examples

The following example creates an interval schedule named `rollingdaily` that runs six hours after the completion of the previous occurrence of the job:

```
cluster1::> job schedule interval create -name rollingdaily -hours 6
```

Related Links

- [job schedule interval show](#)

job schedule interval delete

Delete an interval schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval delete` command deletes an interval schedule. Use the [job schedule interval show](#) command to display all current interval schedules.

You cannot delete interval schedules that are currently being run. Use the [job schedule show-jobs](#) command to

display jobs by schedule.

Parameters

[-cluster <Cluster name>] - Cluster

This parameter specifies the name of the cluster on which you want to delete an interval schedule. By default, the schedule is deleted from the local cluster. In a MetroCluster configuration, the partner cluster can be specified if the local cluster is in switchover state.

[-vserver <vserver name>] - Vserver

This parameter specifies the name of the Vserver on which you want to delete an interval schedule.

-name <text> - Name

Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to delete.

Examples

The following example deletes an interval schedule named rollingdaily:

```
cluster1::> job schedule interval delete -name rollingdaily
```

Related Links

- [job schedule interval show](#)
- [job schedule show-jobs](#)

job schedule interval modify

Modify an interval schedule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval modify` command modifies an interval schedule. An interval schedule runs jobs at a specified interval after the previous job finishes. Use the [job schedule interval show](#) command to display all current interval schedules. See the documentation of [job schedule interval show](#) for more information on how interval schedules work.

Modifying one parameter of a schedule's interval does not affect the other parameters. For example, if a schedule's interval is 1 day 12 hours, and you modify the "hours" parameter to 16, the schedule's new interval is 1 day 16 hours. To clear a parameter of the schedule's interval, you must explicitly set that parameter to "0" or "-".

Parameters

[-cluster <Cluster name>] - Cluster

Use this parameter to specify the cluster of an existing interval schedule you want to modify. The local cluster is provided as the default value. In a MetroCluster configuration, the partner cluster can be specified

if the local cluster is in switchover state.

[`-vserver <vserver name>`] - Vserver

Use this parameter to specify the Vserver of an existing interval schedule you want to modify.

`-name <text>` - Name

Use this parameter with the name of an existing interval schedule to specify the interval schedule you want to modify.

[`-days <integer>`] - Days

Use this parameter to specify a different "days" value for the schedule's interval.

[`-hours <integer>`] - Hours

Use this parameter to specify a different "hours" value for the schedule's interval.

[`-minutes <integer>`] - Minutes

Use this parameter to specify a different "minutes" value for the schedule's interval.

[`-seconds <integer>`] - Seconds

Use this parameter to specify a different "seconds" value for the schedule's interval.

Examples

The following example sets the schedule named `rollingdaily` to run every eight hours:

```
cluster1::> job schedule interval modify -name rollingdaily -hours 8
```

Related Links

- [job schedule interval show](#)

job schedule interval show

Show interval schedules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `job schedule interval show` command displays information about interval schedules.

Parameters

{ [`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [`-instance`] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster

Selects the interval schedules that match this parameter value.

[-vserver <vserver name>] - Vserver

Selects the interval schedules that match this parameter value. These job schedules can only be used by consumers in that Vserver.

[-name <text>] - Name

Selects the interval schedules that match this parameter value.

[-days <integer>] - Days

Selects the interval schedules that match the day value or range of values you specify.

[-hours <integer>] - Hours

Selects the interval schedules that match the hour value or range of values you specify.

[-minutes <integer>] - Minutes

Selects the interval schedules that match the minute value or range of values you specify.

[-seconds <integer>] - Seconds

Selects the interval schedules that match the second value or range of values you specify.

[-description <text>] - Description

Selects the interval schedules that match the description you specify.

Examples

The following example displays information about all interval schedules:

```
cluster1::> job schedule interval show
Cluster      Vserver      Name      Description
-----
cluster1     data_vs_1    rollingdaily
                        Every 8h
```

lun commands

lun convert-from-namespace

Transition an existing NVMe namespace into a LUN.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command transitions an existing NVMe namespace in-place into a LUN within a volume in a Vserver. When performing an in-place transition, the application data remains unchanged and only the metadata gets modified.

When using this command, it is necessary that any existing maps to an NVMe subsystem for this namespace be removed first. If any maps exist for the specified namespace, you will receive an error message.

Only NVMe namespaces with a block size of 512 bytes can be transitioned into a LUN. You will receive an error message if the NVMe namespace has a block size different from 512 bytes.

Parameters

-vserver <Vserver Name> - Vserver Name

The name of the Vserver containing the NVMe namespace. If only one data Vserver exists, you do not need to specify this parameter.

-namespace-path <path> - Path of the NVMe namespace

Specifies the path of the NVMe namespace you want to transition into LUN. Examples of correct namespace paths: `/vol/vol1/ns1` and `/vol/vol1/qtree1/ns1`

Examples

```
cluster1::> lun convert-from-namespace -vserver vs1 -namespace-path
/vol/vol1/ns1
```

Transitions namespace *ns1* in-place to LUN within volume *vol1* in Vserver *vs1*.

lun create

Create a new LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new LUN of a specific size. You cannot create a LUN at a path that already exists. + You must create LUNs at the root of a volume or qtree. You can not create LUNs in the Vserver root volume. + You might find it useful to provide a meaningful path name for the LUN and containing volume. For example,

you might choose a name that describes how the LUN is used, such as the name of the application, the type of data that it stores, or the user accessing the data. Examples are `/vol/database/lun0`, `/vol/finance/lun1`, and `/vol/bill/lun2`. + It is recommended that you distribute LUNs across the cluster. + When you can create a LUN, the size of the LUN could be larger than what you specified. The system generates a message if the size of the LUN is different from what you specified. + By default, when you create a LUN, it is online and it is space-reserved. Use the `lun offline` command to take a LUN offline. When you set space reserved to false, the LUN is non-space reserved. +

For non-space reserved LUNs, write operations to that LUN might fail due to insufficient disk space. As a result, the host application or operating system might crash.

When you create a LUN from a file, that file cannot be deleted without deleting the LUN itself.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the new LUN. The LUN path cannot contain any files. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`

| -volume <volume name> - Volume Name

Specifies the volume that contains the new LUN.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the new LUN.

-lun <text> - LUN Name }

Specifies the new LUN name. A LUN name is a case-sensitive name and has the following requirements:

- Must contain one to 255 characters. Spaces are not allowed.
- Can contain the letters A-Z, a-z, numbers 0-9, "-", "_", "}", "{", and ".".

{ -s, -size <size> - LUN Size

Specifies the size of the LUN in bytes. You can specify a one-character multiplier suffix:

- c (1 byte)
- w (2 bytes)
- B (512 bytes)
- k (1024 bytes)
- M (k*k bytes)
- G (k*m bytes)
- T (m*m bytes)

[-use-exact-size <true>] - Use Exact Size (privilege: advanced)

Create the LUN using the exact value specified by the `-size` parameter instead of rounding the size to best fit the LUN geometry. Size of the LUN must be a multiple of 512 bytes.

| [-f, -file-path <text>] - File Path }

Creates a LUN using the file path as the source.

| [-foreign-disk <text>] - Foreign Disk Serial number (privilege: advanced) }

LUN is created with the same attributes (size, alignment, bytes per sector and so on) as the specified foreign disk.

[-P, -prefix-size <size>] - Prefix Size (privilege: advanced)

Specifies the size of the prefix stream for the new LUN.

-t, -ostype <LUN Operating System Format> - OS Type

Specifies the OS type for the new LUN. + On an All SAN Array, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hpux - the LUN will be used with HP-UX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- solaris - the LUN will be used with Solaris slice partitioning.
- vmware - the LUN will be used with VMware VMFS.
- windows - the LUN will be used with Microsoft Windows.
- Xen - the LUN will be used with Xen.

On all other clusters, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hpux - the LUN will be used with HP-UX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- netware - the LUN will be used with NetWare.
- openvms - the LUN will be used with Open-VMS.
- solaris - the LUN will be used with Solaris slice partitioning.
- solaris_efi - the LUN will be used with Solaris EFI partitioning.
- vmware - the LUN will be used with VMware VMFS.
- windows - the LUN will be used with a Master Boot Record (MBR) partition table on Microsoft Windows 2003 or earlier.
- windows_2008 - the LUN will be used with Microsoft Windows 2008 or later.
- windows_gpt - the LUN will be used with a GUID Partition Type (GPT) partition table on Microsoft Windows.
- xen - the LUN will be used with Xen

[-space-reserve {enabled|disabled}] - Space Reservation

Specifies whether the space reservation setting is *enabled* or *disabled* for the new LUN. If you set the parameter to *enabled*, the LUN is space-reserved. If you set the parameter to *disabled*, the LUN is non-space reserved. The default is *enabled*.

`[-comment <text>]` - Comment

A description for the LUN you want to create. If the comment string contains white space, you must enclose the comment string in double quotes. The limit is 254 characters.

`[-space-allocation {enabled|disabled}]` - Space Allocation

Specifies the value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard. + Specifying *enabled* for this parameter enables support for the SCSI Thin Provisioning features. + Specifying *disabled* for this parameter disables support for the SCSI Thin Provisioning features. + Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation. + The default is *enabled*.

`[-class {regular|protocol-endpoint|vvol}]` - Class

Specifies the class of the new LUN. The class types are:

- regular - the LUN is for normal blocks protocol access. This is the default value.
- protocol-endpoint - the LUN is a vvol protocol endpoint.
- vvol - the LUN is a vvol data LUN.

`{ [-qos-policy-group <text>] - QoS Policy Group`

This optionally specifies which QoS policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a LUN, the system will not monitor and control the traffic to it.

If you specify this parameter for a LUN that you want to create from a file and that file belongs to a QoS policy group, ONTAP adds the LUN to the specified policy group and removes the file from its policy group. Both the file and the LUN that you created from the file cannot belong to QoS policy groups.

`[-qos-adaptive-policy-group <text>] - QoS Adaptive Policy Group }`

This optionally specifies which QoS adaptive policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) and service level agreements (SLAs) that adjust based on the LUN's allocated space or used space.

`[-caching-policy <text>] - Caching Policy Name`

This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.

- `all_read_random_write` - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- `all` - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is `auto`.

Examples

```
cluster1::> lun create -vserver vs1 -path /vol/vol1/lun1 -size 100M
               -ostype linux
```

Creates a 100MB LUN at path `/vol/vol1/lun1` in Vserver `vs1`. The OS type is Linux, and the state is online.

lun delete

Delete the LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes a LUN from a specified Vserver and volume. If the LUN is mapped and online, the `force` option is required to delete it.

If a LUN is mapped to an initiator group, you can unmap it by using the [lun unmap](#) command. If a LUN is online, you take it offline by using the `lun offline` command.

If you create a LUN from a file, you cannot remove the file while the LUN is linked to it. If you want to remove the file, you must first delete the LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN you want to delete. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtreen1/lun1`

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN you want to delete.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN you want to delete.

-lun <text> - LUN Name }

Specifies the LUN that you want to delete.

[-f, -force <true>] - Force Deletion of an Online and Mapped LUN

Force deletion of an online LUN that is mapped to an initiator group.

[-force-fenced <true>] - Force Deletion of a Fenced LUN

Force deletion of a LUN that is currently fenced.

[-disable-smas-proxy <true>] - Disable SMAS Proxy

Force the modification to run locally without sending operations to the source of the SnapMirror Synchronous relationship. The operation may still fail if not supported on the secondary side in the current state.

Examples

```
cluster1::> lun delete -vserver vs1 -path /vol/vol1/lun1
```

Deletes the LUN at path /vol/vol1/lun1 on Vserver vs1.

- [lun unmap](#)

lun maxsize

Display the maximum possible size of a LUN on a given volume or qtree.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command returns the maximum size of LUNs for different OS types in a volume or qtree. The command also includes possible maximum size for LUNs with or without snapshots. You can specify the path of the volume or qtree to determine the maximum size of a LUN that you want to create within that volume or qtree.

If you do not specify a path, the command returns the maximum LUN size for each OS type for all volumes and qtrees in a cluster.

The available space in a volume can change over time which means that the size reported by `lun maxsize` can change as well. In addition, the maximum LUN size allowed in a [lun resize](#) command may be less than the size reported by `lun maxsize`.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Specifies the Vserver.

{ [-path <qtree path>] - Volume or Qtree Path

Specifies the path of the root volume or qtree. Examples of correct volume and qtree paths are `/vol/vol1` and `/vol/vol1/qtree1`.

[-volume <volume name>] - Volume Name

Specifies the volume that contains the LUN you want to get the maximum size for.

[-qtree <qtree name>] - Qtree Name }

Specifies the qtree that contains the LUN you want to get the maximum size for.

[-t, -ostype <text>] - OS Type

Specifies the OS type for the new LUN. + On an All SAN Array, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hpux - the LUN will be used with HP-UX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- solaris - the LUN will be used with Solaris slice partitioning.
- vmware - the LUN will be used with VMware VMFS.
- windows - the LUN will be used with Microsoft Windows.
- Xen - the LUN will be used with Xen.

+ On all other clusters, the following OS types are supported:

- aix - the LUN will be used with AIX.
- hpux - the LUN will be used with HP-UX.
- hyper_v - the LUN will be used with Microsoft Hyper-V.
- linux - the LUN will be used with Linux.
- netware - the LUN will be used with NetWare.
- openvms - the LUN will be used with Open-VMS.
- solaris - the LUN will be used with Solaris slice partitioning.
- solaris_efi - the LUN will be used with Solaris EFI partitioning.
- vmware - the LUN will be used with VMware VMFS.
- windows - the LUN will be used with a Master Boot Record (MBR) partition table on Microsoft Windows 2003 or earlier.
- windows_2008 - the LUN will be used with Microsoft Windows 2008 or later.

- windows_gpt - the LUN will be used with a GUID Partition Type (GPT) partition table on Microsoft Windows.
- xen - the LUN will be used with Xen

[-complete-ss-reserve <size>] - With Complete Snapshot Reserve

Shows the maximum size possible of a LUN if you have the complete snapshot reserve enabled.

[-ss-reserve <size>] - With Snapshot Reserve

Shows the maximum size possible of a LUN if you have snapshot reserve enabled.

[-without-ss-reserve <size>] - Without Snapshot Reserve

Shows the maximum size possible of a LUN if you have no snapshot reserve enabled.

Examples

```
cluster1::> lun maxsize -vserver vs1 -volume vol1 -ostype linux
Virtual
Complete
Server      Volume      Qtree      OS Type    SS Reserve  Reserve    SS
Reserve
-----
vs1         vol1         ""         linux      45MB        45MB
45MB
```

Displays the maximum size of a LUN for the OS type linux.

```
cluster1::> lun maxsize -vserver vs1 -volume vol1
```

Complete				Without	With SS
Vserver	Volume	Qtree	OS Type	SS Reserve	Reserve SS
Reserve					
vs1	vol1	""	aix	178MB	178MB
178MB					
	hpux	178MB	178MB	178MB	
	hyper_v	172.6MB	172.6MB	172.6MB	
	linux	178MB	178MB	178MB	
	netware	178MB	178MB	178MB	
	openvms	178MB	178MB	178MB	
	solaris	178MB	178MB	178MB	
	solaris_efi	178MB	178MB	178MB	
	windows	172.6MB	172.6MB	172.6MB	
	windows_2008	172.6MB	172.6MB	172.6MB	
	windows_gpt	172.6MB	172.6MB	172.6MB	
	xen	178MB	178MB	178MB	

12 entries were displayed.

Displays the maximum size of LUNs for all OS types on volume vol1.

- [lun resize](#)

lun modify

Modify a LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies LUN attributes. Because LUN modifications can result in data corruption or other problems, we recommend that you call technical support if you are unsure of the possible consequences of modifying a LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path for the LUN you want to modify. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

| -volume <volume name> - Volume Name

Specifies the volume for the LUN you want to modify.

-qtree <qtree name> - Qtree Name

Specifies the qtree for the LUN you want to modify.

-lun <text> - LUN Name }

Specifies the name for the LUN you want to modify. A LUN name is a case-sensitive name and has the following requirements:

- Must contain one to 255 characters. Spaces are not allowed.
- Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), right bracket (}), left bracket ({) and period (.).
- Must start with a letter or number.

[-space-reserve {enabled|disabled}] - Space Reservation

Specifies whether the space reservation setting is enabled or disabled for a LUN. If you set the parameter to *enabled*, the LUN is space-reserved. If you set the parameter to *disabled*, the LUN is non-space reserved. The default is *enabled*.

{ [-serial <text>] - Serial Number

Specifies the serial number for the LUN you want to modify.

The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:

- upper- and lower-case letters
- numbers
- the characters: , <, >, /, -, #, \$, %, *, +, =, ?, @, [, !,], ^, ~

Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command line:

- The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command `set -active-help false`. Active help can later be re-enabled with the command `set -active-help true`.
- The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").

Alternatively, the `-serial-hex` parameter can be used to set the LUN serial number specifying the serial number encoded in hexadecimal form.

| [-serial-hex <Hex String>] - Serial Number (Hex) }

Specifies the serial number, encoded in hexadecimal form, for the LUN you want to modify. See the description of the `-serial` parameter for additional details.

[*-comment* <text>] - Comment

Specifies the comment for the LUN you want to modify.

[*-space-allocation* {*enabled*|*disabled*}] - Space Allocation

Specifies the new value for the space allocation attribute of the LUN. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying *enabled* for this parameter enables support for the SCSI Thin Provisioning features.

Specifying *disabled* for this parameter disables support for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

[*-state* {*online*|*offline*|*nvfail*|*space-error*|*foreign-lun-error*}] - State

Specifies the administrative state of a LUN. The options are:

- online
- offline

{ [*-device-legacy-id* <integer>] - Device Legacy ID

Specifies the device legacy ID for the LUN you want to modify.

| [*-device-binary-id* <text>] - Device Binary ID

Specifies the device binary ID for the LUN you want to modify.

| [*-clear-binary-id* <true>] - Clear Device Binary ID }

Clears the binary format of the optional device ID.

{ [*-device-text-id* <text>] - Device Text ID

Specifies the device text ID for the LUN you want to modify.

| [*-clear-text-id* <true>] - Clear Device Text ID }

Clears the text format of the optional device ID.

{ [*-qos-policy-group* <text>] - QoS Policy Group

This optionally specifies which QoS policy group to apply to the lun. This policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a lun, the system will not monitor and control the traffic to it. To remove this lun from a policy group, enter the reserved keyword "none".

| [*-qos-adaptive-policy-group* <text>] - QoS Adaptive Policy Group }

This optional parameter specifies which QoS adaptive policy group to apply to the LUN. This policy group defines measurable service level objectives (SLOs) and Service Level Agreements (SLAs) that adjust based on the LUN's allocated space or used space. To remove this LUN from an adaptive policy group, enter the reserved keyword "none".

[*-caching-policy* <text>] - Caching Policy Name

This optionally specifies the caching policy to apply to the LUN. A caching policy defines how the system caches this volume's data in Flash Cache modules. If a caching policy is not assigned to this LUN, the

system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

[~~-disable-smas-proxy~~ <true>] - Disable SMAS Proxy (privilege: advanced)

Force the modification to run locally without sending the operation to the source of the SnapMirror Synchronous relationship. The operation may still fail if not supported on the secondary side in the current state.

Examples

```
cluster1::> lun modify -path /vol/vol1/lun1 -space-reserve disable
```

Disables the space reserve attribute for LUN /vol/vol1/lun1.

```
cluster1::> lun modify -path /vol/vol1/lun1 -state offline
```

Takes the LUN /vol/vol1/lun1 offline.

```
cluster1::> lun modify -path /vol/vol1/lun1 -comment "new comment"
```

Adds the comment "new comment" to the LUN /vol/vol1/lun1.

Related Links

- [set](#)

lun move-in-volume

Move a LUN within a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command moves a LUN to a new path in the same volume or renames a LUN. If you are organizing LUNs in a qtree, the command moves a LUN from one qtree to another. You can perform a LUN move while the LUN is online and serving data. The process is non-disruptive. Use the [lun move start](#) command to move a LUN to a different volume within the same Vserver.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN you want to move. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

| -volume <volume name> - Volume Name

Specifies the volume of the LUN you want to move.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree of the LUN you want to move.

-lun <text> - LUN Name }

Specifies the name of the LUN that you want to move.

{ -new-path <path> - New LUN Path

Specifies the new path of the LUN. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

| [-new-qtree <qtree name>] - New Qtree Name

Specifies the new qtree name that you want to move the LUN to.

-new-lun <text> - New LUN Name }

Specifies the new name of the LUN.

Examples

```
cluster1::> lun move-in-volume -vserver vs1 -volume vol1 -lun lun1 -new
-lun newlun1
```

Renames *lun1* to *newlun1* on Vserver *vs1* and volume *vol1*.

```
cluster1::> lun show -vserver vs1 -volume vol1
server    Path                               State   Mapped   Type
Size
-----
-----
s1        /vol/vol1/A/lun1                       online  mapped   linux
10MB

cluster1::> lun move-in-volume -vserver vs1 -path /vol/vol1/A/lun1 -new
-path /vol/vol1/B/lun1

cluster1::> lun show -vserver vs1 -volume vol1
server    Path                               State   Mapped   Type
Size
-----
-----
s1        /vol/vol1/B/lun1                       online  mapped   linux
10MB
```

Moves LUN *lun1* from qtree *A* to qtree *B* on volume *vol1* .

Related Links

- [lun move start](#)

lun resize

Changes the size of the LUN to the input value size.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command resizes an existing LUN.

If the value specified by the *-size* parameter is larger than the current size of the LUN, the LUN size will be increased to at least the requested size by appending new empty blocks to the end of the LUN. After resizing, follow the procedures provided by your host operating system to discover the new size of the LUN and expand the filesystem on the LUN.

If the value specified by the *-size* parameter is smaller than the current size of the LUN, the LUN size will be reduced to no less than the requested size by truncating blocks at the end of the LUN beyond the new size. All data in the truncated blocks will be lost. Prior to reducing the size of a LUN, you must follow the procedure provided by the host operating system to resize and migrate the filesystem on the LUN off the blocks that will be truncated. Not all operating systems and filesystems support shrinking an existing filesystem.

You will receive an error message warning of the potential for data loss if the command would reduce the size of the LUN. Once the host filesystem has been migrated off the blocks to be truncated, use the *-force*

parameter to allow the resize to proceed.

Consider taking a snapshot of the volume before reducing the size of the LUN. After the LUN has been resized and the contents verified, you can delete the snapshot.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

{ -path <path> - LUN Path

Specifies the path of the LUN that you want to resize. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN that you want to resize.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN that you want to resize.

-lun <text> - LUN Name }

Specifies the LUN name that you want to resize.

[-f, -force <true>] - Force Reduce LUN Size

Specifies the command may reduce the size of the specified LUN. If the specified `-size` is smaller than the existing size of the LUN and this parameter is not specified, the command will fail with an error instead of potentially destroying data. See the overall command description above for more information concerning reducing the size of a LUN.

[-size <size>] - New Size

Specifies the requested new size of the LUN. The actual size after resizing may be slightly larger than requested. If the value is prefixed with `+` or `-`, the new size will be calculated as the existing size plus or minus the value provided. The following multipliers are recognized as suffixes:

- B - Value specifies number of blocks (512 bytes)
- k - Value specifies number of kilobytes (1024 bytes)
- M - Value specifies number of megabytes (1024 kilobytes)
- G - Value specifies number of gigabytes (1024 megabytes)
- T - Value specifies number of terabytes (1024 gigabytes)

Examples

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size 500M
```

Resizes the LUN */vol/vol1/lun1* in Vserver *vs1* to 500 MB. If the LUN is already larger than 500 MB, this command will fail.

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size +50M
```

Adds 50 MB of space to LUN /vol/vol1/lun1

```
cluster1::> lun resize -vserver vs1 -path /vol/vol1/lun1 -size -10m
```

Error: command failed: Reducing LUN size without coordination with the host system may cause permanent data loss or corruption. Use the force flag to allow LUN size reduction.

```
cluster1::> lun resize -path /vol/vol1/lun1 -size -100M -force
```

Reduces the LUN /vol/vol1/lun1 by 100 MB.

lun show

Display a list of LUNs

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The command displays information for LUNs. Use the *instance* parameter to display additional LUN details, such as serial number and space-reservation settings.

Parameters

{ [-fields <fieldname>,...]

If you specify the *-fields <fieldname>, ...* parameter, the command output also includes the specified field or fields. You can use *'-fields ?'* to display the fields to specify.

| [-instance] }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the LUNs that match this parameter value.

{ [-path <path>] - LUN Path

Selects the LUNs that match this parameter value. Examples of correct LUN paths are */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*.

| [-volume <volume name>] - Volume Name

Selects the LUNs that match this parameter value.

[-qtree <qtree name>] - Qtree Name

Selects the LUNs that match this parameter value.

[-lun <text>] - LUN Name }

Selects the LUNs that match this parameter value.

[-s, -size <size>] - LUN Size

Selects the LUNs that match this parameter value.

[-P, -prefix-size <size>] - Prefix Size (privilege: advanced)

Selects the LUNs that match the prefix stream size that you specify.

[-t, -ostype <LUN Operating System Format>] - OS Type

Selects the LUNs that match this parameter value. The operating system types are:

- *aix* - the LUN stores AIX data.
- *hpux* - the LUN stores HP-UX data.
- *hyper_v* - the LUN stores Windows Server 2008 or Windows Server 2012 Hyper-V data
- *linux* - the LUN stores a Linux raw disk without a partition table.
- *netware* - the LUN stores NetWare data.
- *openvms* - the LUN stores Open-VMS data
- *solaris* - the LUN stores Solaris raw disk in a single-slice partition.
- *solaris_efi* - the LUN stores Solaris_EFI data.
- *vmware* - the LUN stores VMware data
- *windows* - the LUN stores a raw disk type in a single-partition Windows disk using the Master Boot Record (MBR) partitioning style.
- *windows_gpt* - the LUN stores Windows data using the GUID Partition Type (GPT) partitioning style.
- *windows_2008* - the LUN stores Windows data for Windows 2008 or later systems.
- *xen* - the LUN stores Xen data

[-space-reserve {enabled|disabled}] - Space Reservation

Selects the LUNs that match this parameter value. A value of *enabled* selects LUN that are space-reserved. A value of *disabled* selects LUNs that are non-space reserved.

[-serial <text>] - Serial Number

Selects the LUNs that match this parameter value. The LUN serial number is a twelve-character alphanumeric string containing one or more of the following:

- upper- and lower-case letters
- numbers
- the characters: , <, >, /, -, #, \$, %, *, +, =, ?, @, [, !,], ^, ~

Some of the characters that are valid in a LUN serial number also have special meaning to the cluster shell command:

- The question mark (?) activates the command line active help. In order to type a question mark as part of a LUN's serial number, it is necessary to disable active help with the command `set -active-help false` . Active help can later be re-enabled with the command `set -active-help true` .
- The number sign (#) indicates the beginning of a comment to the command line and will cause the remainder of the line to be ignored. To avoid this, enclose the serial number in double quotes (").
- The less than (<), greater than (>), asterisk (*), and exclamation point (!) influence the query behavior of the command. To use these as characters in a LUN's serial query, you must first press escape (ESC). To use these characters to influence the query, enclose the serial number, or partial serial number, in double quotes (") and apply <, >, *, or !, outside of the double quotes.

Alternatively, the `-serial-hex` parameter can be used to select LUNs using the serial number encoded in hexadecimal form.

`[-serial-hex <Hex String>] - Serial Number (Hex)`

Selects the LUNs that match this parameter value. This parameter applies to the LUN serial number encoded in hexadecimal form. See the description of the `-serial` parameter for additional details.

`[-comment <text>] - Comment`

Selects the LUNs that match this parameter value.

`[-space-reserve-honored {true|false}] - Space Reservations Honored`

Selects the LUNs that match this parameter value. A value of *true* selects LUNs that have their space reservation honored by the container volume. A value of *false* displays the LUNs that are non-space reserved.

`[-space-allocation {enabled|disabled}] - Space Allocation`

Selects the LUNs that match this parameter value. The space allocation attribute determines if the LUN supports the SCSI Thin Provisioning features defined in the Logical Block Provisioning section of the SCSI SBC-3 standard.

Specifying *enabled* for this parameter selects LUNs with support enabled for the SCSI Thin Provisioning features.

Specifying *disabled* for this parameter selects LUNs with support disabled for the SCSI Thin Provisioning features.

Hosts and file systems that do not support SCSI Thin Provisioning should not enable space allocation.

`[-container-state {online|aggregate-offline|volume-offline|error}] - LUN Container State (privilege: advanced)`

Selects the LUNs that match this parameter value. The container states are:

- *online* - The LUN's aggregate and volume are online.
- *aggregate-offline* - The LUN's aggregate is offline.
- *volume-offline* - The LUN's volume is offline.
- *error* - An error occurred accessing the LUN's volume.

`[-state {online|offline|nvfail|space-error|foreign-lun-error}] - State`

Selects the LUNs that match this parameter value. The states are:

- *online* - The LUN is online.
- *offline* - The LUN is administratively offline, or a more detailed offline reason is not available.
- *foreign-lun-error* - The LUN has been automatically taken offline due to a media error on the associated foreign LUN.
- *nvfail* - The LUN has been automatically taken offline due to an NVRAM failure.
- *space-error* - The LUN has been automatically taken offline due to insufficient space.

[-uuid <UUID>] - LUN UUID

Selects the LUNs that match this parameter value.

[-mapped {mapped|unmapped}] - Mapped

Selects the LUNs that match this parameter value. A value of `mapped` selects the LUNs that are mapped to an initiator group.

[-block-size {512|4KB}] - Physical Size of Logical Block

Selects the LUNs that match this parameter value.

[-device-legacy-id <integer>] - Device Legacy ID

Selects the LUNs that match this parameter value.

[-device-binary-id <text>] - Device Binary ID

Selects the LUNs that match this parameter value.

[-device-text-id <text>] - Device Text ID

Selects the LUNs that match this parameter value.

[-read-only {true|false}] - Read Only

Selects the LUNs that match this parameter value.

[-restore-inaccessible {true|false}] - Fenced Due to Restore

Selects the LUNs that match the state you specify. A value of `true` means that a LUN is fenced for I/O and management due to a restore operation.

[-size-used <size>] - Used Size

Selects the LUNs that match this parameter value.

[-max-resize-size <size>] - Maximum Resize Size

Selects the LUNs that match this parameter value.

[-creation-timestamp <MM/DD/YYYY HH:MM:SS>] - Creation Time

Selects the LUNs that match this parameter value.

[-class {regular|protocol-endpoint|vvol}] - Class

Selects the LUNs that match this parameter value.

[-node <nodename>] - Node Hosting the LUN

Selects the LUNs that match this parameter value.

`[-qos-policy-group <text>]` - QoS Policy Group

Selects the LUNs that match this parameter value.

A policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated. If you do not assign a policy group to a LUN, the system will not monitor and control the traffic to it.

`[-qos-adaptive-policy-group <text>]` - QoS Adaptive Policy Group

Selects the LUNs that match this parameter value.

An adaptive policy group defines measurable service level objectives (SLOs) that apply to the storage objects with which the adaptive policy group is associated.

`[-caching-policy <text>]` - Caching Policy Name

Display the LUNs that match the specified cache.

A caching policy defines the caching behavior of this LUN at the Flash Cache level. If a caching policy is not assigned to this LUN, the system uses the caching policy that is assigned to the containing volume or Vserver. If a caching policy is not assigned to the containing volume or Vserver, the system uses the default cluster-wide policy. The available caching policies are:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- all_read - Read caches all metadata, randomly read and sequentially read user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data.
- all - Read caches all data blocks read and written. It does not do any write caching.

Default caching-policy is auto.

`[-is-clone {true|false}]` - Clone

Selects the LUNs that match this parameter value.

`[-is-clone-autodelete-enabled {true|false}]` - Clone Autodelete Enabled

Selects the LUNs that match this parameter value.

`[-inconsistent-import {true|false}]` - Inconsistent Import

Selects the LUNs that match this parameter value. A value of *true* means that the import of this LUN is incomplete.

`[-serial-7-mode <text>]` - 7-mode Serial Number (privilege: advanced)

Selects the LUNs that match this parameter value.

LUNs transitioned from ONTAP 7-Mode are assigned new serial numbers for use with ONTAP. The original 7-Mode serial number is displayed in this field for reference.

[`-application <text>`] - Application

Selects the LUNs that are part of an application that matches the parameter value.

**[`-include-offline-containers <true>`] - Include LUNs on Offline Volumes and Aggregates
(privilege: advanced)**

If true, include available information for LUNs in offline aggregates and offline volumes in the output. By default, LUNs in offline aggregates and offline volumes are excluded from the output.

[`-zrto-vol-consensus {true|false}`] - ZRTO Volume consensus

Selects the LUNs that match the specified value. The status indicates whether the volume containing the LUN in a SnapMirror Synchronous relationship can process operations.

[`-consistency-group <text>`] - Consistency Group Name

Selects the LUNs that are associated with the specified consistency group.

Examples

The following example displays details of the LUN at path /vol/vol1/lun1 in Vserver vs1.

```

cluster1::> lun show -vserver vs1 -path /vol/vol1/lun1 -instance
      Vserver Name: vs1
        LUN Path: /vol/vol1/lun1
      Volume Name: vol1
        Qtree Name: ""
        LUN Name: lun1
        LUN Size: 10MB
        OS Type: linux
      Space Reservation: disabled
        Serial Number: wCVt1jIlvQWv
      Serial Number (Hex): 77435674315d496c76515776
        Comment: new comment
Space Reservations Honored: false
      Space Allocation: disabled
        State: offline
        LUN UUID: 76d2eba4-dd3f-494c-ad63-1995c1574753
        Mapped: mapped
        Block Size: 512
      Device Legacy ID: -
      Device Binary ID: -
      Device Text ID: -
        Read Only: false
Fenced Due to Restore: false
      Used Size: 5MB
      Maximum Resize Size: 64.00GB
      Creation Time: 9/14/2016 13:55:09
        Class: regular
Node Hosting the LUN: node1
      QoS Policy Group: -
      Caching Policy Name: -
        Clone: false
Clone Autodelete Enabled: false
      Inconsistent Import: false
      Application: -

```

The following example displays information for the LUN with serial number 1r/wc+9Cpbls.

```

cluster1::> lun show -serial 1r/wc+9Cpbls
Vserver  Path                               State  Mapped  Type
Size
-----
vs1      /vol/vol2/lun1                       online mapped  linux
10MB

```

The following example displays all the LUNs on Vserver vs1 and volume vol1.

```
cluster1::> lun show -vserver vs1 -volume vol1
Vserver    Path                               State    Mapped    Type
Size
-----
vs1        /vol/vol1/lun1                    offline mapped    linux
10MB
vs1        /vol/vol1/lun2                    online  mapped    windows
47.07MB
2 entries were displayed.
```

lun bind commands

lun bind create

Bind a VVol LUN to a protocol endpoint

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command creates a new binding between a protocol endpoint and a vvol LUN. If a binding between the specified endpoint and vvol already exists, the reference count for the binding is incremented by one.

For optimal results, the protocol endpoint and vvol must be hosted by the same node in the cluster.

Parameters

-vserver <Vserver Name> - Vserver name (privilege: advanced)

Specifies the name of the Vserver.

-protocol-endpoint-path <path> - Protocol Endpoint (privilege: advanced)

Specifies the path to the protocol endpoint. The specified LUN must already exist and be of class "protocol-endpoint". Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

-vvol-path <path> - VVol Path (privilege: advanced)

Specifies the path to the vvol. The specified LUN must already exist and be of the class "vvol". Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

Examples

```
cluster1::*> lun bind create -vserver vs1 -protocol-endpoint-path  
/vol/VV1/PE1 -vvol-path /vol/VV3/234ace
```

Bind the vvol /vol/VV3/234ace to the protocol endpoint /vol/VV1/PE1 in Vserver vs1.

lun bind destroy

Unbind a VVol LUN from a protocol endpoint

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Decrement the reference count of the binding between a protocol endpoint and vvol LUN. If the resulting reference count is zero, the binding is removed.

Parameters

-vserver <Vserver Name> - Vserver name (privilege: advanced)

Specifies the Vserver.

-protocol-endpoint-path <path> - Protocol Endpoint (privilege: advanced)

Specifies the path of the protocol endpoint LUN. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

-vvol-path <path> - VVol Path (privilege: advanced)

Specifies the path of the vvol LUN. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

[-force <true>] - If true, unbind the Vvol completely even if the current reference count is greater than 1. The default is false. (privilege: advanced)

Completely remove the specified binding, regardless of the current reference count.

Examples

```
cluster1::*> lun bind destroy -protocol-endpoint-path /vol/VV2/PE2 -vvol  
-path /vol/VV2/30dfab -vserver vs1
```

Remove the binding between the vvol /vol/VV2/30dfab and the protocol endpoint /vol/VV2/PE2 on Vserver vs1.

lun bind show

Show list of Vvol bindings

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Shows the configured VVol to protocol endpoint bindings.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)

Selects the bindings that match this parameter value.

[-protocol-endpoint-msid <integer>] - PE MSID (privilege: advanced)

Selects the bindings that match this parameter value.

[-protocol-endpoint-vdisk-id <text>] - PE Vdisk ID (privilege: advanced)

Selects the bindings that match this parameter value.

[-vvol-msid <integer>] - VVol MSID (privilege: advanced)

Selects the bindings that match this parameter value.

[-vvol-vdisk-id <text>] - VVol Vdisk ID (privilege: advanced)

Selects the bindings that match this parameter value.

[-vserver-uuid <UUID>] - Vserver UUID (privilege: advanced)

Selects the bindings that match this parameter value.

[-protocol-endpoint-path <path>] - Protocol Endpoint (privilege: advanced)

Selects the bindings that match this parameter value. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

[-protocol-endpoint-node <nodename>] - PE Node (privilege: advanced)

Selects the bindings that match this parameter value.

[-vvol-path <path>] - VVol (privilege: advanced)

Selects the bindings that match this parameter value. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

[-vvol-node <nodename>] - VVol Node (privilege: advanced)

Selects the bindings that match this parameter value.

[-secondary-lun <Hex 64bit Integer>] - Secondary LUN (privilege: advanced)

Selects the bindings that match this parameter value.

[*-is-optimal* {true|false}] - Optimal binding (privilege: advanced)

Selects the bindings that match this parameter value.

[*-reference-count* <integer>] - Reference Count (privilege: advanced)

Selects the bindings that match this parameter value.

Examples

```
cluster1::*> lun bind show -vserver vs1
Vserver          Protocol Endpoint          Node
                  Vvol LUN                      Secondary LUN
Optimal?
-----
vs1              /vol/VV1/PE1                cluster-node1
                  /vol/VV2/30dfab            d20000010000 false
                  /vol/VV3/234ace        d20000020000 true
                  /vol/VV3/234acf        d20000030000 true
                  /vol/VV2/PE2                cluster-node2
                  /vol/VV2/30dfab            d20000010000 true
4 entries were displayed.
```

The example above displays all the LUN bindings on Vserver vs1.

lun copy commands

lun copy cancel

Cancel a LUN copy operation before the new LUN has been created

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun copy cancel` command cancels an ongoing LUN copy operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, use the [lun delete](#) command to delete the LUN at the destination path.

All data transfers will be halted.

This is an advanced command because the preferred way to cancel a LUN copy operation is to wait until the new LUN becomes visible, and then use the [lun delete](#) command to delete the LUN.

Parameters

{ -vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path (privilege: advanced)

Specifies the path of the new LUN. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`

Examples

```
cluster1::*> lun copy cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

Cancels the copy operation identified by Vserver `vs1` and destination path `/vol/vol2/lun2`.

Related Links

- [lun delete](#)

lun copy modify

Modify an ongoing LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy modify` command modifies the maximum throughput of an ongoing copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the path of the new LUN. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`

-max-throughput {<integer>[KB|MB|GB|TB|PB]} - Maximum Transfer Rate (per sec)

Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun copy modify -vserver vs1 -destination-path /vol/vol2/lun2
-max-throughput 25MB
```

Modifies the maximum throughput for the ongoing copy job identified by Vserver *vs1* and destination path */vol/vol2/lun2* to 25 MB/sec.

lun copy pause

Pause an ongoing LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy pause` command pauses an ongoing copy operation. Use the [lun copy resume](#) command to resume the copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the path of the new LUN. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtrees1/lun1*

Examples

```
cluster1::> lun copy pause -vserver vs1 -destination-path /vol/vol2/lun2
```

Pauses the ongoing copy operation identified by Vserver *vs1* and destination path */vol/vol2/lun2*.

Related Links

- [lun copy resume](#)

lun copy resume

Resume a paused LUN copy operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy resume` command resumes a paused copy operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the path of the new LUN. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtrees1/lun1`

Examples

```
cluster1::> lun copy resume -vserver vs1 -destination-path /vol/vol2/lun2
```

Resumes the paused copy operation identified by Vserver `vs1` and destination path `/vol/vol2/lun2`.

lun copy show

Display a list of LUNs currently being copied

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy show` command shows information about LUNs currently being copied in the cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Destination Vserver Name

Selects LUN copy operations that match this parameter value.

[-destination-path <path>] - Destination Path

Selects LUN copy operations that match this parameter value.

[-source-vserver <vserver name>] - Source Vserver Name

Selects LUN copy operations that match this parameter value.

[-source-path <path>] - Source Path

Selects LUN copy operations that match this parameter value.

[-source-snapshot <snapshot name>] - Source Snapshot Name

Selects LUN copy operations that match this parameter value.

[-is-promoted-early {true|false}] - Is Destination Promoted Early

Selects LUN copy operations that match this parameter value.

[`-max-throughput` {<integer>[KB|MB|GB|TB|PB]}] - Maximum Transfer Rate (per sec)

Selects LUN copy operations that match this parameter value.

[`-job-status` {Preparing|Allocation-Map|Data|Destroying|Paused-Manual|Paused-Error|Complete|Destroyed|Terminated-Manual}] - LUN Copy Status

Selects LUN copy operations that match this parameter value. The possible values are:

- `Preparing` - the LUN copy job is in Preparing status.
- `Allocation-Map` - the LUN copy job is in Allocating status.
- `Data` - the LUN copy job is in Moving Data status.
- `Destroying` - the LUN copy job is in Destroying status.
- `Paused-Manual` - the LUN copy job is in Manually Paused status.
- `Paused-Error` - the LUN copy job is in Paused By Error status.
- `Complete` - the LUN copy job is in Complete status.
- `Destroyed` - the LUN copy job is in Destroyed status.
- `Terminated-Manual` - the LUN copy job is in Manually Terminated status.

[`-progress-percent` <percent>] - LUN Copy Progress (%)

Selects LUN copy operations that match this parameter value.

[`-elapsed-time` <time_interval>] - Elapsed Time

Selects LUN copy operations that match this parameter value.

[`-cutover-time` <time_interval>] - Cutover Time

Selects LUN copy operations that match this parameter value.

[`-is-snapshot-fenced` {true|false}] - Is Snapshot Fenced

Selects LUN copy operations that match this parameter value.

[`-is-destination-ready` {true|false}] - Is Destination Ready

Selects LUN copy operations that match this parameter value.

[`-last-failure-reason` <text>] - Last Failure Reason

Selects LUN copy operations that match this parameter value.

Examples

```
cluster1::> lun copy show
Vserver      Destination Path      Status      Progress
-----
vs1          /vol/vol2/lun1       Data        35%
vs1          /vol/vol2/lun2       Complete    100%
2 entries were displayed.
```

The example above displays information about all the LUN copy operations in the cluster.

```
cluster1::> lun copy show -vserver vs1 -destination-path /vol/vol2/lun1
-instance
Destination Vserver Name: vs1
      Destination Path: /vol/vol2/lun1
      Source Vserver Name: vs1
      Source Path: /vol/vol1/lun1
      Source Snapshot Name: -
      Is Destination Promoted Early: false
Maximum Transfer Rate (per sec): 0B
      LUN Copy Status: Data
      LUN Copy Progress (%): 35%
      Elapsed Time: 145s
      Cutover Time (secs): 0s
      Is Snapshot Fenced: true
      Is Destination Ready: true
      Last Failure Reason: -
```

The example above displays all information about the LUN being copied to `/vol/vol2/lun1` in Vserver `vs1`.

lun copy start

Start copying a LUN from one volume to another within a cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun copy start` command initiates copying of a LUN from one volume to another. The destination volume can be located in the same Vserver as the source volume (intra-Vserver copy) or in a different Vserver (inter-Vserver).

A cluster administrator must first create a Vserver peering relationship using [vserver peer create](#) before initiating an inter-Vserver LUN copy operation.

Parameters

-vserver <Vserver Name> - Destination Vserver Name

Specifies the name of the Vserver that will host the new LUN.

| -destination-path <path> - Destination Path

Specifies the path of the new LUN. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtreet1/lun1`

-source-path <path> - Source Path }

Specifies the path of the source LUN. Examples of correct LUN paths: `/vol/vol1/lun1`,

/vol/vol1/qtreet1/lun1 , and */vol/vol1/.snapshot/qtreet1/lun1*

[*-source-vserver* <*vserver name*>] - Source Vserver Name

Optionally specifies the name of the Vserver hosting the LUN to be copied.

If this parameter is not specified, it is assumed that an intra-Vserver copy operation is being initiated. The source volume is expected to be in the same Vserver as the destination volume.

[*-promote-early* <*true*>] - Promote Early

Optionally specifies that the destination LUN needs to be promoted early.

If the destination is promoted early, the new LUN will be visible immediately. However, snapshots of the volume containing the new LUN cannot be taken until the LUN copy operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN copy job will not block the creation of snapshots of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted late.

[*-max-throughput* {<*integer*>[KB|MB|GB|TB|PB]}] - Maximum Transfer Rate (per sec)

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun copy start -vserver vs2 -destination-path /vol/vol2/lun2
-source-vserver vs1 -source-path /vol/vol1/lun1
```

Starts an inter-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs2* .

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2
-source-path /vol/vol1/lun1
```

Starts an intra-Vserver copy of LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs1* .

```
cluster1::> lun copy start -vserver vs1 -destination-path /vol/vol2/lun2
-source-path /vol/vol1/.snapshot/snap1/lun1
```

Starts an intra-Vserver copy of LUN *lun1* from snapshot *snap1* of volume *vol1* in Vserver *vs1* to *lun2* on

volume *vol12* in Vserver *vs1* .

Related Links

- [vserver peer create](#)

lun igroup commands

lun igroup add

Add initiators to an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds initiators to an existing initiator group (igroup). You can add an initiator to an initiator group only if there are no LUN mapping conflicts. Mapping conflicts occur when an initiator is already paired with a LUN. If you attempt to run this command and there are LUN mapping conflicts, the command returns an error.

An initiator cannot be a member of two igroups of different OS types. For example, if you have an initiator that belongs to a Solaris igroup, the command does not allow you to add this initiator to an AIX igroup.

When you add FCP initiators, you can specify an alias instead of the initiator's World Wide Port Name (WWPN) or the iSCSI Qualified name (IQN).

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group to which you want to add a new initiator.

[-initiator <text>,...] - Initiators

Specifies the initiator that you want to add. You can specify the WWPN, IQN, or alias of the initiator.

[-child-igroups <text>,...] - Child Igroups

Specifies the child initiator groups you want to add. The initiator group inherits the initiators of any child igroups. An initiator group can have either initiators or child initiator groups, but not both simultaneously. Initiator groups can be nested to match host cluster hierarchies. If the host cluster then changes, initiators only need to be updated in the child igroups and the parent igroups inherit the changes.

[-proximal-vserver {local|peer}] - Proximal Vserver (privilege: advanced)

Specifies a Vserver to add to any initiators being added to an initiator group. *local* refers to the initiator group's Vserver. *peer* refers to the initiator group's replication peer. *proximal-vserver* can only be set for replicated initiator groups.

Examples

```
cluster1::> lun igroup add -vserver vs1 -igroup ig1 -initiator ign.1992-08.com.mv.mvinitiator
```

Adds the initiator ign.1992-08.com.mv.mvinitiator to the initiator group ig1 on Vserver vs1.

lun igroup bind

Bind an existing initiator group to a given portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command binds an initiator group to a portset so the host knows which LIFs or TPGs to access. When you bind a portset to an igroup, the host knows which iSCSI or FCP LIF to access. If you do not bind an igroup to a portset, and you map a LUN to the igroup, then the initiators in the igroup can access the LUN on any port on the Vserver.

The initiator group cannot be bound to another portset when you use this command. If you attempt to bind a portset to an initiator group that is already bound to an existing portset, the command returns an error. You can only bind an initiator group to one portset at a time.

If the initiator group is bound, use the [lun igroup unbind](#) command to unbind the initiator group from the portset. After the initiator group is unbound, you can bind it to another portset.

You can only bind an initiator group to a non-empty portset.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to bind a portset to.

-portset <text> - Portset Binding Igroup

Specifies the portset name that you want to bind an initiator group to.

Examples

```
cluster1::> lun igroup bind -vserver vs1 -igroup ig1 -portset-name ps1
```

Binds igroup ig1 to portset ps1.

- [lun igroup unbind](#)

lun igroup create

Create a new initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new initiator group (igroup). Use igroups to control which hosts have access to specific LUNs. When you bind an igroup to a portset, a host in the igroup can access the LUNs only by connecting to the target ports in the portset.

When you create an igroup, you can add multiple existing initiators by specifying them in a list, separating them with commas. Later, you can add or remove initiators from the initiator group. Use the [lun igroup add](#) command to add initiators. Use the [lun igroup remove](#) command to remove an initiator. Unless the `-initiator` option is supplied, no initiators are added to a new igroup.

You can also bind a portset to an initiator when you create an initiator group. You can modify the portset binding of an initiator group by using the [lun igroup bind](#) command or the [lun igroup unbind](#) command.

The name you assign to an igroup is independent of the name of the host that is used by the host operating system, host files, or Domain Name Service (DNS). If you name an igroup `aix1`, for example, it is not mapped to the actual IP host name (DNS name) of the host.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the name of the new initiator group. An initiator group name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.

It might be useful to provide meaningful names for igroups, ones that describe the hosts that can access the LUNs mapped to them.

{ [-protocol {mixed|fc|iscsi}] - Protocol

Specifies if the initiator group protocol is *fc*, *iscsi*, or *mixed*.

| [-f, -fc <true>] - FCP

Specifies FCP as the protocol type of the new initiator group.

| [-i, -iscsi <true>] - iSCSI }

Specifies iSCSI as the protocol type of the new initiator group.

-t, -ostype <Initiator Group OS Type> - OS Type

Specifies the operating system type for the new initiator group. The operating system type indicates the type of host operating system used by all of the initiators in the igroup. All initiators in an igroup must be of the same operating system type. The operating system types of initiators are:

- solaris

- windows
- hpux
- aix
- linux
- netware
- vmware
- openvms
- xen
- hyper_v

[-a, -portset <text>] - Portset Binding Igroup

Specifies that a portset is bound to the initiator.

{ -initiator <text>, ... - Initiators

Specifies the initiators that are attached to the new initiator group. By default, no initiators are added to the new igroup.

| [-child-igroups <text>, ...] - Child Igroups }

Specifies the child initiator groups that are attached to the new initiator group. The initiator group inherits the initiators of any child igroups. An initiator group can have either initiators or child initiator groups, but not both. Initiator groups can be nested to match host cluster hierarchies. If the host cluster then changes, initiators only need to be updated in the child igroups and the parent igroups inherit the changes.

[-delete-on-unmap {true|false}] - Delete on Last Unmap

Specifies if this initiator group will be deleted automatically when no longer a member of a LUN mapping relationship.

[-comment <text>] - Igroup Comment

A description for the igroup to create. If the comment string contains white space, it must be enclosed in double quotes. The limit is 254 characters.

[-replication-peer <text>] - Replication Peer

Specifies the local name of a peer Vserver to which the initiator group should be replicated. By default, the initiator group is not replicated.

[-proximal-vserver {local|peer}] - Proximal Vserver (privilege: advanced)

Specifies a Vserver to add to any initiators being added to an initiator group. *local* refers to the initiator group's Vserver. *peer* refers to the initiator group's replication peer. *proximal-vserver* can only be set for replicated initiator groups.

Examples

```
cluster1::> lun igroup create -vserver vs1 -igroup ig1 -protocol mixed
-ostype linux -initiator iqn.2001-04.com.example:abc123
```

Creates initiator group *ig1* on Vserver *vs1* with a *mixed* protocol type on a Linux operating system with the

initiator *ign.2001-04.com.example:abc123*.

- [lun igroup unbind](#)

lun igroup delete

Delete an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an existing initiator group. By default, you cannot delete an initiator group if LUN maps for that initiator group exist. You need to unmap all the LUNs that are associated with that initiator group before you can delete the initiator group. Use the [lun unmap](#) command to remove LUNS from an initiator group.

You can specify the `force` option to delete an initiator group and remove existing LUN maps defined for that initiator group.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to delete.

[-f, -force <true>] - Force

Deletes an initiator group and all associated LUN maps.

Examples

```
cluster1::> lun igroup delete -vserver vs1 -igroup ig1
```

Deletes the initiator group ig1 on Vserver vs1.

Related Links

- [lun unmap](#)

lun igroup disable-aix-support

Disables SAN AIX support on the cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the SAN AIX support across the cluster (all Vservers and all AIX initiator groups). However, before you can disable SAN AIX support, you must remove all SAN AIX related objects from the cluster. You need to unmap all the LUNs that are associated with the AIX initiator groups. Then you need to delete all of the AIX initiator groups. Use the [lun unmap](#) command to remove LUNS from an initiator group. Use the `igroup delete` command to delete an initiator group.

This command is not intended to be used in normal operation. Use only when you are downgrading to a release that does not support SAN AIX operation.

Examples

```
cluster1::> lun igroup disable-aix-support
```

Disables the SAN AIX support for cluster1.

- [lun unmap](#)

lun igroup modify

Modify an existing initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies an attribute for an initiator group. Currently, the only settable attribute is the operating system.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group whose attribute you want to modify.

[-t, -ostype <Initiator Group OS Type>] - OS Type

Specifies the operating system that you want to modify. The operating system types of initiators are:

- solaris
- windows
- hpux
- aix

- linux
- netware
- vmware
- openvms
- xen
- hyper_v

[`-delete-on-unmap {true|false}`] - Delete on Last Unmap

Specifies if this initiator group will be deleted automatically when no longer a member of a LUN mapping relationship.

[`-comment <text>`] - Igroup Comment

Specifies the comment for the igroup you want to modify. If the comment string contains white space, it must be enclosed in double quotes. The limit is 254 characters. To clear the comment, specify the empty string enclosed in double quotes.

[`-replication-peer <text>`] - Replication Peer

Specifies the local name of a peer Vserver to which the initiator group should be replicated. To terminate replication of the initiator group, set this to "-".

Examples

```
cluster1::> lun igroup modify -vserver vs1 -igroup ig1 -ostype windows
```

Changes the operating system to *windows* for initiator group *ig1* on Vserver *vs1*.

lun igroup remove

Remove initiators from an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes an initiator from an initiator group. You can only remove an initiator if no existing LUN maps are defined for that initiator group. You must unmap the LUNs from the initiator group with the [lun unmap](#) command before you can remove initiators from the initiator group.

You can use the *force* option to remove an initiator from a mapped initiator group. Removing an initiator from a mapped initiator group makes the LUNs to which the initiator group is mapped no longer available to the initiator. This might cause a disruption in the availability of data.

Parameters

`-vserver <Vserver Name>` - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group from which to remove an initiator.

[-initiator <text>,...] - Initiators

Specifies the initiator name to remove. Use the WWPN, IQN or the alias of the initiator.

[-f, -force <true>] - Force

Forcibly removes an initiator from a mapped initiator group. This might cause a disruption in the availability of data.

[-child-igroups <text>,...] - Child Igroups

Specifies the child initiator groups to remove.

Examples

```
cluster1::> lun igroup remove -vserver vs1 -igroup ig1 -initiator  
iqn.1992-08.com.mv.mvinitiator
```

Removes the initiator iqn.1992-08.com.mv.mvinitiator from Vserver vs1 and initiator group ig1.

Related Links

- [lun unmap](#)

lun igroup rename

Rename an existing initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command renames an existing initiator group. When you rename an initiator group, this action does not affect access to the LUNs mapped to the initiator group you want to rename.

An initiator group name is a case-sensitive name and must meet the following requirements:

- Must contain one to 96 characters. Spaces are not allowed.
- Can contain the letters A through Z, a through z, numbers 0 through 9, hyphen (-), underscore (_), colon (:), and period (.).
- Must start with a letter or number.

Parameters**-vserver <Vserver Name> - Vserver Name**

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group you want to rename.

-new-name <text> - New Igroup Name

Specifies the new name of the initiator group.

Examples

```
cluster1::> lun igroup rename -vserver vs1 -igroup ig1 -new-name ignew1
```

Renames an initiator group from ig1 to ignew1 on Vserver vs1.

lun igroup show

Display a list of initiator groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays status information for initiator groups (igroup). By default, the command displays status for all initiator groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Specifies the Vserver.

[-igroup <text>] - Igroup Name

Selects the initiator groups that match this parameter value.

[-protocol {mixed|fcp|iscsi}] - Protocol

Selects the initiator groups that match this parameter value (FCP , iSCSI , or mixed).

[-t, -ostype <Initiator Group OS Type>] - OS Type

Selects the initiator groups that match this parameter value. The operating system types are

- solaris
- windows
- hpux

- aix
- linux
- netware
- vmware
- openvms
- xen
- hyper_v

[-a, -portset <text>] - Portset Binding Igroup

Selects the initiator groups that match this parameter value.

[-initiator <text>,...] - Initiators

Selects the initiator groups that match this parameter value.

[-child-igroups <text>,...] - Child Igroups

Selects the initiator groups that match this parameter value.

[-uuid <UUID>] - Igroup UUID

Selects the initiator groups that match this parameter value.

[-delete-on-unmap {true|false}] - Delete on Last Unmap

Selects the initiator groups that match this parameter value. A value of `true` displays all the initiator groups that will be deleted automatically when they are no longer used in a LUN mapping relationship.

[-comment <text>] - Igroup Comment

Selects the igroups that match this parameter value.

[-replication-peer <text>] - Replication Peer

Selects the initiator groups that match this parameter value. The replication-peer is the local name of the peer Vserver, as reported by the [vserver peer show -fields peer-vserver](#) command. When set, the igroup and any lun maps to LUNs in SMBC relationships are replicated to the peer cluster.

[-replication-error <text>] - Replication Error

Selects the initiator groups that match this parameter value. This field provides information about asynchronous errors encountered while replicating this igroup. Igroups within a peering relationship are replicated in the same stream, so the error reported here might be related to this igroup or a prior replicated igroup that is now blocking the replication of this igroup. Both the error information and the igroup encountering the error are reported. If the error is configuration related, it can be corrected on the referenced igroup. The replication is retried using exponential backoff up to a maximum of one retry every 5 minutes. Every operation on the same stream triggers an immediate retry and restarts the exponential backoff starting with a 1 second delay. If the error is system related, the retries should correct the error when the system enters a healthy state.

[-replication-error-igroup <text>] - Replication Error Igroup

Selects the initiator groups that match this parameter value. The name of the igroup encountering the error reported by the 'replication-error' field.

[`-replicated-igroup-unreplicated-luns {true|false}`] - Replicated Igroup Contains Unreplicated LUNs

Selects the initiator groups that match this parameter value. This field indicates that the initiator group is replicated but contains one or more unreplicated LUNs.

Examples

```
cluster1::> igroup show -instance
      Vserver Name: vs0
      Igroup Name: ig1
      Protocol: mixed
      OS Type: linux
Portset Binding Igroup: -
      Igroup UUID: 358338ba-cfd6-11df-a9ab-123478563412
      Initiators: iqn.1992-08.com.mv:abc (not logged in)
Vserver Name: vs0
      Igroup Name: ig2
      Protocol: mixed
      OS Type: linux
Portset Binding Igroup: -
      Igroup UUID: 3fb136c7-cfd6-11df-a9ab-123478563412
      Initiators: -
Vserver Name: vs1
      Igroup Name: ig1
      Protocol: mixed
      OS Type: windows
Portset Binding Igroup: p1
      Igroup UUID: 03accf6b-d08c-11df-a9ab-123478563412
      Initiators: -
3 entries were displayed.
```

The example above displays information about all initiator groups.

Related Links

- [vserver peer show](#)

lun igroup unbind

Unbind an existing initiator group from a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command unbinds an initiator group from a portset. When you unbind an initiator group from a portset, all of the initiators in the initiator group have access to all target LUNs on all network interfaces.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-igroup <text> - Igroup Name

Specifies the initiator group that you want to unbind from the portset.

Examples

```
cluster1::> lun igroup unbind -vserver vs1 -igroup ig1
```

Unbinds the initiator group ig1 from the portset on Vserver vs1.

lun igroup initiator add-proximal-vserver

Add a Vserver to the initiator's proximal list

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command is used to configure which site in a SnapMirror Active Synchronous (SM-AS) relationship is proximal with the provided FCP or iSCSI initiator.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Specifies the name of the Vserver the initiator will access.

-initiator <text> - Initiator (privilege: advanced)

Specifies the FCP WWPN or iSCSI IQN of the initiator.

-proximal-vservers <text>, ... - Proximal Vserver Name (privilege: advanced)

Specifies the name of the Vserver to configure as proximal. The specified Vserver must either be the same as the `-vserver` parameter or a Vserver in a peer relationship with *snapmirror* as an allowed application.

[-replace <true>] - Replace Existing (privilege: advanced)

If true, replace all existing `-proximal-vservers` for the initiator with the ones specified. By default, the specified `-proximal-vservers` are added to any existing values.

Examples

The following example configures *iqn.2001-04.com.example:uefi-0232314* in Vserver *local-vserver* as proximal to the *peer-vserver* Vserver:

```
cluster1::*> lun igroup initiator add-proximal-vserver -vserver local-  
vserver -initiator iqn.2001-04.com.example:uefi-0232314 -proximal-vservers  
peer-vserver
```

lun igroup initiator modify

Modify an initiator

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies an attribute for an initiator.

Parameters

-vserver <Vserver Name> - Vserver

Specifies the vserver of the initiator you want to modify.

-initiator <text> - Initiator

Specifies the initiator whose attribute you want to modify.

[-comment <text>] - Comment

The initiator's new comment. The comment has a maximum length of 255 characters. To clear the current comment, provide an empty string.

Examples

```
cluster1::> lun igroup initiator modify -vserver vs1 -initiator iqn.1991-  
05.com.example:name -comment "My application host"
```

Changes the comment to "My application host" for initiator *iqn.1991-05.com.example:name* in Vserver *vs1*.

```
cluster1::> lun igroup initiator modify -vserver vs1 -initiator iqn.1991-  
05.com.example:name -comment ""
```

Clears the comment for initiator *iqn.1991-05.com.example:name* in Vserver *vs1*.

lun igroup initiator remove-proximal-vserver

Remove a Vserver from the initiator's proximal list

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command is used to remove the proximal Vserver configuration from an FCP or iSCSI initiator.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Specifies the name of the Vserver the initiator will access.

-initiator <text> - Initiator (privilege: advanced)

Specifies the FCP WWPN or iSCSI IQN of the initiator.

{ -proximal-vservers <text>, ... - Proximal Vserver Name (privilege: advanced)

Specifies the name of the Vserver to remove as proximal. The specified Vserver must either be the same as the `-vserver` parameter or a Vserver in a peer relationship with `snapmirror` as an allowed application.

| -all <true> - Remove All (privilege: advanced) }

If true, remove all existing proximal Vservers from the specified initiator.

Examples

The following example configures `iqn.2001-04.com.example:uefi-0232314` in Vserver `local-vserver` as not proximal to the `peer-vserver` Vserver:

```
cluster1::*> lun igroup initiator remove-proximal-vserver -vserver local-  
vserver -initiator iqn.2001-04.com.example:uefi-0232314 -proximal-vservers  
peer-vserver
```

lun igroup initiator show

Display initiators

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information for initiators that are members of initiator groups (igroups).

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver

Selects the initiators of igroups whose Vserver matches the specified value.

[`-initiator <text>`] - Initiator

Selects initiators whose name matches the specified value.

[`-comment <text>`] - Comment

Selects initiators whose comment matches the specified value.

[`-igroups <text>,...`] - Igroups

Selects initiators belonging to the specified igroups.

[`-proximal-vservers <text>,...`] - Proximal Vservers (privilege: advanced)

Selects initiators configured as proximal to the specified Vservers.

Examples

```
cluster1::> lun igroup initiator show -instance
Vserver: vs0
Initiator: init1
Comment: Initiator Comment
Igroups: ig1,ig2
Vserver: vs0
Initiator: init2
Comment: Initiator Comment2
Igroups: ig3
2 entries were displayed.
```

This example displays detailed information for all initiators in igroups.

lun igroup initiator upgrade show-partially-connected

Display partially connected initiators

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

If upgrade proceeds with partially connected initiators, a host outage is likely. Each initiator should be connected to both nodes in each HA pair where the initiator is mapped to a LUN. This command displays connections that are missing and should be established before proceeding with an upgrade.

Parameters**[`-fields <fieldname>,...`]**

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver (privilege: advanced)

Selects the missing logins whose Vserver matches the specified value.

[`-igroup <text>`] - Igroup (privilege: advanced)

Selects the missing logins whose igroup matches the specified value.

[`-initiator <text>`] - Initiator (privilege: advanced)

Selects the missing logins whose initiator matches the specified value.

[`-required-nodes {<nodename>|local}`] - Required Nodes (privilege: advanced)

Selects the missing logins whose required-nodes matches the specified value. The initiator should be logged in to all required nodes.

[`-missing-nodes {<nodename>|local}`] - Missing Nodes (privilege: advanced)

Selects the missing logins whose missing-nodes matches the specified value. The initiator is not currently logged in to these nodes. If the initiator group is bound to a portset, the initiator needs to connect to a LIF in the portset on these nodes.

[`-portset <text>`] - Portset (privilege: advanced)

Selects the missing logins whose portset matches the specified value. If the initiator group is bound to a portset, the logins must be to LIFs in the portset.

[`-refresh-login-cache <true>`] - Force Refresh (privilege: advanced)

This command displays information based on a cache that is updated every 15 minutes. To force refresh the cache prior to displaying data, set this parameter to true.

Examples

The following example displays a partially connected initiator that needs to be connected to node2.

```
cluster1::*> lun igroup initiator upgrade show-partially-connected
      Vserver      Igroup      Initiator      Missing
Nodes
-----
vs1      igroup1      iqn.1992-08.com.mv:abc      node2
```

lun igroup initiator upgrade missing-logins delete

Remove a missing login record

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Missing initiator connections are likely to lead to a host outage during upgrade. If this is not a concern or it is known that a host connection is not required, the record of a missing login can be manually deleted to allow upgrade to proceed.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Specifies the Vserver of the entry you want to delete.

-initiator <text> - Initiator (privilege: advanced)

Specifies the initiator of the entry you want to delete.

-lif <text> - LIF (privilege: advanced)

Specifies the LIF of the entry you want to delete.

Examples

The following example manually removes the record of a missing initiator login so that upgrade can proceed without this initiator connecting again.

```
cluster1::*> lun igroup initiator upgrade missing-logins delete -vserver  
vs1 -initiator iqn.1992-08.com.mv:def -lif iscsi4
```

lun igroup initiator upgrade missing-logins show

Display missing logins

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Display initiator logins that have not reconnected since the first node rebooted as part of an upgrade. These connections should be restored before to continuing with the upgrade process to avoid a host outage.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver (privilege: advanced)

Selects the missing logins whose Vserver matches the specified value.

[`-initiator <text>`] - Initiator (privilege: advanced)

Selects the missing logins whose initiator matches the specified value.

[`-lif <text>`] - LIF (privilege: advanced)

Selects the missing logins whose LIF matches the specified value.

[`-node <nodename>`] - Node (privilege: advanced)

Selects the missing logins whose node matches the specified value.

[`-last-seen <Date>`] - Last Seen (privilege: advanced)

Selects the missing logins whose last-seen time matches the specified value. If this parameter is not set, then the connection has not been seen in over 24 hours.

[`-vserver-uuid <UUID>`] - Vserver UUID (privilege: advanced)

Selects the missing logins whose vservers-uuid matches the specified value.

[`-refresh-login-cache <true>`] - Force Refresh (privilege: advanced)

This command displays information based on a cache that is updated every 15 minutes. To force refresh the cache prior to displaying data, set this parameter to true.

Examples

The following example displays a initiators that were logged into LIFs prior to upgrading the first node to the currently running version that are not connected now.

```
cluster1::*> lun igroup initiator upgrade missing-logins show
Vserver      Initiator                                     LIF          Last Seen
-----
vs1          iqn.1992-08.com.mv:abc                          iscsi3        -
vs1          iqn.1992-08.com.mv:abc                          iscsi4        -
vs1          iqn.1992-08.com.mv:def                          iscsi3        -
vs1          iqn.1992-08.com.mv:def                          iscsi4        -
4 entries were displayed.
```

lun import commands

lun import create

Create an import relationship

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command creates an import relationship between a specified LUN and a specified foreign disk so you can import the foreign disk data into a LUN.

The foreign disk must be marked as foreign using [storage disk set-foreign-lun](#) command before you can begin the import progress.

The LUN must be of the same size as the foreign disk.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN where you import data to from the foreign disk data.

-foreign-disk <text> - Foreign Disk Serial Number (privilege: advanced)

Specifies the serial number of the Foreign Disk.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN where you want to import the data of the foreign disk to. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

Examples

```
cluster1::> lun import create -vserver vs1 -path /vol/dvol1/lun1 -foreign
-disk 6000B5D0006A0000006A020E00040000
```

Creates an import relationship between lun1 at the path `/vol/dvol1/lun1` and foreign disk with serial number 6000B5D0006A0000006A020E00040000.

lun import delete

Deletes the import relationship of the specified LUN or the specified foreign disk

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command deletes the import relationship of a specified LUN or a specified foreign disk.

You cannot use this command if an import is in-progress between the foreign disk and the LUN unless you use the force option. The import has to either successfully completed or be stopped before deleting the import relationship.

You can use the [lun import stop](#) command to stop the data import, and then you delete the import relationship.

Parameters

{ -vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN that you want to delete the import relationship.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN where you want to delete the import relationship. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

| -foreign-disk <text> - Foreign Disk Serial Number (privilege: advanced) }

Specifies the serial number of the foreign disk.

[-force {true|false}] - Force Delete (privilege: advanced)

When set to true, stops the in progress data import.

Examples

```
cluster1::> lun import delete -vserver vs1 -path /vol/vol2/lun2
```

Deletes the import relationship of lun2 at the path `/vol/vol2/lun2`.

```
cluster1::> lun import delete -vserver vs0 -foreign-disk
6000B5D0006A0000006A020E00040000
```

Deletes the import relationship of the foreign disk with serial number `6000B5D0006A0000006A020E00040000`.

- [lun import stop](#)

lun import pause

Pause the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command pauses the data import to a specified LUN.

This command does not reset all import checkpoints. To resume a paused import, use the `lun import resume` command to restart from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the `lun import stop` command. Then use the `lun import start` command.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to pause the data import to.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN you want to pause the data import to. Examples of correct LUN

paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

Examples

```
cluster1::> lun import pause -vserver vs1 -path /vol/vol2/lun2
```

Pauses the data import for lun2 at the path `/vol/vol2/lun2`

lun import prepare-to-downgrade

Prepares LUN import to be downgraded

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command prepares the cluster for a downgrade to a version of ONTAP earlier than 8.3.1 by disabling the online LUN import feature. Before using this command verify that all LUNs in an import relationships are offline by running [lun show](#) .

Examples

```
cluster1::> lun import prepare-to-downgrade
```

The above example will disable the online LUN import feature if all LUNs in import relationships are offline

Related Links

- [lun show](#)

lun import resume

Resume the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Resumes the data import to a specified LUN.

The import starts from the last checkpoint taken before you paused the data import.

If you want to resume the data import from the beginning, use the `lun import stop` command. Then use the `lun import start` command.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to resume the data import to.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN that you want to resume the data import to. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

Examples

```
cluster1::> lun import resume -vserver vs1 -path /vol/vol2/lun2
```

Resumes the data import to lun2 at the path `/vol/vol2/lun2`.

lun import show

Display a list of import relationships

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays information about the import relationships.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver Name (privilege: advanced)

Displays import relationships for a specified Vserver.

[`-foreign-disk <text>`] - Foreign Disk Serial Number (privilege: advanced)

Enables you to see the import relationship for a particular foreign disk with the specified serial number.

[`-path <path>`] - LUN Path (privilege: advanced)

Enables you to see the import relationship for a particular LUN path. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

[`-import-home-node {<nodename>|local}`] - Import Home Node (privilege: advanced)

Enables you to see the node that initially started the data import and where the I/O for the foreign disk is directed. If failover occurs, any in-progress data import restarts on the partner node.

[`-import-current-node {<nodename>|local}`] - Import Current Node (privilege: advanced)

Displays the node that is currently importing data and where the I/O for the foreign disk is directed. During giveback and if the import home node is different from the current home node , import restarts on the initial node (import-home-node).

[`-operation-in-progress {import|verify}`] - Operation in Progress (privilege: advanced)

Enables you to see the imports in progress or import verification in progress.

[`-admin-state {stopped|started|paused}`] - Admin State (privilege: advanced)

Enables you to see the import relationships for a specified administrative state. For example, you can list all the imports that have started in a cluster.

[`-operational-state {in_progress|failed|completed|stopped|paused}`] - Operational State (privilege: advanced)

Enables you to see the import relationships for a specified operational state. For example, you can list all the imports that have completed in a cluster.

[`-percent-complete <integer>`] - Percent Complete (privilege: advanced)

Enables you to see the percentage of completion for both import and verification. If you want to see all the complete imports and verifications, you would specify 100.

[`-imported-blocks <integer>`] - Blocks Imported (privilege: advanced)

Enables you to see the number of blocks that have been imported to the LUN.

[`-compared-blocks <integer>`] - Blocks Compared (privilege: advanced)

Enables you to see the number of LUN and foreign disk blocks that have been compared.

[`-total-blocks <integer>`] - Total Blocks (privilege: advanced)

Enables you to see the total number of blocks that must be imported to complete the data import to a LUN or the number of blocks that must be compared to complete the import verification.

[`-estimated-remaining-duration {<seconds>| [<d> days] <hh>:<mm>[:<ss>]}`] - Estimated Remaining Duration (privilege: advanced)

If this parameter is specified, the command displays import or verify operations that match the specified time.

[`-failure-reason <text>`] - Failure Reason (privilege: advanced)

Selects LUN import operations that match this parameter value.

[`-max-throughput-limit {<integer>[KB|MB|GB|TB|PB]}`] - Maximum Throughput Limit (per sec) (privilege: advanced)

Selects the LUN import operations that match this parameter value. This value is the throughput limit at which an import or verify will be throttled. By default, there is no throttling.

[`-current-throughput {<integer>[KB|MB|GB|TB|PB]}`] - Current Throughput (per sec) (privilege: advanced)

Selects the LUN import operations that match this parameter value. This value is the current throughput for an in-progress import or verify operation.

[`-qos-policy-group <text>`] - QoS Policy Group (privilege: advanced)

Selects the LUN import operations that match this parameter value. This value is the QoS policy group associated with an import relationship.

Examples

```
cluster1::> lun import show
vserver          foreign-disk          path
operation-in-progress  admin-state  operational-state  percent-complete
-----
-
vs1              6000B5D0006A0000006A020E00040000  /vol/dvol1/lun1
import          stopped      stopped          0
vs1              60060480343631336433336538366537  /vol/vol1/lun1
import          started      failed          11
vs2              6000B5D0006A0000006A020E00040001  /vol/dvol1/lun2
verify          started      in_progress      5
```

Display information about all import relationships in the cluster.

```
cluster1::> lun import show -instance

in-progress          5%
```

Display active LUN import sessions in a cluster.

lun import start

Start the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command initiates the data import to a specified LUN.

You must use the `lun import create` command to create an import relationship between a LUN and a foreign disk before you can initiate the data import.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to import data to.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN that you want to import data to. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

Examples

```
cluster1::> lun import start -vserver vs1 -path /vol/vol2/lun2
```

Starts the data import to lun2 at the path `/vol/vol2/lun2`.

lun import stop

Stop the import for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command stops the data import into a specified LUN.

After you stop the data import and if you start the import again using [lun import start](#) command, then the import restarts from the beginning.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to stop importing data to.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN that you want to stop the data import to.

Examples

```
cluster1::> lun import stop -vserver vs1 -path /vol/vol2/lun2
```

Stops data import to lun2 at the path /vol/vol2/lun2.

Related Links

- [lun import start](#)

lun import throttle

Modify the max throughput limit for the specified import relationship

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command throttles the speed of the import for a given LUN by specifying a maximum throughput limit on the import.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN to which data from the foreign disk is imported.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN to which data from the foreign disk is imported. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

-max-throughput-limit {<integer>[KB|MB|GB|TB|PB]} - Maximum Throughput Limit (per sec) (privilege: advanced)

Specifies the maximum amount of throughput to be allocated for processing import requests on the bound LUN. At the time of creation, the default is zero. A value of zero implies that import traffic is processed by the system at best effort rate along with on-going user I/O. A non-zero value indicates that import will be throttled at a rate which is at most the maximum throughput limit set.

Examples

```
cluster1::*> lun import throttle -vserver vs1 -path /vol/vol1/lun1 -max  
-throughput-limit 3M
```

The above example limits the import speed for the bound LUN with path /vol/vol1/lun1 to a maximum of 3MB/s.

lun import verify start

Start the verification of the foreign disk and LUN data

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command compares the LUN and the foreign disk block by block. You are not required to run this command; it is optional. Before you can do this verification process, the operation state must be stopped or completed. Use the `lun import show` command to determine the operation state.

If a block mismatch occurs, the verification process stops.

Verification must be done offline. Ensure the foreign disk and LUN cannot be accessed by a host. To prevent access of the LUN, the LUN should be taken offline administratively using the `lun offline` command.

Note: The specified LUN must be in an import relationship with a foreign disk before you can verify the data import.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to compare block by block with the foreign disk.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN that you want to compare the foreign disk to. Examples of correct LUN paths: /vol/vol1/lun1 and /vol/vol1/qtreet1/lun1

Examples

```
cluster1:::> lun import verify start -vserver vs1 -path /vol/vol2/lun2
```

Starts the import verification on lun2 at path /vol/vol2/lun2.

lun import verify stop

Stop the verify for the specified LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command stops the block by block verification of the foreign disk and LUN data.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver that contains the LUN you want to stop block by block comparison with the foreign disk.

-path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN that you want to stop the block by block comparison. Examples of correct LUN paths: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

Examples

```
cluster1::> lun import verify stop -vserver vs1 -path /vol/vol2/lun2
```

Stops the import verify on lun at path `/vol/vol2/lun2`.

lun mapping commands

lun mapping add-reporting-nodes

Add Reporting Nodes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used before or after a data mobility event that modifies the owning node of the LUN to add the new optimized nodes to the specified LUN mapping's reporting nodes.

For more information on managing reporting nodes in response to data mobility events, see the ONTAP SAN Administration Guide.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are: `/vol/vol1/lun1` and `/vol/vol1/qtree1/lun1`

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN.

`[-qtree <qtree name>] - Qtree Name`

Specifies the qtree that contains the LUN.

`-lun <text> - LUN Name }`

Specifies the LUN name.

`-g, -igroup <text> - Igroup Name`

Specifies the igroup the LUN is mapped to.

`{ -local-nodes <true> - Add Nodes for Current LUN Location`

Add the current LUN owner node and HA partner to the LUN mapping's reporting nodes.

This option should be used after a LUN mobility event to restore optimized access to the LUN.

`| -destination-aggregate <aggregate name> - Add Nodes for Aggregate`

Add the specified aggregate's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing aggregate.

`| -destination-volume <volume name> - Add Nodes for Volume }`

Add the specified volume's owner node and HA partner to the LUN mapping's reporting nodes.

This option may be used prior to a LUN mobility event that changes the LUN's containing volume.

`| -all <true> - Add All Nodes (privilege: advanced) }`

Set the LUN mapping to report on all nodes in preparation for a revert to a previous version of ONTAP.

Examples

```
cluster1::> lun mapping add-reporting-nodes -vserver vs1 -path
/vol/vol1/lun1 -igroup ig1
```

Add the current owner node and HA partner for the LUN mapping of `/vol/vol1/lun1` to igroup `ig1`.

```
cluster1::> lun mapping add-reporting-nodes -vserver vs1 -lun * -igroup
ig1 -destination-aggregate aggr2
```

Add the aggregate owner node and HA partner for aggregate `aggr2` to all LUN mappings in volume `vol1` to igroup `ig1` prior to starting a volume move operation.

lun mapping create

Map a LUN to an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command maps a LUN to all of the initiators in an initiator group (igroup). After you map the LUN, the LUN is visible to all initiators in the igroup.

ONTAP ensures that there are no LUN map conflicts whether the LUN is offline or online. A LUN map conflict is a mapping that would violate either of the following rules:

- Each LUN can be mapped to an initiator only once. A LUN can be mapped to multiple igroups as long as each igroup has a distinct set of initiators.
- LUN IDs must be unique such that every initiator has a unique ID for each LUN to which it is mapped. If you map a LUN to an igroup, the LUN ID for that mapping cannot be reused by any of the initiators in that igroup.

In order to determine if a LUN ID is valid for a mapping, ONTAP checks each initiator in the igroup to make sure that the LUN ID is not used for another mapping that includes that initiator.

Prior to mapping a LUN, you must have at least one iSCSI or FCP LIF provisioned on the LUN's owner node and high-availability partner node.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver that contains the LUN you want to map.

{ -path <path> - LUN Path

Specifies the path of the LUN that you want to map. Examples of correct LUN paths: */vol/voll/lun1* and */vol/voll/qtree1/lun1*

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN you want to map.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN you want to map.

-lun <text> - LUN Name }

Specifies the LUN name that you want to map.

-g, -igroup <text> - Igroup Name

Specifies the igroup that you want to map.

[-lun-id <integer>] - LUN ID

Specifies the LUN ID for the mapping. The LUN ID is specific to the mapping, not to the LUN itself. This is used by the initiators in the igroup as the Logical Unit Number for the initiator when accessing the storage.

[-additional-reporting-node <nodename>] - Additional Reporting Node (privilege: advanced)

Specifies an additional node to populate the *-reporting-nodes* list when creating the LUN mapping. The specified node's high availability partner will be automatically populated as well. Use this parameter when preferred data mobility destinations are known ahead of time and the appropriate paths can be pre-configured.

Examples

```
cluster1::> lun mapping create -vserver vs1 -path /vol/vol1/lun1 -igroup
ig1 -lun-id 8
```

Maps a LUN at /vol/vol1/lun1 on Vserver vs1 to the igroup ig1 with LUN ID 8.

lun mapping delete

Unmap a LUN from an initiator group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command unmaps a LUN from an initiator group. After you use this command, the LUN is not visible to any of the initiators in the initiator group.

Parameters

-vserver <Vserver Name> - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

{ -path <path> - LUN Path

Specifies the path of the LUN you want to unmap. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtreet1/lun1*

| -volume <volume name> - Volume Name

Specifies the volume of the LUN you want to unmap.

-qtree <qtree name> - Qtree Name

Specifies the qtree of the LUN you want to unmap.

-lun <text> - LUN Name }

Specifies the name of the LUN you want to unmap.

-g, -igroup <text> - Igroup Name

Specifies the initiator group that you want to unmap the LUN from.

Examples

```
cluster1::> lun mapping delete -vserver vs1 -path /vol/vol1/lun1 -igroup
ig1
```

Unmaps LUN at path /vol/vol1/lun1 from the initiator group ig1 on Vserver vs1.

lun mapping remove-reporting-nodes

Remove Reporting Nodes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used after a data mobility event to remove reporting nodes that are no longer required for optimized access from the specified LUN mapping.

For more information on managing reporting nodes in response to data mobility events, see the ONTAP SAN Administration Guide.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver containing the LUN.

{ -path <path> - LUN Path

Specifies the path of the LUN. Examples of correct LUN paths are: */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*

| -volume <volume name> - Volume Name

Specifies the volume that contains the LUN.

[-qtree <qtree name>] - Qtree Name

Specifies the qtree that contains the LUN.

-lun <text> - LUN Name }

Specifies the LUN name.

-g, -igroup <text> - Igroup Name

Specifies the igroup the LUN is mapped to.

-remote-nodes <true> - Remove Remote Nodes for LUN Location

If specified, remove all nodes other than the LUN's owner and HA partner from the LUN mapping's reporting nodes.

Examples

```
cluster1::> lun mapping remove-reporting-nodes -vserver vs1 -path  
/vol/vol1/lun1 -igroup ig1
```

Remove excess remote nodes from the LUN mapping of */vol/vol1/lun1* to igroup *ig1* .

lun mapping show-initiator

Show the LUN mappings to a specific initiator

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun mapping show-initiator` command lists the LUNs which are mapped to an initiator group which contains a specific initiator.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`](privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver Name (privilege: advanced)

Selects the LUN mappings for the vservers that you specify.

`-initiator <text>` - Initiator Name (privilege: advanced)

Selects the LUN mappings for the initiator that you specify.

[`-lun-id <integer>`] - Logical Unit Number (privilege: advanced)

Selects the LUN mappings with a LUN ID that you specify.

[`-igroup <text>`] - Igroup Name (privilege: advanced)

Selects the LUN mappings for the initiator group that you specify.

[`-path <path>`] - LUN Path (privilege: advanced)

Selects the LUN mappings for the LUN path that you specify.

[`-node <nodename>`] - LUN Node (privilege: advanced)

Selects the LUN mappings for the LUNs which are being hosted on the node that you specify.

[`-reporting-nodes <nodename>,...`] - Reporting Nodes (privilege: advanced)

Selects the LUN mappings for the LUNs which have reporting nodes that you specify.

[`-vserver-uuid <UUID>`] - Vserver UUID (privilege: advanced)

Selects the LUN mappings for the Vserver UUID that you specify.

[`-igroup-uuid <UUID>`] - Igroup UUID (privilege: advanced)

Selects the LUN mappings for the initiator group UUID that you specify.

[`-lun-uuid <UUID>`] - LUN UUID (privilege: advanced)

Selects the LUN mappings for the LUN UUID that you specify.

Examples

The following example displays the LUN mappings for initiator `20:10:0a:50:00:01:01:01` in Vserver `vs1`.

```
cluster1::> lun mapping show-initiator -vserver vs1 -initiator
20:10:0a:50:00:01:01:01
Vserver Initiator LUN ID Path IGroup
-----
vs1      20:10:0a:50:00:01:01:01
          0 /vol/igroup_1_1_vol/lun1      igroup_1
          2 /vol/igroup_1_1_vol/lun3      igroup_1
          3 /vol/igroup_1_2_vol/lun1      igroup_1
          5 /vol/igroup_1_2_vol/lun3      igroup_1
          6 /vol/igroup_1_3_vol/lun1      igroup_1
          8 /vol/igroup_1_3_vol/lun3      igroup_1
          9 /vol/igroup_1_4_vol/lun1      igroup_1
         11 /vol/igroup_1_4_vol/lun3      igroup_1
         12 /vol/igroup_2_1_vol/lun1      igroup_2
         14 /vol/igroup_2_1_vol/lun3      igroup_2
         15 /vol/igroup_2_2_vol/lun1      igroup_2
         17 /vol/igroup_2_2_vol/lun3      igroup_2
         18 /vol/igroup_2_3_vol/lun1      igroup_2
         20 /vol/igroup_2_3_vol/lun3      igroup_2
         21 /vol/igroup_2_4_vol/lun1      igroup_2
         23 /vol/igroup_2_4_vol/lun3      igroup_2
16 entries were displayed.
```

lun mapping show

Lists the mappings between LUNs and initiator groups.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command lists the mappings between LUNs and initiator groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the LUN maps for the Vserver that matches the parameter value.

{ [-path <path>] - LUN Path

Selects the LUN maps for the LUN with the path that matches the parameter value. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*

| [-volume <volume name>] - Volume Name

Selects the LUN maps for the volumes that match the parameter value.

[-qtree <qtree name>] - Qtree Name

Selects the LUN maps for the queue trees that match the parameter value.

[-lun <text>] - LUN Name }

Selects the LUN maps for the LUNs with a name that matches the parameter value.

[-g, -igroup <text>] - Igroup Name

Selects the LUN maps for the igroup that matches the parameter value.

[-ostype <Initiator Group OS Type>] - Igroup OS Type

Selects the LUN maps for the initiator groups with the OS type that matches the parameter value.

[-protocol <protocol_enum>] - Igroup Protocol Type

Selects the LUN maps for initiator groups with a protocol that matches the parameter value. Possible values include FCP, iSCSI, or mixed.

[-lun-id <integer>] - LUN ID

Selects the LUN maps with a LUN ID that matches the parameter value.

[-portset <text>] - Portset Binding Igroup

Selects the LUN maps for initiator groups bound to the portset that matches the parameter value.

[-alua {true|false}] - ALUA

Selects the LUN maps with ALUA settings that match the parameter value.

[-n, -initiators <text>,...] - Initiators

Selects the LUN maps for initiator groups containing the initiators that match the parameter value.

[-node <nodename>] - LUN Node

Selects the LUN maps for nodes that match the parameter value.

[-reporting-nodes <nodename>,...] - Reporting Nodes

Selects the LUN maps that match the parameter value.

Examples

Displays all of the mappings between LUNs and initiator groups and the LUN ID for each mapping.

```
cluster1::> lun mapping show
```

Vserver	Path	Igroup	LUN ID
Protocol			
vs1	/vol/vol1/lun1	igroup1	10
mixed			
vs1	/vol/vol1/lun1	igroup2	4
mixed			
vs1	/vol/vol5/lun1	igroup3	6
mixed			
vs1	/vol/vol5/lun2	igroup3	1
mixed			

4 entries were displayed.

lun move commands

lun move cancel

Cancel a LUN move operation before the new LUN has been created

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `lun move cancel` command cancels an ongoing LUN move operation prior to creation of the new LUN. The command fails if the LUN already exists at the destination path; in that case, allow the current move operation to complete and then move it back using the [lun move start](#) command.

All data transfers will be halted. If the source LUN was quiesced, it will be restored to normal operation.

This is an advanced command because the preferred way to cancel a LUN move operation is to wait until the new LUN becomes visible, and then move it back.

Parameters

{ -vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path (privilege: advanced)

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::*> lun move cancel -vserver vs1 -destination-path /vol/vol2/lun2
```

Cancels the move operation identified by Vserver *vs1* and destination path */vol/vol2/lun2*.

Related Links

- [lun move start](#)

lun move modify

Modify an ongoing LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move modify` command modifies the maximum throughput of an ongoing move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-max-throughput {<integer>[KB|MB|GB|TB|PB]} - Maximum Transfer Rate (per sec)

Specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun move modify -vserver vs1 -destination-path /vol/vol2/lun2
-max-throughput 25MB
```

Modifies the maximum throughput for the ongoing move job identified by Vserver *vs1* and destination path */vol/vol2/lun2* to 25 MB/sec.

lun move pause

Pause an ongoing LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move pause` command pauses an ongoing move operation. Use the [lun move resume](#) command to resume the move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun move pause -vserver vs1 -destination-path /vol/vol2/lun2
```

Pauses the ongoing move operation identified by Vserver `vs1` and destination path `/vol/vol2/lun2`.

Related Links

- [lun move resume](#)

lun move resume

Resume a paused LUN move operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move resume` command resumes a paused move operation.

Parameters

{ -vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the destination LUN.

-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

Examples

```
cluster1::> lun move resume -vserver vs1 -destination-path /vol/vol2/lun2
```

Resumes the paused move operation identified by Vserver `vs1` and destination path `/vol/vol2/lun2`.

lun move show

Display a list LUNs currently being moved

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move show` command shows information about LUNs currently being moved in the cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects LUN move operations that match this parameter value.

[-destination-path <text>] - Destination Path

Selects LUN move operations that match this parameter value.

[-source-path <path>] - Source Path

Selects LUN move operations that match this parameter value.

[-is-promoted-late {true|false}] - Is Destination Promoted Late

Selects LUN move operations that match this parameter value.

[-max-throughput {<integer>[KB|MB|GB|TB|PB] }] - Maximum Transfer Rate (per sec)

Selects LUN move operations that match this parameter value.

[-job-status {Preparing|Allocation-Map|Data|Destroying|Paused-Manual|Paused-Error|Complete|Destroyed|Terminated-Manual}] - LUN Move Status

Selects LUN move operations that match this parameter value. The possible values are:

- `Preparing` - the LUN move job is in Preparing status.
- `Allocation-Map` - the LUN move job is in Allocating status.
- `Data` - the LUN move job is in Moving Data status.
- `Destroying` - the LUN move job is in Destroying status.
- `Paused-Manual` - the LUN move job is in Manually Paused status.
- `Paused-Error` - the LUN move job is in Paused By Error status.
- `Complete` - the LUN move job is in Complete status.
- `Destroyed` - the LUN move job is in Destroyed status.
- `Terminated-Manual` - the LUN move job is in Manually Terminated status.

[-progress-percent <percent>] - LUN Move Progress (%)

Selects LUN move operations that match this parameter value.

[-elapsed-time <time_interval>] - Elapsed Time

Selects LUN move operations that match this parameter value.

[-cutover-time <time_interval>] - Cutover Time

Selects LUN move operations that match this parameter value.

[-is-snapshot-fenced {true|false}] - Is Snapshot Fenced

Selects LUN move operations that match this parameter value.

[-is-destination-ready {true|false}] - Is Destination Ready

Selects LUN move operations that match this parameter value.

[-last-failure-reason <text>] - Last Failure Reason

Selects LUN move operations that match this parameter value.

Examples

```
cluster1::> lun move show
```

Vserver	Destination Path	Status	Progress
vs1	/vol/vol2/lun1	Data	35%
vs1	/vol/vol2/lun2	Complete	100%

2 entries were displayed.

The example above displays information about all the LUN move operations in the cluster.

```
cluster1::> lun move show -vserver vs1 -destination-path /vol/vol2/lun1
-instance
Destination Vserver Name: vs1
      Destination Path: /vol/vol2/lun1
      Source Path: /vol/vol1/lun1
Is Destination Promoted Early: false
Maximum Transfer Rate (per sec): 0B
      LUN Move Status: Data
LUN Move Progress (%): 35%
      Elapsed Time: 145s
      Cutover Time (secs): 0s
      Is Snapshot Fenced: true
Is Destination Ready: true
      Last Failure Reason: -
```

The example above displays all information about the LUN being moved to `/vol/vol2/lun1` in Vserver `vs1` .

lun move start

Start moving a LUN from one volume to another within a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `lun move start` command initiates moving of a LUN from one volume to another. The destination volume can be located on the same node as the original volume or on a different node.

Use `lun move-in-volume` command if you want to rename the LUN or move it within the same volume.

This command does not support movement of LUNs that are created from files.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the name of the Vserver that will host the new LUN.

[-destination-path <path> - Destination Path

Specifies the full path to the new LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

-source-path <path> - Source Path }

Specifies the full path to the source LUN, in the format `/vol/<volume>[/<qtree>]/<lun>`.

[-promote-late <true>] - Promote Late

Optionally specifies that the destination LUN needs to be promoted late.

If the destination is promoted early, the new LUN will be visible immediately. However, snapshots of the volume containing the new LUN cannot be taken until the LUN move operation reaches 'Moving Data' status.

If the destination is promoted late, the new LUN will be visible only after it has been fully framed. However, the LUN move job will not block the creation of snapshots of the volume containing the new LUN.

If this parameter is not specified, the destination LUN will be promoted early.

[-max-throughput {<integer>[KB|MB|GB|TB|PB] }] - Maximum Transfer Rate (per sec)

Optionally specifies the maximum amount of data, in bytes, that can be transferred per second in support of this operation. This mechanism can be used to throttle a transfer, to reduce its impact on the performance of the source and destination nodes.

If this parameter is not specified, throttling is not applied to the data transfer.

The specified value will be rounded up to the nearest megabyte.

Examples

```
cluster1::> lun move start -vserver vs1 -destination-path /vol/vol2/lun2
-source-path /vol/vol1/lun1
```

Starts moving LUN *lun1* from volume *vol1* in Vserver *vs1* to *lun2* on volume *vol2* in Vserver *vs1*.

- [lun move-in-volume](#)

lun persistent-reservation commands

lun persistent-reservation clear

Clear the SCSI-3 persistent reservation information for a given LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Clears the persistent reservation for the specified LUN.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Specifies the Vserver.

{ -path <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*

| -volume <volume name> - Volume Name (privilege: advanced)

Specifies the volume.

-lun <text> - LUN Name (privilege: advanced)

Specifies the name of the LUN.

[-qtree <qtree name>] - Qtree Name (privilege: advanced) }

Specifies the qtree.

Examples

```
cluster1::*> lun persistent-reservation clear -vserver vs_1 -path
/vol/vol_1/lun_1
```

Clears the persistent reservation data for lun *lun_1* in volume *vol_1* for Vserver *vs_1*.

lun persistent-reservation show

Display the current reservation information for a given LUN

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

Displays reservation information for a specified LUN in a Vserver. Unlike other show commands, the user must specify the LUN.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

| [*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

***-vserver* <Vserver Name> - Vserver Name (privilege: advanced)**

Specifies the Vserver.

{ *-path* <path> - LUN Path (privilege: advanced)

Specifies the path of the LUN. Examples of correct LUN paths: */vol/vol1/lun1* and */vol/vol1/qtree1/lun1*

| *-volume* <volume name> - Volume Name (privilege: advanced)

Specifies the volume.

***-lun* <text> - LUN Name (privilege: advanced)**

Specifies the name of the LUN.

[*-qtree* <qtree name>] - Qtree Name (privilege: advanced) }

Specifies the qtree.

[*-scsi-revision* {*scsi2*|*scsi3*}] - SCSI Revision (privilege: advanced)

Selects the reservations that match this parameter value.

[*-entry-type* {*reservation*|*registration*}] - Reservation or Registration (privilege: advanced)

Selects the reservations that match this parameter value.

[*-protocol* {*fcp*|*iscsi*}] - Protocol (privilege: advanced)

Selects the reservations that match this parameter value.

[*-reservation-key* <text>] - Reservation Key (privilege: advanced)

Selects the reservations that match this parameter value.

`[-reservation-type-code <text>]` - Reservation Type (privilege: advanced)

Selects the reservations that match this parameter value. The possible values for SCSI-3 reservations are:

- write exclusive
- exclusive access
- write exclusive registrants only
- exclusive access registrants only
- write exclusive all registrants
- exclusive access all registrants

and for SCSI-2 are:

- regular
- third party

`[-initiator-name <text>]` - Initiator Name (privilege: advanced)

Selects the reservations that match this parameter value.

`[-aptpl {true|false}]` - Persist Through Power Loss (privilege: advanced)

Selects the reservations that match this parameter value. If `true`, the reservation will be preserved over a power loss. If `false`, it will not. This value is for SCSI-3 reservations only.

`[-rtpid <integer>]` - Relative Target Port ID (privilege: advanced)

Selects the reservations that match the specified Relative Target Port ID (RTPID). This applies to SCSI-3 reservations only.

`[-target-wwpn <text>]` - FCP Target WWPN (privilege: advanced)

Selects the reservations that match the specified World Wide Port Name (WWPN).

`[-isid <text>]` - Initiator Session ID (privilege: advanced)

Selects the reservations that match this parameter value.

`[-tpgroup-tag <integer>]` - TPGGroup Tag (privilege: advanced)

Selects the reservations that match the specified target portal group tag. The tag identifies the tpgroup the reservation was made over.

`[-third-party-initiator-name <text>]` - Third Party Initiator Name (privilege: advanced)

Selects the reservations that match this parameter value (the initiator name that the reservation was made for). This is specific to third party reservation types, which is indicated by reservation-type-code.

`[-zrto-status {none|primary-out-of-sync|primary-in-sync|secondary-out-of-sync|secondary-in-sync}]` - ZRTO Status (privilege: advanced)

Selects the reservations that match this parameter value.

Examples

```
cluster1::*> lun persistent-reservation show -vserver vs_1
/vol/vol_1/lun_1
```

Key	Protocol	Type	Initiator Name

APTPL: true			
a0:00:00:00:00:00:01 iscsi	write exclusive	iqn.1993-08.org.debian:01:fa752b8a5a3a

2 entries were displayed.			

The example above displays the current reservations for lun_1 on Vserver vs_1.

lun portset commands

lun portset add

Add iSCSI/FCP LIFs to a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds existing iSCSI and FCP LIFs to a portset. To create a new portset, use the [lun portset create](#) command.

Use the [network interface create](#) command to create new LIFs.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the portset you want to add the LIFs to.

-port-name <port_name>, ... - LIF or TPG Name

Specifies the LIF name you want to add to the portset.

Examples

```
cluster1:::> portset add -vserver vs1 -portset ps1 -port-name lif1
```

Adds port lif1 to portset ps1 on Vserver vs1.

Related Links

- [lun portset create](#)
- [network interface create](#)

lun portset create

Creates a new portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new portset for FCP and iSCSI. The portset name can include a maximum of 96 characters. You can add LIFs to the new portset. If you do not add a LIF to the portset, you create an empty portset. To add LIFs to an existing portset, use the [lun portset add](#) command.

After you create a portset, you must bind the portset to an igroup so the host knows which FC or iSCSI LIFs to access. If you do not bind an igroup to a portset, and you map a LUN to an igroup, then the initiators in the igroup can access the LUN on any LIF on the Vserver.

You cannot bind an igroup to an empty portset because the initiators in the igroup would have no LIFs to access the LUN.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the name of the new portset. A portset name is a case-sensitive name that must contain one to 96 characters. Spaces are not allowed.

[-port-name <port_name>,...] - LIF Or TPG Name

Specifies the name of the logical interface that you want to add to the portset you want to create.

{ [-protocol {mixed|fc|iscsi}] - Protocol

Specifies if the portset protocol type is *fc*, *iscsi*, or *mixed*. The default is *mixed*.

| [-f, -fc <true>] - FCP

Specifies FCP as the protocol type of the new portset.

| [-i, -iscsi <true>] - iSCSI }

Specifies iSCSI as the protocol type of the new portset.

Examples

```
cluster1::> portset create -vserver vs1 -portset ps1 -protocol mixed
```

Creates a portset *ps1* on Vserver *vs1* with the protocol type of *mixed*.

```
cluster1::> portset create -vserver vs1 -portset iscsips -protocol iscsi
```

Creates a portset *iscsips* on Vserver *vs1* with the protocol type of *iscsi*.

```
cluster1::> portset create -vserver vs1 -portset fcppc -protocol fcp
```

Creates a portset *fcppc* on Vserver *vs1* with the protocol type of *fcp*.

```
cluster1::> portset create -vserver vs1 -portset ps2 -protocol mixed -port  
-name 111
```

Creates a portset *ps2* on Vserver *vs1* with the protocol type of *mixed* and LIF *111*.

Related Links

- [lun portset add](#)

lun portset delete

Delete the portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an existing portset. By default, you cannot delete a portset if it is bound to an initiator group. If a portset is bound to an initiator group, you can do one of the following:

- specify the *force* option to unbind the portset from the initiator group and delete the portset.
- use the [lun igroup unbind](#) command to unbind the portset from the initiator group. Then you can delete the portset.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the portset you want to delete.

[-f, -force <true>] - Force

Forcibly unbinds the portset from the initiator group.

Examples

```
cluster1::> portset delete -vserver vs1 -portset ps1
```

Deletes portset ps1 on Vserver vs1.

Related Links

- [lun igroup unbind](#)

lun portset remove

Remove iSCSI/FCP LIFs from a portset

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes a LIF from a portset.

You cannot remove the last LIF in a portset if the portset is bound to an initiator group (igroup). To remove the last LIF in a portset, use the [lun igroup unbind](#) command to unbind the portset from the igroup. Then you can remove the last LIF in the portset.

Parameters

-vserver <Vserver Name> - Vserver Name

Specifies the Vserver.

-portset <text> - Portset Name

Specifies the portset you want to remove a LIF from.

-port-name <port_name>, ... - LIF or TPG Name

Specifies the LIF name you want to remove from the portset.

Examples

```
cluster1::> portset remove -vserver vs1 -portset ps1 -port-name lif1
```

Removes port lif1 from portset ps1 on Vserver vs1.

Related Links

- [lun igroup unbind](#)

lun portset show

Displays a list of portsets

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the LIFs in a portset. By default, the command displays all LIFs in all portsets.

Parameters

- { [-fields <fieldname>,...]**
If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
- | [-instance] }**
If you specify the `-instance` parameter, the command displays detailed information about all fields.
- [-vserver <Vserver Name>] - Vserver Name**
Selects the portsets that match this parameter value.
- [-portset <text>] - Portset Name**
Selects the portsets that match this parameter value.
- [-uuid <UUID>] - Portset Uuid**
Selects the portsets that match this parameter value.
- [-port-name <port_name>,...] - LIF Or TPG Name**
Selects the portsets that match this parameter value.
- [-protocol {mixed|fc|iscsi}] - Protocol**
Selects the portsets that match this parameter value.
- [-port-count <integer>] - Number Of Ports**
Selects the portsets that match this parameter value.
- [-igroups <igroup>,...] - Bound To Igroups**
Selects the portsets that match this parameter value.

Examples

```
cluster1::> lun portset show
Vserver   Portset      Protocol  Port Names          Igroups
-----
vs1       ps0          mixed    lif1, lif2          igroup1
          ps1          iscsi    lif3                igroup2
          ps2          fcp      lif4                -
3 entries were displayed.
```

The example above displays all portsets.

```
cluster1::> lun portset show -port-count 0
```

Vserver	Portset	Protocol	Port Names	Igroups
vs1	p1	iscsi	-	-

The example above displays the portsets that contain zero LIFs.

```
cluster1::> lun portset show -protocol iscsi
```

Vserver	Portset	Protocol	Port Names	Igroups
vs1	p1	iscsi	-	-
vs1	iscsips	iscsi	lif1	igroup1

2 entries were displayed.

The example above displays the portsets that have the iSCSI protocol.

```
cluster1::> lun portset show -port-name lif1
```

Vserver	Portset	Protocol	Port Names	Igroups
vs1	iscsips	iscsi	lif1	igroup1

The example above displays the portsets that contain LIF lif1.

lun transition commands

lun transition show

Display the status of LUN transition processing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition show` command displays information about the LUN transition processing status of volumes. If no parameters are specified, the command displays the following information about all volumes:

- Vserver name
- Volume name
- Transition status

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)

Selects the volumes in the specified Vserver.

[-volume <volume name>] - Volume Name (privilege: advanced)

Selects the volumes with the specified name.

[-status {none|complete|failed|active}] - Transition Status (privilege: advanced)

Selects the volumes that match the specified transition status. The possible status values are:

- *active* - The volume is in an active SnapMirror transition relationship and not yet transitioned.
- *complete* - LUN transition has completed for the volume.
- *failed* - LUN transition has failed for the volume.
- *none* - The volume did not contain LUNs to transition from ONTAP 7-Mode.

[-vserver-uuid <UUID>] - Vserver UUID (privilege: advanced)

Selects the volumes in the Vserver that matches the specified UUID.

[-node <nodename>] - Filer ID (privilege: advanced)

Selects the volumes that match the specified node.

Examples

The following example displays LUN transition information for all volumes in a Vserver named `vs1` :

```
cluster1::*> lun transition show -vserver vs1
Vserver          Volume          Transition Status
-----
vs1              vol0            none
                vol1            complete
                vol2            failed
                vol3            active
4 entries were displayed.
```

lun transition start

Start LUN Transition Processing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition start` command starts LUN transition for the specified volume. Normally, transition is started automatically when [snapmirror break](#) is issued for the volume, this command allows restarting in the event automatic transitioning was interrupted or failed.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

The name of the Vserver containing the volume. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name (privilege: advanced)

The name of the volume to restart LUN transition.

Examples

The following example starts LUN transition on a volume named `volume1` in a Vserver named `vs1` :

```
cluster1::*> lun transition start -vserver vs1 -volume volume1
```

lun transition 7-mode delete

Delete an Untransitioned 7-Mode LUN

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition 7-mode delete` command deletes an untransitioned LUN copied from a ONTAP 7-Mode system. This allows the admin to recover space from the volume for LUNs that may not be transitioned to ONTAP without disrupting LUNs that have transitioned, for example, if the LUN is an unsupported OS type.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

This specifies the name of the Vserver from which the LUN is to be deleted. If only one data Vserver exists, you do not need to specify this parameter.

-path <path> - LUN Path (privilege: advanced)

This specifies the path to the LUN to delete.

Examples

The following example deletes the LUN `/vol/vol1/lun1` in a Vserver named `vs1` :

```
cluster1::*> lun transition 7-mode delete -vserver vs1 -path
/vol/vol1/lun1
```

lun transition 7-mode show

Display the 7-Mode LUN Inventory

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `lun transition 7-mode show` command displays information about LUNs copied from a ONTAP 7-Mode system. If no parameters are specified, the command displays the following information about all 7-Mode LUNs:

- Vserver name
- LUN path
- Operating system type
- Size
- Whether or not the LUN has been transitioned to ONTAP

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <Vserver Name>] - Vserver Name (privilege: advanced)`

Selects the 7-Mode LUNs in the specified Vserver.

`[-path <path>] - LUN Path (privilege: advanced)`

Selects the 7-Mode LUNs with the specified path.

`[-volume <volume name>] - Volume Name (privilege: advanced)`

Selects the 7-Mode LUNs that match the specified volume.

`[-ostype <LUN Operating System Format>] - OS Type (privilege: advanced)`

Selects the 7-Mode LUNs that match the specified operating system type.

`[-size <size>] - LUN Size (privilege: advanced)`

Selects the 7-Mode LUNs that match the specified size.

`[-prefix-size <size>] - Prefix Stream Size (privilege: advanced)`

Selects the 7-Mode LUNs that match the specified prefix stream size.

[`-suffix-size <size>`] - Suffix Stream Size (privilege: advanced)

Selects the 7-Mode LUNs that match the specified suffix stream size.

[`-serial <text>`] - Serial Number (privilege: advanced)

Selects the 7-Mode LUNs that match the specified serial number for ONTAP. LUNs where `is-transitioned` is `false` do not have a serial number assigned for ONTAP.

[`-uuid <UUID>`] - UUID (privilege: advanced)

Selects the 7-Mode LUNs that match the specified UUID for ONTAP. LUNs where `is-transitioned` is `false` do not have a UUID assigned for ONTAP.

[`-serial-7-mode <text>`] - 7-mode Serial Number (privilege: advanced)

Selects the 7-Mode LUNs that match the specified serial number from 7-Mode.

[`-is-transitioned {true|false}`] - Transition Complete (privilege: advanced)

Selects the 7-Mode LUNs that match the specified transition state. LUNs where this value is `true` have been transitioned and are available to be mapped for client access. LUNs where this value is `false` have not yet been transitioned and may not be mapped.

[`-vserver-uuid <UUID>`] - Vserver UUID (privilege: advanced)

Selects the 7-Mode LUNs that match the specified Vserver UUID.

[`-node <nodename>`] - Node (privilege: advanced)

Selects the 7-Mode LUNs that match the specified node name.

Examples

The following example displays a summary of all 7-Mode LUNs for the volume `vol1` in a Vserver named `vs1`:

```
cluster1::*> lun transition 7-mode show -vserver vs1 -volume vol1
Vserver  Path                                     Type    Size    Transitioned
-----  -
vs1      /vol/vol1/lun1                          linux    10MB    false
         /vol/vol1/lun2                          linux    500MB    true
         /vol/vol1/lun3                          linux    500MB    true
8 entries were displayed.
```

The following example displays detailed information for the 7-Mode LUN `/vol/vol1/lun2` in a Vserver named `vs1`:

```
cluster1::*> lun transition 7-mode show -vserver vs1 -path /vol/vol1/lun2
Vserver Name: vs1
    LUN Path: /vol/vol1/lun2
    Volume Name: vol1
    OS Type: linux
    LUN Size: 500MB
Prefix Stream Size: 0
Suffix Stream Size: 0
    Serial Number: BCVvv$DLZu8g
        UUID: f53d603b-9663-4567-9680-95c1a9cc6d9e
7-mode Serial Number: C4eqKotPI8Ui
Transition Complete: true
    Vserver UUID: be4cc135-163f-11e3-931f-123478563412
        Node: cluster-01
```

metrocluster commands

metrocluster configure

Configure MetroCluster and start DR mirroring for the node and its DR group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configure` command creates a MetroCluster configuration on either all the nodes in both MetroCluster clusters or solely on nodes in a DR group. The command configures a HA partner, DR partner, and a DR auxiliary partner for the nodes and also starts NVRAM mirroring between the configured DR partner nodes.

In MetroCluster, a DR group is a group of four nodes, two in each of the MetroCluster clusters:

- In the local cluster, a node and its HA partner,
- In the peer cluster, a node and its HA partner. These nodes are DR partners to the nodes in the local cluster.

In a two node MetroCluster configuration, a DR group is a group of two nodes, one in each of the MetroCluster clusters.

There can be several DR groups in the MetroCluster configuration. MetroCluster provides synchronous DR protection to all data sets belonging to nodes within a properly configured DR group.

Without the `-node` parameter, the `metrocluster configure` command configures all the DR groups in both the MetroCluster clusters.

With the `-node mynode` parameter, the command configures both the `mynode` node and its HA partner node from the local cluster, and its DR partner and DR auxiliary partner from the peer cluster.

Before running the `metrocluster configure` command, the aggregates and Vservers on each node must be prepared for the MetroCluster configuration. Each node should have:

- At least one non-root, mirrored aggregate of size greater than 10GB. This non-root aggregate should not have any volumes in it.
- No other non-root aggregates. Any other non-root, unmirrored aggregates and volumes should be deleted.
- No Vservers other than Vservers of type "node" or "admin." Any Vservers that are not of type "node" or "admin" should be deleted.
- A mirrored and healthy root aggregate.

After the command is successful all nodes in the local and remote clusters will have HA, DR, and DR auxiliary partners and NVRAM mirroring between the DR partners will be turned on. The same conditions apply before running the `metrocluster configure-node mynode` command, except that only one DR group is configured.

For a MetroCluster over IP configuration, the `metrocluster configuration-settings` commands must be completed before using the `metrocluster configure` command. The commands required to be completed are:

- [metrocluster configuration-settings dr-group create](#)
- [metrocluster configuration-settings interface create](#)
- [metrocluster configuration-settings connection connect](#)

Parameters

[`-node-name` {<nodename>|local}] - Node to Configure

This optional parameter specifies the name of a single node in the local cluster. The command creates MetroCluster configuration on the local node specified by this parameter and the three other nodes belonging to the same DR group.

[`-refresh` {true|false}] - Refresh Configuration (privilege: advanced)

This optional parameter specifies if the node partner configuration steps should be done again. Not specifying this parameter will cause the MetroCluster configuration to continue using the current node partner information.

[`-allow-with-one-aggregate` {true|false}] - Override the Two Data Aggregates Requirement (privilege: advanced)

This optional parameter specifies if MetroCluster configuration should be allowed with only one data aggregate in each cluster. This option has no effect if two or more aggregates are present.

Examples

The following example shows the creation of the MetroCluster configuration for a single DR group:

```
clusA::> metrocluster show
```

Cluster	Configuration	State	Mode
Local: clusA	not-configured		-
Remote: clusB	not-configured		-

```
clusA::> metrocluster node show
```

DR Group	Cluster	Node	Configuration State	DR Mirroring	Mode
-	clusA	clusA-01	ready to configure	-	-
		clusA-02	ready to configure	-	-
		clusA-03	ready to configure	-	-
		clusA-04	ready to configure	-	-

4 entries were displayed.

```
clusA::> metrocluster configure -node clusA-01
```

[Job 45] Job succeeded: Configure is successful

```
clusA::> metrocluster show
```

Cluster	Configuration	State	Mode
Local: clusA	partially-configured		normal
Remote: clusB	partially-configured		normal

```
clusA::> metrocluster node show
```

DR Group	Cluster	Node	Configuration State	DR Mirroring	Mode
-	clusA	clusA-03	ready to configure	-	-
		clusA-04	ready to configure	-	-
1	clusA	clusA-01	configured	enabled	normal
		clusA-02	configured	enabled	normal
	clusB	clusB-01	configured	enabled	normal
		clusB-02	configured	enabled	normal

6 entries were displayed.

The following example shows the creation of the MetroCluster configuration for all DR groups:

```
clusA::> metrocluster show
```

Cluster	Configuration State	Mode
-----	-----	

Local: clusA	not-configured	-
Remote: clusB	not-configured	-

```
clusA::> metrocluster node show
```

DR			Configuration	DR
Group	Cluster	Node	State	Mirroring Mode
-----	-----	-----	-----	-----
-	clusA	clusA-01	ready to configure	-
		clusA-02	ready to configure	-
		clusA-03	ready to configure	-
		clusA-04	ready to configure	-

4 entries were displayed.

```
clusA::> metrocluster configure
```

[Job 45] Job succeeded: Configure is successful

```
clusA::> metrocluster show
```

Cluster	Configuration State	Mode
-----	-----	

Local: clusA	configured	normal
Remote: clusB	configured	normal

```
clusA::> metrocluster node show
```

DR			Configuration	DR
Group	Cluster	Node	State	Mirroring Mode
-----	-----	-----	-----	-----
1	clusA	clusA-01	configured	enabled normal
		clusA-02	configured	enabled normal
	clusB	clusB-01	configured	enabled normal
		clusB-02	configured	enabled normal
2	clusA	clusA-03	configured	enabled normal
		clusA-04	configured	enabled normal
	clusB	clusB-03	configured	enabled normal
		clusB-04	configured	enabled normal

8 entries were displayed.

metrocluster heal

Heal DR data aggregates and DR root aggregates

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster heal` command heals DR data aggregates and DR root aggregates in preparation for a DR switchback. You must issue this command twice to complete the two phases of the healing process: first to heal the aggregates by resynchronizing the mirrored plexes and then to heal the root aggregates by switching them back to the disaster site. The DR partner nodes must be powered off and remote disk shelves must be powered on before running this command.

Parameters

-phase {aggregates|root-aggregates} - MetroCluster Healing Phase

This parameter specifies the healing phase. The first phase, *aggregates*, heals aggregates by resynchronizing mirrored plexes. The second phase, *root-aggregates*, heals the root aggregates of partner nodes. Healing root aggregates switches them back to the disaster site, allowing the site to boot.

[-override-vetoes <true>] - Override All Soft Vetoes

This optional parameter overrides almost all heal operation soft vetoes. If this optional parameter is set to *true*, the system overrides subsystem soft vetoes that might prevent the heal operation. Hard vetoes cannot be overridden and can still prevent the switchback operation.

Examples

The following example performs the healing of both the aggregates and root aggregates:

```
cluster1::> metrocluster heal -phase aggregates
[Job 136] Job succeeded: Heal Aggregates is successful
cluster1::> metrocluster heal -phase root-aggregates
[Job 137] Job succeeded: Heal Root Aggregates is successful
```

metrocluster modify

Modify MetroCluster configuration options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster modify` command modifies MetroCluster parameters for nodes in the MetroCluster configuration.

Parameters

{ -auto-switchover-failure-domain <MetroCluster AUSO Failure Domain> - Cluster Level AUSO Option

This parameter specifies the configuration of automatic switchover.

The parameter values are:

- `auso-on-cluster-disaster` - triggers an unplanned switchover if all nodes in a DR cluster are down.
- `auso-on-dr-group-disaster` - triggers an unplanned switchover if both nodes of a DR group are down.
- `auso-disabled` - automatic switchover is disabled.

A change to the parameter affects only the local cluster where the `metrocluster modify` command is used.

| -enable-unmirrored-aggr-deployment {true|false} - Enable or Disable Unmirrored Aggregate Deployment

Enable or disable unmirrored aggregates deployment

| -is-encryption-enabled {true|false} - Is Encryption Enabled

This parameter is used to enable or disable NVLog and Storage data encryption in MetroCluster over IP configuration.

-dr-group-id <integer> - DR Group ID

This parameter identifies the DR group where encryption is being enabled or disabled.

| [-allow-auto-forced-switchover {true|false}] - Allow Automatic Forced Switchover (privilege: advanced)

This parameter is used to enable automatic forced switchover on node failures. The `allow-auto-forced-switchover` parameter is only supported on a MetroCluster over IP configuration. Refer to the MetroCluster documentation for risks and limitations of this feature.

All nodes in a MetroCluster configuration must have this option enabled to enable automatic forced switchover on failure.

| -node-name {<nodename>|local} - Node to Change the Option On }

This parameter is used to specify the node in the cluster for which the parameter needs to be modified.

[-automatic-switchover-onfailure <true>] - Node Level AUSO Option (privilege: advanced) }

This parameter is used to enable automatic switchover on node failures. The `automatic-switchover-onfailure` parameter is not supported on a MetroCluster over IP configuration.

All nodes in a MetroCluster configuration must have this option enabled to enable automatic switchover on failure.

Examples

The following example shows the output of MetroCluster modification done on a node:

```
clusA::~*> metrocluster modify -node-name clusA-01 -node-object-limit on
[Job 168] Job succeeded: Modify is successful
clusA::~*> metrocluster modify -node-name clusA-01 -automatic-switchover
-onfailure false
[Job 308] Job succeeded: Modify is successful
clusA::> metrocluster modify -auto-switchover-failure-domain auto-on-
cluster-disaster
[Job 308] Job succeeded: Modify is successful
clusA::> metrocluster modify -is-encryption-enabled true -dr-group-id 1
[Job 206] Job succeeded: Modify is successful
```

metrocluster remove-dr-group

Remove a DR group from a MetroCluster configuration with multiple DR groups

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster remove-dr-group` command removes a DR group from a MetroCluster configuration with multiple DR groups.

The command removes the local nodes in the identified DR group from the MetroCluster configuration. The command must be repeated on the partner cluster to remove the remote nodes in the identified DR group.

A DR group cannot be removed when the MetroCluster configuration has only a single DR group. Two or more DR groups must be configured. The command does not allow a user from unconfiguring the entire MetroCluster. Contact technical support to unconfigure the entire MetroCluster.

The following preparation steps must be completed on the local and partner clusters before removing a DR group.

- Move all data volumes to another DR group.
- Move all MDV_CRS metadata volumes to another DR group.
- Delete all MDV_aud metadata volumes that may exist in the DR group to be removed.
- Delete all data aggregates in the DR group to be removed. Root aggregates are not deleted.
- Migrate all data LIFs to home nodes in another DR group.
- Migrate the cluster management LIF to a home node in another DR group. Node management and inter-cluster LIFs are not migrated.
- Transfer epsilon to a node in another DR group.

The command is vetoed if the preparation steps are not completed on the local and partner clusters.

Parameters

-dr-group-id <integer> - DR Group ID (privilege: advanced)

This parameter identifies the DR group to be removed.

Examples

```
cluster_A::*> metrocluster remove-dr-group -dr-group-id 1
```

Warning: Nodes in the DR group that are removed from the MetroCluster configuration will lose their disaster recovery protection.

Local nodes "node_A1, node_A2" will be removed from the MetroCluster configuration. You must repeat the operation on the partner cluster "cluster_B" to remove the remote nodes in the DR group.

Do you want to continue? {y|n}: y

Info: The following preparation steps must be completed on the local and partner clusters before removing a DR group.

1. Move all data volumes to another DR group.
2. Move all MDV_CRS metadata volumes to another DR group.
3. Delete all MDV_aud metadata volumes that may exist in the DR group to be removed.
4. Delete all data aggregates in the DR group to be removed. Root aggregates are not deleted.
5. Migrate all data LIFs to home nodes in another DR group.
6. Migrate the cluster management LIF to a home node in another DR group. Node management and inter-cluster LIFs are not migrated.
7. Transfer epsilon to a node in another DR group.

The command is vetoed if the preparation steps are not completed on the local and partner clusters.

Do you want to continue? {y|n}: y

[Job 80] Job succeeded: Remove DR Group is successful.

metrocluster show

Display MetroCluster configuration information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster show` command displays configuration information for the pair of clusters configured in MetroCluster.

This command displays the following details about the local cluster and the DR partner cluster:

- Configuration State: This field specifies the configuration state of the cluster.
- Mode: This field specifies the operational mode of the cluster.
- AUSO Failure Domain: This field specifies the AUSO failure domain of the cluster.

Parameters

[`-periodic-check-status`]

If this option is used the MetroCluster periodic check status is displayed.

Examples

The following example shows the output of the command before MetroCluster configuration is done:

```
clusA::> metrocluster show
Configuration: -
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  not-configured
      Mode                 -
      AUSO Failure Domain  -
Remote: clusB
      Configuration State  not-configured
      Mode                 -
      AUSO Failure Domain  -
```

The following example shows the output of the command after MetroCluster configuration is done only for some DR groups:

```
clusA::> metrocluster show
Configuration: -
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  partially-configured
      Mode                 -
      AUSO Failure Domain  -
Remote: clusB
      Configuration State  partially-configured
      Mode                 -
      AUSO Failure Domain  -
```

The following example shows the output of the command after a MetroCluster IP configuration is done:

```
clusA::> metrocluster show
Configuration: IP-fabric
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  configured
      Mode                normal
      AUSO Failure Domain  auso-on-cluster-disaster
Remote: clusB
      Configuration State  configured
      Mode                normal
      AUSO Failure Domain  auso-on-cluster-disaster
```

The following example shows the output of the command after a MetroCluster FC configuration is done:

```
clusA::> metrocluster show
Configuration: Fabric
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  configured
      Mode                normal
      AUSO Failure Domain  auso-on-
cluster-disaster
Remote: clusB
      Configuration State  configured
      Mode                normal
      AUSO Failure Domain  auso-on-
cluster-disaster
```

The following example shows the output of the command in switchover mode for a MetroCluster IP configuration:

```
clusA::> metrocluster show
Configuration: IP-fabric
Cluster                               Entry Name                               State
-----
Local: clusA
      Configuration State  configured
      Mode                switchover
      AUSO Failure Domain  auso-on-cluster-disaster
Remote: clusB
      Configuration State  not-reachable
      Mode                -
      AUSO Failure Domain  not-reachable
```

The following example shows the output of the command when `-periodic-check-status` option is used:

```
clusA::> metrocluster show -periodic-check-status
Cluster                               Periodic Check Enabled
-----
Local: clusA                          true
Remote: clusB                         true
```

metrocluster switchback

Switch back storage and client access

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The ``metrocluster switchback`` command initiates the switchback of storage and client access from nodes in the DR site to their home nodes. The home nodes and storage shelves must be powered on and reachable by nodes in the DR site. The `xref:{relative_path}metrocluster-heal.html[metrocluster heal]`-phase` ``_aggregates_``` and `xref:{relative_path}metrocluster-heal.html[metrocluster heal]`-phase` ``_root-aggregates_``` commands must have successfully completed before running the ``metrocluster switchback`` command.

Parameters

`[-f, -override-veto`s <true>] - Override All Soft Vetoes

This optional parameter overrides all switchback operation soft vetoes. If this optional parameter is used, the system overrides subsystem soft vetoes that might prevent the switchback operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

`[-simulate <true>]` - Simulate Switchback (privilege: advanced)

If this optional parameter is used, the system runs a simulation of the switchback operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchback operations performed for switching back left-behind aggregates or for retrying a partially successful switchback.

Examples

The following is an example of how to start the switchback operation.

```
clusA::> metrocluster switchback
```

metrocluster switchover

Switch over storage and client access

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The ``metrocluster switchover`` command initiates the switchover of storage and client access from the source cluster to the disaster recovery (DR) site. This command is to be used after a disaster that renders all the nodes in the source cluster unreachable and powered off. It can also be used for negotiated switchover when the outage of the source cluster is anticipated as in cases such as disaster recovery testing or a site going offline for maintenance. If a switchover operation previously failed on certain nodes on the DR site then issuing the command retries the operation on all of those nodes.

Parameters

`{ [-simulate <true>]` - Simulate Negotiated Switchover (privilege: advanced)

If this optional parameter is used, the system runs a simulation of the negotiated switchover operation to make sure all the prerequisites for the operation are met. This parameter cannot be used with switchover with the `-forced-on-disaster` parameter.

{ [-controller-replacement <true>] - Indicate Controller Replacement

If this optional parameter is used, the nodes in the DR site will be halted during the negotiated switchover operation, to facilitate controller replacement.

| [-forced-on-disaster <true>] - Force Switchover on Disaster

This optional parameter forces a switchover on disaster. This parameter should be used if all the nodes on the disaster stricken site are powered off and unreachable. In the absence of this parameter, the command attempts to perform a negotiated switchover operation.

[-force-nvfail-all <true>] - Sets in-nvfailed-state on All Volumes (privilege: advanced)

If this parameter is used, the switchover command will set the in-nvfailed-state parameter to true for all volumes being switched over and will set the `-dr-force-nvfail` parameter to true for any volumes that do not already have it enabled. This parameter has no effect when performing a negotiated switchover.

[-retry-failed-nodes <Node name>,...] - Nodes to Switchover }

This optional parameter takes the list of nodes that previously failed the switchover operation and it retries the switchover operation on each of the nodes. This parameter is applicable only for a switchover with the `-forced-on-disaster` parameter.

[-override-vetoes <true>] - Override All Soft Vetoes

This optional parameter overrides all switchover operation soft vetoes. If this parameter is used, the system overrides all subsystem soft vetoes that might prevent the switchover operation. Hard vetoes cannot be overridden and can still prevent the switchover operation.

Examples

When a disaster strikes one site, the `metrocluster switchover` command is issued on the disaster recovery site as follows:

```

cluster1::> metrocluster switchover -forced-on-disaster true

Warning: MetroCluster switchover is a Disaster Recovery operation that
could
    cause some data loss. The cluster on the other site must either
be
    prevented from serving data or be simply powered off (nodes and
disk
    shelves)
    The following nodes ( cluster1-01 cluster1-02 ) will participate
in
    the switchover operation
Do you want to continue? {y|n}: y
Queued job. Use 'metrocluster operation show' to check status of the DR
operation.
cluster1::> metrocluster operation show
    Operation: switchover
    State: successful
    Start time: 10/3/2013 22:11:47
    End time: 10/3/2013 22:11:53
    Errors: -

```

metrocluster check commands

metrocluster check disable-periodic-check

Disable Periodic Check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check disable-periodic-check` command disables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will be prevented from periodically checking the configuration for errors.

Parameters

Examples

```
clusA::> metrocluster check disable-periodic-check
```

metrocluster check enable-periodic-check

Enable Periodic Check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check enable-periodic-check` command enables the periodic checking of the MetroCluster configuration.

After this command is run, the MetroCluster Check job will be able to run in the background and periodically check the configuration for errors.

Parameters

Examples

```
clusA::> metrocluster check enable-periodic-check
```

metrocluster check run

Check the MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check run` command performs checks on the MetroCluster configuration and reports configuration errors if any.

To run this command, at least one DR group needs to be configured. The command checks the following parts of the configuration:

Node Configuration:

- `node-reachable`: This check verifies that the node is reachable.
- `metrocluster-ready`: This check verifies that the node is ready for MetroCluster configuration.
- `local-ha-partner`: This check verifies that the HA partner node is in the same cluster.
- `ha-mirroring-on`: This check verifies that HA mirroring for the node is configured.
- `symmetric-ha-relationship`: This check verifies that the relationship between the node and its HA partner is symmetric.
- `remote-dr-partner`: This check verifies that the DR partner node is in the remote cluster.
- `dr-mirroring-on`: This check verifies that DR mirroring for the node is configured.
- `symmetric-dr-relationship`: This check verifies that the relationship between the node and its DR partner is symmetric.
- `remote-dr-auxiliary-partner`: This check verifies that the DR auxiliary partner node is in the remote cluster.

- **symmetric-dr-auxiliary-relationship:** This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.
- **storage-failover-enabled:** This check verifies that storage failover is enabled.
- **has-intercluster-lif:** This check verifies that the node has an intercluster LIF.
- **node-object-limit:** This check verifies that the node object limit option for the node is turned on.

Aggregate Configuration:

- **mirroring-status:** This check verifies that the aggregate is mirrored.
- **disk-pool-allocation:** This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

At the end of the check the command displays a summary of the results. This summary output can be viewed again by running `metrocluster check show`. If any of the rows in this output show any warnings more details can be viewed by running the `metrocluster check show` command for that component.

Parameters

`[-skip-dr-simulation {true|false}]` - Skip the DR Readiness Checks (privilege: advanced)

If this optional parameter is set to true, the switchover and switchback simulations are not run.

Examples

The following example shows the execution of the command when there are no warnings:

```
clusA::> metrocluster check run

                Last Checked On: 4/9/2014 20:11:46
Component              Result
-----
nodes                  ok
clusters               ok
lifs                   ok
config-replication    ok
aggregates             ok
5 entries were displayed.
Command completed. Use the "metrocluster check show -instance" command or
sub-commands in "metrocluster check" directory for detailed results.
```

The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check run
Last Checked On: 4/9/2014 20:11:46
Component          Result
-----
nodes              warning
clusters           ok
lifs               ok
config-replication ok
aggregates         ok
5 entries were displayed.
Command completed. Use the "metrocluster check show -instance" command or
sub-commands in "metrocluster check" directory for detailed results.
```

Related Links

- [metrocluster check show](#)

metrocluster check show

Show the results of the last instance of MetroCluster check

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check show` command displays the results of the [metrocluster check run](#) command.

This command displays the high-level verification results for each of the components. If there are any errors for a component, running the show command for that component (for example [metrocluster check node show](#) or [metrocluster check aggregate show](#)) will display more information about the warning.

Note that this command does not run the checks but only displays the results of checks. To look at the latest results, run the [metrocluster check run](#) command and then run this command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Check

This is the time at which the [metrocluster check run](#) command was last run in this cluster and these results were produced. If this parameter is specified, only rows with this timestamp will be displayed.

[-component <MetroCluster Check Components>] - Name of the Component

This is the name of the component. If this parameter is specified, only rows with this component will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check for the component. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is the additional info for the verification for this component. This field will have detailed information about the warning and recovery steps. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command when there are no warnings:

```
clusA::> metrocluster check show
cked On: 4/9/2014 20:11:46
t          Result
-----
nodes      ok
clusters   ok
lifs       ok
config-replication ok
aggregates ok
connections ok
s were displayed.
```

The following example shows the execution of the command when there are some warnings:

```
clusA::> metrocluster check show
cked On: 4/9/2014 20:11:46
t          Result
-----
nodes      warning
clusters   ok
lifs       ok
config-replication ok
aggregates ok
connections ok
s were displayed.
```

The following example shows the execution of the command with -instance option:

```
clusA::> metrocluster check show -instance
Time of Check: 4/9/2014 20:12:36
      Name of the Component: nodes
      Result of the Check: warning
      Additional Information/Recovery Steps:

metrocluster check aggregate show

Show results of MetroCluster check for aggregates

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check aggregate show` command displays the results of aggregate checks performed by the [metrocluster check run](#) command.

The command verifies the following aspects of the configuration of all aggregates in MetroCluster:

- **mirroring-status:** This check verifies that the aggregate is mirrored.
- **disk-pool-allocation:** This check verifies that the disks belonging to this aggregate have been correctly allocated to the right pools.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <Node name>] - Node Name

This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.

[-aggregate <aggregate name>] - Name of the Aggregate

This is the name of the aggregate for which the check was run. If this parameter is specified, only rows with this aggregate will be displayed.

[-check <MetroCluster Aggregate Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Name of Cluster

This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>,...] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

```
clusA::> metrocluster check aggregate show
```

```
Last Checked On: 4/9/2014 20:11:46
```

Node	Aggregate	Check	Result
clusA-01	a1_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_a1	mirroring-status	ok
		disk-pool-allocation	ok
clusA-02	a2_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_a2	mirroring-status	ok
		disk-pool-allocation	ok
clusB-01	b1_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok
	aggr0_b1	mirroring-status	ok
		disk-pool-allocation	ok
clusB-02	aggr0_b2	mirroring-status	ok
		disk-pool-allocation	ok
	b2_required_data_aggr	mirroring-status	ok
		disk-pool-allocation	ok

```
16 entries were displayed.
```

The following example shows the execution of the command with -instance option:

```
clusA::> metrocluster check aggregate show -instance
```

```
Node Name: clusA-01
```

```
    Name of the Aggregate: a1_required_data_aggr_1
```

```
        Type of Check: mirroring-status
```

```

- [metrocluster check run](#)

metrocluster check cluster show

Show results of MetroCluster check for the cluster components

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check cluster show` command displays the results of cluster checks performed by the [metrocluster check run](#) command.

The command displays the results of the following cluster configuration checks:

- **negotiated-switchover-ready:** This check verifies that the cluster is ready for a negotiated switchover operation.
- **switchback-ready:** This check verifies that the cluster is ready for a switchback operation.
- **job-schedules:** This check verifies that the job schedules between the local and remote clusters are consistent.
- **licenses:** This check verifies that the licenses between the local and remote clusters are consistent.
- **periodic-check-enabled:** This check verifies that the periodic MetroCluster Check Job is enabled.
- **onboard-key-management:** This check verifies that the Onboard Key Management hierarchies are consistent.

- **external-key-management:** This check verifies that the External Key Management configurations are consistent.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-check {negotiated-switchover-ready|switchback-ready|job-schedules|licenses|periodic-check-enabled|onboard-key-management|external-key-management}] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Cluster Name

This is the name of the cluster the check results apply to. If this parameter is specified, only rows matching the specified cluster will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration:

```
clusA::> metrocluster check cluster show
```

```
Last Checked On: 11/29/2018 17:15:00
```

Cluster	Check	Result
-----	-----	-----
clusA	negotiated-switchover-ready	not-applicable
	switchback-ready	not-applicable

metrocluster check config-replication show-aggregate-eligibility

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check config-replication show-aggregate-eligibility` command displays the MetroCluster configuration replication aggregate eligibility.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-aggregate <aggregate name>] - Aggregate

This is the aggregate name. If this parameter is specified, only rows with this aggregate will be displayed.

[-hosted-configuration-replication-volumes <volume name>,...] - Currently Hosted Configuration Replication Volumes

This is the list of the configuration replication volumes hosted on this aggregate. If this parameter is specified, only rows with these configuration replication volumes will be displayed.

[-is-eligible-to-host-additional-volumes {true|false}] - Eligibility to Host Another Configuration Replication Volume

This is the eligibility of the aggregate to host additional configuration replication volumes. If this parameter is specified, only rows with this eligibility will be displayed.

[-comment <text>] - Comment for Eligibility Status

This is a comment regarding the eligibility of the aggregate to host configuration replication volumes. If this parameter is specified, only rows with this comment will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with thirteen aggregates in the cluster:

```
clusA::metrocluster check config-replication> show-aggregate-eligibility
```

Aggregate	Hosted Config Replication Vols	Eligible to Host Addl Vols
Comments

metrocluster check config-replication show-capture-status

Display MetroCluster capture status information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster check config-replication show-capture-status` command indicates whether or not a configuration change that would prevent a negotiated switchover is currently being captured for replication.

Examples

The following example shows the execution of the command in a MetroCluster configuration when capture is not in progress:

```
cluster1::*> metrocluster check config-replication show-capture-status  
Is Capture in Progress: false
```

metrocluster check config-replication show

Display MetroCluster config-replication status information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check config-replication show` command displays the results of MetroCluster configuration replication.

The command verifies the following aspects of MetroCluster configuration replication :

- **Enabled:** Verifies that MetroCluster configuration replication is enabled on the cluster.
- **Running:** Verifies that MetroCluster configuration replication is running on the cluster.
- **Remote Heartbeat:** Verifies that the MetroCluster configuration replication heartbeat with the remote cluster is healthy.
- **Last Heartbeat Sent:** Prints the timestamp of the last MetroCluster configuration replication heartbeat sent to the remote cluster.
- **Last Heartbeat Received:** Prints the timestamp of the last MetroCluster configuration replication heartbeat received from the remote cluster.
- **Storage Status:** Verifies that MetroCluster configuration replication storage is healthy.
- **Storage In Use:** Prints the location of MetroCluster configuration replication storage.
- **Storage Remarks:** Prints the underlying root cause for non healthy MetroCluster configuration storage.
- **Vserver Streams:** Verifies that MetroCluster configuration replication Vserver streams are healthy.
- **Cluster Streams:** Verifies that MetroCluster configuration replication Cluster streams are healthy.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

[`-instance`]

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows the output of `metrocluster check config-replication show`:

```
clusA::metrocluster check config-replication> show
      Enabled: true
      Running: true
      Remote Heartbeat: ok
      Last Heartbeat Sent: 12/12/2013 14:24:59
      Last Heartbeat Received: 12/12/2013 14:25:00
      Storage Status: ok
      Storage In Use: Cluster-wide Volume:
MDV_CRS_1bc7134a5ddf11e3b63f123478563412_A
      Storage Remarks: -
      Vserver Streams: ok
      Cluster Streams: ok
```

metrocluster check connection show

Display the check results of connections for nodes in a MetroCluster over IP configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check connection show` command displays the check results of connections for nodes in a MetroCluster over IP configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance] }

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching node specified by uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[`-home-port` {<netport>|<ifgrp>}] - Home Port

If this parameter is specified, the command displays information for the matching home-port.

[`-relationship-type` <Roles of MetroCluster Nodes>] - Relationship Role Type

If this parameter is specified, the command displays information for the matching relationship-type.

[`-source-address` <IP Address>] - Source Network Address

If this parameter is specified, the command displays information for the matching source address.

[`-destination-address` <IP Address>] - Destination Network Address

If this parameter is specified, the command displays information for the matching destination address.

[`-partner-cluster-uuid` <UUID>] - Partner Cluster UUID

If this parameter is specified, the command displays information for the matching partner-cluster-uuid.

[`-partner-node-uuid` <UUID>] - Partner Node UUID

If this parameter is specified, the command displays information for the matching partner-node-uuid.

[`-partner-node` <text>] - Partner Node Name

If this parameter is specified, the command displays information for the matching partner-node.

[`-partner-type` <text>] - Partner Relationship Type

If this parameter is specified, the command displays information for the matching partner-type.

[`-config-state` <text>] - Configuration State

If this parameter is specified, the command displays information for the matching config-state.

[`-config-error-info` <text>] - Configuration Error Information

If this parameter is specified, the command displays information for the matching config-error-info.

[`-check-result` {ok|warning|not-run|not-applicable}] - Check Connection Result

If this parameter is specified, the command displays information for the matching check-result.

[`-check-ping-error-info` <text>] - Check Connection Ping Error Info

If this parameter is specified, the command displays information for the matching check-ping-error-info.

[`-check-mtu-size-error-info` <text>] - Check Connection MTU Size Error Info

If this parameter is specified, the command displays information for the matching check-mtu-size-error-info.

[`-check-storage-error-info` <text>] - Check Connection Storage Error Info

If this parameter is specified, the command displays information for the matching check-storage-error-info.

Examples

The following example shows the output of the `metrocluster check connection show` command:

```
clusA::> metrocluster check connection show
DR                               Source           Destination
```

metrocluster check lif repair-placement

Repair LIF placement for the sync-source Vserver LIFs in the destination cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check lif repair-placement` command reruns LIF placement for those LIFs displayed by the `metrocluster check lif show` command. This command is expected to be run after the admin manually rectifies the LIF placement failures displayed in the `metrocluster check lif show` command output. The command is successful if the LIF placement rerun does not encounter any LIF placement failure. This is to be confirmed by subsequent running of the `metrocluster check lif show` .

Parameters

-vservers <Vserver Name> - sync-source Vserver Name

This is the name of the sync source Vserver that has LIF placement failures as reported by the `metrocluster check lif show` command. This input ensures that the command is run on the specified Vserver.

[-lif <lif-name>] - Logical Interface Name

This is the Logical Interface name that belongs to the sync source Vserver that has a LIF placement failure in the destination cluster as reported by the `metrocluster check lif show` command. This input ensures that the command is run on the specified LIF only.

Examples

The following example shows the execution of the command with a sync source Vserver and a LIF specified:

```
clusA::> metrocluster check lif repair-placement -vserver vs1.example.com
-lif fcplif1
Command completed. Run the "metrocluster check lif show" command for
results.

clusA::> metrocluster check lif repair-placement -vserver vs1.example.com
-lif iscsilif1
Command completed. Run the "metrocluster check lif show" command for
results.
```

The following example shows the execution of the command with only a sync-source Vserver specified:

```
clusA::> metrocluster check lif repair-placement -vserver vs1.example.com

Command completed. Run the "metrocluster check lif show" command for
results.

clusA::>
```

metrocluster check lif show

Show results of MetroCluster check results for the data LIFs

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check lif show` command displays the LIF placement failures in the MetroCluster configuration.

The command verifies the following aspects of the LIF placements of all the data LIFs in MetroCluster:

- `lif-placed-on-dr-node`: This check verifies that the LIF is placed on DR partner node.
- `port-selection`: This check verifies that the LIF is placed on correct port.

The LIF placement failures are mostly fabric/network connectivity issues that require manual intervention. Once the connectivity issues are resolved manually, the admin is expected to run [metrocluster check lif repair-placement](#) command to resolve the LIF placement issues for the sync source Vserver.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` option.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Name of the Cluster

This is the name of the cluster the LIF belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-vserver <text>] - Name of the Vserver

This is the name of the Vserver in the MetroCluster configuration

[-lif <lif-name>] - Name of the Lif

This is the name of the LIF.

[-check <MetroCluster LIF placement Check>] - Description

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check performed. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration with two nodes per cluster:

```
clusA::>metrocluster check lif show
```

Cluster	Vserver	LIF	Check	Result
ClusA	vs1	a_data1	lif-placed-on-dr-node	ok

metrocluster check node show

Show results of MetroCluster check for nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check node show` command displays the results of node checks performed by the [metrocluster check run](#) command.

The command displays the results of the following node configuration checks:

- **node-reachable:** This check verifies that the node is reachable.

- **metrocluster-ready:** This check verifies that the node is ready for MetroCluster configuration.
- **local-ha-partner:** This check verifies that the HA partner node is in the same cluster.
- **ha-mirroring-on:** This check verifies that HA mirroring for the node is configured.
- **ha-mirroring-op-state:** This check verifies that the HA mirroring operation is online.
- **symmetric-ha-relationship:** This check verifies that the relationship between the node and its HA partner is symmetric.
- **remote-dr-partner:** This check verifies that the DR partner node is in the remote cluster.
- **dr-mirroring-on:** This check verifies that DR mirroring for the node is configured.
- **dr-mirroring-op-state:** This check verifies that the DR mirroring operation is online.
- **symmetric-dr-relationship:** This check verifies that the relationship between the node and its DR partner is symmetric.
- **remote-dr-auxiliary-partner:** This check verifies that the DR auxiliary partner node is in the remote cluster.
- **symmetric-dr-auxiliary-relationship:** This check verifies that the relationship between the node and its DR auxiliary partner is symmetric.
- **storage-failover-enabled:** This check verifies that storage failover is enabled.
- **has-intercluster-lif:** This check verifies that the node has an intercluster LIF.
- **node-object-limit:** This check verifies that the node object limit option for the node is turned on.
- **automatic-uso:** This check verifies that the automatic USO option for the node is enabled.

Additional information about the warnings (if any) and recovery steps can be viewed by running the command with the `-instance` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <Node name>] - Node Name

This is the name of the node for which the check was run. If this parameter is specified, only rows with this node will be displayed.

[-check <MetroCluster Node Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-cluster <Cluster name>] - Cluster Name

This is the name of the cluster the node belongs to. If this parameter is specified, only rows with this cluster will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

metrocluster check volume show

Show results of the MetroCluster check for volumes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster check volume show` command displays the results of volume checks performed by the [metrocluster check run](#) command.

The command displays the results of the following volume configuration checks:

- **unmirrored-flexgroups:** This check looks for FlexGroup volumes residing on unmirrored aggregates.
- **mixed-flexgroups:** This check looks for FlexGroup volumes residing on a mix of mirrored and unmirrored aggregates.

Additional information about the warnings, if any, and recovery steps can be viewed by running the command with the `-instance` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This is the name of the vservers that contains the volume that the check results apply to. If this parameter is specified, only rows matching the specified cluster will be displayed.

[-volume <volume name>] - Volume Name

This is the name of the volume that the check results apply to. If this parameter is specified, only rows matching the specified volume will be displayed.

[-check <MetroCluster Volume Check>] - Type of Check

This is the type of the check performed. If this parameter is specified, only rows with this check will be displayed.

[-result {ok|warning|not-run|not-applicable}] - Result of the Check

This is the result of the check. If this parameter is specified, only rows with this result will be displayed.

[-additional-info <text>,...] - Additional Information/Recovery Steps

This is additional information about the check. This field has more information and recovery steps for the warning. If this parameter is specified, only rows with this additional info will be displayed.

Examples

The following example shows the execution of the command in a MetroCluster configuration:

```
clusA::*> metrocluster check volume show

metrocluster config-replication commands

metrocluster config-replication cluster-storage-configuration modify

Modify MetroCluster storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication cluster-storage-configuration modify` command modifies the configuration of storage used for configuration replication.

Parameters

[`-disallowed-aggregates <aggregate name>,...`] - Disallowed Aggregates (privilege: advanced)

Use this parameter to set the list of storage aggregates that are not available to host storage for configuration replication.

Examples

The following example disallows two aggregates named `aggr1` and `aggr2`:

```
cluster1::*> metrocluster config-replication cluster-storage-configuration  
modify -disallowed-aggregates aggr1,aggr2
```

metrocluster config-replication cluster-storage-configuration show

Display MetroCluster storage configuration information

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication cluster-storage-configuration show` command shows details of the configuration of the storage used for configuration replication.

The information displayed is the following:

- Disallowed Aggregates - The list of storage aggregates that are configured as not allowed to host storage areas.
- Auto-Repair - Displays `true` if the automatic repair of storage areas used by configuration replication is enabled.
- Auto-Recreate - Displays `true` if the automatic recreation of storage volumes used by configuration replication is enabled.
- Use Mirrored Aggregate - Displays `true` if storage areas for configuration replication are to be hosted on a mirrored aggregate.

Examples

The following is an example of the `metrocluster config-replication cluster-storage-configuration show` command:

```
cluster1::*> metrocluster config-replication cluster-storage-configuration
show
Disallowed Aggregates: -
    Auto-Repair: true
    Auto-Recreate: true
Use Mirrored Aggregate: true
```

metrocluster config-replication resync-status show

Display MetroCluster Configuration Resynchronization Status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster config-replication resync-status show` command displays the state of the configuration synchronization operation between the two clusters in the MetroCluster configuration.

This command displays the following details about the local cluster and the peer cluster:

- **Source:** This is the source side whose configuration is being replicated to the destination side.
- **Destination:** This is the destination side where the configuration is being replicated to from the source side.
- **State:** This is the state of the synchronization operation.
- **% Complete:** This is completion percentage of the operation.

Examples

The following example shows the output of the command when synchronization is in progress:

```
clusterA::> metrocluster config-replication resync-status show
      Source                Destination                State                %
Complete
-----
clusterA                clusterB                complete                -
clusterB                clusterA                complete                -
```

The following example shows the output of the command when synchronization from clusB to clusA is in progress:

```
clusA::> metrocluster config-replication resync-status show
```

Source	Destination	State	%
Complete			
-----	-----	-----	

clusterA	clusterB	complete	-
clusterB	clusterA	messaging	95

metrocluster configuration-settings commands

metrocluster configuration-settings show-status

Display the configuration settings status for a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings show-status` command displays the configuration settings status for nodes in a MetroCluster setup. If a DR group has not been created, then status for nodes in the local cluster only are displayed.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance] }

If this parameter is specified, the command displays detailed information about all entries.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays detailed information about all nodes in the cluster matching the specified cluster-uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays detailed information about all the nodes in the specified cluster.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-configuration-status <text>] - Configuration Settings Status

If this parameter is specified, the command displays detailed information about all nodes with the specified configuration status.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, the command displays detailed information about all nodes with the specified configuration error information.

Examples

The following example shows the display of MetroCluster setup status:

Nodes do not have a valid platform-specific personality value (equivalent to HAOSC parameter on non-Apollo platforms) for a MetroCluster setup.

```
clusA::> metrocluster configuration-settings show-status
```

Cluster	Node	Configuration Settings
Status		

clusA	A1	not a MetroCluster setup
	A2	not a MetroCluster setup

2 entries were displayed.

MetroCluster setup uses FC links rather than IP

```
xref:{relative_path}clusA::> metrocluster configuration-settings show-status
```

Cluster	Node	Configuration Settings
Status		

clusA	A1	not applicable for FC and SAS
	A2	not applicable for FC and SAS

2 entries were displayed.

Output of the command when MetroCluster setup uses IP links and before

`"metrocluster configuration-settings dr-group create"` command is run:

```
clusA::> metrocluster configuration-settings show-status
```

Cluster	Node	Configuration Settings
Status		

clusA	A1	ready for DR group create
	A2	ready for DR group create

2 entries were displayed.

Output of the command after `"metrocluster configuration-settings dr-group create"` command is run:

```
clusA::> metrocluster configuration-settings show-status
```

Cluster	Node	Configuration Settings
Status		

```

clusA
      A1      ready for interface create
      A2      ready for interface create
clusB
      B1      ready for interface create
      B2      ready for interface create

```

4 entries were displayed.

Output of the command after ` "metrocluster configuration-settings interface create" ` command is run for every node:

```

clusA::> metrocluster configuration-settings show-status
Cluster      Node      Configuration Settings
Status
-----

```

```

clusA
      A1      ready for next interface
create
      A2      ready for connection connect
clusB
      B1      ready for connection connect
      B2      ready for connection connect

```

4 entries were displayed.

Output of the command after ` "metrocluster configuration-settings connection connect" ` command is run:

```

usA::> metrocluster configuration-settings show-status
Cluster      Node      Configuration Settings
Status
-----

```

```

clusA
      A1      completed
      A2      completed
clusB
      B1      completed
      B2      completed

```

4 entries were displayed.

Output of the command after ` "metrocluster configuration-settings connection connect" ` command is run and there are connection errors:

```

clusA::> metrocluster configuration-settings show-status
Cluster      Node      Configuration Settings
Status
-----

```

```

clusA
      A1      connection error
      A2      completed

```

```
clusB          B1          connection error
               B2          completed
4 entries were displayed.
```

metrocluster configuration-settings calibration measure

Measure latency and bandwidth values

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster configuration-settings calibration measure` command measures the bandwidth and latency between local and remote nodes in a MetroCluster over IP configuration.

This command should not be run when the MetroCluster configuration is under a heavy load. Bandwidth measurements will attempt to fully saturate network connections to the remote cluster and may disrupt the quality of service.

Examples

The following example shows the output for the calibration measure command in MetroCluster over IP configurations:

```
clusA::*> metrocluster configuration-settings calibration measure
Warning: This operation will attempt to fully saturate the network
connection to
    the remote cluster for measuring bandwidth. This may disrupt
    performance and should not be run when MetroCluster is under
heavy
    load. Do you want to continue? {y|n}: y
    Measuring latency and bandwidth between node "A1" (10.140.113.214) and
node "B1" (10.140.113.26) over port "e0f".
    Measuring latency and bandwidth between node "A1" (10.140.113.215) and
node "B1" (10.140.113.27) over port "e0g".
    Measuring latency and bandwidth between node "A2" (10.140.113.216) and
node "B2" (10.140.113.25) over port "e0f".
    Measuring latency and bandwidth between node "A2" (10.140.113.217) and
node "B2" (10.140.113.28) over port "e0g".
    Measurements complete. Use the "metrocluster configuration-settings
calibration show" command to display the results.
```

metrocluster configuration-settings calibration show

Display the calibration measurements for local nodes in MetroCluster over IP

configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings calibration show` command shows the bandwidth and latency between local and remote nodes in a MetroCluster over IP configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-calibration-id <integer>] - Calibration ID

This field specifies Calibration ID.

[-subnet <IP Address>] - IP Subnet

This field specifies subnet.

[-node-uuid <UUID>] - Node UUID

This field specifies UUID of the node.

[-home-port {<netport>|<ifgrp>}] - Home Port

This field specifies name of the port used to measure latency and bandwidth.

[-node {<nodename>|local}] - Node Name

This field specifies name of the node.

[-collection-time <MM/DD/YYYY HH:MM:SS>] - Collection Time of Sample

This field specifies collection time of sample.

[-source-address <IP Address>] - Source Network Address

This field specifies IP address of the port on the node.

[-destination-address <IP Address>] - Destination Network Address

This field specifies IP address of the port on the partner node.

[-latency <double>] - Latency in ms

This field specifies latency in ms.

[-bandwidth <double>] - Bandwidth in Mb/s

This field specifies bandwidth in Mb/s.

[-num-packets-retransmitted <integer>] - Number of Packets Retransmitted

This field specifies the number of TCP packets retransmitted during bandwidth measurement.

[-pct-pkt-retrans <double>] - Percentage of packages retransmitted

This field specifies the percent of TCP packets retransmitted during bandwidth measurement.

Examples

The following example shows the output for the calibration show command in MetroCluster over IP configurations:

```
clusA::*> metrocluster configuration-settings calibration show
                                     Home Latency Bandwidth
      ID Subnet      Node      Port (ms)      (Mb/s)      Collection Time

metrocluster configuration-settings connection check

Check the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster configuration-settings connection check` command checks the settings of a MetroCluster over IP configuration.

This command is used for MetroCluster configurations that are connected through IP links.

Parameters

[-v, -verbose <true>] - Enable Detailed Output (privilege: advanced)

This optional parameter enables verbose mode.

[-p, -ping <true>] - Check Ping Response Only (privilege: advanced)

Specify this parameter to perform reachability checks.

[-t, -throughput <true>] - Check Throughput Only (privilege: advanced)

Specify this parameter to perform throughput checks.

{ [-z, -tos <Hex String>] - Type of Service for Pings (privilege: advanced)

This optional parameter specifies the value for the Type of Service field to be used for ping or throughput checks. If specified, the ping and throughput checks will be limited to only the specified value and not cycle through all the pre-defined TOS values for those checks.

| [-D, -dscp <text>] - DSCP for Throughput or Pings (privilege: advanced)

This optional parameter specifies the DSCP value to be used for ping or throughput checks. The value can be specified as a number, hexadecimal string or as a symbolic name. For example, "32", "0x20" and "CS4" all refer to the same value. If specified, the ping and throughput checks will be limited to only the specified value and not cycle through all the pre-defined DSCP values for these checks.

[-E, -ecn <integer>] - ECN for Pings (privilege: advanced) }

This optional parameter specifies the ECN value to be used for ping checks.

[-c, -count <integer>] - Ping Count (privilege: advanced)

This optional parameter specifies the number of ping requests to send for each destination. The default value is 1.

[-i, -interval <double>] - Ping Interval (privilege: advanced)

This optional parameter specifies the interval to use between pings. The default value is 1 second.

[-S, -source <IP Address>] - Source IP Address (privilege: advanced)

This optional parameter specifies the source IP address to use for ping or throughput check.

[-destination <IP Address>] - Destination IP Address (privilege: advanced)

This optional parameter specifies the destination IP address to use for ping or throughput checks.

[-role <Roles of MetroCluster Nodes>] - Partner Role (privilege: advanced)

This optional parameter specifies the partner role to use for ping and throughput checks. Only the nodes with the matching role will be used.

[-I, -port {<netport>|<ifgrp>}] - Interface Port Name (privilege: advanced)

This optional parameter specifies the port to use for ping and throughput checks.

Examples

The following example shows the output for the check command in MetroCluster over IP configurations:

```
clusA::*> metrocluster configuration-settings connection check
[Job 68] Job succeeded: Connect is successful.

Begin connection check.
Start checking the partner cluster.
    Check partner cluster: PASS.
Start checking the configuration settings.
    Check configuration settings: PASS.
Start ping the network endpoints from cluster "clusA".
    Ping network endpoints: PASS.
Start ping the network endpoints from cluster "clusB".
    Ping network endpoints: PASS.
Start checking the network MTU sizes from cluster "clusA".
    Check network MTU sizes: PASS.
Start checking the network MTU sizes from cluster "clusB".
    Check network MTU sizes: PASS.
Start checking the network subnets from cluster "clusA".
    Check network subnets: PASS.
Start checking the network subnets from cluster "clusB".
    Check network subnets: PASS.
Start checking the storage daemons on cluster "clusA".
    Check storage daemons: PASS.
Start checking the storage daemons on cluster "clusB".
    Check storage daemons: PASS.
End of connection check.
```

metrocluster configuration-settings connection connect

Configure the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection connect` command configures the connections that mirror NV logs and access remote storage between partner nodes in a MetroCluster setup.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links will configure the FC connections automatically.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create` ,
- `metrocluster configuration-settings interface create` ,
- `metrocluster configuration-settings connection connect` .

Before this command is run

- The DR groups must have been configured. Run the `metrocluster configuration-settings dr-group show` command to verify that every node is partnered in a DR group.
- The network logical interfaces must have been configured on every node. Use the `metrocluster configuration-settings interface show` command to verify that every node has network logical interfaces configured to mirror NV logs and access remote storage.

After this command completes successfully, every node will:

- Have NV log mirroring configured and mirroring disabled. NV log mirroring will be enabled by the `metrocluster configure` command.
- Have access to remote storage. Use the `storage disk show -pool Pool1` command to view the remote disks that are hosted on DR partner nodes.

The DR groups and network logical interfaces that were configured by the `metrocluster configuration-settings` commands cannot be deleted after the connections have been configured. The `metrocluster configuration-settings connection disconnect` command must be run to remove the connections before the DR groups and network logical interfaces can be deleted.

Parameters

Examples

The following example shows configuration of connections in a MetroCluster over IP setup:

```
clusA::> metrocluster configuration-settings connection connect
[Job 269] Job succeeded: Connect is successful.
clusA::> metrocluster configuration-settings connection show
```

metrocluster configuration-settings connection disconnect

Tear down the network connections between partner nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection disconnect` command removes the connections between nodes in a DR group that are used to mirror NV logs and access remote storage.

This command cannot be run if a node in the DR group has remote disks assigned to the node. The assigned ownership of remote disks can be removed by running the `storage disk removeowner` command.

The `metrocluster configuration-settings` commands are run in the following order to remove MetroCluster over IP configuration:

- `metrocluster configuration-settings connection disconnect`,
- `metrocluster configuration-settings interface delete`,
- `metrocluster configuration-settings dr-group delete`.

Parameters

-dr-group-id <integer> - DR Group ID

This parameter identifies the DR group to be disconnected.

Examples

The following example illustrates removal of connections in a four-node MetroCluster setup:

```
clusA::> metrocluster configuration-settings connection disconnect -dr
-group-id 1
[Job 270] Job succeeded: Disconnect is successful.

metrocluster configuration-settings connection show

Display the connections between partner nodes in a MetroCluster setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings connection show` command displays the connection configuration information between the nodes in a MetroCluster setup.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance] }

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching node specified by uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-home-port {<netport>|<ifgrp>}] - Home Port

If this parameter is specified, the command displays information for the matching home-port.

[-relationship-type <Roles of MetroCluster Nodes>] - Relationship Role Type

If this parameter is specified, the command displays information for the matching relationship-type.

[-source-address <IP Address>] - Source Network Address

If this parameter is specified, the command displays information for the matching source address.

[-destination-address <IP Address>] - Destination Network Address

If this parameter is specified, the command displays information for the matching destination address.

[-partner-cluster-uuid <UUID>] - Partner Cluster UUID

If this parameter is specified, the command displays information for the matching partner-cluster-uuid.

[-partner-node-uuid <UUID>] - Partner Node UUID

If this parameter is specified, the command displays information for the matching partner-node-uuid.

[-partner-node <text>] - Partner Node Name

If this parameter is specified, the command displays information for the matching partner-node.

[-partner-type <text>] - Partner Relationship Type

If this parameter is specified, the command displays information for the matching partner-type.

[-config-state <text>] - Configuration State

If this parameter is specified, the command displays information for the matching config-state.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, the command displays information for the matching config-error-info.

Examples

The following example shows the output of `metrocluster configuration-settings connection connect` command:

Output of the command before the connections are established using the `xref:{relative_path}metrocluster-configuration-settings-connection-connect.html` [metrocluster configuration-settings connection connect] command:

```
clusA::> metrocluster configuration-settings connection show
```

metrocluster configuration-settings dr-group create

Create a DR group in a MetroCluster over IP setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group create` command partners the nodes that will make up a DR group in a MetroCluster setup.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links will configure DR groups automatically and do not require the `metrocluster configuration-settings` commands.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create` ,
- [metrocluster configuration-settings interface create](#) ,
- [metrocluster configuration-settings connection connect](#) .

Before running this command, cluster peering must be configured between the local and partner clusters. Run the [cluster peer show](#) command to verify that peering is available between the local and partner clusters.

This command configures a local node and a remote node as DR partner nodes. The command also configures the HA partner of the local node and the HA partner of the remote node as the other DR partner nodes in the DR group.

Parameters

-partner-cluster <Cluster name> - Partner Cluster Name

Use this parameter to specify the name of the partner cluster.

-local-node {<nodename>|local} - Local Node Name

Use this parameter to specify the name of a node in the local cluster.

-remote-node <text> - Remote Node Name

Use this parameter to specify the name of a node in the partner cluster that is to be the DR partner of the specified local node.

Examples

The following example shows the creation of the MetroCluster DR group:

```
clusA::> metrocluster configuration-settings dr-group create -partner
-cluster clusB -local-node A1 -remote-node B1
[Job 268] Job succeeded: DR Group Create is successful.

clusA::> metrocluster configuration-settings dr-group show

metrocluster configuration-settings dr-group delete

Delete a DR group in a MetroCluster over IP setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group delete` command deletes a DR group and its node partnerships that were configured using the [metrocluster configuration-settings dr-group create](#) command.

This command cannot be run if the [metrocluster configuration-settings interface create](#) command has configured a network logical interface on a network port provisioned for MetroCluster. The [metrocluster configuration-settings interface delete](#) command must then be run to delete the network logical interfaces on every node in the DR group.

The `metrocluster configuration-settings` commands are run in the following order to remove the MetroCluster over IP configuration:

- [metrocluster configuration-settings connection disconnect](#) ,
- [metrocluster configuration-settings interface delete](#) ,
- `metrocluster configuration-settings dr-group delete` .

Parameters

-dr-group-id <integer> - Dr group Id

This parameter identifies the DR group to be deleted.

Examples

The following example shows the deletion of the MetroCluster DR group:

```
clusA::> metrocluster configuration-settings dr-group delete -dr-group-id 1
```

Warning: This command deletes the existing DR group relationship. Are you sure

you want to proceed ? {y|n}: y

[Job 279] Job succeeded: DR Group Delete is successful.

```
clusA::> metrocluster configuration-settings dr-group show
No DR groups exist.
```

```
clusA::> metrocluster configuration-settings show-status
```

metrocluster configuration-settings dr-group show

Display the DR groups in a MetroCluster over IP setup

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings dr-group show` command displays the DR groups and their nodes in the MetroCluster over IP setup.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you

specify.

[-instance] }

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the specified cluster.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching nodes uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-dr-partner-node-uuid <UUID>] - DR Partner Node UUID

If this parameter is specified, the command displays information for the matching DR partner node uuid.

[-dr-partner-node <text>] - DR Partner Node Name

If this parameter is specified, the command displays information for the matching DR partner nodes.

Examples

The following example illustrates the display of DR group configuration in a four-node MetroCluster setup:

```
clusA::> metrocluster configuration-settings dr-group show
DR Group ID Cluster                               Node                               DR Partner Node

           clusB
           B2                                     A2
           B1                                     A1
4 entries were displayed.
```

metrocluster configuration-settings interface create

Create a MetroCluster interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface create` command configures the network logical interfaces that will be used on a node in a MetroCluster setup to mirror NV logs and access remote storage.

This command is used for MetroCluster setups that are connected through IP links. MetroCluster setups that are connected through FC links do not require the user to provision network logical interfaces to mirror NV logs and access remote storage.

The `metrocluster configuration-settings` commands are run in the following order to set up MetroCluster:

- `metrocluster configuration-settings dr-group create` ,
- `metrocluster configuration-settings interface create` ,
- `metrocluster configuration-settings connection connect` .

Before running this command , the node's DR group must be configured using the `metrocluster configuration-settings dr-group create` command. Run the `metrocluster configuration-settings dr-group show` command to verify that the node's DR group has been configured.

Parameters

-cluster-name <Cluster name> - Cluster Name

Use this parameter to specify the name of the local or partner cluster.

-home-node <text> - Home Node

Use this parameter to specify the home node in the cluster which hosts the interface.

-home-port {<netport>|<ifgrp>} - Home Port

Use this parameter to specify the home port provisioned for MetroCluster.

-address <IP Address> - Network Address

Use this parameter to specify the network address to be assigned to the home port.

-netmask <Contiguous IP Mask> - Netmask

Use this parameter to specify the network mask to be assigned to the interface.

[-gateway <IP Address>] - Gateway

Use this parameter to specify the gateway to be assigned for the routed network.

[-vlan-id <integer>] - Virtual LAN ID

Use this parameter to specify the VLAN id.

Examples

This example shows configuring logical interface on MetroCluster IP capable port:

```
clusA::> metrocluster configuration-settings interface create -cluster
-name clusA -home-node A1 -home-port e0f -address 10.140.113.214 -netmask
```

255.255.192.0

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface delete` command deletes the network logical interface that was configured on a network port provisioned for MetroCluster.

This command cannot be run if the [metrocluster configuration-settings connection connect](#) command has set up the connections between the nodes in a DR group. The [metrocluster configuration-settings connection disconnect](#) command must then be run to remove the connections.

The `metrocluster configuration-settings` commands are run in the following order to remove the MetroCluster over IP configuration:

- [metrocluster configuration-settings connection disconnect](#) ,
- `metrocluster configuration-settings interface delete` ,
- [metrocluster configuration-settings dr-group delete](#) .

Parameters

-cluster-name <Cluster name> - Cluster Name

Use this parameter to specify the name of the local or partner cluster.

-home-node <text> - Home Node

Use this parameter to specify the home node in the cluster which hosts the interface.

-home-port {<netport>|<ifgrp>} - Home Port

Use this parameter to specify the home port provisioned for MetroCluster.

Examples

The following example shows the deletion of interface in a MetroCluster setup:

```
clusA::> metrocluster configuration-settings interface delete -cluster
-name clusA -home-node A1 -home-port e0f
[Job 271] Job succeeded: Interface Delete is successful.

clusA::> metrocluster configuration-settings interface show

metrocluster configuration-settings interface modify

Modify a MetroCluster interface

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster configuration-settings interface modify` command modifies the network logical interfaces that were provisioned for MetroCluster.

Parameters

-cluster-name <Cluster name> - Cluster Name (privilege: advanced)

Use this parameter to specify the name of the local or partner cluster.

-home-node <text> - Home Node (privilege: advanced)

Use this parameter to specify the home node in the cluster which hosts the interface.

-home-port {<netport>|<ifgrp>} - Home Port (privilege: advanced)

Use this parameter to specify the home port provisioned for MetroCluster.

[-address <IP Address>] - Network Address (privilege: advanced)

Use this parameter to specify the network address to be assigned to the home port.

[-netmask <Contiguous IP Mask>] - Netmask (privilege: advanced)

Use this parameter to specify the network mask to be assigned to the interface.

[-gateway <IP Address>] - Gateway (privilege: advanced)

Use this parameter to specify the gateway address to be assigned to the interface.

metrocluster configuration-settings interface show

Display the network logical interfaces provisioned for MetroCluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings interface show` command displays the network logical interfaces that were provisioned for MetroCluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance] }

If this parameter is specified, the command displays detailed information about all entries.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, the command displays information for the matching DR group.

[-cluster-uuid <UUID>] - Cluster UUID

If this parameter is specified, the command displays information for the matching cluster specified by uuid.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, the command displays information for the matching cluster..

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the command displays information for the matching nodes uuid.

[-node <text>] - Node Name

If this parameter is specified, the command displays information for the matching nodes.

[-home-port {<netport>|<ifgrp>}] - Home Port

If this parameter is specified, all interfaces with home-port set to this value are displayed.

[-address <IP Address>] - Network Address

If this parameter is specified, the command displays information for the matching network address.

[-netmask <Contiguous IP Mask>] - Netmask

If this parameter is specified, all interfaces with netmask set to this value are displayed.

[-gateway <IP Address>] - Gateway

If this parameter is specified, all interfaces with gateway set to this value are displayed.

[-config-state <text>] - Configuration State

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

[-config-error-info <text>] - Configuration Error Information

If this parameter is specified, all interfaces with this field set to the specified value are displayed.

[-vlan-id <integer>] - Virtual LAN ID

If this parameter is specified, all interfaces with vlan-id set to this value are displayed.

Examples

The following example illustrates display of logical interfaces configured in a four-node MetroCluster setup:

```

clusA::> metrocluster configuration-settings interface show

```

metrocluster configuration-settings mediator add

Configure the network connections between the Mediator and MetroCluster nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings mediator add` command configures the connection between the mediator and all the nodes in a MetroCluster configuration.

Before this command is run MetroCluster should be configured on all the clusters.

Mediator username and password are required to successfully add the mediator.

After this command completes successfully, every node will:

- Have a connection with the mediator.
- The mediator disks will be assigned to the nodes in the MetroCluster configuration.
- AUSO will be enabled.

Parameters

-mediator-address <IP Address> - Mediator IP Address

Specifies the IP address of the mediator to which the nodes in the MetroCluster configuration will be connected.

Examples

The following example connects the nodes to the mediator in a MetroCluster configuration over IP setup:

```
clusA::> metrocluster configuration-settings mediator add -mediator
-address 10.234.133.115
    Adding mediator and enabling Automatic Unplanned Switchover. It
might take a few minutes to complete.
    Please enter the username for the mediator: mediatoradmin
    Please enter the password for the mediator:
    Confirm the mediator password:
    Creating mediator mailboxes...
    Setting up connections to mediator from all nodes in the
clusters...
    Setting mediator mailbox from all nodes in the cluster...
    Enabling Automatic Unplanned Switchover for all nodes in the
cluster...
    Successfully added mediator.
```

metrocluster configuration-settings mediator remove

Tear down connections between the Mediator and MetroCluster nodes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings mediator remove` command removes the connection between the mediator and all the nodes in a MetroCluster configuration.

Mediator username and password are required to successfully remove the mediator.

Parameters

[-dr-group-id <integer>] - DR Group Id (privilege: advanced)

Specifies the Disaster Recovery Group Identifier for which the mediator connections need to be removed.

Examples

The following example removes the connections between the nodes and the mediator in a MetroCluster configuration over IP setup:

```
clusA::> metrocluster configuration-settings mediator remove
Removing the mediator and disabling Automatic Unplanned Switchover.
It may take a few minutes to complete.
Please enter the username for the mediator: mediatoradmin
Please enter the password for the mediator:
Confirm the mediator password:
Disabling Automatic Unplanned Switchover for all nodes in the
cluster...
Removing mediator mailboxes...
Performing final cleanup...
Successfully removed the mediator.
```

metrocluster configuration-settings mediator show

Display the nodes connected to the mediator

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster configuration-settings mediator show` command displays the connection status of the nodes with the Mediator in a MetroCluster configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*] }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-mediator-address* <IP Address>] - Mediator IP Address

Specifies the IP address of the mediator to which the nodes in the MetroCluster configuration are connected.

[*-port* <integer>] - Mediator port number

Specifies the port of the mediator to which the nodes in the MetroCluster configuration are connected.

[*-node* {<nodename>|local}] - Node Name

Specifies the nodes in the MetroCluster configuration which are connected to the mediator.

[*-reachable* {true|false}] - Connection Status of the Mediator

Specifies the connection status of the nodes with the mediator in the MetroCluster configuration.

[*-configured* {true|false}] - Mediator Configuration Status

Specifies the configuration status of the nodes with the mediator in the MetroCluster configuration.

Examples

The following example shows the mediator connection status in a MetroCluster configuration over IP setup:

```
cluster1_node_01::*> metrocluster configuration-settings mediator show
      Mediator IP      Port      Node      Configuration
Connection
Status
-----
10.234.217.168
31784 cluster1_node_01      true      true
      cluster1_node_02      true      true
      cluster2_node_01      true      true
      cluster2_node_02      true      true
```

metrocluster interconnect commands

metrocluster interconnect adapter modify

Modify MetroCluster interconnect adapter settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster interconnect adapter modify` command enables you to modify settings of the MetroCluster interconnect adapter.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

This parameter specifies the node name.

-is-ood-enabled {true|false} - Is Out-of-Order Delivery Enabled? (privilege: advanced)

This parameter specifies the out-of-order delivery setting on the adapter.

Examples

The following example enables out-of-order delivery for the port 'fcvi_device_0' on the node 'clusA-01':

```
clusA::*> metrocluster interconnect adapter modify -node clusA-01 -adapter  
-port-name fcvi_device_0 -is-ood-enabled true
```

metrocluster interconnect adapter show

Display MetroCluster interconnect adapter information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect adapter show` command displays interconnect adapter information for the nodes in a MetroCluster configuration.

This command displays the following details about the local node and the HA partner node:

- Node: This field specifies the name of the node in the cluster.
- Adapter Name: This field specifies the name of the interconnect adapter.
- Adapter Type: This field specifies the type of the interconnect adapter.
- Link Status: This field specifies the physical link status of the interconnect adapter.
- Is OOD Enabled: This field specifies the out-of-order delivery status of the interconnect adapter.
- IP Address: This field specifies the IP address assigned to the interconnect adapter.
- Port Number: This field specifies the port number of the interconnect adapter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-connectivity]

Displays the connectivity information from all the interconnect adapters to the connected nodes.

| [-connectivity-hidden] (privilege: advanced)

Displays additional connectivity information (IP address, Area ID, Port ID) from all the interconnect adapters to the connected nodes.

| [-switch]

Displays details of switches connected to all the interconnect adapters.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

Displays information only about the interconnect adapters that are hosted by the specified node.

[-adapter <text>] - Adapter

Displays information only about the interconnect adapters that match the specified name.

[-port-name <text>] - Port Name

Displays information only about the interconnect adapters that host the specified port name.

[-type <text>] - Adapter Type

Displays information only about the interconnect adapters that match the specified adapter type.

[-physical-status <text>] - Physical Status

Displays information only about the interconnect adapters that match the specified physical status.

[-wwn <text>] - Adapter Port World Wide Name

Displays information only about the interconnect adapters that match the specified world wide name.

[-address <text>] - IP Address

Displays information only about the interconnect adapters that match the specified IP address.

[-firmware-version <text>] - Firmware Version

Displays information only about the interconnect adapters that match the specified firmware version.

[-link-speed <text>] - Link Speed

Displays information only about the interconnect adapters that match the specified link speed.

[-link-speed-neg-type <text>] - Link Speed Negotiation Type

Displays information only about the interconnect adapters that match the specified negotiated link speed type.

[-switch-name <text>] - Switch Name

Displays information only about the interconnect adapters that are connected to the specified switch.

[-switch-model <text>] - Switch Model

Displays information only about the interconnect adapters that are connected to the switch with the specified model.

[-switch-wwn <text>] - Switch WWName

Displays information only about the interconnect adapters that are connected to the switch with the specified world wide name.

[-switch-vendor <text>] - Switch Vendor

Displays information only about the interconnect adapters that are connected to the switch with the specified vendor.

[-switch-status <text>] - Switch Status

Displays information only about the interconnect adapters that are connected to the switch with the specified operational status.

[-switch-port-number <text>] - Switch Port Number

Displays information only about the interconnect adapters that are connected to the switch with the specified port number.

[-switch-port-wwpn <text>] - Switch Port WWPN

Displays information only about the interconnect adapters that are connected to the switch with the specified word wide port name.

[-remote-adapter-name-list <text>,...] - Remote Adapter Name List

Displays information only about the interconnect adapters that are connected to the specified remote adapters.

[-remote-adapter-wwn-list <text>,...] - Remote Adapter WWName List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified world wide names.

[-remote-adapter-address-list <text>,...] - Remote Adapter IP Address List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified IP addresses.

[-remote-adapter-port-id-list <Hex Integer>,...] - Remote Adapter Port ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified port IDs.

[-remote-adapter-domain-id-list <integer>,...] - Remote Adapter Domain ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified domain IDs.

[-remote-adapter-area-id-list <integer>,...] - Remote Adapter Area ID List

Displays information only about the interconnect adapters that are connected to the remote adapters with the specified Area IDs.

[-remote-partner-system-id-list <integer>,...] - Remote Partner System ID List

Displays information only about the interconnect adapters that are connected to the remote nodes with the

specified System IDs.

[`-remote-partner-name-list {<nodename>|local}`] - Remote Partner Name List

Displays information only about the interconnect adapters that are connected to the specified remote nodes.

[`-is-ood-enabled {true|false}`] - Is Out-of-Order Delivery Enabled?

Displays information only about the interconnect adapters that match the specified out-of-order delivery setting.

Examples

The following example shows the output of the command during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect adapter show
```

	Node	Adapter	Type	Link Status	Is OOD Enabled?	IP Address	Port
Number							
	clusA-01	cxgb3_0	iWARP	Up	false	10.0.1.1	c0a
	clusA-01	cxgb3_0	iWARP	Down	false	10.0.2.1	c0b
	clusA-01	fcvi_device_0	FC-VI	Up	false	1.0.0.1	1a
	clusA-01	fcvi_device_1	FC-VI	Up	false	2.0.0.3	1b
	clusA-02	cxgb3_0	iWARP	Up	false	10.0.1.2	c0a
	clusA-02	cxgb3_0	iWARP	Down	false	10.0.2.2	c0b
	clusA-02	fcvi_device_0	FC-VI	Up	false	1.0.1.1	1a
	clusA-02	fcvi_device_1	FC-VI	Up	false	2.0.1.3	1b

The following example shows the output of the command after MetroCluster switchover is performed:

```
clusA::> metrocluster interconnect adapter show
```

	Node	Adapter	Type	Link Status	Is OOD Enabled?	IP Address	Port
Number							
	clusA-01	cxgb3_0	iWARP	Up	false	10.0.1.1	c0a
	clusA-01	cxgb3_0	iWARP	Down	false	10.0.2.1	c0b
	clusA-01	fcvi_device_0	FC-VI	Down	false	1.0.0.1	1a
	clusA-01	fcvi_device_1	FC-VI	Down	false	2.0.0.3	1b
	clusA-02	cxgb3_0	iWARP	Up	false	10.0.1.2	c0a
	clusA-02	cxgb3_0	iWARP	Down	false	10.0.2.2	c0b
	clusA-02	fcvi_device_0	FC-VI	Down	false	1.0.1.1	1a
	clusA-02	fcvi_device_1	FC-VI	Down	false	2.0.1.3	1b

The following example shows the output of the command with connectivity field during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect adapter show -connectivity -node local
-type FC-VI
Adapter Name: fcvi_device_0
                WWName: 21:00:00:24:ff:32:01:68

metrocluster interconnect mirror show

Display MetroCluster interconnect mirror information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect mirror show` command displays NVRAM mirror information for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Partner Name:** This field specifies the name of the partner node.
- **Partner Type:** This field specifies the type of the partner.
- **Mirror Admin Status:** This field specifies the administrative status of the NVRAM mirror between partner nodes.
- **Mirror Oper Status:** This field specifies the operational status of the NVRAM mirror between partner nodes.
- **Adapter:** This field specifies the name of the interconnect adapter used for NVRAM mirroring.
- **Type:** This field specifies the type of the interconnect adapter used for NVRAM mirroring.
- **Status:** This field specifies the physical status of the interconnect adapter used for NVRAM mirroring.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

If this parameter is specified, mirror details of the specified node are displayed.

[-partner-type {HA|DR|AUX}] - Partner Type

If this parameter is specified, mirror details of the specified partner type are displayed.

[-adapter <text>] - Adapter

If this parameter is specified, mirror details of the specified adapter are displayed.

[-type <text>] - Adapter Type

If this parameter is specified, mirror details of the specified adapter type are displayed.

[-status <text>] - Status

If this parameter is specified, mirror details of the adapter with the specified status are displayed.

[-mirror-oper-status {unknown|online|offline}] - Mirror Operational Status

If this parameter is specified, only mirror details with the specified operational status are displayed.

[-partner-name <text>] - Partner Name

If this parameter is specified, mirror details of the specified partner are displayed.

[-mirror-admin-status {enabled|disabled}] - Mirror Administrative Status

If this parameter is specified, only mirror details with the specified administrative status are displayed.

Examples

The following example shows the output of the command during normal operation (neither cluster is in switchover state):

```
clusA::> metrocluster interconnect mirror show
```

			Mirror	Mirror				
		Partner	Admin	Oper				
Node	Partner	Name	Type	Status	Status	Adapter	Type	Status
----	-----	-----	-----	-----	-----	-----	-----	-----
clusA-01								
	clusA-02		HA	enabled	online			
						cxgb3_0	iWARP	Up
						cxgb3_0	iWARP	Up
	clusB-01		DR	enabled	online			
						fcvi_device_0		
							FC-VI	Up
						fcvi_device_1		
							FC-VI	Up
clusA-02								
	clusA-01		HA	enabled	online			
						cxgb3_0	iWARP	Up
						cxgb3_0	iWARP	Up
	clusB-02		DR	enabled	online			
						fcvi_device_0		
							FC-VI	Up
						fcvi_device_1		
							FC-VI	Up

The following example shows the output of the command after MetroCluster switchover is performed:

```
clusA::> metrocluster interconnect mirror show
```

			Mirror	Mirror				
		Partner	Admin	Oper				
Node	Partner	Name	Type	Status	Status	Adapter	Type	Status
----	-----	-----	-----	-----	-----	-----	-----	-----

						fcvi_device_1		
							FC-VI	Up

metrocluster interconnect mirror multipath show

Display multipath information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster interconnect mirror multipath show` command displays the NVRAM mirror multipath policy for the nodes configured in a MetroCluster.

This command displays the following details about the local node and the HA partner node:

- **Node:** This field specifies the name of the node in the cluster.
- **Multipath Policy:** This field specifies the multipath policy used for NVRAM mirroring.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

If this parameter is specified, mirror details of the specified node are displayed.

[-multipath-policy {no-mp|static-map|dynamic-map|round-robin}] - Multipath Policy

If this parameter is specified, nodes with the specified multipath policy are displayed.

Examples

The following example shows the output of the command:

```
clusA::> metrocluster interconnect mirror multipath show
Node           Multipath Policy
-----
clusA-1        static-map
clusA-2        static-map
```

metrocluster node commands

metrocluster node show

Display MetroCluster node configuration information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster node show` command displays configuration information for the nodes in the MetroCluster configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-partners]

If this option is used the MetroCluster node partnership view will be displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-dr-group-id <integer>] - DR Group ID

If this parameter is specified, all nodes belonging to the specified DR group are displayed.

[-cluster <Cluster name>] - Cluster Name

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-node <Node name>] - Node Name

If this parameter is specified, the specified node is displayed.

[-ha-partner <Node name>] - HA Partner Name

If this parameter is specified, the node with the specified HA partner is displayed.

[-dr-cluster <Cluster name>] - DR Cluster Name

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-dr-partner <Node name>] - DR Partner Name

If this parameter is specified, the node with the specified DR partner is displayed.

[-dr-auxiliary <Node name>] - DR Auxiliary Name

If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

[-node-uuid <UUID>] - Node UUID

If this parameter is specified, the node with the specified Uuid is displayed.

[-ha-partner-uuid <UUID>] - HA Partner UUID

If this parameter is specified, the nodes with the specified HA partner is displayed.

[-dr-partner-uuid <UUID>] - DR Partner UUID

If this parameter is specified, the node with the specified DR partner is displayed.

[-dr-auxiliary-uuid <UUID>] - DR Auxiliary UUID

If this parameter is specified, the node with the specified DR auxiliary partner is displayed.

[-node-cluster-uuid <UUID>] - Node Cluster UUID

If this parameter is specified, all nodes belonging to the specified cluster are displayed.

[-ha-partner-cluster-uuid <UUID>] - HA Partner Cluster UUID

If this parameter is specified, all nodes whose HA partner belong to the specified cluster are displayed.

[-dr-partner-cluster-uuid <UUID>] - DR Partner Cluster UUID

If this parameter is specified, all nodes whose DR partner belong to the specified cluster are displayed.

[-dr-auxiliary-cluster-uuid <UUID>] - DR Auxiliary Cluster UUID

If this parameter is specified, all nodes whose DR auxiliary partner belong to the specified cluster are displayed.

[-node-systemid <integer>] - Node System ID

If this parameter is specified, all nodes with the specified system ID are displayed.

`[-ha-partner-systemid <integer>]` - HA Partner System ID

If this parameter is specified, all nodes with an HA partner with the specified system ID are displayed.

`[-dr-partner-systemid <integer>]` - DR Partner System ID

If this parameter is specified, all nodes with a DR partner with the specified system ID are displayed.

`[-dr-auxiliary-systemid <integer>]` - DR Auxiliary System ID

If this parameter is specified, all nodes with a DR auxiliary partner with the specified system ID are displayed.

`[-dr-mirroring-state <text>]` - State of DR Mirroring Config

If this parameter is specified, all nodes with this field set to the specified value are displayed. This field specifies if the NVRAM mirroring to the DR partner is enabled through the [metrocluster configure](#) command. This field needs to be set to "enabled" for the DR mirroring to be active.

`[-configuration-state <text>]` - Configuration State of Node

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-additional-configuration-info <text>]` - Additional Configuration Info

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-dr-operation-state <text>]` - DR Operation State

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-dr-operation-time <integer>]` - Time to Complete Operation (secs)

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-node-object-limit {on|off}]` - Specifies if the Node Object Limits are Enforced

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-node-ha-partner <text>]` - Node and its HA Partner

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-automatic-uso {true|false}]` - Automatic USO (privilege: advanced)

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-mccip-node {true|false}]` - MCC-IP Node (privilege: advanced)

If this parameter is specified, all nodes with this field set to the specified value are displayed.

`[-is-encryption-enabled {true|false}]` - Encryption Enabled

If this parameter is specified, all nodes with this field set to the specified value are displayed.

Examples

The following example shows the output of the command before the MetroCluster configuration is done:

```
clusA::> metrocluster node show
```

DR Group	Cluster	Node	Configuration State	DR Mirroring Mode
-	clusA	clusA-01	ready to configure	-
		clusA-02	ready to configure	-
		clusA-03	ready to configure	-
		clusA-04	ready to configure	-

4 entries were displayed.

```
clusA::> metrocluster node show -partners
```

	Node (HA Partner)	DR Partner	(DR Auxiliary)
Cluster:	clusA	-	
	clusA-01	(-)	(-)
	clusA-02	(-)	(-)
	clusA-03	(-)	(-)
	clusA-04	(-)	(-)

4 entries were displayed.

The following example shows the output of the command when some DR groups in the MetroCluster configuration are not yet configured:

```
clusA::> metrocluster node show
```

DR Group	Cluster	Node	Configuration State	DR Mirroring Mode
-	clusA	clusA-03	ready to configure	-
		clusA-04	ready to configure	-
1	clusA	clusA-01	configured	enabled normal
		clusA-02	configured	enabled normal
	clusB	clusB-01	configured	enabled normal
		clusB-02	configured	enabled normal

6 entries were displayed.

```
clusA::> metrocluster node show -partners
```

Node (HA Partner)	DR Partner (DR Auxiliary)
Cluster: clusA -	
clusA-03 (-)	(-)
clusA-04 (-)	(-)
Cluster: clusA clusB	
clusA-01 (clusA-02)	clusB-01 (clusB-02)
clusA-02 (clusA-01)	clusB-02 (clusB-01)
Cluster: clusB clusA	
clusB-01 (clusB-02)	clusA-01 (clusA-02)
clusB-02 (clusB-01)	clusA-02 (clusA-01)

6 entries were displayed.

The following example shows the output of the command after after all DR groups in the MetroCluster configuration are configured:

```
clusA::> metrocluster node show
```

DR	Group	Cluster	Node	Configuration State	DR Mirroring Mode
			-----	-----	-----

1	clusA	clusA-01	configured	enabled	normal
		clusA-02	configured	enabled	normal
	clusB	clusB-01	configured	enabled	normal
		clusB-02	configured	enabled	normal
2	clusA	clusA-03	configured	enabled	normal
		clusA-04	configured	enabled	normal
	clusB	clusB-03	configured	enabled	normal
		clusB-04	configured	enabled	normal

8 entries were displayed.

```
clusA::> metrocluster node show -partners
```

	Node (HA Partner)	DR Partner (DR Auxiliary)

Cluster:	clusA clusB	
	clusA-01 (clusA-02)	clusB-01 (clusB-02)
	clusA-02 (clusA-01)	clusB-02 (clusB-01)
Cluster:	clusB clusA	
	clusB-01 (clusB-02)	clusA-01 (clusA-02)
	clusB-02 (clusB-01)	clusA-02 (clusA-01)
Cluster:	clusA clusB	
	clusA-03 (clusA-04)	clusB-03 (clusB-04)
	clusA-04 (clusA-03)	clusB-04 (clusB-03)
Cluster:	clusB clusA	
	clusB-03 (clusB-04)	clusA-03 (clusA-04)
	clusB-04 (clusB-03)	clusA-04 (clusA-03)

8 entries were displayed.

metrocluster operation commands

metrocluster operation show

Display details of the last MetroCluster operation

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster operation show` command displays information about the most recent MetroCluster operation run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the `metrocluster check` directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

Examples

The following example shows the output of `metrocluster operation show` after running a [metrocluster configure](#) command was successful:

```
clusA::> metrocluster operation show
      Operation: configure
      State: successful
Start time: 2/15/2013 18:22:46
End time: 2/15/2013 18:25:18
      Errors: -
```

- [metrocluster configure](#)

metrocluster operation history show

Display details of all MetroCluster operations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster operation history show` command displays information about all the MetroCluster operations run on the local cluster.

This command will display information about all MetroCluster commands except for the commands in the `metrocluster check` directory. This command will not display any information after MetroCluster has been completely unconfigured using the `metrocluster unconfigure` command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-operation-uuid <UUID>`] - Identifier for the Operation

This is the UUID of the operation. If this parameter is specified, only the operation with this UUID is displayed.

[`-cluster <Cluster name>`] - Cluster Where the Command Was Run

This is the name of the cluster where the command was run. If this parameter is specified, only the operations that were run in this cluster are displayed.

[`-node-name <Node name>`] - Node Where the Command Was run

This is the name of the node where the command was run. If this parameter is specified, only the operations that were run on this node are displayed.

[`-operation <MetroCluster Operation Name>`] - Name of the Operation

This is the name of the operation. If this parameter is specified, only the operations with this name are displayed.

[`-start-time <MM/DD/YYYY HH:MM:SS>`] - Start Time

This is the time the operation started execution. If this parameter is specified, only the operations that were started at this time are displayed.

[`-state <MetroCluster Operation state>`] - State of the Operation

This is the state of the operation. If this parameter is specified, only the operations that are in this state are displayed.

[`-end-time <MM/DD/YYYY HH:MM:SS>`] - End Time

This is the time the operation completed. If this parameter is specified, only the operations that completed at this time are displayed.

[`-error-list <text>,...`] - Error List For the Operation

This is the list of errors that were encountered during an operation's execution. If this parameter is specified, only the operations that have the matching errors are displayed.

[`-job-id <integer>`] - Identifier for the Job

This is the job id for the operation. If this parameter is specified, only the operation that has the matching job id displayed.

[`-additional-info <text>`] - Additional Info for Auto Heal

This is the completion status of the auto heal aggregates and auto heal root aggregates phases when processing switchover with auto heal.

Examples

The following example shows the output of `metrocluster operation history show` after some MetroCluster operations have been performed:

```
clusA::> metrocluster operation history show
Operation          State          Start time      End time
-----
configure          successful      2/15/2013 18:22:46
                   2/15/2013 18:25:18
configure          failed         2/15/2013 18:13:45
                   2/15/2013 18:13:45
2 entries were displayed.
```

metrocluster transition commands

metrocluster transition disable

Disable Transition

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster transition disable` command is used to end the transition from a MetroCluster FC to a MetroCluster IP configuration. The command clears the setting for transition mode on the local and partner clusters.

Examples

The following example shows how to disable the transition mode:

```
clusA::> metrocluster transition disable
clusA::> metrocluster transition show-mode
Transition Mode
-----
not-enabled
```

metrocluster transition enable

Enable Transition

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster transition enable` command is used to start the transition from a MetroCluster FC to a MetroCluster IP configuration. The command sets the transition mode on the local and partner cluster.

Parameters

-transition-mode <Mode For FC To Ip Transition> - Transition Mode (privilege: advanced)

This parameter specifies the setting for the transition-mode.

[-force {true|false}] - Force enable (privilege: advanced)

This optional parameter forces the setting for the transition-mode.

Examples

The following example shows how to enable the non-disruptive transition mode:

```
clusA::> metrocluster transition enable transition-mode non-disruptive
clusA::> metrocluster transition show-mode
Transition Mode
-----
non-disruptive
```

The following example shows how to enable the disruptive transition mode:

```
clusA::> metrocluster transition enable transition-mode disruptive
clusA::> metrocluster transition show-mode
Transition Mode
-----
disruptive
```

metrocluster transition show-mode

Display the transition mode

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster transition show-mode` command is used to display the current setting of transition.

Examples

The following example shows the output of the command when transition is not enabled:

```
clusA::> metrocluster transition show-mode
Transition Mode
-----
not-enabled
```

The following example shows the output of the command when non-disruptive transition is enabled:

```
clusA::> metrocluster transition show-mode
Transition Mode
-----
non-disruptive
```

The following example shows the output of the command when disruptive transition is enabled:

```
clusA::> metrocluster transition show-mode
Transition Mode
-----
disruptive
```

metrocluster vsver commands

metrocluster vsver recover-from-partial-switchback

Recover vservers from partial switchback

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster vsver recover-from-partial-switchback` command executes the necessary steps needed for a Vserver to be in healthy state after partial completion of the Switchback.

Parameters

Examples

```
cluster::> metrocluster vsver recover-from-partial-switchback
```

metrocluster vsver recover-from-partial-switchover

Recover vservers from partial switchover

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `metrocluster vsver recover-from-partial-switchover` command executes the necessary steps needed for a Vserver to be in healthy state after partial completion of the Switchover.

Parameters

Examples

```
cluster::> metrocluster vserver recover-from-partial-switchover
```

metrocluster vserver resync

Resynchronize Vserver with its partner Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster vserver resync` command resynchronizes the Vserver with its partner Vserver

Parameters

-cluster <Cluster name> - Cluster Name

Name of the cluster where the Vserver belongs

-vserver <vserver> - Vserver

Name of the Vserver to be resynchronized

Examples

```
cluster::> metrocluster vserver resync -cluster clus1 -vserver vs1
```

metrocluster vserver show

Display MetroCluster Vserver relationships

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `metrocluster vserver show` command displays configuration information for all pairs of Vservers in MetroCluster.

Parameters

{ [-fields <fieldname>,...]

The command output includes the specified field or fields

| [-creation-time] (privilege: advanced)

Shows the last configuration modification time on the Vserver

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-cluster <Cluster name>] - Cluster Name

Name of the cluster where the Vserver belongs

[-vserver <vserver>] - Vserver

Name of the Vserver

[-partner-vserver <vserver>] - Partner Vserver

Name of the partner Vserver

[-configuration-state {healthy|unhealthy|degraded|pending-setup|syncing|replication-paused|pending-switchback}] - Configuration State

Configuration states include:

- *healthy*
- *unhealthy*
- *degraded* indicates that Vservers are not in sync
- *syncing* indicates that the Vserver configuration is being synchronized
- *replication-paused* indicates that the configuration replication was manually paused
- *pending-setup* indicates that partner Vserver creation is pending

[-corrective-action <text>] - Corrective Action

Corrective action which can be followed to successfully create the partner Vserver

[-creation-time-of-last-applied-change <MM/DD/YYYY HH:MM:SS>] - Creation Time on the Source

Last configuration modification time on the Vserver

[-failed-row <smdb-row-op>] - Failed Row

Failed replication row

[-failed-object <text>] - Failed Object

Displays the failed object name

[-failed-reason <text>] - Failed Replication Reason

Failed replication reason

[-out-of-sync <true>] - Is Out of Sync

Indicates that the Vserver configuration replication is not in sync

[-config-resume-time <MM/DD/YYYY HH:MM:SS>] - Configuration Resume Time

Displays the resume time of the Vserver configuration replication

[-irrecoverable-apply-failed-reason <text>] - Reason for Failure

Reason for the replication failure

Examples

The following example shows the output of the command when partner Vservers are created

```
clusA::> metrocluster vserver show
Cluster: clusA

Configuration
Vserver
State
-----
-----
clusA
healthy
vs1
healthy
Cluster: clusB

Configuration
Vserver
State
-----
-----
clusB
healthy
vs1-mc
Partner
Vserver
-----
clusA
3 entries were displayed.
```

The following example shows the output of the command when the partner Vserver creation is pending

```
clusA::> metrocluster vserver show
Cluster: clusA

Configuration
Vserver
State
-----
-----
clusA
healthy
vs1
pending-setup
Corrective Action: Create Ipspace ips1 on the partner cluster.
2 entries were displayed.
```

network commands

network ping

Ping

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network ping` command displays whether a remote address is reachable and responsive, the (if specified) number of transmitted and received packets, and their round-trip time. The command requires a source node or logical interface from where the ping will be run, and a destination IP address. You can specify the source node by name, or a logical interface and its Vserver.

Parameters

{ -node <nodename> - Node

Use this parameter to send the ping from the node you specify.

| -lif <lif-name> - Logical Interface }

Use this parameter to send the ping from the logical interface you specify.

-vserver <vserver> - Vserver

Use this parameter to send the ping from the Vserver where the intended logical interface resides. The default value is the system Vserver for cluster administrators.

**[-use-source-port {true|false}] - (DEPRECATED)-Use Source Port of Logical Interface
(privilege: advanced)**

This parameter is only applicable when the `-lif` parameter is specified. When set to `true`, the ping packet will be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping packet will be sent out via a port based on the routing table.

The `use-source-port` parameter is deprecated and may be removed in a future release of ONTAP.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote internet address destination of the ping.

[-s, -show-detail <true>] - Show Detail Output

Use this parameter to display detailed output about the ping.

[-R, -record-route <true>] - Record Route

Use this parameter to display the route followed by the ping. You should set this option to `false` for pinging to succeed.

[-v, -verbose <true>] - Show All ICMP Packets

Use this parameter to display all ICMP packets.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the number of data bytes to be sent in the ping packet. The default is 56 bytes, which is 64 ICMP data bytes total after 8 bytes of ICMP header data is added.

[-count <integer>] - Count

Use this parameter to specify the maximum number of ECHO_REQUESTS to be sent to the destination. The default is 20 requests. In the absence of the 'show-detail' option, ping reports that the destination is alive after receiving the first ECHO_REPLY response, independent of this value.

[-wait <integer>] - Packet Send Wait Time (secs)

Use this parameter to specify the number of seconds to wait between sending packets. The default is one second.

[-flood <true>] - Flood Ping (privilege: advanced)

Use this parameter to execute the command in flood mode. In flood mode, the command issues pings as fast as they are received, unless you specify a wait time.

[-D, -disallow-fragmentation <true>] - Disallow Packet Fragmentation

Use this parameter to prevent transport mechanisms from fragmenting ping packets in transit. Preventing fragmentation assures consistent packet size, making it easier to see transport bottlenecks.

[-wait-response <integer>] - Packet Response Wait Time (ms)

Use this parameter to specify the number of milliseconds to wait for each response packet. The default is 10000 milliseconds (10 seconds).

[-services <LIF Service Name>,...] - Services

Use this parameter to specify the list of services used to select the LIF from which to send the ping.

Examples

This example shows a ping from node xena to the destination server 10.98.16.164 with the server responding that it is up and running.

```
cluster1::> network ping -node xena -destination 10.98.16.164
(network ping)
10.98.16.164 is alive
```

network ping6

Ping an IPv6 address

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network ping6` command uses the ICMPv6 protocol's mandatory ICMP6_ECHO_REQUEST datagram to elicit an ICMP6_ECHO_REPLY from a host or gateway. ICMP6_ECHO_REQUEST datagrams ("pings") have an IPv6 header, and ICMPv6 header formatted as documented in RFC2463.

Parameters

{ -node <nodename> - Node Name

Use this parameter to originate ping6 from the specified node.

| -lif <lif-name> - Logical Interface }

Use this parameter to originate ping6 from the specified logical interface.

-vserver <vserver name> - Vserver Name

Use this parameter to originate ping6 from the specified Vserver. The default value is the system Vserver for cluster administrators.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the IPv6 address of the destination node.

[-b, -buffer-size <integer>] - Socket Buffer Size

Use this parameter to set the socket buffer size.

[-c, -count <integer>] - Max Requests to Send/Receive

Use this parameter to specify the maximum number of requests and replies. The default value is 20.

[-H, -reverse-lookup <true>] - Reverse-lookup of IPv6 addresses

Use this parameter to specify reverse-lookup of IPv6 addresses. Unless this parameter is specified, ping6 command does not attempt reverse lookup.

[-i, -interval <integer>] - Wait between Packets (secs)

Use this parameter to specify the delay time between packets in seconds. The default value is 1 second. This parameter is incompatible with the flood parameter.

[-l, -preload <integer>] - Send Packets as Fast as Possible (privilege: advanced)

Use this parameter if preload is required. If specified, ping6 sends that many packets as fast as possible before falling into its normal mode of behavior.

[-use-source-port {true|false}] - Use Source Port of Logical Interface (privilege: advanced)

This parameter is only applicable when the -lif parameter is specified. When set to true, the ping packet will be sent out via the port which is currently hosting the IP address of the logical interface. Otherwise, the ping packet will be sent out via a port based on the routing table.

[-p, -pattern <text>] - Up to 16 'pad' Specified for Out Packet

Use this parameter to fill the -16 'pad' bytes in the sent packet. This is useful for diagnosing data dependent problems in a network. For example, -pattern ff causes the sent packet to be filled with all ones.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the number of data bytes to be sent. The default is 56, which translates to 64 ICMP data bytes when combined with the 8 bytes of ICMP header data.

[-v, -verbose <true>] - Show All ICMP Packets

Use this parameter to get verbose output. Verbose output displays both source address and destination addresses. Received ICMP packets other than ECHO_RESPONSE are listed. This parameter can be used only in conjunction with the show-detail parameter.

[-s, -show-detail <true>] - Show Detail Output

Use this parameter to display detailed output about the ping.

[-f, -flood <true>] - Flood Ping (privilege: advanced)

Use this parameter to output packets as fast as they come back or one hundred times per second, whichever is more. For every ECHO_REQUEST sent a period "." is printed, while for every ECHO_REPLY received a backspace is printed. This provides a rapid display of how many packets are being dropped. This can be very hard on a network and should be used with caution.

[-D, -disable-fragmentation <true>] - Disable Fragmentation.

Use this parameter to disallow fragmentation of the outgoing packets, if they do not fit in the Maximum Transmission Unit.

Examples

This example shows a ping6 from node 'node1' to the destination server ipv6.google.com with the server responding that it is up and running.

```
cluster1::> network ping6 -node node1 -destination ipv6.google.com
ipv6.google.com is alive.
```

network test-path

Test path performance between two nodes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-path` command runs a performance test between two nodes. The command requires a source node, destination node, destination cluster, and application, or session type. All tests are run using intracluster or intercluster LIFs, depending on whether the test is between two nodes in the same cluster, or between nodes in peered clusters.

The test itself is different from most bandwidth test tools. It creates a "session" consisting of TCP connections between all possible paths between the nodes being tested. This is how internal ONTAP applications communicate between nodes. This means the test is using multiple paths, and thus the bandwidth reported might exceed the capacity of a single 10 Gb path.

Parameters

-source-node {<nodename>|local} - Node Initiating Session (privilege: advanced)

Use this parameter to specify the node that initiates the test. Source-node parameter must be a member of the cluster in which the command is run.

-destination-cluster <Cluster name> - Cluster Containing Passive Node (privilege: advanced)

Use this parameter to specify the destination cluster; the local cluster, or a peered cluster.

-destination-node <text> - Remote Node in Destination Cluster (privilege: advanced)

Use this parameter to specify the destination node in the destination cluster

-session-type {AsyncMirrorLocal|AsyncMirrorRemote|RemoteDataTransfer} - Type of Session to Test (privilege: advanced)

The session type parameter is used to mimic the application settings used. A session consists of multiple TCP connections.

- AsyncMirrorLocal: settings used by SnapMirror between nodes in the same cluster
- AsyncMirrorRemote: settings used by SnapMirror between nodes in different clusters
- RemoteDataTransfer: settings used by ONTAP for remote data access between nodes in the same cluster

The default session-type is AsyncMirrorRemote.

[-connection-detail {true|false}] - Display Test Results per Network Path (privilege: advanced)

Boolean argument to specify if the network test-path run should be executed for specific network paths. This defaults to false.

Examples

The following example runs a test between two nodes in the same cluster:

```
cluster1::*> network test-path -source-node node1 -destination-cluster
cluster1 -destination-node node2
Test Duration: 10.65 secs
  Send Throughput: 1092.65 MB/sec
Receive Throughput: 1092.65 MB/sec
    MB Sent: 11633.69
    MB Received: 11633.69
    Avg Latency:    64.40 ms
    Min Latency:    2.41 ms
    Max Latency:   2099.17 ms
```

network traceroute

Traceroute

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network traceroute` command performs a network probe from a node to a specified IP address. The command requires a source node or logical interface and a destination IP address. You can specify the source node by name, or specify a logical interface and its Vserver. The traceroute is performed between the source and destination.

Parameters

{ -node <nodename> - Node

Use this parameter to originate the traceroute from the node you specify.

| -lif <lif-name> - Logical Interface }

Use this parameter to originate the traceroute from the specified network interface.

-vserver <vserver> - LIF Owner

Use this parameter to originate the traceroute from the Vserver where the intended logical interface resides. The default value is the system Vserver for cluster administrators.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote internet address destination of the traceroute.

[-m, -maxttl <integer>] - Maximum Number of Hops

Use this parameter to specify the maximum number of hops (time-to-live) setting used by outgoing probe packets. The default is 30 hops.

[-n, -numeric <true>] - Print Hop Numerically

Use this parameter to print the hop addresses only numerically rather than symbolically and numerically.

[-port <integer>] - Base UDP Port Number

Use this parameter to specify the base UDP port number used in probes. The default is port 33434.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the size of probe packets, in bytes.

[-q, -nqueries <integer>] - Number of Queries

Use this parameter to specify the number of probes per hop. The default is 3 probes.

[-v, -verbose <true>] - Verbose Output

Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets.

[-w, -waittime <integer>] - Wait Between Packets (secs)

Use this parameter to specify the time (in seconds) to wait for the response to a probe. The default is 5 seconds.

Examples

This example shows a traceroute from node node1 to a destination address of 10.98.16.164, showing a maximum of five hops.

```
cluster1::> traceroute -node node1 -destination 10.98.16.164 -maxttl 5
 1  10.68.208.1 <10.68.208.1> 0.307 ms 293 ms 305 ms
 2  152.164.13.205 <152.164.13.205> 3.754 ms 3.722 ms 3.981 ms
 3  68.137.122.222 <68.137.122.222> 25.603 ms 24.947 ms 24,565 ms
 4  * * *
 5  * * *
```

```
traceroute to 10.98.16.164, 5 hops max, 52 byte packets
```

network traceroute6

traceroute6

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network traceroute6` command performs a network probe from a node to a specified IPv6 address. The command requires a source node or logical interface, Vserver from where `traceroute6` will originate and a destination IPv6 address. `traceroute6` is performed between the source and destination.

Parameters

{ **-node <nodename>** - Node

Use this parameter to originate `traceroute6` from the node you specify. This parameter is available only to cluster administrators.

| **-lif <lif-name>** - Logical Interface }

Use this parameter to originate `traceroute6` from the logical interface you specify.

-vserver <vserver name> - LIF Owner

Use this parameter to originate `traceroute6` from the Vserver you specify. The default value is the system Vserver for cluster administrators.

[**-d, -debug-mode <true>**] - Debug Mode

Use this parameter to enable socket level debugging. The default value is false.

{ [**-I, -icmp6 <true>**] - ICMP6 ECHO instead of UDP

Use this parameter to specify the use of ICMP6 ECHO instead of UDP datagrams for the probes. The default value is false.

| [**-U, -udp <true>**] - UDP }

Use this parameter to specify the use of UDP datagrams for the probes. The default value is true.

[**-n, -numeric <true>**] - Print Hops Numerically

Use this parameter to print the hop addresses only numerically rather than symbolically and numerically. The default value is false.

[-v, -verbose <true>] - Verbose Output

Use this parameter to display all received ICMP packets, rather than just TIME_EXCEEDED and UNREACHABLE packets. The default value is false.

[-f, -first-hop <integer>] - Number of Hops to Skip in Trace

Use this parameter to specify the number of hops to skip in trace. The default value is 1.

[-g, -gateway <Remote InetAddress>] - Intermediate Gateway

Use this parameter to specify the intermediate gateway.

[-m, -hop-limit <integer>] - Maximum Number of Hops

Use this parameter to specify the maximum hoplimit, up to 255. The default value is 64 hops.

[-p, -port <integer>] - Base UDP Port Number

Use this parameter to specify the base UDP port number used in probes. The default value is port 33434.

[-q, -nqueries <integer>] - Number of Queries

Use this parameter to specify the number of probes per hop. The default value is 3 probes.

[-w, -wait-time <integer>] - Wait Between Packets (secs)

Use this parameter to specify the delay time between probes in seconds. The default value is 5 seconds.

-destination <Remote InetAddress> - Destination

Use this parameter to specify the remote IPv6 address destination of traceroute6.

[-packet-size <integer>] - Packet Size

Use this parameter to specify the size of probe packets, in bytes. The default value is 16 bytes for ICMP6 ECHO and 12 bytes for UDP datagrams.

Examples

The following example shows traceroute6 from node node1 to the destination fd20:8b1e:b255:4071:d255:1fcd:a8cd:b9e8.

```
cluster1::> network traceroute6 -node node1 -vserver vs1
               -destination 3ffe:b00:c18:1::10
traceroute6 to 3ffe:b00:c18:1::10 (3ffe:b00:c18:1::10)
      from 2001:0db8:0000:f101::2,
      64 hops max, 12 byte packets
 1  2001:0db8:0000:f101::1 4.249 ms  2.021 ms  0.864 ms
 2  3ffe:2000:0:400::1 0.831 ms  0.579 ms
 3  3ffe:2000:0:1::132 227.693 ms  227.596 ms  227.439 ms
 4  3ffe:c00:8023:2b::2 229.028 ms  228.267 ms  231.891 ms
 5  3ffe:2e00:e:c::3 227.929 ms  228.696 ms  228.558 ms
 6  3ffe:b00:c18:1::10 227.702 ms  227.806 ms  227.439 ms
```

network arp commands

network arp create

Create static ARP entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp create` command creates a static ARP entry for a given Vserver. Statically created ARP entries will be stored permanently in the Vserver context and will be used by the network stack.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver on which the ARP entry is created.

-remotehost <IP Address> - Remote IP Address

Use this parameter to specify the IP address to be added as an ARP entry.

-mac <MAC Address> - MAC Address

Use this parameter to specify the MAC address (Ethernet address) for the host specified with `-remotehost`. Specify the MAC address as six hex bytes separated by colons.

Examples

The following example creates a static ARP entry on Vserver `vs1` for the remote host with the IP address `10.63.0.2` having MAC address `40:55:39:25:27:c1`

```
cluster1::> network arp create -vserver vs1 -remotehost 10.63.0.2 -mac  
40:55:39:25:27:c1
```

network arp delete

Delete static ARP entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp delete` command deletes static ARP entries from the Vserver and from the network stack.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the name of the Vserver from which the ARP entry is deleted.

-remotehost <IP Address> - Remote IP Address

Use this parameter to specify the IP address of the ARP entry being deleted.

Examples

The following example deletes the ARP entry for IP address 10.63.0.2 from the Vserver vs1.

```
cluster1::> network arp delete -vserver vs1 -remotehost 10.63.0.2
```

network arp show**Display static ARP entries**

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network arp show` command displays static ARP entries present in a given Vserver. This command will not display dynamically learned ARP entries in the network stack. Use the [network arp active-entry show](#) command to display dynamically learned ARP entries in the network stack.

Parameters

{ [-fields <fieldname>,...]

Use this parameter to display only certain fields of the ARP table.

| [-instance] }

Use this parameter to display all the fields of the ARP table.

[-vserver <vserver name>] - Vserver Name

Use this parameter to display ARP entries that are specific to a given Vserver.

[-remotehost <IP Address>] - Remote IP Address

Use this parameter to display ARP entries for the specified IP address

[-mac <MAC Address>] - MAC Address

Use this parameter to display ARP entry for the specified MAC address

[-ipspace <IPspace>] - IPspace

Use this parameter to specify the IPspace associated with the Vserver

Examples

The following example displays static ARP entries from the Vserver vs1.

```
cluster1::> network arp show -vserver vs1
Vserver      Remote Host      MAC Address
-----
vs1
            10.238.0.2      40:55:39:25:27:c1
```

- [network arp active-entry show](#)

network arp active-entry delete

Delete active ARP entry from a System or Admin Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network arp active-entry delete` command deletes dynamically learned ARP entries from the network stack of a node. To delete statically configured ARP entries use the [network arp delete](#) command.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

Use this parameter to specify the name of the node in which the ARP entry is deleted.

-vserver <vserver> - System or Admin Vserver Name (privilege: advanced)

Use this parameter to specify the name of the Vserver in which the ARP entry is deleted. Only Vservers with a type of Admin or System have dynamically learned ARP entries.

-subnet-group <IP Address/Mask> - Subnet Group Name (privilege: advanced)

Use this parameter to specify the name of the routing group in which the ARP entry is deleted.

-remotehost <text> - Remote IP Address (privilege: advanced)

Use this parameter to specify the IP address to be deleted from the active ARP entries.

-port <text> - Port (privilege: advanced)

Use this parameter to specify the name of the Port to be deleted from the active ARP entries.

Examples

The following example deletes the active ARP entry with an IP address of 10.224.64.1, subnet group of 0.0.0.0/0, port e0c on node node2 in the Admin Vserver cluster1:

```
cluster1::*> network arp active-entry delete -node cluster1-01 -vserver
cluster1 -subnet-group 0.0.0.0/0 -remotehost 10.224.64.1 -port e0c
```

Related Links

- [network arp delete](#)

network arp active-entry show

Display active ARP entries organized by Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network arp active-entry show` command displays ARP entries present in the network stack of the node. The entries includes both dynamically learned ARP entries and user configured static ARP entries.

Parameters

[`-fields <fieldname>,...`]

Use this parameter to display only certain fields of the active ARP table.

[`-instance`] (privilege: advanced) }

Use this parameter to display all the fields of the active ARP table.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Use this parameter to display active ARP entries that are specific to a given node.

[`-vserver <vserver>`] - System or Admin Vserver Name (privilege: advanced)

Use this parameter to display active ARP entries that are specific to a given System or Admin Vserver. Data and Node Vservers will not have any active-arp entries.

[`-subnet-group <IP Address/Mask>`] - Subnet Group Name (privilege: advanced)

Use this parameter to display active ARP entries that are specific to a given subnet group.

[`-remotehost <text>`] - Remote IP Address (privilege: advanced)

Use this parameter to display active ARP entries for the specified IP address.

[`-port <text>`] - Port (privilege: advanced)

Use this parameter to display active ARP entries for the specified Port name.

[`-mac <text>`] - MAC Address (privilege: advanced)

Use this parameter to display the active ARP entry for the specified MAC address.

[`-ipspace <IPspace>`] - IPspace (privilege: advanced)

Use this parameter to specify the IPspace associated with the System or Admin Vserver.

Examples

The following example displays active ARP entries for the Admin Vserver cluster1:

```
cluster1::*> network arp active-entry show -vserver cluster1
```

```
Node: node-01
```

```
Vserver: cluster1
```

```
Subnet Group: 169.254.0.0/16
```

```
Remote IP Address  MAC Address          Port
```

```
-----
```

```
169.254.106.95      0:55:39:27:d1:c1  10
```

network bgp commands

network bgp config create

Create BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config create` command is used to create the border gateway protocol (BGP) configuration for a node. It can be used to override the BGP parameters defined in the global BGP defaults.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node on which configuration details will be created.

-asn <integer> - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a positive integer of the range from 1 to 4,294,967,295. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use" or the AS number assigned to the operator's organization.

-hold-time <integer> - Hold Time

This parameter specifies the hold time in seconds. The default value is 180.

-router-id <IP Address> - Router ID

This parameter specifies the local router ID. The router-id value takes the form of an IPv4 address. The default router-id will be initialized using a local IPv4 address in admin vserver.

Examples

```
cluster1::> network bgp config create -node node1 -asn 10 -hold-time 180  
-router-id 10.0.1.112
```

network bgp config delete

Delete BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config delete` command deletes a node's border gateway protocol (BGP) configuration. A BGP configuration cannot be deleted if there are BGP peer groups configured on the associated node.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node for which the BGP configuration will be deleted.

Examples

```
cluster1::> network bgp config delete -node node1
```

network bgp config modify

Modify BGP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp config modify` command is used to modify a node's border gateway protocol (BGP) configuration.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node on which BGP configuration will be modified.

[-asn <integer>] - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a positive integer of the range from 1 to 4,294,967,295. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use" or the AS number assigned to the operator's organization.

[-hold-time <integer>] - Hold Time

This parameter specifies the hold time in seconds.

[-router-id <IP Address>] - Router ID

This parameter specifies the local router ID. The router-id value takes the form of an IPv4 address.

Examples

```
cluster1::> network bgp config modify -node node1 -router-id 1.1.1.1 -asn
20
```

network bgp config show

Display BGP configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp config show` command displays the border gateway protocol (BGP) configuration for each node.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This parameter selects the BGP configurations that match the specified node.

[-asn <integer>] - Autonomous System Number

This parameter selects the BGP configurations that match the specified autonomous system number.

[-hold-time <integer>] - Hold Time

This parameter selects BGP configurations that match the specified hold time.

[-router-id <IP Address>] - Router ID

This parameter selects the BGP configurations that match the specified router ID.

Examples

```
cluster1::> network bgp config show
Autonomous
System      Hold Time
Node        Number      (seconds)  Router ID
-----
node1       10         180        10.0.1.112
```

network bgp defaults modify

Modify BGP defaults

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp defaults modify` command modifies the global defaults for border gateway protocol (BGP) configurations.

Parameters

[-asn <integer>] - Autonomous System Number

This parameter specifies the autonomous system number (ASN). The ASN attribute is a positive integer. It should typically be chosen from RFC6996 "Autonomous System (AS) Reservation for Private Use", or the AS number assigned to the operator's organization. The default ASN is 65501.

[-hold-time <integer>] - Hold Time

This parameter specifies the hold time in seconds. The default value is 180.

Examples

```
cluster1::> network bgp defaults modify -asn 20
```

network bgp defaults show

Display BGP defaults

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp defaults show` command displays the global defaults for border gateway protocol (BGP) configurations.

Examples

```
cluster1::> network bgp defaults show
Autonomous
System Number   Hold Time
      (Seconds)
-----
10             180
```

network bgp peer-group create

Create a new BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group create` command is used to create a border gateway protocol (BGP) peer group. A BGP peer group will advertise VIP routes for the list of vservers in the peer group's `vserver-list` using the BGP LIF of the peer group. A BGP peer group will advertise VIP routes to a peer router using the border gateway protocol. The address of the peer router is identified by the `peer-address` value.

Parameters

-ipspace <IPspace> - IPspace Name

This parameter specifies the IPspace of the peer group being created.

-peer-group <text> - Peer Group Name

This parameter specifies the name of the peer group being created.

-bgp-lif <lif-name> - BGP LIF

This parameter specifies the BGP interface (BGP LIF) of the peer group being created.

-peer-address <IP Address> - Peer Router Address

This parameter specifies the IP address of the peer router for the peer group being created.

[-peer-asn <integer>] - Peer Router Autonomous number

This parameter specifies the peer router autonomous system number (ASN) in the peer group being created. The default value is the value of the local node's ASN.

-route-preference <integer> - Route Preference

This parameter specifies the preference field in BGP update messages for VIP routes. If a router receives multiple VIP route announcements for the same VIP LIF from different BGP LIFs, it will install the one that has the highest preference value. The default route preference value is 100.

[-asn-prepend-type <ASN Prepend type>] - ASN prepend type (privilege: advanced)

This parameter specifies the ASN that will be prepended in the BGP attributes. The possible values are `local-asn` and `peer-asn`. The default behavior is not to prepend any ASN.

[-asn-prepend-count <integer>] - ASN prepend count (privilege: advanced)

This parameter specifies the number of times ASN, as specified in `asn-prepend-type` will be prepended in the BGP path attributes. The default behavior is not to prepend any ASN.

[-community <BGP community>, ...] - BGP Community (privilege: advanced)

This parameter specifies the communities that will be included in the BGP path attributes. The default behavior is not to include any community in BGP path attributes.

[-med <integer>] - Multi Exit Discriminator (privilege: advanced)

This parameter specifies the Multi Exit Discriminator (MED) attribute of BGP update messages, which can be used by routers for best path selection, in cases where more than one peer advertises the same route with similar attributes.

[`-use-peer-as-next-hop {true|false}`] - Use Peer Address As Next Hop

This parameter specifies whether the peer group uses the peer address as a next hop route. When the value is true, the peer address is used as the next hop router for packets sent from VIP LIFs via the port on which `bgp-lif` is configured. Internally, a default route with a gateway configured as the `peer-address` is added automatically on the node for all the Vservers in this peer group's IPspace. The route will be added for a Vserver only if it has a VIP LIF hosted on the current node of `bgp-lif`. Note that these automatically installed default routes are for VIP traffic; however, they can be used for non-VIP traffic as well if a Vserver hosts both VIP and non-VIP LIFs in the same subnet as `bgp-lif`. This route will have metric of 20 and will be used to forward traffic through the current port of `bgp-lif`. The default value of this parameter is false.

[`-md5-enabled {true|false}`] - TCP MD5 Enabled (privilege: advanced)

This parameter specifies whether the peer group configuration uses TCP MD5 authentication to communicate with its peer router. When the value is true, an `md5-secret` must be specified for the peer group being created. The default value is false.

[`-md5-secret <text>`] - TCP MD5 Secret Key (privilege: advanced)

This parameter specifies TCP MD5 secret key. The value for `md5-secret` may be specified as either a string of printable ASCII characters or as a hexadecimal string. If a string of ASCII characters is specified, the string should be enclosed in quotes and be from 1-79 characters in length. If a hexadecimal string is specified, the string of hexadecimal bytes should be prefaced with 0x (e.g., 0x893785c6) and contain from 2-160 hexadecimal characters. The `md5-secret` should match the MD5 secret configured on the peer router.

Examples

```
cluster1::> network bgp peer-group create -peer-group group1 -ipspace
Default -bgp-lif bgp_lif -peer-address 10.0.1.112
```

network bgp peer-group delete

Delete a BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group delete` command is used to delete border gateway protocol (BGP) peer group configuration.

Parameters

`-ipspace <IPspace>` - IPspace Name

This parameter specifies the IPspace of the BGP peer group being deleted.

`-peer-group <text>` - Peer Group Name

This parameter specifies the name of the BGP peer group being deleted.

Examples

```
cluster1::> network bgp peer-group delete -ip-space Default -peer-group group1
```

network bgp peer-group modify

Modify a BGP peer group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group modify` command is used to modify a border gateway protocol (BGP) peer group configuration.

Parameters

-ip-space <IPspace> - IPspace Name

This parameter specifies the IPspace of the peer group being modified.

-peer-group <text> - Peer Group Name

This parameter specifies the name of the peer group being modified.

[-peer-address <IP Address>] - Peer Router Address

This parameter specifies an updated value for the IP address of the peer router.

[-use-peer-as-next-hop {true|false}] - Use Peer Address As Next Hop

This parameter specifies whether the peer group uses the peer address as a next hop route. When the value is true, the peer address is used as the next hop router for packets sent from VIP LIFs via the port on which `bgp-lif` is configured. Internally, a default route with a gateway configured as the `peer-address` is added automatically on the node for all the Vservers in this peer group's IPspace. The route will be added for a Vserver only if it has a VIP LIF hosted on the current node of `bgp-lif`. Note that these automatically installed default routes are for VIP traffic; however, they can be used for non-VIP traffic as well if a Vserver hosts both VIP and non-VIP LIFs in the same subnet as `bgp-lif`. This route will have metric of 20 and will be used to forward traffic through the current port of `bgp-lif`. The default value of this parameter is false.

[-md5-enabled {true|false}] - TCP MD5 Enabled (privilege: advanced)

This parameter specifies whether the peer group configuration uses TCP MD5 authentication to communicate with its peer router. When the value is true, an `md5-secret` must be specified for the peer group being created. The default value is false.

[-md5-secret <text>] - TCP MD5 Secret Key (privilege: advanced)

This parameter specifies TCP MD5 secret key. The value for `md5-secret` may be specified as either a string of printable ASCII characters or as a hexadecimal string. If a string of ASCII characters is specified, the string should be enclosed in quotes and be from 1-79 characters in length. If a hexadecimal string is specified, the string of hexadecimal bytes should be prefaced with 0x (e.g., 0x893785c6) and contain from 2-160 hexadecimal characters. The `md5-secret` should match the MD5 secret configured on the peer router.

Examples

```
cluster1::> network bgp peer-group modify -ipspace Default -peer-group  
peer1 -peer-address 10.10.10.10
```

network bgp peer-group rename

Rename a BGP peer group

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network bgp peer-group rename` command is used to assign a new name to a BGP peer group.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

This parameter specifies the IPspace of the peer group being renamed.

-peer-group <text> - Peer Group Name (privilege: advanced)

The name of the peer group to be updated.

-new-name <text> - New Name (privilege: advanced)

The new name for the peer group.

Examples

```
cluster1::> network bgp peer-group rename -peer-group old_name -new-name  
new_name
```

network bgp peer-group show

Display BGP peer groups information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp peer-group show` command displays the BGP peer groups configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name

This parameter selects peer groups that match the specified IPspace.

[-peer-group <text>] - Peer Group Name

This parameter selects peer groups that match the specified name.

[-bgp-lif <lif-name>] - BGP LIF

This parameter selects peer groups that match the specified BGP Interface.

[-peer-address <IP Address>] - Peer Router Address

This parameter selects peer groups that match the specified peer router address.

[-peer-asn <integer>] - Peer Router Autonomous number

This parameter selects peer groups that match the specified autonomous system number.

[-state <BGP Session State>] - Peer Group State

This parameter selects peer groups that match the specified BGP session state.

[-bgp-node <nodename>] - BGP LIF Node

This parameter selects peer groups that match the specified `bgp-node` value. This value is calculated based on the current node of the corresponding BGP LIF.

[-bgp-port <netport>] - BGP LIF Port

This parameter selects peer groups that match the specified `bgp-port` value. This value is calculated based on the current port of the associated BGP LIF.

[-route-preference <integer>] - Route Preference

This parameter selects peer groups that match the specified route preference value.

[-asn-prepend-type <ASN Prepend type>] - ASN prepend type (privilege: advanced)

This parameter selects peer groups that match the specified `asn-prepend-type` value. The possible values are `local-asn` and `peer-asn`.

[-asn-prepend-count <integer>] - ASN prepend count (privilege: advanced)

This parameter selects peer groups that match the specified `asn-prepend-count` value.

[-community <BGP community>,...] - BGP Community (privilege: advanced)

This parameter selects peer groups that match the specified `community` value.

[-med <integer>] - Multi Exit Discriminator (privilege: advanced)

This parameter selects peer groups that match the specified `med` value.

[-use-peer-as-next-hop {true|false}] - Use Peer Address As Next Hop

This parameter selects peer groups that match the specified `use-peer-as-next-hop` value.

[`-md5-enabled {true|false}`] - TCP MD5 Enabled (privilege: advanced)

This parameter selects peer groups that match the specified md5-enabled value.

[`-md5-secret <text>`] - TCP MD5 Secret Key (privilege: advanced)

This parameter selects peer groups that match the specified TCP MD5 secret key value. The value for md5-secret may be specified as either a string of printable ASCII characters or as a hexadecimal string. If a string of ASCII characters is specified, the string should be enclosed in quotes and be from 1-79 characters in length. If a hex string is specified, the string of hexadecimal bytes should be prefaced with 0x (e.g., 0x893785c6) and be from 2-160 hexadecimal characters in length.

Examples

```
cluster1::> network bgp peer-group show
IPspace: Default
Peer          Local BGP Peer router          Autonomous
Group         Interface Address/subnet    state          Number      Node
Port
-----
gp1           bgp_lif1  10.0.5.37         up              10
node1 e1a
gp2           bgp_lif2  10.0.6.38         up              12
node1 e2a
```

network bgp vserver-status show

Display Vserver BGP status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network bgp vserver-status show` command displays the per-node border gateway protocol (BGP) status for each vserver. The BGP status for a particular vserver is "up" when at least one BGP peer group supporting that vserver is able to communicate with its peer router.

Parameters

{ [`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

| [`-instance ]`}

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`]} - Node

This parameter selects the BGP status that match the specified node.

[`-vserver <vserver name>`] - Vserver

This parameter selects the BGP status for specified vserver.

[`-ipv4-status {unknown|unconfigured|up|down}`] - IPv4 status

This parameter selects the BGP status that matches the specified status for IPv4 address family.

[`-ipv6-status {unknown|unconfigured|up|down}`] - IPv6 status

This parameter selects the BGP status that matches the specified status for IPv6 address family.

Examples

```
cluster1::> network bgp vserver-status show
Node                vserver    IPv4 status IPv6 status
-----
node1               vs1        up          up
```

network cloud commands

network cloud routing-table create

Create a new external routing table

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table create` command creates a new external routing table.

Parameters

`-route-table-id <text>` - Route Table ID (privilege: advanced)

This parameter is used to provide the name of the external routing table to be created.

Examples

The following example creates an external routing table "eni-123456":

```
cluster1::> network cloud routing-table create -route-table-id eni-123456
```

network cloud routing-table delete

Delete an existing external routing table

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table delete` deletes an existing external routing table.

Parameters

-route-table-id <text> - Route Table ID (privilege: advanced)

This parameter is used to provide the name of an existing external routing table to be deleted.

Examples

The following example deletes the external routing table "eni-123456":

```
cluster1::> network cloud routing-table delete -route-table-id eni-123456
```

network cloud routing-table show

Show existing external routing tables

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network cloud routing-table show` command retrieves the configured routing tables on mediator and displays them.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-route-table-id <text>] - Route Table ID (privilege: advanced)

This parameter is the name of the external routing table to be shown.

Examples

The following example shows external routing tables, for this cluster, that are configured on the mediator

```
cluster1::> network cloud routing-table show
Route Table ID
-----
rtb-16924571
rtb-9c9245fb
rtb-a36calc4
3 entries were displayed.
```

network connections commands

network connections active show-clients

Show a count of the active connections by client

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-clients` command displays information about client connections, including the client's IP address and the number of client connections.

The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

This parameter is used by the system to break down the output per vserver.

[-remote-address <Remote IP>] - Remote IP Address

Use this parameter to display information only about the connections that use the remote IP address you specify.

[-count <integer>] - Client Count

Use this parameter to only clients with the number of active client connections you specify.

Examples

The following example displays information about active client connections:

```
cluster1::> network connections active show-clients
Node      Vserver Name      Client IP Address      Count
-----
node0     vs1                192.0.2.253            1
          vs2                192.0.2.252            2
          vs3                192.0.2.251            5
node1     vs1                192.0.2.250            1
          vs2                192.0.2.252            3
          vs2                customer.example.com     4
```

network connections active show-lifs

Show a count of the active connections by logical interface

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-lifs` command displays the number of active connections on each logical interface, organized by node and Vserver.

The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[-vserver <vserver>] - Vserver

Use this parameter to display information only about the connections that are using the node or Vserver you specify.

[-lif-name <lif-name>] - Logical Interface Name

Use this parameter to display information only about the connections that are using the logical interface you specify.

[-count <integer>] - Client Count

Use this parameter to display only logical interfaces with the number of active client connections you specify.

[-blocked-count <integer>] - (DEPRECATED)-Load Balancing Blocking Count

This parameter has been deprecated and may be removed in a future version of ONTAP.

Use this parameter to display information only about data logical interfaces blocked from migrating and the connection that is blocking it.

Examples

The following example displays information about the servers and logical interfaces being used by all active connections:

```
cluster1::> network connections active show-lifs
Node      Vserver Name  Interface Name  Count
-----
node0
    vs0        datalif1        3
    vs0        cluslif1        6
    vs0        cluslif2        5
node1
    vs0        datalif2        3
    vs0        cluslif1        3
    vs0        cluslif2        5
node2
    vs1        datalif2        1
    vs1        cluslif1        5
    vs1        cluslif2        3
node3
    vs1        datalif1        1
    vs1        cluslif1        2
    vs1        cluslif2        1
```

At privilege levels above "admin", the command displays an extra column.

```
cluster1::*> network connections active show-lifs
```

Node	Vserver Name	Interface Name	Count	LB Migrate Blocking
-----	-----	-----	-----	-----
node0				
	vs0	datalif1	3	0
	vs0	cluslif1	6	0
	vs0	cluslif2	5	2
node1				
	vs0	datalif2	3	0
	vs0	cluslif1	3	0
	vs0	cluslif2	5	0
node2				
	vs1	datalif2	1	0
	vs1	cluslif1	5	0
	vs1	cluslif2	3	2
node3				
	vs1	datalif1	1	0
	vs1	cluslif1	2	0
	vs1	cluslif2	1	0

network connections active show-protocols

Show a count of the active connections by protocol

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-protocols` command displays the number of active connections per protocol, organized by node.

The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[*-vserver* <*vserver*>] - Vserver

This parameter is used by the system to break down the output per vservers.

[*-proto* {*UDP*|*TCP*|*TLS*|*RDMA*}] - Protocol

Use this parameter to display information only about the connections that use the network protocol you specify. Possible values include tcp (TCP), udp (UDP), and NA (not applicable).

[*-count* <*integer*>] - Client Count

Use this parameter to display only protocols with the number of active client connections you specify.

Examples

The following example displays information about all network protocols being used by active connections:

```
cluster1:> network connections active show-protocols
Node      Vserver Name      Protocol      Count
-----
node0
    vs1           UDP           19
    vs1           TCP           11
    vs2           UDP           17
node1
    vs1           UDP           14
    vs2           TCP           10
```

network connections active show-services

Show a count of the active connections by service

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show-services` command displays the number of active connections by protocol service, organized by node.

The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [*-fields* <*fieldname*>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [*-instance*] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node` <nodename>|local}] - Node

Use this parameter to display information only about the connections on the node you specify.

[`-vserver` <vserver>] - Vserver

This parameter is used by the system to break down the output per vservers

[`-service` <protocol service>] - Protocol Service

Use this parameter to display information only about the connections that use the protocol service you specify. Possible values include: nfs, iscsi, and loopback.

[`-count` <integer>] - Client Count

Use this parameter to display information only about protocol services with the number of active client connections you specify.

Examples

The following example displays information about all protocol services being used by active connections:

```
cluster1::> network connections active show-services
Node      Vserver Name      Service      Count
-----
node0
    vs1          mount           3
    vs1          nfs            14
    vs1          nlm_v4         4
    vs1          cifs_srv       3
    vs1          port_map       18
    vs2          rclopcp        27
node1
    vs1          nfs            5
    vs2          rclopcp        12
    vs2          nfs            4
    vs2          port_map       8
```

network connections active show

Show the active connections in this cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections active show` command displays information about active network connections.

The results of this command set are refreshed independently every 30 seconds and might not reflect the immediate state of the system.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-print-ip-addresses]

Print IP addresses for remote hosts — do not attempt to resolve the addresses to a hostname.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the connections that match this parameter value.

[-cid <Cid>] - Connection ID

Selects the connections that match this parameter value.

[-vserver <vserver>] - Vserver

Selects the connections that match this parameter value.

[-lif-name <lif-name>] - Logical Interface Name

Selects the connections that match this parameter value.

[-local-address <IP Address>] - Local IP address

Selects the connections that match this parameter value.

[-local-port <integer>] - Local Port

Selects the connections that match this parameter value.

[-remote-ip <InetAddress>] - Remote IP Address

Selects the connections that match this parameter value.

[-remote-host <Remote IP>] - Remote Host

Selects the connections that match this parameter value.

[-remote-port <integer>] - Remote Port

Selects the connections that match this parameter value.

[-proto {UDP|TCP|TLS|RDMA}] - Protocol

Selects the connections that match this parameter value. Possible values are `tcp` (TCP), `udp` (UDP), and `NA` (not applicable).

[-lifid <integer>] - Logical Interface ID

Selects the connections that match this parameter value.

[-service <protocol service>] - Protocol Service

Selects the connections that match this parameter value. Possible values include: `nfs`, `iscsi`, and `loopback`.

[-lru {yes|no}] - Least Recently Used

Selects the connections that match this parameter value.

[-blocks-lb {true|false}] - Connection Blocks Load Balance Migrate

Selects the logical interfaces that are blocked (true) or not blocked (false) from migrating due to an active client connection.

Examples

The following example displays information about active network connections for the node named node0:

```
cluster1::> network connections active show node -node0
```

Vserver Name	Interface Name:Local Port	Remote IP Address:Port	Protocol/Service
node0	cluslif1:7070	192.0.2.253:48621	UDP/rclopcp
node0	cluslif1:7070	192.0.2.253:48622	UDP/rclopcp
node0	cluslif2:7070	192.0.2.252:48644	UDP/rclopcp
node0	cluslif2:7070	192.0.2.250:48646	UDP/rclopcp
node0	cluslif1:7070	192.0.2.245:48621	UDP/rclopcp
node0	cluslif1:7070	192.0.2.245:48622	UDP/rclopcp
node0	cluslif2:7070	192.0.2.251:48644	UDP/rclopcp
node0	cluslif2:7070	192.0.2.251:48646	UDP/rclopcp
node0	cluslif1:7070	192.0.2.248:48621	UDP/rclopcp
node0	cluslif1:7070	192.0.2.246:48622	UDP/rclopcp
node0	cluslif2:7070	192.0.2.252:48644	UDP/rclopcp
node0	cluslif2:7070	192.0.2.250:48646	UDP/rclopcp
node0	cluslif1:7070	192.0.2.254:48621	UDP/rclopcp
node0	cluslif1:7070	192.0.2.253:48622	UDP/rclopcp
[...]			

At privilege levels above "admin", the command displays an extra column.

```
cluster1::*> network connections active show node -node0
```

Vserver	Interface	Remote		Blocks
Name	Name:Local Port	IP Address:Port	Protocol/Service	LB Migrate
node0	cluslif1:7070	192.0.2.253:48621	UDP/rclopcp	false

[...]				

network connections listening show

Show the listening connections in this cluster

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network connections listening show` command displays information about network connections that are in an open and listening state.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the listening connections that match this parameter value.

[-mgmt-cid <integer>] - Management Connection ID

Selects the listening connections that match this parameter value.

[-vserver <vserver>] - Vserver

Selects the listening connections that match this parameter value.

[-cid <integer>] - System Connection ID

Selects the listening connections that match this parameter value.

[-lif-name <lif-name>] - Logical Interface Name

Selects the listening connections that match this parameter value.

[-local-address <IP Address>] - Local IP Address

Selects the listening connections that match this parameter value.

[-local-port <integer>] - Local Port

Selects the listening connections that match this parameter value.

[-remote-ip <InetAddress>] - Remote IP Address

Selects the listening connections that match this parameter value.

[-remote-host <Remote IP>] - Remote Host

Selects the listening connections that match this parameter value.

[-remote-port <integer>] - Remote Port

Selects the listening connections that match this parameter value.

[-proto {UDP|TCP|TLS|RDMA}] - Protocol

Selects the listening connections that match this parameter value. Possible values include tcp (TCP), udp (UDP), and NA (not applicable).

[-lifid <integer>] - Logical Interface ID

Selects the listening connections that match this parameter value.

[-service <protocol service>] - Protocol Service

Selects the listening connections that match this parameter value. Possible values include: nfs, iscsi, and loopback.

[-lru {yes|no}] - Least Recently Used

Selects the listening connections that match this parameter value.

Examples

The following example displays information about all listening network connections:

```

cluster1::> network connections listening show
Vserver Name Interface Name:Local Port Protocol/Service
-----
node0          cluslif1:7700          UDP/rclopcp
node0          cluslif2:7700          UDP/rclopcp
node1          cluslif1:7700          UDP/rclopcp
node1          cluslif2:7700          UDP/rclopcp
node2          cluslif1:7700          UDP/rclopcp
node2          cluslif2:7700          UDP/rclopcp
node3          cluslif1:7700          UDP/rclopcp
node3          cluslif2:7700          UDP/rclopcp
8 entries were displayed.

```

The following example displays detailed information about listening network connections for the node named node0:

```

cluster1::> network connections listening show -node node0
      Node: node0
Management Connection Id: 0
      System Connection Id: 0
      Vserver: vs0
Logical Interface Name: datalif1
      Local IP address: 192.0.2.130
      Local Port: 111
      Remote IP address:
      Remote Port: 0
      Protocol: UDP
Logical Interface Id: 1029
      Protocol Service: port_map
      least recently used: yes
      Node: node0
Management Connection Id: 1
      System Connection Id: 0
      Server: vs0
Logical Interface Name: datalif2
      Local IP address: 192.0.2.131
      Local Port: 111
      Remote IP address:
      Remote Port: 0
      Protocol: UDP
Logical Interface Id: 1030
      Protocol Service: port_map
      least recently used: yes

```

network device-discovery commands

network device-discovery show

Display device discovery information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The network device-discovery show command displays information about discovered devices. This information may be useful in determining the network topology or investigating connectivity issues. By default, the command displays the following information:

- Local interface
- Discovered device
- Discovered interface
- Discovered platform

Parameters

{ [-fields <fieldname>,...]

Include the specified field or fields in the command output. Use '-fields ?' to display the valid fields.

| [-instance] }

Use this parameter to display detailed information about all fields.

[-node <nodename>] - Node

Displays the discovery ports that match the node name.

[-protocol {cdp|lldp}] - Protocol

Displays the devices that are discovered by the given protocol.

[-port <text>] - Port

Displays the discovery ports that match the physical network port. For example, e0a will display devices discovered on port e0a.

[-discovered-device <text>] - Discovered Device

Displays the discovered devices that match the discovered device name.

[-interface <text>] - Discovered Device Interface

Displays the discovered devices that match this interface port name. The format is dependent on the reporting device. For example: FastEthernet0/12

[-device-ip <IP Address>,...] - Discovered Device IP Addresses

Displays the discovered devices that match the IP address(es). At present, only IPv4 addresses are included. It is recommended to use wildcards around the desired value.

[-platform <text>] - Discovered Device Platform

Displays the discovery ports that contain the platform of discovered devices. For example: N5K-C5010P-BF

[-version <text>] - Discovered Device Version

Displays the discovery ports that contain the version of discovered devices.

[-chassis-id <text>] - Discovered Device Chassis ID

Displays the discovered devices that match the chassis ID.

[-system-name <text>] - Discovered Device System Name

Displays the discovered devices that match the system name.

[-hold-time-remaining <integer>] - Discovered Device's Remaining Hold Time

Displays the discovered devices that match the remaining packet hold time in seconds. If an advertisement from the device isn't received before this time reaches zero, the entry will expire and be removed from the list. For example, "<120" will display discovered devices which will expire within the next 120 seconds.

[-capabilities {router|trans-bridge|source-route-bridge|switch|host|igmp|repeater|phone}] - Discovered Device Capabilities

Displays the discovered devices that match the capability or capabilities. Possible values:

- "router" - Router
- "trans-bridge" - Trans Bridge
- "source-route-bridge" - Source Route Bridge
- "switch" - Switch
- "host" - Host
- "igmp" - IGMP
- "repeater" - Repeater
- "phone" - Phone

Examples

```
cluster1::> network device-discovery show
```

network fcp commands

network fcp adapter modify

Modify the fcp adapter settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modifies the FCP target adapter information.

The adapter argument is in the form Xy or Xy_z where X and z are integers and y is a letter. An example is 4a or 4a_1.

You cannot bring an adapter offline until all logical interfaces connected to that adapter are offline. Use the [network interface modify](#) command to take your logical interfaces offline.

The speed option sets the Fibre Channel link speed of an adapter. You can set adapters that support:

- 10Gb/s to 10 or auto
- 8Gb/s to 2, 4, 8 or auto
- 4Gb/s to 2, 4 or auto
- 2Gb/s to 2 or auto

By default, the link speed option is set to auto for auto negotiation. Setting the link speed to a specific value disables auto negotiation. Under certain conditions, a speed mismatch can prevent the adapter from coming online.

The system reports the actual link speed with the "Data Link Rate (Gbit)" field in the output of [network fcp adapter show](#)-instance .

Parameters

-node {<nodename>|local} - Node

Specifies the node of the target adapter.

-adapter <text> - Adapter

Specifies the target adapter.

[-status-admin {down|up}] - Administrative Status

Specifies the desired (administrative) status of the adapter. To view the actual operational status, run [network fcp adapter show](#)-fields *status-oper* .

[-speed {1|2|4|8|10|16|32|64|auto}] - Configured Speed

Specifies the adapter configuration speed in Gigabytes.

Examples

```
cluster1::> network fcp adapter modify -node node1 -adapter 0d -speed 2
```

Configures the speed of FCP adapter 0d on node1 to 2 Gb/s.

network fcp adapter show

Display FCP adapters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays FCP target adapter information. You can also use this information to determine if adapters are active and online.

The adapter argument is in the form Xy or Xy_z where X and z are integers and y is a letter. An example is 4a or 4a_1.

Parameters

{ [-fields <fieldname>, ...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command displays information only about the FCP target adapters that are present on the specified node.

[-adapter <text>] - Adapter

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified name.

[-description <text>] - Description

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified description.

[-physical-protocol {fibre-channel|ethernet}] - Physical Protocol

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified physical protocol. Possible values are *fibre-channel* and *ethernet*.

[-max-speed {1|2|4|8|10|16|32|64|auto}] - Maximum Speed

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified maximum speed.

[-status-admin {down|up}] - Administrative Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the administrative state. Possible values are *up* and *down*.

[-status-oper <text>] - Operational Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified operational status.

[-status-extended <text>] - Extended Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified extended status.

[-portaddr <Hex Integer>] - Host Port Address

If this parameter is specified, the command displays information only about the FCP target adapters connected with the specified fabric port address.

[-firmware-rev <text>] - Firmware Revision

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified firmware revision.

[-data-link-rate <integer>] - Data Link Rate (Gbit)

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified data link rate.

[-fabric-established {true|false}] - Fabric Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified fabric login establishment state.

[-fabric-name <text>] - Fabric Name

If this parameter is specified, the command displays information only about the FCP target adapters that are logged in to the fabric with the specified WWN.

[-conn-established {loop|ptp}] - Connection Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection type. Possible values are *loop* and *ptp*.

[-is-conn-established {true|false}] - Is Connection Established

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified connection established state.

[-media-type {loop|ptp|auto}] - Mediatype

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured media type. Possible values are *loop*, *ptp*, and *auto*.

[-speed {1|2|4|8|10|16|32|64|auto}] - Configured Speed

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified configured speed. If the adapter is set to auto-negotiate, then the value will be *auto*.

[-data-protocols-supported {fcp|fc-nvme}] - Data Protocols Supported

If this parameter is specified, the command displays information only about the FCP target adapters that may host LIFs with the specified data protocol. Possible values are *fcp* and *fc-nvme*.

[-domain-id <integer>] - Domain ID

If this parameter is specified, the command displays information only about the FCP target adapters with a domain identifier that matches the specified domain identifier.

[-fc-wwnn <text>] - Adapter WWNN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide node name.

[-fc-wwpn <text>] - Adapter WWPN

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified world wide port name.

[-switch-port <text>] - Switch Port

If this parameter is specified, the command displays information only about the FCP target adapters that are connected to the specified switch port.

[-sfp-formfactor <text>] - Form Factor Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP form factor.

[-sfp-vendor-name <text>] - Vendor Name Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor name.

[-sfp-part-number <text>] - Part Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP part number.

[-sfp-rev <text>] - Revision Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP revision number.

[-sfp-serial-number <text>] - Serial Number Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP serial number.

[-sfp-fc-speed-capabilities <text>] - FC Capabilities Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP speed capabilities.

[-sfp-vendor-oui <text>] - Vendor OUI Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP vendor OUI.

[-sfp-wavelength <integer>] - Wavelength In Nanometers

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP wavelength.

[-sfp-date-code <text>] - Date Code Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP date code.

[-is-sfp-optical-transceiver-valid {true|false}] - Validity Of Transceiver

If this parameter is specified, the command displays information only about the FCP target adapters that

match whether the SFP is installed and valid.

[-sfp-connector <text>] - Connector Used

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP connector type.

[-sfp-encoding <text>] - Encoding Used

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP physical encoding.

[-is-sfp-diagnostics-internally-calibrated {true|false}] - Is Internally Calibrated

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the SFP diagnostics are internally calibrated or not.

[-sfp-diagnostic-monitoring-type <Hex Integer>] - Diagnostic Monitoring Type

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP diagnostic monitoring type.

[-sfp-ddm-capabilities <text>] - Status Monitoring Available

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the specified SFP digital diagnostics monitoring are supported or not.

[-sfp-sff8472-compliance <Hex Integer>] - SFF-8472 Compliance

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP SFF8472 compliance.

[-sfp-rx-power <text>] - Received Optical Power

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified observed SFP receive power.

[-is-sfp-rx-power-in-range {true|false}] - Is Received Power In Range

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP receive power is within the valid range for the SFP.

[-sfp-tx-power <text>] - SFP Transmitted Optical Power

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP transmit power.

[-is-sfp-tx-power-in-range {true|false}] - Is Xmit Power In Range

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmit power is within the valid range for the SFP.

[-sfp-ddm-status-control <Hex Integer>] - DDM Status

If this parameter is specified, the command displays information only about the FCP target adapters that match the specified SFP DDM status and control.

[-is-sfp-tx-in-disable {true|false}] - Is Xmit Disabled

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmitter is in disabled state.

`[-is-sfp-tx-in-fault {true|false}] - Is Xmit In Fault`

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP transmitter is in faulted state.

`[-is-sfp-rx-in-los {true|false}] - Is Receiver In LOS`

If this parameter is specified, the command displays information only about the FCP target adapters that match whether the observed SFP receiver is in loss of signal state.

Examples

```
cluster1::> fcp adapter show

                Connection  Host
Node      Adapter Established Port Address
-----
sti6280-021  0a          ptp          30012c
```

The example above displays information regarding FCP adapters within cluster1.

```
cluster1::> fcp adapter show -instance -node sti6280-021 -adapter 0a
Node: sti6280-021
                Adapter: 0a
                Description: Fibre Channel Target Adapter 0a (QLogic
2532 (2562), rev. 2, 8G)
                Physical Protocol: fibre-channel
                Maximum Speed: 8
Administrative Status: up
Operational Status: online
Extended Status: ADAPTER UP
Host Port Address: 30012c
Firmware Revision: 5.8.0
Data Link Rate (Gbit): 4
Fabric Established: true
                Fabric Name: 20:14:54:7f:ee:54:b9:01
Connection Established: ptp
Is Connection Established: true
                Mediatype: ptp
                Configured Speed: auto
                Adapter WWNN: 50:0a:09:80:8f:7f:8b:1c
                Adapter WWPN: 50:0a:09:81:8f:7f:8b:1c
                Switch Port: RTP-AG01-410B51:1/41
Form Factor Of Transceiver: SFP
Vendor Name Of Transceiver: OPNEX, INC
Part Number Of Transceiver: TRS2000EN-SC01
Revision Of Transceiver: 0000
Serial Number Of Transceiver: T10H64793
```

```

FC Capabilities Of Transceiver: 10 (Gbit/sec)
  Vendor OUI Of Transceiver: 0:11:64
  Wavelength In Nanometers: 850
  Date Code Of Transceiver: 10:08:17
  Validity Of Transceiver: true
    Connector Used: LC
    Encoding Used: 64B66B
  Is Internally Calibrated: true
  Diagnostic Monitoring Type: 68
  Status Monitoring Available: fa {Rx_Loss_of_Sig, Tx_Fault, Tx_Disable}
    SFF-8472 Compliance: 5
    Received Optical Power: 441.3 (uWatts)
  Is Received Power In Range: true
  SFP Transmitted Optical Power: 600.4 (uWatts)
    Is Xmit Power In Range: true
      DDM Status: 30
      Is Xmit Disabled: false
      Is Xmit In Fault: false
    Is Receiver In LOS: false

```

The example above displays detailed information regarding FCP adapter 0a in sti6280-021 within cluster1.

network fcp topology show

FCP topology interconnect elements per adapter

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display FCP topology interconnect elements per adapter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to select the interconnect elements for adapters that are located on the node that you specify.

[-adapter <text>] - Adapter

Use this parameter to select the interconnect elements for the specified adapter.

[-domain-id <integer>] - Domain Id

Use this parameter to select the interconnect elements with the specified domain identifier.

[-port-wwpn <text>] - Port WWPN

Use this parameter to select the interconnect elements with the specified port world wide name.

[-switch-name <text>] - Switch Name

Use this parameter to select the interconnect elements with the specified switch.

[-switch-vendor <text>] - Switch Vendor

Use this parameter to select the interconnect elements with the specified vendor.

[-switch-release <text>] - Switch Release

Use this parameter to select the interconnect elements with the specified release.

[-switch-wwpn <text>] - Switch WWPN

Use this parameter to select the interconnect elements with the specified world wide port name.

[-switch-wwn <text>] - Switch WWN

Use this parameter to select the interconnect elements with the specified world wide name.

[-port-count <integer>] - Port Count

Use this parameter to select the interconnect elements with the specified port count.

[-port-slot <text>] - Port Slot

Use this parameter to select the interconnect elements with the specified port slot.

[-port-state {Unknown|Online|Offline|Testing|Fault}] - Port State

Use this parameter to select the interconnect elements with the specified port state.

[-port-type {None|N-Port|NL-Port|FNL-Port|NX-Port|F-Port|FL-Port|E-Port|B-Port|TNP-Port|TF-Port|NV-Port|FV-Port|SD-Port|TE-Port|TL-Port}] - Port Type

Use this parameter to select the interconnect elements with the specified port type.

[-port-attached-wwpn <text>] - Attached Port WWPN

Use this parameter to select the interconnect elements with the specified attached wwpn.

[-port-attached-id <text>] - Attached Port Id

Use this parameter to select the interconnect elements with the specified attached id.

[-port-attached-visible <text>] - Visible

Use this parameter to select the interconnect elements with the specified visibility flag on attached port structure.

Examples

```
cluster1::> network fcp topology show

The example above show FCP topology interconnect information for the cluster.

network fcp zone show

Display the active zone set information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Displays the active zone set information.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to select the active zone set information for adapters that located on the node name that you specify.

[-adapter <text>] - Adapter

Use this parameter to select the active zone set information for the specified adapter.

[-zoneset-name <text>] - Zoneset Name

Use this parameter to select the active zone set information for the specified zone set name.

[-zone-name <text>] - Zone Name

Use this parameter to select the active zone set information for the specified zone name.

[-type-name <text>] - Type Name

Use this parameter to select the active zone set information with the specified symbolic type.

[-type <integer>] - Type

Use this parameter to select the active zone set information with the specified port type.

[-port-id <Hex Integer>] - Member Port Id

Use this parameter to select the active zone set information with the specified member port id.

[-domain-id <integer>] - Member Domain Id

Use this parameter to select the active zone set information with the specified member domain id.

[-port <integer>] - Member Port

Use this parameter to select the active zone set information with the specified member port.

[-wwn <text>] - Member WWN

Use this parameter to select the active zone set information with the specified member WWN.

[-zone-count <integer>] - Zone Count

Use this parameter to select the active zone set information with the specified number of zones.

[-zone-member-count <integer>] - Zone Member Count

Use this parameter to select the active zone set information with the specified number of zone members in a zone.

[-contents <text>] - Member Contents

Use this parameter to select the active zone set information using any type.

Examples

```
cluster1::> network fcp adapter zone show
```

Zone Name	Member Type	WWN

Active Zone Set on adapter 0c		
Zone Set Name: zoneset_name		
zone_name_1	Port ID	-
zone_name_1	Port ID	-
zone_name_1	Port ID	-
zone_name_2	Domain ID/Port	-
zone_name_2	Domain ID/Port	-
zone_name_2	Domain ID/Port	-
zone_name_3	Fabric Port Name	
00:00:00:00:00:00:00:00		
zone_name_3	Fabric Port Name	
01:00:00:00:00:00:00:00		
zone_name_3	Fabric Port Name	
02:00:00:00:00:00:00:00		

9 entries were displayed.

The example above displays information regarding active zone set information for the cluster.

network interface commands

network interface create

Create a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface create` command creates a logical interface (LIF).

A logical interface is an IP address associated with a physical network port. For logical interfaces using NAS data protocols, the interface can fail over or be migrated to a different physical port in the event of component failures, thereby continuing to provide network access despite the component failure.

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the LIF is created.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the LIF that is created. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

[-service-policy <text>] - Service Policy

Use this parameter to specify a service policy for the LIF. If no policy is specified, a default policy will be assigned automatically. Use the [network interface service-policy show](#) command to review available service policies.

[-role {undef|cluster|data|node-mgmt|intercluster|cluster-mgmt}] - (DEPRECATED)-Role

This parameter has been deprecated and may be removed in a future version of ONTAP. Use the `-service-policy` parameter instead.

Use this parameter to specify the role of the LIF. LIFs can have one of five roles:

- Cluster LIFs, which provide communication among the nodes in a cluster
- Intercluster LIFs, which provide communication among peered clusters
- Data LIFs, which provide data access to NAS and SAN clients
- Node-management LIFs, which provide access to cluster management functionality
- Cluster-management LIFs, which provide access to cluster management functionality

LIFs with the cluster-management role behave as LIFs with the node-management role except that cluster-management LIFs can failover between nodes.

[-data-protocol {nfs|cifs|iscsi|fc|fcache|none|fc-nvme|s3|nvme-tcp}] - Data Protocol

Use this parameter to specify the list of data protocols that can be served by the LIF. The supported protocols are NFS, CIFS, iSCSI, FCP, and FC-NVMe. NFS and CIFS are available by default when you create a LIF. If you specify "none", the LIF does not support any data protocols. Also, none, iscsi, fcp or fc-nvme cannot be combined with any other protocols.

The data-protocol field must be specified when the LIF is created and cannot be modified later.

The NFS protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

-address <IP Address> - Network Address

Use this parameter to specify the LIF's IP address.

A cluster LIF cannot be on the same subnet as a management or data LIF.

{ -netmask <IP Address> - Netmask

Use this parameter to specify the LIF's netmask.

| -netmask-length <integer> - Bits in the Netmask

Use this parameter to specify the length (in bits) of the LIF's netmask.

| -is-vip <true> - Is VIP LIF

Use this parameter to display only logical interfaces matching a specify "is-vip" flag. Specifying "true" matches only LIFs to implement a Virtual IP; "false" matches only LIFs that do not.

{ [-auto <true>] - Allocate Link Local IPv4 Address

Use this parameter to specify whether IPv4 link local addressing is enabled for this LIF.

| [-subnet-name <subnet name>] - Subnet Name }

Use this parameter to allocate the interface address from a subnet. If needed, a default route will be created for this subnet.

[-home-node <nodename>] - Home Node

Use this parameter to specify the LIF's home node. The home node is the node to which the LIF returns when the [network interface revert](#) command is run on the LIF.

[-home-port {<netport>|<ifgrp>}] - Home Port

Use this parameter to specify the LIF's home port or interface group. The home port is the port or interface group to which the LIF returns when the [network interface revert](#) command is run on the LIF.

[-status-admin {up|down}] - Administrative Status

Use this parameter to specify whether the initial administrative status of the LIF is up or down. The default setting is up . The administrative status can differ from the operational status For example, if you specify the status as up but a network problem prevents the interface from functioning, the operational status remains as down.

[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}] - Failover Policy

Use this parameter to specify the failover policy for the LIF.

- system-defined - The system determines appropriate failover targets for the LIF. The default behavior is that failover targets are chosen from the LIF's current hosting node and also from one other non-partner node when possible.
- local-only - The LIF fails over to a port on the local or home node of the LIF.
- sfo-partner-only - The LIF fails over to a port on the home node or SFO partner only.
- broadcast-domain-wide - The LIF fails over to a port in the same broadcast domain as the home port.
- disabled - Failover is disabled for the LIF.

The failover policy for cluster logical interfaces is local-only and cannot be changed. The default failover policy for data logical interfaces is system-defined. This value can be changed.

`[-firewall-policy <policy>]` - (DEPRECATED)-Firewall Policy

This parameter has been deprecated and may be removed in a future version of ONTAP. Use the `-service-policy` parameter instead.

Use this parameter to specify the firewall policy for the LIF. A LIF can use a default firewall policy that corresponds to its role (management, cluster, intercluster, or data) or a custom firewall policy created by an administrator. View and modify existing firewall policies using the [system services firewall policy show](#) and [system services firewall policy modify](#) commands, respectively.

The NFS data protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

`[-auto-revert {true|false}]` - Auto Revert

Use this parameter to specify whether a data LIF is automatically reverted to its home port under certain circumstances. These circumstances include startup, when the status of the management database changes to either master or secondary, or when the network connection is made.

`[-dns-zone {<zone-name>|none}]` - Fully Qualified DNS Zone Name

Use this parameter to specify a unique, fully qualified domain name of a DNS zone to which this data LIF is added. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If a LIF is not added to a DNS zone the data LIF is created with the value `none`.

`[-listen-for-dns-query {true|false}]` - DNS Query Listen Enable

Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is `true`.

`[-allow-lb-migrate {true|false}]` - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

This parameter has been deprecated and may be removed in a future version of ONTAP.

Use this parameter to specify whether load balancing migration is activated for this data LIF. The default value of this parameter is `false`. If you set the value of this parameter to `true`, automatic revert capability for this data LIF is disabled (the `-auto-revert` parameter is set to `false`). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

`[-lb-weight {load|0..100}]` - Load Balanced Weight (privilege: advanced)

Use this parameter to specify a load balancing weight for a data LIF. A valid numeric load balancing weight is any integer between 0 and 100. When you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight. "load" is the default value of this parameter. If set to "load", node utilization statistics are used to dynamically assign the load balancing weight.

`[-failover-group <failover-group>]` - Failover Group Name

Use this parameter to specify the name of the failover group to associate with the LIF. Manage failover groups by using the `network interface failover-groups` command. Each broadcast domain has a

default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

`[-comment <text>]` - Comment

Use this parameter to specify the comment to associate with the LIF.

`[-force-subnet-association <true>]` - Force the LIF's Subnet Association

This command will fail if the IP address falls within the address range of a named subnet. Set this to `true` to acquire the address from the named subnet and assign the subnet to the LIF.

`[-is-dns-update-enabled {true|false}]` - Is Dynamic DNS Update Enabled?

If this parameter is set to `true`, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to `true` by default for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

`[-probe-port <integer>]` - Probe-port for Cloud Load Balancer

Use this parameter to specify a probe-port for the LIF in the Azure environment. It is a required field in the Azure environment. If no probe-port is specified, an error would be returned.

`[-broadcast-domain <text>]` - Broadcast Domain

Use this parameter to display the broadcast domain that contains the home port of the logical interface.

`[-rdma-protocols <roce>,...]` - Required RDMA offload protocols

Defines RDMA offload protocols required by the LIF. A non-empty list will ensure that this LIF can only be moved to network ports that support the specified RDMA offload protocols.

Examples

The following example creates an IPv4 LIF named `datalif1` and an IPv6 LIF named `datalif2` on a Vserver named `vs0`. Their home node is `node0` and home port is `e0c`. The failover policy `broadcast-domain-wide` is assigned to both LIFs. The service policy is `default-data-files` and the LIFs are automatically reverted to their home node at startup and under other circumstances. The `datalif1` has the IP address `192.0.2.130` and netmask `255.255.255.128`, and `datalif2` has the IP address `3ffe:1::aaaa` and netmask length of `64`.

```
cluster1::> network interface create -vserver vs0 -lif datalif1 -home-node
node0 -home-port e0c -address 192.0.2.130 -netmask 255.255.255.128
-failover-policy broadcast-domain-wide -service-policy default-data--files
-auto-revert true
cluster1::> network interface create -vserver vs0 -lif datalif2 -home-node
node0 -home-port e0c -address 3ffe:1::aaaa -netmask-length 64 -failover
-policy broadcast-domain-wide -service-policy default-data-files -auto
-revert true
```

network interface delete

Delete a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface delete` command deletes a logical interface (LIF) from a Vserver. Only administratively down LIFs can be deleted. To make a LIF administratively down, use the [network interface modify](#) command to set the "status-admin" parameter to "down".

If the LIF is configured for a SAN protocol and is part of a portset, the LIF must be removed from the portset before it can be deleted. To determine if a LIF is in a portset, use the [lun portset show](#) command. To remove the LIF from the portset, use the [lun portset remove](#) command.

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the logical interface to be deleted is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface to delete.

Examples

The following example deletes a logical interface named `cluslif3` that is located on a Vserver named `vs0`.

```
cluster1::> network interface delete -vserver vs0 -lif cluslif3
```

network interface migrate-all

Migrate all data logical interfaces away from the specified node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface migrate-all` command migrates all data logical interfaces from the node you specify.

Manual migration of a logical interface can take up to 15 seconds to complete. Logical interface migration is a best-effort command and can only be completed if the destination node and port are operational. Logical interface migration requires that the logical interface be pre-configured with valid failover rules to facilitate failover to a remote node.

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-node <nodename> - Node

Use this parameter to specify the node from which all logical interfaces are migrated. Each data logical interface is migrated to another node in the cluster, assuming that the logical interface is configured with failover rules that specify an operational node and port.

[-port {<netport>|<ifgrp>}] - Port

Use this parameter to specify the port from which all logical interfaces are migrated. This option cannot be used with asynchronous migrations. If this parameter is not specified, then logical interfaces will be migrated away from all ports on the specified node.

Examples

The following example migrates all data logical interfaces from the current (local) node.

```
cluster1::> network interface migrate-all -node local
```

network interface migrate

Migrate a logical interface to a different port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface migrate` command migrates a logical interface to a port or interface group on the node you specify.

Manual migration of a logical interface can take up to 15 seconds to complete. Also, when you migrate a cluster logical interface, you must do so from the local node. Logical interface migration is a best-effort command, and can only be completed if the destination node and port are operational

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver that owns the logical interface that is to be migrated.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface that is to be migrated.

-destination-node <nodename> - Destination Node

Use this parameter to specify the node to which the logical interface is to be migrated.

[-destination-port {<netport>|<ifgrp>}] - Destination Port

Use this parameter to specify the port or interface group to which the logical interface is to be migrated.

[-force <true>] - Force Migrate Data LIF Flag (privilege: advanced)

Use this parameter to force the migration operation. Intended for disaster recovery only. Specifying this parameter implies the LIF's current node is down and will skip removing the LIF from its current node.

Examples

The following example migrates a logical interface named datalif1 on a Vserver named vs0 to port e0c on a node named node2:

```
cluster1::> network interface migrate -vserver vs0 -lif datalif1 -dest  
-node node2 -dest-port e0c
```

network interface modify

Modify a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface modify` command modifies attributes of a logical interface (LIF).

You cannot modify some properties of an iSCSI or FCP LIF, such as `-home-node` or `-home-port`, if the LIF is in a portset. To modify these properties, first remove the LIF from the portset. To determine if a LIF is in a portset, use the [lun portset show](#) command. To remove the LIF from the portset, use the [lun portset remove](#) command.

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the LIF to be modified is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the LIF that is to be modified

[-service-policy <text>] - Service Policy

Use this parameter to modify the service policy associated with the LIF.

[-address <IP Address>] - Network Address

Use this parameter to modify the LIF's IP address.

A cluster LIF cannot be on the same subnet as a data or management LIF.

{ [-netmask <IP Address>] - Netmask

Use this parameter to modify the LIF's netmask.

| [-netmask-length <integer>] - Bits in the Netmask

Use this parameter to modify the length (in bits) of the LIF's netmask.

| [-subnet-name <subnet name>] - Subnet Name }

Use this parameter to allocate the interface address from a subnet. Modifying this parameter will cause a new IP address to be allocated and assigned to the interface.

[-home-node <nodename>] - Home Node

Use this parameter to modify the LIF's home node. The home node is the node to which the LIF returns when the [network interface revert](#) command is run on that LIF.

[-home-port {<netport>|<ifgrp>}] - Home Port

Use this parameter to modify the LIF's home port. The home port is the port or interface group to which the LIF returns when the [network interface revert](#) command is run on that LIF.

[-status-admin {up|down}] - Administrative Status

Use this parameter to modify the administrative status of the LIF. The administrative status can differ from the operational status. For example, if you specify the status as `up` but a network problem prevents the interface from functioning, the operational status remains as `down`.

[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}] - Failover Policy

Use this parameter to modify the failover policy for the LIF.

- `system-defined` - The system determines appropriate failover targets for the LIF. The default behavior is that failover targets are chosen from the LIF's current hosting node and also from one other non-partner node when possible.
- `local-only` - The LIF fails over to a port on the local or home node of the LIF.
- `sfo-partner-only` - The LIF fails over to a port on the home node or SFO partner only.
- `broadcast-domain-wide` - The LIF fails over to a port in the same broadcast domain as the home port.
- `disabled` - Failover is disabled for the LIF.

The failover policy for cluster logical interfaces is local-only and cannot be changed. The default failover policy for data logical interfaces is system-defined. This value can be changed.

[`-firewall-policy <policy>`] - (DEPRECATED)-Firewall Policy

This parameter has been deprecated and may be removed in a future version of ONTAP. Use the `-service-policy` parameter instead.

Use this parameter to set the firewall policy for the LIF. A LIF can use a default firewall policy that corresponds to its role (management, cluster, or data) or a custom firewall policy created by an administrator. When using a custom policy, the interface will fallback on its role's default policy for unspecified services. View existing firewall policies with the "[system services firewall policy show](#)" command. Modify existing firewall policies with the "[system services firewall policy modify](#)" command.

The NFS data protocol relies on firewall services included in the built-in "data" and "mgmt-nfs" firewall policies. Assigning a different firewall policy might disrupt some NFS client implementations.

[`-auto-revert {true|false}`] - Auto Revert

Use this parameter to modify whether a data LIF is reverted automatically to its home port under certain circumstances. These circumstances would include startup, when the status of the management database changes to either master or secondary, and when the network connection is made.

[`-dns-zone {<zone-name>|none}`] - Fully Qualified DNS Zone Name

Use this parameter to modify the unique, fully qualified domain name of the DNS zone to which this data LIF belongs. You can associate a data LIF with a single DNS zone. All data LIFs included in a zone must be on the same Vserver. If you do not specify a value for this parameter, the data LIF is created with the value `none`.

[`-listen-for-dns-query {true|false}`] - DNS Query Listen Enable

Use this parameter to specify if the LIF has to listen for DNS queries. The default value for this parameter is `true`.

NetApp recommends that you enable `-listen-for-dns-query` on a maximum of three LIFs in an SVM.

[`-allow-lb-migrate {true|false}`] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)

This parameter has been deprecated and may be removed in a future version of ONTAP.

Use this parameter to modify whether or not load balancing migration is enabled for this data LIF. The default value of this parameter is `false`. If you set the value of this parameter to `true`, the automatic revert capability of the data LIF is disabled (the `-auto-revert` parameter is set to `false`). Also, data LIFs that migrate as a result of load balancing adhere to network interface failover rules.

During times when a LIF is hosting active NFSv4, CIFS, or NRV connections, load balancing based LIF migrations between nodes will be temporarily disabled.

[`-lb-weight {load|0..100}`] - Load Balanced Weight (privilege: advanced)

Use this parameter to modify the load balancing weight of the data LIF. A valid load balancing weight is any

integer between 1 and 100. If you specify the same load balancing weight for all data LIFs in a DNS zone, client requests are uniformly distributed, similar to round-robin DNS. A data LIF with a low load balancing weight is made available for client requests less frequently than one that has a high load balancing weight.

`[-failover-group <failover-group>]` - Failover Group Name

Use this parameter to modify the name of the failover group to associate with the network interface. Manage failover groups using the `network interface failover-groups` command. Each broadcast domain has a default failover group which is created by the system automatically and has the same name as the broadcast domain. The failover group associated with the broadcast domain includes all ports in the broadcast domain. A logical interface's failover group is set to the failover group of the home port's broadcast domain by default, but this value can be modified.

`[-comment <text>]` - Comment

Use this parameter to modify the comment associated with the LIF.

`[-force-subnet-association <true>]` - Force the LIF's Subnet Association

This command will fail if the IP address falls within the address range of a named subnet. Set this to `true` to acquire the address from the named subnet and assign the subnet to the LIF.

`[-is-dns-update-enabled {true|false}]` - Is Dynamic DNS Update Enabled?

If this parameter is set to `true`, then dynamic DNS update is sent to the DNS server for the particular LIF entry if dynamic DNS updates are enabled for the corresponding Vserver. This field is set to `true` by default for both IPv4 and IPv6 LIFs. DNS Update is not supported on LIFs not configured with either the NFS or CIFS protocol.

`[-rdma-protocols <roce>, ...]` - Required RDMA offload protocols

Defines RDMA offload protocols required by the LIF. A non-empty list will ensure that this LIF can only be moved to network ports that support the specified RDMA offload protocols.

Examples

The following example modifies a LIF named `datalif1` on a logical server named `vs0`. The LIF's netmask is modified to `255.255.255.128`.

```
cluster1::> network interface modify -vserver vs0 -lif datalif1 -netmask
255.255.255.128
```

network interface rename

Rename a logical interface

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Use the `network interface rename` command to change the name of an existing logical interface.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the logical interface to rename is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the name of the logical interface to rename.

-newname <text> - The new name for the interface

Use this parameter to specify the new name of the logical interface. For iSCSI and FC LIFs, the name cannot be more than 254 characters.

Examples

The following example renames a cluster logical interface named `cluslif1` to `cluslif4` on a Vserver named `vs0`.

```
cluster1::> network interface rename -vserver vs0 -lif cluslif1 -newname  
cluslif4
```

network interface revert

Revert a logical interface to its home port

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface revert` command reverts a logical interface that is not currently on its home port to its home port, assuming that the home node and port are both operational. A logical interface's home port is specified when the logical interface is created. Determine a logical interface's home port by using the [network interface show](#) command.

When you revert a cluster logical interface, you must do so from the local node.

On some cloud platforms, this operation might perform changes to the external route tables.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the logical interface to be reverted is located.

-lif <lif-name> - Logical Interface Name

Use this parameter to specify the logical interface that is to be reverted.

Logical interfaces for SAN protocols are always home. Thus, this command has no effect on such interfaces. The same applies to logical interfaces for NAS protocols that are already home.

Examples

The following example returns any logical interfaces that are not currently on their home ports to their home ports.

```
cluster1::> network interface revert -vserver * -lif *
```

- [network interface show](#)

network interface show

Display logical interfaces

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface show` command displays information about logical interfaces.

Running the command with the `-failover` parameter displays information relevant to logical interface failover rules.

Running the command with the `-status` parameter displays information relevant to logical interface operational status.

Running the command with the `-by-ip-space` parameter displays information relevant to logical interfaces on a specific IPspace.

See the examples for more information.

You can specify additional parameters to display only information that matches those parameters. For example, to display information only about logical interfaces whose operational status is down, run the command with the `-status-oper down` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-by-ipospace]

Use this parameter to display logical-interfaces sorted by IPspace and Vserver.

| [-dns-zones]

Use this parameter to display logical-interfaces and whether the interface is associated with a Domain Name System (DNS) load balancing zone.

| [-failover]

Use this parameter to display logical-interface failover information.

| [-status]

Use this parameter to display detailed logical-interface status information.

| [-instance] }

Use this parameter to display all the fields for the specified logical-interfaces.

[-vserver <vserver>] - Vserver Name

Use this parameter to display information only about logical interfaces on the Vserver you specify.

Use this parameter plus the `-lif` parameter to display detailed information only about the logical interface you specify.

[-lif <lif-name>] - Logical Interface Name

Use this parameter to display information only about logical interfaces that match the name you specify.

Use this parameter with the `-vserver` parameter to display detailed information only about the logical interface you specify.

[-service-policy <text>] - Service Policy

Use this parameter to display information only about logical interfaces that have the service policy you specify.

[-services <LIF Service Name>,...] - Service List

Use this parameter to display information only about logical interfaces that support all services in a comma-separated list of service names.

[-role {undef|cluster|data|node-mgmt|intercluster|cluster-mgmt}] - (DEPRECATED)-Role

This parameter has been deprecated and may be removed in a future version of ONTAP. Use either the `-service-policy` or `-services` parameter instead.

Use this parameter to display information only about logical interfaces that are associated with network ports that have the role you specify.

[-data-protocol {nfs|cifs|iscsi|fc|fcache|none|fc-nvme|s3|nvme-tcp}] - Data Protocol

Use this parameter to display information only about logical interfaces that have the enabled data protocols you specify.

[`-address <IP Address>`] - Network Address

Use this parameter to display information only about logical interfaces that match the IP address or address range you specify.

[`-netmask <IP Address>`] - Netmask

Use this parameter to display information only about logical interfaces that have the netmask you specify.

[`-netmask-length <integer>`] - Bits in the Netmask

Use this parameter to display information only about logical interfaces with a netmask that has the number of bits you specify.

[`-is-vip <true>`] - Is VIP LIF

Use this parameter to display information only about logical interfaces that are VIP LIFs or not as you specify.

[`-subnet-name <subnet name>`] - Subnet Name

Use this parameter to display the logical interfaces that matches the subnet name.

[`-home-node <nodename>`] - Home Node

Use this parameter to display information only about logical interfaces that have the home node you specify.

[`-home-port {<netport>|<ifgrp>}`] - Home Port

Use this parameter to display information only about logical interfaces that have the home port or interface group you specify.

[`-curr-node <nodename>`] - Current Node

Use this parameter to display information only about logical interfaces that are currently located on the node you specify.

[`-curr-port {<netport>|<ifgrp>}`] - Current Port

Use this parameter to display information only about logical interfaces that are currently located on the port or interface group you specify.

[`-status-oper {up|down}`] - Operational Status

Use this parameter to display information only about logical interfaces that have the operational status you specify.

[`-status-extended <text>`] - Extended Status

Use this parameter to display information only about logical interfaces that match the extended status that you specify.

[`-numeric-id <integer>`] - Numeric ID (privilege: advanced)

Use this parameter to display information only about logical interfaces with the numeric ID (or range of IDs) you specify. The numeric ID is an integer that identifies the logical interface in the cluster.

[`-is-home {true|false}`] - Is Home

Use this parameter to display information only about logical interfaces that are (true) or are not (false) currently located on their home node and port.

`[-status-admin {up|down}] - Administrative Status`

Use this parameter to display information only about logical interfaces that have the administrative status you specify.

`[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}] - Failover Policy`

Use this parameter to display information only about logical interfaces that use the failover policy you specify.

`[-firewall-policy <policy>] - (DEPRECATED)-Firewall Policy`

This parameter has been deprecated and may be removed in a future version of ONTAP. Use the `-service-policy` parameter instead.

Use this parameter to display information only about logical interfaces that use the firewall policies you specify.

`[-auto-revert {true|false}] - Auto Revert`

Use this parameter to display information only about logical interfaces that have auto-revert setting you specify.

`[-sticky {true|false}] - Sticky Flag (privilege: advanced)`

Use this parameter to display information only about logical interfaces that are "sticky". A sticky logical interface is one that has been manually migrated to another node and is not subject to auto-revert settings. A sticky logical interface remains at the migrated location until it is manually reverted or until it fails over to another node.

`[-dns-zone {<zone-name>|none}] - Fully Qualified DNS Zone Name`

Use this parameter to display information only about logical interfaces in the specified DNS zone.

`[-listen-for-dns-query {true|false}] - DNS Query Listen Enable`

Use this parameter to display information only about logical interfaces that have the DNS query listen value you specify.

`[-allow-lb-migrate {true|false}] - (DEPRECATED)-Load Balancing Migrate Allowed (privilege: advanced)`

This parameter has been deprecated and may be removed in a future version of ONTAP.

Use this parameter to display information only about logical interfaces for which load balancing migration is activated (true) or not activated (false).

`[-lb-weight {load|0..100}] - Load Balanced Weight (privilege: advanced)`

Use this parameter to display information only about logical interfaces that have the load balancing weight you specify.

`[-failover-group <failover-group>] - Failover Group Name`

Use this parameter to display information only about logical interfaces that are in the failover group you specify. Logical interfaces in the same failover group are capable of failing over to the same set of ports.

[-wwpn <text>] - FCP WWPN

Use this parameter to display information only about logical interfaces that have the Fibre Channel Protocol port identifier (World Wide Port Name) you specify.

[-address-family {ipv4|ipv6|ipv6z}] - Address family

Use this parameter to view the address family that is in use on the interface. Only IPv4 and IPv6 non-zoned addresses can be configured. Configuration of IPv6z addresses is not allowed.

[-comment <text>] - Comment

Use this parameter to display information only about logical interfaces that have the comment you specify.

[-ipspace <IPspace>] - IPspace of LIF

Use this parameter to display information only about logical interfaces on the IPspace you specify.

[-is-dns-update-enabled {true|false}] - Is Dynamic DNS Update Enabled?

Use this parameter to display information only about logical interfaces that have (true) or do not have (false) dynamic DNS updates enabled for them.

[-probe-port <integer>] - Probe-port for Cloud Load Balancer

Use this parameter display the probe-port for the logical interface in the Azure environment.

[-broadcast-domain <text>] - Broadcast Domain

Use this parameter to display the broadcast domain that contains the home port of the logical interface.

[-vserver-type <vserver type>] - Vserver Type

Use this parameter to display information only about logical interfaces owned by Vservers of the specified type.

[-rdma-protocols <roce>, ...] - Required RDMA offload protocols

Use this parameter to display the logical interfaces associated with one or more RDMA protocols.

Examples

The following example displays general information about all logical interfaces.

```

cluster1::> network interface show

```

Is	Logical	Status	Network	Current	Current
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
-----	-----	-----	-----	-----	-----

cluster1	cluster_mgmt	up/up	192.0.2.1/192	node0	e0M
true					
	node0_mgmt1	up/up	192.0.2.2/192	node0	e0M
true					
	node1_mgmt1	up/up	192.0.2.3/192	node1	e0M
true					
Cluster	node0_clus1	up/up	192.0.2.66/192	node0	e0a
true					
	node0_clus2	up/up	192.0.2.67/192	node0	e0b
true					
	node1_clus1	up/up	192.0.2.68/192	node1	e0a
true					
	node1_clus2	up/up	192.0.2.69/192	node1	e0b
true					

The following example displays failover information about all logical interfaces.

```

cluster1::> network interface show -failover

```

Vserver	Logical Interface	Home Node:Port	Failover Policy	Failover Group
cluster1	cluster_mgmt	node0:e0M	broadcast-domain-wide	Default
		Failover Targets:	node0:e0M, node0:e0d, node0:e0e, node0:e0f, node1:e0M, node1:e0d, node1:e0e, node1:e0f	
	node0_mgmt1	node0:e0M	local-only	Default
		Failover Targets:	node0:e0M, node0:e0d, node0:e0e, node0:e0f	
	node1_mgmt1	node1:e0M	local-only	Default
		Failover Targets:	node1:e0M, node1:e0d, node1:e0e, node1:e0f	
Cluster	node0_clus1	node0:e0a	local-only	Cluster

network interface start-cluster-check

(DEPRECATED)-Use the network interface check cluster-connectivity start command

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command has been deprecated and may be removed in a future version of ONTAP. Use the `network interface check cluster-connectivity start` command instead.

The `network interface start-cluster-check` command initiates an accessibility check from every logical interface to every aggregate. Automatic checks run periodically, but this command manually initiates a check immediately.

This command produces no direct output. Any errors encountered during the check are reported in the event log. See the [event log show](#) command for more information.

Examples

This example shows an execution of this command, with all parameters and output.

```
cluster1::> network interface start-cluster-check
```

network interface capacity show

Display the number of IP data LIFs capable of being configured on the cluster.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface capacity show` command displays the number of IP LIFs of role *data* supported on the cluster, as well as the number of IP LIFs of role *data* currently configured on the cluster.

The number of IP LIFs of role *data* that are supported on a node depends on the hardware platform and the Cluster's ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

Examples

The following displays the IP data LIF capacity.

```
cluster1::> network interface capacity show
      IP Data LIF      IP Data LIF
Supported Limit          Count
-----
                1024          256
```

network interface capacity details show

Display details about the IP data LIFs capable of being configured on each node.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface capacity details show` command displays the number of IP LIFs of role *data* that can be configured on each node, the number of IP data LIFs of role *data* that are supported on each node, and the number of IP data LIFs of role *data* that are configured to be homed on each node.

The number of IP LIFs of role *data* that are supported on a node depends on the hardware platform and the Cluster's ONTAP version. If one or more nodes in the cluster cannot support additional LIFs, then none of the nodes in the cluster can support additional LIFs.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node Name (privilege: advanced)`

Use this parameter to specify the node for which to obtain data LIF capacity.

`[-capacity-for-node <integer>] - Number of IP data LIFs that can be configured on the node (privilege: advanced)`

This parameter specifies the number of IP LIFs of role *data* that can be configured on the node at the currently running ONTAP version. To view the version of a node, use the [cluster image show](#) command.

`[-limit-for-node <integer>] - Number of IP data LIFs that are supported on the node (privilege: advanced)`

This parameter specifies the number of IP LIFs of role *data* that are supported on the node at the current effective cluster version (ECV). To view the version of a node, use the [cluster image show](#) command.

`[-count-for-node <integer>] - Number of IP data LIFs that are assigned to the node (privilege: advanced)`

This parameter specifies the number of IP LIFs of role *data* currently configured to be homed on the node. To view LIFs homed on this node, use the [network interface show -home-node](#) command.

Examples

The following displays the IP data LIF capacity.

```
cluster1::> network interface capacity details show
```

Node	IP Data LIF Capacity	IP Data LIF Supported Limit	IP Data LIF Count
node1	512	512	128
node2	512	512	128

network interface check cluster-connectivity show

Display the Cluster Connectivity Log

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface check cluster-connectivity show` command displays the cluster check result log.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

[`-n`](privilege: advanced)

Selects IP addresses instead of LIF names.

[`-instance`](privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Selects cluster health records that match the specified node name.

[`-record-number <integer>`] - Record Number (privilege: advanced)

Selects the cluster health records that match specified record number.

[`-date-time {MM/DD/YYYY HH:MM:SS [{+|-}hh:mm]}`] - Record Date (privilege: advanced)

Selects the cluster health records that match the specified date and time.

[`-src-name <text>`] - Source LIF Name (privilege: advanced)

Selects the cluster health records that match the specified source LIF name.

[-src-addr <IP Address>] - Source IP Address (privilege: advanced)

Selects the cluster health records that match the specified source IP address.

[-dst-name <text>] - Destination LIF Name (privilege: advanced)

Selects the cluster health records that match the specified destination LIF name.

[-dst-addr <IP Address>] - Destination IP Address (privilege: advanced)

Selects the cluster health records that match the specified destination IP address.

[-loss {None|Partial|All}] - Packet Loss (privilege: advanced)

Selects the cluster health records that match the specified loss value.

Examples

The following example displays the cluster connectivity records.

```
cluster1::> network interface check cluster-connectivity show
```

Node	Date		Source LIF	Destination LIF	Packet Loss

node1					
	8/26/2020	10:35:36 -04:00	node1_clus_1	node1_clus_2	none
	8/26/2020	10:35:37 -04:00	node1_clus_1	node2_clus_1	none
	8/26/2020	10:35:38 -04:00	node1_clus_1	node2_clus_2	none
	8/26/2020	10:35:39 -04:00	node1_clus_2	node1_clus_1	none
	8/26/2020	10:35:40 -04:00	node1_clus_2	node2_clus_1	none
	8/26/2020	10:35:41 -04:00	node1_clus_2	node2_clus_2	none
node2					
	8/26/2020	10:35:36 -04:00	node2_clus_1	node2_clus_2	none
	8/26/2020	10:35:37 -04:00	node2_clus_1	node1_clus_1	none
	8/26/2020	10:35:38 -04:00	node2_clus_1	node1_clus_2	none
	8/26/2020	10:35:39 -04:00	node2_clus_2	node2_clus_1	none
	8/26/2020	10:35:40 -04:00	node2_clus_2	node1_clus_1	none
	8/26/2020	10:35:41 -04:00	node2_clus_2	node1_clus_2	none

12 entries were displayed.

network interface check cluster-connectivity start

Start the cluster check function

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface check cluster-connectivity start` command initiates an accessibility check from every logical interface to every aggregate. Automatic checks run periodically, but this command

manually initiates a check immediately.

This command produces no direct output. Any errors encountered during the check are reported via the `cluster-check show` and the event log. See the [network interface check cluster-connectivity show](#) and [event log show](#) commands for more information.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

This optionally selects the node on which to initiate the accessibility check. If no node is specified, the accessibility check is initiated on the local node.

Examples

This example shows an execution of this command with no parameter which will initiate the accessibility check on the local node.

```
cluster1::> network interface check cluster-connectivity start
```

network interface check failover show

Discover if any LIFs might become inaccessible during a node outage, due to over-provisioning

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command identifies logical interfaces (LIFs) at risk of becoming inaccessible if their hosting nodes were to experience an outage. The source-nodes parameter is the only required input.

The tuple <destination-nodes, vserver-name, lif-name> is sufficient to uniquely identify a record in the returned listing. All fields other than source-nodes can be filtered on in the usual fashion. There are some examples of this filtering below.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-destination-nodes <nodename>, ...]` - Set Of Nodes Over Capacity

Use this parameter to display the nodes an at-risk LIF or LIFs could fail over to.

`[-vserver-name <vserver>]` - Vserver Name

Use this parameter to display only LIFs on the Vserver you specify.

`[-lif-name <lif-name>]` - LIF Name

Use this parameter to display at-risk information only about the LIF or LIFs whose name you specify.

`-source-nodes <nodename>, ...` - Nodes Going Down

List of nodes to test. At-risk LIFs currently hosted on these nodes will be identified. The list should contain no more than half the nodes in the cluster.

`[-over-amount <integer>]` - Amount Capacity Exceeded

Use this parameter to select only at-risk LIFs associated with a set of destination nodes whose amount over capacity matches the number you specify.

Note that the number of LIFs considered to be at risk may be higher than the actual amount over capacity a given set of nodes is. Once a given set of nodes is determined to be potentially over capacity, all LIFs whose set of failover target nodes is an exact match are marked as at risk. The amount over capacity is an upper bound on the number LIFs which could become unhosted if LIFs were to fail over in a random order, each to a target randomly selected from that LIF's configured failover targets.

`[-failover-group <failover-group>]` - Failover Group Name

Use this parameter to display information only about at-risk LIFs whose failover-group you specify.

`[-failover-policy {system-defined|local-only|sfo-partner-only|disabled|broadcast-domain-wide}]` - Failover Policy

Use this parameter to display information only about at-risk LIFs whose failover-policy you specify.

Examples

The following example shows all the at-risk LIFs for a specific two-node outage in a six-node cluster.

```
cluster1::> network interface check failover show -source-nodes
node1,node5
```

Destination Nodes: node2, node3, node4, node6

Amount Over Capacity: 2

Vserver	Logical Interface	Failover Group	Failover Policy
vs0	data1	Default	broadcast-
domain-wide			
	data2	Default	broadcast-
domain-wide			
	data3	Default	broadcast-
domain-wide			
vs1	data1	Custom_Name	broadcast-
domain-wide			

Destination Nodes: node2

Amount Over Capacity: 1

Vserver	Logical Interface	Failover Group	Failover Policy
vs0	data6	Default	sfo-partner-only
vs1	data7	Default	sfo-partner-only

The following example shows the same two-node outage scenario, but now with some filtering applied to the results.

```
cluster1::> network interface check failover show -source-nodes
node1,node5 -destination-nodes node2,node3,node4,node6 -failover-group
Def*
```

Destination Nodes: node2, node3, node4, node6

Amount Over Capacity: 2

Vserver	Logical Interface	Failover Group	Failover Policy
vs0	data1	Default	broadcast-
domain-wide			
	data2	Default	broadcast-
domain-wide			
	data3	Default	broadcast-
domain-wide			

network interface dns-lb-stats show

Show the DNS load-balancer stats for this node

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network interface dns-lb-stats show` command displays the statistics for DNS load-balancing lookups for the zones belonging to the specified Vserver. These statistics represent the data for the Vserver on the local node. The following counts can be seen in the statistics output:

- `success-count` : Number of successful lookups.
- `authoritative-count` : Number of authoritative answers sent.
- `nonauthoritative-count` : Number of non authoritative answers sent.
- `rr-set-missing-count` : Number of times the RR set was missing.
- `domain-missing-count` : Number of times the domain was not be found.
- `failure-count` : Number of failed lookups.
- `dropped-count` : Number of lookups dropped.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver>`] - Vserver (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified Vservers.

[`-zone <text>`] - DNS Zone (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified DNS zones.

[`-success-count <integer>`] - Successful Lookup Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of successful lookups.

[`-authoritative-count <integer>`] - Authoritative Answer Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of authoritative answers sent.

[`-nonauthoritative-count <integer>`] - Non Authoritative Answer Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of non-authoritative answers sent.

[`-rr-set-missing-count <integer>`] - RR Set Missing Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of times the RR set was missing.

[`-domain-missing-count <integer>`] - Name Missing Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of times the domain was not found.

[`-failure-count <integer>`] - Failed Lookup Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of failed lookups.

[`-dropped-count <integer>`] - Dropped Count (privilege: advanced)

Use this parameter to display DNS load-balancer statistics only for the specified number of dropped lookups.

Examples

The following example displays stats for the zone "x.com".

```
cluster1::> network interface dns-lb-stats show -zone x.com
Vserver      DNS Zone      SUCCESS      AUTH  NOAUTH  NORR  NODOM  FAILED
DROP
-----
-----
-----
vs2
      x.com      5      5      0      0      0      0      0
```

network interface failover-groups add-targets

Add failover targets to a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups add-targets` command enables you to add a list of failover targets such as network ports, interface groups, or VLANs to an existing logical interface failover group.

Parameters

`-vserver <vserver>` - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

`-failover-group <text>` - Failover Group Name

Use this parameter to specify the failover group that you want to extend.

-targets [node>:<port] ,... - Failover Targets

Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you want to add to the failover group.

Examples

This example shows the failover group "clyde" being extended to include additional failover targets.

```
cluster1::> network interface failover-group add-targets -vserver vs1
-failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups create

Create a new failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups create` command creates a grouping of failover targets for logical interfaces on one or more nodes. Use this command to add a new network port or interface group to an existing failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the name of the logical interface failover group that you want to create.

-targets [node>:<port] ,... - Failover Targets

Use this parameter to specify the list of failover targets (network ports, interface groups, or VLANs on a node) belonging to this failover group.

Examples

The following example shows how to create a failover group named `failover-group_2` containing ports `e1e` and `e2e` on node `Xena`.

```
cluster1::> network interface failover-groups create -vserver vs0
-failover-group failover-group_2 -targets xena:e1e,xena:e2e
```

network interface failover-groups delete

Delete a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups delete` command deletes a logical interface failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the name of the logical interface failover group to be deleted.

Examples

The following example shows how to delete a failover group named `failover-group_2`.

```
cluster1::> network interface failover-groups delete -vserver vs1
-failover-group failover-group_2
```

network interface failover-groups modify

Modify a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups modify` command enables you modify the list of network ports, interface groups, or VLANs belonging to an existing logical interface failover group. The specified list will overwrite the existing list of network ports, interface groups, and VLANs currently belonging to the logical interface failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to modify.

[-targets [node>:<port> ,...]] - Failover Targets

Use this parameter to specify the network ports, interface groups, or VLANs you want to now belong to the failover group.

Examples

This example shows the failover group "clyde" being modified to now contain the specified network ports.

```
cluster1::> network interface failover-group modify -vserver vs1 -failover
-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups remove-targets

Remove failover targets from a failover group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups remove-targets` command enables you to specify a list of failover targets such as network ports, interface groups, or VLANs to be removed from an existing logical interface failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vserver(s) from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to remove failover targets from.

-targets [node>:<port>] , ... - Failover Targets

Use this parameter to specify the failover targets such as network ports, interface groups, or VLANs you want to remove from the failover group.

Examples

This example shows the failover targets `xena1:e0c` and `xena1:e0d-100` being removed from the failover group "clyde".

```
cluster1::> network interface failover-group remove-targets -vserver vs1
-failover-group clyde -targets xena1:e0c, xena1:e0d-100, xena2:a0a
```

network interface failover-groups rename

Rename a logical interface failover Group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface failover-groups rename` command enables you to rename an existing logical interface failover group.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the name of the Vservers from which this failover group is accessible.

-failover-group <text> - Failover Group Name

Use this parameter to specify the failover group that you want to rename.

-new-failover-group-name <text> - New name

Use this parameter to specify the new name of the failover group.

Examples

This example shows the failover group "clusterwide" being renamed "clyde".

```
cluster1::> network interface failover-group rename -failover -vserver vs1
-failover-group clusterwide -new-failover-group-name clyde
```

network interface failover-groups show

Display logical interface failover groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface failover-groups show` command displays information about logical interface failover groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name

Use this parameter to display information only about the logical interface failover groups that have the target Vserver you specify.

[-failover-group <text>] - Failover Group Name

Use this parameter to display information only about the logical interface failover groups you specify.

[-targets [node>:<port>],...] - Failover Targets

Use this parameter to display information only about the logical interface failover groups that have the failover target (physical port, interface group, or VLAN) you specify.

[-broadcast-domain <Broadcast Domain>] - Broadcast Domain

Use this parameter to display information only about the logical interface failover groups that have the broadcast domain you specify.

Examples

The following example displays information about all logical interface failover groups on a two node cluster.

```
cluster1::> network interface failover-groups show
```

Vserver	Group	Failover Targets

Cluster	Cluster	node1:e1a, node1:e2a, node2:e1a, node2:e2a,
cluster1	Default	node1:e0M, node1:e0a, node1:e0b, node1:e0c, node1:e0d, node2:e0M, node2:e0a, node2:e0b, node2:e0c, node2:e0d

network interface lif-weights show

Show the load-balancer LIF weights

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network interface lif-weights show` command displays the weights assigned to each LIF in a DNS load-balancing zone in a Vserver.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver (privilege: advanced)

Use this parameter to display information only for the specified Vservers.

[*-zone* <text>] - DNS Zone (privilege: advanced)

Use this parameter to display information only for the specified DNS zones.

[*-address* <IP Address>] - Network Address (privilege: advanced)

Use this parameter to display information only for the specified IP addresses.

[*-weight* <double>] - Load Balancer Weight (privilege: advanced)

Use this parameter to display information only for the specified load balancer weights

Examples

The following example displays LIF weights for vserver "vs1".

```
cluster1::> network interface lif-weights show -vserver vs1
```

Vserver	DNS Zone	Network Address	Weight
vs1			
	a.com	4.4.4.4	12.4206
	x.com	1.1.1.1	12.4206
	x.com	10.72.46.236	12.4206

3 entries were displayed.

network interface service show

Display available interface services

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network interface service show` command displays available services for IP LIFs and the TCP or UDP ports that each service listens on. The ports listed in this table correspond to well-known ports that each service can be expected to open a listening socket. Services that do not listen for ingress connections are presented with an empty port list.

Parameters

{ [*-fields* <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command displays only the fields that you specify.

| [*-restrictions*] (privilege: advanced)

The `network interface service show-restrictions` command displays available services for IP LIFs and usage restrictions for each service. The restrictions determine which LIFs are permitted to use each service and what restrictions the service implies for the LIFs that do use it.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-service <LIF Service Name>] - Service Name

Selects services that match the specified service name.

[-ports <integer>,...] - TCP/UDP Port Numbers

Selects services that contain all IP ports in the specified list.

[-protocol-ports <text>,...] - Protocol: Port Numbers

Selects services that match the `<protocol>:<port>` combination.

[-vserver-policy <svc_vserver_policy>] - Vserver Restrictions

Selects services that match a specific vservers restriction.

[-failover-policy <svc_failover_policy>] - Failover Restrictions

Selects services that match a specific interface failover restriction.

Examples

The following example displays the built-in services.

```
cluster1:> network interface service show
Service                               Protocol:Port
-----
intercluster-core                     tcp:11104
                                      tcp:11105
management-bgp                       tcp:179

2 entries were displayed.
```

network interface service-policy add-service

Add an additional service entry to an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy add-service` command adds an additional service to an existing service-policy. When an allowed address list is specified, the list applies to only the service being added. Existing services included in this policy are not impacted.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be updated.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of service policy to be updated.

-service <LIF Service Name> - Service entry to be added (privilege: advanced)

Use this parameter to specify the name of service to be added to the existing service policy.

[-allowed-addresses <IP Address/Mask>, ...] - Allowed address ranges for the service (privilege: advanced)

Use this parameter to specify a list of subnet masks for addresses that are allowed to access this service.

Use the value 0.0.0.0/0 to represent the wildcard IPv4 address and ::/0 to represent the wildcard IPv6 address.

Examples

The following example shows the addition of a service to an existing service policy.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----
-----
cluster1
      default-intercluster      intercluster-core: 0.0.0.0/0
                                management-https: 0.0.0.0/0

```

network interface service-policy clone

Clone an existing network service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy clone` command creates a new service policy that includes the same services and allowed addresses as an existing policy. Once the new service policy has been created, it can be modified as necessary without impacting the original policy.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be cloned.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of the service policy to be cloned.

-target-vserver <vserver name> - Vserver Name (privilege: advanced)

Use this parameter to specify the name of the vserver on which the new service policy should be created.

-target-policy <text> - New Service Policy Name (privilege: advanced)

Use this parameter to specify the name of the new service policy.

Examples

The following example shows the cloning of a service policy.

```
cluster1::> network interface service-policy show -vserver
cluster1,ipspacel
Vserver    Policy                                Service: Allowed Addresses

```

network interface service-policy create

Create a new service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy create` command creates a new service policy with a list of included services. LIFs can reference this policy to control the list of services that they are able to transport on their network. Services can represent applications accessed by a LIF as well as applications served by this cluster.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the name of the Vserver on which the service policy will be created.

-policy <text> - Policy Name

Use this parameter to specify the name of service policy to be created.

[-services <LIF Service Name>,...] - Included Services

Use this parameter to specify a list of services that should be included in this policy.

[-allowed-addresses <IP Address/Mask>,...] - Allowed Addresses

Use this parameter to specify a list of subnet masks for addresses that are allowed to access the services in this policy. Use the value `0.0.0.0/0` to represent the wildcard IPv4 address and `::/0` to represent the wildcard IPv6 address.

Examples

The following example shows the creation of a service policy with no initial services.

```
cluster1::> network interface service-policy create -vserver cluster1
-policy empty

cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----
cluster1
  default-intercluster                intercluster-core: 0.0.0.0/0
                                      management-https: 0.0.0.0/0
default-management                    management-core: 0.0.0.0/0
                                      management-autosupport: 0.0.0.0/0
                                      management-ssh: 0.0.0.0/0
                                      management-https: 0.0.0.0/0
default-route-announce               management-bgp: 0.0.0.0/0
empty                                -

4 entries were displayed.
```

The following example shows the creation of a new service policy with a specified service list.

```

cluster1::> network interface service-policy create -vserver cluster1
-policy custom -services intercluster-core,management-ssh

cluster1::> network interface service-policy show -vserver cluster1

```

network interface service-policy delete

Delete an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy delete` command deletes an existing service policy.

Parameters

-vserver <vserver name> - Vserver

Use this parameter to specify the name of the Vserver of the service policy to be deleted.

-policy <text> - Policy Name

Use this parameter to specify the name of the service policy to be deleted.

Examples

The following example shows the deletion of a service policy.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses

network interface service-policy modify-service

Modify a service entry in an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy modify-service` command modifies the policy-specific attributes of a service that is already included in a particular service policy. Other services in the policy are not

impacted by the change.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be updated.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of service policy to be updated.

-service <LIF Service Name> - Service entry to be modified (privilege: advanced)

Use this parameter to specify the name of service to be updated.

-allowed-addresses <IP Address/Mask>, ... - Allowed address ranges for the service (privilege: advanced)

Use this parameter to specify a list of subnet masks for addresses that are allowed to access this service.

Use the value 0.0.0.0/0 to represent the wildcard IPv4 address and ::/0 to represent the wildcard IPv6 address.

Examples

The following example shows the modification of a service on an existing service policy.

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----
-----
cluster1

network interface service-policy remove-service

Remove a service entry from an existing service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy remove-service` command removes an individual service from an existing service policy. Other services in the the policy are not impacted by the change.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be updated.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of service policy to be updated.

-service <LIF Service Name> - Service entry to be removed (privilege: advanced)

Use this parameter to specify the name of service to be removed from the existing service policy.

Examples

The following example shows the removal of a service from an existing service policy.

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----
cluster1
            default-intercluster          intercluster-core: 0.0.0.0/0
                                           management-https: 0.0.0.0/0
default-management      management-core: 0.0.0.0/0
                                           management-autosupport: 0.0.0.0/0
                                           management-ssh: 0.0.0.0/0
                                           management-https: 0.0.0.0/0
default-route-announce  management-bgp: 0.0.0.0/0
```

network interface service-policy rename

Rename an existing network service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network interface service-policy rename` command assigns a new name to an existing service policy without disrupting the LIFs using the policy.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be renamed.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of the service policy to be renamed.

-new-name <text> - New Service Policy Name (privilege: advanced)

Use this parameter to specify the new name for the service policy.

Examples

The following example shows the renaming of a service policy.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----

```

network interface service-policy restore-defaults

Restore default settings to a service policy

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network interface `service-policy restore-defaults` command restores a built-in service-policy to its original state. The default list of services replaces any customizations that have been applied by an administrator. All included services will be updated to use the default allowed address list.

Parameters

-vserver <vserver name> - Vserver (privilege: advanced)

Use this parameter to specify the name of the Vserver of the service policy to be restored.

-policy <text> - Policy Name (privilege: advanced)

Use this parameter to specify the name of the service policy to be restored.

Examples

The following example shows the restoration of a service policy's default settings.

```

cluster1::> network interface service-policy show -vserver cluster1
Vserver    Policy                               Service: Allowed Addresses
-----
-----
cluster1
      default-intercluster      intercluster-core: 10.1.0.0/16
                                management-ssh: 10.1.0.0/16
                                management-https: 10.1.0.0/16
default-management      management-core: 0.0.0.0/0
                                management-autosupport: 0.0.0.0/0
                                management-ssh: 0.0.0.0/0
                                management-https: 0.0.0.0/0

```

network interface service-policy show

Display existing service policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network interface service-policy show` command displays existing service policies.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the fields that you specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects service policies that match the specified vservers name.

[-policy <text>] - Policy Name

Selects service policies that match the specified service policy name.

[-services <LIF Service Name>,...] - Included Services

Selects service policies that contain all services in the specified list of service names.

[-service-allowed-addresses <text>,...] - Service: Allowed Addresses

Selects service policies that contain all "`<service>:<allowed-addresses>`" in the specified list of addresses.

Examples

The following example displays the built-in service policies.

```
cluster1::> network interface service-policy show -vserver cluster1
Vserver      Policy                               Service: Allowed Addresses
-----
cluster1
      default-intercluster      intercluster-core: 0.0.0.0/0

default-management      management-core: 0.0.0.0/0
                                management-autosupport: 0.0.0.0/0
                                management-ssh: 0.0.0.0/0
                                management-https: 0.0.0.0/0
default-route-announce      management-bgp: 0.0.0.0/0

3 entries were displayed.
```

network ipspace commands

network ipspace create

Create a new IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

IPspaces are distinct IP address spaces in which Storage Virtual Machines (SVMs) reside. The "Cluster" IPspace and "Default" IPspace are created by default. You can create more custom IPspaces when you need your SVMs to have overlapping IP addresses, or you need more control over networking configurations for cluster peering. Reference the "Network Management Guide" for the limit of how many custom IPspaces are supported on your system..

Parameters

-ipspace <IPspace> - IPspace name

The name of the IPspace to be created.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", "-", or "_".
- The first character of each label, delimited by ".", must be one of the following characters: A-Z or a-z.
- The last character of each label, delimited by ".", must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "local" and "localhost".
- The system provides the following IPspaces: "Cluster" and "Default".

Examples

The following example creates IPspace "ips1".

```
cluster1::> network ipspace create -ipspace ips1
```

network ipspace delete

Delete an IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete an IPspace that contains no ports or Vservers.

Parameters

-ipspace <IPspace> - IPspace name

The name of the IPspace to be deleted. If the IPspace is associated with one or more logical-interfaces, you must delete them before you can delete the IPspace.

Examples

The following example deletes the IPspace "ips1".

```
cluster1::> network ipspace delete -ipspace ips1
```

network ipspace rename

Rename an IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename an IPspace.

Parameters

-ipspace <IPspace> - IPspace name

The name of the IPspace to be renamed.

-new-name <IPspace> - New Name

The new name for the IPspace.

- The name must contain only the following characters: A-Z, a-z, 0-9, ".", "-", or "_".
- The first character of each label, delimited by ".", must be one of the following characters: A-Z or a-z.
- The last character of each label, delimited by ".", must be one of the following characters: A-Z, a-z or 0-9.
- The maximum supported length is 47 characters.
- The system reserves the following names: "all", "cluster", "local" and "localhost".

Examples

The following example renames IPspace "ips1" to "ips2".

```
cluster1::> network ipspace rename -ipspace ips1 -new-name ips2
```

network ipspace show

Display IPspace information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display network IPspaces.

Parameters

{ [-fields <fieldname>,...]

Specify the fields to be displayed for each IPspace.

| [-instance] }

Display all parameters of the IPspace objects.

[-ipspace <IPspace>] - IPspace name

Display the names of the IPspaces.

[-ports [node>:<port>],...] - Ports

The list of network ports assigned to each IPspace.

[-broadcast-domains <Broadcast Domain>,...] - Broadcast Domains

The list of broadcast domains that belong to the IPspace.

[-vservers <vserver name>,...] - Vservers

The list of Vservers assigned to each IPspace.

Examples

The following example displays general information about IPspaces.

```
cluster1::> network ipspace show
IPspace          Vserver List          Broadcast Domains
-----
Cluster
Default          cluster1, vs1, vs2          br1, br2, br3
2 entries were displayed.
```

network ndp commands

network ndp default-router delete-all

Delete default routers on a given IPspace

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp default-router delete-all` command deletes default router lists from the specified IPspace.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

Use this parameter to specify the IPspace where the default routers are to be deleted.

Examples

The following example deletes default routers from IPspace ips1.

```
cluster1::*> network ndp default-router delete-all -ipspace ips1
```

network ndp default-router show

Display default routers

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp default-router show` command displays Neighbor Discovery Protocol (NDP) default routers learned on a specified port.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node (privilege: advanced)

Displays the NDP default routers from the specified node.

[-ipspace <IPspace>] - IPspace name (privilege: advanced)

Displays the NDP default routers from the specified IPspace.

[-port {<netport>|<ifgrp>}] - Port (privilege: advanced)

Displays the NDP default routers from the specified port.

[-router-addr <IP Address>] - Router Address (privilege: advanced)

Displays the default routers that have the specified IPv6 addresses.

[-flag {none|managed-address-DHCPv6|other-DHCPv6}] - Flag (privilege: advanced)

Displays the default routers that have the specified flag. The flag indicates whether addresses are available via DHCPv6 or other configuration information is available via DHCPv6.

[*-expire-time* { [*<integer>d*] [*<integer>h*] [*<integer>m*] [*<integer>s*] | *never* | *expired* }] -
Expire Time (privilege: advanced)

Displays the default routers that have the specified expire time.

Examples

The following example displays NDP default routers on local port e0f.

```
cluster1::*> network ndp default-router show -port e0f -node local
```

Node: node1

IPspace: Default

Port	Router Address	Flag	Expire Time
e0f	fe80::5:73ff:fea0:107	none	0d0h23m9s

network ndp neighbor create

Create a static NDP neighbor entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor create` command creates a static Neighbor Discovery Protocol (NDP) neighbor entry within a Vserver.

Parameters

-vserver <vserver name> - Vserver Name (privilege: advanced)

Use this parameter to specify the Vserver on which the NDP neighbor is to be created.

-neighbor <IP Address> - Neighbor Address (privilege: advanced)

Use this parameter to specify the neighbor's IPv6 address.

-mac-address <MAC Address> - MAC Address (privilege: advanced)

Use this parameter to specify the neighbor's MAC address.

Examples

The following example creates a NDP neighbor entry within Vserver vs0.

```
cluster1::*> network ndp neighbor create -vserver vs0 -neighbor 20:20::20  
-mac-address 10:10:10:0:0:1
```

network ndp neighbor delete

Delete a static NDP neighbor entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor delete` command deletes a static Neighbor Discovery Protocol (NDP) neighbor from a Vserver.

Parameters

-vserver <vserver name> - Vserver Name (privilege: advanced)

Use this parameter to specify the Vserver on which the NDP neighbor is to be deleted.

-neighbor <IP Address> - Neighbor Address (privilege: advanced)

Use this parameter to specify the neighbor's IPv6 address.

Examples

The following example deletes a NDP neighbor entry within Vserver vs0.

```
cluster1::*> network ndp neighbor delete -vserver vs0 -neighbor 20:20::20
```

network ndp neighbor show

Display static NDP neighbor entries

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor show` command displays a group of static Neighbor Discovery Protocol (NDP) neighbors within one or more Vservers. You can view static NDP neighbors within specified Vservers, neighbors with specified IPv6 address, and neighbors with specified MAC address.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name (privilege: advanced)

Displays the static NDP neighbors that have the specified Vserver as their origin.

[-neighbor <IP Address>] - Neighbor Address (privilege: advanced)

Displays the static NDP neighbors that have the specified IPv6 address.

[-mac-address <MAC Address>] - MAC Address (privilege: advanced)

Displays the static NDP neighbors that have the specified MAC address.

Examples

The following example displays all of the static NDP neighbors configured on Vserver vs0.

```
cluster1::*> network ndp neighbor show -vserver vs0
Vserver           Neighbor           MAC Address
-----
vs0
                  10:10::10          04:04:04:04:04:04
                  20:20::20          01:01:01:01:01:01
2 entries were displayed.
```

network ndp neighbor active-entry delete

Delete active neighbor entry from a System or Admin Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor active-entry delete` command deletes a Network Discovery Protocol (NDP) neighbor entry on the specified port from a given Vserver's subnet group.

Parameters

-node {<nodename>|local} - Node (privilege: advanced)

Use this parameter to specify the node on which the neighbor entry is to be deleted.

-vserver <vserver> - System or Admin Vserver Name (privilege: advanced)

Use this parameter to specify the System or Admin Vserver on which the neighbor entry is to be deleted.

-subnet-group <IP Address/Mask> - Subnet Group (privilege: advanced)

Use this parameter to specify the subnet group from which the neighbor entry is to be deleted.

-neighbor <IP Address> - Neighbor (privilege: advanced)

Use this parameter to specify the IPv6 address of the neighbor entry which is to be deleted.

-port {<netport>|<ifgrp>} - Port (privilege: advanced)

Use this parameter to specify the port on which the neighbor entry is to be deleted.

Examples

The following example deletes a neighbor entry from the Admin Vserver cluster1:

```
cluster1::*> network ndp neighbor active-entry delete -vserver cluster1
-node local -subnet-group ::/0 -neighbor fe80:4::5:73ff:fea0:107 -port e0d
```

network ndp neighbor active-entry show

Display active neighbor entries organized by Vserver

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp neighbor active-entry show` command displays Network Discovery Protocol (NDP) neighbor cache entries on one or more nodes. You can view ndp neighbors within specified nodes and within specified System or Admin Vservers.

Parameters

[`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-verbose`] (privilege: advanced)

Displays the expire time, state, is-router, and probe count fields.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node {<nodename>|local}`] - Node (privilege: advanced)

Displays the NDP neighbors from the specified node.

[`-vserver <vserver>`] - System or Admin Vserver Name (privilege: advanced)

Displays the NDP neighbors from the specified System or Admin Vserver. Data and Node Vservers do not have dynamic NDP neighbors.

[`-subnet-group <IP Address/Mask>`] - Subnet Group (privilege: advanced)

Displays the NDP neighbors in the specified subnet group.

[`-neighbor <IP Address>`] - Neighbor (privilege: advanced)

Displays the NDP neighbors that have the specified IPv6 address.

[`-port {<netport>|<ifgrp>}`] - Port (privilege: advanced)

Displays the NDP neighbors on the specified port.

[`-mac-address <MAC Address>`] - MAC Address (privilege: advanced)

Displays the NDP neighbors have the specified MAC address.

[`-expire-time { [<integer>d [<integer>h [<integer>m [<integer>s] | never | expired ] }`] - Expire Time (privilege: advanced)

Displays the NDP neighbors have the specified expire time.

[`-state {<nostate|incomplete|reachable|stale|delay|probe|unknown>}`] - State (privilege: advanced)

Displays the NDP neighbors in the specified state.

[`-is-router {true|false}`] - Is Router (privilege: advanced)

Displays the NDP neighbor which is a router.

[`-probe-count <integer>`] - Probe Count (privilege: advanced)

Displays the NDP neighbors with the specified probe count. Probe count is the number of times that this neighbor's MAC address has been queried.

[`-is-static {true|false}`] - Is Static (privilege: advanced)

Displays the NDP neighbors which are statically configured.

Examples

The following example displays NDP neighbors on the Admin Vserver cluster1:

```
cluster1::*> network ndp neighbor active-entry show -vserver cluster1

Node: node1
Vserver: cluster1
Subnet Group: ::/0
Neighbor                               MAC Address           Port
-----
fe80:4::5:73ff:fea0:107                00:05:73:a0:01:07      e0d
fe80:4::226:98ff:fe0c:b6c1              00:26:98:0c:b6:c1      e0d
fe80:4::4255:39ff:fe25:27c1             40:55:39:25:27:c1      e0d
3 entries were displayed.
```

network ndp prefix delete-all

Delete IPv6 prefixes on a given IPspace

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp prefix delete-all` command deletes all prefixes learned from the specified IPspace.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

Use this parameter to specify the IPspace where the IPv6 prefixes are to be deleted.

Examples

The following example deletes all IPv6 prefixes within IPspace ips1.

```
cluster1::*> network ndp prefix delete-all -ipspace ips1
```

network ndp prefix show

Display IPv6 prefixes

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network ndp prefix show` command displays IPv6 prefixes on one or more nodes.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-verbose] (privilege: advanced)

Displays the valid-lifetime, preferred-lifetime, origin and advertising-router fields.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node (privilege: advanced)

Displays the IPv6 prefixes from the specified node.

[-ipspace <IPspace>] - IPspace name (privilege: advanced)

Displays the IPv6 prefixes from the specified IPspace.

[-port {<netport>|<ifgrp>}] - Port (privilege: advanced)

Displays the IPv6 prefixes on the specified port.

[-prefix <IP Address/Mask>] - Prefix (privilege: advanced)

Displays the IPv6 prefixes with the specified prefix value.

[-flag {none|on-link|autonomous|on-link-autonomous}] - Flag (privilege: advanced)

Displays the IPv6 prefixes with the specified flag. The flag indicates whether a prefix is on-link and whether it can be used in autonomous address configuration.

[`-valid-lifetime` {<unsigned integer>|infinity}] - Valid Lifetime (privilege: advanced)

Displays the IPv6 prefixes having the specified valid lifetime in seconds.

[`-preferred-lifetime` {<unsigned integer>|infinity}] - Preferred Lifetime (privilege: advanced)

Displays the IPv6 prefixes having the specified preferred lifetime in seconds.

[`-expire-time` {[<integer>d][<integer>h][<integer>m][<integer>s] | never | expired}] - Expire Time (privilege: advanced)

Displays the IPv6 prefixes having the specified expire time.

[`-origin` {router-advertise|renumber-request|static|kernel|unknown}] - Origin of the Prefix (privilege: advanced)

Displays the IPv6 prefixes with the specified origin.

[`-advertising-router` <IP Address>,...] - Router that Advertised the Prefix (privilege: advanced)

Displays the IPv6 prefixes which are propagated by the specified router list.

Examples

The following example displays IPv6 prefixes on port e0f.

```
cluster1::*> network ndp prefix show -port e0f -node local

Node: node1
IPspace: Default
Port      Prefix                               Flag                               Expire Time
-----
e0f       fd20:8b1e:b255:814e::/64  on-link-autonomous  29d23h56m48s
```

network options commands

network options cluster-health-notifications modify

cluster health notification options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command enables or disables cluster health notifications on the specified node.

Parameters

-node {<nodename>|local} - Node

This parameter specifies the node for which the cluster health notification status will be modified.

`[-enabled {true|false}] - Cluster Health Notifications Enabled`

Setting this parameter to *true* enables cluster health notification. Setting it to *false* disables cluster health notification.

Examples

The following example modifies the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications modify -node
node1 -enabled true
```

network options cluster-health-notifications show

Display cluster health notification options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network options cluster-health-notifications show` command displays whether the node's cluster health notifications are enabled.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node`

This parameter specifies the node for which the cluster health notification status will be displayed.

`[-enabled {true|false}] - Cluster Health Notifications Enabled`

Selects the entries that match this parameter value.

Examples

The following example displays the cluster health notification status for a node:

```
cluster1::> network options cluster-health-notifications show -node node1
Node: node1
Cluster Health Notifications Enabled: true
```

network options cluster-network-overlay-enabled show

Display cluster network overlay enabled option

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the cluster-network-overlay-enabled for the cluster.

Examples

```
cluster1::*> network options cluster-network-overlay-enabled show
Cluster Network Overlay Enabled: false
```

network options detect-switchless-cluster modify

Modify the status of switchless cluster detection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables or disables the automatic detection of a switchless cluster. A switchless cluster consists of two nodes where the cluster ports are directly connected without a switch between them.

Parameters

[-enabled {true|false}] - Enable Switchless Cluster Detection (privilege: advanced)

This parameter specifies whether switchless cluster detection is enabled or not. Setting this parameter to *true* enables switchless cluster detection.

Examples

```
The following example enables switchless cluster detection:
cluster1::*> network options detect-switchless-cluster modify
-enabled true
```

network options detect-switchless-cluster show

Display the status of switchless cluster detection

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network options detect-switchless-cluster show command displays whether switchless cluster detection is enabled.

Examples

The following example displays whether switchless cluster detection is enabled:

```
cluster1::*> network options detect-switchless-cluster show
Enable Detect Switchless Cluster: true
```

network options ipv6 modify

Modify IPv6 options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command sets the state of IPv6 options for the cluster.

Parameters

[-enabled <true>] - IPv6 Enabled

Setting this parameter to *true* enables IPv6 for the cluster. IPv6 cannot be disabled once it is enabled for the cluster. Call technical support for guidance regarding disabling IPv6.

[-is-ra-processing-enabled {true|false}] - Router Advertisement (RA) Processing Enabled

Setting this parameter to *true* enables cluster to process IPv6 router advertisements. Setting it to *false* disables router advertisement processing by the cluster.

Examples

The following example enables IPv6 for the cluster:

```
cluster1::> network options ipv6 modify -enabled true
```

The following example enables IPv6 Router Advertisement processing for the cluster:

```
cluster1::> network options ipv6 modify -is-ra-processing-enabled true
```

The following example disables IPv6 Router Advertisement processing for the cluster:

```
cluster1::> network options ipv6 modify -is-ra-processing-enabled
false
```

network options ipv6 show

Display IPv6 options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of IPv6 options for the cluster.

Examples

```
cluster1::> network options ipv6 show

IPv6 Enabled: false
Router Advertisement (RA) Processing Enabled: false
```

network options load-balancing modify

Modify load balancing algorithm

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets the state of geometric mean algorithm for load balancing

Parameters

[-enable {true|false}] - Geometric Mean Algorithm for Load Balancing (privilege: advanced)

Setting this parameter to *true* enables the geometric mean algorithm for load balancing. Setting it to *false* disables the geometric mean algorithm for the cluster.

Examples

```
The following example will enable the geometric mean algorithm for load
balancing.
cluster1::> network options load-balancing modify -enable true
The following example will disable the geometric mean algorithm for load
balancing.
cluster1::> network options load-balancing modify -enable false
```

network options load-balancing show

Display load balancing algorithm

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the use of geometric mean load balancing algorithm.

Examples

```
cluster1::> network options load-balancing show
Geometric Mean Algorithm for load balancing: false
```

network options multipath-routing modify

Modify multipath-routing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network options multipath-routing modify` command is used to modify cluster-wide multipath routing configuration.

Parameters

`[-is-enabled {true|false}]` - Is Multipath Routing Enabled (privilege: advanced)

This parameter specifies whether multipath routing configuration is enabled or not. Setting this parameter to `_ true _` enables multipath routing for all nodes in the cluster.

Examples

```
cluster1::> network options multipath-routing modify -is-enabled true
```

network options multipath-routing show

Display multipath-routing

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network options multipath-routing show` command displays the multipath routing configuration for the cluster.

Examples

```
cluster1::> network options multipath-routing show
Is Multipath Routing Enabled: false
```

network options port-health-monitor disable-monitors

Disable one or more port health monitors

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command disables the given port health monitors for the given IPspaces in the cluster.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

The name of the IPspace for which the specified port health monitors are disabled.

-health-monitors {l2-reachability|link-flapping|crc-errors|vswitch-link} - List of Port Health Monitors to Disable (privilege: advanced)

The port health monitors to disable.

Examples

The following example disables the "l2_reachability" health monitor for the "Default" IPspace.

The status of the "link_flapping" monitor is unaffected by the command.

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
-----	-----
Cluster	l2_reachability, link_flapping
Default	l2_reachability, link_flapping

2 entries were displayed.

```
cluster1::*> network options port-health-monitor disable-monitors -ipspace  
Default -health-monitors l2_reachability
```

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
-----	-----
Cluster	l2_reachability, link_flapping
Default	link_flapping

2 entries were displayed.

network options port-health-monitor enable-monitors

Enable one or more port health monitors

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command enables the given port health monitors for the given IPspaces in the cluster.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

The name of the IPspace for which the specified port health monitors are enabled.

-health-monitors {l2-reachability|link-flapping|crc-errors|vswitch-link} - List of Port Health Monitors to Enable (privilege: advanced)

The port health monitors to enable. Upon enabling the *l2_reachability* health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the *l2_reachability* health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the *l2_reachability* health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

Examples

The following example enables the "l2_reachability" health monitor for the "Default" IPspace:

The status of the "link_flapping" monitor is unaffected by the command.

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
Cluster	l2_reachability, link_flapping
Default	link_flapping

2 entries were displayed.

```
cluster1::*> network options port-health-monitor enable-monitors -ipspace  
Default -health-monitors l2_reachability
```

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
Cluster	l2_reachability, link_flapping
Default	l2_reachability, link_flapping

2 entries were displayed.

network options port-health-monitor modify

Modify port health monitors configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the enabled port health monitors for the given IPspaces in the cluster.

Parameters

-ipspace <IPspace> - IPspace Name (privilege: advanced)

The name of the IPspace for which enabled port health monitors are modified.

[-health-monitors {l2-reachability|link-flapping|crc-errors|vswitch-link}] - List of Enabled Port Health Monitors (privilege: advanced)

All of the port health monitors that you want to enable. This command enables any port health monitors in this list that are currently disabled, and it disables any currently enabled monitors that are not in this list. Upon enabling the *l2_reachability* health monitor, it runs in an "unpromoted" state. While in this state, the monitor does not mark any ports as unhealthy due to the *l2_reachability* health check. The monitor is promoted in the "Cluster" IPspace when the "Cluster" broadcast domain is found to have passed the *l2_reachability* health check. An EMS event called "vifmgr.hm.promoted" event is generated when the health monitor is promoted for the IPspace.

Examples

The following example modifies the port health monitor configuration of the "Default" IPspace such that only the "link_flapping" port health monitor is enabled. enabled for all IPspaces in the cluster.

Only the specified monitor is enabled after the modify command is issued.

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
Cluster	l2_reachability, link_flapping
Default	l2_reachability, link_flapping

2 entries were displayed.

```
cluster1::*> network options port-health-monitor modify -ip-space Default  
-health-monitors link_flapping
```

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
Cluster	l2_reachability, link_flapping
Default	link_flapping

2 entries were displayed.

network options port-health-monitor show

Display port health monitors configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the enabled port health monitors for the IPspaces in the cluster.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-ip-space* <IPspace>] - IPspace Name (privilege: advanced)

Displays the port health monitors that are enabled only for the given IPspace name.

[*-health-monitors* {l2-reachability|link-flapping|crc-errors|vswitch-link}] - List of Enabled Port Health Monitors (privilege: advanced)

Displays the IPspaces that have the given monitors enabled.

Examples

The following example lists all port health monitors that are enabled for all IPspaces in the cluster.

```
cluster1::*> network options port-health-monitor show
```

IPspace	Enabled Port Health Monitors
-----	-----
Cluster	l2_reachability, link_flapping
Default	l2_reachability, link_flapping

2 entries were displayed.

network options send-soa modify

Modify Send SOA settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets the status of sending statement of authority record in the DNS response.

Parameters

[-enable {true|false}] - Enable Sending SOA (privilege: advanced)

Setting this parameter to *true* enables sending the statement of authority (SOA) record in the DNS response. Setting it to *false* disables sending the statement of authority (SOA) record in the DNS response for the cluster.

Examples

The following example will enable the sending of statement of authority (SOA)

in the DNS response.

```
cluster1::> network options send-soa modify -enable true
```

The following example will disable the sending of statement of authority (SOA)

in the DNS response.

```
cluster1::> network options send-soa modify -enable false
```

network options send-soa show

Display Send SOA settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays whether sending the statement of authority record (SOA) in the DNS response is enabled or not.

Examples

```
cluster1::> network options send-soa show
Enable sending SOA: true
```

network options switchless-cluster modify

Modify switchless cluster network options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command sets whether the cluster network is in switchless or switched mode. A switchless cluster is physically formed by connecting two nodes back-to-back, without a switch between them.

Parameters

[-enabled {true|false}] - Enable Switchless Cluster (privilege: advanced)

This parameter specifies whether the switchless cluster is enabled or not. Setting this parameter to *true* enables the switchless cluster.

Examples

```
The following example enables the switchless cluster:
cluster1::*> network options switchless-cluster modify -enabled
true
```

network options switchless-cluster show

Display switchless cluster network options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The network options switchless-cluster show command displays the attributes of a switchless cluster.

Examples

```
The following example displays the attributes of the switchless cluster:  
cluster1::*> network options switchless-cluster show  
Enable Switchless Cluster: true
```

network port commands

network port delete

Delete a network port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port delete` command deletes a network port that is no longer physically present on the storage system.

Parameters

-node {<nodename>|local} - Node

This specifies the node on which the port is located.

-port {<netport>|<ifgrp>} - Port

This specifies the port to delete.

Examples

The following example deletes port e0c from a node named node0. The command works only when the port does not physically exist on the storage system.

```
cluster1::*> network port delete -node node0 -port e0c
```

network port modify

Modify network port attributes

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port modify` command enables you to change the maximum transmission unit (MTU) setting, autonegotiation setting, administrative duplex mode, and administrative speed of a specified network port.

The MTU of ports that belong to broadcast-domains must be updated through the `broadcast-domain modify` command.

Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a ONTAP

8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace.

Parameters

-node {<nodename>|local} - Node

Use this parameter to specify the node on which the port is located.

-port {<netport>|<ifgrp>} - Port

Use this parameter to specify the port that you want to modify.

[-mtu <integer>] - MTU

The port's MTU setting. The default setting for ports in the "Cluster" IPspace is 9000 bytes. All other ports use a default value of 1500 bytes.

[-autonegotiate-admin {true|false}] - Auto-Negotiation Administrative

Whether the port uses Ethernet autonegotiation to determine the highest speed and duplex mode that the port and its endpoint can support. The default setting when you create a port is `true`.

[-duplex-admin {auto|half|full}] - Duplex Mode Administrative

The administrative setting for the port's duplex mode. This is the duplex mode that you prefer the port to use. Depending on network limitations, the operational value can be different from the administrative setting. The default setting when you create a port is `full`.

[-speed-admin {auto|10|100}] - Speed Administrative

The administrative speed setting, in megabits per second. This is the speed setting that you prefer the port to use. Depending on network limitations, the operational value can be lower than the administrative setting.

[-flowcontrol-admin {none|receive|send|full|pfc}] - Flow Control Administrative

The administrative flow control setting of the port. This is the flow control setting that you prefer the port to use. Depending on network and port limitations, the operational value can be different from the administrative setting.

[-up-admin {true|false}] - Up Administrative (privilege: advanced)

The administrative state of the port. If set to `true`, the port is used if it is operational. If set to `false`, the port is configured down.

[-ipspace <IPspace>] - IPspace Name

Use this parameter to specify the IPspace the network port is assigned to. Modification of a port's IPspace will only work before a node is added to a cluster, when the cluster version is below ONTAP 8.3, or when the node is offline. To change the IPspace of a port once the node is in a ONTAP 8.3 cluster, the port should be added to a broadcast-domain that belongs to that IPspace. If there is an inconsistency between the broadcast-domain and IPspace, this parameter can be set to bring the IPspace into alignment with the broadcast-domain.

[-ignore-health-status {true|false}] - Ignore Port Health Status (privilege: advanced)

Use this parameter to specify that the system ignore network port health status of the specified port for the purpose of hosting a logical interface.

[-pfc-queues-admin <integer>,...] - List of PFC Queues Administrative

Use this parameter to set the list of PFC queues.

Examples

The following example modifies port e0a on a node named node0 not to use auto-negotiation, to preferably use half duplex mode, and to preferably run at 100 Mbps.

```
cluster1::> network port modify -node node0 -port e0a -autonegotiate-admin  
false -duplex-admin half -speed-admin 100
```

network port show-address-filter-info

Print the port's address filter information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port show-address-filter-info` command displays information about the port's address filter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

-node <nodename> - Node

Use this parameter to specify the node.

-port {<netport>|<ifgrp>} - Port

Use this parameter to specify the port. For example, e0c.

[-num-total <integer>] - Total Number Of Entries

Use this parameter to specify the total number of entries.

[-num-used <integer>] - Number Of Used Entries

Use this parameter to specify the number of used entries.

[-used-entries <text>,...] - The Used Entries

Use this parameter to list the used entries.

Examples

The following example displays information of the given port's address filter on the specified node of the cluster.

```
cluster1::*> network port show-address-filter-info -node local -port e0c
```

Node: node1

Port	Total Number of Address Filter Entries	Number of Used Address Filter Entries	Used Address Filter Entries
----	-----	-----	-----
e0c	1328	3	U 0 a0 98 40 e 6 M 1 80 c2 0 0 e M 1 0 5e 0 0 fb

network port show

Display network port attributes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network port show` command displays information about network ports. The command output indicates any inactive links, and lists the reason for the inactive status.

Some parameters can have "administrative" and "operational" values. The administrative setting is the preferred value for that parameter, which is set when the port is created or modified. The operational value is the actual current value of that parameter. Administrative and operational settings are not shown for virtual ports, '-' will be displayed. See the physical port hosting the target virtual port for these values.

If the operational duplex mode and speed of a port cannot be determined (for instance, if the link is down), that port's status is listed as *undef*, meaning undefined. This is different from '-', meaning no value.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-health]

Use this parameter to display detailed health information for the specified network ports.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the network ports that match this parameter value. Use this parameter with the `-port` parameter to select a port.

[-port {<netport>|<ifgrp>}] - Port

Selects the network ports that match this parameter value. If you do not use this parameter, the command

displays information about all network ports.

[-link {off|up|down}] - Link

Selects the network ports that match this parameter value.

[-mtu <integer>] - MTU

Selects the network ports that match this parameter value.

[-autonegotiate-admin {true|false}] - Auto-Negotiation Administrative

Selects the network ports that match this parameter value.

[-autonegotiate-oper {true|false}] - Auto-Negotiation Operational

Selects the network ports that match this parameter value.

[-duplex-admin {auto|half|full}] - Duplex Mode Administrative

Selects the network ports that match this parameter value.

[-duplex-oper {auto|half|full}] - Duplex Mode Operational

Selects the network ports that match this parameter value.

[-speed-admin {auto|10|100}] - Speed Administrative

Selects the network ports that match this parameter value.

[-speed-oper {auto|10|100}] - Speed Operational

Selects the network ports that match this parameter value.

[-flowcontrol-admin {none|receive|send|full|pfc}] - Flow Control Administrative

Selects the network ports that match this parameter value.

[-flowcontrol-oper {none|receive|send|full|pfc}] - Flow Control Operational

Selects the network ports that match this parameter value.

[-mac <MAC Address>] - MAC Address

Selects the network ports that match this parameter value.

[-up-admin {true|false}] - Up Administrative (privilege: advanced)

Selects the network ports that match this parameter value.

[-type {physical|if-group|vlan|vip|pvlan}] - Port Type

Selects the network ports that match this parameter value.

[-ifgrp-node <nodename>] - Interface Group Parent Node

Selects the network ports that match this parameter value.

[-ifgrp-port {<netport>|<ifgrp>}] - Interface Group Parent Port

Selects the network ports that match this parameter value.

[-ifgrp-distr-func {mac|ip|sequential|port}] - Distribution Function

Selects the network ports that match this parameter value.

`[-ifgrp-mode {multimode|multimode_lacp|singlemode}] - Create Policy`

Selects the network ports that match this parameter value.

`[-vlan-node <nodename>] - Parent VLAN Node`

Selects the network ports that match this parameter value.

`[-vlan-port {<netport>|<ifgrp>}] - Parent VLAN Port`

Selects the network ports that match this parameter value.

`[-vlan-tag <integer>] - VLAN Tag`

Selects the network ports that match this parameter value.

`[-remote-device-id <text>] - Remote Device ID`

Selects the network ports that match this parameter value.

`[-ipspace <IPspace>] - IPspace Name`

Use this parameter to display information only about the ports that match the IPspace you specify.

`[-broadcast-domain <Broadcast Domain>] - Broadcast Domain`

Use this parameter to display information only about the ports that match the broadcast-domain you specify.

`[-mtu-admin <integer>] - MTU Administrative`

Selects the network ports that match this parameter value.

`[-health-status {healthy|degraded}] - Port Health Status`

Use this parameter to display information only about the ports that match the health-status you specify.

`[-ignore-health-status {true|false}] - Ignore Port Health Status`

Use this parameter to display information only about the ports that match the ignore-health-status you specify.

`[-health-degraded-reasons {l2-reachability|link-flapping|crc-errors|vswitch-link}] - Port Health Degraded Reasons`

Use this parameter to display information only about the ports that match the degraded-reason you specify.

`[-vm-network-name <text>] - Virtual Machine Network Name`

Use this parameter to display information only about the ports that match the network name you specify.
Google Cloud Platform only.

`[-rdma-protocols <roce>,...] - Supported RDMA Protocols`

Use this parameter to display information only about the ports that support the specified RDMA protocols.

`[-pfc-queues-admin <integer>,...] - List of PFC Queues Administrative`

Selects the network ports that match this parameter value.

`[-pfc-queues-oper <integer>,...] - List of PFC Queues Operational`

Selects the network ports that match this parameter value.

Examples

The following example displays information about all network ports.

```
cluster1::> network port show

Node: node1

Ignore
Speed(Mbps) Health
Health
Port      IPspace      Broadcast Domain Link MTU  Admin/Oper  Status

network port broadcast-domain add-ports

Add ports to a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Add ports to a broadcast domain.

The IPspace of the ports added will be updated to the IPspace of the broadcast-domain. The ports will be added to the failover-group of the broadcast-domain. The MTU of the ports will be updated to the MTU of the broadcast-domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain for this port assignment.

-ports [node>:<port>] , ... - List of ports

The ports to be added to this broadcast domain.

Examples

The following example adds the port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" to broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> add-ports -ipspace Default  
-broadcast-domain mgmt -ports cluster1-1:e0d, cluster1-2:e0d
```

network port broadcast-domain create

Create a new layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Create a new broadcast domain.

The IPspace of the ports added will be updated to the IPspace of the broadcast-domain. A failover-group will be generated containing the ports of the broadcast-domain. The MTU of all of the ports in the broadcast-domain will be updated to the MTU specified for the broadcast-domain.

Parameters

[-ipspace <IPspace>] - IPspace Name

The IPspace to which the new broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain to be created. The name of the broadcast domain needs to be unique within the IPspace.

-mtu <integer> - Configured MTU

MTU of the broadcast domain.

[-ports [node>:<port>],...] - Ports

The network ports to be added to the broadcast domain. Ports need to be added to the broadcast domain before interfaces can be hosted on the port. By default, no port will be added to the broadcast domain.

Examples

The following example creates broadcast domain "mgmt" in IPspace "Default" with an MTU of 1500 and network ports e0c from node "gx1" and node "gx2".

```
cluster1::> network port broadcast-domain create -ipspace Default  
-broadcast-domain mgmt -mtu 1500 -ports gx1:e0c,gx2:e0c
```

network port broadcast-domain delete

Delete a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete a broadcast domain that contains no ports.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain to be deleted.

Examples

The following example deletes the broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> delete -ipspace Default  
-broadcast-domain mgmt
```

network port broadcast-domain merge

Merges two layer 2 broadcast domains

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Merges a broadcast domain into an existing broadcast domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The merging broadcast domain.

-into-broadcast-domain <Broadcast Domain> - Merge with This Layer 2 Broadcast Domain

The target broadcast domain for the merge operation.

Examples

The following example merges broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".

```
cluster1::network port broadcast-domain> merge -ipspace Default -broadcast  
-domain bd-mgmt -into-broadcast-domain bd-data
```

network port broadcast-domain modify

Modify a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modify a broadcast domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain.

[-mtu <integer>] - Configured MTU

MTU of the broadcast domain. All ports that belong to the broadcast domain are modified.

Examples

The following example modifies the mtu attribute of broadcast domain "mgmt" in IPspace "Default" to 1500

```
cluster1::network port broadcast-domain*> modify -ipspace Default  
-broadcast-domain mgmt -mtu 1500
```

network port broadcast-domain move

Move a layer 2 broadcast domain to another IPspace

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Move a broadcast domain to another IPspace.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain.

-to-ipspace <IPspace> - Name of the destination IPspace

The name of the destination IPspace.

Examples

The following example moves the broadcast domain named "mgmt" from IPspace "Default" to IPspace "Default-1".

```
cluster1::network port broadcast-domain> move -ipspace Default -broadcast
-domain mgmt -to-ipspace Default-1
```

network port broadcast-domain remove-ports

Remove ports from a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Remove port assignments from a broadcast domain.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain of the ports.

-ports [node>:<port>] ,... - List of ports

The ports to removed from the broadcast-domain.

Examples

The following example removes port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "mgmt" in IPspace "Default".

```
cluster1::network port broadcast-domain> remove-ports -ipspace Default
-broadcast-domain mgmt -ports cluster1-1:e0d, cluster1-2:e0d
```

network port broadcast-domain rename

Rename a layer 2 broadcast domain

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename a broadcast domain.

Parameters

-ipSPACE <IPspace> - IPspace Name

The IPspace to which the broadcast domain belongs.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The name of the broadcast domain.

-new-name <text> - New Name

The new name of the broadcast domain.

Examples

The following example renames the broadcast domain named "mgmt" to "mgmt2" in IPspace "Default".

```
cluster1::network port broadcast-domain> rename -ipSPACE Default  
-broadcast-domain mgmt -new-name mgmt2
```

network port broadcast-domain show

Display layer 2 broadcast domain information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display broadcast domain information.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ipSPACE <IPspace>] - IPspace Name

Selects the broadcast domains that match the IPspace name.

[-broadcast-domain <Broadcast Domain>] - Layer 2 Broadcast Domain

Selects the broadcast domains that match the broadcast domain name.

[-mtu <integer>] - Configured MTU

Selects the broadcast domains that match the MTU value. This field is the MTU that was configured by the

user, which might be different from the operational MTU.

[-ports [node>:<port] ,...] - Ports

Selects the broadcast domains that contain the network ports. For example, node1:e0a will display broadcast domains that contain node1:e0a network port.

[-port-update-status {complete|in-progress|error|overridden-while-offline}] - Port Update Status

Selects the broadcast domains that contain the network port status. For example, specifying "error" will display broadcast domains that contain "Error" network port status.

[-port-update-status-details <text>,...] - Status Detail Description

Selects the broadcast domains that contain the network port status detail text.

[-port-update-status-combined {complete|in-progress|error|overridden-while-offline}] - Combined Port Update Status

Selects the broadcast domains that contain the combined network port status. For example, specifying "error" will display broadcast domains that contain a combined network port status of "Error".

[-failover-groups <failover-group>,...] - Failover Groups

Selects the broadcast domains that contain the failover groups.

[-subnet-names <subnet name>,...] - Subnet Names

Selects the broadcast domains that contain the subnet name or names.

[-is-vip {true|false}] - Is VIP Broadcast Domain

Selects the broadcast domains that match a specific "is-vip" flag. Specifying "true" matches only broadcast domains associated with the Virtual IP feature; "false" matches only broadcast domains that do not.

Examples

The following example displays general information about broadcast domains.

```
cluster1::> network port broadcast-domain show
IPspace Broadcast
Name      Domain Name      MTU  Port List      Update
-----
Cluster Cluster      9000 node1:e0a      complete
                        node1:e0b      complete
Default Default      1500 node1:e0c      complete
                        node1:e0d      complete
2 entries were displayed.
```

network port broadcast-domain split

Splits a layer 2 broadcast domain into two layer 2 broadcast domains.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Splits ports from a broadcast domain into a new broadcast domain.

The following restrictions apply to this command:

- If the ports are in a failover group, all ports in the failover group must be provided. Use [network interface failover-groups show](#) to see which ports are in failover groups.
- If the ports have LIFs associated with them, the LIFs cannot be part of a subnet's ranges and the LIF's *curr-port* and *home-port* must both be provided. Use [network interface show](#) -fields *subnet-name* , *home-node* , *home-port* , *curr-node* , *curr-port* to see which ports have LIFs associated with them and whether the LIFs are part of a subnet's ranges. Use [network subnet remove-ranges](#) with the LIF's IP address and *-force-update-lif-associations* set to *true* to remove the LIF's association with a subnet.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace of the broadcast domain.

-broadcast-domain <Broadcast Domain> - Layer 2 Broadcast Domain

The broadcast domain to split.

-new-broadcast-domain <Broadcast Domain> - New Layer 2 Broadcast Domain Name

The new broadcast domain.

-ports [[node>:<port](#)] , ... - List of Ports

The ports to be split from this broadcast domain.

Examples

The following example splits port "e0d" on node "cluster1-1" and port "e0d" on node "cluster1-2" from broadcast domain "bd-mgmt" in IPspace "Default" to broadcast domain "bd-data".

```
cluster1::> network port broadcast-domain split -ipspace Default
-broadcast-domain bd-mgmt -new-broadcast-domain bd-data -ports cluster1-
1:e0d, cluster1-2:e0d
```

network port ifgrp add-port

Add a port to an interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp add-port` command adds a network port to a port interface group. The port interface group must already exist. You can create a port interface group by using the [network port ifgrp create](#) command.

The following restrictions apply to port interface groups:

- A port that is already a member of a port interface group cannot be added to another port interface group.
- Cluster ports and management ports cannot be in a port interface group.
- A port to which a logical interface is already bound cannot be added to a port interface group.
- A port that already has an assigned failover role cannot be added to a port interface group.
- A VLAN port cannot be added to a port interface group.
- A port which attaches to a VLAN cannot be added to a port interface group.
- An interface group port cannot be added to a port interface group.
- A port that is assigned to a broadcast domain cannot be added to a port interface group.
- All ports in a port interface group must be physically located on the same node.

Parameters

-node {<nodename>|local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group to which a port is to be added.

-port <netport> - Specifies the name of port.

The network port that is to be added to the port interface group.

[-skip-broadcast-domain-placement <true>] - Skip Placement Into Broadcast Domain (privilege: advanced)

When specified along with the first port added to the ifgrp, the ifgrp will not be placed into any broadcast domain.

Examples

The following example adds port e0c to port interface group a1a on a node named node1:

```
cluster1::> network port ifgrp add-port -node node1 -ifgrp a1a -port e0c
```

- [network port ifgrp create](#)

network port ifgrp create

Create a port interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp create` command creates a port interface group. See the documentation for the [network port ifgrp add-port](#) command for a list of restrictions on creating port interface groups.

Parameters

-node {<nodename>|local} - Node

The node on which the port interface group will be created.

-ifgrp <ifgrp name> - Interface Group Name

The name of the port interface group that will be created. Port interface groups must be named using the syntax "a<number><letter>", where <number> is an integer in the range [0-999] without leading zeros and <letter> is a lowercase letter. For example, "a0a", "a0b", "a1c", and "a2a" are all valid port interface group names.

-distr-func {mac|ip|sequential|port} - Distribution Function

The distribution function of the port interface group that will be created. Valid values are:

- mac - Network traffic is distributed based on MAC addresses
- ip - Network traffic is distributed based on IP addresses
- sequential - Network traffic is distributed in round-robin fashion from the list of configured, available ports
- port - Network traffic is distributed based on the transport layer (TCP/UDP) ports

-mode {multimode|multimode_lacp|singlemode} - Create Policy

The create policy for the interface group that will be created. Valid values are:

- multimode - Bundle multiple member ports of the interface group to act as a single trunked port
- multimode_lacp - Bundle multiple member ports of the interface group using Link Aggregation Control Protocol
- singlemode - Provide port redundancy using member ports of the interface group for failover

Examples

The following example creates a port interface group named a0a on node node0 with a distribution function of ip:

```
cluster1::> network port ifgrp create -node node0 -ifgrp a0a -distr-func  
ip -mode multimode
```

- [network port ifgrp add-port](#)

network port ifgrp delete

Destroy a port interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp delete` command destroys a port interface group.

When you delete an interface group port, it is automatically removed from failover rules and groups to which it belongs.

Parameters

-node {<nodename>|local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group that will be deleted.

Examples

The following example deletes port interface group a0b from a node named node0.

```
cluster1::> network port ifgrp delete -node node0 -ifgrp a0b
```

network port ifgrp remove-port

Remove a port from an interface group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp remove-port` command removes a network port from a port interface group.

Parameters

-node {<nodename>|local} - Node

The node on which the port interface group is located.

-ifgrp <ifgrp name> - Interface Group Name

The port interface group from which a port will be removed.

-port <netport> - Specifies the name of port.

The network port that will be removed from the port interface group.

Examples

The following example removes port e0d from port interface group a1a on a node named node1:

```
cluster1::> network port ifgrp remove-port -node node1 -ifgrp a1a -port
e0d
```

network port ifgrp show

Display port interface groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port ifgrp show` command displays information about port interface groups. By default, it displays information about all port interface groups on all nodes in the cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the port interface groups that match this parameter value. Use this parameter with the `-ifgrp` parameter to select information about a specific port interface group.

[-ifgrp <ifgrp name>] - Interface Group Name

Selects the port interface groups that match this parameter value. Use this parameter with the `-node` parameter, to select information about a specific port interface group.

[-distr-func {mac|ip|sequential|port}] - Distribution Function

Selects the port interface groups that match this parameter value.

[-mode {multimode|multimode_lacp|singlemode}] - Create Policy

Selects the port interface groups that match this parameter value.

[-mac <MAC Address>] - MAC Address

Selects the port interface groups that match this parameter value.

[`-activeports {full|partial|none}`] - Port Participation

Selects the port interface groups that match this parameter value. The value "partial" indicates that some but not all of the port interface group's ports are active. the value "full" indicates that all of the port interface group's ports are active.

[`-ports {<netport>|<ifgrp>}`] - Network Ports

Selects the port interface groups that match this parameter value.

[`-up-ports {<netport>|<ifgrp>}`] - Up Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are up.

[`-down-ports {<netport>|<ifgrp>}`] - Down Ports

Selects the port interface groups that match this parameter value. Displays only the ports that are down.

Examples

The following example displays information about all port interface groups.

```
cluster1::> network port ifgrp show
```

	Port	Distribution		Active	
Node	ifgrp	Function	MAC Address	Ports	Ports
-----	-----	-----	-----	-----	-----
node0					
	a0a	ip	b8:f8:7a:20:00	partial	e0c
node1					
	ala	ip	07:26:60:02:00	full	e0d

network port reachability repair

Repair reachability

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Repair network port configuration to match the detected reachable broadcast domain. If the reachability scan has completed with a reachability-status of misconfigured-reachability, meaning the network port does not have reachability to its configured broadcast domain, but has reachability to another broadcast domain, then repairing the network port's reachability will assign the port to the detected broadcast domain. Similarly, if the reachability scan has completed with a reachability status of no-reachability, then repairing the network port's reachability will assign the port to an empty broadcast domain. LIFs configured on the port will be adjusted to be configured on another port in their current broadcast domain if possible. Vlans on the specified port that do not have reachability to their configured broadcast domain will be removed. If the port was part of an ifgrp, the port will be removed from the ifgrp. If the port is not configured on a broadcast domain and has no reachability to any existing broadcast domains, it will be configured in a newly created broadcast domain.

Parameters

-node {<nodename>|local} - Node

Selects the node on which the port resides.

-port <netport> - Port

Selects the port on which to repair configuration.

Examples

The following example applies the scanned broadcast domain reachability information to the specified port's configuration.

```
cluster1::> network port reachability repair -node node1 -port e0c
```

network port reachability scan

Perform a reachability scan

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Scan network port configuration to detect reachable broadcast domains.

Parameters

-node {<nodename>|local} - Node

Selects the node on which the port resides.

-port <netport> - Port

Selects the port on which to scan broadcast domain reachability.

Examples

The following example applies the scanned broadcast domain reachability information to the specified port's configuration.

```
cluster1::> network port reachability scan -node node1 -port e0c
```

network port reachability show

Display Reachability Status

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display broadcast domain reachability information for the specified port. If the port is discovered, via a layer 2 reachability scan, to have reachability to broadcast domains other than the one on which it is expected, the

command will list the reachable broadcast domains and an appropriate reachability status message. If the reachable broadcast domain matches the expected one, the reachability status is displayed as Ok.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-detail]

When true, additional details regarding which broadcast domains have been found to be reachable from the specified network port are displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the node on which the port resides.

[-port <netport>] - Port

Selects the port for which to display broadcast domain reachability information.

[-expected-broadcast-domain [IPspace]:<Broadcast Domain>] - Expected Broadcast Domain

The IPspace and broadcast domain currently assigned to the network port. If the specified port is an ifgrp member, the expected broadcast domain is the IPspace and broadcast domain currently assigned to the parent ifgrp.

[-reachable-broadcast-domains [IPspace]:<Broadcast Domain> ,...] - Reachable Broadcast Domains

The name of the IPspaces and broadcast domains that have reachability to the specified port, as discovered by a layer 2 reachability scan.

[-reachability-status {unknown|ok|no-reachability|misconfigured-reachability|multi-domain-reachability|internal-error}] - Reachability Status

The status of the broadcast domain reachability for the specified port. "Ok" if the expected broadcast domain matches the reachable broadcast domains, i.e., the port can reach other ports in the expected broadcast domain, but no ports configured in other broadcast domains. "No-reachability" if the port cannot reach any ports in the expected broadcast domain, and also cannot reach any ports in any other broadcast domains. "Misconfigured-reachability" if the port cannot reach any ports in the expected broadcast domain, but can reach ports in one other broadcast domain. "Multi-domain-reachability" if the port can reach other ports configured in multiple broadcast domains. "Unknown" if the port has not been link-up long enough for reachability to be determined.

[-unreachable-ports [node]:<port> ,...] - Unreachable Ports

The list of network ports that are expected in the same broadcast domain as the specified port but cannot be reached, either because those ports are down or because there is no network connectivity to those ports.

[-unexpected-ports [node]:<port> ,...] - Unexpected Ports

The list of network ports that are not expected in the same broadcast domain yet have network connectivity to the specified port.

Examples

The following example displays the broadcast domain reachability for the specified port.

```
cluster1::> network port reachability show -node node1 -port e0d
network port reachability show)
ode          Port          Expected Reachability          Reachability Status
-----
ode1         e0d           Default:Default                ok
```

The following example displays the detailed reachability for the 'e0d' port when it has misconfigured-reachability, i.e., it cannot reach the other 'e0d' port in the expected broadcast domain 'Default:Default', but can reach the 'e0c' ports configured in the 'Default:Default-3' broadcast domain.

```
cluster1::> network port reachability show -node node1 -port e0d -detail
network port reachability show)
ode          Port          Expected Reachability          Reachability Status
-----
ode1         e0d           Default:Default                misconfigured-
reachability
Actual Reachability: Default:Default-3
Unreachable Ports: node2:e0d
Unexpected Ports: node2:e0c, node1:e0c
```

The following example displays the detailed reachability for the 'e0d' port when it has multi-domain-reachability, i.e., it can reach the other 'e0d' port in the expected broadcast domain 'Default:Default', but can also reach the 'e0c' ports configured in the 'Default:Default-3' broadcast domain.

```
cluster1::> network port reachability show -node node1 -port e0d -detail
network port reachability show)
ode          Port          Expected Reachability          Reachability Status
-----
ode1         e0d           Default:Default                multi-domain-
reachability
Actual Reachability: Default:Default,
                    Default:Default-3
Unreachable Ports: -
Unexpected Ports: node2:e0c, node1:e0c
```

The following example displays the detailed reachability for the 'e0d' port when it has no-reachability, i.e., it cannot reach the other 'e0d' port in the expected broadcast domain 'Default:Default', and also cannot reach any other ports configured in broadcast domains.

```
cluster1::> network port reachability show -node node1 -port e0d -detail
network port reachability show)
ode          Port          Expected Reachability          Reachability Status
-----
ode1          e0d          Default:Default          no-reachability
Actual Reachability: -
Unreachable Ports: node2:e0d
Unexpected Ports: -
```

network port vip create

Create a VIP port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port vip create` command creates a VIP port in the specified IPspace on the specified node. Only one VIP port can be created per IPspace on the given node.

Parameters

-node {<nodename>|local} - Node

The node where the VIP port should be created.

-port <netport> - Network Port

The name of the VIP port to be created in the format v<slot-number><port-letter>

-ipspace <IPspace> - IPspace Name

The IPspace where the VIP port should be created. The default value for this parameter is "Default", which identifies the default IPspace.

Examples

This example shows how to create a VIP port named v0a in ipspace ips on node1.

```
cluster1::> network port vip create -node node1 -port v0a -ipspace ips
```

network port vip delete

Delete a VIP port

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network port vip delete` command deletes a VIP port.

Parameters

-node {<nodename>|local} - Node

The node associated with the VIP port to be deleted.

-port <netport> - Network Port

The name of the VIP port to be deleted.

Examples

This example shows how to delete VIP Port v0a on node1.

```
cluster1::> network port vip delete -node node1 -port v0a
```

network port vip show

Display VIP ports

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vip show` command displays information about VIP ports.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This parameter selects the VIP ports that match the specified node.

[-port <netport>] - Network Port

This parameter selects the VIP ports that match the specified port.

[-ipspace <IPspace>] - IPspace Name

This parameter selects the VIP ports that match the specified IPspace.

Examples

The example below shows VIP port v0a is created in IPspace ips on node1.

```
cluster1::> network port vip show
Node    VIP Port IPspace
-----
node1   v0a    ips
```

network port vlan create

Create a virtual LAN (VLAN)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan create` command attaches a VLAN to a network port on a specified node.

Parameters

-node {<nodename>|local} - Node

The node to which the VLAN is to be attached.

You cannot attach a VLAN to a cluster port.

{ -vlan-name {<netport>|<ifgrp>} - VLAN Name

The name of the VLAN that is to be attached. This name should be a combination of the name of the port or interface group and the VLAN ID, with a hyphen between, such as "e1c-80".

| -port {<netport>|<ifgrp>} - Associated Network Port

The network port to which the VLAN is to be attached.

-vlan-id <integer> - Network Switch VLAN Identifier }

The ID tag of the created VLAN.

[-skip-broadcast-domain-placement <true>] - Skip Placement Into Broadcast Domain (privilege: advanced)

When specified, the VLAN will not be placed into any broadcast domain.

Examples

This example shows how to create VLAN e1c-80 attached to network port e1c on node1.

```
cluster1::> network port vlan create -node node1 -vlan-name e1c-80
```

network port vlan delete

Delete a virtual LAN (VLAN)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan delete` command deletes a VLAN from a network port.

When you delete a VLAN port, it is automatically removed from all failover rules and groups that use it.

Parameters

-node {<nodename>|local} - Node

The node from which the VLAN is to be deleted.

{ -vlan-name {<netport>|<ifgrp>} - VLAN Name

The name of the VLAN that is to be deleted

| -port {<netport>|<ifgrp>} - Associated Network Port

The network port to which the VLAN is to be attached.

-vlan-id <integer> - Network Switch VLAN Identifier }

The ID tag of the deleted VLAN.

Examples

This example shows how to delete VLAN e1c-80 from network port e1c on node1.

```
cluster1::> network port vlan delete -node node1 -vlan-name e1c-80
```

network port vlan show

Display virtual LANs (VLANs)

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network port vlan show` command displays information about network ports that are attached to VLANs. The command output indicates any inactive links and lists the reason for the inactive status.

If the operational duplex mode and speed cannot be determined (for instance, if the link is down), they are listed as `undef`, meaning undefined.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-node` {<nodename>|local}] - Node

Selects the VLAN network ports that match this parameter value.

{ [`-vlan-name` {<netport>|<ifgrp>}] - VLAN Name

Selects the VLAN network ports that match this parameter value.

| [`-port` {<netport>|<ifgrp>}] - Associated Network Port

Selects the VLAN network ports that match this parameter value. If neither this parameter nor `-name` are used, the command displays information about all network ports.

[`-vlan-id` <integer>] - Network Switch VLAN Identifier }

Selects the VLAN network ports that match this parameter value.

[`-mac` <MAC Address>] - MAC address

Selects the VLAN network ports that match this parameter value.

Examples

The example below shows VLAN e1b-70 attached to port e1b on node1.

```
cluster1::> network port vlan show
```

		Network	Network	
Node	VLAN Name	Port	VLAN ID	MAC Address
node1	e1b-70	e1b	70	00:15:17:76:7b:69

network qos-marking commands

network qos-marking modify

Modify the QoS marking values

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network qos-marking modify` command modifies the QoS marking values for different protocols, for each IPspace.

Parameters**`-ipspace` <IPspace> - IPspace name**

Use this parameter to specify the IPspace for which the QoS marking entry is to be modified.

`-protocol` <text> - Protocol

Use this parameter to specify the protocol for which the QoS marking entry is to be modified. The possible values are NFS, CIFS, iSCSI, NVMe-TCP, SnapMirror, SnapMirror-Sync, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.

[-dscp <integer>] - DSCP Marking Value

Use this parameter to specify the DSCP value. The possible values are 0 to 63.

[-is-enabled {true|false}] - Is QoS Marking Enabled

Use this parameter to enable or disable the QoS marking for the specified protocol and IPspace.

Examples

The following example modifies the QoS marking entry for the NFS protocol in the Default IPspace:

```
cluster1::> network qos-marking modify -ipspace Default -protocol NFS
-dscp 10 -is-enabled true
```

network qos-marking show

Display the QoS marking values

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `network qos-marking show` command displays the QoS marking values for different protocols, for each IPspace.

Parameters

{ [-fields <fieldname>,...]

Use this parameter to display only certain fields of the QoS marking table.

| [-instance] }

Use this parameter to display all the fields of the QoS marking table.

[-ipspace <IPspace>] - IPspace name

Use this parameter to display the QoS marking entries for the specified IPspace.

[-protocol <text>] - Protocol

Use this parameter to display the QoS marking entries for the specified protocol. The possible values are NFS, CIFS, iSCSI, NVMe-TCP, SnapMirror, SnapMirror-Sync, NDMP, FTP, HTTP-admin, HTTP-filesrv, SSH, Telnet, and SNMP.

[-dscp <integer>] - DSCP Marking Value

Use this parameter to display the QoS marking entries matching the specified DSCP value. The possible values are 0 to 63.

[-is-enabled {true|false}] - Is QoS Marking Enabled

Use this parameter to display the QoS marking entries matching the specified flag.

Examples

The following example displays the QoS marking entries for the Default IPspace.

```
cluster1::> network qos-marking show -ipspace Default

network route commands

network route create

Create a static route

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route create` command creates a static route within a Vserver.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the route is to be created.

-destination <IP Address/Mask> - Destination/Mask

Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash ("/"), mask. 0.0.0.0/0 is a valid destination value to create default IPv4 route. And ::/0 is a valid destination value to create default IPv6 route

-gateway <IP Address> - Gateway

Use this parameter to specify the IP address of the gateway server leading to the route's destination.

[-metric <integer>] - Metric

Use this parameter to specify the metric of the route.

Examples

The following example creates default routes within Vserver vs0 for IPv4 and IPv6.

```
cluster1::> network route create -vserver vs0 -destination 0.0.0.0/0
-gateway 10.61.208.1
cluster1::> network route create -vserver vs0 -destination ::/0 -gateway
3ffe:1::1
```

network route delete

Delete a static route

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route delete` command deletes a static route from a Vserver.

Parameters

-vserver <vserver> - Vserver Name

Use this parameter to specify the Vserver on which the route is to be deleted.

-destination <IP Address/Mask> - Destination/Mask

Use this parameter to specify the IP address and subnet mask of the route's destination. The format for this value is: address, slash ("/"), mask. For example, 0.0.0.0/0 is a correctly formatted value for the -destination parameter.

-gateway <IP Address> - Gateway

Use this parameter to specify the gateway on which the route is to be deleted.

Examples

The following example deletes a route within Vserver vs0 for destination 0.0.0.0/0.

```
cluster1::network route delete -vserver vs0 -destination 0.0.0.0/0
```

network route show-lifs

Show the Logical Interfaces for each route entry

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route show-lifs` command displays the association of static routes and Logical Interfaces (LIFs) within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver Name

Use this parameter to display only routes that have the specified Vserver as their origin.

[-destination <IP Address/Mask>] - Destination/Mask

Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash ("/"), mask. For example, `0.0.0.0/0` is a valid value for the `-destination` parameter.

[-gateway <IP Address>] - Gateway

Use this parameter to display only routes that have the specified IP address as their gateway.

[-lifs <lif-name>,...] - Logical Interfaces

Use this parameter to display only the routes that are associated with the specified Logical Interfaces (LIFs).

[-address-family {ipv4|ipv6|ipv6z}] - Address Family

Use this parameter to display only the routes that belong to specified address family.

network route show

Display static routes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `network route show` command displays a group of static routes within one or more Vservers. You can view routes within specified Vservers, routes with specified destinations, and routes with specified gateways.

Parameters

{ [-fields <fieldname>,...]

Use this parameter to display only certain fields of the routing tables.

[*-instance*] }

Use this parameter to display all fields of the routing tables.

[*-vserver* <*vserver*>] - Vserver Name

Use this parameter to display only routes that have the specified Vserver as their origin.

[*-destination* <*IP Address/Mask*>] - Destination/Mask

Use this parameter to display only routes that have the specified IP address and subnet mask as their destination. The format for this value is: address, slash ("/"), mask. The example below has 0.0.0.0/0 as a valid value for the *-destination* parameter.

[*-gateway* <*IP Address*>] - Gateway

Use this parameter to display only routes that have the specified IP address as their gateway.

[*-metric* <*integer*>] - Metric

Use this parameter to display only routes that have the specified metric.

[*-ipspace* <*IPspace*>] - IPspace Name

Use this parameter to optionally specify the IPspace associated with the Vserver. This parameter can be used in conjunction with the Vserver parameter in order to configure the same route across multiple Vservers within an IPspace.

[*-address-family* {*ipv4|ipv6|ipv6z*}] - Address family of the route

Use this parameter to display only the routes that have the specified address-family.

Examples

The following example displays information about all routing groups.

```
cluster1::> network route show
(network route show)
Server          Destination      Gateway          Metric
-----
node1
                0.0.0.0/0       10.61.208.1     20
node2
                0.0.0.0/0       10.61.208.1     20
vs0
                0.0.0.0/0       10.61.208.1     20
3 entries were displayed.
```

network route active-entry show

Display active routes

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

The `network route active-entry show` command displays installed routes on one or more nodes. You can view routes within specified nodes, within specified Vservers, routes in specified subnet groups, and routes with specified destinations.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-verbose ] (privilege: advanced)`

Use this parameter to display the reference count, use, interface, and Path MTU fields.

`[-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-vserver <vserver>] - Vserver Name (privilege: advanced)`

Displays the routes that have the specified Vserver as their origin.

`[-node {<nodename>|local}] - Node (privilege: advanced)`

Displays the routes from the specified node.

`[-address-type {ipv4|ipv6|ipv6z}] - Address Family (privilege: advanced)`

Displays the routes that have the specified IP address type.

`[-subnet-group <IP Address/Mask>] - Subnet Group (privilege: advanced)`

Displays the group of routes that belong to the specified subnet. Routes within the specified subnet group are used first before the default set. The "default" subnet group is a system-provided set of default routes.

`[-destination <text>] - Destination (privilege: advanced)`

Displays the routes that have the specified IP address or subnet as their destination. The format for the subnet is: `<address>/<mask>`. IPv6 address includes the scope value after percentage ("%"). `0.0.0.0/0`, `169.254.4.60`, `ff02::%e0a/32` and `fe80::250:56ff:fea6:db7c%e0b` are valid values for this parameter.

`[-interface <text>] - Interface Name (privilege: advanced)`

Displays the routes that use the specified interface to transmit packets to the destination. A valid interface has the format of `{<netport>|<ifgrp>}`, such as `"e0a"`, `"e0a-1"` and `"a0a"`, or it can be a loopback interface, such as `"lo"` and `"losk"`.

`[-route-interface-address <text>] - Route Interface Address (privilege: advanced)`

Displays the routes that use the specified IP address on the transmit interface.

`[-gateway <text>] - Route gateway (privilege: advanced)`

Displays the routes that have the specified gateway. The gateway can be an IP address, such as `"10.10.2.1"` and `"fe80::1%lo"`, MAC address, such as `"0:5:73:a0:1:7"` or refer to a local link, such as `"link#3"`.

`[-metric <integer>] - Metric (privilege: advanced)`

Displays the routes that have the specified metric.

[`-flags <text>`] - Flags (privilege: advanced)

Displays the routes that have the specified flags. The type string for "`-flags`" needs to be one or more of the following {U|G|H|R|D|S|1|2|L|C} in the order shown.

- U - Usable
- G - Gateway
- H - Host
- R - Reject
- D - Dynamic
- S - Static
- 1 - Protocol1
- 2 - Protocol2
- L - LInfo
- C - Clone

Multiple values can be specified (for example: UHL).

[`-reference-count <integer>`] - Reference Count (privilege: advanced)

Displays the routes that have the specified reference count in the system.

[`-lookup-count <integer>`] - Lookup Count (privilege: advanced)

Displays the routes that have the specified use count (the count of lookups for the route).

[`-path-mtu <integer>`] - Path MTU (privilege: advanced)

Displays the routes that have the specified path maximum transmission unit.

Examples

The following example displays active routes on all nodes in Vserver vs0 with subnet-group 10.10.10.0/24.

```
cluster1::*> network route active-entry show -vserver vs0 -subnet-group
10.10.10.0/24
(network route active-entry show)
```

Vserver: vs0

Node: node1

Subnet Group: 10.10.10.0/24

Destination	Gateway	Interface	Metric	Flags
-----	-----	-----	-----	-----
default	10.10.10.1	e0c	0	UGS

Vserver: vs0

Node: node2

Subnet Group: 10.10.10.0/24

Destination	Gateway	Interface	Metric	Flags
-----	-----	-----	-----	-----
default	10.10.10.1	e0c	0	UGS

2 entries were displayed.

network subnet commands

network subnet add-ranges

Add new address ranges to a subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Add new address ranges to a subnet.

All addresses in a range must be the same address family (IPv4 or IPv6) and must have the same subnet mask. Ranges that overlap or are next to existing ranges will be merged with the existing ranges.

Parameters

-ip-space <IPspace> - IPspace Name

The IPspace in which the range resides.

-subnet-name <subnet name> - Subnet Name

The name of the subnet.

-ip-ranges {<ipaddr>|<ipaddr>-<ipaddr>} - IP Ranges

The list of ranges to add to the subnet.

[-force-update-lif-associations <true>] - Force Update LIF Associations

This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.

Examples

The following example allocates addresses for subnet *s1* in IPspace *Default*.

```
cluster1:> network subnet add-ranges -ip-space Default -subnet-name s1
        -ip-ranges "10.98.1.20-10.98.1.30, 10.98.1.35, 10.98.1.40-10.98.1.49"
```

network subnet create

Create a new layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Create a new subnet.

Parameters

[-ip-space <IPspace>] - IPspace Name

The IPspace to which the new subnet belongs.

-subnet-name <subnet name> - Subnet Name

The name of the subnet to be created. The name of the subnet needs to be unique within the IPspace.

-broadcast-domain <Broadcast Domain> - Broadcast Domain

The broadcast domain to which the new subnet belongs.

-subnet <IP Address/Mask> - Layer 3 Subnet

The address and mask of the subnet.

[-gateway <IP Address>] - Gateway

The gateway of the subnet.

[-ip-ranges {<ipaddr>|<ipaddr>-<ipaddr>}] - IP Addresses or IP Address Ranges

The IP ranges associated with this subnet.

[-force-update-lif-associations <true>] - Change the subnet association

This command will fail if any service processor interfaces or network interfaces are using the IP addresses in the ranges provided. Using this parameter will associate any manually addressed interfaces with the subnet and will allow the command to succeed.

Examples

The following examples create subnets named *s1* and *s6* in IPspace *Default*.

```
cluster1::> network subnet create -ipspace Default -broadcast-domain bd1
-subnet-name s1
-subnet 192.168.1.0/24 -gateway 192.168.1.1 -ip-ranges "192.168.1.1-
192.168.1.100, 192.168.1.112, 192.168.1.145"
```

```
cluster1::> network subnet create -ipspace Default -broadcast-domain bd1
-subnet-name s6
-subnet 3FFE::/64 -gateway 3FFE::1 -ip-ranges "3FFE::10-3FFE::20"
```

network subnet delete

Delete an existing subnet object

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Delete a subnet that contains no ports.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the subnet belongs.

-subnet-name <subnet name> - Subnet Name

The name of the subnet to be deleted.

[-force-update-lif-associations <true>] - Change the subnet association

This command will fail if the subnet has ranges containing any existing service processor interface or network interface IP addresses. Setting this value to true will remove the network interface associations with the subnet and allow the command to succeed. However, it will not affect service processor interfaces.

Examples

The following example deletes subnet *s1* in IPspace *Default*.

```
cluster1::> network subnet delete -ipspace Default -subnet-name s1
```

network subnet modify

Modify a layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Modify a subnet.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the subnet belongs.

-subnet-name <subnet name> - Subnet Name

The name of the subnet to modify.

[-subnet <IP Address/Mask>] - Layer 3 Subnet

The new address and mask of the subnet.

[-gateway <IP Address>] - Gateway

The new gateway address.

[-ip-ranges {<ipaddr>|<ipaddr>-<ipaddr>}] - IP Addresses or IP Address Ranges

The new IP ranges for this subnet.

[-force-update-lif-associations <true>] - Change the subnet association

This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being added. It will also fail if any existing service processor interfaces or network interfaces are using IP addresses in the IP ranges being removed. Using this parameter will associate the interfaces with the IP addresses in the ranges being added to the subnet. It will also remove the subnet's association with the interfaces with IP addresses in the IP ranges being removed and will allow the command to succeed.

Examples

The following example modifies the subnet address and gateway.

```
cluster1::> network subnet modify -ipspace Default -subnet-name s1 -subnet
192.168.2.0/24 -gateway 192.168.2.1
```

network subnet remove-ranges

Remove address ranges from a subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Remove address ranges from a subnet.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace in which the range resides.

-subnet-name <subnet name> - Subnet Name

The name of the subnet.

-ip-ranges {<ipaddr>|<ipaddr>-<ipaddr>} - IP Ranges

IP ranges to remove.

[-force-update-lif-associations <true>] - Force Update LIF Associations

This command will fail if any existing service processor interfaces or network interfaces are using IP addresses in the ranges provided. Using this parameter will remove the subnet's association with those interfaces and allow the command to succeed.

Examples

The following example removes an address range with starting address of *10.98.1.1* from subnet *s1* in IPspace *Default*.

```
cluster1::> network subnet remove-ranges -ipspace Default -subnet-name s1
-ip-ranges "10.98.1.1-10.98.1.30"
```

network subnet rename

Rename a layer 3 subnet

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Rename a Subnet.

Parameters

-ipspace <IPspace> - IPspace Name

The IPspace to which the subnet belongs.

-subnet-name <subnet name> - Subnet Name

The name of the subnet to rename.

-new-name <text> - New Name

The new name for the subnet.

Examples

The following example renames subnet *s1* to *s3*.

```
cluster1::> network subnet rename -ipspace Default -subnet s1 -new-name s3
```

network subnet show

Display subnet information

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Display subnet information.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ipspace <IPspace>] - IPspace Name

Selects the subnets that match the given IPspace name.

[-subnet-name <subnet name>] - Subnet Name

Selects the subnets that match the given subnet name.

[-broadcast-domain <Broadcast Domain>] - Broadcast Domain

Selects the subnets that match the given broadcast domain name.

[-subnet <IP Address/Mask>] - Layer 3 Subnet

Selects the subnets that match the given address and mask.

[-gateway <IP Address>] - Gateway

Selects the subnets that match the given gateway address.

[-ip-ranges {<ipaddr>|<ipaddr>-<ipaddr>}] - IP Addresses or IP Address Ranges

Selects the subnets that match the given IP range.

[-total-count <integer>] - Total Address Count

Selects the subnets that match the given total address count.

[-used-count <integer>] - Used Address Count

Selects the subnets that match the given number of addresses allocated.

[-available-count <integer>] - Available Address Count

Selects the subnets that match the given number of addresses available.

Examples

The following example displays general information about the subnets.

```
cluster1::> network subnet show
IPspace: Default
  Subnet
  Name      Subnet      Broadcast
  -----
s4          192.168.4.0/24  bd4
192.168.5.6-192.168.5.10
s6          192.168.6.0/24  bd4
192.168.6.6-192.168.6.10
IPspace: ips1
  Subnet
  Name      Subnet      Broadcast
  -----
s10         192.168.6.0/24  bd10
192.168.6.1-192.168.6.10
3 entries were displayed.
```

network test-link commands

network test-link run-test

Test link bandwidth

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link run-test` command runs a performance test between two nodes. The command requires a source node, Vserver, and destination address.

Before executing the `network test-link run-test` command, the [network test-link start-server](#) command must be run to start a server on the node hosting the destination LIF. After all tests to that node are complete the [network test-link stop-server](#) command must be run to stop the server.

The test results are stored non-persistently and can be viewed using the [network test-link show](#) command. Results include input parameters, the bandwidth achieved, and the date and time of the test.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

Use this parameter to specify the node which initiates the test.

-vserver <vserver> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver to access the destination LIF. DC (Data Channel) Vserver option is available only in an ONTAP Select or Cloud Volumes ONTAP cluster. It is a special vservers that hosts LIFs that are used to mirror data aggregates to partner node.

-destination <Remote InetAddress> - Destination (privilege: advanced)

Use this parameter to specify the destination IP address.

Examples

The following example runs a test between the cluster LIFs, including the start and stop of the server side of the test:

```
cluster1::*> network test-link start-server -node node1

cluster1::*> network test-link run-test -node node2 -vserver Cluster
-destination 172.31.112.173
Node: node2
    Vserver: Cluster
    Destination: 172.31.112.173
Time of Test: 4/22/2016 15:33:18
    MB/s: 41.2678

cluster1::*> network test-link stop-server -node node1
cluster1::*> network test-link show
```

Node	Vserver	Destination	Time of Test
MB/s			
node2	Cluster	172.31.112.173	4/22/2016
15:33:18	41.2678

- [network test-link start-server](#)
- [network test-link stop-server](#)
- [network test-link show](#)

network test-link show

Display test results

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link show` command displays the results of prior [network test-link run-test](#) commands.

The test results are stored non-persistently and can be viewed using the `network test-link show` command. Results include input parameters, the bandwidth achieved, and the date and time of the test.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`-node {<nodename>|local} - Node (privilege: advanced)`

Selects the nodes that match this parameter value. Use this parameter to display the test results specific to a node. By default, the test results across all nodes are shown.

`-vserver <vserver> - Vserver (privilege: advanced)`

Use this parameter to display the test results specific to a Vserver. Use DC (Data Channel) Vserver option only in an ONTAP Select or Cloud Volumes ONTAP cluster to show network performance of links hosting DC LIFs. DC Vserver is a special Vserver that hosts LIFs that are used to mirror data aggregates to partner node

`[-destination <Remote InetAddress>] - Destination (privilege: advanced)`

Use this parameter to display the test results associated with the specified destination.

`[-timestamp <MM/DD/YYYY HH:MM:SS>] - Time of Test (privilege: advanced)`

Use this parameter to display the test results with the specified timestamp.

`[-bandwidth <double>] - MB/s (privilege: advanced)`

Use this parameter to display the test results only matching the specified bandwidth.

Examples

The following example runs a test between the cluster LIFs twice and then demonstrates the show command results:

```

cluster1::*> network test-link run-test -node node2 -vserver Cluster
-destination 172.31.112.173
Node: node2
    Vserver: Cluster
    Destination: 172.31.112.173
Time of Test: 4/25/2016 10:37:52
    MB/s: 29.9946

cluster1::*> network test-link run-test -node node2 -vserver Cluster
-destination 172.31.112.173
Node: node2
    Vserver: Cluster
    Destination: 172.31.112.173
Time of Test: 4/25/2016 10:38:32
    MB/s: 39.8192

cluster1::*> network test-link show -node node2 -vserver Cluster
Node          Vserver          Destination      Time of Test
MB/s
-----
node2          Cluster          172.31.112.173   4/25/2016
10:38:32      39.8192

```

- [network test-link run-test](#)

network test-link start-server

Start server for bandwidth test

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link start-server` command starts the server side of the `network test-link` test on the designated node.

Only one server at a time can be running for the `network test-link` command on a given node. If the `network test-link start-server` command is issued and a server is already running on the node, then the command is ignored, and the existing server continues to run.

The server started is listening on port 5201.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

Use this parameter to specify the node where the server is to be started.

Examples

The following example starts a server:

```
cluster1::*> network test-link start-server -node node1
```

network test-link stop-server

Stop server for bandwidth test

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `network test-link stop-server` command stops the `network test-link` server running on the designated node.

Parameters

-node {<nodename>|local} - Node Name (privilege: advanced)

Use this parameter to specify the node where the server is to be stopped.

Examples

The following example starts a server and stops it:

```
cluster1::*> network test-link start-server -node node1  
  
cluster1::*> network test-link stop-server -node node1
```

network tuning commands

network tuning icmp modify

Modify ICMP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays options which can be used to fine tune icmp protocol behavior.

Parameters

-node {<nodename>|local} - Node

Sets this parameter to indicate on which node the ICMP tuning options are modified.

`[-is-drop-redirect-enabled {true|false}] - Drop redirect ICMP`

Sets this parameter to drop redirect ICMP message.

`[-tx-icmp-limit <integer>] - Maximum number of ICMP packets sent per second`

Sets the maximum number of ICMP messages including TCP RSTs can be sent per second.

`[-redirect-timeout <integer>] - Maximum seconds for route redirect timeout`

Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.

Examples

```
cluster1::> network tuning icmp modify -node nodel -is-drop-redirect
-enabled false
```

network tuning icmp show

Show ICMP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the ICMP tuning options for the given node.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

Displays all ICMP tuning options.

`[-node {<nodename>|local}] - Node`

Specifies the node for which the ICMP tuning options are displayed.

`[-is-drop-redirect-enabled {true|false}] - Drop redirect ICMP`

Displays all entries that match the "is-drop-redirect-enabled" value.

`[-tx-icmp-limit <integer>] - Maximum number of ICMP packets sent per second`

Displays all entries that match the "tx-icmp-limit" value.

`[-redirect-timeout <integer>] - Maximum seconds for route redirect timeout`

Displays all the entries that match the "redirect-timeout" value.

Examples

```
cluster1::> network tuning icmp show
Drop Redirect Maximum ICMP      Redirect Timeout
Node      ICMP      Sends per Second  in Seconds
-----
node1
      true      100      300
```

network tuning icmp6 modify

Modify ICMPv6 tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays options which can be used to fine tune icmpv6 protocol behavior.

Parameters

-node {<nodename>|local} - Node

Sets this parameter to indicate on which node the ICMPv6 tuning options are modified.

[-is-v6-redirect-accepted {true|false}] - Accept redirects via ICMPv6

Sets this parameter to indicate whether or not redirect ICMPv6 messages are accepted.

[-redirect-v6-timeout <integer>] - Maximum seconds for route redirect timeout

Sets this parameter to indicate the number of seconds after which the route is deleted. Value of zero means infinity. The default value is 300 seconds.

[-tx-icmp6-err-limit <integer>] - Maximum number of ICMPv6 error messages sent per second

Sets the maximum number of ICMPv6 error messages that can be sent per second.

Examples

```
cluster1::> network tuning icmp6 modify -node node1 -is-v6-redirect
-accepted false
```

network tuning icmp6 show

Show ICMPv6 tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the ICMPv6 tuning options for the given node.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

Displays all ICMPv6 tuning options.

[-node {<nodename>|local}] - Node

Specifies the node for which the ICMPv6 tuning options are displayed.

[-is-v6-redirect-accepted {true|false}] - Accept redirects via ICMPv6

Displays all entries that match the "is-v6-redirect-accepted" value.

[-redirect-v6-timeout <integer>] - Maximum seconds for route redirect timeout

Displays all the entries that match the "redirect-v6-timeout" value.

[-tx-icmp6-err-limit <integer>] - Maximum number of ICMPv6 error messages sent per second

Displays all entries that match the "tx-icmp6-err-limit" value.

Examples

```
cluster1::> network tuning icmp6 show
Accept Redirect Maximum ICMPv6 Error Redirect Timeout
Node      ICMPv6          Sends per Second    in Seconds
-----
node1
           true          100                 300
```

network tuning tcp modify

Modify TCP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This commands sets TCP tuning options on the node.

Parameters

-node {<nodename>|local} - Node

Indicates on which node the TCP tuning options will be modified.

`[-is-path-mtu-discovery-enabled {true|false}] - Path MTU discovery enabled`

Enables path MTU discovery feature.

`[-is-rfc3465-enabled {true|false}] - RFC3465 enabled`

Enables the rfc3465 feature.

`[-max-cwnd-increment <integer>] - Maximum congestion window segments incrementation`

Sets the maximum congestion window increment segments during slow start.

`[-is-rfc3390-enabled {true|false}] - RFC3390 enabled`

Enables the rfc3390 feature.

`[-is-sack-enabled {true|false}] - SACK support enabled`

Enables the selective ACK feature.

Examples

```
cluster1:> network tuning tcp modify -node node1 -is-path-mtu-discovery
-enabled false
```

network tuning tcp show

Show TCP tuning options

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the current state of the TCP tuning options for the given node.

Parameters

`{ [-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] }`

Displays all TCP tuning options.

`[-node {<nodename>|local}] - Node`

Specifies the node for which the TCP tuning options will be displayed.

`[-is-path-mtu-discovery-enabled {true|false}] - Path MTU discovery enabled`

Displays all entries that match the "is-path-mtu-discovery-enabled" value.

`[-is-rfc3465-enabled {true|false}] - RFC3465 enabled`

Displays all entries that match the "is-rfc3465-enabled" value.

[-max-cwnd-increment <integer>] - Maximum congestion window segments incrementation

Displays all entries that match the "max-cwnd-increment" value.

[-is-rfc3390-enabled {true|false}] - RFC3390 enabled

Displays all entries that match the "is-rfc3390-enabled" value.

[-is-sack-enabled {true|false}] - SACK support enabled

Displays all entries that match the "is-sack-enabled" value.

Examples

```
cluster1::> network tuning tcp show
```

Node	Path MTU Discovery Enabled	Maximum RFC3465 Congestion Window RFC3390 Enabled	Incrementation	Selective Ack Enabled
node1	true	true	2	true

protection-type commands

protection-type show

Display the supported protection types and available RPOs

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the protection types available for application provisioning.

Parameters

[*-fields* <fieldname>,...]

Specifies fields that you want included in the output. You can use *-fields ?* to display the available fields.

[*-instance*] (privilege: advanced) }

Specifies the display of all available fields for each selected protection type.

[*-vserver* <vserver name>] - Vserver (privilege: advanced)

Selects the protection types of Vservers that match the parameter value.

[*-protection-type* {local|remote}] - Protection Type (privilege: advanced)

Selects the protection types that match the parameter value.

[*-rpo-list* <text>,...] - List of available RPOs (privilege: advanced)

Selects the protection types whose list of available RPOs matches the parameter value.

[*-rpo-list-description* <text>,...] - List of descriptions of available RPOs (privilege: advanced)

Selects the protection types whose list of description of available RPOs matches the parameter value.

[*-description* <text>] - Description of Protection Type (privilege: advanced)

Selects the protection types with a description that matches the parameter value.

Examples

The following example displays the protection types and the associated available RPOs for all Vservers in the cluster.

```
cluster1::*> protection-type show
```

```
Vserver Protection Type RPO List
```

```
-----
```

```
vs1
```

```
    local          hourly, none
```

```
    remote         none
```

```
vs2
```

```
    local          hourly, none
```

```
    remote         none, zero
```

qos commands

qos adaptive-policy-group commands

qos adaptive-policy-group create

Create an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group create` command creates a new adaptive policy group. After the adaptive policy group is created, you can assign one or more storage objects to the policy. When a storage object is assigned to an adaptive policy group, the maximum throughput QoS setting automatically adjusts based on the storage object used space or the storage object allocated space. QoS minimum throughput setting is calculated from the expected-iops parameter and the storage object allocated size. It is set only for the storage objects that reside on AFF platforms.

After you create an adaptive policy group, use the storage object create command or storage object modify command to apply the adaptive policy group to a storage object.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the [qos adaptive-policy-group rename](#) command to change the adaptive policy group name.

-vserver <vserver name> - Vserver

Specifies the data Vserver to which this adaptive policy group belongs to. You can apply this adaptive policy group to only the storage objects contained in the specified Vserver. If the system has only one Vserver, then the command uses that Vserver by default.

-expected-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)} - Expected IOPS

Specifies the minimum expected IOPS per TB or GB allocated based on the storage object allocated size.

-peak-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)} - Peak IOPS

Specifies the maximum possible IOPS per TB or GB allocated based on the storage object allocated size or the storage object used size.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS

Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:

if expected-iops >= 6144/TB, then absolute-min-iops = 1000IOPS; if expected-iops >= 2048/TB and expected-iops < 6144/TB, then absolute-min-iops = 500IOPS; if expected-iops >= 1/MB and expected-iops < 2048/TB, then absolute-min-iops = 75IOPS.

[`-expected-iops-allocation {used-space|allocated-space}`] - Expected IOPS Allocation

Specifies the expected IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the expected-iops-allocation policy is set to *allocated-space*, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to *used-space*, the expected IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *allocated-space*.

[`-peak-iops-allocation {used-space|allocated-space}`] - Peak IOPS Allocation

Specifies the peak IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the peak-iops-allocation policy is set to *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to *used-space*, the peak IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *used-space*.

[`-block-size {ANY|4K|8K|16K|32K|64K|128K}`] - Block Size

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

Examples

```
cluster1::> qos adaptive-policy-group create p1 -vserver vs1
               -expected-iops 100IOPS/TB -peak-iops 1000/TB
```

Creates the "p1" adaptive policy group which belongs to Vserver "vs1" with expected-iops of 100IOPS/TB and peak-iops of 1000IOPS/TB with default value for absolute-min-iops

```
cluster1::> qos adaptive-policy-group create p2 -vserver vs1
               -expected-iops 100IOPS/GB -peak-iops 1000IOPS/GB
               -absolute-min-iops 200IOPS
```

Creates the "p1" adaptive policy group which belongs to Vserver "vs1" with expected-iops of 100IOPS/TB and peak-iops of 1000IOPS/TB with the absolute-min-iops set to 200IOPS.

- [qos adaptive-policy-group rename](#)

qos adaptive-policy-group delete

Delete an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group delete` command deletes an adaptive policy group from a cluster. You cannot delete a policy group if a QoS workload associated with a storage object is assigned to it unless you

use the `-force` parameter. Using the `-force` parameter will delete all the QoS workloads for storage objects associated with the specified adaptive policy groups .

Only user created adaptive policy groups can be deleted. Default adaptive policy groups are read only and cannot be deleted.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group that you want to delete.

[-force <true>] - Force Delete Workloads for the QoS adaptive policy group (privilege: advanced)

Specifies whether to delete an adaptive policy group along with any underlying workloads.

Examples

The following example deletes "p1" adaptive policy group:

```
cluster1::> qos adaptive-policy-group delete p1
```

Deletes the "p1" adaptive policy group along with any underlying QoS workloads.

```
cluster1::> qos adaptive-policy-group delete p1 -force
```

qos adaptive-policy-group modify

Modify an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group modify` command modifies an adaptive policy group.

Only user-created adaptive policy groups can be modified. Default adaptive policy groups are read-only and cannot be modified.

Parameters

-policy-group <text> - Name

Specifies the name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character. Use the [qos adaptive-policy-group rename](#) command to change the adaptive policy group name.

[-expected-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)}] - Expected IOPS

Specifies the minimum expected IOPS per TB or GB allocated based on the storage object allocated size.

QoS minimum throughput setting is calculated from the expected-iops parameter. It is set only for the storage objects that reside on AFF platforms.

`[-peak-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)}] - Peak IOPS`

Specifies the maximum possible IOPS per TB or GB allocated based on the storage object allocated size or the storage object used size.

`[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS`

Specifies the absolute minimum IOPS which is used as an override when the expected IOPS is less than this value. The default value is computed as follows:

if expected-iops >= 6144/TB, then absolute-min-iops = 1000IOPS; if expected-iops >= 2048/TB and expected-iops < 6144/TB, then absolute-min-iops = 500IOPS; if expected-iops >= 1/MB and expected-iops < 2048/TB, then absolute-min-iops = 75IOPS.

`[-expected-iops-allocation {used-space|allocated-space}] - Expected IOPS Allocation`

Specifies the expected IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the expected-iops-allocation policy is set to *allocated-space*, the expected IOPS is calculated based on the size of the storage object. When the expected-iops-allocation policy is set to *used-space*, the expected IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *allocated-space*.

`[-peak-iops-allocation {used-space|allocated-space}] - Peak IOPS Allocation`

Specifies the peak IOPS allocation policy. The allocation policy is either *allocated-space* or *used-space*. When the peak-iops-allocation policy is set to *allocated-space*, the peak IOPS is calculated based on the size of the storage object. When the peak-iops-allocation policy is set to *used-space*, the peak IOPS is calculated based on the amount of data stored in the storage object taking into account storage efficiencies. The default value is *used-space*.

`[-block-size {ANY|4K|8K|16K|32K|64K|128K}] - Block Size`

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

Examples

The following example modifies the "p1" adaptive policy group with specified values.

```
cluster1::> qos adaptive-policy-group modify -policy-group p1
           -expected-iops 200IOPS/TB -peak-iops 2000IOPS/TB
           -absolute-min-iops 100IOPS
```

- [qos adaptive-policy-group rename](#)

qos adaptive-policy-group rename

Rename an adaptive policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group rename` command changes the name of an existing adaptive policy group.

Parameters

-policy-group <text> - Name

Specifies the existing name of the adaptive policy group that you want to rename.

-new-name <text> - New adaptive policy group name

Specifies the new name of the adaptive policy group. Adaptive policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Adaptive policy group names must start with an alphanumeric character.

Examples

```
cluster1::> qos adaptive-policy-group rename -policy-group p1 -new-name  
p1_new
```

Renames the adaptive policy group from "p1" to "p1_new".

qos adaptive-policy-group show

Display a list of adaptive policy groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos adaptive-policy-group show` command shows the current settings of the adaptive policy groups on a cluster. You can view the list of adaptive policy groups and also the detailed information about a specific adaptive policy group.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-policy-group <text>] - Name

Selects the adaptive policy groups that match this parameter value.

Adaptive policy groups define measurable service level objectives (SLOs) that adjust based on the storage object used space or the storage object allocated space.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information only about the adaptive policy groups with a matching vservers.

[-uuid <UUID>] - Uuid

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified UUID.

[-pgid <integer>] - ID

If this parameter is specified, the command displays information only about the adaptive policy groups that match the given policy group ID, which is an integer that uniquely identifies the adaptive policy group.

[-expected-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)}] - Expected IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified minimum expected IOPS per TB or GB.

[-peak-iops {<integer>[IOPS[/{GB|TB}]] (default: TB)}] - Peak IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified maximum possible IOPS per TB or GB.

[-absolute-min-iops <qos_tput>] - Absolute Minimum IOPS

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified absolute minimum IOPS.

[-expected-iops-allocation {used-space|allocated-space}] - Expected IOPS Allocation

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified expected IOPS allocation policy used to compute the expected IOPS per TB or GB.

[-peak-iops-allocation {used-space|allocated-space}] - Peak IOPS Allocation

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified peak IOPS allocation policy used to compute the maximum possible IOPS per TB or GB.

[-block-size {ANY|4K|8K|16K|32K|64K|128K}] - Block Size

Specifies the I/O block size for the QoS adaptive policy group. The default value is "ANY". When block-size of "ANY" is specified, then control is by IOPS. When block-size other than "ANY" is specified, then control is by IOPS and bytes per second(bps). bps is the product of IOPS and block-size.

[-num-workloads <integer>] - Number of Workloads

If this parameter is specified, the command displays information only about the adaptive policy groups with the specified number of workloads.

Examples

The example above displays all adaptive policy groups on the cluster.

```
cluster1::> qos adaptive-policy-group show
qos adaptive-policy-group show
Expected      Peak      Minimum  Block
Name          Vserver Wklds   IOPS      IOPS      IOPS      Size
-----
apg1          vs1      1       100IOPS/MB 1000IOPS/MB 75IOPS    8K
apg2          vs1      1       100IOPS/MB 1000IOPS/MB 75IOPS    4K

value         clus-1   0       128IOPS/TB 512IOPS/TB 75IOPS    ANY
5 entries were displayed.
```

qos policy-group commands

qos policy-group create

Create a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group create` command creates a new policy group. You can use a QoS policy group to control a set of storage objects known as "workloads" - LUNs, volumes, files, or Vservers. Policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated.

After you create a policy group, you use the storage object create command or the storage object modify command to apply the policy group to a storage object.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character. You use the [qos policy-group rename](#) command to change the policy group name.

-vserver <vserver name> - Vserver

Specifies the data Vserver to which this policy group belongs. You can apply this policy group to only the storage objects contained in the specified Vserver. For example, if you want to apply this policy group to a volume, that volume must belong to the specified Vserver. Using this parameter does not apply the policy group's SLOs to the Vserver. You need to use the vserver modify command if you want to apply this policy group to the Vserver. If the system has only one Vserver, then the command uses that Vserver by default.

[-max-throughput <qos_tput>] - Maximum Throughput

Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is

internally treated as infinity.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note that there is no default unit - all numbers except zero require explicit specification of the units.

Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", "100iops", "100iops,400KB/s", and "800KB/s,100iops"

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", "100iops", "100iops,400KB/s", and "800KB/s,100iops"

[-is-shared {true|false}] - Is Shared

Specifies whether the policy group can be shared or not. The default value is "true". This parameter specifies if the SLOs of the policy group are shared between the workloads or if the SLOs are applied separately to each workload.

Examples

```
cluster1::> qos policy-group create p1 -vserver vs1
```

Creates the "p1" policy group which belongs to Vserver "vs1" with default policy values.

```
cluster1::> qos policy-group create p2 -vserver vs1 -max-throughput  
500MB/s
```

Creates the "p2" policy group which belongs to Vserver "vs1" with the maximum throughput set to 500 MB/s.

```
cluster1::> qos policy-group create p3 -vserver vs1 -max-throughput  
500MB/s -is-shared false
```

Creates the "p3" policy group which belongs to Vserver "vs1" with the maximum throughput set to 500 MB/s and shared set to false.

- [qos policy-group rename](#)

qos policy-group delete

Delete an existing QoS Policy Group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group delete` command deletes a policy group from a cluster. You cannot delete a policy group if a qos workload associated with storage object is assigned to it unless you use "-force". Using "-force" will delete all the qos workloads for storage objects associated with the specified policy groups .

You can only delete user-defined policy groups. You cannot delete preset policy groups.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group that you want to delete.

[-force <true>] - Force Delete Workloads for the QoS Policy Group (privilege: advanced)

Specifies whether to delete a policy group along with any underlying workloads.

Examples

```
cluster1::> qos policy-group delete p1
```

Deletes the "p1" policy group.

```
cluster1::> qos policy-group delete p1 -force
```

Deletes the "p1" policy group along with any underlying qos workloads.

qos policy-group modify

Modify a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group modify` command modifies a user-created policy group.

Parameters

-policy-group <text> - Policy Group Name

Specifies the name of the policy group that you want to modify.

[-max-throughput <qos_tput>] - Maximum Throughput

Specifies the maximum throughput for the policy group. A maximum throughput limit specifies the throughput that the policy group must not exceed. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s. The range is one to infinity. A value of zero is accepted but is internally treated as infinity.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for max-throughput is infinity, which can be specified by the special value "INF". Note there is no default unit - all numbers except zero require explicit specification of the units.

Two reserved keywords, "none" and "INF", are available for the situation that requires removal of a value, and the situation that needs to specify the maximum available value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", and "100iops".

[-min-throughput <qos_tput>] - Minimum Throughput

Specifies the minimum throughput for the policy group. A minimum throughput specifies the desired performance level for a policy group. It is specified in terms of IOPS or MB/s, or a combination of comma separated IOPS and MB/s.

The values entered here are case-insensitive, and the units are base ten. There should be no space between the number and the units. The default value for min-throughput is "0". The default unit is IOPS.

One reserved keyword, 'none' is available for the situation that requires removal of a value.

Examples of valid throughput specifications are: "100B/s", "10KB/s", "1gb/s", "500MB/s", "1tb/s", "100iops", "100iops,400KB/s", and "800KB/s,100iops"

Examples

```
cluster1::> qos policy-group modify pl -max-throughput 10IOPS
```

Modifies the "p1" policy group and sets its max throughput value to 10 IOPS.

qos policy-group rename

Rename a policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group rename` command changes the name of an existing policy group.

Parameters

-policy-group <text> - Policy Group Name

Specifies the existing name of the policy group that you want to rename.

-new-name <text> - New Policy Group Name

Specifies the new name of the policy group. Policy group names must be unique and are restricted to 127 alphanumeric characters including underscores "_" and hyphens "-". Policy group names must start with an alphanumeric character.

Examples

```
cluster1::> qos policy-group rename -policy-group p1 -new-name p1_new
```

Renames the policy group from "p1" to "p1_new".

qos policy-group show

Display a list of policy groups

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos policy-group show` command shows the current settings of the policy groups on a cluster. You can display a list of the policy groups and you can view detailed information about a specific policy group.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-policy-group <text>] - Policy Group Name

Selects the policy groups that match this parameter value

Policy groups define measurable service level objectives (SLOs) that apply to the storage objects with which the policy group is associated.

[-vserver <vserver name>] - Vserver

Selects the policy groups that match this parameter value

[-uuid <UUID>] - Uuid

Selects the policy groups that match this parameter value

[-class <QoS Configuration Class>] - Policy Group Class

Selects the policy groups that match this parameter value

[-pgid <integer>] - Policy Group ID

Selects the policy groups that match this parameter value

This uniquely identifies the policy group

[-max-throughput <qos_tput>] - Maximum Throughput

Selects the policy groups that match this parameter value

A maximum throughput limit specifies the throughput (in IOPS or MB/s) that the policy group must not exceed.

[-min-throughput <qos_tput>] - Minimum Throughput

Selects the policy groups that match this parameter value

A minimum throughput specifies the desired performance level for a policy group.

[-num-workloads <integer>] - Number of Workloads

Selects the policy groups that match this parameter value.

[-throughput-policy <text>] - Throughput Policy

Selects the policy groups that match this parameter value. You can specify the throughput range in terms of IOPS or data rate. For example, 0-INF, 0-400IOPS, 0-200KB/s, 0-400MB/s .

[-is-shared {true|false}] - Is Shared

Selects the policy groups that match this parameter value.

The shared value specifies whether the policy group is a shared policy group or not.

[-is-auto-generated {true|false}] - Is Policy Auto Generated

Selects the policy groups that match this parameter value.

The auto-generated value specifies whether the policy group is an automatically generated policy group or not.

Examples

```
cluster1::> qos policy-group show
Name                Vserver      Class           Wklds Throughput
-----
pg1                 vs4          user-defined    0      0-200IOPS
pg2                 vs0          user-defined    0      0-500IOPS
pg5                 vs0          user-defined    0      0-300IOPS
pg6                 vs0          user-defined    0      0-INF
4 entries were displayed.
```

The example above displays all policy groups on the cluster.

qos settings commands

qos settings nested-qos-svm-vol

Enable/Disable SVM Vol level Nested QoS feature

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `qos settings nested-qos-svm-vol` command is used to enable or disable the nested QoS feature at SVM-Vol level. The default is enabled. With this feature enabled, the user can attach a shared policy group on the parent SVM while the child FlexGroup/FlexVol already has a shared, non shared or adaptive policy group attached to it or vice versa.

Parameters

-enable {true|false} - enable or disable svm vol level nested QoS feature (privilege: advanced)

This specifies if nested QoS feature at SVM-Vol level is enabled or disabled. If this parameter is specified with *false* nested QoS at SVM-Vol level will be disabled.

Examples

The following example disables nested QoS feature at SVM-Vol level.

```
cluster1::*> qos settings nested-qos-svm-vol -enable false
```

qos settings throughput-floors-v2

Enable/Disable throughput floors v2 on AFF

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `qos settings throughput-floors-v2` command is used to enable or disable floors v2 on AFF. The default is enabled. With floors v2 enabled, throughput floors can be met when controllers are heavily utilized at the expense of higher latency on other workloads. Floors v2 applies to both QoS and Adaptive QoS.

Parameters

-enable {true|false} - enable or disable throughput floors v2 on AFF (privilege: advanced)

This specifies if floors v2 is enabled or disabled. If this parameter is specified with *false* floors v2 will be disabled.

Examples

The following example disables floors v2 on AFF.

```
cluster1::*> qos settings throughput-floors-v2 -enable false
```

qos settings cache modify

Modify the cache policy

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos settings cache modify` command modifies the existing default caching-policy. The list of caching policies can be obtained from the `qos setting cache show -fields cache-setting` command.

Parameters

-cache-setting <text> - Cache Policy Name

Valid inputs to this parameter include any one of the listed caching-policies. This command is to be used together with the default parameter. If you use this parameter, the command modifies the specified caching-policy based on the default parameter.

[-default {true|false}] - Is Default?

Valid inputs to this parameter are true and false. Together with cache-setting, this parameter helps set or unset a caching-policy as default.

Examples

```
cluster1:::> qos settings cache modify -default true -cache-setting  
random_read_write-random_write
```

Sets caching-policy random_read_write-random_write as default.

qos settings cache show

Display list of cache policies

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos settings cache show`` shows the current caching-policies, class to which they belong, the number of workloads associated with each of the policies, and whether or not they are set to default. The following external-cache policies are available:

- none - Does not cache any user data or metadata blocks.
- auto - Read caches all metadata and randomly read user data blocks, and write caches all randomly overwritten user data blocks.
- all - Read caches all data blocks read and written. It does not do any write caching.

- all-random_write - Read caches all data blocks read and written. It also write caches randomly overwritten user data blocks.
- all_read - Read caches all metadata, randomly read, and sequentially read user data blocks.
- all_read-random_write - Read caches all metadata, randomly read, and sequentially read user data blocks. It also write caches randomly overwritten user data blocks.
- all_read_random_write - Read caches all metadata, randomly read, sequentially read and randomly written user data.
- all_read_random_write-random_write - Read caches all metadata, randomly read, sequentially read, and randomly written user data blocks. It also write caches randomly overwritten user data blocks.
- meta - Read caches only metadata blocks.
- meta-random_write - Read caches all metadata and write caches randomly overwritten user data blocks.
- noread-random_write - Write caches all randomly overwritten user data blocks. It does not do any read caching.
- random_read - Read caches all metadata and randomly read user data blocks.
- random_read_write - Read caches all metadata, randomly read and randomly written user data blocks.
- random_read_write-random_write - Read caches all metadata, randomly read, and randomly written user data blocks. It also write caches randomly overwritten user data blocks.

Note that in a caching-policy name, a hyphen (-) separates read and write caching policies.

Parameters

{ [-fields <fieldname>,...]

The input to this parameter is one of the following: {cache-setting|class|default|num-workloads}. If you use this parameter, the command displays information related to the specified input field.

| [-instance] }

If you use this parameter, the command displays information about the caching-policies in a list format.

[-cache-setting <text>] - Cache Policy Name

The input to this parameter is any one of the above listed caching-policies. If you use this parameter, the command displays information corresponding to the specified caching-policy.

[-class <QoS Configuration Class>] - Cache Policy Class

The input to this parameter is one of the following: {undefined|preset|user-defined|system-defined|autovolume}. If you use this parameter, the command displays information corresponding to the specified policy-group class.

[-default {true|false}] - Is Default?

The input to this parameter is true and false. If you use this parameter, the command displays information corresponding to entries that have the specified default value.

[-num-workloads <integer>] - Number Of Workloads With This Policy

The input to this parameter is an integer. If you use this parameter, the command displays information about policy-groups matching the specified number of workloads.

Examples

```
cluster1::> qos settings cache show
Policy Name   Class           Num Workloads   Default
-----
all           preset          0               false
all-random_write
              preset          0               false
all_read      preset          0               false
all_read-random_write
              preset          0               false
all_read_random_write
              preset          0               false
all_read_random_write-random_write
              preset          0               false
auto          preset          2               false
meta          preset          0               false
meta-random_write
              preset          0               false
none          preset          0               false
noread-random_write
              preset          0               false
random_read   preset          25              false
random_read_write
              preset          0               false
random_read_write-random_write
              preset          28              true
14 entries were displayed.
```

Shows QoS settings for the caching policies.

qos statistics commands

qos statistics characteristics show

Display QoS policy group characterization

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics characteristics show` command displays data that characterizes the behavior of QoS policy groups.

The command displays the following data:

- The QoS policy group name (Policy Group)

- Input/output operations performed per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total I/O (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

[`-node {<nodename>|local}`]] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations <integer>`]] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [`-rows <integer>`]] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

| [`-policy-group <text>`]] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

| [`-adaptive-policy-group <text>`]] - Adaptive QoS Policy Group Name }

Selects the QoS adaptive policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[`-refresh-display {true|false}`]] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics characteristics show -iterations 100 -rows 4
Policy Group          IOPS      Throughput Request size  Read
Concurrency
-----

1
```

The example above displays the system characteristics of the QoS policy group *pg1* and refreshes the display *100* times before terminating.

qos statistics latency show

Display latency breakdown data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics latency show` command displays the average latencies for QoS policy groups across the various ONTAP subsystems.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the N-Blade subsystem (N-Blade)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the D-Blade subsystem (D-Blade)
- Latency observed per I/O operation in the Storage subsystem (Disk)

- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)
- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store (Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for SnapMirror Synchronous (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations
- Latency observed per I/O operation for Anti Virus Scan (AVSCAN) operations
- Latency observed per I/O operation in the Network queues (Network)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons related to CP (Susp-CP)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons not related to CP (Susp-Other)
- Latency observed for I/O operations in D-Blade response queues (WAFL Resp)

The results displayed per iteration are sorted by the Latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms), observed across all QoS policy groups.

Parameters

[`-node {<nodename>|local}`] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations <integer>`] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [`-rows <integer>`] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

| [`-policy-group <text>`] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

| [`-adaptive-policy-group <text>`] - Adaptive QoS Policy Group Name }

Selects the QoS adaptive policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[`-refresh-display {true|false}`] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics latency show -iterations 100 -rows 3
```

The example above displays latencies for the QoS policy group *pg1* and refreshes the display 100 times before terminating.

qos statistics performance show

Display system performance data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics performance show` command shows the current system performance levels that QoS policy groups are achieving.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS policy groups. Other columns in this row are either totals or averages.

Parameters

[`-node` {<nodename>|local}] - Node

Selects the policy groups that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations` <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [`-rows` <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

| [`-policy-group` <text>] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

| [`-adaptive-policy-group` <text>] - Adaptive QoS Policy Group Name }

Selects the QoS adaptive policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[`-refresh-display` {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics performance show -iterations 100 -rows 4
```

Policy Group	IOPS	Throughput	Latency
-----	-----	-----	-----
-total-	79	1296.00KB/s	337.41ms
_System-Best-Effort	25	0KB/s	0ms
vol1	24	96.00KB/s	193.72ms
vol2	18	1152.00KB/s	750.98ms
vs1vol0	12	48.00KB/s	707.38ms
-total-	109	1.99MB/s	133.27ms
_System-Best-Effort	35	0KB/s	0ms
vol2	29	1.81MB/s	249.27ms
vs1vol0	24	96.00KB/s	48.32ms
vol1	21	84.00KB/s	292.30ms

The example above displays the system performance for the 4 QoS policy groups with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics performance show -iterations 100 -policy-group pg1
```

Policy Group	IOPS	Throughput	Latency
-----	-----	-----	-----
-total-	2833	10.66MB/s	924.00us
pg1	2655	10.37MB/s	917.00us
-total-	2837	10.65MB/s	923.00us
pg1	2655	10.37MB/s	917.00us
-total-	2799	10.73MB/s	802.00us
pg1	2737	10.69MB/s	815.00us
-total-	2930	13.33MB/s	905.00us
pg1	2720	10.62MB/s	858.00us

The example above displays the system performance for the QoS policy group *pg1* and refreshes the display 100 times before terminating.

qos statistics resource cpu show

Display CPU resource utilization data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics resource cpu show` command displays the CPU utilization for QoS policy groups per node.

The command displays the following data:

- The QoS policy group name (Policy Group)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS policy groups.

Parameters

-node {<nodename>|local} - Node

Selects the policy groups that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

| [-policy-group <text>] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

| [-adaptive-policy-group <text>] - Adaptive QoS Policy Group Name }

Selects the QoS adaptive policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1:> qos statistics resource cpu show -node nodeA -iterations 100
-rows 3
```

Policy Group	CPU

-total- (100%)	9%
fast	1%
slow	3%
medium	5%
-total- (100%)	8%
slow	1%
fast	3%
medium	3%

The example above displays the total CPU utilization for the 3 QoS policy groups with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics resource cpu show -node local -iterations 100
-policy-group pg1
```

Policy Group	CPU
-----	-----
-total- (100%)	7%
pg1	1%
-total- (100%)	7%
pg1	1%
-total- (100%)	7%
pg1	1%
-total- (100%)	10%
pg1	1%

The example above displays the total CPU utilization for the QoS policy group *pg1* and refreshes the display *100* times before terminating.

qos statistics resource disk show

Display disk resource utilization data per QoS policy group

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics resource disk show` command displays the disk utilization for QoS policy groups per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined policy groups; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS policy group name (Policy Group)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS policy groups.

Parameters

-node {<nodename>|local} - Node

Selects the policy groups that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

| [-policy-group <text>] - QoS Policy Group Name

Selects the QoS policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

| [-adaptive-policy-group <text>] - Adaptive QoS Policy Group Name }

Selects the QoS adaptive policy group whose name matches the specified value. If you do not specify this parameter, the command displays data for all QoS policy groups.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

Examples

```
cluster1::> qos statistics resource disk show -node nodeA -iterations 100
-rows 3
```

Policy Group	Disk	Number of HDD Disks
-----	-----	-----
-total-	40%	27
pg1	22%	5
slow	10%	10
fast	8%	12
_System_Default	7%	20
-total-	42%	27
pg1	22%	5
slow	12%	10
fast	8%	12
_System_Default	7%	20

The example above displays the total disk utilization for the 3 QoS policy groups with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics resource disk show -node local -iterations 100
-policy-group pg1
```

Policy Group	Disk	Number of HDD Disks
-----	-----	-----
-total-	3%	10
pg1	1%	24
-total-	3%	10
pg1	1%	24
-total-	3%	10
pg1	1%	24
-total-	3%	10
pg1	1%	24

The example above displays the total disk utilization for the QoS policy group *pg1* and refreshes the display *100* times before terminating.

qos statistics volume characteristics show

Display volume characteristics

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume characteristics show` command displays data that characterizes the behavior of volumes.

The command displays the following data:

- QoS volume name (Workload)
- QoS workload ID (ID)
- Input/output operations per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total IOPS (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

[`-node {<nodename>|local}`]} - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name }

Selects the characteristic data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```

cluster1::> qos statistics volume characteristics show -iterations 100
-rows 3

The example above displays characteristics for volume `vs0_vol0` in Vserver `vs0` and it refreshes the display `100` times before terminating.

qos statistics volume latency show

Display latency breakdown data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume latency show` command displays the average latencies for volumes on ONTAP subsystems.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Total latency observed per I/O operation (Latency)

- Latency observed per I/O operation in the N-Blade subsystem (N-Blade)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the D-Blade subsystem (D-Blade)
- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)
- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store (Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for SnapMirror Synchronous (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations
- Latency observed per I/O operation for Anti Virus Scan (AVSCAN) operations
- Latency observed per I/O operation in the Network queues (Network)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons related to CP (Susp-CP)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons not related to CP (Susp-Other)
- Latency observed for I/O operations in D-Blade response queues (WAFL Resp)

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all volumes.

Parameters

[`-node <nodename>|local`]] - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

{ [`-rows <integer>`]] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| `-vserver <vserver name>` - Vserver Name

Specifies the Vserver to which the volume belongs.

`-volume <volume name>` - Volume Name }

Selects the latency data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[`-iterations <integer>`]] - Number of Iterations

Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[`-refresh-display {true|false}`]] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`[-show-flexgroup-as-constituents {true|false}]` - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics volume latency show -iterations 100 -rows 3
```

The example above displays latencies for volume `vs0_vol0` in Vserver `vs0` and it refreshes the display 100 times before terminating.

qos statistics volume performance show

Display system performance data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume performance show` command shows the current system performance that each volume is achieving.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all volumes. Other columns in this row are either totals or averages.

Parameters

[`-node {<nodename>|local}`]] - Node

Selects the volumes that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

{ [`-rows <integer>`]] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| `-vserver <vserver name>` - Vserver Name

Specifies the Vserver to which the volume belongs.

`-volume <volume name>` - Volume Name }

Selects the performance data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[`-iterations <integer>`]] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[`-refresh-display {true|false}`]] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[`-show-flexgroup-as-constituents {true|false}`]] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics volume performance show -iterations 100 -rows 3
```

Workload	ID	IOPS	Throughput	Latency
-total-	-	97	1.90MB/s	216.87ms
vol_2-wid104	104	28	1.75MB/s	412.78ms
vol_1-wid103	103	25	100.00KB/s	169.16ms

vs0_vol0-wid1..	15658	525	262.50KB/s	297.00us

The example above displays the system performance for volume `vs0_vol0` in Vserver `vs0` and it refreshes the display 100 times before terminating.

qos statistics volume resource cpu show

Display CPU resource utilization data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume resource cpu show` command displays the CPU utilization for volumes per node.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all volumes.

Parameters

-node {<nodename>|local} - Node

Selects the volumes that match this parameter value.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name }

Selects the CPU utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics volume resource cpu show -node nodeA
-iterations 100 -rows 3
```

Workload	ID	CPU
-----	-----	-----
--total- (100%)	-	9%
vs0vol1-wid-102	102	5%
vs0vol2-wid-121	121	2%
vs2_vol0-wid-..	212	2%
-total- (100%)	-	8%
vs0vol1-wid-102	102	5%
vs0vol2-wid-121	121	2%
vs2_vol0-wid-..	212	1%

The example above displays total CPU utilization for the 3 volumes with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics volume resource cpu show -node local -vserver
vs0 -volume vs0_vol1 -iterations 100
```

Workload	ID	CPU
-----	-----	-----
-total- (100%)	-	2%
vs0_vol1-wid7..	7916	2%
-total- (100%)	-	2%
vs0_vol1-wid7..	7916	2%
-total- (100%)	-	1%
vs0_vol1-wid7..	7916	1%
-total- (100%)	-	2%
vs0_vol1-wid7..	7916	1%
-total- (100%)	-	2%
vs0_vol1-wid7..	7916	2%

The example above displays total CPU utilization for volume `vs0_vol1` in Vserver `vs0` and it refreshes the display 100 times before terminating.

qos statistics volume resource disk show

Display disk resource utilization data per volume

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics volume resource disk show` command displays the disk utilization for volumes per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command only supports hard disks.

The command displays the following data:

- The QoS volume name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all volumes.

Parameters

-node {<nodename>|local} - Node

Selects the volumes that match this parameter value.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. The default setting is 10. The allowed range of values is 1 to 20.

| -vserver <vserver name> - Vserver Name

Specifies the Vserver to which the volume belongs.

-volume <volume name> - Volume Name }

Selects the disk utilization data that match this parameter value. Enter a complete volume name or press the <Tab> key to complete the name. Wildcard query characters are not supported.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics volume resource disk show -node nodeB
-iterations 100 -rows 3
```

Workload	ID	Disk	Number of HDD	Disks
-total- (100%)	-	30%		4
vs0vol1-wid101	101	12%		2
vs0vol2-wid121	121	10%		1
vol0-wid1002	1002	8%		1
-total- (100%)	-	30%		4
vs0vol1-wid101	101	12%		2
vs0vol2-wid121	121	10%		1
vol0-wid1002	1002	8%		1

The example above displays total disk utilization for the 3 volumes with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics volume resource disk show -node local -vserver
vs0 -volume vs0_vol0 -iterations 100
```

Workload	ID	Disk	Number of HDD	Disks
-total-	-	5%		10
vs0_vol0-wid1..	15658	1%		6
-total-	-	5%		10
vs0_vol0-wid1..	15658	1%		6
-total-	-	6%		10
vs0_vol0-wid1..	15658	2%		6
-total-	-	6%		10
vs0_vol0-wid1..	15658	2%		6
-total-	-	6%		10
vs0_vol0-wid1..	15658	2%		6

The example above displays total disk utilization for volume `vs0_vol0` in Vserver `vs0` and it refreshes the display 100 times before terminating.

qos statistics workload characteristics show

Display QoS workload characterization

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload characteristics show` command displays data that characterizes the behavior of QoS workloads.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput achieved in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Request size in bytes (B) (Request size)
- Read percentage from total IOPS (Read)
- Concurrency, which indicates the number of concurrent users generating the I/O traffic (Concurrency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.

Parameters

[`-node {<nodename>|local}`] - Node

Selects the QoS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations <integer>`] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[`-refresh-display {true|false}`] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [`-rows <integer>`] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[`-policy-group <text>`] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [`-adaptive-policy-group <text>`] - Adaptive QoS Policy Group Name

Selects the QoS workloads that belong to the QoS adaptive policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [`-workload <text>`] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [`-workload-id <integer>`] - QoS Workload ID }

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[`-show-flexgroup-as-constituents {true|false}`] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```

The example above displays the characteristics for the QoS workload with QoS workload ID *9492* and it refreshes the display *100* times before terminating.

qos statistics workload latency show

Display latency breakdown data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload latency show` command displays the average latencies for QoS workloads on ONTAP subsystems.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Total latency observed per I/O operation (Latency)
- Latency observed per I/O operation in the N-Blade subsystem (N-Blade)
- Latency observed per I/O operation across the internally connected nodes in a Cluster (Cluster)
- Latency observed per I/O operation in the D-Blade subsystem (D-Blade)

- Latency observed per I/O operation in the Storage subsystem (Disk)
- Latency observed per I/O operation for QoS Policy Group Ceiling (QoS Max)
- Latency observed per I/O operation for QoS Policy Group Floor (QoS Min)
- Latency observed per I/O operation for NVRAM transfer (NVRAM)
- Latency observed per I/O operation for Object Store (Cloud) operations
- Latency observed per I/O operation for FlexCache (FlexCache) operations
- Latency observed per I/O operation for SnapMirror Synchronous (SM Sync) operations
- Latency observed per I/O operation for Volume Activation (VA) operations
- Latency observed per I/O operation for Anti Virus Scan (AVSCAN) operations
- Latency observed per I/O operation in the Network queues (Network)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons related to CP (Susp-CP)
- Latency observed for suspended I/O operations waiting in the WAFL for reasons not related to CP (Susp-Other)
- Latency observed for I/O operations in D-Blade response queues (WAFL Resp)

The results displayed per iteration are sorted by the total latency field. Each iteration starts with a row that displays the average latency, in microseconds (us) or milliseconds (ms) observed across all QoS workloads.

Parameters

[`-node` {<nodename>|local}] - Node

Selects the QoS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

[`-iterations` <integer>] - Number of Iterations

Specifies the number of times that the command refreshes the display with updated data before terminating. If you do not specify this parameter, the command continues to run until you interrupt it by pressing Ctrl-C.

[`-refresh-display` {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [`-rows` <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[`-policy-group` <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [`-adaptive-policy-group` <text>] - Adaptive QoS Policy Group Name

Selects the QoS workloads that belong to the QoS adaptive policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| **[-workload <text>] - QoS Workload Name**

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| **[-workload-id <integer>] - QoS Workload ID }**

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

| **[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents**

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics workload latency show -iterations 100 -rows 3

The example above displays the latencies for the QoS workload with QoS workload ID *9492* and it refreshes the display *100* times before terminating.

qos statistics workload performance show

Display system performance data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload performance show` command shows the current system performance

that each QoS workload is achieving.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Input/output operations performed per second (IOPS)
- Throughput in kilobytes per second (KB/s) or megabytes per second (MB/s) as appropriate (Throughput)
- Latency observed per request in microseconds (us) or milliseconds (ms) as appropriate (Latency)

The results displayed per iteration are sorted by IOPS. Each iteration starts with a row that displays the total IOPS used across all QoS workloads. Other columns in this row are either totals or averages.

Parameters

`[-node {<nodename>|local}] - Node`

Selects the QOS workloads that match this parameter value. If you do not specify this parameter, the command displays data for the entire cluster.

`[-iterations <integer>] - Number of Iterations`

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

`[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration`

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

`{ [-rows <integer>] - Number of Rows in the Output`

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

`[-policy-group <text>] - QoS Policy Group Name`

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`| [-adaptive-policy-group <text>] - Adaptive QoS Policy Group Name`

Selects the QoS workloads that belong to the QoS adaptive policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`| [-workload <text>] - QoS Workload Name`

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

`| [-workload-id <integer>] - QoS Workload ID }`

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

`[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents`

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics workload performance show -iterations 100 -rows 4
```

Workload	ID	IOPS	Throughput	Latency
-total-	-	97	1.90MB/s	216.87ms
_Scan_Besteff..	101	31	0KB/s	0ms
vol_2-wid104	104	28	1.75MB/s	412.78ms
vol_1-wid103	103	25	100.00KB/s	169.16ms
vs1vol0-wid102	102	13	52.00KB/s	403.78ms
-total-	-	98	1276.00KB/s	89.98ms
_Scan_Besteff..	101	34	0KB/s	0ms
vs1vol0-wid102	102	28	112.00KB/s	80.70ms
vol_1-wid103	103	19	76.00KB/s	114.72ms
vol_2-wid104	104	17	1088.00KB/s	257.60ms
-total-	-	78	1152.00KB/s	225.22ms
_Scan_Besteff..	101	30	0KB/s	0ms
vol_1-wid103	103	17	68.00KB/s	452.27ms
vol_2-wid104	104	16	1024.00KB/s	419.93ms
vs1vol0-wid102	102	15	60.00KB/s	210.63ms

The example above displays the system performance for the 4 QoS workloads with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload performance show -iterations 100 -rows 2 -policy-group pg1
```

Workload	ID	IOPS	Throughput	Latency
-total-	-	2598	9.96MB/s	1223.00us
file-testfile..	4228	650	2.54MB/s	1322.00us
file-testfile..	11201	635	2.48MB/s	1128.00us
-total-	-	2825	10.89MB/s	714.00us
file-testfile..	4228	707	2.76MB/s	759.00us
file-testfile..	11201	697	2.72MB/s	693.00us
-total-	-	2696	10.13MB/s	1149.00us
file-testfile..	4228	645	2.52MB/s	945.00us
file-testfile..	6827	634	2.48MB/s	1115.00us

The example above displays the system performance for the 2 QoS workloads belonging to QoS policy group *pg1* with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload performance show -iterations 100
-workload-id 11201
```

Workload	ID	IOPS	Throughput	Latency
-total-	-	2866	10.92MB/s	905.00us
file-testfile..	11201	674	2.63MB/s	889.00us
-total-	-	2761	10.55MB/s	1054.00us
file-testfile..	11201	638	2.49MB/s	1055.00us
-total-	-	2810	10.58MB/s	832.00us
file-testfile..	11201	685	2.68MB/s	909.00us
-total-	-	2593	9.86MB/s	1092.00us
file-testfile..	11201	632	2.47MB/s	964.00us

The example above displays the system performance for the QoS workload with QoS workload ID *11201* and it refreshes the display *100* times before terminating.

qos statistics workload resource cpu show

Display CPU resource utilization data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload resource cpu show` command displays the CPU utilization for QoS workloads per node.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- CPU utilization observed in percentage (CPU)

The results displayed per iteration are sorted by total CPU utilization. Each iteration starts with a row that displays the total CPU utilization across all QoS workloads.

Parameters

-node {<nodename>|local} - Node

Selects the QOS workloads that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-adaptive-policy-group <text>] - Adaptive QoS Policy Group Name

Selects the QoS workloads that belong to the QoS adaptive policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload-id <integer>] - QoS Workload ID }

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics workload resource cpu show -node nodeA
-iterations 100 -rows 3
  Workload          ID    CPU
  -----
--total- (100%)      -    9%
vs0-wid-102         102    5%
file-bigvmdk-..     121    2%
vs2_vol0-wid-..     212    2%
-total- (100%)      -    8%
vs0-wid-101         102    5%
file-bigvmdk-..     121    2%
vs2_vol0-wid-..     212    1%
```

The example above displays total CPU utilization for the 3 QoS workloads with the highest CPU utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload resource cpu show -node local
-iterations 100 -rows 2 -policy-group pg1
```

Workload	ID	CPU
-----	-----	-----
-total- (100%)	-	41%
file-test1_b-..	9492	16%
file-test1_c-..	5078	16%
-total- (100%)	-	43%
file-test1_c-..	5078	17%
file-test1_b-..	9492	16%
-total- (100%)	-	40%
file-test1_c-..	5078	16%
file-test1_b-..	9492	15%

The example above displays total CPU utilization for the 2 QoS workloads belonging to QoS policy group *pg1* with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload resource cpu show -node local
-iterations 100 -workload-id 9492
```

Workload	ID	CPU
-----	-----	-----
-total- (100%)	-	15%
file-test1_b-..	9492	3%
-total- (100%)	-	14%
file-test1_b-..	9492	3%
-total- (100%)	-	14%
file-test1_b-..	9492	2%
-total- (100%)	-	13%
file-test1_b-..	9492	3%

The example above displays total CPU utilization for the QoS workload with QoS workload ID 9492 and it refreshes the display 100 times before terminating.

qos statistics workload resource disk show

Display disk resource utilization data per QoS workload

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `qos statistics workload resource disk show` command displays the disk utilization for QoS workloads per node. The disk utilization shows the percentage of time spent on the disk during read and write operations. The command displays disk utilization for system-defined workloads; however, their disk utilization is not included in the total utilization. The command only supports hard disks.

The command displays the following data:

- The QoS workload name (Workload)
- The QoS workload ID (ID)
- Disk utilization (Disk)
- The number of HDD data disks utilized (Number of HDD Disks)

The results displayed are sorted by total disk utilization. Each iteration starts with a row that displays the total disk utilization across all QoS workloads.

Parameters

-node {<nodename>|local} - Node

Selects the QOS workloads that match this parameter value.

[-iterations <integer>] - Number of Iterations

Specifies the number of times the display is refreshed before terminating. If you do not specify this parameter, the command iterates until interrupted by Ctrl-C.

[-refresh-display {true|false}] - Toggle Screen Refresh Between Each Iteration

Specifies the display style. If true, the command clears the display after each data iteration. If false, the command displays each data iteration below the previous one. The default is false.

{ [-rows <integer>] - Number of Rows in the Output

Specifies the number of busiest QoS policy groups to display. Valid values are from 1 to 20. The default value is 10.

[-policy-group <text>] - QoS Policy Group Name

Selects the QoS workloads that belong to the QoS policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-adaptive-policy-group <text>] - Adaptive QoS Policy Group Name

Selects the QoS workloads that belong to the QoS adaptive policy group specified by this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload <text>] - QoS Workload Name

Selects the QoS workload that match this parameter value. If you do not specify this parameter, the command displays data for all QoS workloads.

| [-workload-id <integer>] - QoS Workload ID }

Selects the QoS workload that match the QoS workload ID specified by this parameter value.

[-show-flexgroup-as-constituents {true|false}] - Display Flexgroups as Constituents

If the parameter is specified and if the value is true, it will display data for FlexVol volumes and FlexGroup constituents. Otherwise it will display data for FlexVol volumes and FlexGroup volumes.

Examples

```
cluster1::> qos statistics workload resource disk show -node nodeB
-iterations 100 -rows 3
```

Workload	ID	Disk	Number of HDD	Disks
-total- (100%)	-	30%		4
_RAID	-	20%		4
vs0-wid101	101	12%		2
file-1-wid121	121	10%		1
vol0-wid1002	1002	8%		1
_WAFL	-	7%		3
-total- (100%)	-	30%		4
vs0-wid101	101	12%		2
file-1-wid121	121	10%		1
_RAID	-	10%		4
vol0-wid1002	1002	8%		1
_WAFL	-	7%		3

The example above displays total disk utilization for the 3 QoS workloads with the highest disk utilization and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload resource disk show -node local
-iterations 100 -rows 2 -policy-group pg1
```

Workload	ID	Disk	Number of HDD	Disks
-total-	-	3%		10
file-test1_a-..	6437	6%		6
file-test1-wi..	7872	6%		6
-total-	-	3%		10
file-test1_a-..	6437	5%		6
file-test1-wi..	7872	5%		6
-total-	-	3%		10
file-test1_a-..	6437	6%		6
file-test1-wi..	7872	6%		6

The example above displays total disk utilization for the 2 QoS workloads belonging to QoS policy group *pg1* with the highest IOPS and it refreshes the display 100 times before terminating.

```
cluster1::> qos statistics workload resource disk show -node local
-iterations 100 -workload-id 6437
Workload          ID   Disk Number of HDD Disks
-----
-total-           -    3%                      10
file-test1_a-..   6437   6%                      6
-total-           -    3%                      10
file-test1_a-..   6437   5%                      6
-total-           -    3%                      10
file-test1_a-..   6437   6%                      6
```

The example above displays total disk utilization for the QoS workload with QoS workload ID *6437* and it refreshes the display *100* times before terminating.

qos workload commands

qos workload delete

Delete workload

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

Deletes a workload from a cluster. When you delete a workload, the associated data object is no longer controlled by its policy group.

You can only delete user-defined workloads. You cannot delete system-defined or preset workloads.

Parameters

-workload <text> - Workload Name

Specifies the name of the workload that you want to delete.

Examples

```
cluster1::> qos workload delete workload1
```

Deletes the "workload1" user-defined workload from the "cluster1" cluster.

qos workload show

Display a list of workloads

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

Shows the current status of workloads on a cluster. Use this command to determine the types of workloads that are currently on a cluster. The types of workloads include: system-defined, preset, and user-defined. The system generates system-defined and preset workloads. You cannot create, modify, or delete these workloads. Also, you can only modify or delete a user-defined workload , but cannot create one

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-workload <text>] - Workload Name

If you use this parameter, the command displays the workloads that contain the specified workload name.

[-uuid <UUID>] - Workload UUID (privilege: advanced)

If you use this parameter, the command displays the workloads that contain the specified UUID.

[-class <QoS Configuration Class>] - Workload Class

If you use this parameter, the command displays the workloads that contain the specified class. The Class options include system-defined, preset, and user-defined.

[-wid <integer>] - Workload ID

If you use this parameter, the command displays the workloads that contain the specified internal workload ID.

[-category <text>] - Workload Category

If you use this parameter, the command displays the workloads that contain the specified category. The category options include Scanner and Efficiency.

[-policy-group <text>] - Policy Group Name

If you use this parameter, the command displays the workloads that match the specified policy group name.

[-read-ahead <text>] - Read-ahead Tunables

If you use this parameter, the command displays the workloads that contain the specified read-ahead cache tunable.

[-vserver <vserver name>] - Vserver

If you use this parameter, the command displays the workloads that match the specified Vserver.

[-volume <volume name>] - Volume

If you use this parameter, the command displays the workloads that match the specified volume.

[-qtree <qtree name>] - Qtree Name

If you use this parameter, the command displays the workloads that match the specified Qtree name.

[-lun <text>] - LUN Name

If you use this parameter, the command displays the workloads that match the specified LUN name.

[-file <text>] - File Path

If you use this parameter, the command displays the workloads that match the specified file path.

[-max-throughput <qos_tput>] - Maximum Throughput

Selects the workloads that match this parameter value

A maximum throughput limit specifies the throughput in IOPS that the workload must not exceed.

[-min-throughput <qos_tput>] - Minimum Throughput

Selects the workloads that match this parameter value

A minimum throughput specifies the desired performance level for a workload in IOPS.

[-is-adaptive {true|false}] - Adaptive

If you use this parameter, the command displays only adaptive workloads.

[-is-constituent {true|false}] - Is Constituent Volume

If this parameter is specified, the command displays information only about storage objects that either are or are not constituents of a FlexGroup, depending on the value provided.

Examples

```
cluster1::> qos workload show -class user-defined
Workload      Wid  Policy Group Vserver  Volume  LUN  Qtree  File
Path
-----
vs2-wid100    100  pg1          vs2      -      -      -      -
```

Shows all user-defined workloads and the corresponding storage objects on the "cluster1" cluster.

san commands

san config commands

san config show

Show SAN configuration options for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The command displays cluster SAN configuration options.

Examples

The following example displays the cluster SAN configuration.

```
cluster1::> san config show
All SAN Array: true
```

security commands

security snmpusers

Show SNMP users

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security snmpusers` displays the following information about SNMP users:

- User name
- Authentication method
- Hexadecimal engine ID
- Authentication protocol
- Privacy protocol
- Security group

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified Vserver.

[-username <text>] - User Name

If this parameter is specified, the command displays information only about the SNMP user with the specified user name.

[-authmethod <text>] - Authentication Method

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication method. Possible values include the following:

- community-SNMP community strings
- usm-SNMP user security model

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

If this parameter is specified, the command displays information only about the remote SNMP user or users that belong to the specified remote switch.

[-engineid <Hex String>] - Engine Id

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified engine ID, specified in hexadecimal format.

[-authprotocol <text>] - Authentication Protocol

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified authentication protocol.

[-privprotocol <text>] - Privacy Protocol

If this parameter is specified, the command displays information only about the SNMP user or users that use the specified privacy protocol.

[-securitygroup <text>] - Security Group

If this parameter is specified, the command displays information only about the SNMP user or users that belong to the specified security group.

Examples

The following example displays information about all SNMP users:

```
cluster1::> security snmpusers
```

Vserver	UserName	AuthMethod	EngineId	Protocols Auth	Security Priv	Remote Group	Switch
IP							
cluster1	comm1	community	8000031504312d38302d313233343536	-	-	readwrite	-
cluster1	private	community	8000031504312d38302d313233343536	-	-	readwrite	-
cluster1	snmpuser1	usm	80000634b21000000533296869	-	-	readwrite	
172.2.20.91							
vs1	snmpuser2	community	8000031504312d38302d31323334353632	-	-	readwrite	-
vs1	snmpuser3	usm	8000031504312d38302d31323334353632	-	-	readwrite	-

security anti-ransomware commands

security anti-ransomware show

Display Anti-ransomware Package Version of the Node

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security anti-ransomware show` command displays the Anti-ransomware version of a node.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

If this parameter is specified, the command displays the Anti-ransomware version of specified node.

[-version <text>] - Anti-Ransomware Version

If this parameter is specified, the command displays node with the specified Anti-ransomware version.

Examples

The following example shows a sample output for this command:

```
C1_cluster::*> security anti-ransomware show-version
Node                               Version
-----
sti221-vsim-sr049g                1.0
sti221-vsim-sr049h                1.0

security anti-ransomware update-package-from-uri

Install the new Anti-ransomware package in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security anti-ransomware update-package-from-uri` command downloads a new Anti-ransomware package to replace the version installed in all nodes of the cluster.

Use only Anti-ransomware package provided by NetApp support for ONTAP with this command."

To update the Anti-ransomware package, perform the following steps:

- Download the required Anti-ransomware package file from the NetApp support website.
- Place the downloaded package file (.tgz) on a local web server that the cluster can access without a password.
- Execute the `security anti-ransomware update-package-from-uri` command, passing the

Universal Resource Identifier (URI) of the file as a parameter.

"The command only needs to be executed once for the entire cluster. It will then download and install the package on each node."

Parameters

-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - URI of Anti-ransomware package

URI of the new Anti-ransomware package.

Examples

The following example installs a new version of the Anti-ransomware to the cluster:

```
cluster1::> security anti-ransomware update-package-from-uri
http://www.example.com/auDev__ontap_arpm1_package_v1.0.tgz__440ae2e4-fd8f-
4225-9bee-94e2da3f9d8d.tgz
```

security anti-ransomware auto-enable modify

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security anti-ransomware auto-enable modify` command changes the cluster-level auto enablement setting for new volumes.

Parameters

[-new-volume-auto-enable {true|false}] - Auto-enable ARP Setting for New Volumes

Sets the Auto-Enable Anti-Ransomware Protection setting for newly created volumes. Specify *true* to automatically enable Anti-Ransomware on new volumes.

[-warm-up-period-total-duration <time_interval>] - Warm-up Period Total Duration

Sets the total duration of the warm-up period.

Examples

```
cluster1::> security anti-ransomware auto-enable modify -new-volume-auto
-enable false -warm-up-period-total-duration 24h
```

Disables auto-enablement of Anti-Ransomware protection for new volumes and adjusts warm-up period duration to 24 hours.

```
cluster1::> security anti-ransomware auto-enable show
New Volume Auto-Enable:           false
Warm-Up Period Applicable:        true
Warm-Up Period Completed:         false
Warm-Up Period Duration:          24h
Warm-Up Period Time Remaining:    10h
```

After warm-up period ends, warm-up related fields wont be displayed.

```
cluster1::> security anti-ransomware auto-enable show
New Volume Auto-Enable:           false
```

security anti-ransomware auto-enable show

Show the auto-enable anti-ransomware setting for the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security anti-ransomware auto-enable show` command retrieves the current anti-ransomware auto enablement values, including details about warm-up period and auto enablement setting for new volumes.

Parameters

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example shows a sample output for this command:

```
cluster1::> security anti-ransomware auto-enable show
New Volume Auto-Enable:           true
Warm-Up Period Applicable:        true
Warm-Up Period Completed:         false
Warm-Up Period Duration:          12h
Warm-Up Period Time Remaining:    10h
```

After warm-up period ends, warm-up related fields wont be displayed.

```
cluster1::> security anti-ransomware auto-enable show
New Volume Auto-Enable:           true
```

security anti-ransomware volume disable

Disable anti-ransomware on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume disable` command disables anti-ransomware monitoring on a volume.

Parameters

-vserver <vserver name> - Vserver Name

Anti-ransomware monitoring is disabled on volumes that match the values for the Vserver and volume parameters. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

Anti-ransomware monitoring is disabled on volumes matching the parameter value.

[-auto-enabled-volumes-only {true|false}] - Option to disable only on auto enabled volumes (privilege: advanced)

Anti-ransomware monitoring will be disabled on volumes matching the parameter value.

Examples

security anti-ransomware volume dry-run

(DEPRECATED) Dry-run anti-ransomware on a volume (DEPRECATED: All fields to this command are deprecated)

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume dry-run` command starts anti-ransomware monitoring in the evaluation mode on a volume. Deprecated: This command is no longer supported and may be removed in a future release.

Parameters

-vserver <vserver name> - Vserver Name

Anti-ransomware monitoring is enabled in the evaluation mode on volumes that match the values for the Vserver and volume parameters. If only one data Vserver exists, you do not need to specify this parameter. Deprecated: This parameter is no longer supported and may be removed in a future release.

-volume <volume name> - Volume Name

Anti-ransomware monitoring is enabled in the evaluation mode on volumes matching the parameter value. Deprecated: This parameter is no longer supported and may be removed in a future release.

Examples

security anti-ransomware volume enable

Enable anti-ransomware on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume enable` command enables anti-ransomware monitoring on a volume.

Parameters

-vserver <vserver name> - Vserver Name

Anti-ransomware monitoring is enabled on volumes that match the values for the Vserver and volume parameters. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

Anti-ransomware monitoring is enabled on volumes matching the parameter value.

Examples

security anti-ransomware volume pause

Pause anti-ransomware on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume pause` command pauses Anti-ransomware monitoring on a volume.

Parameters

-vserver <vserver name> - Vserver Name

Anti-ransomware monitoring is paused in the evaluation mode on volumes that match the values for the Vserver and volume parameters. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

Anti-ransomware monitoring is paused on volumes matching the parameter value.

Examples

security anti-ransomware volume resume

Resume anti-ransomware on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume resume` command resumes Anti-ransomware monitoring on a volume.

Parameters

-vserver <vserver name> - Vserver Name

Anti-ransomware monitoring is resumed on volumes that match the values for the Vserver and volume parameters. If only one data Vserver exists, you do not need to specify this parameter.

-volume <volume name> - Volume Name

Anti-ransomware monitoring is resumed on volumes matching the parameter value.

Examples

security anti-ransomware volume show

Show anti-ransomware related information of volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume show` command displays information related to Anti-ransomware on the volumes in the cluster. The following information is displayed:

- Vserver Name: The Vserver on which the volume is located.
- Volume Name: The volume name
- State: The Anti-ransomware state of the volume. The possible values are *disabled*, *enabled*, *dry-run*, *dry-run-paused*, *enable-paused* and *disable-in-progress*.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-attack]

If this parameter is specified, ransomware attack details are displayed.

| [-clear-suspect-status]

If this parameter is specified, the command displays the progress of the clear suspect operation. This option will not display clear suspect operation progress for volumes that do not have *junction-path* set.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter and the `-volume` parameter are specified, the command displays detailed information

related to Anti-ransomware about the specified volume. If this parameter is specified by itself, the command displays information related to the Anti-ransomware about all volumes on the specified Vserver.

[-volume <volume name>] - Volume Name

If this parameter and the `-vserver` parameter are specified, the command displays detailed information related to Anti-ransomware about the specified volume. If this parameter is specified by itself, the command displays information related to the Anti-ransomware about all volumes matching the specified name.

[-state {disabled|enabled|dry-run|paused|dry-run-paused|enable-paused|disable-in-progress}] - State

If this parameter is specified, the command displays information only about the volume or volumes that have the specified Anti-ransomware state. The possible values are *disabled*, *enabled*, *dry-run*, *dry-run-paused*, *enable-paused* and *disable-in-progress*. The possible states are:

- disabled - Anti-ransomware is disabled on the volume.
- enabled - Anti-ransomware is enabled on the volume.
- dry-run - Anti-ransomware is enabled in the dry-run or evaluation mode on the volume.
- dry-run-paused - Anti-ransomware is paused from dry-run or evaluation mode on the volume.
- enable-paused - Anti-ransomware is paused on the volume.
- disable-in-progress - Anti-ransomware disable work is in progress on the volume.

[-attack-probability {none|low|moderate|high}] - Attack Probability

If this parameter is specified, the command displays information only about the volumes that have the specified probability. The possible values are *none*, *low*, *moderate*, and *high*.

- none - No data is suspected for ransomware activity.
- low - Small amount data is suspected for ransomware activity.
- moderate - Moderate amount of data is suspected for ransomware activity.
- high - Large amount data is suspected for ransomware activity.

[-attack-timeline <MM/DD/YYYY HH:MM:SS>, ...] - Attack Timeline

If this parameter is specified, the command displays information only about the volumes that have the specified attack-timeline.

[-no-of-attacks <integer>] - Number of Attacks

This provides the number of ransomware attacks observed.

[-attack-detected-by <anti_ransomware_detection_type>] - Attack Detected By

If this parameter is specified, the command displays information only about the volumes that have the specified attack detection type. The possible values are *file*, *block*.

- file_analysis - Attack is detected by file activity analysis.
- encryption_percentage_analysis - Attack is detected by data encryption percentage.

[-block-device-detection-status <arw_block_device_detection_status>] - Block Device Detection Status

If this parameter is specified, the command displays information only about the volumes that have the specified block device detection status. The possible values are:

- `evaluation_period` - Attack detection is currently in its evaluation phase.
- `active_unsuitable_workload` - Attack detection is active, but the current workload is not suitable for Anti-ransomware protection.
- `active_suitable_workload` - Attack detection is active, and the current workload is appropriate for Anti-ransomware protection.

`[-block-device-evaluation-start-time <MM/DD/YYYY HH:MM:SS>]` - Block Device Evaluation Start-time

If this parameter is specified, the command displays information only about the volumes that have the specified evaluation start time.

`[-clear-suspect-start-time <MM/DD/YYYY HH:MM:SS>]` - Clear Suspect Start Time

If this parameter is specified, the command displays information only about the volumes that have the specified clear suspect start time.

`[-clear-suspect-phase <arp_command_op_status>]` - Clear Suspect Phase

If this parameter is specified, the command displays information only about the volumes that have the specified clear suspect phase.

Examples

The following example shows a sample output for this command:

```
cluster1::> security anti-ransomware volume show
```

Vserver	Volume	State
-----	-----	-----
vs1	vol1	enabled

security anti-ransomware volume attack clear-suspect

Clear suspect record

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `anti-ransomware volume attack clear-suspect` command removes the specified files from suspect files report. When no optional parameters are provided, the suspect report file is cleared. If the attack is marked as a true positive, by setting the `false-positive` parameter to `false`, the snapshot is retained for 7 days. If marked as a false positive, by setting the `false-positive` parameter to `true`, the snapshot is retained for 24 hours.

Parameters

`-vserver <vserver name>` - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume on which anti-ransomware feature is enabled.

{ [-sequence-number <integer>] - Sequence Number

This optionally specifies the sequence number of the suspect file obtained from generated report.

| [-extensions <text>, ...] - File Extensions

This optionally specifies the extensions of ransomware attacked files that needs to be cleared from attack report.

| [-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

This optionally specifies the lower bound of the time to clear a suspect record. Any suspect record with time greater than or equal to start-time is cleared.

[-end-time <MM/DD/YYYY HH:MM:SS>] - End Time }

This optionally specifies upper bound of the time to clear a suspect record. Any suspect record with time less than or equal to end-time is cleared.

-false-positive {true|false} - False Positive?

This indicates whether the suspect record of specific extensions, time range, and so on, are to be considered a false positive.

Examples

The following example shows a sample output for clearing all the suspects observed with timestamp in the start-time and end-time range, and with given extension.

```
clus1::> security anti-ransomware volume attack clear-suspect -volume  
testvol -start-time "4/14/2021 04:16:48" -end-time "4/14/2021 06:16:50"  
5 suspect records cleared.
```

The following examples shows output when given sequence-number is not present.

```
clus1::*> security anti-ransomware volume attack clear-suspect -volume  
testvol -sequence-number 1000
```

```
Error: command failed: No suspect records found.
```

security anti-ransomware volume attack generate-report

Generates Report File of the Suspected Attack on the Volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `anti-ransomware volume attack generate-report` command copies the report file to the given path. The report file is not an exhaustive list of all suspected files during the attack, since the maximum number of entries allowed per file extension is 20.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume on which anti-ransomware feature is enabled.

-dest-path <sub dir> - Destination path under the volume to copy the report file

This parameter specifies the destination junction-path where requested file is to be copied.

Examples

The following example shows sample output for generating report-file of volume copied to its own destination junction path.

```
cluster1::> volume show -fields junction-path -vserver vs0 -volume
test_vol

          vs0      test_vol  /test_vol_path
-----
cluster1::> security anti-ransomware volume attack generate-report -volume
test_vol -dest-path vs0:/test_vol_path
          Report "report_file_vs0_test_vol_08-07-2025_04-27-18"
          available at path "vs0:/test_vol_path".
```

The following example shows sample output for generating report-file of volume copied to different volume's destination junction path.

```
cluster1::> volume show -fields junction-path -vserver vs1 -volume
test_vs1_vol

          vs1      test_vs1_vol  /ontap_vol
-----
cluster1::> security anti-ransomware volume attack generate-report -volume
test_vol -vserver vs0 -dest-path vs1:/ontap_vol
          Report "report_file_vs0_test_vol_08-07-2025_04-39-44"
          available at path "vs1:/ontap_vol".
```

security anti-ransomware volume attack-detection-parameters modify

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The security anti-ransomware volume attack-detection-parameters modify command can be used to modify the attack detection parameters of an anti-ransomware enabled volume.

Parameters

-vserver <Vserver Name> - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume.

-volume <volume name> - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the attack detection parameters need to be modified.

[-based-on-high-entropy-data-rate {true|false}] - High Entropy Data Rate at Volume Level

This parameter indicates whether ransomware detection is based on a high entropy data rate at the volume level. Ransomware detection is also done based on high entropy data rate at the file level and this method of detection is always enabled and has no dependency on this parameter.

[-based-on-never-seen-before-file-extension {true|false}] - Never Seen before File Extension

This parameter indicates whether ransomware detection is based on new file types not seen before at the volume level. This detection method is based only on the file extension not on the file entropy. Some variants of ransomware modify the data such that the file entropy remains unchanged. This method helps in detecting those ransomware but there is a possibility of false positives. Note that ransomware detection is also done based on combined file extension and file entropy and this method of detection is always enabled and has no dependency on this parameter.

[-based-on-file-create-rate {true|false}] - Is Based on File Create Operation Rate

This parameter indicates whether ransomware detection is based on the file create rate at the volume level. If this is true and the number of files created per timeslot surges by `-file-create-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an attack.

[-based-on-file-rename-rate {true|false}] - Is Based on File Rename Operation Rate

This parameter indicates whether ransomware detection is based on the file rename rate at the volume level. If this is true and the number of files renamed per timeslot surges by `-file-rename-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an attack.

[-based-on-file-delete-rate {true|false}] - Is Based on File Delete Operation Rate

This parameter indicates whether ransomware detection is based on the file delete rate at the volume level. If this is true and the number of files deleted per timeslot surges by `-file-delete-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an attack.

[-relaxing-popular-file-extensions {true|false}] - Is Relaxing Popular File Extensions

This parameter indicates whether ransomware detection is based on commonly used extensions. If true, then a predetermined commonly used extension, such as .mp3, is considered safe. If false, only those file extensions observed during the dry-run state are considered safe; any extension not observed during the dry-run state but observed later is a suspected ransomware attack, even if it is a commonly used extension.

`[-high-entropy-data-surge-notify-percentage <integer>]` - High Entropy Data Surge Notify Percentage

This parameter displays the surge value that is considered safe in the overall incoming data at the volume level.

`[-file-create-rate-surge-notify-percentage <integer>]` - File Create Operation Rate Surge Notify Percentage

This parameter displays the surge rate that is considered safe for file create operations at the volume level.

`[-file-delete-rate-surge-notify-percentage <integer>]` - File Delete Operation Rate Surge Notify Percentage

This parameter displays the surge rate that is considered safe for file delete operations at the volume level.

`[-file-rename-rate-surge-notify-percentage <integer>]` - File Rename Operation Rate Surge Notify Percentage

This parameter displays the surge rate that is considered safe for file rename operations at the volume level.

`[-never-seen-before-file-extn-count-notify-threshold <integer>]` - Never Seen before File Extension Count Notify Threshold

This parameter displays the threshold value of number of files observed with a new file extension not seen before for create/rename operations.

`[-never-seen-before-file-extn-duration-in-hours <integer>]` - Never Seen before File Extension Duration in Hours

This parameter displays the duration for new file extensions not seen before, in hours. If a new file extension is observed and `-never-seen-before-file-extn-count-notify-threshold` number of files are created/renamed with this new file extension for this duration, then it is reported as an attack.

Examples

The following example displays attack detection parameter information of a volume.

```
cluster1::> security anti-ransomware volume attack-detection-parameters
show -vserver vs1 -volume voll
```

```

Vserver Name : vs1
Volume Name : voll
Is Detection Based on High Entropy Data Rate? : true
Is Detection Based on Never Seen before File Extension? : true
    Is Detection Based on File Create Rate? : true
    Is Detection Based on File Rename Rate? : true
    Is Detection Based on File Delete Rate? : true
Is Detection Relaxing Popular File Extensions? : true
    High Entropy Data Surge Notify Percentage : 100
    File Create Rate Surge Notify Percentage : 100
    File Rename Rate Surge Notify Percentage : 100
    File Delete Rate Surge Notify Percentage : 100
Never Seen before File Extensions Count Notify Threshold : 20
    Never Seen before File Extensions Duration in Hour : 24
```

```
cluster1::> security anti-ransomware volume attack-detection-parameters
modify -vserver vs1 -volume voll -file-delete-rate-surge-notify-percentage
25
```

```
cluster1::> security anti-ransomware volume attack-detection-parameters
show -vserver vs1 -volume voll
```

```

Vserver Name : vs1
Volume Name : voll
Is Detection Based on High Entropy Data Rate? : true
Is Detection Based on Never Seen before File Extension? : true
    Is Detection Based on File Create Rate? : true
    Is Detection Based on File Rename Rate? : true
    Is Detection Based on File Delete Rate? : true
Is Detection Relaxing Popular File Extensions? : true
    High Entropy Data Surge Notify Percentage : 100
    File Create Rate Surge Notify Percentage : 100
    File Rename Rate Surge Notify Percentage : 100
    File Delete Rate Surge Notify Percentage : 25
Never Seen before File Extensions Count Notify Threshold : 20
    Never Seen before File Extensions Duration in Hour : 24
```

security anti-ransomware volume attack-detection-parameters show

Show anti-ransomware volume attack detection parameters

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume attack-detection-parameters show` command displays attack detection parameter details of an anti-ransomware enabled volume.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume.

-volume <volume name> - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the attack detection parameters need to be displayed.

[-based-on-high-entropy-data-rate {true|false}] - High Entropy Data Rate at Volume Level

This parameter displays whether ransomware detection is based on a high entropy data rate at the volume level. Ransomware detection is also done based on high entropy data rate at the file level and this method of detection is always enabled and has no dependency on this parameter.

[-based-on-never-seen-before-file-extension {true|false}] - Never Seen before File Extension

This parameter indicates whether ransomware detection is based on new file types not seen before at the volume level. This detection method is based only on the file extension not on file entropy. Some variants of ransomware modify the data such that the file entropy remains unchanged. This method helps in detecting those ransomware but there is a possibility of false positives. Note that ransomware detection is also done based on combined file extension and file entropy and this method of detection is always enabled and has no dependency on this parameter.

[-based-on-file-create-rate {true|false}] - Is Based on File Create Operation Rate

This parameter displays whether ransomware detection is based on the file create rate at the volume level. If this is true and the number of files created per timeslot surges by `-file-create-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an attack.

[-based-on-file-rename-rate {true|false}] - Is Based on File Rename Operation Rate

This parameter displays whether ransomware detection is based on the file rename rate at the volume level. If this is true and the number of files renamed per timeslot surges by `-file-rename-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an attack.

[-based-on-file-delete-rate {true|false}] - Is Based on File Delete Operation Rate

This parameter displays whether ransomware detection is based on the file delete rate at the volume level. If this is true and the number of files deleted per timeslot surges by `-file-delete-rate-surge -notify-percentage` percentage compared to the historically observed value, then it is considered an

attack.

`[-relaxing-popular-file-extensions {true|false}] - Is Relaxing Popular File Extensions`

This parameter displays whether ransomware detection is based on commonly used extensions. If true, then a predetermined commonly used extension, such as .mp3, is considered safe. If false, only those file extensions observed during the dry run state are considered safe; any extension not observed during the dry-run state but observed later is suspected as a ransomware attack, even if it is a commonly used extension.

`[-high-entropy-data-surge-notify-percentage <integer>] - High Entropy Data Surge Notify Percentage`

This parameter displays the surge value that is considered safe in the overall incoming data at the volume level.

`[-file-create-rate-surge-notify-percentage <integer>] - File Create Operation Rate Surge Notify Percentage`

This parameter displays the surge rate that is considered safe for file create operations at the volume level.

`[-file-delete-rate-surge-notify-percentage <integer>] - File Delete Operation Rate Surge Notify Percentage`

This parameter displays the surge rate that is considered safe for file delete operations at the volume level.

`[-file-rename-rate-surge-notify-percentage <integer>] - File Rename Operation Rate Surge Notify Percentage`

This parameter displays the surge rate that is considered safe for file rename operations at the volume level.

`[-never-seen-before-file-extn-count-notify-threshold <integer>] - Never Seen before File Extension Count Notify Threshold`

This parameter displays the threshold value of new file extensions not seen before for create/rename operations.

`[-never-seen-before-file-extn-duration-in-hours <integer>] - Never Seen before File Extension Duration in Hours`

This parameter displays the duration for new file extensions not seen before, in hours. If a new file extension is observed and `-never-seen-before-file-extn-count-notify-threshold` number of files are created/renamed with this same new file extension for this duration, then it is reported as an attack.

`[-block-device-auto-learned-encryption-threshold <integer>] - Block Device Auto Learned Encryption Threshold`

This parameter displays block device auto learned encryption threshold.

Examples

The following example displays attack detection parameter information of a volume.

```

cluster1::> security anti-ransomware volume attack-detection-parameters
show -vserver vs1 -volume vol1
      Vserver Name : vs1
      Volume Name : vol1
      Is Detection Based on High Entropy Data Rate? : true
      Is Detection Based on Never Seen before File Extension? : true
      Is Detection Based on File Create Rate? : true
      Is Detection Based on File Rename Rate? : true
      Is Detection Based on File Delete Rate? : true
      Is Detection Relaxing Popular File Extensions? : true
      High Entropy Data Surge Notify Percentage : 100
      File Create Rate Surge Notify Percentage : 100
      File Rename Rate Surge Notify Percentage : 100
      File Delete Rate Surge Notify Percentage : 100
      Never Seen before File Extensions Count Notify Threshold : 20
      Never Seen before File Extensions Duration in Hour : 24

```

security anti-ransomware volume auto-switch-to-enable-mode show

(DEPRECATED) Show anti-ransomware volume auto-switch to enable-mode stats

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume auto-switch-to-enable-mode show` command displays stats related to auto-switch to enable-mode of the volumes in dry-run state. Deprecated: This command is no longer supported and may be removed in a future release.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - (DEPRECATED) Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume. Deprecated: This parameter is no longer supported and may be removed in a future release.

[-volume <volume name>] - (DEPRECATED) Volume Name

This parameter specifies the anti-ransomware enabled volume for which the auto-switch info need to be displayed. Deprecated: This parameter is no longer supported and may be removed in a future release.

[`-total-writes <integer>`] - (DEPRECATED) Total writes

Total data writes size so far in dry-run period. Deprecated: This parameter is no longer supported and may be removed in a future release.

[`-dry-run-days-count <integer>`] - (DEPRECATED) Dry run days count

Number of days a volume is in learning mode. Deprecated: This parameter is no longer supported and may be removed in a future release.

[`-days-since-new-extn-seen <integer>`] - (DEPRECATED) Days since new extn seen

Number of days where no new extension is observed in the volume. Deprecated: This parameter is no longer supported and may be removed in a future release.

[`-dry-run-new-file-count <integer>`] - (DEPRECATED) Dry run new file count

Number of files created in a volume during learning period. Deprecated: This parameter is no longer supported and may be removed in a future release.

[`-dry-run-new-file-extension-count <integer>`] - (DEPRECATED) Dry run new file extensions count

Number of file extensions observed in a volume during learning period. Deprecated: This parameter is no longer supported and may be removed in a future release.

Examples

The following example displays attack detection parameter information of a volume. Deprecated: This example is no longer valid as the command may be removed in a future release.

```
cluster1::> security anti-ransomware volume auto-switch-to-enable-mode
show -vserver vs1 -volume vol1
      Vserver                                     : vs_1
      Volume                                       : volt1
      Amount of Write (KB) Received during Dry-run Mode :
23920640
      Number of Days Completed in Dry-run Mode          : 40
      Days Without a New Extension seen in Dry-run Mode : 2
      Number of Files created during Dry-run Period     : 1991
      Number of File extensions observed in Dry-run period : 20
```

security anti-ransomware volume entropy-stat show-encryption-percentage-histogram

Display the volume encryption percentage histogram

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume entropy-stat show-encryption-percentage-histogram` command displays the histogram for the volume.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume for which the entropy stats histogram need to be displayed. If this parameter is specified, the command displays entropy stats histogram only for the specified Vserver.

[-volume <volume name>] - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the entropy stats histogram need to be displayed. If this parameter is specified, the command displays entropy stats histogram only for the specified volume.

[-duration {real_time|evaluation_period|30days|90days|180days}] - Duration

This parameter specifies the duration for which other details will be displayed

[-encryption-percent-range {0-5%|6-10%|11-15%|16-20%|21-25%|26-30%|31-35%|36-40%|41-45%|46-50%|51-55%|56-60%|61-65%|66-70%|71-75%|76-80%|81-100%}] - Encryption Percent Range

This parameter specifies the range of encryption percentage for which additional details will be displayed.

[-count <integer>] - Count

This parameter specifies the number of times data is written within the given encryption percentage range.

[-data-written {<integer>[KB|MB|GB|TB|PB]}] - Data Written

This parameter specifies the amount of data written within the given encryption percentage range.

Examples

The following example displays the entropy stats histogram information of a volume.

```
cluster1::> security anti-ransomware volume entropy-stat show-encryption-
percentage-histogram -vserver vs1 -volume volume_1
```

		Encryption		
Vserver	volume	Percent Range	Count	Data Written
-----	-----	-----	-----	
vs1	volume_1	0-5	2	17MB
vs1	volume_1	6-10	11	2GB
vs1	volume_1	11-15	54	10GB
vs1	volume_1	16-20	41	3.23GB
vs1	volume_1	21-25	35	15GB
vs1	volume_1	26-30	0	0B
vs1	volume_1	31-35	0	0B
vs1	volume_1	36-40	0	0B
vs1	volume_1	41-45	0	0B
vs1	volume_1	46-50	0	0B
vs1	volume_1	51-55	0	0B
vs1	volume_1	56-60	0	0B
vs1	volume_1	61-65	0	0B
vs1	volume_1	66-70	0	0B
vs1	volume_1	71-75	0	0B
vs1	volume_1	76-80	0	0B
vs1	volume_1	81-100	0	0B

17 entries were displayed.

security anti-ransomware volume entropy-stat show-recent-daily-stat

Display the volume entropy recent daily stats

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume entropy-stat show-recent-daily-stat` command displays the percentage of data classified as encrypted using an entropy algorithm measured at daily intervals, at the volume level.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <vserver name>`] - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Vserver.

[`-volume <volume name>`] - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Volume.

[`-timestamp <MM/DD/YYYY HH:MM:SS>`] - Start Time

This parameter specifies the start time of entropy stats collection interval. If this parameter is specified, only rows that match the specified input for timestamp will be displayed.

[`-total-data-written {<integer>[KB|MB|GB|TB|PB]}`] - Total Data Blocks written

This parameter specifies the amount of data written in the interval. If this parameter is specified, only rows that match the specified input for total-data-written will be displayed.

[`-encryption-percentage <percent>`] - Encryption Percentage

This parameter specifies the encryption percentage of the interval. If this parameter is specified, only rows that match the specified input for encryption-percentage will be displayed.

[`-duration <time_interval>`] - Duration of the interval

This parameter specifies the duration of the interval. If this parameter is specified, only rows that match the specified input for duration will be displayed.

Examples

The following example displays the recent daily entropy stats information of a volume.

```
cluster1::> security anti-ransomware volume entropy-stat show-recent-
daily-stat -vserver vs1 -volume vol1
```

Vserver	Volume	Start Time	Total Duration	Encrypted Data Written	Data%
vs0	vol1	1/21/2025 10:49:40	24h10m0s	100MB	10%
vs0	vol1	1/22/2025 10:59:40	24h10m4s	1GB	0%
vs0	vol1	1/23/2025 11:49:44	24h9m57s	500MB	0%
vs0	vol1	1/24/2025 11:59:41	24h9m59s	2GB	2%
vs0	vol1	1/25/2025 12:09:40	24h10m1s	400MB	14%
vs0	vol1	1/26/2025 12:19:41	24h10m2s	4GB	4%
vs0	vol1	1/27/2025 12:29:43	24h9m58s	150MB	5%

security anti-ransomware volume entropy-stat show-recent-high-encryption-stat

Display the volume entropy recent high encryption stats

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The security anti-ransomware volume entropy-stat show-recent-high-encryption-stat command displays the intervals during which a high percentage of data was classified as encrypted using a data analysis algorithm. These intervals correspond to the reported attack timeline. This statistic is reset when the administrator runs the attack clear-suspect command.

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance] }

If you specify the -instance parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Vserver.

[-volume <volume name>] - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Volume.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Start Time

This parameter specifies the start time of entropy stats collection interval. If this parameter is specified, only rows that match the specified input for timestamp will be displayed.

[-total-data-written {<integer>[KB|MB|GB|TB|PB] }] - Total Data Blocks written

This parameter specifies the amount of data written in the interval. If this parameter is specified, only rows that match the specified input for total-data-written will be displayed.

[-encryption-percentage <percent>] - Encryption Percentage

This parameter specifies the encryption percentage of the interval. If this parameter is specified, only rows that match the specified input for encryption-percentage will be displayed.

[-duration <time_interval>] - Duration of the interval

This parameter specifies the duration of the interval. If this parameter is specified, only rows that match the specified input for duration will be displayed.

Examples

The following example displays the recent high encryption stat information of a volume.

```
cluster1::> security anti-ransomware volume entropy-stat show-recent-high-encryption-stat -vserver vs1 -volume vol1
```

Vserver	Volume	Start Time	Total	Encrypted	
			Duration	Data Written	Data%
vs0	vol1	1/21/2025 10:49:40	0h10m10s	3GB	55%
vs0	vol1	1/21/2025 11:10:43	0h10m58s	2GB	60%

security anti-ransomware volume entropy-stat show-recent-hourly-stat

Display the volume entropy recent hourly stats

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume entropy-stat show-recent-hourly-stat` command displays the percentage of data classified as encrypted using an entropy algorithm measured at hourly intervals, at the volume level.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Vserver.

[-volume <volume name>] - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Volume.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Start Time

This parameter specifies the start time of entropy stats collection interval. If this parameter is specified, only rows that match the specified input for timestamp will be displayed.

[-total-data-written {<integer>[KB|MB|GB|TB|PB] }] - Total Data Blocks written

This parameter specifies the amount of data written in the interval. If this parameter is specified, only rows that match the specified input for total-data-written will be displayed.

[-encryption-percentage <percent>] - Encryption Percentage

This parameter specifies the encryption percentage of the interval. If this parameter is specified, only rows

that match the specified input for encryption-percentage will be displayed.

[*-duration* <time_interval>] - Duration of the interval

This parameter specifies the duration of the interval. If this parameter is specified, only rows that match the specified input for duration will be displayed.

Examples

The following example displays the recent hourly entropy stats information of a volume.

```
cluster1::> security anti-ransomware volume entropy-stat show-recent-
hourly-stat -vserver vs1 -volume vol1
```

Vserver	Volume	Start Time	Total Duration	Encrypted Data Written	Data%
vs0	vol1	1/27/2025 19:49:39	0h59m8s	500MB	0%
vs0	vol1	1/27/2025 20:48:47	1h0m0s	200MB	0%
vs0	vol1	1/27/2025 21:48:47	1h0m0s	40MB	10%
vs0	vol1	1/27/2025 22:48:47	1h10m52s	1GB	20%
vs0	vol1	1/27/2025 23:59:39	0h59m8s	2GB	10%
vs0	vol1	1/28/2025 00:58:47	1h10m0s	350MB	0%
vs0	vol1	1/28/2025 02:08:47	1h0m0s	77.48MB	13%
vs0	vol1	1/28/2025 03:08:47	1h0m0s	44MB	0%
vs0	vol1	1/28/2025 04:08:47	1h0m54s	3GB	0%

security anti-ransomware volume entropy-stat show-recent-sub-hourly-stat

Display the volume entropy recent sub-hourly stats

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume entropy-stat show-recent-sub-hourly-stat` command displays the percentage of data classified as encrypted using an entropy algorithm measured at sub-hourly intervals, at the volume level.

Parameters

{ [*-fields* <fieldname>, ...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [*-instance*] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[*-vserver* <vserver name>] - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume for which the entropy stats

need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Vserver.

[-volume <volume name>] - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the entropy stats need to be displayed. If this parameter is specified, the command displays entropy stats only for the specified Volume.

[-timestamp <MM/DD/YYYY HH:MM:SS>] - Start Time

This parameter specifies the start time of entropy stats collection interval. If this parameter is specified, only rows that match the specified input for timestamp will be displayed.

[-total-data-written {<integer>[KB|MB|GB|TB|PB]}] - Total Data Blocks written

This parameter specifies the amount of data written in the interval. If this parameter is specified, only rows that match the specified input for total-data-written will be displayed.

[-encryption-percentage <percent>] - Encryption Percentage

This parameter specifies the encryption percentage of the interval. If this parameter is specified, only rows that match the specified input for encryption-percentage will be displayed.

[-duration <time_interval>] - Duration of the interval

This parameter specifies the duration of the interval. If this parameter is specified, only rows that match the specified input for duration will be displayed.

Examples

The following example displays the recent sub-hourly entropy stats information of a volume.

```
cluster1::> security anti-ransomware volume entropy-stat show-recent-sub-  
hourly-stat -vservers vs1 -volume vol1
```

Vserver	Volume	Start Time	Total Duration	Encrypted Data Written	Data%
vs0	vol1	1/28/2025 10:49:40	0h10m0s	100MB	0%
vs0	vol1	1/28/2025 10:59:40	0h50m4s	150MB	10%
vs0	vol1	1/28/2025 11:49:44	0h9m57s	200MB	0%
vs0	vol1	1/28/2025 11:59:41	0h9m59s	400MB	0%
vs0	vol1	1/28/2025 12:09:40	0h10m1s	300MB	0%
vs0	vol1	1/28/2025 12:19:41	0h10m2s	10MB	0%
vs0	vol1	1/28/2025 12:29:43	0h9m58s	1MB	0%
vs0	vol1	1/28/2025 12:39:41	0h10m0s	50MB	0%

security anti-ransomware volume event-log modify

Modify anti-ransomware event-log for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The security anti-ransomware volume event-log command.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver of anti-ransomware enabled volume.

-volume <volume name> - Volume Name

This parameter specifies the anti-ransomware enabled volume.

[-is-enabled-on-new-file-extension-seen {true|false}] - Is Enabled on New File Extension Seen

This parameter indicates whether an alert event should be created when files with new extensions are created.

[-is-enabled-on-snapshot-copy-creation {true|false}] - Is Enabled on Snapshot Copy Creation

This parameter indicates whether an alert event should be created when snapshots are created.

Examples

```
cluster1::> security anti-ransomware volume event-log modify -vserver vs1
-volume vol1 -is-enabled-on-new-file-extension-seen true -is-enabled-on
-snapshot-copy-creation true

cluster1::> security anti-ransomware volume event-log show -vserver vs1
-volume vol1
Vserver : vs1
          Volume : vol1
          Is Enabled on
New File Extension Seen : true
          Is Enabled on
Snapshot Copy Creation : true
```

security anti-ransomware volume event-log show

Show anti-ransomware event-log for volumes

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The security anti-ransomware volume event-log command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver of anti-ransomware enabled volume.

[-volume <volume name>] - Volume Name

This parameter specifies the anti-ransomware enabled volume.

[-is-enabled-on-new-file-extension-seen {true|false}] - Is Enabled on New File Extension Seen

This parameter indicates whether an alert event is generated on creation of files with new extensions.

[-is-enabled-on-snapshot-copy-creation {true|false}] - Is Enabled on Snapshot Copy Creation

This parameter indicates whether an alert event is generated when a snapshot is created.

security anti-ransomware volume space show

Display the details of anti-ransomware space usage

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This `security anti-ransomware volume space show` displays the space usage by Anti-ransomware feature.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver on which the volume is located.

[-volume <volume name>] - Volume Name

This parameter specifies the name of the volume whose space usage details are to be shown.

[*-space-used-by-snapshot* {<integer>[KB|MB|GB|TB|PB]}] - Space Used by snapshots

This parameter shows space usage by Anti-ransomware snapshots.

[*-space-used-by-logs* {<integer>[KB|MB|GB|TB|PB]}] - Space Used by logs

This parameter shows the space used by the Anti-ransomware logs.

[*-total-space-used* {<integer>[KB|MB|GB|TB|PB]}] - Total space used by anti-ransomware

This parameter shows the total space used by the Anti-ransomware feature.

[*-no-of-snapshot* <integer>] - Number of Anti-ransomware Snapshot Copies

This parameter shows the total count of the Anti-ransomware snapshots.

Examples

The following example shows a sample output for this command:

```
clus1::>> security anti-ransomware volume space show
                                     Space Used By Space Used By Total Space Snapshot
Vserver   Volume   Snapshot      logs           Used           Copies
-----
vs1       voll     308KB         8B             308.0KB
2
```

security anti-ransomware volume workload-behavior clear-surge

Clear the observed surge values on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume workload-behavior clear-surge` command clears the observed surge values.

Parameters

***-vserver* <vserver name> - Vserver Name**

This parameter specifies the Vserver on which the volume is located.

***-volume* <volume name> - Volume Name**

This parameter specifies the name of the volume on which anti-ransomware feature is enabled.

Examples

```
cluster1::> security anti-ransomware volume workload-behavior show
-vserver vs1 -volume voll
                                     Vserver: vs1
```

```

                                Volume: voll
                                File Extensions Observed: .txt, .exe, .pdf, .img
                                Number of File Extensions Observed: 4

```

security anti-ransomware volume workload-behavior show

Display information about the volume's workload-behavior learnt by the analytics algorithm

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This `security anti-ransomware volume workload-behavior show` displays the workload characteristics observed during anti-ransomware monitoring.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

-vserver <Vserver Name> - Vserver Name

This parameter specifies the Vserver of the anti-ransomware enabled volume.

-volume <volume name> - Volume Name

This parameter specifies the anti-ransomware enabled volume for which the workload behavior details are displayed.

[-file-extensions-included <text>,...] - List of File Extensions Observed

This parameter displays the list of file extensions observed during anti-ransomware monitoring.

[-total-file-extensions-included <integer>] - Number of File Extensions Observed

This parameter displays the number of file extensions observed during anti-ransomware monitoring.

[-high-entropy-data-write-peak-percent <integer>] - High Entropy Data Write Peak Percentage

This parameter displays the peak historical high entropy data write percentage of the incoming data.

[-high-entropy-data-write-peak-rate <integer>] - High Entropy Data Write Peak Rate (KB/minute)

This parameter displays the peak historical high entropy data write rate.

[-file-create-peak-rate <integer>] - File Create Peak Rate per Minute

This parameter displays the peak historical rate of file create operations in the volume.

[-file-rename-peak-rate <integer>] - File Rename Peak Rate per Minute

This parameter displays the peak historical rate of file rename operations in the volume.

[-file-delete-peak-rate <integer>] - File Delete Peak Rate per Minute

This parameter displays the peak historical rate of file delete operations in the volume.

[-surge-timeline <MM/DD/YYYY HH:MM:SS>] - Surge Timeline

This parameter displays the timeline where a surge was observed in the workload characteristics compared to the historically learned characteristics.

[-surge-high-entropy-data-write-peak-percent <integer>] - High Entropy Data Write Percentage During Surge

This parameter displays the peak percentage value of high entropy data write in the incoming data when the surge was observed.

[-surge-high-entropy-data-write-peak-rate <integer>] - High Entropy Data-write Peak Rate Surge (KB/minute)

This parameter displays the peak rate of high entropy data write when the surge was observed.

[-surge-file-create-peak-rate <integer>] - File Create Peak Rate (per Minute) During Surge

This parameter displays the surge in the peak rate of file create operations.

[-surge-file-delete-peak-rate <integer>] - File Delete Peak Rate (per Minute) During Surge

This parameter displays the surge in the peak rate of file delete operations.

[-surge-file-rename-peak-rate <integer>] - File Rename Peak Rate (per Minute) During Surge

This parameter displays the surge in the peak rate of file rename operations.

[-attack-file-extensions-observed <text>,...] - File Extensions Observed During Attack

This parameter displays the list of file types observed during a suspected ransomware attack.

[-attack-file-extensions-observed-counts <integer>,...] - Number of File Extensions Observed During Attack

This parameter displays the count of various file types observed during a suspected ransomware attack.

Examples

The following example shows sample output for this command:

```

cluster1::> security anti-ransomware volume workload-behavior show
-vserver vs1 -volume voll

                                Vserver: vs1
                                Volume: voll
                                File Extensions Observed: .ext1, .ext2, .ext3
                                Number of File Extensions Observed: 3
Historical Statistics
    High Entropy Data Write Percentage: 40
    High Entropy Data Write Peak Rate (KB/Minute): 50
    File Create Peak Rate (per Minute): 100
    File Delete Peak Rate (per Minute): 100
    File Rename Peak Rate (per Minute): 100

```

security anti-ransomware volume workload-behavior update-baseline-from-surge

Set the observed surge values as the new baseline on a volume

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware volume workload-behavior update-baseline-from-surge` command sets the observed surge value as new baseline.

Parameters

-vserver <vserver name> - Vserver Name

This parameter specifies the Vserver on which the volume is located.

-volume <volume name> - Volume Name

This parameter specifies the name of the volume on which anti-ransomware feature is enabled.

Examples

```

cluster1::> security anti-ransomware volume workload-behavior show
-vserver vs1 -volume voll

                                Vserver: vs1

```

```

                                Volume: voll
                                File Extensions Observed: .txt, .exe, .pdf, .img
                                Number of File Extensions Observed: 4

security anti-ransomware vserver event-log modify

Modify anti ransomware event log configuration for Vservers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware vserver event-log modify` command modifies the anti ransomware event log configuration of a specified Vserver

Parameters

-vserver <vserver name> - Vserver

Vserver whose anti ransomware event log configuration will be modified.

[-is-enabled-on-new-file-extension-seen {true|false}] - Is Enabled on New File Extension Seen

This parameter indicates whether an alert event should be created when files with new extensions are created.

[-is-enabled-on-snapshot-copy-creation {true|false}] - Is Enabled on Snapshot Copy Creation

This parameter indicates whether an alert event should be created when snapshots are created.

security anti-ransomware vserver event-log show

Show anti ransomware event log configuration for Vservers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security anti-ransomware vserver event-log show` command displays anti ransomware event log configuration for a Vserver.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays anti ransomware event log information about the specified Vserver.

[-is-enabled-on-new-file-extension-seen {true|false}] - Is Enabled on New File Extension Seen

If this parameter is specified, the command displays information only about the Vservers that match the specified value for new file extension seen event logging.

`[-is-enabled-on-snapshot-copy-creation {true|false}] - Is Enabled on Snapshot Copy Creation`

If this parameter is specified, the command displays information only about the Vservers that match the specified value for snapshot creation event logging.

Examples

The following example shows a sample output for this command:

```
cluster1::> security anti-ransomware vserver event-log show
Vserver: vs_1
  Is Enabled on New File Extension Seen: true
  Is Enabled on Snapshot Copy Creation: false
```

security audit commands

security audit modify

Set administrative audit logging settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit modify` command modifies the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the ONTAP API (ONTAPI) are audited

Parameters

`[-cliget {on|off}] - Enable Auditing of CLI Get Operations`

This specifies whether get requests for the CLI are audited. The default setting is *off*.

`[-httpget {on|off}] - Enable Auditing of HTTP Get Operations`

This specifies whether get requests for the web (HTTP) interface are audited. The default setting is *off*.

`[-ontapiget {on|off}] - Enable Auditing of Data ONTAP API Get Operations`

This specifies whether get requests for the ONTAP API (ONTAPI) interface are audited. The default setting is *off*.

`[-cluster-peer {on|off}] - Enable Auditing of Cross Cluster Operations (privilege: advanced)`

This specifies whether cross cluster operations are audited. The default setting is *on*.

Examples

The following example turns off auditing of get requests for the CLI interface:

```
cluster1::> security audit modify -cliget off
```

security audit show

Show administrative audit logging settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit show` command displays the following audit-logging settings for the management interface:

- Whether get requests for the CLI are audited
- Whether get requests for the web (HTTP) interface are audited
- Whether get requests for the ONTAP API (ONTAPI) are audited

Audit log entries are written to the 'audit' log, viewable via the 'security audit log show' command.

Examples

The following example displays the audit-logging settings for the management interface:

```
cluster1::> security audit show
              Auditing State for
Operation Get Requests
-----
      CLI off
      HTTP off
      ONTAPI off
```

security audit log show

Display audit entries merged from multiple nodes in the cluster

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security audit log show` command displays cluster-wide audit log messages. Messages from each node are interleaved in chronological order.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-detail]

This display option shows the individual fields of the audit record.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-timestamp <Date>] - Log Entry Timestamp

Selects the entries that match the specified input for timestamp. This will be in a human-readable format `<day> <month> <day of month> <hour>:<min>:<sec> <year>` in the local timezone.

[-node {<nodename>|local}] - Node

Selects the entries that match the specified input for node.

[-entry <text>] - Log Message Entry

Selects the entries that match the specified input for entry.

[-session-id <text>] - Session ID

This is the "session id" for this audit record. Each ssh/console session is assigned a unique session ID. Each ZAPI/HTTP/SNMP request is assigned a unique session ID

[-command-id <text>] - Command ID

This is useful with ssh/console sessions. Each command in a session is assigned a unique command ID. Each ZAPI/HTTP/SNMP request does not have a command ID.

[-application <text>] - Protocol

This is the application used to connect to the cluster. Possible values include the following: internal, console, ssh, http, ontapi, snmp, rsh, telnet, service-processor

[-location <text>] - Remote user location

The remote IP address or remote access point.

[-vserver <text>] - Vserver name

Storage Virtual Machine name

[-username <text>] - Username

Username

[-input <text>] - Command being executed

The operation being attempted

[-state {Pending|Success|Error}] - State of this audit request

State of this request

[-message <text>] - Additional information and/or error message

Additional information which may be error or informative message.

[-role <text>] - Role

Role

Examples

The following example displays specific fields based on a custom query:

```
cluster1::> security audit log show -fields application, location, state,
input, message -location 10.60.* -state Error|Success -input v*|st*
-timestamp >"Jul 10 12:00:00 2020"
timestamp                node  application location      input
state  message
-----
"Fri Jul 17 11:32:44 2020" node1 ssh          10.60.250.79 storage
aggregate create test -diskcount 5 Success -
"Fri Jul 17 11:36:47 2020" node1 ssh          10.60.250.79 vserver create
vs1                      Success -
"Fri Jul 17 11:37:33 2020" node1 ssh          10.60.250.79 volume create
voll                      Error    One of the following parameters is
required: -aggregate, -aggr-list, -auto-provision-as
"Fri Jul 17 11:38:08 2020" node1 ssh          10.60.250.79 volume create
voll -aggregate test      Success -
Some more examples for -timestamp usage:
cluster1::> security audit log show -timestamp "Mon Jan 03 18:37:05 2022"
Time                      Node           Audit Message
-----
Mon Jan 03 18:37:05 2022  node1
                                [kern_audit:info:988] mlogd:
started

cluster1::> security audit log show -timestamp Mon Jan 03 *
Time                      Node           Audit Message
-----
Mon Jan 03 18:37:05 2022  node1
                                [kern_audit:info:988] mlogd:
started
Mon Jan 03 18:37:06 2022  node2
                                [kern_audit:info:988] mlogd:
started
Mon Jan 03 18:41:25 2022  node1
                                [kern_audit:info:977] mlogd:
started
```

```

Mon Jan 03 18:41:25 2022  node2
                                [kern_audit:info:977] mlogd:
started

cluster1::> security audit log show -timestamp Mon Jan 03 18:37*
Time                               Node           Audit Message
-----
Mon Jan 03 18:37:05 2022  node1
                                [kern_audit:info:988] mlogd:
started
Mon Jan 03 18:37:06 2022  node2
                                [kern_audit:info:988] mlogd:
started
2 entries were displayed.

```

security certificate commands

security certificate azure-install

Install a Digital Certificate from Azure Key Vault

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security certificate azure-install` command downloads and installs digital security certificates signed by a certificate authority (CA) and the public key certificate of the root CA stored on Azure Key Vault (AKV). With FIPS enabled, the following restrictions apply to the certificate getting installed.

server/client/server-ca/client-ca: Key size >= 2048, server/client: Hash function (No MD-5, No SHA-1), server-ca/client-ca: (Intermediate CA), Hash Function (No MD-5, No SHA-1), server-ca/client-ca: (Root CA), Hash Function (No MD-5)

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the Vserver that contains the certificate.

-cert-name <text> - Certificate Name

This specifies the system's internal identifier for the certificate. It must be unique within a Vserver. If not provided, it is automatically generated by the system.

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - includes server certificates and intermediate certificates.
- *client-ca* - includes the public key certificate for the root CA of the SSL client
- *server-ca* - includes the public key certificate for the root CA of the SSL server to which ONTAP is a client

- *client* - includes a self-signed or CA-signed digital certificate and private key to be used for ONTAP as an SSL client

-key-vault-uri {scheme://(hostname|IPv4 Address|['IPv6 Address']) ...} - Deployed Azure Key Vault DNS Name

The DNS name of the deployed AKV.

-client-id <text> - Application (Client) ID of Deployed Azure Application

The ID of the client.

-tenant-id <text> - Directory (Tenant) ID of Deployed Azure Application

The ID of the tenant.

-authentication-method <AKV Authentication Method> - AKV Authentication Method

Use this parameter to specify the authentication method.

[-oauth-host <text>] - Open Authorization Host Name

The hostname of the OAuth server.

[-proxy-type {http|https}] - Proxy Type

Proxy Type.

[-proxy-host <text>] - Proxy Host

Proxy hostname.

[-proxy-port <integer>] - Proxy Port

Proxy port.

[-proxy-username <text>] - Proxy Username

Proxy username.

[-proxy-password <text>] - Proxy Password

Proxy password.

[-timeout <integer>] - AKV Connection Timeout in Seconds

AKV Connection Timeout in Seconds.

[-verify-host {true|false}] - Verify the identity of the AKV host

Set to true to verify the identity of the AKV host name.

Examples

This example installs a CA-signed certificate (along with intermediate certificates) for a Vserver named vs0.

```
cluster-1::> security certificate azure-install -vserver vs0 -type client
-client-id client1 -tenant-id tenant1 -key-vault-uri
https://samplevault.vault.azure.net -cert-name certname
```

Enter the {0} for Azure Key Vault:

security certificate create

Create and Install a Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security certificate create` command creates and installs a self-signed digital certificate, which can be used for server authentication, for signing other certificates by acting as a certificate authority (CA), or for ONTAP as an SSL client. The certificate function is selected by the `-type` field. Self-signed digital certificates are not as secure as certificates signed by a CA. Therefore, they are not recommended in a production environment.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the name of the Vserver on which the certificate will exist.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - creates and installs a self-signed digital certificate and intermediate certificates to be used for server authentication
- *root-ca* - creates and installs a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)
- *client* - includes a self-signed digital certificate and private key to be used for ONTAP as an SSL client

[`-subtype <kmip-cert>`] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- `kmip-cert` - this is a Key Management Interoperability Protocol (KMIP) certificate

[`-cert-name <text>`] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It must be unique within a Vserver. If not provided, it is automatically generated by the system.

`-size <size of requested certificate in bits>` - Size of Requested Certificate in Bits

This specifies the number of bits in the private key. The larger the value, the more secure is the key. The default is 2048. Possible values include `512`, `1024`, `1536`, `2048`, `3072` and `4096` when the "FIPS Mode" in "security config" is false. When the "FIPS Mode" is true, the possible values are `2048`, `3072` and `4096`.

`-country <text>` - Country Name

This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes:

[Country Codes](#)

`-state <text>` - State or Province Name

This specifies the state or province where the Vserver resides.

`-locality <text>` - Locality Name

This specifies the locality where the Vserver resides. For example, the name of a city.

`-organization <text>` - Organization Name

This specifies the organization where the Vserver resides. For example, the name of a company.

`-unit <text>` - Organization Unit

This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

`-email-addr <mail address>` - Contact Administrator's Email Address

This specifies the email address of the contact administrator for the Vserver.

`-expire-days <integer>` - Number of Days until Expiration

This specifies the number of days until the certificate expires. The default value is 365 days. Possible values are between `1` and `3652`.

`-protocol <protocol>` - Protocol

This specifies the protocol type. This parameter currently supports only the SSL protocol type. The default is SSL.

-hash-function <hashing function> - Hashing Function

This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include *SHA256*, *SHA224*, *SHA384* and *SHA512*.

Examples

This example creates a server type, self-signed digital certificate for a Vserver named *vs0* at a company whose custom common name is *www.example.com* and whose Vserver name is *vs0*.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type server
```

This example creates a root-ca type, self-signed digital certificate with a 2048-bit private key generated by the SHA256 hashing function that will expire in 365 days for a Vserver named *vs0* for use by the Software group in IT at a company whose custom common name is *www.example.com*, located in Sunnyvale, California, USA. The email address of the contact administrator who manages the Vserver is *web@example.com*.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type root-ca -size 2048 -country US -state California
-locality Sunnyvale -organization IT -unit Software -email-addr
web@example.com -expire-days 365 -hash-function SHA256
```

This example creates a client type of self-signed digital certificate for a Vserver named *vs0* at a company that uses ONTAP as an SSL client. The company's custom common name is *www.example.com* and its Vserver name is *vs0*.

```
cluster1::> security certificate create -vserver vs0 -common-name
www.example.com -type client -size 2048 -country US -state California
-locality Sunnyvale -organization IT -unit Software -email-addr
web@example.com -expire-days 365 -hash-function SHA256
```

security certificate delete

Delete an Installed Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an installed digital security certificate.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the Vserver that contains the certificate.

-common-name <FQDN or Custom Common Name> - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

[-serial <text>] - Serial Number of Certificate

This specifies the certificate serial number.

-ca <text> - Certificate Authority

This specifies the certificate authority (CA).

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - includes server certificates and intermediate certificates
- *root-ca* - includes a self-signed digital certificate to sign other certificates by acting as a certificate authority (CA)
- *client-ca* - includes the public key certificate for the root CA of the SSL client. If this client-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- *server-ca* - includes the public key certificate for the root CA of the SSL server to which ONTAP is a client. If this server-ca certificate is created as part of a root-ca, it will be deleted along with the corresponding deletion of the root-ca.
- *client* - includes a public key certificate and private key to be used for ONTAP as an SSL client

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

Examples

This example deletes a root-ca type digital certificate for a Vserver named vs0 in a company named

`www.example.com` with serial number 4F57D3D1.

```
cluster1::> security certificate delete -vserver vs0 -common-name
www.example.com -ca www.example.com -type root-ca -serial 4F57D3D1
```

security certificate generate-csr

Generate a Digital Certificate Signing Request

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command generates a digital certificate signing request and displays it on the console. A certificate signing request (CSR or certification request) is a message sent to a certificate authority (CA) to apply for a digital identity certificate.

Parameters

[`-common-name <text>`] - FQDN or Custom Common Name

This specifies the desired certificate name as a fully qualified domain name (FQDN) or custom common name or the name of a person. The supported characters, which are a subset of the ASCII character set, are as follows:

- Letters a through z, A through Z
- Numbers 0 through 9
- Asterisk (*), period (.), underscore (_) and hyphen (-)

The common name must not start or end with a "-" or a ".". The maximum length is 253 characters.

{ [`-size <size of requested certificate in bits>`] - (DEPRECATED)-Size of Requested Certificate in Bits

This specifies the number of bits in the private key. A larger size value provides for a more secure key. The default is 2048. Possible values include *512* , *1024* , *1536* , and *2048* .

This parameter has been deprecated in ONTAP 9.8 and may be removed in future releases of ONTAP. Use the `security-strength` parameter instead.

| [`-security-strength <bits of security strength>`] - Security Strength in Bits }

Use this parameter to specify the minimum security strength of the certificate in bits. The security bits mapping to RSA and ECDSA key length, in bits, are as follows:

Size	RSA Key Length	Elliptic Curve Key Length
112	2048	224
128	3072	256
192	4096	384

Note: For ECDSA, TLSv1.3 requires key length of 256 or greater.

`[-algorithm <Asymmetric key generation algorithm>] - Asymmetric Encryption Algorithm`

Use this parameter to specify the asymmetric encryption algorithm to use for generating the public/private key for the certificate signing request. Algorithm values can be RSA or EC. Default value is RSA.

`[-country <text>] - Country Name`

This specifies the country where the Vserver resides. The country name is a two-letter code. The default is US. Here is the list of country codes:

[Country Codes](#)

`[-state <text>] - State or Province Name`

This specifies the state or province where the Vserver resides.

`[-locality <text>] - Locality Name`

This specifies the locality where the Vserver resides. For example, the name of a city.

`[-organization <text>] - Organization Name`

This specifies the organization where the Vserver resides. For example, the name of a company.

`[-unit <text>] - Organization Unit`

This specifies the unit where the Vserver resides. For example, the name of a section or a department within a company.

`[-email-addr <mail address>] - Contact Administrator's Email Address`

This specifies the email address of the contact administrator for the Vserver.

`[-hash-function <hashing function>] - Hashing Function`

This specifies the cryptographic hashing function for signing the certificate. The default is SHA256. Possible values include *SHA224* , *SHA256* , *SHA384* , and *SHA512* .

`[-key-usage <Certificate key usage extension>,...] - Key Usage Extension`

Use this parameter to specify the key usage extension values. The default values are: *digitalSignature* , *keyEncipherment* . Possible values include:

- *digitalSignature*
- *nonRepudiation*
- *keyEncipherment*
- *dataEncipherment*
- *keyAgreement*
- *keyCertSigning*
- *cRLSigning*
- *encipherOnly*
- *decipherOnly*
- *critical*

`[-extended-key-usage <Certificate extKeyUsage extension>,...]` - Extended Key Usage Extension

Use this parameter to specify the extended key usage extension values. The default values are: *serverAuth*, *clientAuth*. Possible values include:

- *serverAuth*
- *clientAuth*
- *codeSigning*
- *emailProtection*
- *timeStamping*
- *OCSPSigning*
- *critical*

`[-rfc822-name <mail address>,...]` - Email Address SAN

Use this parameter to specify the Subject Alternate Name extension - a list of rfc822-names (email addresses).

`[-uri <text>,...]` - URI SAN

Use this parameter to specify the Subject Alternate Name extension - a list of URIs.

`[-dns-name <text>,...]` - DNS Name SAN

Use this parameter to specify the Subject Alternate Name extension - a list of DNS names.

`[-ipaddr <IP Address>,...]` - IP Address SAN

Use this parameter to specify the Subject Alternate Name extension - a list of IP addresses.

Examples

This example creates a certificate-signing request with a 2048-bit RSA private key generated by the SHA256 hashing function for use by the Engineering group in IT at a company whose custom common name is *www.example.com*, located in Durham, NC, USA. The email address of the contact administrator who manages the Vserver is *web@example.com*. The request also specifies the subject alternative names, key-usage and extended-key-usage extensions.

```
cluster-1::> security certificate generate-csr -common-name
www.example.com -algorithm RSA -hash-function SHA256 -security-strength
128 -key-usage "critical,digitalSignature,keyEncipherment" -extended-key
-usage "serverAuth,clientAuth" -country US -state NC -locality Durham
-organization IT -unit Engineering -email-addr web@example.com -rfc822
-name example@example.com -dns-name "shop.example.com,store.example.com"
```

security certificate install

Install a Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security certificate install` command installs digital security certificates signed by a certificate authority (CA) and the public key certificate of the root CA. Digital security certificates also include the intermediate certificates to construct the chain for server certificates (the *server* type), client-side root CA certificates (the *client-ca* type), or server-side root CA certificates (the *server-ca* type). With FIPS enabled, the following restrictions apply to the certificate getting installed. *server/client/server-ca/client-ca*: Key size >= 2048, *server/client*: Hash function (No MD-5, No SHA-1), *server-ca/client-ca*: (Intermediate CA), Hash Function (No MD-5, No SHA-1), *server-ca/client-ca*: (Root CA), Hash Function (No MD-5)

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the Vserver that contains the certificate.

-type <type of certificate> - Type of Certificate

This specifies the certificate type. Valid values are the following:

- *server* - includes server certificates and intermediate certificates.
- *client-ca* - includes the public key certificate for the root CA of the SSL client

- *server-ca* - includes the public key certificate for the root CA of the SSL server to which ONTAP is a client
- *client* - includes a self-signed or CA-signed digital certificate and private key to be used for ONTAP as an SSL client

[*-subtype* <*kmp-cert*>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

This specifies a certificate subtype. This optional parameter can have an empty value (the default). The only valid value is as follows:

- *kmp-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[*-cert-name* <*text*>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It must be unique within a Vserver. If not provided, it is automatically generated by the system.

Examples

This example installs a CA-signed certificate (along with intermediate certificates) for a Vserver named vs0.

```
cluster1::> security certificate install -vserver vs0 -type server
Enter certificate: Press <Enter> when done

security certificate print

Display the contents of a certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the details of either an installed certificate or by reading a certificate from user input.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver that has the certificate installed.

{ [-cert-name <text>] - Installed Certificate Name

Use this parameter to specify the unique name of the installed certificate to read and display.

| [-cert-uuid <UUID>] - Installed Certificate UUID }

Use this parameter to specify the unique UUID of the installed certificate to read and display. With no name or UUID specified, the certificate will read and display from user input.

Examples

The following example reads and prints the details of the certificate.

```
cluster1::> security certificate print -vserver vs0 -cert-name
AAACertificateServices

security certificate rename

Rename a certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command allows the user to modify the name of an installed digital certificate. This command does not alter the certificate itself.

Parameters

-vserver <Vserver Name> - Vserver Name

This specifies the name of the Vserver on which the certificate exists.

-cert-name <text> - Existing Certificate Name

This specifies the current name of the certificate.

-new-name <text> - New Certificate Name

This specifies the desired name of the certificate. It must be unique among certificates in the Vserver.

Examples

```
cluster1::> security certificate rename -vserver vs0 -cert-name
AAACertificateServices -new-nameAAACertServ
```

security certificate show-generated

Display ONTAP generated certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the ONTAP generated digital digital certificates. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the *-fields <fieldname>*, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

| [-instance] }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true|false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true|false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

[-authority-key-identifier <text>] - Authority Key Identifier

Selects the certificates that match this parameter value.

[-subject-key-identifier <text>] - Subject Key Identifier

Selects the certificates that match this parameter value.

[-rfc822-name <mail address>,...] - Email Address SAN

Selects the certificates that match this parameter value.

[-uri <text>,...] - URI SAN

Selects the certificates that match this parameter value.

[-dns-name <text>,...] - DNS Name SAN

Selects the certificates that match this parameter value.

[-ipaddr <IP Address>,...] - IP Address SAN

Selects the certificates that match this parameter value.

Examples

The examples below display information about ONTAP generated digital certificates.

```
cluster1::> security certificate show-generated
```

Vserver	Serial Number	Certificate Name	Type
vs0	4F4E4D7B	www.example.com	server

Certificate Authority: www.example.com
Expiration Date: Thu Feb 28 16:08:28 2013

```

```

security certificate show-truststore

Display default truststore certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the default CA certificates that come pre-installed with ONTAP. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true|false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true|false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

[-authority-key-identifier <text>] - Authority Key Identifier

Selects the certificates that match this parameter value.

[-subject-key-identifier <text>] - Subject Key Identifier

Selects the certificates that match this parameter value.

[-rfc822-name <mail address>,...] - Email Address SAN

Selects the certificates that match this parameter value.

[-uri <text>,...] - URI SAN

Selects the certificates that match this parameter value.

[-dns-name <text>,...] - DNS Name SAN

Selects the certificates that match this parameter value.

[-ipaddr <IP Address>,...] - IP Address SAN

Selects the certificates that match this parameter value.

Examples

The examples below display information about the pre-installed truststore digital certificates.

```
cluster1::> security certificate show-truststore
```

Vserver	Serial Number	Certificate Name	Type
vs0	4F4E4D7B	www.example.com	server-ca

```

security certificate show-user-installed

Display user installed certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the user installed digital certificates. Some details are displayed only when you use the command with the *-instance* parameter. In systems upgraded to ONTAP 9.4 or later, existing ONTAP generated certificates will also be shown as part of this command.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true|false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true|false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

[-authority-key-identifier <text>] - Authority Key Identifier

Selects the certificates that match this parameter value.

[-subject-key-identifier <text>] - Subject Key Identifier

Selects the certificates that match this parameter value.

[-rfc822-name <mail address>,...] - Email Address SAN

Selects the certificates that match this parameter value.

[-uri <text>,...] - URI SAN

Selects the certificates that match this parameter value.

[-dns-name <text>,...] - DNS Name SAN

Selects the certificates that match this parameter value.

[-ipaddr <IP Address>,...] - IP Address SAN

Selects the certificates that match this parameter value.

Examples

The examples below display information about user installed digital certificates.

```

                Locality Name (e.g. city): Sunnyvale
                Organization Name (e.g. company): example
                Organization Unit (e.g. section): IT
                Email Address (Contact Name): web@example.com
                Protocol: SSL
                Hashing Function: SHA256

```

security certificate show

Display Installed Digital Certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays information about the installed digital certificates. Some details are displayed only when you use the command with the *-instance* parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the Vserver whose digital certificates you want to display.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-type <type of certificate>] - Type of Certificate

Selects the certificates that match this parameter value.

[-subtype <kmip-cert>] - (DEPRECATED)-Certificate Subtype

This parameter has been deprecated in ONTAP 9.6 and may be removed in a future release of ONTAP.

Selects the certificate subtype that matches the specified value. The valid values are as follows:

- *kmip-cert* - this is a Key Management Interoperability Protocol (KMIP) certificate

[-cert-name <text>] - Unique Certificate Name

This specifies the system's internal identifier for the certificate. It is unique within a Vserver.

[-size <size of requested certificate in bits>] - Size of Requested Certificate in Bits

Selects the certificates that match this parameter value.

[-start <Date>] - Certificate Start Date

Selects the certificates that match this parameter value.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-public-cert <certificate>] - Public Key Certificate

Selects the certificates that match this parameter value.

[-country <text>] - Country Name

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Contact Administrator's Email Address

Selects the certificates that match this parameter value.

[-protocol <protocol>] - Protocol

Selects the certificates that match this parameter value.

[-hash-function <hashing function>] - Hashing Function

Selects the certificates that match this parameter value.

[-self-signed {true|false}] - Self-Signed Certificate

Selects the certificates that match this parameter value.

[-is-root {true|false}] - Is Root CA Certificate?

Selects the certificates that match this parameter value.

[-authority-key-identifier <text>] - Authority Key Identifier

Selects the certificates that match this parameter value.

[-subject-key-identifier <text>] - Subject Key Identifier

Selects the certificates that match this parameter value.

[-rfc822-name <mail address>,...] - Email Address SAN

Selects the certificates that match this parameter value.

[-uri <text>,...] - URI SAN

Selects the certificates that match this parameter value.

[-dns-name <text>,...] - DNS Name SAN

Selects the certificates that match this parameter value.

[-ipaddr <IP Address>,...] - IP Address SAN

Selects the certificates that match this parameter value.

Examples

The examples below display information about digital certificates.

```
cluster1::> security certificate show
```

Vserver	Serial Number	Certificate Name	Type

security certificate sign

Sign a Digital Certificate using Self-Signed Root CA

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command signs a digital certificate signing request and generates a certificate using a Self-Signed Root CA certificate in either PEM or PKCS12 format. You can use the [security certificate generate-csr](#) command to generate a digital certificate signing request.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the name of the Vserver on which the signed certificate will exist.

-ca <text> - Certificate Authority to Sign

This specifies the name of the Certificate Authority that will sign the certificate.

-ca-serial <text> - Serial Number of CA Certificate

This specifies the serial number of the Certificate Authority that will sign the certificate.

[-expire-days <integer>] - Number of Days until Expiration

This specifies the number of days until the signed certificate expires. The default value is 365 days.

Possible values are between 1 and 3652 .

[-format <certificate format>] - Certificate Format

This specifies the format of signed certificate. The default value is PEM. Possible values include *PEM* and *PKCS12* .

[-destination {scheme://(hostname|IPv4 Address|' 'IPv6 Address'')}] - Where to Send File

This specifies the destination to upload the signed certificate. This option can only be used when the format is PKCS12.

[-hash-function <hashing function>] - Hashing Function

This specifies the cryptographic hashing function for the self-signed certificate. The default value is SHA256. Possible values include *SHA224* , *SHA256* , *SHA384* , and *SHA512* .

Examples

This example signs a digital certificate for a Vserver named vs0 using a Certificate Authority certificate that has a ca of *www.ca.com* and a ca-serial of 4F4EB629 in PEM format using the SHA256 hashing function.

```
cluster1::> security certificate sign -vserver vs0 -ca www.ca.com -ca
-serial 4F4EB629 -expire-days 36 -format PEM -hash-function SHA256
```

Enter certificate signing request (CSR): Press <Enter> when done

security certificate ca-issued revoke

Revoke a Digital Certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command revokes a digital certificate signed by a Self-Signed Root CA.

Parameters

-vserver <Vserver Name> - Name of Vserver

This specifies the name of the Vserver on which the certificate is stored.

-serial <text> - Serial Number of Certificate

This specifies the serial number of the certificate.

-ca <text> - Certificate Authority

This specifies the name of the Certificate Authority whose certificate will be revoked.

-ca-serial <text> - Serial Number of CA Certificate

This specifies the serial number of Certificate Authority.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

This specifies a fully qualified domain name (FQDN) or custom common name or the name of a person.
This field is optional if ca-serial is specified.

Examples

This example revokes a signed digital certificate for a Vserver named vs0 with serial as 4F5A2DF2 for a Certificate Authority certificate that has a ca of *www.ca.com* and a ca-serial of 4F4EB629.

```
cluster1::> security certificate ca-issued revoke -vserver vs0 -serial  
4F5A2DF2 -ca www.ca.com -ca-serial 4F4EB629
```

security certificate ca-issued show

Display CA-Issued Digital Certificates

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the following information about the digital certificates issued by the self-signed root-ca:

- Vserver
- Serial number of certificate
- FQDN or custom common name or the name of a person

- Serial number of CA certificate
- Status (active, revoked)
- Certificate Authority
- Expiration date
- Revocation date

To display more details, run the command with the `-instance` parameter. This will add the following information:

- Country name
- State or province name
- Locality name
- Organization name
- Organization unit
- Contact administrator's email address

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Name of Vserver

Selects the certificates that match this parameter value.

[-serial <text>] - Serial Number of Certificate

Selects the certificates that match this parameter value.

[-ca <text>] - Certificate Authority

Selects the certificates that match this parameter value.

[-ca-serial <text>] - Serial Number of CA Certificate

Selects the certificates that match this parameter value.

[-common-name <FQDN or Custom Common Name>] - FQDN or Custom Common Name

Selects the certificates that match this parameter value.

[-status <status of certificate>] - Status of Certificate

Selects the certificates that match this parameter value. Possible values include active and revoked.

[-expiration <Date>] - Certificate Expiration Date

Selects the certificates that match this parameter value.

[-revocation <Date>] - Certificate Revocation Date

Selects the certificates that match this parameter value.

[-country <text>] - Country Name (2 letter code)

Selects the certificates that match this parameter value.

[-state <text>] - State or Province Name (full name)

Selects the certificates that match this parameter value.

[-locality <text>] - Locality Name (e.g. city)

Selects the certificates that match this parameter value.

[-organization <text>] - Organization Name (e.g. company)

Selects the certificates that match this parameter value.

[-unit <text>] - Organization Unit (e.g. section)

Selects the certificates that match this parameter value.

[-email-addr <mail address>] - Email Address (Contact Name)

Selects the certificates that match this parameter value.

Examples

The examples below display information about CA issued digital certificates.

```
cluster1::> security certificate ca-issued show
Serial Number of
Vserver      Serial Number  Common Name          CA's Certificate
Status
-----
vs0          4F5A2C90       example.com          4F4EB629
active
  Certificate Authority: vs0.cert
    Expiration Date: Sat Apr 14 16:15:13 2012
    Revocation Date: -

vs0          4F5A2DF2       example.com          4F4EB629
revoked
  Certificate Authority: vs0.cert
    Expiration Date: Sat Apr 14 16:21:06 2012
    Revocation Date: Fri Mar 09 17:08:30 2012

2 entries were displayed.
```

```

cluster1::> security certificate ca-issued show -instance
Vserver: vs0
    Serial Number of Certificate: 4F5A2C90
    Certificate Authority: vs0.cert
    Serial Number of CA Certificate: 4F4EB629
    FQDN or Custom Common Name: example.com
    Status of Certificate: active
    Certificate Expiration Date: Sat Apr 14 16:15:13 2012
    Certificate Revocation Date: -
    Country Name (2 letter code): US
    State or Province Name (full name): California
    Locality Name (e.g. city): Sunnyvale
    Organization Name (e.g. company): example
    Organization Unit (e.g. section): IT
    Email Address (Contact Name): web@example.com

```

security certificate config modify

Modify the certificate management configurations

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the certificate management configuration information for the cluster.

Parameters

[-min-security-strength <bits of security strength>] - Minimum Security Strength

Use this parameter to modify the allowed minimum security strength for certificates. The security bits mapping to RSA and ECDSA key length are as follows:

Length	Security Bits	Asymmetric Key Length	Elliptic Curve Key
	112	2048	224
	128	3072	256
	192	4096	384

FIPS supported values are restricted to 112 and 128.

+
NOTE: This does not affect root CA certificates.

+

[*-expiration-warn-threshold* <integer>] - Minimum Days to EMS for Expiring Certificates

Use this parameter to modify the number of days prior to certificate expiration the system sends a warning EMS event.

Examples

The following example modifies the minimum security strength allowed for certificates.

```
cluster-1::> security certificate config modify -min-security-strength 192
```

security certificate config show

Displays the certificate management configurations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the certificate management configuration information for the cluster.

"min-security-strength" - If you specify this parameter, the command displays the minimum allowed security strength for certificates.

"expiration-warn-threshold" - If you specify this parameter, the command displays the minimum number of days before expiration date configured for event management system (EMS) notification of expiring certificates.

Examples

The following example lists minimum security strength certificate management configuration.

```
cluster-1::> security certificate config show -fields min-security-  
strength
```

```
Minimum Security Strength
```

```
-----
```

```
112
```

security certificate truststore check

Initiate a TLS connection and identify the root CA certificate

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command allows the user to check if the node can use the installed set of CA certificates to establish a secure connection with the specified server. If the connection attempt fails, the system reports which expected certificates are missing. If the attempt succeeds, the system displays details of the certificates used.

Parameters

-vserver <Vserver Name> - Vserver Name (privilege: advanced)

Use this parameter to specify the Vserver that needs the connectivity check.

-server <Hostname and Port> - Server Name (privilege: advanced)

Use this parameter to specify the server to establish a connection with and look up the required CA certificate.

Examples

The following example demonstrates a missing CA certificate:

```
cluster1::*> security certificate truststore check -vserver cluster1  
-server example.com:443
```

```
Error: command failed: Missing certificate with subject name: "CN =  
ExampleRoot, C = US"
```

The following example demonstrates the required certificate being present:

```
cluster1::*> security certificate truststore check -server example.com:443
```

```
CA certificate with cert-name "ExampleRoot" is already installed in the  
truststore. Use "security certificate show -cert-name ExampleRoot" to see  
the details of the CA certificate.
```

security certificate truststore clear

Clear the default root certificates from truststore

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security certificate truststore clear` command deletes the pre-installed certificates of the type 'server-ca'. If you delete these certificates, some of the applications performing SSL communication can fail.

Examples

The following example removes the default certificate bundle:

```
cluster1::> security certificate truststore clear
```

security certificate truststore load

Load the default root certificates to truststore

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security certificate truststore load` command installs default root certificates in the certificate table of type 'server-ca'. These are the certificates required to validate any incoming server certificate during the SSL handshake process. Note: This command only installs PEM formatted certificates.

Parameters

{ [-path <text>] - File to load PEM certificates from (privilege: advanced)

This specifies the path to the PEM formatted certificate bundle. This optional parameter can have an empty value (the default).

| [-uri <text>] - URL to download PEM certificates from (privilege: advanced) }

This specifies the URL from which to download the PEM formatted certificate bundle.

[-ontap-version <ontap_version>] - Certificates from specific ONTAP version (privilege: advanced)

This specifies the ONTAP version in which the certificates were introduced. Only those certificates will be loaded. This optional parameter can have an empty value (the default) which indicates that no filtering on version is done.

Examples

The following example installs the default certificate bundle:

```
cluster1::> security certificate truststore load
```

security cluster-network commands

security cluster-network modify

Modify cluster security configurations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network modify` command modifies the cluster security configurations.

Parameters

[-enabled {true|false}] - Enable Cluster Security?

Choose whether to enable cluster security or to disable it. The default state is false.

`[-mode <cluster security mode>] - Cluster Security Mode`

Cluster security mode.

Examples

The following example enables the cluster security feature and sets the mode.

```
cluster1::> security cluster-network modify -enabled true -mode tls
```

security cluster-network show

Show cluster security configurations

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network show` command displays the cluster security configuration.

Examples

The following example displays the cluster security configuration

```
cluster1::> security cluster-network show
      Enabled: false
      Mode:    tls
      Status:  READY
```

security cluster-network certificate create

Specify the certificate used for cluster security

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network certificate create` command creates a certificate entry for the cluster security feature configuration on one node.

Parameters

`-node <nodename>` - Node Name

Node name.

`-name <text>` - Certificate Name

The certificate name used for the cluster security feature for the specified node.

Examples

The following example creates a certificate entry for the cluster security feature configuration on one node.

```
cluster1::> security cluster-network certificate create -node node1 -name
installed_cert_sample
```

security cluster-network certificate delete

Remove the certificate used for cluster security

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network certificate delete` command removes the certificate for the cluster security feature configuration on one node.

Parameters

-node <nodename> - Node Name

Node name.

Examples

The following example removes the certificate used for cluster security.

```
cluster1::> security cluster-network certificate delete -node node1 -name
installed_cert_sample
```

security cluster-network certificate modify

Modify the certificate used for cluster security

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network certificate modify` command modifies the certificate used for by a specified node for the cluster security feature configuration.

Parameters

-node <nodename> - Node Name

Node name.

[-name <text>] - Certificate Name

The certificate name used by the specified node for the cluster security feature.

Examples

The following example modifies the certificate used by a specified node for the cluster security feature configuration.

```
cluster1::> security cluster-network certificate modify -node node1 -name
installed_cert_sample
```

security cluster-network certificate renew

Renew cluster security certificates

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security cluster-network certificate renew` command renews all system generated cluster security certificates.

Examples

The following example renews all system generated certificates in the cluster security feature configuration.

```
cluster1::> security cluster-network certificate renew
```

security cluster-network certificate show

Show the certificates used for cluster security

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security cluster-network certificate show` command displays the certificates used for the cluster security feature configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node <nodename>] - Node Name

Node name.

[*-name* <text>] - Certificate Name

The certificate name used by the specified node for the cluster security feature.

[*-uuid* <UUID>] - Certificate UUID

Certificate UUID.

[*-ca* <text>] - Certificate Authority

The certificate's issuer.

Examples

The following example displays the certificate information for the cluster security feature configuration.

```
cluster1::> security cluster-network certificate show
Node                Certificate Name                Certificate Authority
-----
node1                cluster1_1850F6011570F72E      CA_cluster1
node2                cluster1_11570F72E332222      CA_cluster1

security config commands

security config modify

Modify Security Configuration Options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config modify` command modifies the existing cluster-wide security configuration. If you enable FIPS-compliant mode, the cluster will automatically select only compliant TLS protocols (currently TLSv1.3 and TLSv1.2). Non-compliant protocols are not enabled when FIPS-compliant mode is disabled. Use the `-supported-protocols` parameter to include or exclude TLS protocols independently from the FIPS mode. All protocols at or above the lowest version specified will be enabled, even those not explicitly specified. By default, FIPS mode is disabled, and ONTAP supports the TLSv1.3 and TLSv1.2 protocols. For backward compatibility, ONTAP supports adding SSLv3 and TLSv1 to the supported-protocols list when FIPS mode is disabled. Use the `-supported-cipher-suites` parameter to control which TLS cipher suites are permitted by the system. By default the supported-cipher-suites setting is `TLS_RSA_WITH_AES_128_CCM`, `TLS_RSA_WITH_AES_128_CCM_8`, `TLS_RSA_WITH_AES_128_GCM_SHA256`, `TLS_RSA_WITH_AES_128_CBC_SHA`, `TLS_RSA_WITH_AES_128_CBC_SHA256`, `TLS_RSA_WITH_AES_256_CCM`, `TLS_RSA_WITH_AES_256_CCM_8`, `TLS_RSA_WITH_AES_256_GCM_SHA384`, `TLS_RSA_WITH_AES_256_CBC_SHA`, `TLS_RSA_WITH_AES_256_CBC_SHA256`, `TLS_RSA_WITH_ARIA_128_GCM_SHA256`, `TLS_RSA_WITH_ARIA_256_GCM_SHA384`, `TLS_RSA_WITH_CAMELLIA_128_CBC_SHA`,

Select a cipher suite which is available with the corresponding selected protocol. An invalid configuration may cause some functionality to fail to operate properly. Valid values for supported-cipher-suites are listed at "<https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml>" published by IANA.

Parameters

-interface <SSL> - (DEPRECATED)-FIPS-Compliant Interface (privilege: advanced)

This parameter has been deprecated in ONTAP 9.8 and may be removed in a future release of ONTAP.

Selects the FIPS-compliant interface. The only valid value is ```_SSL_```.

[-is-fips-enabled {true|false}] - FIPS Mode (privilege: advanced)

Enables or disables FIPS-compliant mode for the entire cluster. Default is `false`.

[-supported-protocols {TLSv1.3|TLSv1.2|TLSv1.1|TLSv1|SSLv3}] - Supported Protocols (privilege: advanced)

Selects the supported protocols for the selected interface. Default is `TLSv1.3, TLSv1.2`

[-supported-ciphers <Cipher String>] - (DEPRECATED)-Supported Ciphers (privilege: advanced)

This parameter has been deprecated in ONTAP 9.8 and may be removed in a future release of ONTAP. Use the supported-ciphers-suites parameter instead.

Selects the supported cipher suites for the selected interface. Default is ```_ALL:!LOW:!aNULL:!EXP:!eNULL_```.

[-supported-cipher-suites <Cipher String>, ...] - Supported Cipher Suites (privilege: advanced)

Selects the supported cipher suites for the selected interface.

Examples

The following command enables FIPS mode in the cluster. (Default setting for FIPS mode is *false*)

```
cluster1::> security config modify * -is-fips-enabled true
```

The following command limits the supported protocols to just TLSv1.3 in the cluster. (Default setting for supported protocols is *TLSv1.3,TLSv1.2*)

```
cluster1::*> security config modify * -supported-protocols TLSv1.3
```

The following command limits the supported cipher suites in the cluster to the listed ciphers.

```
cluster1::*> security config modify * -supported-cipher-suites  
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384,TLS_AES_256_GCM_SHA384
```

security config show

Display Security Configuration Options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config show` command displays the security configurations of the cluster in advanced privilege mode.

Default values are as follows:

- SSL FIPS mode: disabled
- Supported protocols: TLSv1.3,TLSv1.2
- Supported cipher suites: All suites for the listed protocols except those that have no authentication, low encryption strength (less than 56 bits), or use 3DES or static DH key exchange.

Enabling FIPS mode will cause the entire cluster to use FIPS-compliant crypto operations only.

Use the [security config modify](#) command to change the protocols and cipher suites that the cluster will support.

Parameters

[*-fields* <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-interface <SSL>] - (DEPRECATED)-FIPS-Compliant Interface (privilege: advanced)`

This parameter has been deprecated in ONTAP 9.8 and may be removed in a future release of ONTAP. As there only ever existed one valid value for this parameter, filtering on it has never altered the results.

Displays configurations that match the specified value for the interface.

`[-is-fips-enabled {true|false}] - FIPS Mode (privilege: advanced)`

Display configurations that match the specified value for FIPS mode.

`[-supported-protocols {TLSv1.3|TLSv1.2|TLSv1.1|TLSv1|SSLv3}] - Supported Protocols (privilege: advanced)`

Displays configurations that match the specified protocols.

`[-supported-ciphers <Cipher String>] - (DEPRECATED)-Supported Ciphers (privilege: advanced)`

This parameter has been deprecated in ONTAP 9.8 and may be removed in a future release of ONTAP. Use the supported-cipher-suites parameter instead.

Displays the configurations that match the specified supported ciphers.

`[-supported-cipher-suites <Cipher String>,...] - Supported Cipher Suites (privilege: advanced)`

Displays the configurations that match the specified supported cipher suites.

Examples

The following example shows the default security configurations for a cluster.

```
cluster1::> security config show
Cluster      Supported
FIPS Mode    Protocols Supported Cipher Suites
-----
false        TLSv1.3,  TLS_RSA_WITH_AES_128_CCM, TLS_RSA_WITH_AES_128_CCM_8,

security config ocsf disable

Disable OCSP for one or more selected applications

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsf disable` command disables the OCSP-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSP-based certificate status check for applications supporting SSL/TLS communications, see the [security config ocsf show](#) command.

Parameters

-application <SSL/TLS Application supporting OCSP>,... - Application Name (privilege: advanced)

Use this parameter to specify the application to disable the OCSP support. To disable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

Examples

The following example disables the OCSP support for AutoSupport and EMS applications:

```
cluster1:*> security config ocsf disable -application autosupport,ems

cluster1:*> security config ocsf show
Application          OCSF Enabled?
-----
autosupport          false
audit_log             true
fabricpool            true
ems                   false
kmip                   true
ldap                  true
ssh                   true
6 entries were displayed.
```

The following example disables the OCSF support for all applications:

```
cluster1:*> security config ocsf disable -application all
Warning: OCSF will be disabled for all applications. Any previous
modifications
        will be ignored.
        Do you want to continue? {y|n}: y

cluster1:*> security config ocsf show
Application          OCSF Enabled?
-----
autosupport          false
audit_log             false
fabricpool            false
ems                   false
kmip                   false
ldap                  false
ssh                   false
6 entries were displayed.
```

security config ocsf enable

Enable OCSF for one or more selected applications

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsd enable` command enables the OCSP-based certificate status check for applications supporting SSL/TLS communications. For more information about the OCSP-based certificate status check for applications supporting SSL/TLS communications, see the [security config ocsd show](#) command.

Parameters

-application <SSL/TLS Application supporting OCSP>, ... - List of Applications (privilege: advanced)

Use this parameter to specify the application to enable the OCSP support. To enable all applications, the value 'all' can be used. Note: You cannot specify the value 'all' with other applications.

Examples

The following example enables the OCSP support for AutoSupport and EMS applications:

```
cluster1::*> security config ocsd enable -application autosupport,ems

cluster1::> security config ocsd show
Application          OCSP Enabled?
-----
autosupport          true
audit_log             false
fabricpool            false
ems                   true
kmip                  false
ldap                  false
ssh                   true
6 entries were displayed.
```

The following example enables the OCSP support for all applications:

```

cluster1::*> security config ocsf enable -application all
Warning: OCSF will be enabled for all applications. Any previous
modifications
        will be ignored.
        Do you want to continue? {y|n}: y

cluster1::*> security config ocsf show
Application          OCSF Enabled?
-----
autosupport          true
audit_log             true
fabricpool            true
ems                   true
kmip                  true
ldap                  true
ssh                   true
6 entries were displayed.

```

security config ocsf show

Show Online Certificate Status Protocol (OCSF) settings

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security config ocsf show` command displays the support status of the OCSF-based certificate status check for applications supporting SSL/TLS communications. If the OCSF support is enabled for an application, this check is done in addition to the certificate chain validation as part of the SSL handshake process. The OCSF-based certificate status check is done for all the certificates in the chain, provided that each certificate has the OCSF URI access points mentioned in them. If no access points are specified, the OCSF-based certificate revocation status check is ignored for that certificate and checking continues for the rest of the certificates in the chain.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

[`-instance`](privilege: advanced**) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-application <SSL/TLS Application supporting OCSP>`] - Application Name (privilege: advanced)

Selects the application that matches this parameter value. Applications include:

- `autosupport` - AutoSupport
- `audit_log` - Audit Logging
- `fabricpool` - External capacity tiers
- `ems` - Event Management System
- `kmip` - Key Management Interoperability Protocol
- `ldap_ad` - Lightweight Directory Access Protocol - Active Directory (query and modify items in Active Directory)
- `ldap_nis_namemap` - Lightweight Directory Access Protocol - NIS and Name Mapping (query Unix user, group, netgroup and name mapping information)
- `ssh` - Secure Shell

[`-is-ocsp-enabled {true|false}`] - Is OCSP-based Certificate Status Check Enabled? (privilege: advanced)

Selects the application that matches this parameter value.

Examples

The following example displays the OCSP support for the applications supporting SSL/TLS communications:

```
cluster1::> security config ocsp show
Application          OCSP Enabled?
-----
autosupport          true
audit_log            false
fabricpool            false
ems                  true
kmip                  false
ldap                  false
ssh                   false
6 entries were displayed.
```

The following example displays the OCSP support for AutoSupport:

```
cluster1::*> security config ocsp show -application autosupport
Application Name: autosupport
Is OCSP-based Certificate Status Check Enabled?: true
```

security config status show

(DEPRECATED)-Display Security Configuration Status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command has been deprecated as of 9.9 and may be removed in a future release of ONTAP. Reboot is no longer required to apply the security configuration, so it now always displays false.

The ``security config status show`` command displays the required reboot status of the nodes in the cluster after security configuration settings have been modified using the `xref:{relative_path}security-config-modify.html[security config modify]` command. Use this command to monitor the status of the required reboot process. When all nodes have rebooted, the cluster is ready to use the new security configuration settings.

Parameters

`[-fields <fieldname>,...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`| [-instance ] (privilege: advanced) }`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-node {<nodename>|local}] - Node Name (privilege: advanced)`

Select the node whose reboot-status you want to display.

`[-reboot-needed {true|false}] - Reboot Needed (privilege: advanced)`

reboot-needed status of the node that tells if the node requires a reboot for security configuration to take effect.

Examples

The following example displays the status of a configuration change in a four-node cluster.

```
cluster1::> security config status show
Nodes in Cluster      Reboot Needed
-----
node1                  true
node2                  true
node3                  false
node4                  false
4 entries were displayed.
```

The following example shows the output of the command after the cluster reboot process is complete.

```
cluster1::> security config status show
Nodes in Cluster      Reboot Needed
-----
node1                  false
node2                  false
node3                  false
node4                  false
4 entries were displayed.
```

security cryptomod-fips commands

security cryptomod-fips show

Display the status of cryptomod-fips

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays information about the status of the cryptomod FIPS module. By default, this command displays the following information:

- Node name
- FIPS version
- Module version
- FIPS state
- Boolean indicating if module is a user-space module
- Boolean indicating if module is operating in FIPS mode
- Boolean indicating if module is currently under validation

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value.

`[-fips-state-text <text>] - FIPS State`

Shows the FIPS state of the module.

- POWER ON STATE
- SELF-TEST STATE
- ERROR STATE
- OPERATE STATE
- POWER OFF STATE

`[-fips-version <text>] - FIPS Version`

Shows the FIPS version.

`[-module-version <text>] - Module Version`

Shows the cryptomod FIPS module version.

`[-is-user-space-module {true|false}] - Is User Space Module?`

True if the module is a user-space module.

`[-is-fips-enabled {true|false}] - Is FIPS Mode Enabled?`

True if the module is operating in FIPS mode.

`[-is-iut-enabled {true|false}] - Is an IUT Module Enabled?`

True if the module is currently under validation.

Examples

```
cluster1::> security cryptomod-fips show
Node    FIPS           FIPS    Module
        State           Version Version
-----
node-1  OPERATE STATE   140-2   2.2
node-2  OPERATE STATE   140-2   2.2
```

security dynamic-authorization commands

security dynamic-authorization modify

Modify dynamic-authorization global settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization modify` command modifies one or more dynamic authorization settings.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the setting. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver is used.

[-state {disabled|visibility|enforced}] - Dynamic Authorization State

This parameter sets the state of the dynamic authorization feature. Valid values are *disabled*, *visibility* and *enforced*.

- **disabled:** Dynamic Authorization is disabled. This is the default factory setting.
- **visibility:** Dynamic Authorization is enabled in visibility mode. Customers will typically use this mode during a trial run to test the feature and ensure that users are not being inadvertently locked out. In this mode, the trust score is checked every time the user attempts to execute a restricted command, but not enforced. That is, the user will be allowed to execute all restricted commands as long as his RBAC privileges allow it. However, all commands that will either be denied or subject to additional MFA challenge will be logged.
- **enforced:** Dynamic Authorization is enabled in enforcement mode. Customers will typically use this mode after they have completed their trial run using visibility mode and verified that their configuration settings are correct, i.e. no users are being inadvertently locked out as a result of incorrect configuration. In this mode, the trust score is checked every time the user attempts to execute a restricted command and use to enforce dynamic authorization. That is, the user will be allowed to execute all restricted commands without additional MFA challenge only if the trust score exceeds the upper MFA challenge boundary. If the trust score falls within the lower and upper MFA challenge boundary, the user will be subject to an additional MFA challenge before being allowed to execute the command. If the trust score falls below the lower MFA challenge boundary, the user will be denied access. All additional MFA challenges and denials will be logged. The suppression interval is also enforced so no additional authentication challenges will be required if repeated authorization requests are made within the suppression interval.

[-suppression-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P<integer>W | disabled}] - Dynamic Authorization Suppression Interval

The dynamic authorization challenge suppression interval in ISO-8601 format. When a series of restricted commands are executed within a short interval, multiple authentication prompts are suppressed to create a good user experience. The default suppression interval is 10 minutes, or *PT10M* in ISO-8601 format.

[-lower-challenge-boundary <percent>] - Lower MFA Challenge Boundary

The lower MFA challenge percentage boundary. Supported values are from 0 to 99. Default value is 0.

[-upper-challenge-boundary <percent>] - Upper MFA Challenge Boundary

The upper MFA challenge percentage boundary. Supported values are from 0 to 100. This must be equal to or greater than the value of the lower boundary. A value of 100 means that every request will either be denied or subject to an additional authentication challenge; there are no requests that are allowed without a challenge. Default value is 90.

Examples

The following command modifies the lower challenge boundary to 10.

```

cluster1::> security dynamic-authorization modify -lower-challenge
-boundary 10

cluster1::> security dynamic-authorization show
Vserver: cluster1

                Dynamic Authorization State: disabled
    Dynamic Authorization Suppression Interval: 10m
                Lower MFA Challenge Boundary: 10%
                Upper MFA Challenge Boundary: 90%

```

security dynamic-authorization show

Show dynamic-authorization global settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization show` displays information on dynamic authorization settings.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the dynamic authorization settings.

[-vserver <vserver name>] - Vserver

Selects the dynamic authorization settings that match this parameter value. If not specified, all cluster-level and Vserver-level settings are displayed.

[-state {disabled|visibility|enforced}] - Dynamic Authorization State

Selects the dynamic authorization settings that match this parameter value.

[-suppression-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled}] - Dynamic Authorization Suppression Interval

Selects the dynamic authorization settings that match this parameter value.

[-lower-challenge-boundary <percent>] - Lower MFA Challenge Boundary

Selects the dynamic authorization settings that match this parameter value.

[-upper-challenge-boundary <percent>] - Upper MFA Challenge Boundary

Selects the dynamic authorization settings that match this parameter value.

Examples

The example below displays information on dynamic authorization settings:

```
cluster1::> security dynamic-authorization show
Vserver: cluster1
                Dynamic Authorization State: disabled
Dynamic Authorization Suppression Interval: 10m
                Lower MFA Challenge Boundary: 0%
                Upper MFA Challenge Boundary: 90%
```

security dynamic-authorization authentication-history-policy modify

Modify authentication history policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization authentication-history-policy modify` command updates the authentication history policy settings for dynamic authorization.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the authentication history policy setting. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

[-use-last-num-days <integer>] - Last Number of Days

This parameter optionally specifies the last number of days of authentication history statistics to use in calculating the trust score for the authentication history component. By default, this is set to -1, which means the trust score for authentication history component is calculated from all successful and failed authentications since the user's first successful login.

[-lower-boundary <percent>] - Lower Boundary of Authentication Failures

This parameter optionally specifies the lower boundary of authentication failures. The value is a percentage from 0 to 99, and must be less than or equal to the upper boundary. When used in conjunction with the *upper-boundary*, if the authentication failures are less than the *lower-boundary* percentage, the authentication history component gets a full trust score, while if the authentication failures are higher than the *upper-boundary* percentage, the authentication history component gets a zero trust score. Authentication failures falling between the *lower-boundary* and *upper-boundary* gets a 50% trust score for the authentication history component.

[-upper-boundary <percent>] - Upper Boundary of Authentication Failures

This parameter optionally specifies upper boundary of authentication failures. The value is a percentage from 0 to 100, and must be greater than or equal to the lower boundary. Refer to the description in the *lower-boundary* parameter on how this setting is used.

Examples

The following command modifies the upper boundary of authentication failures for the Administrative Vserver to 90%.

```

cluster1::*> security dynamic-authorization authentication-history-policy
modify -upper-boundary 90

cluster1::*> security dynamic-authorization authentication-history-policy
show
Vserver: cluster1
                                Last Number of Days: 90
      Lower Boundary of Authentication Failures: 10%
      Upper Boundary of Authentication Failures: 90%
Vserver: svm0
                                Last Number of Days: -1
      Lower Boundary of Authentication Failures: 10%
      Upper Boundary of Authentication Failures: 100%
2 entries were displayed.

```

security dynamic-authorization authentication-history-policy show

Show authentication history policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization authentication-history-policy show` displays information about the dynamic authorization authentication history policy settings.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the dynamic authorization authentication history policy.

[-vserver <vserver name>] - Vserver

Selects the dynamic authorization authentication history policy fields that match this parameter value.

[-use-last-num-days <integer>] - Last Number of Days

Selects the dynamic authorization authentication history policy fields that match this parameter value.

[-lower-boundary <percent>] - Lower Boundary of Authentication Failures

Selects the dynamic authorization authentication history policy fields that match this parameter value.

[-upper-boundary <percent>] - Upper Boundary of Authentication Failures

Selects the dynamic authorization authentication history policy fields that match this parameter value.

Examples

The example below displays information about all dynamic authorization authentication history policy settings:

```
cluster1::> security dynamic-authorization authentication-history-policy
show
Vserver: cluster1
                Last Number of Days: 90
    Lower Boundary of Authentication Failures: 10%
    Upper Boundary of Authentication Failures: 100%
Vserver: svm0
                Last Number of Days: -1
    Lower Boundary of Authentication Failures: 10%
    Upper Boundary of Authentication Failures: 100%
2 entries were displayed.
```

security dynamic-authorization executed-commands show

Display executed commands

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization executed-commands show` command displays information about the executed commands according to the dynamic authorization rules.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the dynamic authorization executed commands.

[-vserver <vserver name>] - Vserver

Selects the dynamic authorization executed command fields that match this Vserver.

[-date <MM/DD/YYYY HH:MM:SS>] - Date

Selects the dynamic authorization executed command fields that match this date.

[-username <text>] - Username

Selects the dynamic authorization executed command fields that match this username.

[-operation <text>] - Operation

Selects the dynamic authorization executed command fields that match this operation.

[-count <integer>] - Count

Selects the dynamic authorization executed command fields that match this count.

[-score <integer>] - Trust Score

Selects the dynamic authorization executed command fields that match this score.

[-result {permit|deny|challenge}] - Result

Selects the dynamic authorization executed command fields that match this result.

Examples

The example below displays information about all dynamic authorization executed commands:

```
cluster1::> security dynamic-authorization executed-commands show

Vserver: usernamecluster-1
```

Date	Operation	Username	Count	Trust Score	Result
-----	-----	-----	-----	-----	-----
12/7/2023 08:25:57	security login create	admin	1	100	permit
12/7/2023 08:26:04	security login unlock	admin	1	100	permit
12/7/2023 08:26:09	security multi-admin-verify approval-group create	admin	1	100	permit

3 entries were displayed.

security dynamic-authorization group create**Add a Dynamic Authorization group**

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization group create` command creates the groups to include in dynamic authorization.

Parameters**-vserver <vserver name> - Vserver**

This parameter optionally specifies the Vserver of the dynamic authorization group that is being created. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

-name <text> - Group Name

This parameter specifies the name of the group that will be part of dynamic authorization.

[*-excluded-usernames* <text>,...] - List of Excluded Users

This parameter optionally specifies the list of users that will be excluded from dynamic authorization.

[*-comment* <text>] - Comment

This parameter optionally specifies the comments.

Examples

The following command creates a group *test* on vservers *vs1* and excludes the user *tsmith* from dynamic authorization.

```
cluster1::> security dynamic-authorization group create -vservers vs1 -name test -excluded-usernames tsmith
```

security dynamic-authorization group delete

Delete a Dynamic Authorization group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization group delete` command deletes the specified group.

Parameters

***-vservers* <vserver name> - Vserver**

This parameter optionally specifies the Vserver of the dynamic authorization group that is being deleted. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

***-name* <text> - Group Name**

This parameter specifies the group name that is being deleted.

Examples

The following command deletes the group *test* from the Vserver *vs1*.

```
cluster1::> dynamic authorization group delete -vservers vs1 -name test
```

security dynamic-authorization group modify

Modify a Dynamic Authorization group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization group modify` command modifies the dynamic authorization groups.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the group for which the `-excluded-usernames` or `-comment` is being modified. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

-name <text> - Group Name

This parameter specifies the name of the group for which the `-excluded-usernames` or `-comment` is being modified.

[-excluded-usernames <text>,...] - List of Excluded Users

This parameter specifies the list of users to be excluded from dynamic authorization.

[-comment <text>] - Comment

This parameter optionally specifies the comments.

Examples

The following command modifies the excluded users for the group `test` who is part of Vserver `vs1`.

```
cluster1::> security dynamic-authorization group modify -vserver vs1
-group-name test -excluded-usernames Jsmith
```

security dynamic-authorization group show

Display Dynamic Authorization groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization group show` command displays information about the dynamic authorization groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects dynamic-authorization groups for this Vserver.

[-name <text>] - Group Name

Selects dynamic-authorization groups that match this group name.

[-excluded-usernames <text>,...] - List of Excluded Users

Selects the dynamic-authorization groups that match the specified excluded username.

[-comment <text>] - Comment

Selects the dynamic-authorization groups that match this comment.

Examples

The example below displays dynamic authorization group information for the Vserver *vs1*.

```
cluster1::> security dynamic-authorization group show -vserver vs1
      Vserver: vs1
      Group Name: NETAPP_ENG
List of Excluded Users: user1, user2, user12
      Comment: -
```

security dynamic-authorization rule create

Add a dynamic authorization rule

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization rule create` command creates a custom dynamic authorization rule for an operation. By default, the set of operations subject to dynamic authorization is the same as the default Multi-Admin-Verify (MAV) set of commands. Additional operations can be configured using the `security dynamic-authorization rule create` command.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom dynamic authorization rule.

-operation <Command or Command Directory> - Command or Command Directory

This parameter specifies the operation for the custom dynamic authorization rule to be created. The operation can be a command or command directory.

-query <query> - Query

This parameter optionally specifies the object (or objects) upon which to apply the operation. Any field or query supported by the operation can be supplied. If a query is not specified for the rule, the rule applies to all objects of the specified operation. The query object must be enclosed in double quotation marks (").

Examples

The following command creates a custom dynamic authorization rule for the [job delete](#) operation for the Administrative Vserver. This rule is applicable only to job objects whose job ID is greater than 50.

```
cluster1::> security dynamic-authorization rule create -operation "job delete" -query "-id >50"
```

The following command creates a custom dynamic authorization rule for the [snapmirror policy create](#) operation for the data Vserver *vs1.example.com*. This rule is applicable only to SnapMirror policies of type other than *async-mirror*.

```
cluster1::> security dynamic-authorization rule create -vserver vs1.example.com -operation "snapmirror policy create" -query "-type !async-mirror"
```

Related Links

- [job delete](#)
- [snapmirror policy create](#)

security dynamic-authorization rule delete

Delete a dynamic authorization rule

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization rule delete` command deletes a custom dynamic authorization rule for an operation. It can be used to delete a custom dynamic authorization rule that was configured using the [security dynamic-authorization rule create](#) command.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom dynamic authorization rule.

-operation <Command or Command Directory> - Command or Command Directory

This parameter specifies the operation for the custom dynamic authorization rule to be deleted.

Examples

The following command deletes a custom dynamic authorization rule for the `network port ifgrp` operation for the Administrative Vserver.

```
cluster1::> security dynamic-authorization rule delete -vserver cluster1
-operation "network port ifgrp"
```

The following command deletes a custom dynamic authorization rule for the `vserver` services `nis-domain create` operation for the data Vserver `vs1.example.com`.

```
cluster1::> security dynamic-authorization rule delete -vserver
vs1.example.com -operation "vserver services nis-domain create"
```

security dynamic-authorization rule modify

Modify a dynamic authorization rule

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization rule modify` command modifies a custom dynamic authorization rule for an operation. It can be used to modify a custom dynamic authorization rule that was configured using the [security dynamic-authorization rule create](#) command.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom dynamic authorization rule.

-operation <Command or Command Directory> - Command or Command Directory

This parameter specifies the operation for the custom dynamic authorization rule to be modified. The operation can be a command or command directory.

[-query <query>] - Query

This parameter optionally specifies the object (or objects) upon which to apply the operation. Any field or query supported by the operation can be supplied. If the query is specified as "" i.e., empty, the rule applies to all objects of the specified operation. The query object must be enclosed in double quotation marks ("").

Examples

The following command modifies the query of a custom dynamic authorization rule for the [storage encryption disk destroy](#) operation in the Administrative Vserver. The new query disallows destroying of storage encryption disks starting with the name `xxxxxx_`.

```
cluster1::> security dynamic-authorization rule modify -operation "storage encryption disk destroy" -query "-disk !xxxxx_*
```

The following command resets the query of a custom dynamic authorization rule for the [vserver active-directory create](#) operation for the data Vserver `vs1.example.com`.

```
cluster1::> security dynamic-authorization rule modify -vserver vs1.example.com -operation "vserver active-directory create" -query ""
```

security dynamic-authorization rule show

Show dynamic authorization rules

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization rule show` displays information about dynamic authorization rules, which includes both pre-defined as well as custom dynamic authorization rules.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the specified dynamic authorization rules.

[-vserver <vserver name>] - Vserver

Selects the dynamic authorization rules that match this parameter value.

[-operation <Command or Command Directory>] - Command or Command Directory

Selects the dynamic authorization rules that match this parameter value.

[-query <query>] - Query

Selects the dynamic authorization rules that match this parameter value.

Examples

The example below displays information about all dynamic authorization rules whose operation matches the prefix `security multi-admin-verify`.

```

cluster1::*> security dynamic-authorization rule show -operation "security
multi-admin-verify"*

Vserver: cluster1

Operation
Query
-----
-----
security multi-admin-verify
security multi-admin-verify approval-group
security multi-admin-verify approval-group replace
security multi-admin-verify rule

Vserver: vs1

Operation
Query
-----
-----
security multi-admin-verify
security multi-admin-verify approval-group
security multi-admin-verify approval-group replace
security multi-admin-verify rule
8 entries were displayed.

```

security dynamic-authorization trust-score-component create

Create a trust score component

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization trust-score-component create` command creates and registers a custom trust score component. Administrators can use this command to configure trust score components in addition to or as an alternative to built-in components.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom trust score component. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

-component <text> - Component Name

The name of the custom component used to obtain the trust score. This must be unique within the Vserver.

[`-weight <integer>`] - Score Weight

An integer giving the raw weight of the component, indicating the importance of the component relative to other components for calculating the trust score. Built-in components have a default weightage of *20*.

[`-provider-uri {scheme: //(hostname|IPv4 Address|['IPv6 Address']) ...}`] - Trust Score Provider URI of Component

The trust score provider URI to obtain the trust score for the component. The response from the URI must be in JSON.

[`-max-score <integer>`] - Max Trust Score of Component

The maximum score for the component. The default value is *20*.

[`-min-score <integer>`] - Min Trust Score of Component

The minimum score for the component. The default value is *0*.

[`-score-field <text>`] - Score field to check in JSON response

The field within the JSON response to obtain the trust score.

[`-score-type {trust-score|risk-score}`] - Score Type

This parameter specifies if the score returned from the component is trust score or risk score. The trust score is in ascending order with a higher score denoting a higher trust level, while the risk score is in descending order. The default value is *trust-score*.

[`-secret-access-key <text>`] - Access key for trust score provider

An optional field giving the access key for the trust score provider. This is used to authenticate to the provider.

[`-provider-http-headers <text>,...`] - Provider HTTP headers

An optional list of HTTP headers required by the trust score provider.

Examples

The following command creates a dynamic authorization custom component for the Administrative Vserver. The username is a parameter that will be replaced with the actual username at run-time:

```
cluster1::> security dynamic-authorization trust-score-component create
-component comp1 -weight 20 -max-score 500 -provider-uri
https://provider.example.com/trust-scores/users/${username}/component
-score-field score
```

security dynamic-authorization trust-score-component delete

Delete a trust score component

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization trust-score-component delete` command deletes a custom trust score component. It can be used to delete a custom trust score component that was configured using the [security dynamic-authorization trust-score-component create](#) command.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom trust score component. If not specified, this defaults to the cluster Vserver.

-component <text> - Component Name

Name of the custom trust score component to be deleted.

Examples

The following command deletes a custom trust score component named `comp1` for the Administrative Vserver.

```
cluster1::> security dynamic-authorization trust-score-component delete
-component comp1
```

Related Links

- [security dynamic-authorization trust-score-component create](#)

security dynamic-authorization trust-score-component modify

Modify a trust score component

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization trust-score-component modify` command updates an existing custom trust score component.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the custom trust score provider component. If this parameter is specified, the setting applies to that Vserver only. If not specified, the cluster Vserver setting is used.

-component <text> - Component Name

The component name.

[-weight <integer>] - Score Weight

An integer giving the raw weight of the component, indicating the importance of the component relative to other components for calculating the trust score. Built-in components have a default weightage of 20.

[`-provider-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}`] - Trust Score Provider URI of Component

The trust score provider URI to obtain the trust score for the component. The response from the URI must be in JSON.

[`-max-score <integer>`] - Max Trust Score of Component

The maximum score for the component.

[`-min-score <integer>`] - Min Trust Score of Component

The minimum score for the component.

[`-score-field <text>`] - Score field to check in JSON response

The field within the JSON response to obtain the trust score.

[`-score-type {trust-score|risk-score}`] - Score Type

This parameter specifies if the score returned from the component is trust score or risk score. The trust score is in ascending order with a higher score denoting a higher trust level, while the risk score is in descending order. The default value is `trust-score`.

[`-secret-access-key <text>`] - Access key for trust score provider

An optional field giving the access key for the trust score provider. This is used to authenticate to the provider.

[`-provider-http-headers <text>,...`] - Provider HTTP headers

An optional list of HTTP headers required by the trust score provider.

Examples

The following command modifies a dynamic authorization custom component for the Administrative Vserver to change the weightage of the component to 100.

```
cluster1::> security dynamic-authorization trust-score-component modify
-component comp1 -weight 100
```

security dynamic-authorization trust-score-component show

Display trust score components

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization trust-score-component show` displays information about the components of the trust score.

Parameters

{ [`-fields <fieldname>,...`]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the specified dynamic authorization trust score components.

[-vserver <vserver name>] - Vserver

Selects the dynamic authorization trust score components that match this parameter value.

[-component <text>] - Component Name

Selects the dynamic authorization trust score components that match this parameter value.

[-weight <integer>] - Score Weight

Selects the dynamic authorization trust score components that match this parameter value.

[-max-percent-score-weight <double hundredths>] - Max Percentage Score Weight

Selects the dynamic authorization trust score components that match this parameter value.

[-provider-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - Trust Score Provider URI of Component

Selects the dynamic authorization trust score components that match this parameter value.

[-max-score <integer>] - Max Trust Score of Component

Selects the dynamic authorization trust score components that match this parameter value.

[-min-score <integer>] - Min Trust Score of Component

Selects the dynamic authorization trust score components that match this parameter value.

[-score-field <text>] - Score field to check in JSON response

Selects the dynamic authorization trust score components that match this parameter value.

[-score-type {trust-score|risk-score}] - Score Type

This parameter specifies if the score returned from the components is trust score or risk score. The trust score is in ascending order with a higher score denoting a higher trust level, while the risk score is in descending order. The default value is *trust-score*.

[-provider-http-headers <text>,...] - Provider HTTP headers

Selects the dynamic authorization trust score components that match this parameter value.

Examples

The example below displays information about all dynamic authorization trust score components, both built-in and custom:

```
cluster1::> security dynamic-authorization trust-score-component create
-component comp1 -weight 20 -max-score 100 -provider-uri
https://provider.example.com/trust-scores/users/admin1/component1.json
-score-field score
```

```
cluster1::> security dynamic-authorization trust-score-component show
Percentage
```

Vserver	Component Name	Score Weight	Score
-----	-----	-----	

cluster1	authentication_history_policy	20	33.33
cluster1	comp1	20	33.33
cluster1	trusted_device	20	33.33
svm0	authentication_history_policy	20	50.00
svm0	trusted_device	20	50.00

5 entries were displayed.

The following command displays the details of all components matching the name *comp1* :

```
cluster1::> security dynamic-authorization trust-score-component show
-vserver cluster1 -component comp1 -instance
Vserver: cluster1
    Trust Score Component Name: comp1
    Weight of the Component: 20
Max Percentage Weight of the component: 50.00
Trust Score Provider URI of Component:
https://provider.example.com/trust-scores/users/admin1/component1.json
    Max Score of Component: 100
Score field to check in JSON response: score
    Provider HTTP headers: -
```

security dynamic-authorization user-trust-score reset

Resets trust score of user

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security dynamic-authorization user-trust-score reset` command resets the trust score of the specified user.

Parameters

-vserver <vserver name> - Vserver

Selects the Vserver that match this parameter value.

-username <text> - Username

Reset the trust score for this user.

-component <text> - Component Name

The component for which the user trust score has to be reset.

Examples

The example below resets the user trust score.

```
cluster1::> security dynamic-authorization user-trust-score reset -vserver  
vs1 -username Tsmith -component authentication_history_policy
```

security ha-network commands

security ha-network modify

Modify HA network security configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security ha network modify` command modifies the HA network security in a cluster.

Parameters

-enabled {true|false} - HA Network Security Enabled

Whether to enable ha network security.

Examples

The following example enables the ha network security configuration.

```
cluster1:: security ha network modify -enabled true
```

security ha-network show

Show HA network security configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security ha-network show` command displays the HA network security in a cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

Node name.

[-enabled {true|false}] - HA Network Security Enabled

This parameter shows the status of the HA network security.

security ipsec commands

security ipsec show-ikesa

Show IKE SA Information

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ipsec show-ikesa` command displays information about IKE Security Associations (SA).

Running this command with the `-node` parameter displays information relevant to IKE SAs generated at the specified node.

Running this command with the `-vserver` parameter displays information relevant to IKE SAs associated with the specified vservers.

Running this command with the `-policy-name` parameter displays information relevant to IKE SAs created based on the specified security policy.

You can specify additional parameters to display only information matching those parameters. For example, to display IKE SAs associated with a specific local address, run the command with the `-local-address` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the specified fields. Notice that key fields are always displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays all fields of the IKE SAs.

-node <nodename> - Node

This required parameter specifies the node from which the IKE SA information will be collected and displayed.

[-vserver <vserver name>] - Vserver Name

Use this parameter to display the IKE SAs associated with the specified Vserver.

[-policy-name <text>] - Policy Name

Use this parameter to display the IKE SAs created based on the specified security policy.

[-local-address <text>] - Local Address

Use this parameter to display the IKE SAs with the specified local endpoint IP address.

[-remote-address <text>] - Remote Address

Use this parameter to display the IKE SAs with the specified remote endpoint IP address.

[-initiator-spi <text>] - Initiator SPI

Use this parameter to display the IKE SAs with the specified initiator Security Parameter Index (SPI).

[-responder-spi <text>] - Responder SPI

Use this parameter to display the IKE SAs with the specified responder SPI.

[-is-initiator {true|false}] - Is Initiator

Use this parameter to display the IKE SAs created when the given node matches the specified initiator role: true means initiator role and false means responder role in IKE negotiation.

[-ike-version <integer>] - IKE Version

Use this parameter to display the IKE SAs created using the specified IKE version.

[-auth-method <IKE Authentication Method>] - Authentication Method

Use this parameter to display the IKE SAs created using the specified authentication method.

[-state <IKE SA State>] - IKE SA State

Use this parameter to display only the IKE SAs that are in the specified state.

[-cipher-suite <Cipher Suite Type>] - Cipher Suite

Use this parameter to display the IKE SAs created using the specified cipher suite.

[-lifetime <integer>] - Lifetime

Use this parameter to display the IKE SAs with the specified remaining lifetime. Notice that lifetime keeps changing for the duration of the security association.

Examples

This example displays all IKE SAs for node *cluster1-node1*:

```
cluster-1::> security ipsec show-ikesa -node cluster1-node1
```

Vserver	Policy Name	Local Address	Remote Address	Initiator-SPI	State
vs1	Policy1	192.186.10.1	192.186.10.2	e658e5bc7ece199e	ESTABLISHED
vs2	Policy2	192.168.20.1	192.168.20.2	8eac392028ab4f12	ESTABLISHED

2 entries were displayed.

This example displays selected fields of all IKE SAs for node *cluster1-node1*:

```
cluster-1::> security ipsec show-ikesa -node cluster1-node1 -fields is-  
initiator,initiator-spi,responder-spi,auth-method,cipher-suite,lifetime
```

node	vserver	policy-name	local-address	remote-address	initiator-spi	responder-spi	is-initiator	auth-method	cipher-suite	lifetime
cluster1-node1	vs1	Policy1	192.186.10.1	192.186.10.2	e658e5bc7ece199e	9b61befff71e8ca2	false	PSK	SUITEB_GCM256	6300
cluster1-node1	vs2	Policy2	192.186.20.1	192.186.20.2	4d43aaba8ca01cd8	00bdd5aac569e08a	true	PSK	SUITEB_GCM256	6720

2 entries were displayed.

This example displays all IKE SAs for vserver *vs1*:

```
cluster-1::> security ipsec show-ikesa -node cluster1-node1
```

	Policy	Local	Remote		
Vserver	Name	Address	Address	Initiator-SPI	State
vs1	Policy1	192.186.10.1	192.186.10.2	e658e5bc7ece199e	ESTABLISHED

This example displays instance view (all fields) for all IKE SAs associated with node *cluster1-node1*, vserver *vs1* and created using policy *Policy1*:

```
cluster-1::> security ipsec show-ikesa -node cluster1-node1 -vserver vs1
-policy-name Policy1 -instance
Node: cluster1-node1
    Vserver Name: vs1
    Policy Name: Policy1
    Local Address: 192.168.10.1
    Remote Address: 192.168.10.2
    Initiator SPI: e658e5bc7ece199e
    Responder SPI: 9b61beffff71e8ca2
    Is Initiator: false
    IKE Version: 2
Authentication Method: PSK
    IKE SA State: ESTABLISHED
    Cipher Suite: SUITEB_GCM256
    Lifetime: 6000
```

security ipsec show-ipsecsa

Show IPsec SA Information

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ipsec show-ipsecsa` command displays information about IPsec Security Associations (SA).

Running the command with the `-node` parameter displays information relevant to IPsec SAs at the specified node.

Running this command with the `-vserver` parameter displays information relevant to IPsec SAs associated with the specified vserver.

Running this command with the `-policy-name` parameter displays information relevant to IPsec SAs created

using the specified security policy.

You can specify additional parameters to display only information matching those parameters. For example, to display IPsec SAs only about a certain local address, run the command with the `-local-address` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the specified fields. Notice that key fields are always displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays all fields of matching IPsec SAs.

-node <nodename> - Node

This required parameter specifies from which node the IPsec SA information will be collected and displayed.

[-vserver <vserver name>] - Vserver Name

Use this parameter to display the IPsec SAs associated with the specified Vserver.

[-policy-name <text>] - Policy Name

Use this parameter to display the IPsec SAs created based on the specified security policy.

[-local-address <text>] - Local Address

Use this parameter to display the IPsec SAs with the specified local endpoint IP address.

[-remote-address <text>] - Remote Address

Use this parameter to display the IPsec SAs with the specified remote endpoint IP address.

[-inbound-spi <text>] - Inbound SPI

Use this parameter to display the IPsec SA having the specified inbound Security Parameter Index (SPI).

[-outbound-spi <text>] - Outbound SPI

Use this parameter to display the IPsec SA having the specified outbound SPI.

[-action <IPsec Action Type>] - IPsec Action

Use this parameter to display IPsec SAs with the specified security action type, such as ESP_TRA for ESP transport mode protection or BYPASS to bypass IPsec, or DISCARD.

[-state <text>] - IPsec SA State

Use the parameter to display only the IPsec SAs that are in the specified state.

[-cipher-suite <Cipher Suite Type>] - Cipher Suite

Use this parameter to display the IPsec SAs that use the specified cipher-suite.

[-ib-bytes <integer>] - Inbound Bytes Processed

Use this parameter to display the IPsec SAs matching the processed inbound bytes. Notice that `ib-bytes` keeps changing as inbound packets are processed.

[`-ib-pkts` <integer>] - Inbound Pkts Processed

Use this parameter to display the IPsec SAs matching the processed inbound packets. Notice that `ib-pkts` keeps changing as inbound packets are processed.

[`-ob-bytes` <integer>] - Outbound Bytes Processed

Use this parameter to display the IPsec SAs matching the processed outbound bytes. Notice that `ob-bytes` keeps changing as outbound packets are processed.

[`-ob-pkts` <integer>] - Outbound Pkts Processed

Use this parameter to display the IPsec SAs matching the processed outbound packets. Notice that `ob-pkts` keeps changing as outbound packets are processed.

[`-lifetime` <integer>] - IPsec SA Lifetime Seconds

Use this parameter to display the IPsec SAs matching the remaining lifetime. Notice that `lifetime` keeps changing for the duration of the security association.

[`-hw-ib-bytes` <integer>] - Inbound Bytes Processed by Offload

Use this parameter to display the IPsec SAs matching the processed inbound bytes by hardware offload. Notice that number of bytes keeps changing as inbound packets are processed.

[`-hw-ib-pkts` <integer>] - Inbound Pkts Processed by Offload

Use this parameter to display the IPsec SAs matching the processed inbound packets by hardware offload. Notice that number of packets keeps changing as inbound packets are processed.

[`-hw-ob-bytes` <integer>] - Outbound Bytes Processed by Offload

Use this parameter to display the IPsec SAs matching the processed outbound bytes by hardware offload. Notice that number of bytes keeps changing as outbound packets are processed.

[`-hw-ob-pkts` <integer>] - Outbound Pkts Processed by Offload

Use this parameter to display the IPsec SAs matching the processed outbound packets by hardware offload. Notice that number of packets keeps changing as outbound packets are processed.

Examples

The this example displays all IPsec SAs for node `cluster1-node1`:

```
cluster-1::> security ipsec show-ipsecsa -node cluster1-nodel
```

Vserver	Policy	Local Address	Remote Address	Inbound SPI	Outbound SPI
vs1	Policy1	192.186.10.1	192.186.10.2	c68de9db	c84f913b
vs2	Policy2	192.186.20.1	192.186.20.2	cbc01493	c6ee7424

2 entries were displayed.

This example displays selected fields of all IPsec SAs for node *cluster1-nodel*:

```
cluster-1::> security ipsec show-ipsecsa -node cluster1-nodel -fields
local-address,remote-address,inbound-spi,outbound-spi
```

node	vserver	policy-name	local-address	remote-address	inbound-spi	outbound-spi
cluster1-nodel	vs1	Policy1	192.186.10.1	192.186.10.2	c68de9db	c84f913b
cluster1-nodel	vs2	Policy2	192.186.20.1	192.186.20.2	cbc01493	c6ee7424

2 entries were displayed.

This example displays selected fields of all IPsec SAs associated with node ```_cluster1-nodel_```:

```
cluster-1::> security ipsec show-ipsecsa -node cluster1-nodel -fields ib-
bytes,ib-pkts,ob-bytes,ob-pkts
```

node	vserver	policy-name	local-address	remote-address	inbound-spi	ib-bytes	ib-pkts	ob-bytes	ob-pkts
cluster1-nodel	vs1	Policy1	192.186.10.1	192.186.10.2	c68de9db	4704	56	6720	56

2 entries were displayed.

This example displays instance view (all fields) for all IPsec SAs associated with node *cluster1-nodel*,

vserver *vs1* and created using policy *Policy1*:

```
cluster-1::> security ipsec show-ipseca -node cluster1-node1 -vserver vs1
-policy-name Policy1 -instance
Node: cluster1-node1
    Vserver Name: vs1
    Policy Name: Policy1
    Inbound SPI: c68de9db
    Outbound SPI: c84f913b
    Local Address: 192.168.10.1
    Remote Address: 192.168.10.2
    IPsec Action: ESP_TRA
    IPsec SA State: INSTALLED
    Cipher Suite: SUITEB_GCM256
Inbound Bytes Processed: 4704
Inbound Pkts Processed: 56
Outbound Bytes Processed: 6720
Outbound Pkts Processed: 56
IPsec SA Lifetime Seconds: 1800
```

security ipsec ca-certificate add

Add CA certificate(s) to a vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds a list of CA certificates to IPsec for the given Vserver. These certificates will be used for PKI authentication with remote IKE endpoint. The CA certificates should have already been installed using either [security certificate install](#) command or [security certificate create](#) command.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver for which the IPsec CA certificates should be added.

-ca-certs <text>,... - CA Certificate Names

Use this parameter to specify the list of CA certificates to be added to IPsec.

Examples

The following example adds two IPsec CA certificates named caCert1 and caCert2 to Vserver v1.

```
cluster-1::>security ipsec ca-certificate add -vserver v1 -ca-certs
caCert1,caCert2
```

- [security certificate install](#)
- [security certificate create](#)

security ipsec ca-certificate remove

Remove CA certificate(s) from a vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes a list of IPsec CA certificates for the given Vserver. The CA certificates being removed should have been previously added to IPsec using [security ipsec ca-certificate add](#) command.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver for which the IPsec CA certificates should be removed.

-ca-certs <text>,... - CA Certificate Names

Use this parameter to specify the list of CA certificates to be removed from IPsec.

Examples

The following example removes two IPsec CA certificates named caCert1 and caCert2 for Vserver v1.

```
cluster-1::>security ipsec ca-certificate remove -vserver v1 -ca-certs  
caCert1,caCert2
```

- [security ipsec ca-certificate add](#)

security ipsec ca-certificate show

Displays the CA certificates added to IPsec

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the configured IPsec CA certificates.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, then the command displays only the IPsec CA certificates configured for the given vservers.

[-ca-certs <text>,...] - CA Certificate Names

If you specify this parameter, then the command displays only the Vservers for which the given CA certificates are present in IPsec.

Examples

The following example lists the IPsec CA certificates configured for all Vservers.

```
cluster-1::>security ipsec ca-certificate show
```

Vserver	CA Certificate Names
v1	caCert1, caCert2
v2	caCert3, caCert4

2 entries were displayed.

security ipsec config modify

Modify IPsec config

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command modifies IPsec configuration parameters.

Parameters

[-is-enabled {true|false}] - Is IPsec Enabled

This parameter enables and disables IPsec on the storage system.

[-log-level <IPsec Log Level>] - IPsec Logging Level

This parameter sets the IPsec logging level, where logging level 0 means no logging, and logging level 5 is most verbose. Default value is 2.

[-replay-window {0|64|128|256|512|1024}] - IPsec Replay Window Size

This parameter sets the IPsec replay window size. The possible values are 0, 64, 128, 256, 512 and 1024. Default value is 0.

[-ready-to-downgrade {true|false}] - IPsec Ready To Downgrade (privilege: advanced)

This parameter is used when downgrading to a non-IPsec capable ONTAP. Set this parameter to true to cleanup IPsec configurations before such downgrade.

`[-is-offload-enabled {true|false}] - Offload Enabled`

This parameter enables and disables IPsec NIC offload. If enabled, ONTAP will try to use NIC offload whenever possible.

Examples

The following example enables IPsec:

```
cluster-1::> security ipsec config modify -is-enabled true
```

The following example sets the IPsec logging level to 4:

```
cluster-1::> security ipsec config modify -log-level 4
```

The following example sets the IPsec replay window size to 64:

```
cluster-1::> security ipsec config modify -replay-window 64
```

The following example enables the IPsec NIC offload. IPsec itself has to be enabled to use the IPsec NIC offload:

```
cluster-1::> security ipsec config modify -is-enabled true -is-offload  
-enabled true
```

security ipsec config show

Display IPsec config

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command shows the current IPsec configuration parameters.

Examples

The following example shows the state of IPsec (enabled/disabled) and the IPsec logging level:

```
cluster-1::> security ipsec config show  
  IPsec Enabled: false  
  IPsec Log Level: 2  
  Replay Window Size: 0  
  Offload Enabled: true
```

security ipsec policy create

Create an IPsec policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a new IPsec policy. The traffic to be protected is specified by the traffic selectors (local-ip-subnets, remote-ip-subnets, local-ports, remote-ports, protocols). IPsec is not supported for the admin Vserver in a MetroCluster environment.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver to which the policy will belong. If there is only a single Vserver capable of supporting IPsec, the Vserver parameter is implied.

-name <text> - Policy Name

This required parameter specifies the name of the policy which may be a text string (1-64 bytes), a hexadecimal string (beginning with '0x') or a base64 encoded binary string (beginning with '0s').

-local-ip-subnets <IP Address/Mask>, ... - Local IP Subnets

This required parameter specifies the IPv4 or IPv6 subnet (address and mask, can be subnet or individual address) representing the local address (range) to be protected by this policy.

-remote-ip-subnets <IP Address/Mask>, ... - Remote IP Subnets

This required parameter specifies the IPv4 or IPv6 subnet (address and mask, can be subnet or individual address) representing the remote address (range) to be protected by this policy.

[-local-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Local Ports

This optional parameter specifies logical port associated with the local address to be protected by this policy. The port defaults to any port ('0-0' or '0') but a single port may be specified ('port number' or 'port number-port number').

[-remote-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Remote Ports

This optional parameter specifies logical port associated with the remote address to be protected by this policy. The port defaults to any port ('0-0' or '0') but a single port may be specified ('port number' or 'port number-port number').

[-protocols {<Protocol Number>|<Protocol Name>}] - Protocols

This optional parameter specifies the protocol to be protected by by this policy. The protocol defaults to any protocol ('any' or '0') but a single protocol may be specified ('tcp', 'udp' or protocol number).

[-action <IPsec Action Type>] - Action

This optional parameter specifies the action to be performed when a packet meets the traffic selectors described by this policy. The possible values are 'ESP_TRA' (Apply ESP Transport Mode), 'ESP_UDP' (Apply ESP UDP Encapsulation), 'DISCARD' (discard matching traffic), or 'BYPASS' (send matching traffic in cleartext (not protected by IPsec)). NOTE: If the action is 'BYPASS' or 'DISCARD' and an authentication method is provided, it will be ignored. The default value is 'ESP_TRA'.

[-cipher-suite <Cipher Suite Type>] - Cipher Suite

This optional parameter specifies the suite of algorithms that will be used to protect the traffic. The possible values are:

SUITEB_GCM256: Suite-B-GCM-256 cipher suite as specified in RFC6379.

SUITEB_GMAC256: Suite-B-GMAC-256 cipher suite as specified in RFC6379.

SUITE_AESCBC: Suite consisting of AES256 CBC and SHA512 for ESP and AES256-SHA512-MODP4096 for IKE.

The default value is 'SUITEB_GCM256'.

[-ike-lifetime <integer>] - IKE Security Association Lifetime

This optional parameter specifies the lifetime of an IKE Security Association (in seconds). Shortly before the expiration of the IKE-lifetime, a new IKE security association will be created and the existing IKE security association (and child IPsec security associations) will be destroyed. The default value is 86400 seconds.

[-ipsec-lifetime <integer>] - IPsec Security Association Lifetime

This optional parameter specifies the lifetime of an IPsec Security Association (in seconds). Shortly before the expiration of the ipsec-lifetime, a new IPsec security association will be created and the existing IPsec security association will be destroyed. The default value is 28800 seconds.

[-ipsec-lifetime-bytes <integer>] - IPsec Security Association Lifetime (bytes)

This optional parameter specifies the byte lifetime of an IPsec Security Association. Shortly before the expiration of the ipsec-lifetime-bytes (ipsec-lifetime-bytes have been processed by the IPsec security association), a new IPsec security association will be created and the existing IPsec security association will be destroyed. The default value is 0, i.e infinity bytes.

[-is-enabled {true|false}] - Is Policy Enabled

This optional parameter specifies whether the IPsec policy is enabled or not. Any policy that is created is stored in a replicated database. The 'is-enabled' parameter determines if the policy will be included in those evaluated when determining the best-matched policy to match the traffic selectors of the packet. The default value is 'true'.

[-local-identity <text>] - Local Identity

This optional parameter specifies the local IKE endpoint's identity for authentication purpose. If this field is not explicitly specified, local-ip-subnet will assume the role for identity. If this field is set to "ANYTHING", then it will be translated to the strongSwan "%any" special identity.

[-remote-identity <text>] - Remote Identity

This optional parameter specifies the remote IKE endpoint's identity for authentication purpose. If this field is not explicitly specified, remote-ip-subnet will assume the role for identity. If this field is set to "ANYTHING", then it will be translated to the strongSwan "%any" special identity.

[-auth-method <IKE Authentication Method>] - Authentication Method

This optional parameter specifies the authentication method for an IPsec policy. The default value is 'PSK', the pre-shared key authentication method.

[-cert-name <text>] - Certificate for Local Identity

This parameter specifies the certificate name and is mandatory for an IPsec policy using the PKI authentication method. The certificate should have already been installed using [security certificate install](#)

command.

[-ppk-identity <text>] - Post-quantum Pre-shared Key Identity

This optional parameter specifies the post-quantum pre-shared key identity to use. Once this parameter is specified, post-quantum pre-shared key will be mandatory for this IPsec policy.

[-cert-modify-keepsa {true|false}] - Keep SAs upon Cert Modification?

This optional parameter specifies whether to keep established IPsec SAs and IKE SAs when the certificate related fields are modified. Default value is false, i.e. Terminate all existing SAs (both IKE and IPsec) when certificate related fields are modified. SAs will be recreated using new certificate information.

Examples

This is an example of the creation of an IPsec policy that protects matching traffic, with all parameters specified. The preshared key can be string of length 18-128 bytes, a sequence hexadecimal digits beginning with 0x or a sequence of Base64 encoded binary data with 0s.

```
cluster-1::> security ipsec policy create -vserver vs_data1 -name Policy1
-local-ip-subnets 192.168.10.1/32 -remote-ip-subnets 192.168.20.1/32
-local-ports 4000 -remote-ports 5001 -protocols tcp -action ESP_TRA
-shared-key This_is_a_shared_key_for_ipsec_policy -ike-version 2 -cipher
-suite SUITEB_GCM256 -ike-lifetime 4000 -ipsec-lifetime 1800 -ipsec
-lifetime-bytes 104880 -is-enabled true
```

Enter the preshared key for IPsec Policy "Policy1" on Vserver "vs_data1":
Re-enter the preshared key:

This is an example of the creation of an IPsec policy that protects matching traffic, with some parameters specified (others will be using the default values). PKI authentication method . is used. In this example, remote-identity does not matter, as long as a trusted certificate is provided.

```
cluster-1::> security ipsec policy create -vserver vs_data1 -name Policy2
-local-ip-subnets 192.168.10.1/32 -remote-ip-subnets 0.0.0.0/0 -local
-ports 2049 -auth-method PKI -cert-name lifcert -local-identity
"CN=lif1_certificate.netapp.com" -remote-identity ANYTHING
```

This is an example of the creation of an IPsec policy that discards matching traffic:

```
cluster-1::> security ipsec policy create -vserver vs_data1 -name
DiscardTraffic -local-ip-subnets 192.168.10.1/32 -remote-ip-subnets
192.168.20.1/32 -action DISCARD
```

security ipsec policy delete

Delete an IPsec policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes an existing IPsec policy.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver to which the policy belongs. If there is only a single Vserver capable of supporting IPsec, the Vserver parameter is implied.

-name <text> - Policy Name

This required parameter specifies the name of the policy to be deleted. The name may be a text string (1-64 bytes), a hexadecimal string (beginning with '0x') or a base64 encoded binary string (beginning with '0s').

Examples

This is an example of IPsec policy deletion where two or more Vservers are capable of supporting IPsec:

```
cluster-1::> security ipsec policy delete -vserver vs_data1 -name
DiscardTraffic
```

This is an example of IPsec policy deletion where only a single Vserver is capable of supporting IPsec:

```
cluster-1::> security ipsec policy delete -name policy1
```

This is an example of an attempt to delete a non-existent IPsec policy:

```
cluster-1::> security ipsec policy delete -vserver vs_data1 -name Discard

Error: There are no entries matching your query.
```

security ipsec policy modify

Modify an IPsec policy

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies an existing IPsec policy. You cannot modify the name or vserver of a policy. Moving a policy from one Vserver to another or renaming a policy requires that the existing policy be deleted and then a

new policy created in the desired Vserver with the desired name.

It is highly recommended that the user set the field `-is-enabled` to `false` prior to making any other modifications to the policy. This will disable the policy and allow all existing IPsec and IKE Security Associations associated with policy to get flushed. Then, the user can modify the policy with the desired changes, along with setting the `-is-enabled` field to `true` to re-enable the policy.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver to which the policy belongs. If there is only a single Vserver capable of supporting IPsec, the Vserver parameter is implied.

-name <text> - Policy Name

This required parameter specifies the name of the policy which may be a text string (1-64 bytes), a hexadecimal string (beginning with '0x') or a base64 encoded binary string (beginning with '0s').

[-local-ip-subnets <IP Address/Mask>, ...] - Local IP Subnets

This parameter specifies the IPv4 or IPv6 subnet (address and mask, can be subnet or individual address) representing the local address (range) to be protected by this policy.

[-remote-ip-subnets <IP Address/Mask>, ...] - Remote IP Subnets

This parameter specifies the IPv4 or IPv6 subnet (address and mask, can be subnet or individual address) representing the remote address (range) to be protected by this policy.

[-local-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Local Ports

This parameter specifies the logical port associated with the local address to be protected by this policy. The value may be specified by 'port number' or 'port number-port number'.

[-remote-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Remote Ports

This parameter specifies the logical port associated with the remote address to be protected by this policy. The value may be specified by 'port number' or 'port number-port number'.

[-protocols {<Protocol Number>|<Protocol Name>}] - Protocols

This parameter specifies the protocol to be protected by this policy. The protocol may be specified as 'tcp', 'udp' or protocol number.

[-cipher-suite <Cipher Suite Type>] - Cipher Suite

This parameter specifies the suite of algorithms that will be used to protect the traffic. The possible values are:

SUITEB_GCM256: Suite-B-GCM-256 cipher suite as specified in RFC6379.

SUITEB_GMAC256: Suite-B-GMAC-256 cipher suite as specified in RFC6379.

SUITE_AESCBC: Suite consisting of AES256 CBC and SHA512 for ESP and AES256-SHA512-MODP4096 for IKE.

The default value is 'SUITEB_GCM256'.

[-ike-lifetime <integer>] - IKE Security Association Lifetime

This parameter specifies the lifetime of an IKE Security Association (in seconds). Shortly before the expiration of the IKE-lifetime, a new IKE security association will be created and the existing IKE security association (and child IPsec security associations) will be destroyed.

[-ipsec-lifetime <integer>] - IPsec Security Association Lifetime

This parameter specifies the lifetime of an IPsec Security Association (in seconds). Shortly before the expiration of the ipsec-lifetime, a new IPsec security association will be created and the existing IPsec security association will be destroyed.

[-ipsec-lifetime-bytes <integer>] - IPsec Security Association Lifetime (bytes)

This parameter specifies the byte lifetime of an IPsec Security Association. Shortly before the expiration of the ipsec-lifetime-bytes (ipsec-lifetime-bytes have been processed by the IPsec security association), a new IPsec security association will be created and the existing IPsec security association will be destroyed.

[-is-enabled {true|false}] - Is Policy Enabled

This parameter specifies the whether the IPsec policy is enabled or not. Any policy which is created is stored in a replicated database. The 'is-enabled' parameter determines if the policy will be included in those evaluated when determining the best-matched policy to match the traffic selectors of the packet. The default value is 'true'.

[-local-identity <text>] - Local Identity

This optional parameter specifies the local IKE endpoint's identity for authentication purpose. If this field is not explicitly specified, local-ip-subnet will assume the role for identity. If this field is set to "ANYTHING", then it will be translated to the strongSwan "%any" special identity.

[-remote-identity <text>] - Remote Identity

This optional parameter specifies the remote IKE endpoint's identity for authentication purpose. If this field is not explicitly specified, remote-ip-subnet will assume the role for identity. If this field is set to "ANYTHING", then it will be translated to the strongSwan "%any" special identity.

[-cert-name <text>] - Certificate for Local Identity

This optional parameter specifies the certificate name for an IPsec policy using PKI authentication method.

[-ppk-identity <text>] - Post-quantum Pre-shared Key Identity

This optional parameter specifies the post-quantum pre-shared key identity to use.

[-cert-modify-keepsa {true|false}] - Keep SAs upon Cert Modification?

This optional parameter specifies whether to keep established IPsec SAs and IKE SAs when the certificate related fields are modified. Default value is false, i.e. Terminate all existing SAs (both IKE and IPsec) when certificate related fields are modified. SAs will be recreated using new certificate information.

Examples

The following example modifies the local-ip-subnets value of an IPsec policy:

```
cluster-1::> security ipsec policy modify -vserver vs_data1 -name Policy1
-local-ip-subnets 192.168.30.2/32
```

security ipsec policy show

Display IPsec policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ipsec policy show` command displays information about configured IPsec policies. All parameters are optional. This command is supported only when IPsec is enabled.

Running the command with the `-vserver` parameter displays all policies associated with the specified vservers.

You can specify additional parameters to display only information that matches those parameters. For example, to display policies associated with a certain local ip subnet, run the command with the `-local-ip -subnets` parameter.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>,...` parameter, the command displays only the specified fields. Notice that key fields are always displayed.

| [-instance] }

If you specify the `-instance` parameter, the command displays all fields of the policies.

[-vserver <vserver name>] - Vserver

If you specify this parameter, only policies associated with this Vserver will be displayed.

[-name <text>] - Policy Name

This parameter specifies the policy to be displayed.

[-local-ip-subnets <IP Address/Mask>,...] - Local IP Subnets

If you specify this parameter, information about local-ip-subnets will be displayed.

[-remote-ip-subnets <IP Address/Mask>,...] - Remote IP Subnets

If you specify this parameter, information about remote-ip-subnets will be displayed.

[-local-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Local Ports

If you specify this parameter, information about local-ports will be displayed.

[-remote-ports {<Number>|<StartingNumber>-<EndingNumber>}] - Remote Ports

If you specify this parameter, information about remote-ports will be displayed.

[-protocols {<Protocol Number>|<Protocol Name>}] - Protocols

If you specify this parameter, information about protocols will be displayed.

[-action <IPsec Action Type>] - Action

If you specify this parameter, information about action will be displayed.

[-cipher-suite <Cipher Suite Type>] - Cipher Suite

If you specify this parameter, information about cipher-suite will be displayed.

[-ike-lifetime <integer>] - IKE Security Association Lifetime

If you specify this parameter, information about ike-lifetime will be displayed.

[-ipsec-lifetime <integer>] - IPsec Security Association Lifetime

If you specify this parameter, information about ipsec-lifetime will be displayed.

[-ipsec-lifetime-bytes <integer>] - IPsec Security Association Lifetime (bytes)

If you specify this parameter, information about ipsec-lifetime-bytes will be displayed.

[-is-enabled {true|false}] - Is Policy Enabled

If you specify this parameter, information about is-enabled will be displayed.

[-local-identity <text>] - Local Identity

If you specify this parameter, information about local IKE endpoint's identity, if configured, will be displayed.

[-remote-identity <text>] - Remote Identity

If you specify this parameter, information about remote IKE endpoint's identity, if configured, will be displayed.

[-auth-method <IKE Authentication Method>] - Authentication Method

If you specify this parameter, the authentication method of the policy will be displayed.

[-cert-name <text>] - Certificate for Local Identity

If you specify this parameter, the name of the certificate will be displayed.

[-address-family {ipv4|ipv6|ipv6z}] - IP Address type

If you specify this parameter, the address type of the ip subnets will be displayed.

[-ppk-identity <text>] - Post-quantum Pre-shared Key Identity

If you specify this parameter, policies with the matching post-quantum pre-shared key identity will be displayed.

[-cert-modify-keepsa {true|false}] - Keep SAs upon Cert Modification?

If you specify this parameter, policies with the matching "cert-modify-keepsa" parameter value will be displayed.

Examples

The this example displays all policies in all Vservers:

```

cluster-1::> security ipsec policy show

```

Policy				
Vserver Name	Local IP Subnet	Remote IP Subnet	Cipher Suite	
vs_data1				
Policy1	192.168.10.1/32	192.168.20.1/32	SUITEB_GCM256	
ESP_TRA				
Policy3	192.158.10.10/32	192.158.10.20/32	SUITEB_GCM256	
DISCARD				
vs_data2				
Policy2	10.10.10.10/32	20.20.20.20/32	SUITE_AESCBC	
ESP_TRA				

3 entries were displayed.

This example displays all of the IPsec policies from a single Vserver:

```

cluster-1::> security ipsec policy show -vserver vs_data1

```

Policy				
Vserver Name	Local IP Subnet	Remote IP Subnet	Cipher Suite	
vs_data1				
Policy1	192.168.10.1/32	192.168.20.1/32	SUITEB_GCM256	
ESP_TRA				
Policy3	192.158.10.10/32	192.158.10.20/32	SUITEB_GCM256	
DISCARD				

2 entries were displayed.

This example displays a specific policy:

```
cluster-1::> security ipsec policy show -vserver vs_data1 -name Policy1
Vserver Name: vs_data1
Policy Name: Policy1
Local IP Subnets: 192.168.10.1/32
Remote IP Subnets: 192.168.20.1/32
Local Ports: 0-0
Remote Ports: 0-0
Protocols: any
Action: ESP_TRA
Cipher Suite: SUITEB_GCM256
IKE Security Association Lifetime: 10800
IPsec Security Association Lifetime: 3600
IPsec Security Association Lifetime (bytes): 0
Is Policy Enabled: true
Local Identity:
Remote Identity:
```

This example displays a specific field from all policies:

```
cluster-1::> security ipsec policy show -fields local-ip-subnets
vserver  name      local-ip-subnets
-----  -
vs_data1 Policy1  192.168.10.1/32
vs_data1 Policy3  192.158.10.10/32
vs_data2
Policy2  10.10.10.10/32
3 entries were displayed.
```

security jit-privilege commands

security jit-privilege elevate

Elevate JIT privilege for user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege elevate` command elevates the privilege of the logged-in user upon successful just-in-time (JIT) password validation.

Examples

The following command elevates the privilege of the logged-in user.

```
cluster1::> security jit-privilege elevate
```

security jit-privilege modify

Modify the JIT configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege modify` modifies the just-in-time (JIT) privilege elevation global settings.

Parameters

-vserver <vserver name> - Vserver

The specific Vserver name where the just-in-time privilege settings apply.

-application <text> - Application

The specific application where the just-in-time privilege settings apply.

[-default-session-validity-period <time_interval>] - Default Session Validity Period

Default session validity period.

[-max-jit-validity-period <time_interval>] - Maximum JIT Validity Period

Maximum just-in-time validity period.

Examples

The following command modifies global just-in-time setting.

```
cluster1::> security jit-privilege modify -application ssh -default  
-session-validity-period 2h -max-jit-validity-period 30d
```

security jit-privilege reset

Reset JIT privilege for user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege reset` resets the just-in-time (JIT) privilege of the logged-in user.

Examples

The following command resets the just-in-time (JIT) privilege of the logged-in user.

```
cluster1::> security jit-privilege reset
```

security jit-privilege show-remaining-time

Shows remaining time of user in the logged-in SSH session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege show-remaining-time` command shows the remaining time of the elevated JIT privilege for the currently logged-in user.

Examples

To get the remaining time of the elevated JIT privilege for the currently logged-in user:

```
cluster1::> security jit-privilege show-remaining-time
           You have 30m15s left for your current JIT elevated privilege
           section.
```

security jit-privilege show

Display the JIT configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege show` command displays global settings of just-in-time (JIT) privilege elevation.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

The specific Vserver name where the just-in-time privilege settings apply.

[-application <text>] - Application

The specific application where the just-in-time privilege settings apply.

[`-default-session-validity-period` <time_interval>] - Default Session Validity Period

Default session validity period.

[`-max-jit-validity-period` <time_interval>] - Maximum JIT Validity Period

Maximum just-in-time validity period.

Examples

The following command displays the global settings of just-in-time privilege elevation.

```
cluster1::> security jit-privilege show
                                     Vserver: vs0
                                     Application: ssh
Default Session validity period: 1h0m0s
Maximum JIT validity period: 2160h0m0s
```

security jit-privilege user create

Create a JIT privilege of user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege user create` command creates a just-in-time (JIT) privilege elevation entry for the user which has already been configured.

Parameters

`-vserver` <vserver name> - Vserver

This is the Vserver of the user for whom you are adding JIT entry. When not set, the default value of *Administrative* Vserver is used.

`-username` <text> - Username

This is the username for whom you are adding the JIT entry.

`-application` <text> - Application

This specifies the application of the JIT entry. When not set, the default value of *ssh* is used.

[`-role` <text>] - Role Name

This specifies an access-control role name for the JIT entry. When not set, the default value of *admin* is used in case of *Administrative* Vserver and *vsadmin* is used in case of *data* Vserver

[`-session-validity-period` <time_interval>] - Session Validity Period

This specifies the validity period for which the just-in-time (JIT) privilege level will remain elevated. When not set, the value specified in the global JIT settings is used.

[`-jit-validity-period <time_interval>`] - JIT Validity Period

This specifies validity period within which the user's JIT privilege level can be elevated and/or reset any number of times. The value of this parameter must always be greater than or equal to the value specified for `session-validity-period` parameter. When not set, the default value is taken from `session-validity-period` of the global JIT settings.

[`-start-time <MM/DD/YYYY HH:MM:SS>`] - Start Time

This specific starting date/time in UTC format from which privilege can be elevated. When not set, the default value is the current date and time in UTC format.

[`-comment <text>`] - Comment

This optionally specifies comment text for the JIT entry.

Examples

The following command creates a JIT entry for user named "jdoe" for Vserver vs1.

```
cluster1::> security jit-privilege user create -username jdoe -application
ssh -role admin -session-validity-period 1h -jit-validity-period 5h -start
-time "4/17/2023 14:37:58" -vserver vs1 -comment "This is a JIT entry for
jdoe"
```

security jit-privilege user delete

Delete a JIT privilege of user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege user delete` deletes just-in-time(JIT) privilege elevation entry for the user which has already been configured.

Parameters

`-vserver <vserver name>` - Vserver

This specifies the Vserver of the user for whom you are deleting JIT entry. When not set, the default value is the Administrative Vserver.

`-username <text>` - Username

This specifies the name of the user for whom you are deleting the JIT entry.

`-application <text>` - Application

This specifies the application of the JIT entry. Possible values include ssh.

Examples

The following command associates deletes a JIT entry for user named "jdoe" for Vserver vs1.

```
cluster1::> security jit-privilege user delete -username jdoe -vserver vs1
-application ssh
```

security jit-privilege user show

Display JIT privilege of users

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security jit-privilege user show` displays just-in-time(JIT) privilege elevation entries.

Parameters

{ [-fields <fieldname>,...]

This specifies the fields that need to be displayed.

| [-instance] }

If this parameter is specified, the command displays information about all just-in-time privilege configuration.

[-vserver <vserver name>] - Vserver

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified Vserver.

[-username <text>] - Username

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified username.

[-application <text>] - Application

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified application.

[-role <text>] - Role Name

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified access-control role name.

[-session-validity-period <time_interval>] - Session Validity Period

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified session validity period.

[-jit-validity-period <time_interval>] - JIT Validity Period

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified just-in-time validity period.

[-start-time <MM/DD/YYYY HH:MM:SS>] - Start Time

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified start time.

[`-end-time` <MM/DD/YYYY HH:MM:SS>] - End Time

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified end time.

[`-comment` <text>] - Comment

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified comment text.

[`-jit-status` <text>] - Status

If this parameter is specified, the command displays information only about the just-in-time configuration that match the specified just-in-time status.

Examples

The following command displays the just-in-time entries configured.

```
cluster1::> security jit-privilege user show
          Vserver : cluster-1
          Username: jdoe
          Application: ssh
          Role Name: admin
Session Validity Period: 1h0m0s
  JIT Validity Period: 1h0m0s
          Start Time: 4/17/2023 14:37:58
          End Time: 4/17/2023 15:37:58
          Comment: JIT entry for jdoe
          Status: active
```

security key-manager commands

security key-manager prepare-to-downgrade

Prepares all configured Key managers for downgrade

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command is deprecated and might be removed in a future release.

The `security key-manager prepare-to-downgrade` command disables the Onboard Key Manager features that are not supported in releases prior to ONTAP 9.1.0. The features that are disabled are Onboard Key Manager support for MetroCluster configurations and Volume Encryption (VE).

Examples

The following example disables the Onboard Key Manager support for MetroCluster configurations and Volume Encryption (VE):

```
cluster1::*> security key-manager prepare-to-downgrade
```

security key-manager show-key-store

(DEPRECATED)-Displays the configured key manager key stores.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is deprecated. Use the "security key-manager keystore show" command to display all keystore configurations instead.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

If you specify this parameter, then the command will list the key manager configured for the given Vserver.

[-key-store <Key Store>] - Key Store

If you specify this parameter, then the command displays only the vservers that have the given key-store configured.

[-state <Key Store state>] - Key Store State

If you specify this parameter, then the command displays only the vservers that have the given state configured.

[-keystore-type <Key Store Type>] - Key Store Type (Azure/AWS etc)

If you specify this parameter, then the command displays only the vservers that have the given keystore-type configured. This parameter is used to specify a particular type of external key manager. If this parameter is specified and 'key-store' is provided as 'onboard', the "security key-manager show-key-store" command will not return any entries.

[-policy <text>] - Key Manager Policy Name

If you specify this parameter, then the command displays only the vservers that have the given policy.

Examples

The following example shows all configured key managers in the cluster. In the example, the admin vserver has the Onboard Key Manager configured and the data vserver "datavs1" has external key management configured:

```
cluster-1::> security key-manager show-key-store
```

Vserver	Key Store	Key Store Type
cluster-1	onboard	-
datavsl	external	AKV

security key-manager config modify

Modify key management configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command modifies the key management configuration options.

Parameters

[-cc-mode-enabled {true|false}] - Enable Common Criteria Mode (privilege: advanced)

This parameter modifies the configuration state of the Onboard Key Manager (OKM) Common Criteria (CC) mode. CC mode enforces some of the policies required by the Common Criteria "Collaborative Protection Profile for Full Drive Encryption-Authorization Acquisition" (FDE-AA cPP) and "Collaborative Protection Profile for Full Drive Encryption-Encryption Engine" documents.

[-health-monitor-polling-interval <integer>] - Health Monitor Polling Period (in minutes) (privilege: advanced)

This parameter modifies the the polling interval of the keyserver health monitor at the cluster level.

[-cloud-kms-retry-count <integer>] - Cloud KMS connection retry count (privilege: advanced)

This parameter modifies the the cloud keymanager connection retry count at the cluster level.

[-are-unencrypted-metadata-volumes-allowed-in-cc-mode {true|false}] - Are Unencrypted Metadata Volumes Allowed in Common Criteria Mode (privilege: advanced)

If Common Criteria (CC) mode is enabled this parameter allows unencrypted metadata volumes to exist. These metadata volumes are created internally during normal operation. Examples are volumes created during SnapMirror and Vserver migrate operations. The default value is *false*.

Examples

The following command enables Common Criteria mode in the cluster:

```
cluster-1::*> security key-manager config modify -cc-mode-enabled true
```

The following command modifies the keyserver health monitor polling interval to be 30 minutes:

```
cluster-1::*> security key-manager config modify -health-monitor-polling
-interval 30
```

The following command modifies the cloud keymanager connection retry count to 3:

```
cluster-1::*> security key-manager config modify -cloud-kms-retry-count 3
```

security key-manager config show

Display key management configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command displays the key management configuration options.

The "cc-mode-enabled" option reflects the current configuration state for Common-Criteria (CC) mode for the Onboard Key Manager. CC mode is an operational mode that enforces some of the policies required by the Common Criteria "Collaborative Protection Profile for Full Drive Encryption-Authorization Acquisition" (FDE-AA cPP) and "Collaborative Protection Profile for Full Drive Encryption-Encryption Engine" documents. The feature can be enabled when the Onboard Key Manager is configured using the `security key-manager setup` command or after the Onboard Key Manager is configured using the [security key-manager config modify](#) command.

Examples

The following example displays the state of all key-manager configuration options:

```
cluster-1::*> security key-manager config show
CC-Mode  health-monitor-polling-interval  cloud-kms-retry-count
Enabled  (in minutes)
-----  -----
true     30                               0
```

security key-manager external add-servers

Add external key management servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command adds the key management servers of the given hosts and ports to the given Vserver's external key manager's list of four possible key management servers. When adding key management servers to the external key manager associated with the admin Vserver, you must run the same command specifying the same set of key servers on the peer cluster. When adding key management servers to a data Vserver, you can run the `security key-manager external add-servers` command on the active cluster only, as the command is replicated to the peer cluster. However, you need to ensure that the key management servers specified are reachable from both clusters. This command is not supported if external key management is not enabled for the Vserver. Use this command to add primary key servers. To modify the list of secondary key servers associated with a primary key server, use the [security key-manager external modify-server](#) command.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which to add the key management servers.

-key-servers <Hostname and Port>,... - External Key Management Servers

Use this parameter to specify the list of additional key management servers that the external key manager uses to store keys.

Examples

The following example adds two key management servers to the list of servers used by the external key manager for Vserver cluster-1. The first key management server's hostname is keyserver1.local and is listening on the default port 5696, and the second key management server's IP is 10.0.0.20 and is listening on port 15696:

```
cluster-1::> security key-manager external add-servers -vserver cluster-1
-key-servers keyserver1.local, 10.0.0.20:15696
```

Related Links

- [security key-manager external modify-server](#)

security key-manager external disable

Disable external key management

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the external key manager associated with the given Vserver. If the key manager is in use by ONTAP, you cannot disable it. When disabling the external key manager associated with the admin Vserver, you must run the same command on the peer cluster. When disabling the external key manager for a data Vserver, you can run the `security key-manager external disable` command on the active cluster only, as the command is replicated on the peer cluster. This command is not supported when the Onboard Key Manager is enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name (privilege: advanced)

Use this parameter to specify the Vserver on which the external key manager is to be disabled.

Examples

The following example removes the external key manager for Vserver cluster-1:

```
cluster-1::*> security key-manager external disable -vserver cluster-1
Warning: This command will permanently delete the external key management
configuration for Vserver "cluster-1".
Do you want to continue? {y|n}: y
```

security key-manager external enable

Enable external key management

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the external key manager associated with the given Vserver. This command is not supported when a key manager for the given Vserver is already enabled. When enabling the external key manager associated with the admin Vserver, you must run the same command specifying the same set of key servers on the peer cluster. When enabling the external key manager for a data Vserver, you can run the `security key-manager external enable` command on the active cluster only, as the configuration will be replicated on the peer cluster. However, you must ensure that the key management servers specified in the `security key-manager external enable` command are reachable from both clusters. Only primary key servers can be added using this command.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the external key manager is to be enabled.

-key-servers <Hostname and Port>, ... - List of External Key Management Servers

Use this parameter to specify the list of up to four key management servers that the external key manager uses to store keys.

-client-cert <text> - Name of the Client Certificate

Use this parameter to specify the unique name of the client certificate that the key management servers use to ensure the identity of ONTAP.

-server-ca-certs <text>, ... - Names of the Server CA Certificates

Use this parameter to specify the unique names of server-ca certificates that ONTAP uses to ensure the identify of the key management servers.

[*-policy* <text>] - Key Manager Policy

Use this parameter to specify a specific key manager security policy to be used by this key manager.

Examples

The following example enables the external key manager for Vserver cluster-1. The command includes three key management servers. The first key server's hostname is `ks1.local` and is listening on port 15696. The second key server's IP address is 10.0.0.10 and is listening on the default port 5696. The third key server's IPv6 address is `fd20:8b1e:b255:814e:32bd:f35c:832c:5a09`, and is listening on port 1234.

```
cluster-1::> security key-manager external enable -vserver cluster-1 -key
-servers
ks1.local:15696,10.0.0.10,[fd20:8b1e:b255:814e:32bd:f35c:832c:5a09]:1234
-client-cert AdminVserverClientCert -server-ca-certs
ServerCaCert1,ServerCaCert2
```

security key-manager external modify-server

Modify key server properties

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies configuration information for configured key management servers. When modifying a key management server from the external key manager associated with the admin Vserver, you must run the same command specifying the same set of parameters on the peer cluster. When modifying a key management server from a data Vserver, you can run the `security key-manager external modify-server` command on the active cluster only as the command is replicated on the peer cluster. However, if the password associated with a key management server is modified, then you must run the `security key-manager external modify-server` command specifying the same password on the peer cluster as the password is not replicated between clusters. This command is supported only when external key manager has been enabled for the given Vserver.

Parameters

***-vserver* <vserver name> - Vserver Name**

Use this parameter to specify the Vserver on which to modify the key management server configuration.

***-key-server* <Hostname and Port> - External Key Server**

Use this parameter to specify the primary key management server for which the command modifies the configuration.

[*-secondary-key-servers* <Remote InetAddress>,...] - Secondary Key Servers

Use this parameter to specify the secondary key management servers that will be members of the set of clustered key servers. When specifying a secondary key server, a port number cannot be associated with the secondary key server.

[*-timeout* <integer>] - Key Server I/O Timeout (privilege: advanced)

Use this parameter to specify the I/O timeout, in seconds, for the selected key management server.

[*-username* <text>] - Authentication User Name (privilege: advanced)

Use this parameter to specify the username with which ONTAP authenticates with the key management server.

[*-create-remove-timeout* <integer>] - Key Server Timeout for Create and Remove

Use this parameter to specify a shorter I/O timeout, in seconds, to be used for create and delete operations for the selected key management server.

[*-port* <integer>] - New Key Server Port

Use this parameter to specify the port number to be used for communicating with the selected key management server.

Examples

The following example modifies the I/O timeout to 45 seconds for Vserver cluster-1, key server keyserver1.local:

```
cluster-1::> security key-manager external modify-server -vserver cluster-1 -key-server keyserver1.local -timeout 45
```

The following example modifies the username and passphrase used to authenticate with key server keyserver1.local:

```
cluster-1::> security key-manager external modify-server -vserver cluster-1 -key-server keyserver1.local -username ksuser
Enter the password:
Reenter the password:
```

The following example modifies the secondary key management servers secondarykeyserver1.local and secondarykeyserver2.local to be in a cluster configuration with the primary key management server keyserver1.local

```
cluster-1::> security key-manager external modify-server -vserver cluster-1 -key-server keyserver1.local -secondary-key-servers secondarykeyserver1.local,secondarykeyserver2.local
```

security key-manager external modify

Modify external key management

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies the external key manager configuration associated with the given Vserver. When modifying the external key manager configuration associated with the admin Vserver, you must run the same command specifying the same parameters on the peer cluster. When modifying the external key manager configuration associated with a data Vserver, you can run the `security key-manager external modify` command on the active cluster only as the configuration modifications are replicated on the peer cluster. This command is not supported when external key management is not enabled for the given Vserver.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the key manager to be modified is located.

[-client-cert <text>] - Name of the Client Certificate

Use this parameter to modify the name of the client certificate that the key management servers use to ensure the identity of ONTAP. If the keys of the new certificate do not match the keys of the existing certificate, or if the TLS connectivity with key-management servers fails with the new certificate, the operation fails. Running this command in the diagnostic privilege mode ignores failures and allows the command to complete.

[-server-ca-certs <text>,...] - Names of the Server CA Certificates

Use this parameter to modify the names of server-ca certificates that ONTAP uses to ensure the identity of the key management servers. Note that the list provided completely replaces the existing list of certificates. If the TLS connectivity with key-management servers fails with the new list of server-ca certificates, the operation fails. Running this command in the diagnostic privilege mode ignores failures and allows the command to complete.

Examples

The following example updates the client certificate used with the key management servers:

```
cluster-1::> security key-manager external modify -vserver cluster-1
-client-cert NewClientCert
```

security key-manager external remove-servers

Remove external key management servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command removes the key management servers at the given hosts and ports from the given Vserver's external key manager's list of key management servers. If any of the specified key management servers is the sole storage location for any key that is in use by ONTAP, then you are unable to remove the key server. When removing key management servers from the external key manager associated with the admin Vserver, you must run the same command specifying the same set of key servers on the peer cluster. When removing key management servers from a data Vserver, you can run the `security key-manager external remove-servers` command on the active cluster only as the the command is replicated on the peer cluster. This command is not supported when external key management is not enabled for the given Vserver. Use this

command is remove primary key servers. To modify the list of secondary key servers associated with a primary key server, use the [security key-manager external modify-server](#) command.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver on which the external key manager is to be removed.

-key-servers <Hostname and Port>,... - External Key Management Servers

Use this parameter to specify the list of key management servers that you want to remove from the external key manager.

[-force {true|false}] - Bypass OOQ Check?

Set this parameter to true to bypass checks for out of quorum nodes.

Examples

The following example removes the key management server keyserver1.local, listening on the default port of 5696 and the key management server at IP 10.0.0.20, listening on port of 15696.

```
cluster-1::*> security key-manager external remove-servers -vserver
cluster-1
-key-servers keyserver1.local,10.0.0.20:15696
```

- [security key-manager external modify-server](#)

security key-manager external restore

Restore the key ID pairs from the key management servers.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores any current unrestored keys associated with the storage controller from the specified key management servers. When restoring keys from the external key manager associated with the admin Vserver, you must run the same command on the peer cluster. When restoring keys from a data Vserver, you can run the `security key-manager external restore` command on the active cluster only as the command is replicated on the peer cluster. This command is not supported when external key management has not been enabled for the Vserver. This command only restores keys from primary key servers.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

This parameter specifies the name of the node that will load unrestored key IDs into its internal key table. If not specified, all nodes retrieve unrestored keys into their internal key table.

[-vserver <vserver name>] - Vserver Name

This parameter specifies the Vserver for which to list the keys. If not specified, this command restores key for all Vservers.

[-key-server <Hostname and Port>] - Key Server

If this parameter is specified, this command restores keys from the key management server identified by the host and port. If not specified, this command restores keys from all available key management servers.

[-key-id <Hex String>] - Key ID

If you specify this parameter, then the command restores only the key IDs that match the specified value.

[-key-tag <text>] - Key Tag

If you specify this parameter, then the command restores only the key IDs that match the specified key-tag. The key-tag for Volume Encryption Keys (VEKs) is set to the UUID of the encrypted volume. If not specified, all key ID pairs for any key tags are restored.

Examples

The following command restores keys that are currently on a key server but are not stored within the key tables on the cluster. One key is missing for vservers cluster-1 on node1, and another key is missing for vservers datav on node1 and node2:

```

cluster-1::> security key-manager external restore
Node: node1
      Vserver: cluster-1
      Key Server: 10.0.0.1:5696

Key ID
-----

000000000000000000002000000000000400a05a7c294a7abc1e0911897132f49c380000000000
000000
Node: node2
      Vserver: datavs
      Key Server: tenant.keyserver:5696

Key ID
-----
-----
000000000000000000002000000000000400a05a7c294a7abc1e0911897132f49c380000000000
000000

```

security key-manager external show-status

Show the set of configured external key management servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays connectivity information between ONTAP nodes and configured external key management servers.

Parameters

{ [-fields <fieldname>, ...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node Name

If you specify this parameter, then the command displays the connectivity information for only the given node.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, then the command displays the key management servers for only the given Vserver.

[-key-server <Hostname and Port>] - Primary Key Server

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given primary key server host name or IP address listening on the given port.

[-key-server-status {available|not-responding|unknown}] - Overall Key Server Status

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given status.

[-status-details <text>] - Overall Key Server Status Details

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given status details.

[-operational-status {true|false}] - Overall Operational Status

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given operational status.

[-secondary-key-servers <text>,...] - Secondary Key Servers

If you specify this parameter, then the command displays the connectivity information of only the primary key management servers that have the given secondary key management servers.

[-kmip-version <text>] - KMIP version

If you specify this parameter, then the command displays the connectivity information for only the key management servers with the given KMIP protocol version.

[-port <integer>] - Key Server Port

If you specify this parameter, then the command displays the connectivity information for only the key management servers listening on the given port.

[-key-servers <text>,...] - Individual Key Servers

Use this parameter to show the host name or IP address of the key management server(s).

[-roles <text>,...] - Individual Key Server Roles

Use this parameter to show the role of the key management server(s).

[-key-server-status-list {available|not-responding|unknown}] - Individual Key Server Statuses

Use this parameter to show the status of the key management server(s).

[*-status-details-list* <text>,...] - Individual Key Server Status Details

Use this parameter to show the status details of the key management server(s).

Examples

The following example lists all configured key management servers for all Vservers:

```
cluster-2::*> security key-manager external show-status
Node: sti219-vsim-sr044e
      Vserver: C1_sti219-vsim-sr044e_1711266079
      Key Server Port: 12014
      KMIP is operational: true

Key Server          Role          Server Status    Reason
-----
10.234.2.30         primary       available        -
10.237.80.83        secondary     available        -
10.237.80.223       secondary     available        -
Node: sti219-vsim-sr044f
      Vserver: C1_sti219-vsim-sr044e_1711266079
      Key Server Port: 12014
      KMIP is operational: true

Key Server          Role          Server Status    Reason
-----
10.234.2.30         primary       available        -
10.237.80.83        secondary     available        -
10.237.80.223       secondary     available        -
2 entries were displayed.
```

security key-manager external show

Show the set of configured external key management servers.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the external key management servers configured on the cluster for a given Vserver. No entries are displayed when external key management is not enabled for the given Vserver. This command displays the primary external key management servers, along with any associated secondary key servers, configured on the cluster for a given Vserver.

Parameters

{ [*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If you specify this parameter, then the command displays only the key management servers for the given Vserver.

[-key-server <text>] - Key Server Name with port

If you specify this parameter, then the command displays only the key management servers with the given primary key server host name or IP address listening on the given port.

[-client-cert <text>] - Name of the Client Certificate

If you specify this parameter, then the command displays only the key management servers using a client certificate with the given name.

[-server-ca-certs <text>, ...] - Names of the Server CA Certificates

If you specify this parameter, then the command displays only the key management servers using server-ca certificates with the given names.

[-timeout <integer>] - Server I/O Timeout

If you specify this parameter, then the command displays only the key management servers using the given I/O timeout.

[-username <text>] - Authentication User Name

If you specify this parameter, then the command displays only the key management servers using the given authentication username.

[-policy <text>] - Security Policy

If you specify this parameter, then the command displays only the key management servers using the given key manager policy.

[-secondary-key-servers <text>, ...] - Secondary Key Servers

If you specify this parameter, then the command displays only the key management servers with the given secondary key servers.

[-create-remove-timeout <integer>] - Key Server Timeout for Create and Remove

If you specify this parameter, then the command displays only the key management servers using the given create-remove I/O timeout.

[-enabled {true|false}] - Is Configuration Enabled?

If you specify this parameter, then the command displays only the key management servers that are enabled.

Examples

The following example lists all configured key management servers for all Vservers:

```
cluster-1::> security key-manager external show
Vserver: datavs
    Client Certificate: datavsClientCert
    Server CA Certificates: datavsServerCaCert1, datavsServerCaCert2
    Security Policy: IBM_Key_Lore
    Enabled: true
```

Primary Key Server

```
-----
keyserver.datavs.com:5696
Vserver: cluster-1
    Client Certificate: AdminClientCert
    Server CA Certificates: AdminServerCaCert
    Security Policy:
    Enabled: true
```

Primary Key Server

```
-----
10.0.0.10:1234
    Secondary Servers: ks1.local, ks2.local
fd20:8b1e:b255:814e:32bd:f35c:832c:5a09:1234
ks1.local:1234
4 entries were displayed.
```

The following example lists all configured key management servers with more detail, including timeouts and usernames:

```

cluster-1::> security key-manager external show -instance
Vserver: datavs
    Client Certificate: datavsClientCert
    Server CA Certificates: datavsServerCaCert1, datavsServerCaCert2
    Primary Key Server: keyserver.datavs.com:5696
        Timeout: 25
        Username: datavsuser
    Security Policy: IBM_Key_Lore
        Enabled: true
    Secondary Key Servers:
Vserver: cluster-1
    Client Certificate: AdminClientCert
    Server CA Certificates: AdminServerCaCert
    Primary Key Server: 10.0.0.10:1234
        Timeout: 25
        Username:
    Security Policy:
        Enabled: true
    Secondary Key Servers: ks1.local, ks2.local
Vserver: cluster-1
    Client Certificate: AdminClientCert
    Server CA Certificates: AdminServerCaCert
    Primary Key Server: fd20:8b1e:b255:814e:32bd:f35c:832c:5a09:1234
        Timeout: 25
        Username:
    Security Policy:
        Enabled: true
    Secondary Key Servers:
Vserver: cluster-1
    Client Certificate: AdminClientCert
    Server CA Certificates: AdminServerCaCert
    Primary Key Server: ks1.local:1234
        Timeout: 45
        Username:
    Security Policy:
        Enabled: true
    Secondary Key Servers:
4 entries were displayed.

```

security key-manager external aws check

Show detailed status of the AWS KMS configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the Amazon Web Service (AWS) Key Management Service (KMS) status.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>|local}] - Node (privilege: advanced)

If this parameter is specified then the command displays only the AWS KMS status for the given node.

[*-vserver* <Vserver Name>] - Vserver Name (privilege: advanced)

If this parameter is specified then the command displays only the AWS KMS status for the given Vserver.

[*-category* <Categories for Cloud KMS status check>] - Component (privilege: advanced)

If this parameter is specified then the command displays only the AWS KMS status for the given category.

Category	Description
-----	-----
service_reachability	Cloud KMS Reachability
ekmip_server	Embedded KMIP Server Reachability
kms_wrapped_key_status	Status of KMS Wrapped Keys On
Cluster	

[*-status* <Status Check>] - Status (privilege: advanced)

If this parameter is specified then the command displays only the AWS KMS status entries matching the given status.

OK
FAILED
UNKNOWN

[*-detail* <text>] - Status Details (privilege: advanced)

This field displays a detailed status message, if available.

Examples

The example below displays the status of all components of all AWS KMS instances configured on node vsim1.

```
cluster-1::> security key-manager external aws check -node vsim1
Vserver: vs1
Node: vsim1

Category: service_reachability
          Status: OK

Category: ekmp_server
          Status: OK

Category: kms_wrapped_key_status
          Status: OK
```

security key-manager external aws disable

Disable AWS KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the Amazon Web Service Key Management Service (AWSKMS) associated with the given Vserver. AWSKMS cannot be disabled if it is in use by ONTAP. This command will fail if AWSKMS has not been enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver on which the AWSKMS is to be disabled.

Examples

The following example disables the AWSKMS for Vserver v1.

```
cluster-1::>security key-manager external aws disable -vserver v1
```

security key-manager external aws enable

Enable AWS KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the Amazon Web Service Key Management Service (AWSKMS) associated with the given Vserver. An AWS project and AWSKMS must be deployed on the AWS portal prior to running this command. AWSKMS can only be enabled on a data Vserver that doesn't already have a key manager configured. AWSKMS cannot be enabled in a MetroCluster environment.

Parameters

-vserver <Vserver Name> - Vserver

Use this parameter to specify the Vserver on which the AWSKMS is to be enabled.

-region <text> - AWS KMS Region

Use this parameter to specify the region of the deployed AWS project.

-key-id <text> - AWS Key Id

Use this parameter to specify the key ID of the deployed AWS project.

[-access-key-id <text>] - AWS Access Key ID

Use this parameter to specify the access key ID of the deployed AWS project.

[-encryption-context <text>] - Additional Layer of Authentication and Logging

Use this parameter to specify the encryption context to satisfy AWS grant constraint if it is configured. The parameter should be in JSON format.

Examples

The following example enables the AWSKMS for Vserver v1. The parameters in the example command identify an Amazon Web Service (AWS) project application deployed on the AWS. The AWS project application has a region "test_na_region", a key ID "test_KEYID", an access key ID "test_accessKeyID" and an encryption context of '{"team": "NVEsecurity"}".

```
cluster-1::*> security key-manager external aws enable -vserver v1 -region
test_na_region -key-id test_KEYID -access-key-id test_accessKeyID
-encryption-context {"team": "NVEsecurity"}
```

Enter the Amazon Web Service Key Management Service secret access key:
Press <Enter> when done

security key-manager external aws rekey-external

Rekey an external key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command replaces the existing AWS KMS key encryption key (KEK) and results in the key hierarchy being protected by the new user specified AWS KMS KEK. Prior to running this command, the user should have already made the necessary changes on the AWS KMS Portal to use the new KEK. Upon successful completion of this command, the internal keys for the given Vserver will be protected by the new AWS KMS KEK.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver for which ONTAP should rekey the AWS KMS KEK

-key-id <text> - AWS Key ID

This parameter specifies the key ID of the new AWS KMS KEK that should be used by ONTAP for the provided Vserver. In the case of automatic AWS KMS KEK rotation, the key ID will be the identifier of the user's already existing AWS KMS Customer Managed Key (CMK). In the case of manual AWS KMS KEK rotation, the key ID will be the identifier of the user's new AWS KMS CMK.

Examples

The following command rekeys the AWS KMS KEK for data Vserver vs1 using a new key-id key3.

```
cluster-1::> security key-manager external aws rekey-external -vserver vs1  
-key-id key3
```

security key-manager external aws rekey-internal

Rekey an internal key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command updates the internal Vserver key hierarchy by rekeying the top-level internal key encryption key (KEK). Upon successful completion of the command, all keys in the Vserver key hierarchy will be protected by the new top-level KEK.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

This parameter specifies the Vserver for which ONTAP should rekey the top-level KEK

Examples

The following command rekeys the top-level KEK for data Vserver vs1.

```
cluster-1::> security key-manager external aws rekey-internal -vserver vs1
```

security key-manager external aws restore

Restore missing keys of AWS KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores any unrestored keys associated with the given Vserver to each node's internal key tables.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver to which the missing keys will be restored.

Examples

The following command restores missing keys for the data Vserver v1 (which has AWSKMS enabled) to the internal key tables on each node in the cluster.

```
cluster-1::> security key-manager external aws restore -vserver v1
```

security key-manager external aws show

Display AWS KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the Amazon Web Service Key Management Service (AWSKMS) configuration for a given Vserver.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, then the command displays only the AWSKMS configuration for the given Vserver.

[-region <text>] - AWS KMS Region

If you specify this parameter, then the command displays only the AWSKMS configuration with the given region.

[-key-id <text>] - AWS Key ID

If you specify this parameter, then the command displays only the AWSKMS configuration with the given key-id.

[-access-key-id <text>] - AWS Access Key ID

If you specify this parameter, then the command displays only the AWSKMS configuration with the given access key ID.

[`-service <text>`] - AWS Service Type

If you specify this parameter, then the command displays only the AWSKMS configurations with the given AWS service type.

[`-default-domain <text>`] - AWS KMS Default Domain

If you specify this parameter, then the command displays only the AWSKMS configurations with the given AWS KMS default domain.

[`-state {available|not-responding|unknown}`] - AWS KMS Cluster State

If you specify this parameter, then the command displays only the AWSKMS configurations with the given state. The state can be either available or unknown.

[`-unavailable-nodes <text>`] - Names of Unavailable Nodes

If you specify this parameter, then the command displays only the AWSKMS configurations with the given unavailable-nodes.

[`-polling-period <integer>`] - Polling period (in minutes)

If you specify this parameter, then the command displays only the AWSKMS configurations with the given polling period.

[`-port <integer>`] - AWS KMS Port

If you specify this parameter, then the command displays only the AWSKMS configurations with the given AWS KMS port.

[`-verify {true|false}`] - Verify the AWS KMS Host

If you specify this parameter, then the command displays only the AWSKMS configurations with the given value of the verify flag.

[`-verify-host {true|false}`] - Verify the AWS KMS Host's Hostname

If you specify this parameter, then the command displays only the AWSKMS configurations with the given value of the verify-host flag.

[`-verify-ip {true|false}`] - Verify the AWS KMS Host's IP

If you specify this parameter, then the command displays only the AWSKMS configurations with the given value of the verify-ip flag.

[`-host <text>`] - AWS KMS Host Name

If you specify this parameter, then the command displays only the AWSKMS configurations with the given AWS KMS host name.

[`-encryption-context <text>`] - Additional Layer of Authentication and Logging

If you specify this parameter, then the command displays only the AWSKMS configurations with the given value of the AWS encryption-context. The parameter should be in JSON format.

Examples

The following example lists all AWSKMS configurations.

```
cluster-1::>security key-manager external aws show
      Vserver: SAMPLE_VSERVER
      Region: SAMPLE_NA_REGION
```

Access Key Id	State
-----	-----
SAMPLE_ACCESS_KEY_ID	unknown
SAMPLE_ACCESS_KEY_ID_2	unknown
Unavailable Nodes:	node1

The following example lists the AWSKMS configurations that have the given encryption context of {"team": "NVEsecurity"}.

```
cluster-1::>security key-manager external aws show -encryption-context
{"team": "NVEsecurity"}
      Vserver: SAMPLE_VSERVER
      Region: SAMPLE_NA_REGION
```

Access Key Id	State
-----	-----
SAMPLE_ACCESS_KEY_ID	unknown
Unavailable Nodes:	node1

security key-manager external aws update-credentials

Update AWS secret access key and access key ID

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command allows the user to update the secret access key which is used by the Amazon Web Service Key Management Service (AWSKMS) configured for the given Vserver. The secret access key is initially set by running the [security key-manager external aws enable](#) command. This command will fail if AWSKMS has not been enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver for which the AWSKMS secret access key will be updated.

-access-key-id <text> - Access Key ID (privilege: advanced)

Use this parameter to specify the new access key id of the updated credentials.

[-skip-verify {true|false}] - Don't verify user credentials (privilege: advanced)

Set this parameter to true to skip verification of the updated credentials.

Examples

The following example updates the AWSKMS secret access key for Vserver v1.

```
cluster-1::> security key-manager external aws update-credentials -vserver
v1

Enter the new secret access key: Press <Enter> when done
```

security key-manager external azure check

Show detailed status of the enabled Azure Key Vault configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the Azure Key Vault (AKV) Key Management Service (KMS) status.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>|local}] - Node (privilege: advanced)

If this parameter is specified then the command displays only the AKV status for the given node.

[*-vserver* <Vserver Name>] - Vserver Name (privilege: advanced)

If this parameter is specified then the command displays only the AKV status for the given Vserver.

[*-category* <Categories for Cloud KMS status check>] - Component (privilege: advanced)

If this parameter is specified then the command displays only the AKV status for the given category.

Category	Description
-----	-----
service_reachability	Cloud KMS Reachability
ekmip_server	Embedded KMIP Server Reachability
kms_wrapped_key_status	Status of KMS Wrapped Keys On
Cluster	

[*-status* <Status Check>] - Status (privilege: advanced)

If this parameter is specified then the command displays only the AKV status entries matching the given status.

```
OK
FAILED
UNKNOWN
```

[*-detail* <text>] - Status Details (privilege: advanced)

This field displays the detailed status message, if available.

Examples

The example below displays the status of all components of all AKV KMS configured on the node.

```
cluster-1::> security key-manager external azure check -node vsim1
Vserver: vs1
Node: vsim1

Category: service_reachability
          Status: OK

Category: ekmp_server
          Status: OK

Category: kms_wrapped_key_status
          Status: OK
```

security key-manager external azure create-config

Create an inactive Azure Key Vault configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates an Azure Key Vault (AKV) configuration which can be enabled on a Vserver.

Parameters

***-vserver* <Vserver Name> - Vserver**

The name of the Vserver.

***-config-name* <text> - Configuration name**

The name of the configuration.

-client-id <text> - Application (Client) ID of Deployed Azure Application

The ID of the client.

-tenant-id <text> - Directory (Tenant) ID of Deployed Azure Application

The ID of the tenant.

-name {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Deployed Azure Key Vault DNS Name

The DNS name of the deployed AKV .

-key-id {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Key Identifier of AKV Key Encryption Key

The ID of the key.

[-oauth-host <text>] - Open Authorization Host Name

The hostname of the OAuth server.

[-authentication-method <AKV Authentication Method>] - Authentication Method for Azure Application

Use this parameter to specify the authentication method.

Examples

The example below creates a configuration on a node with the following details: Configuration name: sampleConfig, Client ID: client1, Tenant ID: tenant1, Deployed AKV name: <https://samplevault.vault.azure.net>, Key ID: <https://samplevault.vault.azure.net/keys/key1/keyversion>, OAuth Host: <https://sampleoauth.net>, for Vserver vsTest.

```
cluster-1::> security key-manager external azure create-config -config
-name sampleConfig -client-id client1 -tenant-id tenant1 -name
https://samplevault.vault.azure.net -key-id
https://samplevault.vault.azure.net/keys/key1/keyversion -oauth-host
https://sampleoauth.net -vserver vsTest
```

security key-manager external azure disable

Disable Azure Key Vault

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the Azure Key Vault (AKV) associated with the given Vserver and deletes its configuration. If the AKV is in use by ONTAP, it cannot be disabled. This command is not supported if AKV has not been enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver on which the AKV is to be disabled.

Examples

The following example disables the AKV for Vserver v1.

```
cluster-1::>security key-manager external azure disable -vserver v1
```

security key-manager external azure enable

Enable Azure Key Vault

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the Azure Key Vault (AKV) associated with the given Vserver and creates a configuration with the name "default". An Azure application and an AKV must be deployed on the Azure portal prior to running this command. This command is not supported for the admin Vserver, or if a key manager for the given data Vserver is already enabled. This command is also not supported in a MetroCluster environment.

Parameters

-vserver <Vserver Name> - Vserver

Use this parameter to specify the Vserver on which the AKV is to be enabled.

-client-id <text> - Application (Client) ID of Deployed Azure Application

Use this parameter to specify the client (application) ID of the deployed Azure application.

-tenant-id <text> - Directory (Tenant) ID of Deployed Azure Application

Use this parameter to specify the tenant (directory) ID of the deployed Azure application.

-name {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Deployed Azure Key Vault DNS Name

Use this parameter to specify the DNS name of the deployed AKV.

[-authentication-method <AKV Authentication Method>] - Authentication Method for Azure Application

Use this parameter to specify either client_secret authentication or certificate authentication for the deployed AKV.

-key-id {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Key Identifier of AKV Key Encryption Key

Use this parameter to specify the key identifier of the AKV Key Encryption Key (KEK).

[-oauth-host <text>] - Open Authorization Host Name

Use this parameter to specify the host name of the Open Authorization server.

Examples

The following example enables the AKV for Vserver v1. An Azure application with client-id "4a0f9c98-c5aa-4275-abe3-2780cf2801c3", tenant-id "8e21f23a-10b9-46fb-9d50-720ef604be98", client secret (not echoed to the screen for security purposes), OAuth host at 10.12.34.1 and an AKV with DNS name "https://akv-keyvault.vault.azure.net" is deployed on the Azure portal. An AKV KEK with DNS name "https://akv-keyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74" is created on the Azure portal for the AKV.

```
cluster-1::>security key-manager external azure enable -client-id
4a0f9c98-c5aa-4275-abe3-2780cf2801c3 -tenant-id 8e21f23a-10b9-46fb-9d50-
720ef604be98 -name https://akv-keyvault.vault.azure.net -key-id
https://akv-
keyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74
-authentication-method client_secret -vserver v1 -oauth-host 10.12.34.1
```

Enter the client secret for Azure Key Vault:

Re-enter the client secret for Azure Key Vault:

The following example enables the AKV for Vserver v1. An Azure application with client-id "4a0f9c98-c5aa-4275-abe3-2780cf2801c3", tenant-id "8e21f23a-10b9-46fb-9d50-720ef604be98", a client certificate (not echoed to the screen for security purposes), OAuth host at 10.12.34.1 and an AKV with DNS name "https://akv-keyvault.vault.azure.net" is deployed on the Azure portal. An AKV KEK with DNS name "https://akv-keyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74" is created on the Azure portal for the AKV.

```
cluster-1::>security key-manager external azure enable -client-id
4a0f9c98-c5aa-4275-abe3-2780cf2801c3 -tenant-id 8e21f23a-10b9-46fb-9d50-
720ef604be98 -name https://akv-keyvault.vault.azure.net -key-id
https://akv-
keyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74
-authentication-method certificate -vserver v1 -oauth-host 10.12.34.1
```

Enter the client certificate for Azure Key Vault:

security key-manager external azure rekey-external

Rekey an external key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command results in the key hierarchy being protected by the user designated AKV key encryption key (KEK). Prior to running this command, the user should have already made the necessary change on the Azure portal to use a new KEK for their key vault. The key-id used in this command is the key ID associated with the user's new AKV KEK. Upon successful completion of this command, the internal keys for the given Vserver will

be protected by the new AKV KEK.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

This parameter specifies the Vserver for which ONTAP should rekey the AKV KEK.

-key-id {scheme://(hostname|IPv4 Address|'['IPv6 Address']')} - Key Identifier of a new AKV Key Encryption Key (privilege: advanced)

This parameter specifies the key id of the new AKV KEK that should be used by ONTAP for the provided Vserver.

Examples

The following command rekeys AKV KEK for data Vserver v1 using a new key, key2 with version 12345678123412341234123456789012.

```
cluster-1::> security key-manager external azure rekey-external -vserver
v1 -key-id https://kmip-akv-
keyvault.vault.azure.net/keys/key2/12345678123412341234123456789012
```

security key-manager external azure rekey-internal

Rekey an internal key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command rekeys the internal Vserver key hierarchy by changing the top-level internal key encryption key (KEK). Upon successful completion of the command, all keys in the Vserver key hierarchy will be protected by the new top-level KEK.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

This parameter specifies the Vserver for which ONTAP should rekey the SVM KEK.

Examples

The following command rekeys the SVM KEK for data Vserver v1.

```
cluster-1::> security key-manager external azure rekey-internal -vserver
v1
```

security key-manager external azure restore

Restore missing keys of Azure Key Vault

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores any current unrestored keys associated with the given Vserver to the nodes internal key tables. This command is not supported when AKV has not been enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver to which the missing keys will be restored.

Examples

The following command restores missing keys for the data vservers v1 (which has AKV configuration) to the internal key tables on the cluster.

```
cluster-1::> security key-manager external azure restore -vserver v1
```

security key-manager external azure show

Display Azure Key Vaults configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the Azure Key Vault (AKV) configuration for a given Vserver.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, then the command displays only the AKV configuration for the given Vserver.

[-config-name <text>] - Configuration Name

If you specify this parameter, then the command displays only the AKV configurations with the given configuration name.

[-enabled {true|false}] - Is This Azure Key Vault Configuration Enabled?

If you specify this parameter, then the command displays only the AKV configurations with the given enabled value.

[-client-id <text>] - Application (Client) ID of Deployed Azure Application

If you specify this parameter, then the command displays only the AKV configuration with the given client id.

[-tenant-id <text>] - Directory (Tenant) ID of Deployed Azure Application

If you specify this parameter, then the command displays only the AKV configuration with the given tenant id.

[-name {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - Deployed Azure Key Vault DNS Name

If you specify this parameter, then the command displays only the AKV configuration with the given key vault name.

[-state {available|not-responding|unknown}] - Azure Key Vault Cluster State

If you specify this parameter, then the command displays only the AKV configuration with the given state. The state can be either available or unknown.

[-key-id {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - Key Identifier of AKV Key Encryption Key

If you specify this parameter, then the command displays only the AKV configuration with the given key id.

[-unavailable-nodes <text>] - Names of Unavailable Nodes

If you specify this parameter, then the command displays only the AKV configuration with the given unavailable-nodes.

[-authentication-method <AKV Authentication Method>] - AKV Authentication Method

If you specify this parameter, then the command displays only the AKV configurations with the given authentication method.

Examples

The following example lists all Vservers with AKV configuration.

```
cluster-1::>security key-manager external azure show
Vserver: vs0
Config Name: default
Enabled: true
Client ID: client1
Tenant ID: tenant1
Key ID:
https://vault.azure.net/keys/key1/9a2b8c1f7e6d5430e5f4a1b69d87c2e2
Authentication: client_secret
Name: https://vault.azure.net
State: unknown
Unavailable Nodes: node-1,node-2
```

security key-manager external azure update-client-secret

(DEPRECATED)-Update client secret for Azure Key Vault

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command is deprecated and may be removed in a future release. Use [security key-manager external azure update-credentials](#) instead.

This command provides a way to update the client secret that is used for the Azure Key Vault (AKV) configured for the given Vserver. The command is initially set by running the [security key-manager external azure enable](#) command. This command is not supported if AKV has not been enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver for which the AKV client secret is to be updated.

Examples

The following example updates the AKV client secret for the data Vserver v1.

```
cluster-1::> security key-manager external azure update-client-secret  
-vserver v1
```

```
Enter new client secret:
```

```
Re-enter new client secret:
```

security key-manager external azure update-credentials

Update client credentials for an Azure Key Vault configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command provides a way to update the authentication credentials that are used for an Azure Key Vault (AKV) configuration. The `-config-name` parameter can optionally be set to specify a specific AKV configuration of the given Vserver. If the `-config-name` parameter is not set, the credentials of the given Vserver's enabled configuration are updated. The credentials are initially set by running either the [security key-manager external azure enable](#) or [security key-manager external azure create-config](#) command.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver for which the AKV client credentials are to be updated.

[-config-name <text>] - Configuration Name (privilege: advanced)

Use this parameter to specify the configuration name for which the AKV client credentials are to be updated.

-authentication-method <AKV Authentication Method> - Authentication Method for the Azure Application (privilege: advanced)

Use this parameter to specify the authentication method.

Examples

The following examples show different ways of updating the AKV client credentials for the data Vserver v1.

```
cluster-1::> security key-manager external azure update-credentials
-vserver v1 -authentication-method client_secret
```

Enter new client secret:

Re-enter new client secret:

```
cluster-1:> security key-manager external azure update-credentials
-vserver v1 -authentication-method certificate
```

Enter the client certificate for Azure Key Vault:

```
cluster-1:> security key-manager external azure update-credentials
-vserver v1 -config-name config10 -authentication-method certificate
```

Enter the client certificate for Azure Key Vault:

security key-manager external barbican check

Show detailed status of the enabled Barbican KMS configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the Barbican Key Management Service (KMS) status.

Parameters

{ [-fields <fieldname>,...]

If you specify the -fields <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '-fields ?' to display the fields to specify.

| [-instance] }

If you specify the -instance parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified then the command displays only the Barbican status for the given node.

[-vserver <Vserver Name>] - Vserver Name

If this parameter is specified then the command displays only the Barbican status for the given Vserver.

[-category <Categories for KMS using SVM KEK KM status check>] - Component

If this parameter is specified then the command displays only the Barbican status for the given category.

Category	Description
-----	-----
Status	Status of the Barbican Key
Management Service	
Details	Detailed description of the status

[-status <Status Check>] - Status

If this parameter is specified then the command displays only the Barbican status entries matching the given status.

OK
FAILED
UNKNOWN

[-detail <text>] - Status Details

This field displays the detailed status message, if available.

Examples

The example below displays the status of all components of all Barbican configurations enabled on the node.

```

cluster-1::> security key-manager external barbican check
    Vserver: vsSample1
    Node: nodeSample
    Category: service_reachability
                Status: OK
                Details: OK
Category: kms_wrapped_key_status
                Status: OK
                Details: OK
Vserver: vsSample2
    Node: nodeSample
Category: service_reachability
                Status: OK
                Details: OK
Category: kms_wrapped_key_status
                Status: OK
                Details: OK
    4 entries were displayed.

```

security key-manager external barbican create-config

Create a Barbican KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a Barbican configuration which can be enabled on a Vserver.

Parameters

-vserver <Vserver Name> - Vserver

The name of the Vserver.

-config-name <text> - Configuration Name

Each configuration must have a configuration name which is unique within a Vserver.

-key-id {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Barbican Key Id

The HTTPS URL of the Barbican secret.

-application-cred-id <text> - Keystone Application Credentials ID

The ID of the Keystone application credentials.

-keystone-url {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - Keystone Authorization URL

The HTTPS URL of the Keystone authorization service.

[`-verify {true|false}`] - Verify the Barbican Host

Use this parameter to verify the authenticity of the the Barbican Host. The verify value can be either true or false.

[`-verify-host {true|false}`] - Verify the Barbican Host's Hostname

Use this parameter to verify the hostname of the Barbican configuration. The verify-host value can be either true or false.

[`-proxy-type {http|https}`] - Proxy Type

Use this parameter to specify the proxy type. The proxy-type value must be HTTP or HTTPS.

[`-proxy-host <text>`] - Proxy Host

Use this parameter to specify the proxy host.

[`-proxy-port <integer>`] - Proxy Port

Use this parameter to specify the proxy port.

[`-proxy-username <text>`] - Proxy Username

Use this parameter to specify the proxy username.

[`-proxy-password <text>`] - Proxy Password

Use this parameter to specify the proxy password.

[`-timeout <integer>`] - Barbican Connection Timeout in Seconds

Use this parameter to specify the timeout, in seconds, for attempting to connect to the Barbican service.

Examples

The example below creates a configuration on a node with the following details: For Vserver vsTest, configuration name: config1, Key ID: <https://sample.com:5000/v3>, Keystone URL: <https://sample.keystone.com:5000/v3>, Application Credentials ID: app_cred_id.

```
cluster-1::> security key-manager external barbican create-config -vserver
vsTest -config-name config1 -key-id https://sample.com:5000/v3 -keystone
-url https://sample.keystone.com:5000/v3 -application-cred-id app_cred_id
```

```
Enter the Barbican Key Management Service application credential secret:
```

security key-manager external barbican rekey-internal

Rekey a Barbican KMS Internal Key

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command rekeys the internal Vserver key hierarchy by changing the top-level internal key encryption key (KEK). Upon successful completion of the command, all keys in the Vserver key hierarchy will be protected by the new top-level KEK.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

This parameter specifies the Vserver for which ONTAP should rekey the SVM KEK.

Examples

The following command rekeys the SVM KEK for data Vserver v1.

```
cluster-1::> security key-manager external barbican rekey-internal  
-vserver v1
```

security key-manager external barbican restore

Restore Missing SVM-KEKs of a Barbican KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores the top level SVM key encryption key associated with the given Vserver to each of the node's internal key tables. This command is not supported when Barbican configuration is not enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver to which the missing SVM Key encryption key will be restored.

Examples

The following command restores the missing SVM Key encryption key for the data vservers v1 (which has a Barbican configuration) to the internal key tables of each node in the cluster.

```
cluster-1::> security key-manager external barbican restore -vserver v1
```

security key-manager external barbican show

Display Barbican KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the Barbican Key Management Service configuration for a given Vserver.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-config]

If this parameter is specified, the command displays the following information:

- verify
- verify-host
- proxy-type
- proxy-host
- proxy-port
- proxy-username
- timeout

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, then the command displays only the Barbican configurations for the given Vserver.

[-config-name <text>] - Configuration Name

If you specify this parameter, then the command displays only the Barbican configurations with the given configuration name.

[-key-id {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - Barbican Key Id

If you specify this parameter, then the command displays only the Barbican configurations with the given key id.

[-application-cred-id <text>] - Keystone Application Credentials ID

If you specify this parameter, then the command displays only the Barbican configurations with the given application credentials id.

[-keystone-url {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - Keystone Authorization URL

If you specify this parameter, then the command displays only the Barbican configurations with the given Keystone authentication URL.

[-verify {true|false}] - Verify the Barbican Host?

If you specify this parameter, then the command displays only the Barbican configurations with the given verify value. The verify value can be either true or false.

[-verify-host {true|false}] - Verify the Barbican Host's Hostname?

If you specify this parameter, then the command displays only the Barbican configurations with the given verify-host value. The verify-host value can be either true or false.

[`-proxy-type {http|https}`] - Proxy Type

If you specify this parameter, then the command displays only the Barbican configurations with the given proxy-type value. The proxy-type value can be either http or https.

[`-proxy-host <text>`] - Proxy Host

If you specify this parameter, then the command displays only the Barbican configurations with the given proxy-host value.

[`-proxy-port <integer>`] - Proxy Port

If you specify this parameter, then the command displays only the Barbican configurations with the given proxy-port number.

[`-proxy-username <text>`] - Proxy Username

If you specify this parameter, then the command displays only the Barbican configurations with the given proxy-username value.

[`-timeout <integer>`] - Barbican Connection Timeout in Seconds

If you specify this parameter, then the command displays only the Barbican configurations with the given timeout value.

[`-enabled {true|false}`] - Is This Barbican Configuration Enabled?

If you specify this parameter, then the command displays only the Barbican configurations with the given enabled value.

Examples

The following example lists all Vservers with Barbican configurations.

```
cluster-1::*> security key-manager external barbican show
Vserver: vsTest
    Configuration Name: config1
        Key ID: https://sample.com:5000/v3
    Application Credentials ID: app_cred_id
        Keystone URL: https://sample.keystone.com:5000/v3
        Enabled? : false
```

The following example lists all fields in the configuration for the Vserver vsTest.

```

cluster-1::*> security key-manager external barbican show -instance
Vserver: vsTest

Configuration Name: config1
Barbican Key Id: https://sample.com:5000/v3
Keystone Application Credentials ID: app_cred_id
Keystone Authorization URL:
https://sample.keystone.com:5000/v3
Verify the Barbican Host?: true
Verify the Barbican Host's Hostname?: true
Verify the Barbican Host's IP?: true
Proxy Type: https
Proxy Host:
Proxy Port: 0
Proxy Username:
Barbican Connection Timeout in Seconds: 10
Is This Barbican Configuration Enabled?: false

```

security key-manager external barbican update-config

Update a Barbican KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command provides a way to update the attributes of a Barbican configuration.

Parameters

-vserver <Vserver Name> - Vserver

Use this parameter to specify the Vserver of the Barbican configuration to be updated.

-config-name <text> - Configuration name

Use this parameter to specify the name of the Barbican configuration to be updated.

[-verify {true|false}] - Verify the Barbican Host?

Use this parameter to specify the verify value of the Barbican configuration. The verify value can be either true or false.

[-verify-host {true|false}] - Verify the Barbican Host's Hostname?

Use this parameter to specify the verify-host value of the Barbican configuration. The verify value can be either true or false.

[-proxy-type {http|https}] - Proxy Type

Use this parameter to specify the proxy type.

[`-proxy-host` <text>] - Proxy Host

Use this parameter to specify the proxy host.

[`-proxy-port` <integer>] - Proxy Port

Use this parameter to specify the proxy port.

[`-proxy-username` <text>] - Proxy Username

Use this parameter to specify the proxy username.

[`-proxy-password` <text>] - Proxy Password

Use this parameter to specify the proxy password.

[`-timeout` <integer>] - Barbican Connection Timeout in Seconds

Use this parameter to specify the timeout, in seconds, for attempting to connect to the Barbican instance.

Examples

The following example updates the `verify` value to `false` for the Barbican configuration "config1" associated with the data Vserver `v1`.

```
cluster-1::> security key-manager external barbican update-config -vserver
v1 -config-name config1 -verify false
```

security key-manager external barbican update-credentials**Update Barbican KMS application credentials**

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command provides a way to update the authentication credentials that are used for a Barbican configuration. The credentials are initially set by running the [security key-manager external barbican create-config](#) command.

Parameters**`-vserver` <Vserver Name> - Vserver**

Use this parameter to specify the Vserver for which the Keystone application credentials are to be updated.

`-config-name` <text> - Configuration Name

Use this parameter to specify the configuration name for which the Keystone application credentials are to be updated.

`-application-cred-id` <text> - Keystone Application Credentials ID

Use this parameter to specify the new Keystone application credentials ID.

Examples

The following example shows updating the Keystone application credentials for the configuration on data Vserver v1.

```
cluster-1::> security key-manager external barbican update-credentials  
-vserver v1 -config-name config1 -application-cred-id app_cred_id
```

```
Enter the new Barbican Key Management Service application credentials  
secret:
```

security key-manager external gcp check

Show detailed status of the Google Cloud KMS configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command displays the Google Cloud Key Management Service (KMS) status.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-node* {<nodename>|local}] - Node (privilege: advanced)

If this parameter is specified then the command displays only the Google Cloud KMS status for the given node.

[*-vserver* <Vserver Name>] - Vserver Name (privilege: advanced)

If this parameter is specified then the command displays only the Google Cloud KMS status for the given Vserver.

[*-category* <Categories for Cloud KMS status check>] - Component (privilege: advanced)

If this parameter is specified then the command displays only the Google Cloud KMS status for the given category.

Category	Description

          Status: OK
```

security key-manager external gcp disable

Disable a Google Cloud KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the Google Cloud Key Management Service (GCKMS) associated with the given Vserver. GCKMS cannot be disabled if it is in use by ONTAP. This command will fail if GCKMS has not been

enabled for the Vserver.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver on which the GCKMS is to be disabled.

Examples

The following example disables the GCKMS for Vserver v1.

```
cluster-1::>security key-manager external gcp disable -vserver v1
```

security key-manager external gcp enable

Create and enable a Google Cloud KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the Google Cloud Key Management Service (GCKMS) associated with the given Vserver. A GCP project and GCKMS must be deployed on the GCP portal prior to running this command. GCKMS can only be enabled on a data Vserver that doesn't already have a key manager configured. GCKMS cannot be enabled in a MetroCluster environment.

Parameters

-vserver <Vserver Name> - Vserver

Use this parameter to specify the Vserver on which the GCKMS is to be enabled.

-project-id <text> - Google Cloud KMS Project ID

Use this parameter to specify the project ID of the deployed GCP project.

-key-ring-name <text> - Google Cloud KMS Key Ring Name

Use this parameter to specify the key ring name of the deployed GCP project.

-key-ring-location <text> - Google Cloud KMS Key Ring Location

Use this parameter to specify the location of the key ring.

-key-name <text> - Google Cloud KMS Key Encryption Key Name

Use this parameter to specify the key name of the GCKMS Key Encryption Key (KEK).

[-authentication-method <GCP Authentication Method>] - GCP Authentication Method

Use this parameter to specify the authentication method.

[-port <integer>] - Google Cloud KMS Port Number

Use this parameter to specify the port of the deployed Google Cloud KMS.

`[-cloudkms-host <text>]` - Google Cloud KMS Host's Subdomain

Use this parameter to specify the Google Cloud KMS Host's Subdomain.

`[-verify {true|false}]` - Verify Identity of Google Cloud KMS?

Use this parameter to specify whether to verify the identity of Google Cloud KMS.

`[-verify-host {true|false}]` - Verify Identity of Google Cloud KMS's Hostname?

Use this parameter to specify whether to verify the identity of Google Cloud KMS hostname.

`[-verify-ip {true|false}]` - Verify Identity of Google Cloud KMS's IP Address?

Use this parameter to specify whether to verify the identity of Google Cloud KMS ip address.

`[-proxy-type {http|https}]` - Proxy Type

Use this parameter to specify the proxy type.

`[-proxy-host <text>]` - Proxy Host

Use this parameter to specify the proxy hostname.

`[-proxy-port <integer>]` - Proxy Port

Use this parameter to specify the proxy port.

`[-proxy-username <text>]` - Proxy Username

Use this parameter to specify the proxy username.

`[-proxy-password <text>]` - Proxy Password

Use this parameter to specify the proxy password.

`[-oauth-host <text>]` - Google Cloud KMS Authorization Host

Use this parameter to specify the host name of the Open Authorization server.

`[-oauth-url <text>]` - Google Cloud KMS Authorization Url

Use this parameter to specify the URL of the Open Authorization access token.

`[-timeout <integer>]` - Google Cloud Platform Connection Timeout in Seconds

Use this parameter to specify the Google Cloud connection timeout in seconds.

`[-privileged-account <text>]` - Google Cloud Privileged Service Account

Use this parameter to specify a privileged service account (email address) with both `cloudkms.cryptoKeyVersions.useToEncrypt` and `cloudkms.cryptoKeyVersions.useToDecrypt` permissions. If this parameter is specified, any calls made to the GCKMS will first use `iam.serviceAccounts.getAccessToken` to impersonate the privileged account.

`[-gce-metadata-server <text>]` - Google Compute Engine Metadata Server

Use this parameter to specify the custom Google Cloud Engine Metadata Server address used for authentication.

Examples

The following example enables the GCKMS for Vserver v1. The parameters in the example command identify a Google Cloud Platform (GCP) project application deployed on the GCP. The GCP project application has a

Project ID "test_project", a key ring name "key_ring_for_test_project", a key ring location "secure_location_for_key_ring", a key name "testKEK" and OAuth server at 10.12.34.1.

```
cluster-1::*> security key-manager external gcp enable -vserver v1
               -project-id test_project -key-ring-name key_ring_for_test_project -key
               -ring-location secure_location_for_key_ring -key-name testKEK -oauth-host
               10.12.34.1
```

Enter the contents of the Google Cloud Key Management Service account key file (json file): Press <Enter> when done

security key-manager external gcp rekey-external

Rekey an external key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command replaces the existing GCP key encryption key (KEK) and results in the key hierarchy being protected by the user specified GCP KEK. The GCP key ring in use by the GCP Portal should be updated to use the new KEK prior to running this command. Upon successful completion of this command, the internal keys for the given Vserver will be protected by the new GCP KEK.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver for which ONTAP should rekey the GCP KEK.

-key-name <text> - Google Cloud KMS Key Encryption Key Name

This parameter specifies the key name of the new GCP KEK that should be used by ONTAP for the provided Vserver.

[-project-id <text>] - Google Cloud KMS Project ID

This parameter specifies the new project ID of the new GCP KEK that should be used by ONTAP for the provided Vserver.

[-key-ring-name <text>] - Google Cloud KMS Key Ring Name

This parameter specifies the new key ring name of the new GCP KEK that should be used by ONTAP for the provided Vserver.

[-key-ring-location <text>] - Google Cloud KMS Key Ring Location

This parameter specifies the new key ring location of the new GCP KEK that should be used by ONTAP for the provided Vserver.

Examples

The following command rekeys GCP KEK for data Vserver v1 using a new key-name key1.

```
cluster-1::> security key-manager external gcp rekey-external -vserver v1
-key-name key1
```

security key-manager external gcp rekey-internal

Rekey an internal key of the Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command rekeys the internal Vserver key hierarchy by changing the SVM key encryption key (KEK). Upon successful completion of the command, all keys in the Vserver key hierarchy will be protected by the new top-level KEK.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

This parameter specifies the Vserver for which ONTAP should rekey the SVM KEK.

Examples

The following command rekeys the SVM KEK for data Vserver v1.

```
cluster-1::> security key-manager external gcp rekey-internal -vserver v1
```

security key-manager external gcp restore

Restore missing keys of a Google Cloud KMS

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command retrieves and restores any unrestored keys associated with the given Vserver to each node's internal key tables.

Parameters

-vserver <Vserver Name> - Vserver

This parameter specifies the Vserver to which the missing keys will be restored.

Examples

The following command restores missing keys for the data Vserver v1 (which has GCKMS enabled) to the internal key tables on each node in the cluster.

```
cluster-1::> security key-manager external gcp restore -vserver v1
```

security key-manager external gcp show

Display Google Cloud KMS configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the Google Cloud Key Management Service (GCKMS) configuration.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

If you specify this parameter, then the command displays only the GCKMS configurations for the given Vserver.

[-project-id <text>] - Google Cloud KMS Project ID

If you specify this parameter, then the command displays only the GCKMS configurations with the given project id.

[-key-ring-name <text>] - Google Cloud KMS Key Ring Name

If you specify this parameter, then the command displays only the GCKMS configurations with the given key ring name.

[-key-ring-location <text>] - Google Cloud KMS Key Ring Location

If you specify this parameter, then the command displays only the GCKMS configurations with the given key ring location.

[-key-name <text>] - Google Cloud KMS Key Encryption Key Name

If you specify this parameter, then the command displays only the GCKMS configurations with the given key name.

[-authentication-method <GCP Authentication Method>] - GCP Authentication Method

If you specify this parameter, then the command displays only the GCKMS configurations with the given authentication method value.

[-state {available|not-responding|unknown}] - Google Cloud KMS Cluster State

If you specify this parameter, then the command displays only the GCKMS configurations with the given state. The state can be either available or unknown.

[`-unavailable-nodes <text>`] - Names of Unavailable Nodes

If you specify this parameter, then the command displays only the GCKMS configurations with the given unavailable-nodes.

[`-privileged-account <text>`] - Google Cloud Privileged Service Account

If you specify this parameter, then the command displays only the GCKMS configurations with the given privileged account.

[`-caller-account <text>`] - Google Cloud Caller Service Account

If you specify this parameter, then the command displays only the GCKMS configurations with the given caller account.

Examples

The following example lists all Vservers with GCKMS configuration.

```
cluster-1::>security key-manager external gcp show
      Vserver: SAMPLE_VSERVER
      Project ID: SAMPLE_PROJECT_ID
      Key Ring Location: SAMPLE_KEY_RING_LOCATION
      Key Name: SAMPLE_KEY_NAME
      Caller Account: SAMPLE@CALLER.COM
      Privileged Account: SAMPLE@PRIVILEGED.COM

Key Ring Name                                State
-----
SAMPLE_KEY_RING_NAME                        unknown
Unavailable Nodes:                          node1
```

security key-manager external gcp update-credentials

Update Google Cloud Project's Service Account Credentials

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command allows the user to update the application credential which is used by the Google Cloud Key Management Service (GCKMS) configured for the given Vserver. The application credential is initially set by running the [security key-manager external gcp enable](#) command. This command will fail if GCKMS has not been enabled for the Vserver.

Parameters

`-vserver <Vserver Name>` - Vserver (privilege: advanced)

Use this parameter to specify the Vserver for which the GCKMS application credential will be updated.

Examples

The following example updates the GCKMS application credential for the data Vserver v1.

```
cluster-1::> security key-manager external gcp update-credentials -vserver  
v1
```

Enter the new application credential: Press <Enter> when done

- [security key-manager external gcp enable](#)

security key-manager health policy modify

Modify the health monitor policy of the given keystore-type

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command modifies the health monitor policy

Parameters

-keystore-type <Key Store Type> - Keystore Type

Use this parameter to specify the keystore-type of the health monitor policy to be updated.

[-enabled {true|false}] - Health Monitor Enabled?

Use this parameter to specify if the health monitor is enabled.

[-manage-volume-offline {true|false}] - Automatically Manage Volume Offline?

Use this parameter to specify if the health monitor can automatically offline the volumes if the key manager cannot be reached.

Examples

The following example updates the AWS 'keystore-type' health monitor policy "enabled" and "manage-volume-offline" values.

```
cluster-1::> security key-manager health policy modify -keystore-type AWS  
-enabled false -manage-volume-offline false
```

security key-manager health policy show

Show the health monitor policy of the given keystore-type

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the health monitor policies

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-keystore-type <Key Store Type>] - Keystore Type

If you specify this parameter, then the command displays only the health monitor policies with the given keystore-type value.

[-enabled {true|false}] - Health Monitor Enabled?

If you specify this parameter, then the command displays only the health monitor policies with the given enabled value.

[-manage-volume-offline {true|false}] - Automatically Manage Volume Offline?

If you specify this parameter, then the command displays only the health monitor policies with the given manage-volume-offline value.

Examples

The following example lists all health monitor policies.

```
cluster-1::> security key-manager health policy show
              Health Monitor Automatically Manage
Keystore Type Enabled?      Volume Offline?
-----
OKM           true         false
KMIP          true         false
AKV           true         true
GCP           true         false
AWS           true         false
IKP           true         true
6 entries were displayed.
```

security key-manager key create

Create a new authentication key

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates a new authentication key (AK) and stores it on the the admin Vserver's key management servers. The command fails if the configured key management servers are already storing more than 256 AKs. If this command fails because there are more than 256 AKs in the cluster, delete unused keys on the Vserver's key management servers and retry the command. This command is not supported when external key management is not enabled for the admin Vserver.

Parameters

[`-key-tag <text>`] - Key Tag

This parameter specifies the key tag to associate with the new authentication key (AK). The default value is the node name. This parameter can be used to help identify created authentication keys (AKs). For example, the [security key-manager key query](#) command's key-tag parameter can be used to query for a specific key-tag value.

[`-prompt-for-key {true|false}`] - Prompt for Authentication Passphrase

If you specify this parameter as true, then the command prompts you to enter an authentication passphrase manually instead of generating it automatically. For security reasons, the authentication passphrase you entered is not displayed at the command prompt. You must enter the authentication passphrase a second time for verification. To avoid errors, copy and paste authentication passphrases electronically instead of entering them manually. ONTAP saves the resulting authentication key/key ID pair automatically on the configured key management servers.

Examples

The following example creates an authentication key with the node name as the default key-tag value:

```
cluster-1::> security key-manager key create
Key ID:
00000000000000000000200000000000100d0f7c2462d626b739fe81b89f29a092f0000000000
000000
```

The following example creates an authentication key with a user-specified authentication passphrase:

```
cluster-1::> security key-manager key create -prompt-for-key true
Enter a new passphrase:
Reenter the passphrase:
Key ID:
000000000000000000002000000000001006268333f870860128fbe17d393e5083b0000000000
000000
```

- [security key-manager key query](#)

manager to "datavs" data Vserver's key manager:

```
cluster-1::> security key-manager key migrate -from-vserver cluster-1 -to
-vserver datavs
```

The following example migrates the keys of "datavs" data Vserver from "datavs" data Vserver's key manager to "cluster-1" admin Vserver's key manager:

```
cluster-1::> security key-manager key migrate -from-vserver datavs -to
-vserver cluster-1
```

security key-manager key query

Display the key IDs.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the IDs of the keys that are stored in the configured key managers. This command does not update the key tables on the node. Primary key servers, along with any associated secondary key servers, are displayed in the output.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Use this parameter to specify the name of the node that queries the specified key management servers. If this parameter is not specified, then all nodes query the specified key management servers.

[-vserver <vserver name>] - Vserver Name

Use this parameter to specify the Vserver for which to list the keys.

[-key-server <Hostname and Port>] - Key Server

This parameter specifies the host and port of the key management server that you want to query. This parameter is used only with external key managers.

[-key-id <Hex String>] - Key Identifier

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[`-key-tag <text>`] - Key Tag

If you specify this parameter, then the command displays only the key IDs that match the specified value. The key-tag for Volume Encryption Keys (VEKs) is set to the UUID of the encrypted volume.

[`-key-type <Key Usage Type>`] - Key Type

If you specify this parameter, then the command displays only the key IDs that match the specified value.

[`-restored {true|false}`] - Restored

This parameter specifies whether the key corresponding to the displayed key ID is present in the specified node's internal key table. If you specify 'true' for this parameter, then the command displays the key IDs of only those keys that are present in the system's internal key table. If you specify 'false' for this parameter, then the command displays the key IDs of only those keys that are not present in the system's internal key table.

[`-key-store <Key Store>`] - Key Store

Use this parameter to specify the key manager type from which to list the keys.

[`-key-user <vserver name>`] - Key User

If you specify this parameter, then the command displays only the key IDs that are used by the specified Vserver.

[`-key-manager <text>`] - Key Manager

This parameter specifies the identity of the key manager. For external key managers that will be the host and the port of the key server. In other cases that will be the name of a corresponding key manager.

[`-key-store-type <Key Store Type>`] - Key Store Type

If you specify this parameter, then the command displays only the key IDs that are used by the specified key manager type.

[`-crn <text>`] - Cloud Resource Name

This parameter specifies the Cloud Resource Name (CRN) of the key. If you specify this parameter, then the command displays only the key IDs that contains such CRN.

[`-policy <text>`] - Key Store Policy

This optional parameter specifies the policy name of the key manager. If you specify this parameter, then the command displays only the key IDs that are associated with the specified policy.

[`-encryption-algorithm <text>`] - Encryption algorithm for the key

This optional parameter specifies the encryption algorithm of the key. If you specify this parameter, then the command displays only the keys of the specified algorithm type.

Examples

The following example shows all of the keys on all configured key servers, and whether or not those keys have been restored for all nodes in the cluster:

```
cluster-1::> security key-manager key query
Node: node1
      Vserver: cluster-1
      Key Manager: onboard
```

Key Manager Type: OKM

security key-manager key key-table create

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates an entry in the key manager key table. It does not create a new key.

Parameters

-key-id <Hex String> - Key ID

This parameter specifies the key ID of the new entry in the table.

-key-type <Key Usage Type> - Key Usage Type

This parameter specifies the key type of the new entry. The following key types are supported: NSE-AK, AEK, VEK, NEK and SVM-KEK.

-encryption-algorithm <text> - Encryption Algorithm For The Key

This parameter specifies the encryption algorithm associated with the key.

-creation-time <MM/DD/YYYY HH:MM:SS> - Key Creation Time

This parameter specifies the date and time that the key was created. The date and time format is "MM/DD/YYYY HH:MM:SS".

Examples

The following example creates an entry in the table:

```
cluster-1::> security key-manager key key-table create -key-id
00000000000000000000200000000000500e9ccf3f08e7533d9cd0298e1ebe6c1000000000000
000000 -key-type SVM-KEK -encryption-algorithm AES-256 -creation-time
01/01/2022 01:01:59

cluster-1::> security key-manager key key-table show

Key ID
Key Type Encryption    Creation Time
-----
-----
00000000000000000000200000000000500e9ccf3f08e7533d9cd0298e1ebe6c1000000000000
000000 SVM-KEK AES-256      1/1/2022 01:01:59
1 entry was displayed.
```

security key-manager key key-table delete

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command removes an entry from the key table.

Parameters

-key-id <Hex String> - Key ID

Use this parameter to specify the key ID of the entry that you want to remove from the key table.

Examples

The following example deletes an entry from the key table:

```
cluster-1::> security key-manager key key-table show

Key ID
Key Type Encryption    Creation Time
-----
00000000000000000000200000000000100239c17902e7515ed397892f75f52e38e0000000000
000000    NSE-AK    AES-256          2/8/2022 10:54:46

-----
00000000000000000000200000000000a00a7af571b8397e7df297128fdeb83f4ba0000000000
000000    SVM-KEK    AES-256          1/1/2022 01:01:59
1 entry was displayed.
```

security key-manager key key-table modify

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command modifies an entry in the key table. Changes made using this command do not affect the key; only the table entry is modified, not the key itself.

Parameters

-key-id <Hex String> - Key ID

This parameter specifies the key ID of the entry to be modified.

[-key-type <Key Usage Type>] - Key Usage Type

If this optional parameter is specified, the key type field is modified accordingly.

[-encryption-algorithm <text>] - Encryption Algorithm For The Key

If this optional parameter is specified, the encryption algorithm field is modified accordingly.

[-creation-time <MM/DD/YYYY HH:MM:SS>] - Key Creation Time

If this optional parameter is specified, the creation time field is modified accordingly.

Examples

The following example shows the key table before and after the modify command:

```
cluster-1::> security key-manager key key-table show

Key ID
Key Type Encryption    Creation Time
-----
-----
0000000000000000000200000000000500e9ccf3f08e7533d9cd0298e1ebe6c1190000000000

-----
0000000000000000000200000000000500e9ccf3f08e7533d9cd0298e1ebe6c1190000000000
000000 VEK          XTS-AES-256  12/25/2022 00:00:00
```

security key-manager key key-table show

Display details of a specific key ID.

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays date and time information for all keys.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-key-id <Hex String>] - Key ID

If this parameter is specified, the command displays the key that has the specified key ID.

[-key-type <Key Usage Type>] - Key Usage Type

If this parameter is specified, the command only displays information about keys with the specified key type.

[-encryption-algorithm <text>] - Encryption Algorithm For The Key

If this parameter is specified, the command only displays information about keys with the specified encryption algorithm.

[-creation-time <MM/DD/YYYY HH:MM:SS>] - Key Creation Time

If this parameter is specified, the command displays only information about keys with the specified creation time.

Examples

The following example shows all date and time information for all keys:

```
cluster-1::> security key-manager key key-table show
```

```
Key ID
```

```
Key Type Encryption    Creation Time
```

```

```

security key-manager keystore delete

Remove a disabled key manager keystore configuration.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command is used to delete keystore configurations. Only keystore configurations that are not enabled can be deleted. Use the [security key-manager keystore show -enable false](#) command to see a list of all the keystore configurations that are not enabled.

Parameters

-vserver <Vserver Name> - Vserver

If you specify this parameter, then the command deletes only the keystore configurations with the given Vserver.

-keystore-type <Key Store Type> - Keystore Type

If you specify this parameter, then the command deletes only the keystore configurations with the given keystore type. This command only deletes keystore configurations with a keystore type of Azure Key Vault (AKV) or Barbican.

-config-name <text> - Configuration Name

If you specify this parameter, then the command deletes only the keystore configurations with the given configuration name.

Examples

The following example deletes all keystore configurations with the name "NewConfig" that are not enabled.

```
Cluster-1::*> security key-manager keystore delete -vserver * -keystore
-type * -config-name NewConfig
1 entry was deleted.

Cluster-1::*>
```

The following example deletes the keystore configuration on Vserver vs0 with a keystore type AKV and "NewConfig" configuration name.

```
Cluster-1::*> security key-manager keystore delete -vserver vs0 -keystore
-type AKV -config-name NewConfig
1 entry was deleted.

Cluster-1::*>
```

The following example attempts and fails to delete an enabled keystore configuration.

```
Cluster-1::*> security key-manager keystore delete -vserver vs0 -keystore
-type AKV -config-name default
```

```
Error: command failed: The keystore configuration with name "default" and
      keystore type "AKV" is currently enabled for Vserver "vs0" and
cannot be
      deleted.
```

```
Cluster-1::*>
```

security key-manager keystore disable

Disable an active key manager

Availability: This command is available to *cluster* and *Vserver* administrators at the *advanced* privilege level.

Description

This command disables the keystore represented by the supplied Vserver, keystore-type, and config-name combination.

Parameters

-vserver <Vserver Name> - Vserver (privilege: advanced)

Use this parameter to specify the Vserver of the desired configuration.

Examples

The following example disables a configuration named sampleConfig for Barbican on Vserver vsTest.

```
cluster-1::> security key-manager keystore disable -vserver vsTest
-keystore-type BARBICAN -config-name sampleConfig
```

security key-manager keystore enable

Enable or switch to an inactive keystore configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command enables the keystore represented by the supplied Vserver, keystore-type, and config-name combination. If the specified Vserver already has a keystore enabled, then the enabled configuration is switched to the desired keystore configuration and the previous configuration is left in an inactive/disabled

state.

Parameters

-vserver <vserver name> - Vserver Name

Use this parameter to specify the Vserver of the desired configuration.

-keystore-type <Key Store Type> - Keystore Type

Use this parameter to specify the keystore type of the desired configuration.

-config-name <text> - Configuration Name

Use this parameter to specify the configuration name of the desired configuration.

Examples

The following example enables a configuration named sampleConfig for the configured AKV on Vserver vsTest.

```
cluster-1::> security key-manager keystore enable -vserver vsTest
-keystore-type AKV -config-name sampleConfig
```

The following example switches the configuration on Vserver vsTest to a new keystore configuration named newConfig.

```
cluster-1::> security key-manager keystore enable -vserver vsTest
-keystore-type AKV -config-name newConfig
```

security key-manager keystore show

Displays the configured key manager keystores.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays all keystore configurations.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-vserver <Vserver Name>`] - Vserver

If you specify this parameter, then the command displays only the keystore configurations with the given Vserver.

[`-keystore-type <Key Store Type>`] - Keystore Type

If you specify this parameter, then the command displays only the keystore configurations with the given keystore type.

[`-config-name <text>`] - Configuration Name

If you specify this parameter, then the command displays only the keystore configurations with the given configuration name.

[`-enabled {true|false}`] - Configuration Is Enabled?

If you specify this parameter, then the command displays only the keystore configurations with the given enabled value.

[`-uuid <UUID>`] - Key Store UUID

If you specify this parameter, then the command displays only the keystore configuration with the given universal unique identifier (UUID) value.

[`-state <Key Store state>`] - Key Store State

If you specify this parameter, then the command displays only the keystores with the given state.

Examples

The following example lists all keystore configurations.

```
Cluster-1::*> security key-manager keystore show
```

Vserver	Keystore Type	Config Name	Enabled
-----	-----	-----	-----
Cluster-1	OKM	default	true
vs0	AKV	default	true
vs0	AKV	AKV-Config-1	false
vs1	AKV	AWS-Config-1	true

4 entries were displayed.

The following example lists only the keystore configurations that are enabled.

```
Cluster-1::*> security key-manager keystore show -enabled true
```

Vserver	Keystore Type	Config Name	Enabled
Cluster-1	OKM	default	true
vs0	AKV	default	true
vs1	AKV	AWS-Config-1	true

3 entries were displayed.

security key-manager onboard disable

Disable the Onboard Key Manager

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command disables the Onboard Key Manager associated with the admin Vserver and permanently deletes the Onboard Key Manager configuration associated with the admin Vserver. The Onboard Key Manager cannot be disabled if there are any encrypted volumes that use encryption keys created by the Onboard Key Manager. This command fails if the Onboard Key Manager is not enabled.

Examples

The following example disables the Onboard Key Manager for the admin Vserver:

```
cluster-1::*> security key-manager onboard disable
```

```
Warning: This command will permanently delete all keys from Onboard Key  
Manager.
```

```
Do you want to continue? {y|n}: y
```

security key-manager onboard enable

Enable the Onboard Key Manager

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command enables the Onboard Key Manager for the admin Vserver.

Parameters

Examples

The following example enables the Onboard Key Manager for the admin Vserver cluster-1:

```
cluster-1::> security key-manager onboard enable
```

Enter the cluster-wide passphrase for the Onboard Key Manager:

Re-enter the cluster-wide passphrase:

After configuring the Onboard Key Manager, save the encrypted configuration data in a safe location so that you can use it if you need to perform a manual recovery operation. To view the data, use the "security key-manager onboard show-backup" command.

The following example enables the Onboard Key Manager for the admin Vserver cluster-1 with the cluster-wide passphrase "myPassphrase" on an external USB mass storage device:

```
cluster-1::> security key-manager onboard enable -vserver cluster-1 -okm  
-on-usb-enabled true -onboard-passphrase myPassphrase
```

Enter the cluster-wide passphrase for the Onboard Key Manager:

Re-enter the cluster-wide passphrase:

After configuring the Onboard Key Manager, save the encrypted configuration data in a safe location so that you can use it if you need to perform a manual recovery operation. To view the data, use the "security key-manager onboard show-backup" command.

security key-manager onboard show-backup

Display the Onboard Key Management backup

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the backup information for the Onboard Key Manager for the admin Vserver, which can be used to recover the cluster in case of catastrophic situations. The information displayed is for the cluster as a whole (not individual nodes).

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example displays the Onboard Key Manager backup data for the admin Vserver:

[illegible]

security key-manager onboard sync

Sync the Onboard Key Manager keys

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command synchronizes missing onboard keys on any node in the cluster. For example, if you add a node to a cluster that has the Onboard Key Manager configured, you should then run this command to synchronize the keys. In a MetroCluster configuration, if the [security key-manager onboard enable](#) command is used to enable the Onboard Key Manager on one site, then run the `security key-manager onboard sync` command on the partner site. In a MetroCluster configuration, if the [security key-manager onboard update-passphrase](#) command is used to update the passphrase on one site, then run this command with the new passphrase on the partner site before proceeding with any key management operations.

Parameters

Examples

The following example synchronizes the Onboard Key Manager key database across all nodes in the cluster. In a MetroCluster configuration, this command synchronizes nodes in the local site.

```
cluster-1::> security key-manager onboard sync
```

- [security key-manager onboard enable](#)
- [security key-manager onboard update-passphrase](#)

security key-manager onboard update-passphrase

Update the Onboard Key Manager Passphrase

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command provides a way to update the cluster-wide passphrase that is used for the Onboard Key Manager and initially created by running the [security key-manager onboard enable](#) command. This command prompts for the existing passphrase, and if that passphrase is correct then the command prompts for a new passphrase. When the Onboard Key Manager is enabled for the admin Vserver, run the [security key-manager onboard show-backup](#) command after updating the passphrase and save the output for emergency recovery scenarios. When the `security key-manager onboard update-passphrase` command is executed in a MetroCluster configuration, then run the [security key-manager onboard sync](#) command with the new passphrase on the partner site before proceeding with any key-manager operations. This allows the updated passphrase to be replicated to the partner site.

Parameters

Examples

The following example updates the cluster-wide passphrase used for the Onboard Key Manager:

```
cluster-1::*> security key-manager onboard update-passphrase
```

Warning: This command will reconfigure the cluster passphrase for onboard key management.

Do you want to continue? {y|n}: y

Enter current passphrase:

Enter new passphrase:

Reenter the new passphrase:

Update passphrase has completed. Save the new encrypted configuration data in

a safe location so that you can use it if you need to perform a manual recovery

operation. To view the data, use the "security key-manager onboard show-backup"

command.

security key-manager onboard verify-backup

Verify the onboard key management backup and its passphrase

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command verifies the backup data and the passphrase of the Onboard Key Manager for the admin Vserver.

Examples

The following example displays the verification of the onboard key management backup data for the admin Vserver:

Description

This command displays the defined key management key policies.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-policy <text>] - Policy name

If you specify this parameter, then the command will list the key manager policy with the given name.

[-check-key-on-online {true|false}] - Pull key from key manager during volume online?

If you specify this parameter, then the command displays only the key manager policies with the given `check-key-on-online` value.

[-purge-key-on-offline {true|false}] - Purge key from memory during volume offline?

If you specify this parameter, then the command displays only the key manager policies with the given `purge-key-on-offline` value.

[-support-on-admin-vserver {true|false}] - Support policy on admin Vserver?

If you specify this parameter, then the command displays only the key manager policies with the given `support-on-admin-vserver` value.

[-key-manager-attribute-required {true|false}] - Key manager attribute required for volume?

If you specify this parameter, then the command displays only the key manager policies with the given `key-manager-attribute-required` value.

Examples

The following example lists all configured key management policies:

```
cluster-1::*> security key-manager policy show
```

Policy	Check Key on Online?	Purge Key on Offline?
-----	-----	-----
IBM_Key_Lore	true	true

security login commands

security login create

Add a login method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login create` command creates a login method for the management utility. A login method consists of a user name, an application (access method), and an authentication method. A user name can be associated with multiple applications. It can optionally include an access-control role name. If an Active Directory, LDAP, or NIS group name is used, then the login method gives access to users belonging to the specified group. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name or Active Directory, LDAP, or NIS group name of the login method. The Active Directory, LDAP, or NIS group name can be specified only with the *domain* or *nsswitch* authentication method and *ontapi* and *ssh* application. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application

This specifies the application of the login method. Possible values include *amqp*, *console*, *http*, *ontapi*, *rsh*, *snmp*, *service-processor*, *ssh*, and *telnet*.

Setting this parameter to *service-processor* grants the user access to the Service Processor (SP). Because the SP supports only password as the first factor of authentication, when you set this parameter to *service-processor*, you must also set the *-authentication-method* parameter to *password*. Vserver user accounts cannot access the SP. Therefore, you cannot use the *-vserver* parameter when you set this parameter to *service-processor*.

-authentication-method <text> - Authentication Method

This specifies the authentication method for login. Possible values include the following:

- *cert* - SSL certificate authentication
- *community* - SNMP community strings
- *domain* - Active Directory authentication
- *nsswitch* - LDAP or NIS authentication
- *password* - Password
- *publickey* - Public-key authentication
- *usm* - SNMP user security model
- *saml* - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is *snmp* and authentication

method is *usm* (SNMP user security model).

-role <text> - Role Name

This specifies an access-control role name for the login method.

[-comment <text>] - Comment Text

This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.

[-is-ns-switch-group {yes|no}] - Whether Ns-switch Group

This specifies whether *user-or-group-name* is an LDAP or NIS group. Possible values are yes or no. Default value is no.

[-second-authentication-method {none|publickey|password|nsswitch|domain|totp}] - Second Authentication Method

This specifies the authentication method for the login. It will be used as the second factor for authentication. This parameter can be specified for *ssh*, *http* and *service-processor* applications only. For *ssh* application, possible values include the following:

- password - Password
- publickey - Public-key authentication
- nsswitch - NIS or LDAP authentication
- domain - Active Directory authentication
- totp - TOTP authentication
- none - default value

For the *http* and *service-processor* applications, possible values include the following:

- publickey - Public-key authentication
- none - default value

[-is-ldap-fastbind {yes|no}] - LDAP Fastbind Authentication

This flag specifies whether the authentication is LDAP fastbind or Not. Default:false

Examples

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, and the access-control role *guest* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
-application ssh -authentication-method password -role guest
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ontapi*, the authentication method *password*, and the access-control role *vsadmin* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
-application ontapi -authentication-method password -role vsadmin
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *publickey*, and the access-control role *guest* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
-application ssh -authentication-method publickey -role guest
```

The following example illustrates how to create a login that has the user name *monitor*, the application *http*, the authentication method *cert*, and the access-control role *admin* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
-application http -authentication-method cert -role admin
```

The following example illustrates how to create a login that has the Active Directory group name *adgroup* in *DOMAIN1*, the application *ssh*, the authentication method *domain*, and the access-control role *vsadmin* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com
-user-or-group-name DOMAIN1\adgroup -application ssh
-authentication-method domain -role vsadmin
```

The following example illustrates how to create a login that has a group name *nssgroup* in the LDAP or NIS server, the application *ontapi*, the authentication method *nsswitch*, and the access-control role *vsadmin* for Vserver *vs1.netapp.com*. Here *is-ns-switch-group* must be set to *yes*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name nssgroup
-application ontapi -authentication-method nsswitch -role vsadmin
-is-ns-switch-group yes
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, the second authentication method *publickey* and the access-control role *vsadmin* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
  -application ssh -authentication-method password
  -second-authentication-method publickey -role vsadmin
```

The following example illustrates how to create a login that has the user name *monitor*, the application *ssh*, the authentication method *password*, the second authentication method *none* and the access-control role *vsadmin* for Vserver *vs1.netapp.com*:

```
cluster1::> security login create -vserver vs1.netapp.com -user-or-group
-name monitor
  -application ssh -authentication-method password
  -second-authentication-method none -role vsadmin
```

The following example illustrates how to create a login that has the user name *spuser*, the application *service-processor*, the authentication method *password*, the second authentication method *publickey* and the access-control role *admin* for the Administrative Vserver *cluster1*:

```
cluster1::> security login create -vserver cluster1 -user-or-group-name
spuser
  -application service-processor -authentication-method password
  -second-authentication-method publickey -role admin
```

security login delete

Delete a login method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login delete` command deletes a login method.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name or Active Directory, LDAP, or NIS group name of the login method that is to be deleted. A user name can be associated with multiple applications.

-application <text> - Application

This specifies the application of the login method. Possible values include *amqp*, *console*, *http*, *ontapi*, *rsh*, *snmp*, *service-processor*, *ssh*, and *telnet*.

-authentication-method <text> - Authentication Method

This specifies the authentication method of the login method. Possible values include the following:

- `cert` - SSL certificate authentication
- `community` - SNMP community strings
- `domain` - Active Directory authentication
- `nsswitch` - LDAP or NIS authentication
- `password` - Password
- `publickey` - Public-key authentication
- `usm` - SNMP user security model
- `saml` - SAML authentication

[-remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is `snmp` and authentication method is `usm` (SNMP user security model).

Examples

The following example illustrates how to delete a login that has the username `guest`, the application `ssh`, and the authentication method `password` for Vserver `vs1.netapp.com`:

```
cluster1::> security login delete -user-or-group-name guest
          -application ssh -authentication-method password -vserver vs1.netapp.com
```

The following example illustrates how to delete a login that has the username `guest`, the application `ontapi`, and the authentication method `cert` for Vserver `vs1.netapp.com`:

```
cluster1::> security login delete -user-or-group-name guest
          -application ontapi -authentication-method cert -vserver vs1.netapp.com
```

The following example illustrates how to delete a login that has the Active Directory group name `adgroup` in `DOMAIN1`, the application `ssh`, and the authentication method `domain` for Vserver `vs1.netapp.com`:

```
cluster1::> security login delete -user-or-group-name DOMAIN1\adgroup
          -application ssh -authentication-method domain -vserver vs1.netapp.com
```

The following example illustrates how to delete a login that has a group name `nssgroup` in the LDAP or NIS server, the application `ontapi`, and the authentication method `nsswitch` for Vserver `vs1.netapp.com`:

```
cluster1::> security login delete -user-or-group-name nssgroup  
-application ontapi -authentication-method nsswitch -vserver  
vs1.netapp.com
```

The following example illustrates how to delete a login that has the username *spuser*, the application *service-processor*, the authentication method *password* and the second authentication method *publickey* for the Administrative Vserver *cluster1*:

```
cluster1::> security login delete -user-or-group-name spuser  
-application service-processor -authentication-method password -vserver  
cluster1
```

security login expire-password

Expire user's password

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login expire-password` command expires a specified user account password, forcing the user to change the password upon next login.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account whose password you want to expire.

[-hash-function {sha512|sha256}] - Password Hash Function

This optionally specifies the password-hashing algorithm used for encrypting the passwords that you want to expire. The supported values include are as follows:

- *sha512* - Secure hash algorithm (512 bits)
- *sha256* - Secure hash algorithm (256 bits)
- *md5* - Message digest algorithm (128 bits)

[-lock-after <integer>] - Lock User Account After N days (privilege: advanced)

This optionally specifies the number of days after which the new password hash policy will be enforced. The enforcement will lock all user accounts that are still compliant with the provided hash algorithm using `-hash-function` parameter.

Examples

The following command expires the password of the 'jdoe' user account which belongs to the 'vs1.netapp.com' Vserver.

```
cluster1::> security login expire-password -vserver vs1.netapp.com  
-username jdoe
```

The following command expires all user account passwords that are encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username * -hash  
-function md5
```

The following command expires the password of any Vserver's user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver * -username jdoe -hash  
-function md5
```

The following command expires the password of the 'vs1.netapp.com' Vserver user account named 'jdoe' that is encrypted with the MD5 hash function.

```
cluster1::> security login expire-password -vserver vs1.netapp.com  
-username jdoe -hash-function md5
```

The following command expires all user account passwords that are encrypted with the MD5 hash function and enforce the new password hash policy after 180 days.

```
cluster1::> security login expire-password -vserver * -username * -hash  
-function md5 -lock-after 180
```

security login lock

Lock a user account with password authentication method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login lock` command locks a specified account, preventing it from accessing the management interface. This command only applies to user accounts configured with the password authentication method where the password is set.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account that is to be locked.

Examples

The following example locks a user account named 'jdoe' which belongs to the Vserver 'vs1.netapp.com'.

```
cluster1::> security login lock -vserver vs1.netapp.com -username jdoe
```

security login modify

Modify a login method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login modify` command modifies the access-control role name of a login method. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver name of the login method.

-user-or-group-name <text> - User Name or Group Name

This specifies the user name, Active Directory, LDAP, or NIS group name of the login method that is to be modified. A user name can be associated with multiple applications. If the user is a member of multiple groups provisioned in the security login table, then the user will get access to a combined list of the commands authorized for the individual groups.

-application <text> - Application

This specifies the application of the login method. Possible values include `amqp`, `console`, `http`, `ontapi`, `rsh`, `snmp`, `service-processor`, `ssh`, and `telnet`.

-authentication-method <text> - Authentication Method

This specifies the authentication method of the login method. Possible values include the following:

- `cert` - SSL certificate authentication
- `community` - SNMP community strings
- `domain` - Active Directory authentication
- `nsswitch` - LDAP or NIS authentication

- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication

[`-remote-switch-ipaddress <IP Address>`] - Remote Switch IP Address

This specifies the IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is *snmp* and authentication method is *usm* (SNMP user security model).

[`-role <text>`] - Role Name

This modifies the access-control role name for the login method.

[`-comment <text>`] - Comment Text

This specifies comment text for the user account, for example, "Guest account". The maximum length is 128 characters.

[`-is-ns-switch-group {yes|no}`] - Whether Ns-switch Group

This specifies if *user-or-group-name* is an LDAP or NIS group. Possible values are yes or no. Default value is no.

[`-second-authentication-method {none|publickey|password|nsswitch|domain|totp}`] - Second Authentication Method

This specifies the authentication method for the login method. It will be used as the second factor for authentication. This parameter can be specified for *ssh*, *http* and *service-processor* applications. For *ssh* application, possible values include the following:

- password - Password
- publickey - Public-key authentication
- nsswitch - NIS or LDAP authentication
- domain - Active Directory authentication
- totp - TOTP authentication
- none - default value

For the *http* and *service-processor* applications, possible values include the following:

- publickey - Public-key authentication
- none - default value

[`-is-ldap-fastbind {yes|no}`] - LDAP Fastbind Authentication

This flag specifies whether modify is allowed or not when the authentication is LDAP fastbind.

Examples

The following example illustrates how to modify a login method that has the user name *guest*, the application *ontapi*, and the authentication method *password* to use the access-control role *guest* for Vserver *vs1.netapp.com*:

```
cluster1::> security login modify -user-or-group-name guest
          -application ontapi -authentication-method password -role guest
          -vserver vs1.netapp.com
```

The following example illustrates how to modify a login method that has the user name *guest* , the application *ssh* , and the authentication method *publickey* to use the access-control role *vsadmin* for Vserver *vs1.netapp.com* :

```
cluster1::> security login modify -user-or-group-name guest
          -application ssh -authentication-method publickey -role vsadmin
          -vserver vs1.netapp.com
```

The following example illustrates how to modify a login method that has the group name *nssgroup* , the application *ontapi* , and the authentication method *nsswitch* to use the access-control role *readonly* for Vserver *vs1.netapp.com* . Here *is-ns-switch-group* must be set to *yes* :

```
cluster1::> security login modify -user-or-group-name nssgroup
          -application ontapi -authentication-method nsswitch -role readonly
          -vserver vs1.netapp.com -is-ns-switch-group yes
```

The following example illustrates how to modify a login method that has the user name *guest* , the application *ssh* , and the authentication method *publickey* to use the second-authentication-method *password* for Vserver *vs1.netapp.com* :

```
cluster1::> security login modify -user-or-group-name guest
          -application ssh -authentication-method publickey
          -second-authentication-method password -vserver vs1.netapp.com
```

The following example illustrates how to modify a login method to have individual authentication methods that have the user name *guest* , the application *ssh* , and the authentication method *publickey* to use the second-authentication-method *none* for Vserver *vs1.netapp.com* :

```
cluster1::> security login modify -user-or-group-name guest
          -application ssh -authentication-method publickey
          -second-authentication-method none -vserver vs1.netapp.com
```

The following example illustrates how to modify a login method that has the user name *spuser* , the application *service-processor* , and the authentication method *password* to use the second-authentication-method *publickey* for the Administrative Vserver *cluster1* :

```
cluster1::> security login modify -user-or-group-name spuser  
-application service-processor -authentication-method password  
-second-authentication-method publickey -vserver cluster1
```

security login password-prepare-to-downgrade

Reset password features introduced in the Data ONTAP version

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

If the password of the system administrator is not encrypted with an encryption type supported by releases earlier than ONTAP 9.0, this command prompts the administrator for a new password and encrypt it using a supported encryption type on each cluster or at each site in a MetroCluster configuration. In a MetroCluster configuration, this command must be run on both sites. The password for all other users are marked as "expired". This causes them to be re-encrypted using a compatible encryption type. The expired passwords are changed with an internally generated password. The administrator must change the passwords for all users before the users can login. The users are prompted to change their password upon login. This command disables the logging of unsuccessful login attempts. The command must be run by a user with the cluster admin role from a clustershell session on the console device. This user must be unlocked. If you fail to run this command, the revert process fails.

Parameters

-disable-feature-set <downgrade version> - Data ONTAP Version (privilege: advanced)

This parameter specifies the ONTAP version that introduced the password feature set.

Examples

The following command disables the logging of unsuccessful login attempts.

```
cluster1::*> security login password prepare-to-downgrade -disable-feature  
-set 8.3.1
```

```
Warning: This command will disable the MOTD feature that prints  
unsuccessful login attempts.
```

```
Do you want to continue? {y|n}: y  
cluster1::*>
```

The following command prompts system administrator to enter password and encrypt it with the hashing algorithm supported by releases earlier than ONTAP 9.0.

```

cluster1::*> security login password prepare-to-downgrade -disable-feature
-set 9.0.0
Warning: If your password is not encrypted with an encryption type
supported by
            releases earlier than ONTAP 9.0.0, this command will
prompt you
            for a new password and encrypt it using a supported
encryption type on
            each cluster or at each site in a MetroCluster configuration. In a
MetroCluster configuration, this command must be run on both sites.
The password for all other users are marked as "expired" and
changed to an internally generated password. The administrator must
change
            the passwords for all users before the users can login. The users are
            prompted to change their password upon login.
            Do you want to continue? {y|n}:

            Enter a new password:
            Enter it again:

cluster1::*>

```

security login password

Modify a password for a user

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login password` command resets the password for a specified user. The command prompts you for the user's old and new password.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name of the login method.

-username <text> - Username

This optionally specifies the user name whose password is to be changed. If you do not specify a user, the command defaults to the user name you are currently using.

Examples

The following command initiates a password change for the 'admin' user account of the 'vs1.netapp.com' Vserver.

```
cluster1::> security login password -username admin -vserver  
vs1.netapp.com
```

security login show

Show user login methods

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login show` command displays the following information about user login methods:

- User name
- Application (amqp, console, http, ontapi, rsh, snmp, service-processor, ssh, or telnet)
- Authentication method (community, password, publickey, or usm)
- Role name
- Whether the account is locked
- Whether the user name refers to *nsswitch* group
- Password hash function
- LDAP fastbind authentication

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Displays the login methods that match the specified Vserver name.

[-user-or-group-name <text>] - User Name or Group Name

Displays the login methods that match this parameter value. Value can be a user name or Active Directory, LDAP, or NIS group name.

[-application <text>] - Application

Displays the login methods that match the specified application type. Possible values include amqp, console, http, ontapi, rsh, snmp, service-processor, ssh, and telnet.

[-authentication-method <text>] - Authentication Method

Displays the login methods that match the specified authentication method. Possible values include the following:

- cert - SSL certificate authentication
- community - SNMP community strings
- domain - Active Directory authentication
- nsswitch - LDAP or NIS authentication
- password - Password
- publickey - Public-key authentication
- usm - SNMP user security model
- saml - SAML authentication

[--remote-switch-ipaddress <IP Address>] - Remote Switch IP Address

Displays the login methods that match the specified IP address of the remote switch. The remote switch could be a cluster switch monitored by cluster switch health monitor (CSHM) or a Fibre Channel (FC) switch monitored by MetroCluster health monitor (MCC-HM). This parameter is applicable only when the application is *snmp* and authentication method is *usm* (SNMP user security model).

[--role <text>] - Role Name

Displays the login methods that match the specified role.

[--is-account-locked {yes|no}] - Account Locked

Displays the login methods that match the specified account lock status.

[--comment <text>] - Comment Text

Displays the login methods that match the specified comment text.

[--is-ns-switch-group {yes|no}] - Whether Ns-switch Group

This specifies whether *user-or-group-name* is an LDAP or NIS group. Possible values are yes or no.

[--hash-function {sha512|sha256}] - Password Hash Function (privilege: advanced)

Displays the login methods that match the specified password-hashing algorithm. Possible values are:

- *sha512* - Secure hash algorithm (512 bits)
- *sha256* - Secure hash algorithm (256 bits)
- *md5* - Message digest algorithm (128 bits)

[--second-authentication-method {none|publickey|password|nsswitch|domain|totp}] - Second Authentication Method

Displays the login methods that match the specified authentication method to be used as the second factor. Presently, *ssh*, *http* and *service-processor* are the only applications supporting a second factor of authentication. For *ssh* application, possible values include the following:

- password - Password
- publickey - Public-key authentication
- nsswitch - NIS or LDAP authentication
- domain - Active Directory authentication
- totp - TOTP authentication

- none - default value

For the *http* and *service-processor* applications, possible values include the following:

- publickey - Public-key authentication
- none - default value

`[-is-ldap-fastbind {yes|no}] - LDAP Fastbind Authentication`

Displays the authentication methods that are LDAP fastbind.

Examples

The example below illustrates how to display information about all user login methods:

```
cluster1::> security login show
```

```
Vserver: cluster1
```

User/Group Authentication		Authentication		Acct		Second
Name	Application	Method	Role Name	Locked	Method	
admin	amqp	password	admin	no	none	
admin	console	password	admin	no	none	
admin	http	password	admin	no	none	
admin	ontapi	password	admin	no	none	
admin	service-processor	password	admin	no	none	
admin	ssh	password	admin	no	none	
autosupport	console	password	autosupport	no	none	
user1	ssh	publickey	admin	-	none	
user2	ssh	password	admin	no	publickey	
spuser	service-processor	password	admin	no	publickey	

```
Vserver: vs1.netapp.com
```

User/Group Authentication		Authentication		Acct		Second
Name	Application	Method	Role Name	Locked	Method	
vsadmin	http	password	vsadmin	yes	none	
vsadmin	ontapi	password	vsadmin	yes	none	
vsadmin	ssh	password	vsadmin	yes	none	

```
12 entries were displayed.
```

security login unlock

Unlock a user account with password authentication method

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login unlock` command unlocks a specified account, enabling it to access the management interface. This command only applies to user accounts configured with the password authentication method where the password is set.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver to which the user account belongs.

-username <text> - Username

This specifies the user name of the account that is to be unlocked.

Examples

The following command unlocks a user account named jdoe which belongs to the Vserver vs1.netapp.com.

```
cluster1::> security login unlock -vserver vs1.netapp.com -username jdoe
```

security login whoami

Show the current user, trust score of the user and role of this session

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login whoami` command displays the name, role and the trust score of the user logged in at the current console session. It takes no options or other parameters.

Examples

The following example shows that the current session is logged in by using the 'admin' user account:

```
cluster1::> whoami
                (security login whoami)
User: admin
          Role: admin
          Trust Score: 90
```

security login banner modify

Modify the login banner message

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login banner modify` command modifies the login banner. The login banner is printed just before the authentication step during the SSH and console device login process.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver whose banner will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message. The cluster-level message is used as the default for data Vservers that do not have a message defined.

{ [-message <text>] - Login Banner Message

This optional parameter can be used to specify a login banner message. If the cluster has a login banner message set, the cluster login banner will be used by all data Vservers as well. Setting a data Vserver's login banner will override the display of the cluster login banner. To reset a data Vserver's login banner to use the cluster login banner, use this parameter with the value `"-"`.

If you use this parameter, the login banner cannot contain newlines (also known as end of lines (EOLs) or line breaks). To enter a login banner message with newlines, do not specify any parameter. You will be prompted to enter the message interactively. Messages entered interactively can contain newlines.

Non-ASCII characters must be provided as Unicode UTF-8.

[-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - Download URI for the Banner Message }

Use this parameter to specify the URI from where the login banner will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

Examples

This example shows how to enter a login banner interactively:

```
cluster1::> security login banner modify
Enter the login banner for Vserver "cluster1".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to
abort.
0          1          2          3          4          5          6          7
8
12345678901234567890123456789012345678901234567890123456789012345678901234
567890
Authorized users only!
cluster1::>
```

security login banner show

Display the login banner message

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login banner show` command displays the login banner.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects login banners that match the specified value. Use the name of the admin Vserver to specify the cluster-level login banner.

[-message <text>] - Login Banner Message

Selects login banners that match the specified value. By default, this command will not display unconfigured, or empty, login banners. To display all banners, specify `-message *`.

Examples

The following shows sample output from this command:

```
cluster1::> security login banner show
Message
-----
----
Authorized users only!
cluster1::>
```

security login domain-tunnel create

Add authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command establishes a gateway (tunnel) for authenticating Windows Active Directory (AD) domain users' access to the cluster.

Before using this command to establish the tunnel, the following must take place:

- You must use the [security login create](#) command to create one or more AD domain user accounts that will be granted access to the cluster.
- The `-authmethod` parameter of the [security login create](#) command must be set to 'domain'.
- The `-username` parameter of the [security login create](#) command must be set to a valid AD domain user account that is defined in a Windows Domain Controller's Active Directory. The user account must be specified in the format of `<domainname>\<username>`, where "domainname" is the name of the CIFS domain server.

- You must identify or create a CIFS-enabled data Vserver that will be used for Windows authentication with the Active Directory server. This Vserver is the tunnel Vserver, and it must be running for this command to succeed.

Only one Vserver can be used as the tunnel. If you attempt to specify more than one Vserver for the tunnel, ONTAP returns an error. If the tunnel Vserver is stopped or deleted, AD domain users' authentication requests to the cluster will fail.

Parameters

-vserver <vserver> - Authentication Tunnel Vserver

This parameter specifies a data Vserver that has been configured with CIFS. This Vserver will be used as the tunnel for authenticating AD domain users' access to the cluster.

Examples

The following commands create an Active Directory domain user account ('DOMAIN1\Administrator') for the 'cluster1' cluster, create a data Vserver ('vs'), create a CIFS server ('vscifs') for the Vserver, and specify 'vs' as the tunnel for authenticating the domain user access to the cluster.

```
cluster1::> security login create -vserver cluster1 -username
DOMAIN1\Administrator -application ssh -authmethod domain -role admin
cluster1::> vservers create -vserver vs -rootvolume vol -aggregate aggr
-rootvolume-security-style mixed
cluster1::> vservers cifs create -vserver vs -cifs-server vscifs
-domain companyname.example.com -ou CN=Computers
cluster1::> security login domain-tunnel create -vserver vs
```

security login domain-tunnel delete

Delete authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel delete` command deletes the tunnel established by the [security login domain-tunnel create](#) command. An error message will be generated if no tunnel exists.

Examples

The following command deletes the tunnel established by [security login domain-tunnel create](#) .

```
cluster1::> security login domain-tunnel delete
```

Related Links

- [security login domain-tunnel create](#)

security login domain-tunnel modify

Modify authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel modify` command modifies or replaces the tunnel Vserver. If a tunnel Vserver is not already specified, it sets the current tunnel Vserver with this Vserver, otherwise, it replaces the current tunnel Vserver with the Vserver that you specify. If the tunnel Vserver is changed, authentication requests via previous Vserver will fail. See [security login domain-tunnel create](#) for more information.

Parameters

[`-vserver <vserver>`] - Authentication Tunnel Vserver

This parameter specifies a Vserver that has been configured with CIFS and is associated with a Windows Domain Controller's Active Directory authentication. This Vserver will be used as an authentication tunnel for login accounts so that they can be used with administrative Vservers.

Examples

The following command modifies the tunnel Vserver for administrative Vserver.

```
cluster1::> security login domain-tunnel modify -vserver vs
```

Related Links

- [security login domain-tunnel create](#)

security login domain-tunnel show

Show authentication tunnel Vserver for administrative Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login domain-tunnel show` command shows the tunnel Vserver that was specified by the [security login domain-tunnel create](#) or [security login domain-tunnel modify](#) command.

Examples

The example below shows the tunnel Vserver, `vs`, that is currently used as an authentication tunnel. The output informs you that the table is currently empty if tunnel Vserver has not been specified.

```
cluster1::> security login domain-tunnel show
Tunnel Vserver: vs
```

security login duo create

Add a Duo Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo create` creates the Duo configuration on the Vserver.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver name of the Duo configurations.

[-is-enabled {true|false}] - Duo Enable Status

This parameter enable the Duo authentication.

-integration-key <text> - Duo Intgration Key

This parameter specifies Duo integration key.

-secret-key <text> - Duo Secret Key

This parameter specifies Duo secret key.

-apihost <text> - Duo API Host

This parameter specifies the Duo API host.

[-autopush {true|false}] - Duo Auto Push Config

This optionally specifies the autopush configurations. Configuring this to true will allows user to authenticate with single tap on their mobile device.

[-pushinfo {true|false}] - Information with Push

This parameter specifies the push info configurations. Configuring this to true will provide additional information in the push notification, such as the name of the application. This helps users to verify that they are logging in to the correct service and provides an additional layer of security

[-fail-mode {safe|secure}] - Duo Fail Safe Config

This parameter specifies the fail mode configurations. Possible values includes safe and secure.

[-http-proxy <text>] - HTTP Proxy URL with Port Number

This parameter specifies the http proxy configurations.

[-max-prompts <integer>] - Duo Max Attempts

This parameter specifies the number of retry before Duo authentication return failure.

[-comment <text>] - Comment

This optionally specifies comment text for the Duo configuration. Note that comment text should be enclosed in quotation marks.

Examples

The following command creates a Duo configurations for Vserver vs1.

```
cluster1::> security login duo create -vserver vs1 -integration-key
AA11A1AAAA1AAAA11A1A -secret-key
xxxxxxxxxx11111111117bd5a3b060947b617355ecf353627c50b1xxxxxxxxxx -apihost
api-99X9X9XX.duosecurity.com
-comment "This is a Duo Config"
```

security login duo delete

Delete a Duo Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo delete` command deletes the Duo configuration.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver name of the Duo configurations.

Examples

The following command deletes the Duo configurations of the Vserver vs1.

```
cluster1::> security login duo delete -vserver vs1
```

security login duo modify

Modify a Duo Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo modify` modifies the Duo configuration.

Parameters

-vserver <vserver name> - Vserver

This parameter specifies the Vserver name of the Duo configurations.

[-is-enabled {true|false}] - Duo Enable Status

This parameter enable the Duo authentication.

[-integration-key <text>] - Duo Integration Key

This parameter specifies Duo integration key.

[-secret-key <text>] - Duo Secret Key

This parameter specifies Duo secret key.

[-apihost <text>] - Duo API Host

This parameter specifies the Duo API host.

[-autopush {true|false}] - Duo Auto Push Config

This optionally specifies the autopush configurations. Configuring this to true will allow user to authenticate with single tap on their mobile device.

[-pushinfo {true|false}] - Information with Push

This parameter specifies the push info configurations. Configuring this to true will provide additional information in the push notification, such as the name of the application. This helps users to verify that they are logging in to the correct service and provides an additional layer of security.

[-fail-mode {safe|secure}] - Duo Fail Safe Config

This parameter specifies the fail mode configurations. Possible values include safe and secure.

[-http-proxy <text>] - HTTP Proxy URL with Port Number

This parameter specifies the http proxy configurations.

[-max-prompts <integer>] - Duo Max Attempts

This parameter specifies the number of retry before Duo authentication return failure.

[-comment <text>] - Comment

This parameter specifies comment text for the Duo. Note that comment text should be enclosed in quotation marks.

Examples

The following command modify the Duo configurations for the Vserver vs1.

```
cluster1::> security login duo modify -vserver vs1 -is-enabled false
```

security login duo show

Display Duo Configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo show` command displays information about the Duo configurations.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the Duo configuration Vserver that match this parameter value.

[-is-enabled {true|false}] - Duo Enable Status

Selects the Duo Configurations that match this parameter value.

[-integration-key <text>] - Duo Integration Key

Selects the Duo Configurations that match this parameter value.

[-fingerprint <text>] - Duo Secret Key Fingerprint

Selects the Duo Configurations that match this parameter value.

[-apihost <text>] - Duo API Host

Selects the Duo Configurations that match this parameter value.

[-autopush {true|false}] - Duo Auto Push Config

Selects the Duo Configurations that match this parameter value.

[-pushinfo {true|false}] - Information with Push

Selects the Duo Configurations that match this parameter value.

[-fail-mode {safe|secure}] - Duo Fail Safe Config

Selects the Duo Configurations that match this parameter value.

[-http-proxy <text>] - HTTP Proxy URL with Port Number

Selects the Duo Configurations that match this parameter value.

[-max-prompts <integer>] - Duo Max Attempts

Selects the Duo Configurations that match this parameter value.

[-status <text>] - Duo Status

Selects the Duo Configurations that match this parameter value.

[-comment <text>] - Comment

Selects the Duo Configurations that match this parameter value.

Examples

The example below displays the Duo information for the Vserver VS1.

```
cluster1::> security login duo show
      Vserver: VS1
      Enabled: true
      Status: OK
      Integration Key: AA11A1AAAA1AAAA11A1A
      SHA Fingerprint:
      xxxxxxxxxxxx1111111117bd5a3b060947b617355ecf353627c50b1xxxxxxxxxx
      API Host: api-xxxxxxx.duosecurity.com
      Autopush: true
      Push info: true

```

security login duo group create

Add a Duo Group Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo group create` creates the groups that need to be included in Duo authentication.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the Duo group that is being created.

-group-name <text> - Group Name

This parameter specifies the name of the group that will be part of Duo authentication.

[-excluded-users <text>, ...] - List of Excluded Users

This parameter optionally specifies the list of users that will be excluded from Duo authentication.

`[-comment <text>]` - Comment

This parameter optionally specifies the comments

Examples

The following command creates a group "test" on vservers "VS1" and exclude the user tsmith from Duo authentication.

```
cluster1::> security login duo group create -vservers vs1 -group-name vs1
-exclude-users tsmith
```

security login duo group delete

Delete a Duo Group Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo group delete` command deletes the specified group.

Parameters

`-vservers <vservers name>` - Vservers

This parameter optionally specifies the Vserver of the Duo group that is being deleted.

`-group-name <text>` - Group Name

This parameter optionally specifies the group name that is being deleted.

Examples

The following command deletes the group "test" from the Vserver "vs1".

```
cluster1::> security login duo group delete -vservers vs1 -group-name test
```

security login duo group modify

Modify a Duo Group Configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo group modify` command modifies the Duo groups.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the group for which the 'exclude-users' or 'comment' is being modified.

-group-name <text> - Group Name

This parameter specifies the name of the group for which the 'exclude-users' or 'comment' is being modified.

[-excluded-users <text>,...] - List of Excluded Users

This parameter specifies the list of users to be excluded from Duo authentication.

[-comment <text>] - Comment

This parameter specifies the comments.

Examples

The following command modifies the excluded users for the group test who is part of Vserver vs1.

```
cluster1::> security login duo group modify -vserver vs1 -group-name test
-exclude-users tsmith, jane
```

security login duo group show**Display Duo Group Configurations**

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login duo group show` command displays information about Duo groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the Vserver that match this parameter value.

[-group-name <text>] - Group Name

Selects the groups that match this parameter value.

[-excluded-users <text>,...] - List of Excluded Users

Selects the excluded users that match this parameter value.

`[-comment <text>]` - Comment

Selects the comments that match this parameter value.

Examples

The example below displays group information for the Vserver vs1.

```
cluster1::> security login duo group show -vserver vs1
Vserver: vs1
Group Name: NETAPP_ENG
Excluded Users: user1, user2, user12
Comment: This is a new group
```

security login external-role-mapping create

Add a external role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates a mapping between an external IDP (Identity Provider) role and an ONTAP role. This allows the system to authorize users based on their roles in the external IDP.

Parameters

`-external-role <text>` - External Role Name

The role name coming from the external IDP. This should match the role name as defined in the IDP, for which the external role mapping is being created. For example, 'Administrator'.

`-provider {basic|keycloak|auth0|adfs|entra}` - Provider Type

The name of the IDP provider. This should be the identifier for the IDP system. For example, 'entra'.

`-ontap-role <text>` - Ontap Role Name

The name of the ONTAP role that the external role should map to. This should be a role defined within ONTAP. For example, 'admin'.

`[-comment <text>]` - Comment

This parameter optionally specifies any comments or notes related to the external role mapping. This can be used to provide additional context or explanation for the mapping.

Examples

This command creates an external role mapping for the external role "Administrator" from the IDP provider "entra" to the ONTAP role "admin". The comment 'External role mapping' provides additional context for this mapping.

```
cluster1::> security login external-role-mapping create -external-role
Administrator -provider entra -ontap-role admin -comment "External role
mapping"
```

security login external-role-mapping delete

Delete a external role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command deletes an external role mapping.

Parameters

-external-role <text> - External Role Name

This parameter specifies the name of the external role to be deleted.

-provider {basic|keycloak|auth0|adfs|entra} - Provider Type

The IDP (Identity Provider) type of the external role to be deleted.

Examples

This command deletes an external role mapping named 'Administrator' from the IDP 'entra'.

```
cluster1::> security login external-role-mapping delete -external-role
Administrator -provider entra
```

security login external-role-mapping modify

Modify a external role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command modifies a configured mapping between an external IDP (Identity Provider) role and an ONTAP role.

Parameters

-external-role <text> - External Role Name

Identifies the external role mapping that is being modified.

-provider {basic|keycloak|auth0|adfs|entra} - Provider Type

Identifies the IDP provider associated with the external role mapping being modified.

`[-ontap-role <text>]` - Ontap Role Name

The new ONTAP role to which the external role should be mapped. This should be a role defined within ONTAP. For example 'admin'.

`[-comment <text>]` - Comment

Optionally, new comments or notes related to the external role mapping can be specified here.

Examples

This command modifies an external role mapping for the external role "Administrator" from the IDP provider "entra" to the ONTAP role "readonly". The comment 'Modified role mapping' provides additional context for this mapping.

```
cluster1::> security login external-role-mapping modify -external-role
Administrator -provider entra -ontap-role readonly -comment "Modified role
mapping"
```

security login external-role-mapping show

Display the external role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the configured mapping between an external IDP (Identity Provider) role and an ONTAP role.

Parameters

`{ [-fields <fieldname>, ...]`

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

`[-instance ]`

If you specify the `-instance` parameter, the command displays detailed information about all fields.

`[-external-role <text>]` - External Role Name

Selects the external role mapping associated with the name that matches this parameter value.

`[-provider {basic|keycloak|auth0|adfs|entra}]` - Provider Type

Selects the external role mapping associated with the provider that matches this parameter value.

`[-ontap-role <text>]` - Ontap Role Name

Selects the external role mapping associated with the ONTAP role that matches this parameter value.

`[-comment <text>]` - Comment

Selects the external role mapping associated with the comment that matches this parameter value.

[*-created* <MM/DD/YYYY HH:MM:SS>] - Create Timestamp

Selects the external role mapping associated with the created time that matches this parameter value.

Examples

The example below displays information about the external role mapping for the role 'Administrator' from the IDP 'entra'.

```
cluster1::> security login external-rolmapping show -external-role
Testing -provider entra
External Role Name      Provider Type      Ontap Role Name      Comment
-----
Administrator          entra              Custom_role          -
```

security login group create

Add a group configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command creates a user group for the login method. A group can only be created with the type *entra*.

Parameters

***-vserver* <vserver name> - Vserver**

This parameter optionally specifies the Vserver with which the group is associated. If this parameter is specified, the group is associated with that specific Vserver. If not specified, the group is associated with the cluster.

***-name* <text> - Group Name**

The name of the group.

***-type* <entra> - Group Type**

This parameter specifies the IDP the group originates from.

[*-uuid* <UUID>] - Group UUID

Specifies the universally unique identifier of the group.

[*-comment* <text>] - Comment

This parameter optionally specifies any comments or notes related to the group.

Examples

This command creates a group named 'Eng_group' for the Vserver 'ontapcluster-1', with the specified UUID and a comment indicating it's an 'Engineering Group'.

```
cluster1::> security login group create -vserver ontapcluster-1 -name  
Eng_group -type entra -uuid 2ef26315-b95e-4778-9944-cf9e7b945d3d -comment  
"Engineering Group"
```

security login group delete

Delete a group configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command deletes a group.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the group. If this parameter is specified, the group deletion applies to that specific Vserver only. If not specified, the cluster Vserver setting is used.

-name <text> - Group Name

The name of the group.

-type <entra> - Group Type

This parameter specifies the IDP the group originates from.

Examples

This command deletes a group named 'Eng_group' for the Vserver 'ontapcluster-1', with the type 'entra'.

```
cluster1::> security login group delete -name Eng_group -type entra  
-vserver ontapcluster-1
```

security login group modify

Modify a group configuration

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies a user group for the login method.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver with which the group is associated.

-name <text> - Group Name

The name of the group.

-type <entra> - Group Type

This parameter specifies the IDP the group originates from.

[-uuid <UUID>] - Group UUID

Specifies the universally unique identifier of the group.

[-comment <text>] - Comment

This parameter optionally specifies any comments or notes related to the group.

Examples

This command modifies the UUID of the group 'Eng_group' on the Vserver 'ontapcluster-1'.

```
cluster1::> security login group modify -vserver ontapcluster-1 -name  
Eng_group -type entra -uuid 2ef26315-1234-4778-9944-cf9e7b945d3d
```

security login group show

Display group configurations

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the configured groups.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the groups associated with the Vserver that matches this parameter value.

[-name <text>] - Group Name

Selects the groups associated with the name that matches this parameter value.

[-type <entra>] - Group Type

Selects the groups associated with the type that matches this parameter value.

[-id <integer>] - Group ID

Selects the groups associated with the group id that matches this parameter value.

[-uuid <UUID>] - Group UUID

Selects the groups associated with the uuid that matches this parameter value.

[-created <MM/DD/YYYY HH:MM:SS>] - Create Timestamp

Selects the groups associated with the created time that matches this parameter value.

[-comment <text>] - Comment

Selects the groups associated with the comment that matches this parameter value.

[-scope {svm|cluster}] - Cluster or SVM

Selects the groups associated with the scope that matches this parameter value.

Examples

The example below displays the "Eng_group" group information of the Vserver VS1.

```
cluster1::> security login group show -name Eng_group -vserver VS1
      Vserver: VS1
      Group Name: Eng_group
      Group ID: 10
      Group Type: entra
      Comment: Engineering Group
```

security login group role-mapping create**Add a role mapping**

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates a mapping between a group and a role.

Parameters**-group-id <integer> - Group ID**

The group ID for which the role mapping is being created. The group ID can be obtained by executing the command 'security login group show'.

-role <text> - Role Name

The name of the role to which the group is being mapped.

[-comment <text>] - Comment

This parameter optionally specifies any comments or notes related to the group to role mapping.

Examples

This command creates a role mapping for the group ID "1" to the role "admin" and a comment indicating it's 'Group of admins'.

```
cluster1::> security login group role-mapping create -group-id 1 -role
admin -comment "Group of admins"
```

security login group role-mapping delete

Delete a role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command deletes a mapping between a group and a role.

Parameters

-group-id <integer> - Group ID

The group ID of the group-role mapping to delete.

-role <text> - Role Name

The role name of the group-role mapping to delete.

Examples

This command deletes a group to role mapping for the group-id 1 and the role "admin".

```
cluster1::> security login group role-mapping delete -group-id 1 -role
admin
```

security login group role-mapping modify

Modify a role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command creates a mapping between a group and a role.

Parameters

-group-id <integer> - Group ID

The group ID for which the role mapping is being modified. The group ID can be obtained by executing the command 'security login group show'.

-role <text> - Role Name

The name of the role to which the group is being mapped.

[-comment <text>] - Comment

This parameter optionally specifies any comments or notes related to the group to role mapping.

Examples

This command modifies the comment of the role mapping for the group ID "1" and role "admin" to a comment indicating it's 'Group of admins'.

```
cluster1::> security login group role-mapping modify -group-id 1 -role
admin -comment "Group of admins"
```

security login group role-mapping show

Display the role mapping

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays the configured group to role mappings.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-group-id <integer>] - Group ID

Selects the group role mapping associated with the group ID that matches this parameter value.

[-role <text>] - Role Name

Selects the group role mapping associated with the role name that matches this parameter value.

[-comment <text>] - Comment

Selects the group role mapping associated with the comment that matches this parameter value.

[-scope {svm|cluster}] - Cluster or SVM

Selects the group role mapping associated with the scope that matches this parameter value.

Examples

The example below displays the group to role mapping for the group ID 1 and the role "admin".

```
cluster1::> security login group role-mapping show -group-id 1 -role admin
          Group ID: 1
          Role Name: admin
          Comment: -
          Cluster or SVM: cluster
```

security login motd modify

Modify the message of the day

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login motd modify` command updates the message of the day (MOTD).

There are two categories of MOTDs: the cluster-level MOTD and the data Vserver-level MOTD. A user logging in to a data Vserver's cluster shell will potentially see two messages: the cluster-level MOTD followed by the Vserver-level MOTD for that Vserver. The cluster administrator can enable or disable the cluster-level MOTD on a per-Vserver basis. If the cluster administrator disables the cluster-level MOTD for a Vserver, a user logging into the Vserver will not see the cluster-level message. Only a cluster administrator can enable or disable the cluster-level message.

Parameters

-vserver <Vserver Name> - Vserver Name

Use this parameter to specify the Vserver whose MOTD will be modified. Use the name of the cluster admin Vserver to modify the cluster-level message.

{ [-message <text>] - Message of the Day (MOTD)

This optional parameter can be used to specify a message. If you use this parameter, the MOTD cannot contain newlines (also known as end of lines (EOLs) or line breaks). If you do not specify any parameter other than the `-vserver` parameter, you will be prompted to enter the message interactively. Messages entered interactively can contain newlines. Non-ASCII characters must be provided as Unicode UTF-8.

The message may contain dynamically generated content using the following escape sequences:

- `\` - A single backslash character.
- `\b` - No output: supported for compatibility with Linux only.
- `\C` - Cluster name.
- `\d` - Current date as set on the login node.
- `\t` - Current time as set on the login node.
- `\I` - Incoming LIF IP address (prints 'console' for a console login).
- `\l` - Login device name (prints 'console' for a console login).
- `\L` - Last login for the user on any node in the cluster.

- `\m` - Machine architecture.
- `\n` - Node or data Vserver name.
- `\N` - Name of user logging in.
- `\o` - Same as `\O`. Provided for Linux compatibility.
- `\O` - DNS domain name of the node. Note that the output is dependent on the network configuration and may be empty.
- `\r` - Software release number.
- `\s` - Operating system name.
- `\u` - Number of active clustershell sessions on the local node. For the cluster admin: all clustershell users. For the data Vserver admin: only active sessions for that data Vserver.
- `\U` - Same as `\u`, but has 'user' or 'users' appended.
- `\v` - Effective cluster version string.
- `\W` - Active sessions across the cluster for the user logging in ('who').

A backslash followed by any other character is emitted as entered.

| [-uri {scheme: //(hostname|IPv4 Address| ' 'IPv6 Address' ') ...}] - Download URI for the MOTD }

Use this parameter to specify the URI from where the message of the day will be downloaded. Note that the message must not exceed 2048 bytes in length. Non-ASCII characters must be provided as Unicode UTF-8.

[-is-cluster-message-enabled {true|false}] - Is Cluster-level Message Enabled?

Use this parameter to enable or disable the display of the cluster-level MOTD for the specified Vserver.

Examples

This example shows how to enter a MOTD interactively:

```
cluster1::> security login motd modify -vserver vs0

Enter the message of the day for Vserver "vs0".
Max size: 2048. Enter a blank line to terminate input. Press Ctrl-C to
abort.
0          1          2          3          4          5          6          7
8
1234567890123456789012345678901234567890123456789012345678901234
567890
Welcome to the Vserver!
cluster1::>
```

security login motd show

Display the message of the day

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login motd show` command displays information about the cluster-level and data Vserver clustershell message of the day (MOTD).

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver Name

Selects the message of the day entries that match this parameter value. Use the name of the cluster admin Vserver to see the cluster-level MOTD.

[-message <text>] - Message of the Day (MOTD)

Selects the message of the day entries that match this parameter value.

[-is-cluster-message-enabled {true|false}] - Is Cluster-level Message Enabled?

Selects the message of the day entries that match this parameter value.

Examples

The following example displays all message of the day entries:

```

cluster1::> security login motd show
Vserver: cluster1
Is the Cluster MOTD Displayed?: true
Message
-----
----
The cluster is running normally.

Vserver: vs0
Is the Cluster MOTD Displayed?: true
Message
-----
----
Welcome to the Vserver!

2 entries were displayed.

```

security login publickey create

Add a new public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey create` associates an existing public key with a user account. This command requires that you enter a valid OpenSSH-formatted public key, a user name, index number, and optionally, a comment and a certificate.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

-username <text> - Username

This parameter specifies the name of the user for whom you are adding the public key. If you do not specify a user, the user named `admin` is specified by default.

[-application <text>] - Application

This parameter optionally specifies the application for which you are adding the public key. Presently, the only supported values are `ssh` and `service-processor`. The default value for this parameter is `ssh`.

[-index <integer>] - Index

This parameter specifies an index number for the public key. The default value is the next available index value, starting with zero if it is the first public key created for the user.

-publickey <certificate> - Public Key

This specifies the OpenSSH public key, which must be enclosed in double quotation marks.

[-comment <text>] - Comment

This optionally specifies comment text for the public key. Note that comment text should be enclosed in quotation marks.

[-x509-certificate <text>] - Install/Modify/Delete X509 Certificate

If this parameter is used, the specified certificate will be installed. The default when the public key is created is no certificate.

Examples

The following command associates a public key with a user named tsmith for Vserver vs1. The public key is assigned index number 5 and the comment text is "This is a new key". Optionally, we can also specify the certificate.

```
cluster1::> security login publickey create -vserver vs1 -username tsmith
-index 5 -publickey
"ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAspH64CYbUsDQCdW22JnK6J
/vU9upnKzd2zAk9C1f7YaWRUAFNs2Qe5lUmQ3ldi8AD0Vfbr5T6HZPCixNAIza
FciDy7hgnmdj9eNGedGr/JNrftQbLD1hZybX+72DpQB0tYWBhe6eDJ1oPLob
ZBGfMlPXh8VjeU44i7W4+s0hG0E=tsmith@publickey.example.com"
-comment "This is a new key"
-x509-certificate install
Enter certificate: Press <Enter> when done
-----BEGIN CERTIFICATE-----
MIIBYTCB56ADAgECAhQybXS4lSL99APGRPqaGTy7CGUICzAKBggqhkJOPQQDAjAS

-----END CERTIFICATE-----
```

The following command associates a public key with a 'service-processor' user named 'joed' for the Administrative Vserver. The public key is assigned index number 1 and the comment text is "This is a new publickey". In this case, the certificate has not been specified.

```
cluster1::> security login publickey create -username joed -application
service-processor -index 1 -publickey
"ecdsa-sha2-nistp256
AAAAE2VjZHNhLXNoYTItbmlzdHAyNTYAAAAIbmlzdHAyNTYAAABBBFgMRmKHV2+sGDPMD8JdMR

-comment "This is a new publickey"
```

security login publickey delete

Delete a public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey delete` command deletes a public key for a specific user. To delete a public key, you must specify a user name and index number.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the public key.

-username <text> - Username

This parameter specifies the name of the user for whom you are deleting a public key. If you do not specify a user, the user named `admin` is specified by default.

-application <text> - Application

This parameter optionally specifies the application for which you are deleting the public key. Presently, the only supported values are `ssh` and `service-processor`. The default value for this parameter is `ssh`.

-index <integer> - Index

This parameter specifies an index number for the public key.

Examples

The following command deletes the public key for the user named `tsmith` with the index number 5 along with the certificate if it was installed.

```
cluster1::> security login publickey delete -username tsmith -application
ssh -index 5
```

The following command deletes the public key at the index number 2 for the 'service-processor' user named 'joed'.

```
cluster1::> security login publickey delete -vserver cluster1 -username
joed -application service-processor -index 2
```

security login publickey load-from-uri

Load one or more public keys from a URI

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey load-from-uri` command loads one or more public keys from a Universal Resource Identifier (URI). To load public keys from a URI, you must specify a user name, the URI from which to load them, and optionally, whether you want to overwrite the existing public keys.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver for the user associated with the public keys.

-username <text> - Username

This parameter specifies the username for the public keys. If you do not specify a username, the username *"admin"* is used by default.

-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')} - URI to load from

This parameter specifies the URI from which the public keys will be loaded.

-overwrite {true|false} - Overwrite Entries

This parameter optionally specifies whether you want to overwrite existing public keys. The default value for this parameter is *false*. If the value is *true* and you confirm to overwrite, then the existing public keys are overwritten with the new public keys. If you use the value *false* or do not confirm the overwrite, then newly loaded public keys are appended to the list of existing public keys using the next available index.

Examples

The following command shows how to load public keys for the user named tsmith from the URI <ftp://ftp.example.com/identity.pub>. This user's existing public keys are not overwritten.

```
cluster1::> security login publickey load-from-uri -username tsmith
-uri ftp://ftp.example.com/identity.pub -overwrite false
```

The following command shows how to load public keys for the user named tsmith from the URI <ftp://ftp.example.com/identity.pub>. This user's existing public keys are overwritten if user entered the option 'y' or 'Y'. The user's existing public keys are not overwritten if user entered the option 'n' or 'N' and the newly loaded public keys are appended to the list of existing public keys using the next available index. The user and password credentials that you provide when you use this command are the credentials to access the server specified by the URI.

```
cluster1::> security login publickey load-from-uri -username  
    tsmith -uri ftp://ftp.example.com/identity.pub -overwrite true -vserver  
vs0
```

Enter User:

Enter Password:

Warning: You are about to overwrite the existing publickeys for the user
"tsmith" in Vserver "vs0". Do you want to proceed? {y|n}:

security login publickey modify

Modify a public key

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey modify` command modifies a public key and optionally its comment text and certificate.

Parameters

-vserver <vserver name> - Vserver

Specifies the Vserver for the user associated with the public key.

-username <text> - Username

Specifies the username for the public key. If you do not specify a username, the username 'admin' is used by default.

-application <text> - Application

Optionally specifies the application for which you are modifying the public key. Presently, the only supported values are *ssh* and *service-processor*. The default value for this parameter is *ssh*.

-index <integer> - Index

Specifies the index number of the public key. The index number of the public key can be found by using the [security login publickey show](#) command.

[-publickey <certificate>] - Public Key

Specifies the new public key. You must enclose the new public key in double quotation marks.

[-comment <text>] - Comment

Specifies the new comment text for the public key.

[-x509-certificate <text>] - Install/Modify/Delete X509 Certificate

This parameter is used to modify or delete an existing certificate.

Examples

The following command modifies the public key and certificate at index number 10 for the SSH user named tsmith of Vserver vs1.

```
cluster1::> security login publickey modify -vserver vs1 -username tsmith
-index 10 -publickey
"ssh-rsa

security login publickey show

Display public keys

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login publickey show` command displays information about public keys.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the public keys that match this parameter value.

[-username <text>] - Username

Selects the public keys that match this parameter value.

[-application <text>] - Application

Selects the public keys that match this parameter value.

[-index <integer>] - Index

Selects the public keys that match this parameter value.

[-publickey <certificate>] - Public Key

Selects the public keys that match this parameter value.

[-fingerprint <text>] - Hex Fingerprint

Selects the public keys that match this parameter value.

[-bubblebabble <text>] - Bubblebabble Fingerprint

Selects the public keys that match this parameter value.

[-comment <text>] - Comment

Selects the public keys that match this parameter value.

[-certificate <certificate>] - Certificate Associated with Public Key

Selects the public keys that match this parameter value.

[-certificate-details <text>] - Details about the Certificate

Selects the public keys that match this parameter value.

`[-certificate-expired <text>]` - Expiry Status of Certificate

Selects the public keys that match this parameter value.

`[-certificate-revoked <text>]` - Revocation Status of Certificate

Selects the public keys that match this parameter value.

Examples

The example below displays public key information for the user named tsmith.

```

cluster1::> security login publickey show -username tsmith
Vserver: vs1
UserName: tsmith Index: 5
Public Key:
ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAIEAAspH64CYbUsDQCdW22JnK6J

security login rest-role create

Add a REST access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role create` command creates a Representational State Transfer (REST) access-control role. A REST access-control role consists of a role name and an Application Programming Interface (API) to which the role has access. It optionally includes an access level (*none*, *readonly*, *read_create*, *read_modify*, *read_create_modify* or *all*) for the API. After you create a REST access-control role, you can apply it to a management-utility login account by using the [security login modify](#) or [security login create](#) commands.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name associated with the REST role.

-role <text> - Role Name

This specifies the REST role that is to be created.

-api <text> - API Path

This specifies the API to which the REST role has access. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
 - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
 - `/api/storage/volumes/{volume.uuid}/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/users`
- SVM Analytics APIs
 - `/api/svm/svms/{svm.uuid}/top-metrics/clients`
 - `/api/svm/svms/{svm.uuid}/top-metrics/directories`
 - `/api/svm/svms/{svm.uuid}/top-metrics/files`
 - `/api/svm/svms/{svm.uuid}/top-metrics/users`
- ONTAP S3 APIs
 - `/api/protocols/s3/services/{svm.uuid}/users`

In the APIs above, and in the context of REST roles, the wildcard character `*` can be used in place of `{volume.uuid}` or `{svm.uuid}` to represent *all* volumes or *all* SVMs, depending on whether the REST endpoint references volumes or SVMs. The `{volume.uuid}` corresponds to the `-instance-uuid` field in the output of the [volume show](#) command at the *diagnostic* privilege level. It can also be retrieved through the REST endpoint `/api/storage/volumes`.

`-access {none|readonly|read_create|read_modify|read_create_modify|all}` - Access Level

This optionally specifies an access level for the REST role. Possible access level settings are *none*, *readonly*, *read_create*, *read_modify*, *read_create_modify* and *all*.

Examples

The following command creates a REST access-control role named *admin* for the *vs1.example.com* Vserver. This REST role has an access-level of *all* for the `/api/storage/volumes` API.

```
cluster1::> security login rest-role create -role admin -api
"/api/storage/volumes" -access all -vserver vs1.example.com
cluster1::>
```

The following command creates a REST access-control role named *rest_role1* for the *cluster1.example.com* administrative Vserver. This REST role has an access-level of *read_create_modify* for the `/api/snapmirror/policies` API.

```
cluster1::> security login rest-role create -role rest_role1 -api
"/api/snapmirror/policies" -access read_create_modify -vserver
cluster1.example.com
cluster1::>
```

The following command creates a REST access-control role named *vs1_role* for the *vs1.example.com* Vserver. This REST role has an access level of *readonly* for all snapshots on the volume with UUID *f8a541b5-b68c-11ea-9581-005056bbabe6*. The volume UUID refers to the *-instance-uuid* field value in the [volume show](#) command output at diagnostic privilege level.

```
cluster1::> security login rest-role create -role vs1_role -api
"/api/storage/volumes/f8a541b5-b68c-11ea-9581-005056bbabe6/snapshots"
-access readonly -vserver vs1.example.com
Warning: Operating on an alias operates on the target of the specified
alias:
        "volume snapshot"
cluster1::>
```

The following command creates a REST access-control role named *vs2_role* for the *vs2.example.com* Vserver. This REST role has an access level of *readonly* for all files on the volume with UUID *15d489b5-1d40-11ec-992e-005056bba268*. The volume UUID refers to the *-instance-uuid* field value in the [volume show](#) command output at diagnostic privilege level.

```
cluster1::> security login rest-role create -role vs2_role -api
"/api/storage/volumes/15d489b5-1d40-11ec-992e-005056bba268/files" -access
readonly -vserver vs2.example.com
cluster1::>
```

The following command creates a REST access-control role named *vs3_role* for the *vs3.example.com* Vserver. This REST role has an access level of *read_create_modify* for all top-metrics directories on the SVM with UUID *881764b5-9ea1-11ec-8771-005056bb1a7c*.

```
cluster1::> security login rest-role create -role vs3_role -api
"/api/svm/svms/881764b5-9ea1-11ec-8771-005056bb1a7c/top-
metrics/directories" -access read_create_modify -vserver vs3.example.com
cluster1::>
```

The following command creates a REST access-control role named *vs4_role* for the *vs4.example.com* Vserver. This REST role has an access level of *all* for command directory *cluster*.

```
cluster1::> security login rest-role create -role vs4_role -api  
"/api/private/cli/cluster" -access all -vserver vs4.example.com  
cluster1::>
```

security login rest-role delete

Delete a REST access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role delete` command deletes a Representational State Transfer (REST) access-control role.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name associated with the REST role.

-role <text> - Role Name

This specifies the REST role that is to be deleted.

-api <text> - API Path

This specifies the Application Programming Interface (API) to which the REST role has access. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
 - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
 - `/api/storage/volumes/{volume.uuid}/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/users`
 - `/api/svm/svms/{svm.uuid}/top-metrics/clients`
 - `/api/svm/svms/{svm.uuid}/top-metrics/directories`

- `/api/svm/svms/{svm.uuid}/top-metrics/files`
- `/api/svm/svms/{svm.uuid}/top-metrics/users`
- ONTAP S3 APIs
- `/api/protocols/s3/services/{svm.uuid}/users`

In the APIs above, and in the context of REST roles, the wildcard character `*` can be used in place of `{volume.uuid}` or `{svm.uuid}` to represent *all* volumes or *all* SVMs, depending on whether the REST endpoint references volumes or SVMs. The `{volume.uuid}` corresponds to the `-instance-uuid` field in the output of the `volume show` command at the *diagnostic* privilege level. It can also be retrieved through the REST endpoint `/api/storage/volumes`.

Examples

The following command deletes a REST access-control role entry with the role name `readonly` and the API `/api/storage/volumes` from Vserver `vs.example.com`.

```
cluster1::> security login rest-role delete -role readonly -api
"/api/storage/volumes" -vserver vs.example.com
cluster1::>
```

The following command deletes a REST access-control role entry with the role name `vs1_role` and the resource-qualified endpoint corresponding to all snapshots on the volume with UUID `0aa39ec1-b68d-11ea-9581-005056bbabe6` from Vserver `vs1.example.com`. The volume UUID refers to the `-instance-uuid` field value in the `volume show` command output at diagnostic privilege level.

```
cluster1::> security login rest-role delete -role vs1_role -api
"/api/storage/volumes/0aa39ec1-b68d-11ea-9581-005056bbabe6/snapshots"
-vserver vs1.example.com
cluster1::>
```

The following command deletes a REST access-control role entry with the role name `vs2_role` and the resource-qualified endpoint corresponding to all top-metrics clients on the volume with UUID `373eb9ef-1d40-11ec-992e-005056bba268` from Vserver `vs2.example.com`. The volume UUID refers to the `-instance-uuid` field value in the `volume show` command output at diagnostic privilege level.

```
cluster1::> security login rest-role delete -role vs2_role -api
"/api/storage/volumes/373eb9ef-1d40-11ec-992e-005056bba268/top-
metrics/clients" -vserver vs2.example.com
cluster1::>
```

The following command deletes a REST access-control role entry with the role name `vs3_role` and the resource-qualified endpoint corresponding to all top-metrics directories for the Vserver `vs3.example.com` with UUID `6dfeb2a7-9a16-11ec-819e-005056bb1a7c`.

```
cluster1::> security login rest-role delete -role vs3_role -api
"/api/svm/svms/6dfeb2a7-9a16-11ec-819e-005056bb1a7c/top-
metrics/directories" -vserver vs3.example.com
cluster1::>
```

The following command deletes a REST access-control role entry with the role name *vs4_role* and the API */api/private/cli/cluster* for the Vserver *vs4.example.com*.

```
cluster1::> security login rest-role delete -role vs4_role -api
"/api/private/cli/cluster" -vserver vs4.example.com
cluster1::>
```

security login rest-role modify

Modify a REST access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role modify` command modifies a Representational State Transfer (REST) access-control role.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name associated with the REST role.

-role <text> - Role Name

This specifies the REST role that is to be modified.

-api <text> - API Path

This specifies the Application Programming Interface (API) to which the REST role has access. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
 - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
 - `/api/storage/volumes/{volume.uuid}/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`

- `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
- `/api/storage/volumes/{volume.uuid}/top-metrics/files`
- `/api/storage/volumes/{volume.uuid}/top-metrics/users`
- `/api/svm/svms/{svm.uuid}/top-metrics/clients`
- `/api/svm/svms/{svm.uuid}/top-metrics/directories`
- `/api/svm/svms/{svm.uuid}/top-metrics/files`
- `/api/svm/svms/{svm.uuid}/top-metrics/users`
- ONTAP S3 APIs
- `/api/protocols/s3/services/{svm.uuid}/users`

In the APIs above, and in the context of REST roles, the wildcard character `*` can be used in place of `{volume.uuid}` or `{svm.uuid}` to represent *all* volumes or *all* SVMs, depending on whether the REST endpoint references volumes or SVMs. The `{volume.uuid}` corresponds to the `-instance-uuid` field in the output of the [volume show](#) command at the *diagnostic* privilege level. It can also be retrieved through the REST endpoint `/api/storage/volumes`.

`[-access {none|readonly|read_create|read_modify|read_create_modify|all}]` - Access Level

This specifies a new access level for the REST role. Possible access level settings are *none*, *readonly*, *read_create*, *read_modify*, *read_create_modify* and *all*.

Examples

The following command modifies a REST access-control role with the role name *readonly* and the API `/api/storage/volumes` to have the access level *readonly* for Vserver *vs.example.com*:

```
cluster1::> security login rest-role modify -role readonly -api
"/api/storage/volumes" -access readonly -vserver vs.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *rest_role1* and the API `/api/snapmirror/policies` to have the access level *read_create* for Vserver *cluster1.example.com*:

```
cluster1::> security login rest-role modify -role rest_role1 -api
"/api/snapmirror/policies" -access read_create -vserver
cluster1.example.com
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs1_role* and the resource-qualified endpoint `/api/storage/volumes/*/snapshots` to have the access level *readonly* for Vserver *vs1.example.com*:

```
cluster1::> security login rest-role modify -role vs1_role -api  
"/api/storage/volumes/*/snapshots" -access readonly -vserver  
vs1.example.com  
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs2_role* and the resource-qualified endpoint */api/storage/volumes/4d383f47-1d40-11ec-81af-005056bb3eae/top-metrics/users* to have the access level *none* for Vserver *vs2.example.com*:

```
cluster1::> security login rest-role modify -role vs2_role -api  
"/api/storage/volumes/4d383f47-1d40-11ec-81af-005056bb3eae/top-  
metrics/users" -access none -vserver vs2.example.com  
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs3_role* and the resource-qualified endpoint */api/svm/svms/6dfef406-9a16-11ec-819e-005056bb1a7c/top-metrics/files* to have the access level *read_modify* for Vserver *vs3.example.com*:

```
cluster1::> security login rest-role modify -role vs3_role -api  
"/api/svm/svms/6dfef406-9a16-11ec-819e-005056bb1a7c/top-metrics/files"  
-access read_modify -vserver vs3.example.com  
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs3_role2* and the wildcard resource-qualified endpoint */api/svm/svms/*/top-metrics/clients* to have the access level *readonly* for Vserver *vs3.example.com*:

```
cluster1::> security login rest-role modify -role vs3_role2 -api  
"/api/svm/svms/*/top-metrics/clients" -access readonly -vserver  
vs3.example.com  
cluster1::>
```

The following command modifies a REST access-control role with the role name *vs4_role* and api */api/private/cli/cluster* to have the access level *readonly* for Vserver *vs4.example.com*:

```
cluster1::> security login rest-role modify -role vs4_role -api  
"/api/private/cli/cluster" -access readonly -vserver vs4.example.com  
cluster1::>
```

security login rest-role show

Show REST access control roles

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login rest-role show` command displays the following information about Representational State Transfer (REST) access-control roles:

- Vserver
- Role name
- Application Programming Interface (API) to which the REST role has access
- Access Level (*none*, *readonly*, *read_create*, *read_modify*, *read_create_modify*, or *all*)

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the REST roles that match this parameter value.

[-role <text>] - Role Name

Selects the REST roles that match this parameter value. If this parameter and the `-api` parameter are both used, the command displays detailed information about the specified REST access-control role.

[-api <text>] - API Path

Selects the REST roles that match this parameter value. If this parameter and the `-role` parameter are both used, the command displays detailed information about the specified REST access-control role. This API can be a private CLI API or a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

- Snapshots APIs
 - `/api/storage/volumes/{volume.uuid}/snapshots`
- File System Analytics APIs
 - `/api/storage/volumes/{volume.uuid}/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/clients`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/directories`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/files`
 - `/api/storage/volumes/{volume.uuid}/top-metrics/users`

- `/api/svm/svms/{svm.uuid}/top-metrics/clients`
- `/api/svm/svms/{svm.uuid}/top-metrics/directories`
- `/api/svm/svms/{svm.uuid}/top-metrics/files`
- `/api/svm/svms/{svm.uuid}/top-metrics/users`
- ONTAP S3 APIs
- `/api/protocols/s3/services/{svm.uuid}/users`
- Private-cli APIs
- `/api/private/cli/cluster`

In the APIs above, and in the context of REST roles, the wildcard character `*` can be used in place of `{volume.uuid}` or `{svm.uuid}` to represent *all* volumes or *all* SVMs, depending on whether the REST endpoint references volumes or SVMs. The `{volume.uuid}` corresponds to the `-instance-uuid` field in the output of the [volume show](#) command at the *diagnostic* privilege level. It can also be retrieved through the REST endpoint `/api/storage/volumes`.

`[-access {none|readonly|read_create|read_modify|read_create_modify|all}]` - Access Level

Selects the roles that match this parameter value.

Examples

The example below displays information about all REST access-control roles:

```

cluster1::> security login rest-role show
Role                                     Access
Vserver                                Name                                API                                Level
-----                                -
vs                                     vsrole1                             /api                              none
vs                                     vsrole1                             /api/storage/volumes/f8a541b5-
b68c-11ea-9581-005056bbabe6/files
                                     all
vs                                     vsrole1                             /api/storage/volumes/f8a541b5-
b68c-11ea-9581-005056bbabe6/snapshots
                                     readonly
vs                                     vsrole1                             /api/storage/volumes/843b87f9-

- [volume show](#)

security login rest-role expanded-rest-roles modify

Modify the status of Expanded REST roles for granular resource control feature

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login rest-role expanded-rest-roles modify` command enables or disables *Expanded REST roles for granular resource control* feature.

Parameters

`[-is-enabled {true|false}] - Is Enabled? (privilege: advanced)`

This parameter specifies whether the *Expanded REST roles for granular resource control* feature is enabled or disabled. The default value is *true* i.e. the feature is enabled by default.

Examples

The following command disables the *Expanded REST roles for granular resource control* feature.

```
cluster1::*> security login rest-role expanded-rest-roles modify -is
-enabled false
cluster1::*>
```

`security login rest-role expanded-rest-roles show`

Show the status of Expanded REST roles for granular resource control feature

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login rest-role expanded-rest-roles show` command specifies whether the *Expanded REST roles for granular resource control* feature is enabled (*true*) or disabled (*false*).

Examples

The command below specifies that the *Expanded REST roles for granular resource control* feature is enabled.

```
cluster1:::> security login rest-role expanded-rest-roles show

Is Enabled? true
```

`security login role create`

Add an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role create` command creates an access-control role. An access-control role consists of a role name and a command or directory to which the role has access. It optionally includes an access level (*none*, *readonly*, or *all*) and a query that applies to the specified command or command directory. After you create an access-control role, you can apply it to a management-utility login account by using the [security login modify](#) or [security login create](#) commands.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be created.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. The command or command directory must be specified either within double quotes or inside curly brackets. To specify the default setting, use the special value `"`DEFAULT`"`.

[-access {none|readonly|read_create|read_modify|read_create_modify|all}] - Access Level

This optionally specifies an access level for the role. Possible access level settings are none, readonly, and all. The default setting is `all`.

[-query <query>] - Query

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by `-cmddirname`. The query object must be enclosed in double quotation marks (`"`), and it must be a valid field name.

Examples

The following command creates an access-control role named "admin" for the `vs1.example.com` Vserver. The role has all access to the "volume" command but only within the "aggr0" aggregate.

```
cluster1::> security login role create -role admin -cmddirname volume
-query "-aggr aggr0" -access all -vserver vs1.example.com
```

security login role delete

Delete an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role delete` command deletes an access-control role.

Parameters

-vserver <vserver name> - Vserver

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be deleted.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. To specify the default setting, use the special value "DEFAULT".

Examples

The following command deletes an access-control role with the role name `readonly` and the command access "volume" for Vserver `vs.example.com`.

```
cluster1:> security login role delete -role readonly -cmddirname volume
-vserver vs.example.com
```

security login role modify

Modify an access control role

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role modify` command modifies an access-control role.

Parameters**-vserver <vserver name> - Vserver**

This optionally specifies the Vserver name associated with the role.

-role <text> - Role Name

This specifies the role that is to be modified.

-cmddirname <text> - Command / Directory

This specifies the command or command directory to which the role has access. To specify the default setting for a role, use the special value "DEFAULT". This value can be modified only for the roles created for the admin Vserver.

[-access {none|readonly|read_create|read_modify|read_create_modify|all}] - Access Level

This optionally specifies a new access level for the role. Possible access level settings are `none`, `readonly`, and `all`. The default setting is `all`.

[-query <query>] - Query

This optionally specifies the object that the role is allowed to access. The query object must be applicable to the command or directory name specified by `-cmddirname`. The query object must be enclosed in double

quotation marks (""), and it must be a valid field name.

Examples

The following command modifies an access-control role with the role name `readonly` and the command access `"volume"` to have the access level `readonly` for `Vserver vs.example.com`:

```
cluster1::> security login role modify -role readonly -cmddirname volume
-access readonly -vserver vs.example.com
```

security login role prepare-to-downgrade

Update role configurations so that they are compatible with earlier releases of Data ONTAP

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login role prepare-to-downgrade` command restores predefined roles of all Vservers earlier than ONTAP 8.3.2. You must run this command in advanced privilege mode when prompted to do so during the release downgrade.

Examples

The following command restores predefined roles of all Vservers earlier than ONTAP 8.3.2.

```
cluster1::*> security login role prepare-to-downgrade
```

security login role show-ontapi

Display the mapping between Data ONTAP APIs and CLI commands

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login role show-ontapi` command displays ONTAP APIs (ONTAPIs) and the CLI commands that they are mapped to.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-ontapi <text>] - ONTAPI Name

Use this parameter to view the corresponding CLI command for the specified API.

[-command <text>] - CLI Command

Use this parameter to view the corresponding API or APIs for the specified CLI command.

Examples

The following command displays all ONTAP APIs and their mapped CLI commands:

```
cluster1::> security login role show-ontapi
ONTAPI                               Command
-----
-----
aggr-add                             storage aggregate add-disks
aggr-check-spare-low                 storage aggregate check_spare_low
aggr-create                          storage aggregate create
aggr-destroy                         storage aggregate delete
aggr-get-filer-info                  aggr
aggr-get-iter                        storage aggregate show-view
aggr-offline                         storage aggregate offline
aggr-online                         storage aggregate online
aggr-options-list-info               storage aggregate show
aggr-rename                         storage aggregate rename
aggr-restrict                       storage aggregate restrict
aggr-set-option                     storage aggregate modify
autosupport-budget-get               system node autosupport budget show
autosupport-budget-get-iter          system node autosupport budget show
autosupport-budget-get-total-records
                                     system node autosupport budget show
autosupport-budget-modify            system node autosupport budget modify
autosupport-config-get               system node autosupport show
autosupport-config-get-iter          system node autosupport show
autosupport-config-get-total-records
                                     system node autosupport show
autosupport-config-modify            system node autosupport modify
Press <space> to page down, <return> for next line, or 'q' to quit...
```

The following example displays all ONTAP APIs which are mapped to the specified CLI command:

```
cluster1::> security login role show-ontapi -command version
ONTAPI                               Command
-----
-----
system-get-ontapi-version            version
system-get-version                   version
2 entries were displayed.
```

The following example displays the CLI command that is mapped to the specified Data ONTAPI API:

```
cluster1::> security login role show-ontapi -ontapi aggr-create

ONTAPI Name: aggr-create
Command: storage aggregate create
```

security login role show-rest

Display the mapping between ONTAP REST APIs and CLI commands

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role show-rest` command displays ONTAP REST APIs and the CLI commands that they are mapped to.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-endpoint <text>] - URI of the REST endpoint

This parameter will filter the output to show CLI commands that match the provided REST endpoint.

[-commands <text>,...] - CLI Command

This parameter will filter the output to show the REST API or APIs that match the provided CLI command.

[-supported-operations <text>,...] - Supported REST operations <GET,POST,PATCH,DELETE>

This parameter filters the output to show REST APIs or CLI commands that match the provided REST operations `<GET,POST,PATCH,DELETE>`

Examples

The following command displays all the ONTAP REST APIs and their mapped CLI commands:

```
cluster1::> security login role show-rest
REST Endpoint          CLI Commands          Supported
Operations
-----
/application/applications  application          GET, PATCH,
POST, DELETE
/application/applications/$id/components/$id/metadata
                        -          GET, PATCH,

security login role show

Show access control roles

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role show` command displays the following information about access-control roles:

- Role name
- Command or command directory to which the role has access
- Access level (none, read-only, or all)
- Query (detailed view only)

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the roles that match this parameter value.

[-role <text>] - Role Name

Selects the roles that match this parameter value. If this parameter and the `-cmddirname` parameter are both used, the command displays detailed information about the specified access-control role.

[-cmddirname <text>] - Command / Directory

Selects the roles that match this parameter value. If this parameter and the `-role` parameter are both used, the command displays detailed information about the specified access-control role.

[-access {none|readonly|read_create|read_modify|read_create_modify|all}] - Access Level

Selects the roles that match this parameter value.

[-query <query>] - Query

Selects the roles that match this parameter value.

Examples

The example below displays information about all access-control roles:

```
cluster1::> security login role show
```

Vserver	RoleName	Command/Directory	Query
AccessLevel			
-----	-----	-----	-----
vs	vsadmin	DEFAULT	none
vs	vsadmin	dashboard health vsadmin	readonly
vs	vsadmin	job	readonly
vs	vsadmin	job schedule	none
vs	vsadmin	lun	all
vs	vsadmin	network connections	readonly
cluster1	admin	DEFAULT	all
cluster1	readonly	DEFAULT	readonly
cluster1	readonly	volume	none

security login role config modify

Modify local user account restrictions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role config modify` command modifies user account and password restrictions.

For the password character restrictions documented below (uppercase, lowercase, digits, etc.), the term "characters" refers to ASCII-range characters only - not extended characters.

Parameters

-vserver <vserver name> - Vserver

This specifies the Vserver name associated with the profile configuration.

-role <text> - Role Name

This specifies the role whose account restrictions are to be modified.

[-username-minlength <integer>] - Minimum Username Length Required

This specifies the required minimum length of the user name. Supported values are 3 to 32 characters. The default setting is 3 characters.

[-username-alphanum {enabled|disabled}] - Username Alpha-Numeric

This specifies whether a mix of alphabetic and numeric characters are required in the user name. If this parameter is enabled, a user name must contain at least one letter and one number. The default setting is *disabled*.

[-passwd-minlength <integer>] - Minimum Password Length Required

This specifies the required minimum length of a password. Supported values are 3 to 127 characters. The default setting is 8 characters.

[-passwd-alphanum {enabled|disabled}] - Password Alpha-Numeric

This specifies whether a mix of alphabetic and numeric characters is required in the password. If this parameter is enabled, a password must contain at least one letter and one number. The default setting is *enabled*.

[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password

This specifies the minimum number of special characters required in a password. Supported values are from 0 to 127 special characters. The default setting is 0, which requires no special characters.

[-passwd-expiry-time <integer_or_unlimited>] - Password Expires In (Days)

This specifies password expiration in days. A value of 0 means all passwords associated with the accounts in the role expire now. The default setting is *unlimited*, which means the passwords never expire.

[-require-initial-passwd-update {enabled|disabled}] - Require Initial Password Update on First Login

This specifies whether users must change their passwords when logging in for the first time. Initial password changes can be done only through SSH or serial-console connections. The default setting is *disabled*.

[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts

This specifies the allowed maximum number of consecutive invalid login attempts. When the failed login attempts reach the specified maximum, the account is automatically locked. The default is 5, which means 5 failed login attempts will cause an account to be locked.

[-lockout-duration <integer>] - (DEPRECATED)-Maximum Lockout Period (Days)

(DEPRECATED)-This specifies the number of days for which an account is locked if the failed login attempts reach the allowed maximum. The default is 0, which means the accounts will be locked for 1 hour. For roles which were created in a release before ONTAP 9.15.0 with the default value of 0, this value will be automatically changed to 1 during upgrade to ONTAP 9.15.0. In other words, the value of this field for roles created before ONTAP 9.15.0 is defaulted to 24 hrs. For the roles which are created in ONTAP 9.15.0 or later, the value of this field defaults to 1 hour. This parameter is deprecated in ONTAP 9.15.0 and later. It may be removed from a future release of ONTAP.

[`-disallowed-reuse <integer>`] - Disallow Last 'N' Passwords

This specifies the number of previous passwords that are disallowed for reuse. The default setting is six, meaning that the user cannot reuse any of their last six passwords. The minimum allowed value is `6`.

[`-change-delay <integer>`] - Delay Between Password Changes (Days)

This specifies the number of days that must pass between password changes. The default setting is `0`.

[`-delay-after-failed-login <integer>`] - Delay after Each Failed Login Attempt (Secs)

This specifies the amount of delay observed by the system in seconds upon invalid login attempts. The default setting is `4` seconds.

[`-passwd-min-lowercase-chars <integer>`] - Minimum Number of Lowercase Alphabetic Characters Required in the Password

This specifies the minimum number of lowercase characters required in a password. Supported values are from 0 to 127 lowercase characters. The default setting is `0`, which requires no lowercase characters.

[`-passwd-min-uppercase-chars <integer>`] - Minimum Number of Uppercase Alphabetic Characters Required in the Password

This specifies the minimum number of uppercase characters required in a password. Supported values are from 0 to 127 uppercase characters. The default setting is `0`, which requires no uppercase characters.

[`-passwd-min-digits <integer>`] - Minimum Number of Digits Required in the Password

This specifies the minimum number of digits required in a password. Supported values are from 0 to 127 digits characters. The default setting is `0`, which requires no digits.

[`-passwd-expiry-warn-time <integer_or_unlimited>`] - Display Warning Message Days Prior to Password Expiry (Days)

This specifies the warning period for password expiry in days. A value of `0` means warn user about password expiry upon every successful login. The default setting is *unlimited*, which means never warn about password expiry.

[`-account-expiry-time <integer_or_unlimited>`] - Account Expires in (Days)

This specifies account expiration in days. The default setting is *unlimited*, which means the accounts never expire. The account expiry time must be greater than account inactive limit.

[`-account-inactive-limit <integer_or_unlimited>`] - Maximum Duration of Inactivity before Account Expiration (Days)

This specifies inactive account expiry limit in days. The default setting is *unlimited*, which means the inactive accounts never expire. The account inactive limit must be less than account expiry time.

[`-account-lockout-duration {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled]}`] - Account Lockout Duration (ISO 8601 Duration Format)

This specifies the duration in ISO 8601 format for which an account is locked if the failed login attempts reach the allowed maximum. The default is 1 hour. Specifying this field will set the field `lockout-duration` as `0` and the field `account-lockout-duration` will be used for further operations.

Examples

The following command modifies the user-account restrictions for an account with the role name `admin` for a Vserver named `vs1`. The minimum size of the password is set to 12 characters.

```
cluster1::> security login role config modify -role admin -vserver vs1
            -passwd-minlength 12
```

The following command sets the maximum allowed number of consecutive invalid login attempts to 3 and the maximum account lockout duration to 1 minute 30 seconds after 3 failed login attempts for role admin for vs1:

```
cluster1::> security login role config modify -role admin -vserver vs1
            -max-failed-login-attempts 3 -account-lockout-duration PT1M30S
```

security login role config reset

Reset RBAC characteristics supported on releases later than Data ONTAP 8.1.2

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security login role config reset` command resets the following role based access control (RBAC) characteristics to their default values. The system prompts you to run this command if you revert to ONTAP 8.1.2 or earlier. If you do not reset these characteristics, the revert process will fail.

- Minimum number of special characters required in password ("0")
- Minimum number of uppercase characters required in password ("0")
- Minimum number of lowercase characters required in password ("0")
- Minimum number of digits required in password ("0")
- Password-expiration time, in days ("unlimited")
- Whether the password must be changed at the initial login ("disabled")
- Maximum number of failed login attempts permitted before the account is locked out ("5")
- Maximum time period for which the user account is locked out after the maximum number of failed login attempts is reached ("1 Hour")

Examples

The following command resets the above mentioned RBAC characteristics of all cluster and Vserver roles to their default values.

```
cluster1::> security login role config reset
```

security login role config show

Show local user account restrictions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security login role config show` command displays the following information about account restrictions for management-utility user accounts:

- Role name `-role`
- Minimum size of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Number of previous passwords that cannot be reused `-disallowed-reuse`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`

You can display detailed information about the restrictions on a specific account by specifying the `-role` parameter. This adds the following information:

- Minimum length of the user name, in characters `-username-minlength`
- Whether the user name requires alphanumeric characters `-username-alphanum`
- Minimum length of the password, in characters `-passwd-minlength`
- Whether the password requires alphanumeric characters `-passwd-alphanum`
- Minimum number of special characters required in password `-passwd-min-special-chars`
- Minimum number of lowercase characters required in password `-passwd-min-lowercase-chars`
- Minimum number of uppercase characters required in password `-passwd-min-uppercase-chars`
- Minimum number of digits required in password `-passwd-min-digits`
- Minimum number of days that must elapse before users can change their passwords `-change-delay`
- Whether the password must be changed at the initial login `-require-initial-passwd-update`
- Password-expiration time, in days `-passwd-expiry-time`
- Display warning message days prior to password expiry `-passwd-expiry-warn-time`
- Number of previous passwords that cannot be reused `-disallowed-reuse`
- Maximum number of failed login attempts permitted before the account is locked out `-max-failed-login-attempts`
- (DEPRECATED)-Number of days for which the user account is locked after the maximum number of failed login attempts is reached. For roles which were created in a release before ONTAP 9.15.0 with the default value of `0`, this value will be automatically changed to `1` during upgrade to ONTAP 9.15.0. In other words, the value of this field for roles created before ONTAP 9.15.0 is defaulted to 24 hrs. For the roles which are created in ONTAP 9.15.0 or later, the value of this field defaults to 1 hour. This parameter is deprecated in ONTAP 9.15.0 and later. It may be removed from a future release of ONTAP `-lockout-duration`
- Account-expiration time, in days `-account-expiry-time`
- Maximum duration of inactivity before account expiration, in days `-account-inactive-limit`
- Delay after each failed login attempt, in secs `-delay-after-failed-login`
- Duration for which the user account is locked after the maximum number of failed login attempts is reached `-account-lockout-duration`

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the profile configurations that match this parameter value

[-role <text>] - Role Name

If this parameter is specified, the command displays detailed information about restrictions for the specified user account.

[-username-minlength <integer>] - Minimum Username Length Required

Selects the profile configurations that match this parameter value.

[-username-alphanum {enabled|disabled}] - Username Alpha-Numeric

Selects the profile configurations that match this parameter value. Enabled means a user name must contain both letters and numbers.

[-passwd-minlength <integer>] - Minimum Password Length Required

Selects the profile configurations that match this parameter value.

[-passwd-alphanum {enabled|disabled}] - Password Alpha-Numeric

Selects the profile configurations that match this parameter value. Enabled means a password must contain both letters and numbers.

[-passwd-min-special-chars <integer>] - Minimum Number of Special Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-expiry-time <integer_or_unlimited>] - Password Expires In (Days)

Selects the profile configurations that match this parameter value.

[-require-initial-passwd-update {enabled|disabled}] - Require Initial Password Update on First Login

Selects the profile configurations that match this parameter value.

[-max-failed-login-attempts <integer>] - Maximum Number of Failed Attempts

Selects the profile configurations that match this parameter value.

[-lockout-duration <integer>] - (DEPRECATED)-Maximum Lockout Period (Days)

Selects the profile configurations that match this parameter value.

[-disallowed-reuse <integer>] - Disallow Last 'N' Passwords

Selects the profile configurations that match this parameter value.

[-change-delay <integer>] - Delay Between Password Changes (Days)

Selects the profile configurations that match this parameter value.

[-delay-after-failed-login <integer>] - Delay after Each Failed Login Attempt (Secs)

Selects the profile configurations that match this parameter value.

[-passwd-min-lowercase-chars <integer>] - Minimum Number of Lowercase Alphabetic Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-min-uppercase-chars <integer>] - Minimum Number of Uppercase Alphabetic Characters Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-min-digits <integer>] - Minimum Number of Digits Required in the Password

Selects the profile configurations that match this parameter value.

[-passwd-expiry-warn-time <integer_or_unlimited>] - Display Warning Message Days Prior to Password Expiry (Days)

Selects the profile configurations that match this parameter value.

[-account-expiry-time <integer_or_unlimited>] - Account Expires in (Days)

Selects the profile configurations that match this parameter value.

[-account-inactive-limit <integer_or_unlimited>] - Maximum Duration of Inactivity before Account Expiration (Days)

Selects the profile configurations that match this parameter value.

[-account-lockout-duration {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W | disabled]}] - Account Lockout Duration (ISO 8601 Duration Format)

Selects the profile configurations that match this parameter value.

Examples

The example below displays restriction information about all user accounts:

```
cluster1::> security login role config show
               ----- Password Restrictions -----
Vserver      RoleName      Size AlphaNum NoReuse ChangeDelay
-----
vs           vsadmin          8  enabled      6      0 days
vs           vsadmin-protocol 8  enabled      6      0 days
vs           vsadmin-readonly 8  enabled      6      0 days
vs           vsadmin-volume  8  enabled      6      0 days
cluster1     admin             6  enabled      6      0 days
cluster1     readonly          6  enabled      6      0 days
```

security login totp create

Add a TOTP secret

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login totp create` associates an new secret key with a user account. This command requires that you enter a user name.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are adding the secret key.

-username <text> - Username

This parameter specifies the name of the user for whom you are adding the secret key. If you do not specify a user in case of Cserver, the user named admin is specified by default. If it is a data vserver, it defaults to logged-in user

[-comment <text>] - Comment

This optionally specifies comment text for the TOTP key. Note that comment text should be enclosed in quotation marks.

Examples

The following command creates a secret key with a user named tsmith for Vserver vs1. The secret key has a comment text is "This is a new key".

```
cluster1::> security login totp create -vserver vs1 -username tsmith  
-comment "This is a new key"
```

security login totp delete

Delete a TOTP secret

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login totp delete` command deletes secret key for a specific user. To delete a secret key, you must specify a user name.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are deleting the secret key.

-username <text> - Username

This parameter specifies the name of the user for whom you are deleting a secret key. If you do not specify a user in case of cserver, the user named admin is specified by default. In case of data vserver, it defaults to logged-in user

Examples

The following command deletes the secret key for the user named tsmith.

```
cluster1::> security login totp delete -username tsmith
```

security login totp modify

Modify a TOTP status

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login totp modify` command modifies the TOTP status. Only admin can modify the TOTP status and it requires that you enter a user name and enabled

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver of the user for whom you are modifying the TOTP status or comment.

-username <text> - Username

This parameter specifies the name of the user for whom you are modifying the TOTP status.

[-enabled {true|false}] - TOTP Status

This parameter specifies the TOTP status of the user for whom you are modifying.

[-comment <text>] - Comment

This optionally specifies comment text for the TOTP key. Note that comment text should be enclosed in quotation marks.

Examples

The following command disable the TOTP for the user named tsmith for Vserver vs1.

```
cluster1::> security login totp modify -vserver vs1 -username tsmith  
-enabled false
```

security login totp show

Display TOTP secret

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security login totp show` command displays information about secret keys.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver

Selects the secret keys that match this parameter value.

[-username <text>] - Username

Selects the secret keys that match this parameter value.

[-fingerprint <text>] - TOTP Secret key fingerprint

Select the secret keys that match this parameter value.

[-enabled {true|false}] - TOTP Status

Selects the secret keys that match this parameter value.

[-comment <text>] - Comment

Selects the secret keys that match this parameter value.

Examples

The example below displays secret key information for the user named tsmith.

```
cluster1::> security login totp show -username tsmith
UserName: tsmith
TOTP SHA Fingerprint:
7038eb494f8b86726bdfae9da1fbadb348f8fe26116f49e09f718a7b8bdd73b8
TOTP status: true
Comment: This is a new key
```

security multi-admin-verify commands

security multi-admin-verify modify

Modify multi-admin-verify settings

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify modify` command is used to modify the Multi-Admin-Verify global settings.

Parameters

`[-approval-groups <text>,...]` - List of Global Approval Groups

This specifies the list of global approval groups which are inherited by the rule if the `approval-groups` is not provided for the rule. The default value is an empty list. The `approval-groups` should be defined to enable multi-admin verification. The supplied value replaces the list. You can create an approval-group by using the [security multi-admin-verify approval-group create](#) command.

`[-required-approvers <integer>]` - Number of Required Approvers

This specifies the required number of approvers to approve the request which is inherited by the rule if `required-approvers` is not provided for the rule. The default and minimum number of required approvers is 1.

`[-enabled {true|false}]` - Is Multi-Admin-Verify Enabled

This specifies the current state. Multi-admin verification is not required to enable the feature. However, it is required to disable the feature. By default, the feature is disabled and the value is set to false. It is recommended that multi-admin-verify is enabled equally on peered ONTAP clusters.

`[-execution-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>]` - Execution Expiry

This is the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

`[-approval-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>]` - Approval Expiry

This is the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

`[-smtp-encryption {true|false}]` - Utilize TLS to access mail server

This specifies whether TLS will be established for email (SMTP) communication. The default is set to false.

`[-validate-smtp-certificate {true|false}]` - Validate SMTP certificate

This specifies whether the server certificate authority is validated when `smtp-encryption` is enabled. The default is set to true.

Examples

This command changes the approval groups:

```
cluster1::> security multi-admin-verify modify -approval-groups group1,
group2
```

This command changes the required number of approvers:

```
cluster1::> security multi-admin-verify modify -required-approvers 3
```

This command enables the feature. The default is false (disabled):

```
cluster1::> security multi-admin-verify modify -enabled true
```

This command changes the execution expiry:

```
cluster1::> security multi-admin-verify modify -execution-expiry 14d
```

This command changes the approval expiry:

```
cluster1::> security multi-admin-verify modify -approval-expiry 48h
```

Related Links

- [security multi-admin-verify approval-group create](#)

security multi-admin-verify show

Display multi-admin-verify configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify show` command displays the object store that contains the global setting values of the multi-admin-verify feature.

- **Is Enabled:** Displays the current state of the feature. This feature is, by default, disabled and the value is set to false.
- **Required Approvers:** Displays the required number of approvers to approve the ONTAP execution request. This is inherited by the rule if `required-approvers` is not provided for the rule. The default and minimum number of required approvers is 1.
- **Approval Expiry:** Displays the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires.
- **Execution Expiry:** Displays the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires.
- **Approval Groups:** Displays the list of global approval groups. This will be in effect if the approval groups is not specified for a multi-admin-verify rule.

Examples

The following example displays typical global settings information:

```
cluster1::> security multi-admin-verify show
Is      Required  Execution Approval Approval
Enabled Approvers Expiry      Expiry      Groups
-----
false   1           1h          1h          group1, group2
```

security multi-admin-verify approval-group create

Create an Approval Group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify approval-group create` command creates an approval group for a specified Vserver for a specified list of ONTAP users.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

-name <text> - Group Name

This specifies the name of an approval group.

-approvers <text>,... - Approvers

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

[-email <mail address>,...] - Email Addresses

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

[-enable-notifications {true|false}] - Enable Email Notifications

This specifies whether email notifications are enabled for the approval group.

Examples

The following example creates a new approval group named `group1` with approver `admin1` that is associated with the default Vserver `cluster1`:

```
cluster1::> security multi-admin-verify approval-group create -name group1
-approvers admin1
```

security multi-admin-verify approval-group delete

Delete an Approval Group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify approval-group delete` command deletes the specified approval group.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver information to which the approval group is associated with. This is an optional parameter. This parameter defaults to Cluster server and supports only Cluster servers.

-name <text> - Group Name

This specifies the name of an approval group to be deleted.

Examples

The following example deletes the approval group, group1:

```
cluster1::> security multi-admin-verify approval-group delete -name group1
```

security multi-admin-verify approval-group modify

Modify an Approval Group

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify approval-group modify` command is used to modify attributes of an approval group.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

-name <text> - Group Name

This specifies the name of an approval group.

[-approvers <text>,...] - Approvers

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

[-email <mail address>,...] - Email Addresses

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

[-enable-notifications {true|false}] - Enable Email Notifications

This specifies whether email notifications are enabled for the approval group.

Examples

This command changes the approvers:

```
cluster1::> security multi-admin-verify approval-group modify -name group1  
-approvers admin1
```

security multi-admin-verify approval-group replace

Add and/or remove approvers from the list

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify approval-group replace` command is used to replace the list of approvers of an approval group.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to Cluster server and supports only Cluster servers.

-name <text> - Group Name

This specifies the name of the approval group whose approvers are to be replaced.

[-approvers-to-add <text>,...] - New Approvers

This specifies the list of ONTAP users that are to be added to the current list of approvers of the approval group.

[-approvers-to-remove <text>,...] - Existing Approvers

This specifies the list of ONTAP users that are to be removed from the current list of approvers of the approval group.

Examples

The following example adds user `admin2` and removes user `admin` from the current approvers list, while `group1` is associated with the default Vserver:

```
cluster1::> security multi-admin-verify approval-group replace -name
group1 -approvers-to-add admin2 -approvers-to-remove admin.
```

security multi-admin-verify approval-group show

Display Approval Groups

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify approval-group show` command displays information about approval groups and the users that are registered with each group.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] - Vserver

This specifies the Vserver name to which the approval group is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

[-name <text>] - Group Name

This specifies the name of an approval group.

[-approvers <text>,...] - Approvers

This specifies the list of ONTAP users that are part of the approval group. Each specified user must belong to the specified Vserver.

[-email <mail address>,...] - Email Addresses

This specifies the email addresses that are notified when a request is created, approved, vetoed, or executed.

[-enable-notifications {true|false}] - Enable Email Notifications

This specifies whether email notifications are enabled for the approval group.

Examples

The following example displays typical approval groups information:

```
cluster1::> security multi-admin-verify approval-group show
Vserver Name: Cluster_Vserver
Approval Group Name: ag
    Approvers: admin, admin1
    Emails: e1@d1.com, e2@d2.com
Email Notifications: false
Vserver Name: Cluster_Vserver
Approval Group Name: ag1
    Approvers: admin, admin1
    Emails: -
Email Notifications: true
    2 entries were displayed.
```

security multi-admin-verify request approve

Approve a request

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request approve` command approves the specified request. Cluster peering commands might require remote approvals.

Parameters

-index <integer> - Request Index

This allows the user to specify the index of the request to be approved.

[-execute-on-approval {true|false}] - Execute Command On Final Approval

If set to *true*, the operation will automatically execute on final approval.

Examples

The following example approves the request with index 1:

```
cluster1::> security multi-admin-verify request approve -index 1
```

security multi-admin-verify request create

Create a request

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request create` command creates a request for the specified ONTAP operation.

Parameters

`[-index <integer>]` - Request Index

This specifies the index of the request which is automatically generated for each request.

`-operation <text>` - Operation

This specifies the ONTAP operation information for which the request is to be created.

`-query <query>` - Query

This identifies the object (or objects) upon which the user wants to apply the operation. Any field or query supported by the operation can be supplied.

`[-comment <text>]` - Comment

This is an optional parameter where users creating a request can provide comments related to the request.

`[-users-permitted <text>,...]` - Users Permitted

This is an optional parameter where a user creating the request can specify the list of ONTAP users who are permitted to perform the ONTAP operation specified by the request, once it is approved. If this parameter is not provided, then any user with default permissions to perform the ONTAP operation is allowed to perform the ONTAP operation specified by the request.

Examples

The following example creates a new request for ONTAP operation `volume delete` which is applicable to objects of `vserver vs0`.

```
cluster1::> security multi-admin-verify request create -operation "volume delete" -query "-vserver vs0"
```

The following example creates a new request for the ONTAP operation `volume snapshot delete` which is applicable to `Vserver` objects `vs0` and `volume v1`. Users permitted to perform this operation on the specified subset of objects are `user1` and `user2`:

```
cluster1::> security multi-admin-verify request create -operation "volume delete" -query "-vserver vs0 -volume v1" -users-permitted user1, user2
```

security multi-admin-verify request delete

Delete a request

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request delete` command deletes the specified request.

Parameters

-index <integer> - Request Index

This allows the user to specify the index of the request to be deleted.

Examples

The following example deletes the request with index 1:

```
cluster1::> security multi-admin-verify request delete -index 1
```

security multi-admin-verify request show-pending

Show only pending requests

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request show-pending` command displays information about multi-admin verification requests that are in the pending state.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-index <integer>] - Request Index

This specifies the index of the request.

[-operation <text>] - Operation

This specifies the ONTAP operation for which the request is created.

[-query <query>] - Query

This identifies the object (or objects) upon which the user wants to apply the operation.

[-required-approvers <integer>] - Required Approvers

This specifies the number of distinct users that are required to approve the request. A user can set the required-approvers to the ONTAP operation rule. If a user does not set the required-approvers to the rule, then the required-approvers from the global setting is applied.

[-pending-approvers <integer>] - Pending Approvers

This specifies the number of distinct users that are still required to approve the request for the request to be marked as approved.

[-approval-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Approval Expiry

This specifies the expiry information within which an approve or veto action is to be taken by the approvers from the time the request is submitted. Any authorized user can set the approval-expiry to the ONTAP operation rule. If the user does not set the approval-expiry to the rule, then the approval-expiry from the global setting is applied.

[-execution-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Execution Expiry

This specifies the expiry information within which an ONTAP operation is to be executed from the time the request is approved. An authorized user can set the execution-expiry to the ONTAP operation rule. If the user does not set the execution-expiry to the rule, then the execution-expiry from the global setting is applied.

[-users-approved <text>,...] - Approvals

This specifies the list of users that have approved the request.

[-user-vetoed <text>] - User Vetoed

This specifies the user who vetoed the request.

[-vserver <vserver>] - Vserver

This specifies the Vserver information to which the request is associated with.

[-user-requested <text>] - User Requested

This specifies the username who created the request.

[-time-created <MM/DD/YYYY HH:MM:SS>] - Time Created

This specifies the time at which the request is created.

[-time-approved <MM/DD/YYYY HH:MM:SS>] - Time Approved

This specifies the time at which the request state changed to approved.

[-comment <text>] - Comment

This specifies the comments that are associated with the request.

[-users-permitted <text>,...] - Users Permitted

This specifies the list of users that are permitted to perform the ONTAP operation for which the request is approved. If users-permitted is empty, then any user who, by default, has permission to perform the ONTAP operation is allowed.

[-execute-on-approval {true|false}] - Execute Approved Command

This specifies whether the operation being approved is automatically executed. If set, the operation is executed immediately when the request is marked as approved.

Examples

The following example displays typical request information:

```
cluster1::> security multi-admin-verify request show-pending
Pending
      Index Operation                Query                State
Approvers Requestor
-----
-----
      1 volume delete                pending    3
admin
```

security multi-admin-verify request show

Display requests

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request show` command displays information about multi-admin verification requests.

Parameters

- { [-fields <fieldname>,...]**
If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.
- | [-instance] }**
If you specify the `-instance` parameter, the command displays detailed information about all fields.
- [-index <integer>] - Request Index**
This specifies the index of the request.
- [-operation <text>] - Operation**
This specifies the ONTAP operation for which the request is created.
- [-query <query>] - Query**
This identifies the object (or objects) upon which the user wants to apply the operation.
- [-state {pending|approved|vetoed|expired|executed}] - State**
This specifies the query information that is applied to the subset of objects of ONTAP operation of the request.
- [-required-approvers <integer>] - Required Approvers**
This specifies the number of distinct users that are required to approve the request. A user can set the

required-approvers to the ONTAP operation rule. If a user does not set the required-approvers to the rule, then the required-approvers from the global setting is applied.

[-pending-approvers <integer>] - Pending Approvers

This specifies the number of distinct users that are still required to approve the request for the request to be marked as approved.

[-approval-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Approval Expiry

This specifies the expiry information within which an approve or veto action is to be taken by the approvers from the time the request is submitted. Any authorized user can set the approval-expiry to the ONTAP operation rule. If the user does not set the approval-expiry to the rule, then the approval-expiry from the global setting is applied.

[-execution-expiry {MM/DD/YYYY HH:MM:SS | {1..7}days | {1..168}hours | PnDTnHnMnS | PnW}] - Execution Expiry

This specifies the expiry information within which an ONTAP operation is to be executed from the time the request is approved. An authorized user can set the execution-expiry to the ONTAP operation rule. If the user does not set the execution-expiry to the rule, then the execution-expiry from the global setting is applied.

[-users-approved <text>,...] - Approvals

This specifies the list of users that have approved the request.

[-user-vetoed <text>] - User Vetoed

This specifies the user who vetoed the request.

[-vserver <vserver>] - Vserver

This specifies the Vserver information to which the request is associated with.

[-user-requested <text>] - User Requested

This specifies the username who created the request.

[-time-created <MM/DD/YYYY HH:MM:SS>] - Time Created

This specifies the time at which the request is created.

[-time-approved <MM/DD/YYYY HH:MM:SS>] - Time Approved

This specifies the time at which the request state changed to approved.

[-comment <text>] - Comment

This specifies the comments that are associated with the request.

[-users-permitted <text>,...] - Users Permitted

This specifies the list of users that are permitted to perform the ONTAP operation for which the request is approved. If users-permitted is empty, then any user who, by default, has permission to perform the ONTAP operation is allowed.

[-execute-on-approval {true|false}] - Execute Approved Command

This specifies whether the operation being approved is automatically executed. If set, the operation is executed immediately when the request is marked as approved.

Examples

The following example displays typical request information:

```
cluster1::> security multi-admin-verify request show
Pending
      Index Operation                Query                State
  Approvers Requestor
  -----
-----
          1 volume delete                pending    3
admin
```

security multi-admin-verify request veto

Veto a request

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify request veto` command vetoes the specified request.

Parameters

-index <integer> - Request Index

This allows the user to specify the index of the request to be vetoed.

Examples

The following example vetoes the request with index 1:

```
cluster1::> security multi-admin-verify request veto -index 1
```

security multi-admin-verify rule create

Create a rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify rule create` command creates a rule for the specified ONTAP operation.

Parameters

[-vserver <vserver>] - Vserver

This specifies Vserver information for which the rule should be associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

-operation <text> - Operation

This specifies the ONTAP operation information for the rule to be created.

[-auto-request-create {true|false}] - Automatic Request Creation

This specifies rule information for the auto request create state. Auto request creation for the rule is enabled by default, by setting this value to true.

[-query <query>] - Query

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule to be created. This is an optional parameter. If a query is not specified for the rule, the rule applies to all objects of the ONTAP operation.

[-required-approvers {<integer>|-}] - Required Number of Approvers

This specifies the required number of approvers to approve the ONTAP execution request. This is an optional parameter. If required-approvers is not specified for the rule, the required-approvers from the global setting is applied to the ONTAP operation request. The required-approvers from the global setting can be viewed using the [security multi-admin-verify show](#) command. The minimum supported value is 1.

[-approval-groups <text>,...] - Approval Groups

This specifies the list of users who can approve the ONTAP operation request. This is an optional parameter. If approval-groups is not specified for the rule, the approval-groups from the global setting is applied to the ONTAP operation request. The approval-groups from the global setting can be viewed using the [security multi-admin-verify show](#) command.

[-execution-expiry [<integer>d [<integer>h [<integer>m [<integer>s]]] - Execution Expiry

This specifies the amount of time after a request has been approved by which the operation must be executed before the approved execution request expires. This is an optional parameter. If execution-expiry is not specified for the rule, the execution-expiry from the global setting is applied to the ONTAP execution request. The execution-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

[-approval-expiry [<integer>d [<integer>h [<integer>m [<integer>s]]] - Approval Expiry

This specifies the amount of time after a new execution request is submitted by which approvers have to approve or disapprove the request before the pending execution request expires. This is an optional parameter. If approval-expiry is not specified for the rule, the approval-expiry from the global setting is applied to the ONTAP execution request. The approval-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

Examples

The following example creates a new rule for the ONTAP operation volume delete with 3 required approvers and is applicable to Vserver vs0 objects:

```
cluster1::> security multi-admin-verify rule create -operation "volume
delete" -query "-vserver vs0" -required-approvers 3
```

security multi-admin-verify rule delete

Delete a rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify rule delete` command deletes the specified rule.

Parameters

-vserver <vserver> - Vserver

This specifies the Vserver information to which the rule is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

-operation <text> - Operation

This specifies the ONTAP operation whose associated rule is to be deleted.

Examples

The following example deletes the rule for ONTAP operation volume delete and the default Vserver cluster1:

```
cluster1::> security multi-admin-verify rule delete -operation "volume
delete"
```

security multi-admin-verify rule modify

Modify a rule

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify rule modify` command is used to modify the attributes of the rule.

Parameters

-vserver <vserver> - Vserver

This specifies Vserver information for which the rule should be associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

-operation <text> - Operation

This specifies the ONTAP operation information for the rule to be created.

[-auto-request-create {true|false}] - Automatic Request Creation

This specifies rule information for the auto request create state. Auto request creation for the rule is enabled by default, by setting this value to true.

[-query <query>] - Query

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule to be created. This is an optional parameter. If a query is not specified for the rule, the rule applies to all objects of the ONTAP operation.

[-required-approvers {<integer>|-}] - Required Number of Approvers

This specifies the required number of approvers to approve the ONTAP execution request. This is an optional parameter. If required-approvers is not specified for the rule, the required-approvers from the global setting is applied to the ONTAP operation request. The required-approvers from the global setting can be viewed using the [security multi-admin-verify show](#) command. The minimum supported value is 1.

[-approval-groups <text>,...] - Approval Groups

This specifies the list of users who can approve the ONTAP operation request. This is an optional parameter. If approval-groups is not specified for the rule, the approval-groups from the global setting is applied to the ONTAP operation request. The approval-groups from the global setting can be viewed using the [security multi-admin-verify show](#) command.

[-execution-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>] - Execution Expiry

This specifies the amount of time after a request has been approved by which the operation must be executed before the approved execution request expires. This is an optional parameter. If execution-expiry is not specified for the rule, the execution-expiry from the global setting is applied to the ONTAP execution request. The execution-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

[-approval-expiry <[<integer>d [<integer>h [<integer>m [<integer>s]]>] - Approval Expiry

This specifies the amount of time after a new execution request is submitted by which approvers have to approve or disapprove the request before the pending execution request expires. This is an optional parameter. If approval-expiry is not specified for the rule, the approval-expiry from the global setting is applied to the ONTAP execution request. The approval-expiry from the global setting can be viewed using the [security multi-admin-verify show](#) command. The default value is one hour (*1h*), the minimum supported value is one second (*1s*), and the maximum supported value is 14 days (*14d*).

Examples

This command changes the approval groups:

```
cluster1:> security multi-admin-verify rule modify -operation "volume
delete" -approval-groups group1, group2
```

This command changes the required number of approvers:

```
cluster1::> security multi-admin-verify rule modify -operation "volume
snapshot delete" -required-approvers 3
```

This command changes the query:

```
cluster1::> security multi-admin-verify rule modify -operation "volume
delete" -query "-vserver vs1"
```

This command changes the execution expiry:

```
cluster1::> security multi-admin-verify rule modify -operation "volume
delete" -execution-expiry 14d
```

This command changes the approval expiry:

```
cluster1::> security multi-admin-verify rule modify -operation "volume
delete" -approval-expiry 48h
```

security multi-admin-verify rule show

Display rules

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security multi-admin-verify rule show` command displays information about multi admin verification rules.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver>] -Vserver

This specifies the Vserver information to which the rule is associated with. This is an optional parameter. This parameter defaults to a Cluster server and supports only Cluster servers.

[-operation <text>] - Operation

This specifies the ONTAP operation information for which the rule is created.

[-auto-request-create {true|false}] - Automatic Request Creation

This specifies the information of the auto request create state for the rule.

[-query <query>] - Query

This specifies the query information which is applied to the subset of objects of ONTAP operation of the rule.

[-required-approvers {<integer>|-}] - Required Number of Approvers

This specifies the number of approvers that are required to approve the ONTAP execution request.

[-approval-groups <text>,...] - Approval Groups

This specifies the list of approval groups that lists the users who can approve the ONTAP execution request.

[-execution-expiry [<integer>d [<integer>h [<integer>m [<integer>s]]] - Execution Expiry

This specifies the amount of time that the authorized users have after a request is approved to execute the requested operation before the request expires.

[-approval-expiry [<integer>d [<integer>h [<integer>m [<integer>s]]] - Approval Expiry

This is the amount of time that the approvers have after a new execution request is submitted to approve or disapprove the request before the request expires.

[-time-created <MM/DD/YYYY HH:MM:SS>] - Time Created

This specifies the time at which the rule is created.

[-system-defined {true|false}] - Is System Defined

Displays the value true if rule is defined by the system. Displays the value false if rule is defined by the user.

Examples

The following example displays typical rule information:

```

cluster1::> security multi-admin-verify rule show

```

		Required
Approval		
Vserver	Operation	Approvers
Groups		

cluster1	security login password	1 -
	Query: -multi-admin-approver true -different-user true	
	security multi-admin-verify approval-group create	1 -
	security multi-admin-verify approval-group delete	1 -
	security multi-admin-verify approval-group modify	1 -
	security multi-admin-verify approval-group replace	1 -
	security multi-admin-verify modify	1 -
	security multi-admin-verify rule create	1 -
	security multi-admin-verify rule delete	1 -
	security multi-admin-verify rule modify	1 -
	volume delete	3 -
	Query: -vserver vs0	

10 entries were displayed.

security oauth2 commands

security oauth2 modify

Modify global OAuth 2.0 configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 modify` command enables or disables the OAuth 2.0 feature for token-based authentication.

Parameters

[-enabled {true|false}] - OAuth 2.0 Enabled

Use this parameter to enable or disable the OAuth 2.0 feature for the cluster.

Examples

The following example enables the OAuth 2.0 feature for the cluster:

```
cluster1::> security oauth2 modify -enabled true
```

security oauth2 show

Display global OAuth 2.0 configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 show` command displays the status of the OAuth 2.0 feature.

Examples

The following example displays the OAuth 2.0 feature status information -

```
cluster1::> security oauth2 show
Is OAuth 2.0 Enabled: true
```

security oauth2 client create

Configure OAuth 2.0 Provider

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 client create` command creates OAuth 2.0 Provider configuration with the specified configuration name for token-based authentication. This command does not enable the OAuth 2.0 feature, it only configures it. Configuring and enabling the OAuth2.0 feature is a two-step process:

- Create an OAuth 2.0 Provider configuration using the `security oauth2 client create` command.
- Enable the OAuth 2.0 feature using the `security oauth2 modify -enabled true` command. This step must be performed once regardless of the number of providers configured. If you have already enabled the OAuth 2.0 feature as part of configuring another provider, you do not have to perform this step again for this provider.

After an OAuth 2.0 configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

Enabling/Disabling OAuth 2.0 restarts the web server. Any HTTP/S connections that are active will be disrupted.

Parameters

-config-name <text> - Configuration Entry Name

This is the OAuth 2.0 configuration entry name.

-application <OAuth 2.0 Applications> - Application

This is the application for which OAuth 2.0 is configured. Currently only the *http* application is supported.

-issuer {scheme://(hostname|IPv4 Address|['IPv6 Address'])...} - OAuth 2.0 Issuer

This is the OAuth 2.0 issuer to match with the "iss" field from the access token.

[-audience <text>] - OAuth 2.0 Audience

This is the OAuth 2.0 audience to match with the "aud" field from the access token. If this parameter is not set, then the "aud" field will not be matched and the REST API request will be forwarded to the provider with the matching "iss" field.

[-client-id <text>] - OAuth 2.0 Client ID

This is the Client identifier used in token introspection calls to the IdP server.

[-introspection-endpoint {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - OAuth 2.0 Token Introspection Endpoint Location

This is the URI of the desired IdP server used for token introspection.

[-introspection-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W] | disabled}] - OAuth 2.0 Token Introspection Refresh Interval in ISO-8601 format

This is the refresh interval in ISO-8601 format for caching the introspected tokens. When not set, the default value of *0s* is used, which caches introspected tokens for a period of "exp" value in the access token. This can be set to the value *disabled* to disable caching of tokens. Otherwise, it can be set to a value from *1s* to *2147483647s*.

[-remote-user-claim <text>] - OAuth 2.0 Remote User Claim

When the *-use-local-roles-if-present* parameter is set to true, and the token scope rules do not explicitly allow or deny the request, the value of the *-remote-user-claim* field will be used to find a match in the local user database for a user of the same name with the application of type *http* and authentication method *password*. When not set, the default value of *sub* is used.

[-provider-jwks-uri {scheme://(hostname|IPv4 Address|['IPv6 Address'])...}] - OAuth 2.0 Provider JSON Web Key Set Location

This is the URI where the JSON Web Key Set (JWKS) is hosted by the Identity Provider server.

[-jwks-refresh-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}] - OAuth 2.0 JSON Web Key Set Refresh Interval in ISO-8601 format

This is the refresh interval in ISO-8601 format for caching the JSON Web Key Set (JWKS) key set obtained from the provider-jwks-uri. When not set, the default value of *1h* is used. This can be set to a value from *3600s* to *2147483647s*.

[-outgoing-proxy <text>] - OAuth 2.0 Outgoing Proxy To Access External IdPs

This is the value for outgoing proxy to access external identity providers (IdPs). Use this parameter for local validation to download the JWKS key set in the JWKS URI, or for remote introspection for validating the access token in the Bearer field of the REST API request when the system is behind a proxy.

`[-use-local-roles-if-present {true|false}] - Use Local Roles, If Present`

When this parameter is set to *true*, and the scopes in the access token do not explicitly allow or deny the request, the local user role matching the user in the `-remote-user-claim` field (defaults to value of the "sub" field of the access token if not specified) will be checked for authorization of the request. The default value is *false* when not set, which means only the scopes in the access token is used to approve or deny the request.

`[-skip-uri-validation {true|false}] - Skip URI Validations`

When this parameter is set to *true*, validation of `provider-jwks-uri` is skipped. The default value of this parameter is *false*.

`[-use-mutual-tls {none|request|required}] - Mutual TLS enforcement`

This is the Mutual TLS setting for the OAuth 2.0 configuration. When set to *required*, OAuth 2.0 mutual TLS authentication is enforced for all access tokens and any token that does not have `x5t#S256` property in the `cnf` section is rejected. The default value is *request* when not set, which means OAuth 2.0 mutual TLS authentication is enforced only if the `x5t#S256` property is present in the `cnf` section of the access token. This can be disabled by setting to value *none*.

`[-provider {basic|keycloak|auth0|adfs|entra}] - OAuth 2.0 Provider`

This parameter optionally specifies the Identity Provider type. The default value of this parameter is *basic*.

Examples

The following example creates OAuth 2.0 Provider configuration for Local Validation:

```
cluster1:> security oauth2 client create -config-name auth1 -application
http -issuer https://issuer.example.com/ -provider-jwks-uri
https://issuer.example.com/.well-known/jwks.json -use-local-roles-if
-present true -remote-user-claim preferred_username -outgoing-proxy
https://outgoing_proxy
```

The following example creates OAuth 2.0 Provider configuration for Remote Introspection:

```
cluster1:> security oauth2 client create -config-name auth1 -application
http -issuer https://issuer.example.com/ -client-id client_id -client
-secret client_secret -use-local-roles-if-present true -remote-user-claim
preferred_username -outgoing-proxy https://outgoing_proxy -use-mutual-tls
required
```

security oauth2 client delete

Delete OAuth 2.0 Provider

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 client delete` command is used to remove an OAuth 2.0 Provider configuration.

Parameters

-config-name <text> - Configuration Entry Name

This is the OAuth 2.0 configuration entry name.

Examples

The following example removes the OAuth 2.0 Provider configuration named `auth1`:

```
cluster1::> security oauth2 client delete -config-name auth1
```

The following example removes all OAuth2.0 Provider configurations:

```
cluster1::> security oauth2 client delete -config-name *
```

security oauth2 client show

Display OAuth 2.0 Provider

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 client show` command displays the configured OAuth 2.0 Provider configuration.

Parameters

{ [-fields <fieldname>,...]

This specifies the fields that need to be displayed.

| [-instance] }

If this parameter is specified, the command displays information about all OAuth 2.0 configuration entries.

[-config-name <text>] - Configuration Entry Name

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified config-name.

[-application <OAuth 2.0 Applications>] - Application

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified application. Currently only the *http* application is supported.

`[-issuer {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Issuer`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified issuer.

`[-audience <text>] - OAuth 2.0 Audience`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified audience.

`[-client-id <text>] - OAuth 2.0 Client ID`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified client-id.

`[-hashed-client-secret <Hex String>] - Hashed representation of client secret`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified hashed-client-secret.

`[-introspection-endpoint {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Token Introspection Endpoint Location`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified introspection-endpoint.

`[-introspection-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W] | disabled}] - OAuth 2.0 Token Introspection Refresh Interval in ISO-8601 format`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified introspection-interval.

`[-remote-user-claim <text>] - OAuth 2.0 Remote User Claim`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified remote-user-claim.

`[-provider-jwks-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...}] - OAuth 2.0 Provider JSON Web Key Set Location`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified provider-jwks-uri.

`[-jwks-refresh-interval {P[<integer>D]T[<integer>H][<integer>M][<integer>S] | P[<integer>W]}] - OAuth 2.0 JSON Web Key Set Refresh Interval in ISO-8601 format`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified jwks-refresh-interval.

`[-outgoing-proxy <text>] - OAuth 2.0 Outgoing Proxy To Access External IdPs`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified outgoing-proxy.

`[-use-local-roles-if-present {true|false}] - Use Local Roles, If Present`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified use-local-roles-if-present.

`[-use-mutual-tls {none|request|required}] - Mutual TLS enforcement`

This is the Mutual TLS setting for the OAuth 2.0 configuration. When set to *required*, OAuth 2.0 mutual

TLS authentication is enforced for all access tokens and any token that does not have `x5t#S256` property in the `cnf` section is rejected. The default value is `request` when not set, which means OAuth 2.0 mutual TLS authentication is enforced only if the `x5t#S256` property is present in the `cnf` section of the access token. This can be disabled by setting to value `none`.

`[-provider {basic|keycloak|auth0|adfs|entra}] - OAuth 2.0 Provider`

If this parameter is specified, the command displays information only about the OAuth 2.0 configuration that match the specified Identity Provider.

Examples

The following example displays the OAuth 2.0 Provider configuration for Local Validation:

```
cluster1::> security oidc client show
Configuration Name: auth1
Application: http
Issuer: https://issuer.example.com/
Audience: -
Client ID: -
Hashed Client Secret: -
Introspection Endpoint: -
Introspection Refresh Interval : -
Use local roles: true
Provider JSON Web Key Set Location:
https://issuer.example.com/.well-known/jwks.json
JSON Web Key Set Refresh Interval: 1h
Remote User Claim: preferred_username
Outgoing Proxy: https://outgoing_proxy
Mutual TLS enforcement: request
Provider: basic
```

The following example displays the OAuth 2.0 Provider configuration for Remote Introspection:

```

cluster1::> security oidc client show
Configuration Name: auth1
Application: http
Issuer:
https://issuer.example.com/
Audience: -
Client ID: client_id
Hashed Client Secret:
e194e3472ee55c4202582cfbf59a03a37ef27085d2baf1b2fd7f7da3973c56fa
Introspection Endpoint: -
Introspection Refresh Interval : 0s
Use local roles: true
Provider JSON Web Key Set Location: -
JSON Web Key Set Refresh Interval: -
Remote User Claim: preferred_username
Outgoing Proxy: https://outgoing_proxy
Mutual TLS enforcement: required
Provider: basic

```

security oauth2 scope cli-to-scope generate

Generate OAuth 2.0 scope for the given CLI REST role creation command parameters

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 scope cli-to-scope generate` command generates an ONTAP-specific OAuth 2.0 scope string based on local ONTAP custom roles created using `security login rest-role create`.

Parameters

-role <text> - Role name

The role name as in the `security login rest-role create -role` parameter. This parameter is required.

-access <text> - Access level

The access level as in the `security login rest-role create -access` parameter. Valid access levels are `none`, `readonly`, `all`, `read_create`, `read_modify` and `read_create_modify`. This parameter is required.

[-api <text>] - API path

The REST API URI as in the `security login rest-role create -api` parameter. Valid APIs start with `/api/`. This parameter is required.

[-cluster-uuid <text>] - Cluster UUID

The cluster UUID for which this scope applies. This parameter is optional. If not specified, the OAuth 2.0 scope is applicable to all clusters.

Examples

To generate the OAuth 2.0 scope string applicable to all clusters for an ONTAP role named myrole for the REST API URI /api/cluster with admin (all) access:

```
cluster1::gt; security oauth2 scope cli-to-scope generate -role myrole
-api /api/cluster -access all -cluster-uuid *
ontap*:myrole:all:*/api/cluster
```

security oauth2 scope scope-to-cli generate

Generate CLI REST role command for the given OAuth 2.0 scope

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security oauth2 scope scope-to-cli generate` command generates an ONTAP CLI security login rest-role create command that is the equivalent of the specified OAuth 2.0 scope string.

Parameters

-scopeString <text> - OAuth 2.0 scope

The OAuth 2.0 scope string. This parameter is required.

Examples

To generate ONTAP CLI command given an OAuth 2.0 scope string applicable to all clusters for an ONTAP role named restclusterrole for the REST API URI /api/cluster with readonly access:

```
cluster1::gt; security oauth2 scope scope-to-cli generate -scopeString
ontap*:restclusterrole:readonly:*/api/cluster
Command for cluster <All>:
security login rest-role create -role restclusterrole -access readonly
-api /api/cluster
```

security protocol commands

security protocol modify

Modify application configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol modify` command modifies the existing cluster-wide configuration of RSH and Telnet. Enable RSH and Telnet in the cluster by setting the `enabled` field as `true`.

Parameters

-application <text> - application (privilege: advanced)

Selects the application. Supported values are *rsh* and *telnet*.

[-enabled {true|false}] - enabled (privilege: advanced)

Enables or disables the corresponding application. The default value is *false*.

Examples

The following command enables RSH in the cluster. The default setting for RSH is *false*:

```
cluster1::> security protocol modify -application rsh -enabled true
```

The following command enables Telnet in the cluster. The default setting for Telnet is *false*:

```
cluster1::> security protocol modify -application telnet -enabled true
```

security protocol show

Show application configuration options

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol show` command displays the cluster-wide configuration of RSH and Telnet in the cluster in advanced privilege mode. RSH and Telnet are disabled by default. Use the [security protocol modify](#) command to change the RSH and Telnet configuration that the cluster supports.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-application <text>] - application (privilege: advanced)

Displays the nonsecure applications in the cluster.

[-enabled {true|false}] - enabled (privilege: advanced)

Displays whether the application is enabled or disabled in the cluster.

Examples

The following example shows the default security protocol configurations for a cluster:

```
cluster1::> security protocol show
```

Application	Enabled
-----	-----
rsh	false
telnet	false

The following example shows the security protocol configuration after RSH and Telnet have been enabled:

```
cluster1::> security protocol show
```

Application	Enabled
-----	-----
rsh	true
telnet	true

- [security protocol modify](#)

security protocol ssh modify

Modify the SSH configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol ssh modify` command modifies the existing cluster-wide configuration of SSH

Parameters

[`-per-source-limit <integer>`] - Per-Source Limit (privilege: advanced)

Modifies the maximum number of SSH instances per source IP address on a per-node basis.

[`-max-instances <integer>`] - Maximum Number of Instances (privilege: advanced)

Modifies the maximum number of SSH instances that can be handled on a per-node basis.

[`-connections-per-second <integer>`] - Connections Per Second (privilege: advanced)

Modifies the maximum number of SSH connections per second on a per-node basis.

Examples

The following example modifies cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh modify -per-source-limit 30 -max
-instances 60 -connections-per-second 5
```

security protocol ssh show

Show the SSH configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security protocol ssh show` command displays the cluster-wide SSH configuration in advanced privilege mode. Use the [security protocol ssh modify](#) command to change the SSH configuration that the cluster supports.

Examples

The following example displays cluster-wide SSH configuration:

```
cluster1::*> security protocol ssh show
Per-Source Limit: 32
Maximum Number of Instances: 64
Connections Per Second: 10
```

security saml-sp commands

security saml-sp create

Configure SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) for single sign-on authentication. This command does not enable SAML SP, it just configures it. Configuring and enabling SAML SP is a two-step process:

- Create a SAML SP configuration using `security saml-sp create` command.
- Enable SAML SP by using [security saml-sp modify](#) `-is-enabled true`

After the SAML SP configuration is created, it cannot be modified. It must be deleted and created again to change any settings.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Parameters

-idp-uri {scheme://(hostname|IPv4 Address|'['IPv6 Address']')...} - Identity Provider (IdP) Metadata Location

This is the URI of the desired identity provider's (IdP) metadata.

[-sp-host <Remote InetAddress>] - SAML Service Provider Host

This specifies the SAML service provider host IP address.

{ -cert-ca <text> - Server Certificate Issuing CA

This specifies the service provider's certificate issuing CA.

-cert-serial <text> - Server Certificate Serial Number

This specifies the service provider's certificate's serial number.

[-cert-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name }

This specifies the service provider certificate's common name.

[-verify-metadata-server {true|false}] - Verify IdP Metadata Server Identity

When the IdP metadata is downloaded, the identity of the server hosting the metadata is verified using Transport Layer Security (TLS), validating the server's X.509 certificate against the list of certificate authorities (CAs) in ONTAP, and verifying that the host in the server certificate matches the host in the URI (the `idp-uri` field). This verification can be bypassed by setting this field to `false`. Bypassing the server verification is not recommended as the server can not be trusted that way, but will be necessary to use non-TLS URIs, e.g. with the "http" scheme, or when the server certificates are self-signed. If the server's certificate was signed by a CA that is not installed in ONTAP, the [security certificate install -type server-ca](#) command can be used to install it.

[-foreground {true|false}] - Foreground Process

When this parameter is set to `false` the command runs in the background as a job. The default is `true`, which causes the command to return after the operation completes.

Examples

The following example configures ONTAP with SAML SP IdP information:

```
cluster1::> security saml-sp create -idp-uri http://public-idp-uri -sp
-host 1.1.1.1
[Job 9] Job succeeded.
cluster1::>
```

Related Links

- [security saml-sp modify](#)
- [security certificate install](#)

security saml-sp delete

Delete SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP). Running this command frees resources used by the SP. SAML SP services will no longer be available after the SP is removed.

If the SAML SP is currently enabled, it is necessary to first use `security saml-sp modify -is-enabled false` prior to `security saml-sp delete`. The `security saml-sp modify -is-enabled false` command must be issued by a password authenticated console application user or from a SAML authenticated command interface.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Examples

The following example unconfigures SAML SP:

```
cluster1::> security saml-sp delete
cluster1::>
```

Related Links

- [security saml-sp modify](#)

security saml-sp modify

Modify SAML service provider authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp modify` command modifies the Security Assertion Markup Language (SAML) Service Provider (SP) configuration for single sign-on authentication. This command is used to enable or disable an existing SAML SP, `security saml-sp modify -is-enabled true` or `false` respectively.

This command will check the validity of the current SAML SP configuration before enabling the SP. Also, it is necessary to use this command with the `-is-enabled false` parameter prior to deleting an existing SAML SP configuration. SAML SP can only be disabled in this way by a password authenticated console application user or from a SAML authenticated command interface. The delete command must be used if the SAML configuration settings are to be changed, as only the `is-enabled` parameter can be modified.

This may restart the web server. Any HTTP/S connections that are active may be disrupted.

Parameters

`[-is-enabled {true|false}]` - SAML Service Provider Enabled

Use this parameter to enable or disable the SAML SP.

Examples

The following example enables SAML SP:

```
cluster1::> security saml-sp modify -is-enabled true
cluster1::>
```

security saml-sp repair

Repair a failed SAML SP configuration

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security saml-sp repair` command attempts to repair a failed SAML SP configuration on a given node. The status of the individual nodes can be viewed using the [security saml-sp status show](#) command.

This restarts the web server. Any active HTTP/S requests to the web server will be disrupted.

Parameters

`-node {<nodename>|local}` - Node (privilege: advanced)

This identifies a single node that matches the input. The repair job will run on this node.

`[-foreground {true|false}]` - Foreground Process (privilege: advanced)

When this parameter is set to *false* the command runs in the background as a job. The default is *true*, which causes the command to return after the operation completes.

Examples

The following example repairs a failed SAML SP configuration:

```
cluster1:> security saml-sp repair -node node-2
Warning: This restarts the web server. Any active HTTP/S requests to the
web
           server will be disrupted
Do you want to continue? {y|n}: y
      [Job 1321] Job succeeded.
cluster1:>
```

Related Links

- [security saml-sp status show](#)

security saml-sp show

Display SAML service provider for authentication

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp show` command displays the Security Assertion Markup Language (SAML) Service Provider (SP) configuration.

The `Identity Provider (IdP) URI` indicates the URI of the desired IdP's metadata.

The `Service Provider (SP) host` indicates the IP address containing SAML SP metadata.

The `Certificate Common Name` indicates the SAML SP certificate's common name.

The `Certificate Serial` indicates the SAML SP certificate's serial number.

Examples

The following example displays the SAML SP configuration:

```
cluster1::> security saml-sp show
Identity Provider URI: https://www.my.idp.com
  Service Provider Host: 1.1.1.1
    Certificate Name: mycert
      Certificate Serial: 1234abcd
        Is SAML Enabled: false
```

security saml-sp default-metadata create

Create SAML Default Metadata

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp default-metadata create` command configures ONTAP with Security Assertion Markup Language (SAML) Service Provider (SP) default metadata for single sign-on authentication. The default metadata is used while configuring the Identity Provider (IDP).

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Parameters

`[-sp-host <Remote InetAddress>]` - SAML Service Provider Host

This specifies the SAML service provider host IP address.

`{ -cert-ca <text> }` - Server Certificate Issuing CA

This specifies the service provider's certificate issuing CA.

`-cert-serial <text>` - Server Certificate Serial Number

This specifies the service provider's certificate's serial number.

`[-cert-common-name <FQDN or Custom Common Name>]` - Server Certificate Common Name }

This specifies the service provider certificate's common name.

`[-foreground {true|false}]` - Foreground Process

When this parameter is set to *false* the command runs in the background as a job. The default is *true*, which causes the command to return after the operation completes.

Examples

The following example configures ONTAP with SAML default metadata:

```
cluster1::> security saml-sp default-metadata create -sp-host 1.1.1.1
[Job 9] Job succeeded: Access the SAML SP default metadata using the
URL:
https://1.1.1.1/saml-sp/Metadata
cluster1::>
```

security saml-sp default-metadata delete

Delete SAML Default Metadata

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp default-metadata delete` command is used to remove the Security Access Markup Language (SAML) Service Provider (SP) default metadata configuration.

This restarts the web server. Any HTTP/S connections that are active will be disrupted.

Examples

The following example unconfigures SAML SP default metadata:

```
cluster1::> security saml-sp default-metadata delete
cluster1::>
```

security saml-sp default-metadata show

Display SAML Default Metadata configuration

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security saml-sp default-metadata show` command displays the Security Assertion Markup Language (SAML) Service Provider (SP) default metadata configuration.

The `Service Provider (SP) host` indicates the IP address containing SAML SP metadata.

The `Certificate Issuing CA` indicates the issuing Certificate Authority (CA) of the SAML SP certificate.

The `Certificate Common Name` indicates the SAML SP certificate's common name.

The `Certificate Serial` indicates the SAML SP certificate's serial number.

Examples

The following example displays the SAML SP default metadata configuration:

```
cluster1::> security saml-sp default-metadata show
SAML Service Provider Host: 1.1.1.1
    Server Certificate Issuing CA: cluster-1
    Server Certificate Serial Number: 180D4457AB87E889
    Server Certificate Common Name: cluster-1
```

security saml-sp status show

Display SAML service provider configuration status

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `security saml-sp status show` command displays the SAML Service Provider (SP) status for all nodes in the cluster.

Parameters

[`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use '`-fields ?`' to display the fields to specify.

[`-instance`] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[*-node* {<nodename>|local}] - Node (privilege: advanced)

This identifies the node in the cluster.

[*-status* {not-configured|config-in-progress|config-failed|config-success}] - Update Status (privilege: advanced)

This identifies the SAML SP status on the specified node.

[*-error-text* <text>] - Error Text (privilege: advanced)

This identifies the error text associated with the latest saml SP update for this node.

[*-is-enabled* {true|false}] - SAML Service Provider Enabled (privilege: advanced)

When this parameter is set to *true* it indicates that the SAML SP is enabled on this node. Similarly, when this parameter is set to *false*, it indicates that the SAML SP is not enabled on this node.

[*-default-metadata* {not-configured|config-in-progress|config-failed|config-success}] - Default Metadata Status (privilege: advanced)

This identifies the SAML default metadata status on the specified node.

Examples

The following example displays the SAML SP status information for all nodes in the cluster.

```
cluster::security saml-sp status> show
```

Node	SAML SP Status	Enabled	Default Metadata Status
cluster-node1	not-configured	false	config-success
cluster-node2	not-configured	false	config-success

2 entries were displayed.
cluster::*>

security session commands

security session kill-cli

Kill a CLI session

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session kill-cli` command is used to terminate CLI sessions. If the session being killed is actively processing a non-read command, the kill will wait until the command is complete before terminating the session. If the session being killed is actively processing a read (show) command, the kill will wait until the current row is returned before terminating the session.

Parameters

-node {<nodename>|local} - Node

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

[-start-time <MM/DD HH:MM:SS>] - Start Time

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

-session-id <integer> - Session ID

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-application <text>] - Client Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

[-state {pending|active|idle}] - Session State

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

[-request <text>] - Active Command

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

Examples

The following example illustrates killing a CLI session by specifying the node and the session id.

```

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show
03/27 16:58:17 1359      ssh          10.98.16.164 cluster1 admin
650
2 entries were displayed.

cluster1::>

cluster1::> security session kill-cli -node node1 -session-id 1359
1 entry was acted on.

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show

cluster1::>

```

The following example illustrates killing a CLI session by specifying the node and specifying a query on idle-seconds.

```

cluster1::> security session show -node node1

Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin

-
    Active Seconds: 0 Request: security session show

cluster1::>

```

security session show

Show current CLI, ONTAPI, and REST sessions

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session show` command displays all active management sessions across the cluster.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that is processing the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that is processing the session.

[-start-time <MM/DD HH:MM:SS>] - Start Time

Selects the sessions that match this parameter value. This identifies the start time of the current active session.

[-session-id <integer>] - Session ID

Selects the sessions that match this parameter value. This number uniquely identifies a management session within a given node.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-application <text>] - Client Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipspace <IPspace>] - IPspace of Location

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made thus far in the active session. The following commands are not counted: top, up, cd, rows, history, exit.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that have failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took for this session.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took for this session.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that has been taken by all completed requests for the current session; it does not include session idle time.

[-state {pending|active|idle}] - Session State

Selects the sessions that match this parameter value. This identifies the state (pending, active, or idle) of the session. The state is "pending" if it hit a session limit and the session is waiting for another session to end. The state is "idle" for CLI sessions that are waiting at the command prompt. The state is "active" if the session is actively working on a request.

[-request <text>] - Request Input

Selects the sessions that match this parameter value. This identifies the request (command) that is currently being handled by the session.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When a session is not actively executing a command request (the session is idle), this indicates the time (in seconds) since the last request completed.

[-active-seconds <integer>] - Active Seconds

Selects the sessions that match this parameter value. When a session is actively executing a command request, this indicates the time (in seconds) since the current request started.

Examples

The following example illustrates displaying all active sessions across the cluster. In this example, we see one active session on node *node2* from the *console* application. We also see three active sessions on node *node1*. One is from the *console* application and two are from the *ssh* application. Also one of the *ssh* sessions is from user *diag* and the other *ssh* session is from user *admin*.

```
cluster1::> security session show
```

```
Node: node1                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 16:58:13 1358      console      console      cluster1 admin
-
    Active Seconds: 0 Request: security session show
03/27 17:17:04 1514      ssh          10.98.16.164 cluster1 admin
139
03/27 17:17:29 1515      ssh          10.98.16.164 cluster1 diag
115
```

```
Node: node2                Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----
03/27 17:18:54 1509      console      console      cluster1 admin
23
4 entries were displayed.
```

```
cluster1::>
```

The following example illustrates displaying all active sessions that have been idle for longer than 500 seconds.

```
cluster1::> security session show -idle-seconds > 500

Node: node1                      Interface: cli
Idle
Start Time      Sess ID Application Location      Vserver Username
Seconds
-----
-----

03/27 17:17:29 1515      ssh          10.98.16.164    cluster1 diag
583
2 entries were displayed.

cluster1::>
```

security session limit create

Create default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows creation of a default management session limit that does not yet exist. The default limits can be overridden for specific values within each category by using advanced privilege level commands.

Parameters

-interface {cli|ontapi|rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application|location|request|user|vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

-max-active-limit <integer> - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates creating a default limit for management sessions using the same application.

```
cluster1::> security session limit create -interface ontapi -category
application -max-active-limit 8
```

security session limit delete

Delete default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows deletion of a default management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application|location|request|user|vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

Examples

The following example illustrates deleting all default limits for CLI management sessions.

```
cluster1::> security session limit delete -interface cli -category *  
3 entries were deleted.
```

security session limit modify

Modify default session limit

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command allows modification of a default management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-category {application|location|request|user|vserver} - Category

The session type for this default limit. The following categories are supported: application, location, request, user, Vserver.

[-max-active-limit <integer>] - Max-Active Limit

The maximum number of concurrent sessions allowed for this interface and category.

Examples

The following example illustrates modifying the default limit for CLI management sessions from the same location.

```
cluster1::> security session limit modify -interface cli -category
location -max-active-limit 4
```

security session limit show

Show default session limits

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command shows the default management session limits that have been configured for each interface and category.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[-category {application|location|request|user|vserver}] - Category

Selects the sessions that match this parameter value. This identifies the category for the limit. The following categories are supported: application, location, request, user, and Vserver.

[-max-active-limit <integer>] - Max-Active Limit

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the default limits for management sessions.

```
cluster1::> security session limit show
Interface Category      Max-Active
-----
cli      user            2
cli      vserver          4
ontapi   vserver            2
3 entries were displayed.
```

security session limit application create

Create per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-application management session limit that does not yet exist.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application (privilege: advanced)

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and application.

Examples

The following example illustrates creating a limit for management sessions from a custom application.

```
cluster1::*> security session limit application create -interface ontapi
-application "custom_app" -max-active-limit 8
```

security session limit application delete

Delete per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-application management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application (privilege: advanced)

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

Examples

The following example illustrates deleting a limit for management sessions from a custom application.

```
cluster1::*> security session limit application delete -interface ontapi  
-application "custom_app"
```

security session limit application modify

Modify per-application session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-application management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-application <text> - Application (privilege: advanced)

The specified application to which this limit applies. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and application.

Examples

The following example illustrates modifying management session limits for some custom applications.

```
cluster1::*> security session limit application modify -interface ontapi  
-application custom* -max-active-limit 4  
2 entries were modified.
```

security session limit application show

Show per-application session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-application management session limits that have been configured for each interface and application.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[*-application* <text>] - Application (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the application for the limit. The limit with the application name *-default-* is the limit used for any application without a specific configured limit.

[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-application limits for ONTAPI management sessions.

```
cluster1::*> security session limit application show -interface ontapi
Interface Application          Max-Active
-----
ontapi    -default-            5
ontapi    custom_app           10
2 entries were displayed.
```

security session limit location create

Create per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-location management session limit that does not yet exist.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location (privilege: advanced)

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

-max-active-limit <integer> - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and location.

Examples

The following example illustrates creating a CLI limit for specific location.

```
cluster1::*> security session limit location create -interface cli
-location 10.98.16.164 -max-active-limit 1
```

security session limit location delete

Delete per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-location management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location (privilege: advanced)

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

Examples

The following example illustrates deleting limits for management sessions from a specific set of locations.

```
cluster1::*> security session limit location delete -interface * -location 10.98.*
3 entries were deleted.
```

security session limit location modify

Modify per-location session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-location management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-location <text> - Location (privilege: advanced)

The specified location to which this limit applies. The limit with the location name *-default-* (in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[-ipspace <IPspace>] - IPspace of Location (privilege: advanced)

This identifies the IPspace of the client location. If not specified, changes are made in the *Default* IPspace.

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and location.

Examples

The following example illustrates modifying management sessions limits for specific locations.

```
cluster1::*> security session limit location modify -interface * -location 10.98.* -max-active-limit 2
3 entries were modified.
```

security session limit location show

Show per-location session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-location management session limits that have been configured for each interface and location.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[*-location* <text>] - Location (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the location for the limit. The limit with the location name *-default-* (only in the *Default* IPspace) is the limit used for any location (in any IPspace) without a specific configured limit.

[*-ipspace* <IPspace>] - IPspace of Location (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the IPspace of the client location. The default IPspace is *Default*.

[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-location limits for management sessions.

```
cluster1::*> security session limit location show
Interface Location          IPspace      Max-Active
-----
cli      -default-             Default      16
cli      10.98.16.164        Default      0
ontapi   -default-             Default      6
ontapi   10.98.16.164        Default      0
4 entries were displayed.
```

security session limit request create

Create per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-request management session limit that does not yet exist.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name (privilege: advanced)

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and request.

Examples

The following example illustrates creating a limit for number of clients executing a specific API.

```
cluster1::*> security session limit request create -interface ontapi
-request storage-disk-get-iter -max-active-limit 2
```

security session limit request delete

Delete per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-request management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name (privilege: advanced)

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

Examples

The following example illustrates deleting custom limits for that were configured for the volume commands and APIs.

```
cluster1::*> security session limit request delete -interface * -request
volume*
4 entries were deleted.
```

security session limit request modify

Modify per-request session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-request management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-request <text> - Request Name (privilege: advanced)

The specified request to which this limit applies. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and request.

Examples

The following example illustrates modifying the limit of the number of clients simultaneously executing a specific API.

```
cluster1::*> security session limit request modify -interface ontapi
-request storage-disk-get-iter -max-active-limit 4
```

security session limit request show

Show per-request session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-request management session limits that have been configured for each interface and request.

Parameters

[*-fields* <fieldname>,...]

If you specify the *-fields* <fieldname>, ... parameter, the command output also includes the specified field or fields. You can use '*-fields ?*' to display the fields to specify.

[*-instance*] (privilege: advanced) }

If you specify the *-instance* parameter, the command displays detailed information about all fields.

[*-interface* {cli|ontapi|rest}] - Interface (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[*-request* <text>] - Request Name (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the request (command or API) for the limit. The limit with the request name *-default-* is the limit used for any request without a specific configured limit.

[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-request limits for management sessions.

```
cluster1::*> security session limit request show
Interface Request                               Max-Active
-----
cli          -default-                          10
ontapi       -default-                          5
ontapi       storage-disk-get-iter              2
3 entries were displayed.
```

security session limit user create

Create per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-user management session limit that does not yet exist.

Parameters

***-interface* {cli|ontapi|rest} - Interface (privilege: advanced)**

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User (privilege: advanced)

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

-max-active-limit <integer> - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

Examples

The following example illustrates creating a per-user limit override for ONTAPI requests for the *admin* user in the admin Vserver.

```
cluster1::*> security session limit user create -interface ontapi -vserver  
cluster1 -username admin -max-active-limit 16
```

security session limit user delete

Delete per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-user management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User (privilege: advanced)

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

Examples

The following example illustrates deleting all user-specific limits for CLI management sessions.

```
cluster1::*> security session limit user delete -interface cli -user !"-  
default-"  
2 entries were deleted.
```

security session limit user modify

Modify per-user session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-user management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-user <text> - User (privilege: advanced)

The specified user to which this limit applies. The limit with the user name *-default-* is the limit used for any user without a specific configured limit.

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface, Vserver, and user.

Examples

The following example illustrates modifying the admin user's limit for CLI management sessions.

```
cluster1::*> security session limit user modify -interface cli -vserver  
cluster1 -username admin -max-active-limit 30
```

security session limit user show

Show per-user session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-user management session limits that have been configured for each interface, Vserver, and user.

Parameters

[`-fields <fieldname>,...`]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[`-instance`] (privilege: advanced**) }**

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-interface {cli|ontapi|rest}`] - Interface (privilege: advanced**)**

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[`-vserver <vserver>`] - Vserver (privilege: advanced**)**

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[`-user <text>`] - User (privilege: advanced**)**

Selects the sessions that match this parameter value. This identifies the user for the limit. The limit with the user name `-default-` is the limit used for any user without a specific configured limit.

[`-max-active-limit <integer>`] - Max-Active Limit (privilege: advanced**)**

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-user limits for CLI management sessions. In this example, there is a default limit of 4 sessions for each user. That limit is expanded to 8 for the admin Vserver. That limit is further expanded to 20 for the `admin` user in the admin Vserver.

```
cluster1::*> security session limit user show -interface cli
Interface Vserver          User                      Max-Active
-----
cli        Cluster         -default-                4
cli        cluster1        -default-                8
cli        cluster1        admin                    20
3 entries were displayed.
```

security session limit vsver create

Create per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows creation of a per-Vserver management session limit that does not yet exist.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

-max-active-limit <integer> - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and Vserver.

Examples

The following example illustrates creating a per-Vserver limit override for ONTAPI requests on the admin Vserver.

```
cluster1::*> security session limit vsriver create -interface ontapi
-vserver cluster1 -max-active-limit 4
```

security session limit vsriver delete

Delete per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows deletion of a per-Vserver management session limit. The "Cluster" vsriver is used when the specific Vserver doesn't have a configured limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

Examples

The following example illustrates deleting all per-Vserver limits for management sessions except the default limit.

```
cluster1::*> security session limit vsriver delete -interface * -vserver
!Cluster
1 entries was deleted.
```

security session limit vserver modify

Modify per-vserver session limit

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command allows modification of a per-Vserver management session limit.

Parameters

-interface {cli|ontapi|rest} - Interface (privilege: advanced)

The interface (CLI, ONTAPI, or REST) to which the limit applies.

-vserver <vserver> - Vserver (privilege: advanced)

The specified Vserver to which this limit applies. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

The maximum number of concurrent sessions allowed for this interface and Vserver.

Examples

The following example illustrates modifying the admin Vserver's limit for CLI management sessions.

```
cluster1::*> security session limit vserver modify -interface cli -vserver  
cluster1 -max-active-limit 40
```

security session limit vserver show

Show per-vserver session limits

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command shows the per-Vserver management session limits that have been configured for each interface and Vserver.

Parameters

[-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

[-instance] (privilege: advanced) }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[`-interface {cli|ontapi|rest}`] - Interface (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) to which the limit applies.

[`-vserver <vserver>`] - Vserver (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the Vserver for the limit. The "Cluster" Vserver is used to limit Vservers that do not have a configured limit.

[`-max-active-limit <integer>`] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying the per-Vserver limits for management sessions.

```
cluster1::*> security session limit vsver show
Interface Vserver          Max-Active
-----
cli        Cluster         4
ontapi     Cluster         2
ontapi     cluster1        16
3 entries were displayed.
```

security session request-statistics show-by-application

Show session request statistics by application

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-application` command shows historical statistics for management session activity, categorized by application name. CLI sessions connections will have an application name based on the connection method, i.e.: *ssh*, *telnet*, *rsh*, *console*, or *ngsh*. ONTAPI sessions will extract the application name from the ZAPI request. ONTAP looks for the application name in the following three locations, in the following order of precedence:

1. The "X-Dot-Client-App" HTTP header;
2. The "app-name" attribute of the "netapp" element, within the ZAPI XML request;
3. The "User-Agent" HTTP header.

Parameters

{ [`-fields <fieldname>`,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified

field or fields. You can use '-fields ?' to display the fields to specify.

[-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-application <text>] - Application

Selects the sessions that match this parameter value. This identifies the calling application by name.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[-last-active-seconds <integer>] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

`[-total-seconds <integer>]` - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

`[-average-time <integer>]` - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

`[-success-percent <percent>]` - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

`[-blocked-percent <percent>]` - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

`[-failed-percent <percent>]` - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

`[-max-active-limit <integer>]` - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by application name.

```
cluster1::> security session request-statistics show-by-application
```

```

security session request-statistics show-by-location

Show session request statistics by location

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-location` command shows historical statistics for management session activity, categorized by client location.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-location <text>] - Client Location

Selects the sessions that match this parameter value. This identifies the location of the calling client application. This is typically the IP address of the calling client, or "console" or "localhost" for console or localhost connections.

[-ipSPACE <IPspace>] - IPspace of Location

Selects the sessions that match this parameter value. This identifies the IPspace of the client location.

[`-total <integer>`] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[`-blocked <integer>`] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[`-failed <integer>`] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[`-max-time <integer>`] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[`-last-time <integer>`] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[`-active <integer>`] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[`-max-active <integer>`] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[`-last-active-seconds <integer>`] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[`-idle-seconds <integer>`] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[`-total-seconds <integer>`] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[`-average-time <integer>`] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[`-success-percent <percent>`] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[`-blocked-percent <percent>`] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[-failed-percent <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by location.

```
cluster1::> security session request-statistics show-by-location

security session request-statistics show-by-request

Show session request statistics by request name

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-request` command shows historical statistics for management session activity, categorized by request (command or API name).

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-request <text>] - Request Name

Selects the sessions that match this parameter value. This identifies the command associated with these requests.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have

been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active requests.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active requests.

[-last-active-seconds <integer>] - Seconds Since Last Request Start

Selects the sessions that match this parameter value. When requests are active, this indicates the time (in seconds) since the last request started.

[-idle-seconds <integer>] - Idle Seconds

Selects the sessions that match this parameter value. When no requests are active, this indicates the time (in seconds) since the last request ended.

[-total-seconds <integer>] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[-average-time <integer>] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[-success-percent <percent>] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[-blocked-percent <percent>] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[*-failed-percent* <percent>] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[*-max-active-limit* <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity on a specific node, with a specific request query.

```
cluster1::> security session request-statistics show-by-request -node

security session request-statistics show-by-user

Show session request statistics by username

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-user` command shows historical statistics for management session activity, categorized by username. Entries for username 'autosupport' reflect commands that are executed by the AutoSupport OnDemand feature.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-username <text>] - Username

Selects the sessions that match this parameter value. This identifies the authenticated user associated with this management session.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[-blocked <integer>] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[-failed <integer>] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[-max-time <integer>] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[-last-time <integer>] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[-active <integer>] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[-max-active <integer>] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently

active sessions.

`[-last-active-seconds <integer>]` - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

`[-idle-seconds <integer>]` - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

`[-total-seconds <integer>]` - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

`[-average-time <integer>]` - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

`[-success-percent <percent>]` - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

`[-blocked-percent <percent>]` - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

`[-failed-percent <percent>]` - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

`[-max-active-limit <integer>]` - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by username.

```
cluster1::> security session request-statistics show-by-user

security session request-statistics show-by-vserver

Show session request statistics by Vserver

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

The `security session request-statistics show-by-vserver` command shows historical statistics for management session activity, categorized by vservers.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the sessions that match this parameter value. This identifies the node that processed the session.

[-interface {cli|ontapi|rest}] - Interface

Selects the sessions that match this parameter value. This identifies the interface (CLI, ONTAPI, or REST) that processed the session.

[-vserver <vserver>] - Vserver

Selects the sessions that match this parameter value. This identifies the Vserver associated with this management session.

[-total <integer>] - Total Requests

Selects the sessions that match this parameter value. This identifies the total number of requests that have been made on a session. The following commands are not counted: top, up, cd, rows, history, exit.

[`-blocked <integer>`] - Blocked Requests

Selects the sessions that match this parameter value. This identifies the number of requests that were blocked due to configured limits.

[`-failed <integer>`] - Failed Requests

Selects the sessions that match this parameter value. This identifies the number of requests that failed for any reason (including if they were blocked by configured limits).

[`-max-time <integer>`] - Maximum Time (ms)

Selects the sessions that match this parameter value. This identifies the maximum amount of time (in milliseconds) that any request took.

[`-last-time <integer>`] - Last Time (ms)

Selects the sessions that match this parameter value. This identifies the amount of time (in milliseconds) that the last request took.

[`-active <integer>`] - Number Active Now

Selects the sessions that match this parameter value. This identifies the number of currently active sessions.

[`-max-active <integer>`] - Max Number Active

Selects the sessions that match this parameter value. This identifies the maximum number of concurrently active sessions.

[`-last-active-seconds <integer>`] - Seconds Since Last Session Start

Selects the sessions that match this parameter value. When a session is active, this indicates the time (in seconds) since the last session started.

[`-idle-seconds <integer>`] - Idle Seconds

Selects the sessions that match this parameter value. When no sessions are active, this indicates the time (in seconds) since the last session ended.

[`-total-seconds <integer>`] - Total Seconds

Selects the sessions that match this parameter value. This identifies the total time (in seconds) that have been taken by all completed requests; it does not include session idle time.

[`-average-time <integer>`] - Average Time (ms)

Selects the sessions that match this parameter value. This identifies the mean time spent processing requests.

[`-success-percent <percent>`] - Success Percent

Selects the sessions that match this parameter value. This identifies the percentage of successful requests.

[`-blocked-percent <percent>`] - Blocked Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that were blocked due to configured limits.

[`-failed-percent <percent>`] - Failed Percent

Selects the sessions that match this parameter value. This identifies the percentage of requests that failed for any reason (including if they were blocked by configured limits).

[-max-active-limit <integer>] - Max-Active Limit (privilege: advanced)

Selects the sessions that match this parameter value. This identifies the configured limit that is used to throttle or reject requests.

Examples

The following example illustrates displaying historical statistics for all management session activity across the cluster, categorized by Vserver.

```
cluster1::> security session request-statistics show-by-vserver
```

security ssh commands

security ssh add

Add SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh add` command adds additional SSH key exchange algorithms or ciphers or MAC algorithms to the existing configurations of the cluster or a Vserver. The added algorithms or ciphers or MAC algorithms are enabled on the cluster or Vserver. If you change the cluster configuration settings, it is used as the default for all newly created Vservers. The existing SSH key exchange algorithms, ciphers, and MAC algorithms remain unchanged in the configuration. If the SSH key exchange algorithms or ciphers or MAC algorithms are already enabled in the current configuration, the command will does not not fail. ONTAP supports the *diffie-hellman-group-exchange-sha256*, *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm*, and *3des-cbc*. ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *umac-64*,

umac-64 , *umac-128* , *hmac-sha2-256* , *hmac-sha2-512* , *hmac-sha1-etm* , *hmac-sha1-96-etm* , *hmac-sha2-256-etm* , *hmac-sha2-512-etm* , *hmac-md5-etm* , *hmac-md5-96-etm* , *umac-64-etm* , and *umac-128-etm* . ONTAP supports host key algorithms of the following types: *ecdsa-sha2-nistp256* , *ssh-rsa* , *ssh-ed25519* , *rsa-sha2-256* and *rsa-sha2-512* .

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver to which you want to add additional SSH key exchange algorithms or ciphers.

[-key-exchange-algorithms <algorithm name>,...] - List of SSH Key Exchange Algorithms to Add

Adds the specified SSH key exchange algorithm or algorithms to the Vserver.

[-ciphers <cipher name>,...] - List of SSH Ciphers to Add

Adds the specified cipher or ciphers to the Vserver.

[-mac-algorithms <MAC name>,...] - List of SSH MAC Algorithms to Add

Adds the specified MAC algorithm or algorithms to the Vserver.

[-host-key-algorithms <HostKey Algorithms>,...] - List of SSH Host Key Algorithms to Add

Adds the specified host key algorithms to the Vserver.

Examples

The following command adds the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group-exchange-sha1* key exchange algorithms for the cluster1 Vserver. It also adds the *aes256-cbc* and *aes192-cbc* ciphers and the *hmac-sha1* and *hmac-sha2-256* MAC algorithms to the cluster1 Vserver.

```
cluster1::> security ssh add -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group-exchange-sha1
-ciphers aes256-cbc,aes192-cbc -mac-algorithms hmac-sha1,hmac-sha2-256
-host-key-algorithms ecdsa-sha2-nistp256,ssh-rsa,rsa-sha2-256,rsa-sha2-512
```

security ssh modify

Modify SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh modify` command replaces the existing configurations of the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether *ssh-rsa* signature scheme is enabled for RSA keys in publickey algorithms, for the cluster or a Vserver, with the configuration settings you specify. If you modify the cluster configuration settings, it will be used as the default for all newly created Vservers. ONTAP supports the *diffie-hellman-group-exchange-sha256* , *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1* , *diffie-hellman-*

group14-sha1 and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*, *aes128-gcm*, *aes256-gcm* and *3des-cbc*. ONTAP supports MAC algorithms of the following types: *hmac-sha1*, *hmac-sha1-96*, *hmac-md5*, *hmac-md5-96*, *umac-64*, *umac-64*, *umac-128*, *hmac-sha2-256*, *hmac-sha2-512*, *hmac-sha1-etm*, *hmac-sha1-96-etm*, *hmac-sha2-256-etm*, *hmac-sha2-512-etm*, *hmac-md5-etm*, *hmac-md5-96-etm*, *umac-64-etm* and *umac-128-etm*. ONTAP supports host key algorithms of the following types: *ecdsa-sha2-nistp256*, *ssh-rsa*, *ssh-ed25519*, *rsa-sha2-256* and *rsa-sha2-512*.

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver for which you want to replace the existing SSH configurations.

[-key-exchange-algorithms <algorithm name>,...] - Key Exchange Algorithms

Enables the specified SSH key exchange algorithm or algorithms for the Vserver. This parameter also replaces all existing SSH key exchange algorithms with the specified settings.

[-ciphers <cipher name>,...] - Ciphers

Enables the specified cipher or ciphers for the Vserver. This parameter also replaces all existing ciphers with the specified settings.

[-mac-algorithms <MAC name>,...] - MAC Algorithms

Enables the specified MAC algorithm or algorithms for the Vserver. This parameter also replaces all existing MAC algorithms with the specified settings.

[-max-authentication-retry-count <integer>] - Max Authentication Retry Count

Modifies the maximum number of authentication retry count for the Vserver.

[-host-key-algorithms <HostKey Algorithms>,...] - Host Key Algorithms

Enables the specified host key algorithm or algorithms for the Vserver. This parameter also replaces all existing host key algorithms with the specified settings.

[-is-rsa-in-publickey-algorithms-enabled {true|false}] - Is ssh-rsa in Publickey Algorithms Enabled

Modifies the flag to enable or disable *ssh-rsa* signature scheme, which is based on SHA-1 hash algorithm, for RSA keys in publickey algorithms.

[-login-grace-time <integer>] - Login Grace Time for SSH Connection in Seconds

Modifies the ssh connection login grace time.

Examples

The following command enables the *diffie-hellman-group-exchange-sha256* and *diffie-hellman-group14-sha1* key exchange algorithms for the "cluster1" Vserver. It also enables the *aes256-ctr*, *aes192-ctr* and *aes128-ctr* ciphers, *hmac-sha1* and *hmac-sha2-256* MAC algorithms for the "cluster1" Vserver. It also enables host key algorithms *ecdsa-sha2-nistp256*, *ssh-rsa*, *ssh-ed25519*, *rsa-sha2-256* and *rsa-sha2-512*. It also disables *ssh-rsa* signature scheme for RSA keys in publickey algorithms and modifies the maximum authentication retry count to 3 for the "cluster1" Vserver:

```
cluster1::> security ssh modify -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group-exchange-sha256,diffie-hellman-group14-sha1 -ciphers
aes256-ctr,aes192-ctr,aes128-ctr -mac-algorithms hmac-sha1,hmac-sha2-256
-host-key-algorithms ecdsa-sha2-nistp256,ssh-rsa,ssh-ed25519,rsa-sha2-
256,rsa-sha2-512 -is-rsa-in-publickey-algorithms-enabled false -max
-authentication-retry-count 3
```

security ssh prepare-to-downgrade

Downgrade the SSH configuration to be compatible with releases earlier than Data ONTAP 9.2.0.

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

This command downgrades the SSH configurations of all Vservers and the cluster to settings compatible with releases earlier than ONTAP 9.2.0. This command also disables the max-authentication-retry feature. You must run this command in advanced privilege mode when prompted to do so during the release downgrade. Otherwise, the release downgrade process will fail.

Examples

The following command downgrades the SSH security configurations of all Vservers and the cluster to settings compatible with releases earlier than ONTAP 9.2.0.

```
cluster1::*> security ssh prepare-to-downgrade
```

security ssh remove

Remove SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security ssh remove` command removes the specified SSH key exchange algorithms or ciphers from the existing configurations of the cluster or a Vserver. The removed algorithms or ciphers are disabled on the cluster or Vserver. If you changed the cluster configuration settings, it will be used as the default for all newly created Vservers. If the SSH key exchange algorithms or ciphers that you specify with this command are not currently enabled, the command does not fail. ONTAP supports the *diffie-hellman-group-exchange-sha256*, *diffie-hellman-group16-sha512* and *diffie-hellman-group18-sha512* key exchange algorithms for SHA-2. ONTAP also supports the *diffie-hellman-group-exchange-sha1*, *diffie-hellman-group14-sha1*, and *diffie-hellman-group1-sha1* SSH key exchange algorithms for SHA-1. The SHA-2 key exchange algorithm is more secure than the SHA-1 key exchange algorithms. ONTAP also supports *ecdh-sha2-nistp256*, *ecdh-sha2-nistp384*, *ecdh-sha2-nistp521*, and *curve25519-sha256*. ONTAP also supports the AES and 3DES symmetric encryption (also known as ciphers) of the following types: *aes256-ctr*, *aes192-ctr*, *aes128-ctr*, *aes256-cbc*, *aes192-cbc*, *aes128-cbc*,

aes128-gcm , *aes256-gcm* and *3des-cbc* . ONTAP supports MAC algorithms of the following types: *hmac-sha1* , *hmac-sha1-96* , *hmac-md5* , *hmac-md5-96* , *umac-64* , *umac-64* , *umac-128* , *hmac-sha2-256* , *hmac-sha2-512* , *hmac-sha1-etm* , *hmac-sha1-96-etm* , *hmac-sha2-256-etm* , *hmac-sha2-512-etm* , *hmac-md5-etm* , *hmac-md5-96-etm* , *umac-64-etm* , and *umac-128-etm* .

Parameters

-vserver <Vserver Name> - Vserver

Identifies the Vserver from which you want to remove the SSH key exchange algorithms or ciphers.

[-key-exchange-algorithms <algorithm name>,...] - List of SSH Key Exchange Algorithms to Remove

Removes the specified key exchange algorithm or algorithms from the Vserver.

[-ciphers <cipher name>,...] - List of SSH Ciphers to Remove

Removes the specified cipher or ciphers from the Vserver.

[-mac-algorithms <MAC name>,...] - List of SSH MAC Algorithms to Remove

Removes the specified MAC algorithm or algorithms from the Vserver.

[-host-key-algorithms <HostKey Algorithms>,...] - List of SSH Host Key Algorithms to Remove

Removes the specified host key algorithms from the Vserver.

Examples

The following command removes the *diffie-hellman-group1-sha1* and *diffie-hellman-group-exchange-sha1* key exchange algorithms from the cluster1 Vserver. It also removes the *aes128-cbc* and *3des-cbc* ciphers and the *hmac-sha1-96* and *hmac-sha2-256* MAC algorithms from the cluster1 Vserver.

```
cluster1::> security ssh remove -vserver cluster1 -key-exchange-algorithms
diffie-hellman-group1-sha1,diffie-hellman-group-exchange-sha1 -ciphers
aes128-cbc,3des-cbc -mac-algorithms hmac-sha1-96,hmac-sha2-256
```

security ssh show

Display SSH configuration options

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `` security ssh show`` command displays the configurations of the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether ```_ssh-rsa_``` signature scheme is enabled for RSA keys in publickey algorithms, for the cluster and Vservers. The SSH protocol uses a Diffie-Hellman based key exchange method to establish a shared secret key during the SSH negotiation phrase. The key exchange method specifies how one-time session keys are generated for encryption and authentication and how the server authentication takes place. ONTAP supports the ```_diffie-hellman-group-exchange-sha256_```, ```_diffie-hellman-group16-sha512_``` and ```_diffie-hellman-group18-sha512_``` key exchange algorithms for SHA-2. ONTAP also supports the ```_diffie-hellman-group-exchange-sha1_```, ```_diffie-hellman-group14-sha1_```, and ```_diffie-hellman-group1-sha1_``` key exchange algorithms for SHA-1. ONTAP also supports ```_ecdh-sha2-nistp256_```, ```_ecdh-sha2-nistp384_```, ```_ecdh-sha2-nistp521_``` and ```_curve25519-sha256_```. ONTAP also supports the AES and 3DES symmetric encryptions (also known as ciphers) of the following types: ```_aes256-ctr_```, ```_aes192-ctr_```, ```_aes128-ctr_```, ```_aes256-cbc_```, ```_aes192-cbc_```, ```_aes128-cbc_```, ```_aes128-gcm_```, ```_aes256-gcm_``` and ```_3des-cbc_```. ONTAP supports MAC algorithms of the following types: ```_hmac-sha1_```, ```_hmac-sha1-96_```, ```_hmac-md5_```, ```_hmac-md5-96_```, ```_umac-64_```, ```_umac-128_```, ```_hmac-sha2-256_```, ```_hmac-sha2-512_```, ```_hmac-sha1-etm_```, ```_hmac-sha1-96-etm_```, ```_hmac-sha2-256-etm_```, ```_hmac-sha2-512-etm_```, ```_hmac-md5-etm_```, ```_hmac-md5-96-etm_```, ```_umac-64-etm_``` and ```_umac-128-etm_```. ONTAP supports host key algorithms of the following types: ```_ecdsa-sha2-nistp256_```, ```_ssh-rsa_```, ```_ssh-ed25519_```, ```_rsa-sha2-256_``` and ```_rsa-sha2-512_```.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Identifies the Vserver for which you want to display the SSH key exchange algorithms, ciphers, MAC algorithms, maximum authentication retry count, host key algorithms and whether `ssh-rsa` signature scheme is enabled for RSA keys in publickey algorithms.

[-key-exchange-algorithms <algorithm name>,...] - Key Exchange Algorithms

Displays the Vserver or Vservers that have the specified key exchange algorithms enabled.

[-ciphers <cipher name>,...] - Ciphers

Displays the Vserver or Vservers that have the specified ciphers enabled.

[-mac-algorithms <MAC name>,...] - MAC Algorithms

Displays the Vserver or Vservers that have the specified MAC algorithm or algorithms.

[-max-authentication-retry-count <integer>] - Max Authentication Retry Count

Displays Vservers with a matching maximum authentication retry count value. The default value of this parameter is *6*.

[-host-key-algorithms <HostKey Algorithms>,...] - Host Key Algorithms

Displays Vservers with matching host key algorithms.

[-is-rsa-in-publickey-algorithms-enabled {true|false}] - Is ssh-rsa in Publickey Algorithms Enabled

Identifies whether *ssh-rsa* signature scheme, which uses the SHA-1 hash algorithm, is enabled or disabled for RSA keys in publickey algorithms. The default value of this parameter is *true*.

[-login-grace-time <integer>] - Login Grace Time for SSH Connection in Seconds

Displays the SSH connection login grace time.

Examples

The following command displays the enabled SSH ciphers, key exchange algorithms, MAC algorithms, host key algorithms, whether *ssh-rsa* signature scheme is enabled for RSA keys in publickey algorithms and maximum number of authentication retry count for the cluster and all Vservers. The cluster settings are used as the default for all newly created Vservers:

```
cluster1::> security ssh show
```

```
Is ssh-rsa      Max
```

```
in Publickey Auth
```

Algorithms	Retry	Key Exchange	MAC	Host Key
Vserver	Ciphers	Algorithms	Algorithms	Algorithms
Enabled	Count			
-----	-----	-----	-----	-----
-----	-----			
cluster1	aes256-ctr,	curve25519-	hmac-sha1-etm,	ecdsa-sha2-
false	4			
	3des-cbc	sha256,	hmac-sha2-256-	nistp256,
		diffie-	etm,	rsa-sha2-256,
		hellman-	hmac-sha2-512	rsa-sha2-512
		group16-sha512		

```
Is ssh-rsa      Max
```

```
in Publickey Auth
```

Algorithms	Retry	Key Exchange	MAC	Host Key
Vserver	Ciphers	Algorithms	Algorithms	Algorithms
Enabled	Count			
-----	-----	-----	-----	-----
-----	-----			
vs1	aes256-ctr,	diffie-	hmac-sha2-256,	ecdsa-sha2-
true	6			
	aes192-ctr,	hellman-group-	hmac-sha2-512,	nistp256,
	aes128-ctr,	exchange-	hmac-sha2-256-	ssh-rsa,
	aes128-gcm,	sha256,	etm,	ssh-ed25519,
	aes256-gcm	ecdh-sha2-	hmac-sha2-512-	rsa-sha2-256,

security ssl commands

security ssl modify

Modify the SSL configuration for HTTP servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command modifies the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

Parameters

-vserver <Vserver Name> - Vserver

Identifies a Vserver for hosting SSL-encrypted web services.

[-ca <text>] - Server Certificate Issuing CA

Identifies a Certificate Authority (CA) of a certificate to be associated with the instance of a given Vserver. If this parameter, along with serial, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

[-serial <text>] - Server Certificate Serial Number

Identifies a serial number of a certificate to be associated with the instance of a given Vserver. If this parameter, along with ca, is omitted during modification, a self-signed SSL certificate can be optionally generated for that Vserver.

[-common-name <FQDN or Custom Common Name>] - Server Certificate Common Name

Identifies the common name (CN) of a certificate to be associated with the instance of a given Vserver. This parameter becomes optional if serial and ca are specified. You can use the [security certificate create](#) and [security certificate install](#) commands to add new certificates to Vservers.

The use of self-signed SSL certificates exposes users to man-in-the-middle security attacks. Where possible, obtain a certificate that is signed by a reputable certificate authority (CA) and use the [security certificate install](#) command to configure it before enabling SSL on a Vserver.

[-server-enabled {true|false}] - SSL Server Authentication Enabled

Defines the working condition of SSL server authentication in an instance of the Vserver. Any Vserver with a valid certificate of type server is server-enabled.

[-client-enabled {true|false}] - SSL Client Authentication Enabled

Defines the working condition of SSL client authentication in an instance of the Vserver. Any Vserver with a valid certificate of type client-ca is client-enabled. It can only be enabled if server-enabled is true.

[-ocsp-enabled {true|false}] - Online Certificate Status Protocol Validation Enabled

This parameter enables OCSP validation of the client certificate chain. When this parameter is enabled, certificates in the certificate chain of the client will be validated against an OCSP responder after normal

verification (including CRL checks) has occurred. The OCSP responder used for validation process is either extracted from the certificate itself, or it is derived by configuration.

`[-ocsp-default-responder <text>]` - URI of the Default Responder for OCSP Validation

This parameter sets the default OCSP responder to use. If this parameter is not enabled, the URI given will be used only if no responder URI is specified in the certificate that are being verified.

`[-ocsp-override-responder {true|false}]` - Force the Use of the Default Responder URI for OCSP Validation

This parameter forces the configured default OCSP responder to be used during OCSP certificate validation, even if the certificate that is being validated references an OCSP responder.

`[-ocsp-responder-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for OCSP Queries

Use this parameter to specify the timeout in seconds for OCSP responders. Specify zero for the minimum possible timeout. The default value is 10 seconds.

`[-ocsp-max-response-age <integer_or_unlimited>]` - Maximum Allowable Age for OCSP Responses (secs)

This parameter sets the maximum allowable age (freshness) in seconds for the OCSP responses. The default value for this parameter is unlimited, which does not enforce a maximum age and the OCSP responses are considered valid as long as their expiration date field is in the future.

`[-ocsp-max-response-time-skew <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Maximum Allowable Time Skew for OCSP Response Validation

This parameter sets the maximum allowable time difference for OCSP responses (when validating their "ThisUpdate" and "NextUpdate" fields).

`[-ocsp-use-request-nonce {true|false}]` - Use a NONCE within OCSP Queries

This parameter determines whether the queries to the OCSP responders should contain a NONCE or not. By default, a query NONCE is always used and checked against the OCSP response. When the responder does not use NONCEs, this parameter should be disabled.

A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

Examples

The following example enables SSL server authentication for a Vserver named vs0 with a certificate that has ca as www.example.com and serial as 4F4EB629.

```
cluster1:> security ssl modify -vserver vs0 -ca www.example.com -serial
4F4EB629 -server-enabled true
```

The following example disables SSL server authentication for a Vserver name vs0.

```
cluster1:> security ssl modify -vserver vs0 -server-enabled false
```

The following example enables SSL client authentication for a Vserver named vs0.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled true
```

The following example disables SSL client authentication for a Vserver named vs0.

```
cluster1::> security ssl modify -vserver vs0 -client-enabled false
```

security ssl show

Display the SSL configuration for HTTP servers

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

This command displays the configuration of encrypted HTTP (SSL) for Vservers in the cluster. Depending on the requirements of the individual node's or cluster's web services (displayed by the [vserver services web show](#) command), this encryption might or might not be used. If the Vserver does not have a certificate associated with it, SSL will not be available.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-ocsp]

If you specify the `-ocsp` parameter, the command displays the Online Certificate Status Protocol configuration.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <Vserver Name>] - Vserver

Identifies a Vserver for hosting SSL-encrypted web services.

[-ca <text>] - Server Certificate Issuing CA

Filters the display of SSL configuration by specifying the Certificate Authority (CA) that issued the server certificate.

`[-serial <text>]` - Server Certificate Serial Number

Filters the display of SSL configuration by specifying the serial number of a server certificate.

`[-common-name <FQDN or Custom Common Name>]` - Server Certificate Common Name

Filters the display of SSL configuration by specifying the common name for the server certificate.

`[-server-enabled {true|false}]` - SSL Server Authentication Enabled

Filters the display of SSL configuration according to whether the SSL server authentication is enabled or disabled. Vservers have self-signed certificates automatically generated during their creation. These Vserver self-signed certificates are server-enabled by default.

`[-client-enabled {true|false}]` - SSL Client Authentication Enabled

Filters the display of SSL configuration according to whether the SSL client authentication is enabled or disabled. You can enable client authentication only when server authentication is enabled.

`[-ocsp-enabled {true|false}]` - Online Certificate Status Protocol Validation Enabled

Filters the display of SSL configuration when the Online Certificate Status Protocol validation is enabled.

`[-ocsp-default-responder <text>]` - URI of the Default Responder for OCSP Validation

Filters the display of SSL configuration according to the URI of the default responder for OCSP validation.

`[-ocsp-override-responder {true|false}]` - Force the Use of the Default Responder URI for OCSP Validation

Filters the display of SSL configuration, which forces the use of the default responder URI for OCSP validation.

`[-ocsp-responder-timeout <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Timeout for OCSP Queries

Filters the display of SSL configuration according to the timeout for queries to OCSP responders.

`[-ocsp-max-response-age <integer_or_unlimited>]` - Maximum Allowable Age for OCSP Responses (secs)

Filters the display of SSL configuration according to the maximum allowable age (freshness) in seconds for the OCSP responses.

`[-ocsp-max-response-time-skew <[<integer>d] [<integer>h] [<integer>m] [<integer>s]>]` - Maximum Allowable Time Skew for OCSP Response Validation

Filters the display of SSL configuration according to the maximum allowable time difference for OCSP responses (when validating their "ThisUpdate" and "NextUpdate" fields).

`[-ocsp-use-request-nonce {true|false}]` - Use a NONCE within OCSP Queries

Filters the display of SSL configuration by specifying whether the queries to the OCSP responders should contain a NONCE or not.

A NONCE is a unique identifier included in each OCSP request or OCSP response to prevent a replay attack.

Examples

The following example displays the configured certificates for Vservers.

```
cluster1::security ssl> show
```

Vserver	Serial Number	Common Name	Server Enabled	Client Enabled
cluster1	516C3CB3	cluster1.company.com	true	true
vs0	516816D4	vs0.company.com	true	false

2 entries were displayed.

security tpm commands

security tpm show

Display the status of TPM

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

This command displays information about the status of the Trusted Platform Module(TPM) device. By default, this command displays the following information:

- Node name
- Availability of the device
- State of the device, if available
- Firmware version
- Firmware upgrade counter
- Manufacturer Id

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

Selects the nodes that match this parameter value

`[-is-available {yes|no}] - Is TPM Available?`

Selects the nodes that match this parameter value.

- yes - The TPM device is mounted and available.
- no - The node does not support a TPM.

`[-is-active {yes|no}] - Is TPM Active?`

Selects the nodes that match this parameter value.

- yes - The TPM device is available and active.
- no - if `-is-available` parameter is `yes`, the TPM device is mounted and available but is not responding to TPM commands.

`[-version <text>] - Firmware Version`

Selects the nodes that match this firmware version.

`[-upgrade-count <integer>] - Firmware Counter`

Selects the nodes that match the given number of firmware upgrade tries left.

`[-sym-key-size <integer>] - Size of Primary Symmetric Key`

Selects the nodes that match the given symmetric key size for the primary symmetric key.

`[-manufacturer <text>] - Manufacturer Id`

Displays the TPM Manufacturer Id.

Examples

```
cluster1::> security tpm show
```

Node	Available?	Active?	Firmware Version	Firmware Counter	Manufacturer
node1	yes	yes	2.5	64	IFX
node2	yes	yes	2.5	64	IFX

2 entries were displayed.

security webauthn commands

security webauthn show

Show Webauthn Global Settings

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security webauthn show` displays information on the global FIDO2/WebAuthn settings.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the global WebAuthn settings.

[-vserver <vserver name>] - Vserver

Selects the WebAuthn settings that match this parameter value. If not specified, all cluster-level and Vserver-level settings are displayed.

[-timeout <integer>] - Timeout (ms)

Displays all the fields for the FIDO2/WebAuthn global settings.

[-attestation {none|indirect|direct|enterprise}] - Attestation Conveyance Type

Displays all the fields for the FIDO2/WebAuthn global settings.

[-require-rk {true|false}] - Require Resident Key

Displays all the fields for the FIDO2/WebAuthn global settings.

[-resident-key {required|preferred|discouraged}] - Resident Key

Displays all the fields for the FIDO2/WebAuthn global settings.

[-user-verification {required|preferred|discouraged}] - User Verification

Displays all the fields for the FIDO2/WebAuthn global settings.

[-scope {svm|cluster}] - Cluster or SVM

Displays all the fields for the FIDO2/WebAuthn global settings.

Examples

The example below displays information on FIDO2/WebAuthn global settings:

```
cluster1::> security webauthn show
Vserver: cluster1
          Timeout (ms): 600000
Attestation Conveyance Type: none
          Require Resident Key: false
          Resident Key: discouraged
          User Verification: discouraged
```

security webauthn credentials delete

Delete Webauthn Credentials Data

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security webauthn credentials delete` command deletes a previously registered FIDO2/WebAuthn credential. All users can delete their own registered FIDO2/WebAuthn credentials, regardless of their authorization role. Only users with *admin* privileges can delete FIDO2/WebAuthn credentials belonging to other users.

Parameters

-vserver <vserver name> - Vserver

This parameter optionally specifies the Vserver associated with the FIDO2/WebAuthn credential. If not specified, this defaults to the cluster Vserver.

-username <text> - Username

Name of the user whose credential is to be deleted.

-index <integer> - Index

The index of the FIDO2/WebAuthn credential to be deleted. This is used to identify the specific credential if the user has multiple FIDO2/WebAuthn credentials registered and only one of them is to be deleted.

-rpId <text> - Relying Party ID

The rpId of the FIDO2/WebAuthn credential to be deleted.

Examples

The following command, when executed by a user with admin privileges, deletes all registered FIDO2/WebAuthn credentials for the Administrative Vserver. When executed by users without admin privileges, the command only deletes that user's own registered credentials:

```
cluster1::> security webauthn credentials delete *  
4 entries were deleted.
```

The following command, when executed by a user with admin privileges, deletes all registered FIDO2/WebAuthn credentials for the Administrative Vserver for the username *user1*:

```
cluster1::> security webauthn credentials delete -username user1 *  
1 entry was deleted.
```

The following command, when executed by a user with admin privileges, deletes the registered FIDO2/WebAuthn credentials for the Administrative Vserver for the username *user1* at index *1* for the rpId *myontap.example.com*:

```
cluster1::> security webauthn credentials delete -username user1 -index 1  
-rpId myontap.example.com  
1 entry was deleted.
```

security webauthn credentials show

Show Webauthn Credentials Data

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security webauthn credentials show` displays information on the FIDO2/WebAuthn registered credentials.

Parameters

{ [-fields <fieldname>,...]

Selects the fields that you specify.

| [-instance] }

Displays all the fields for the FIDO2/WebAuthn registered credentials.

[-vserver <vserver name>] - Vserver

Selects the FIDO2/WebAuthn registered credentials that match this parameter value. Only cluster-level credentials are supported at this time.

[-username <text>] - Username

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-index <integer>] - Index

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-rpId <text>] - Relying Party ID

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-credential-id-sha <text>] - SHA-256 Hashed Credential ID

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-publickey-algorithm <text>] - Public Key Algorithm

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-publickey <text>] - Public Key

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-display-name <text>] - Display Name

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-credential-type <public-key>] - Credential Type

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[-rpName <text>] - Relying Party Name

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[*-creation-time* <MM/DD/YYYY HH:MM:SS>] - Creation Time

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[*-last-used* <MM/DD/YYYY HH:MM:SS>] - Last Used

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

[*-scope* {*svm*|*cluster*}] - Cluster or SVM

Selects the FIDO2/WebAuthn registered credentials that match this parameter value.

Examples

The example below displays information on the FIDO2/WebAuthn registered credentials:

```
cluster1:> security webauthn credentials show
Vserver: cluster1
                                Username: admin
                                Index: 0
                                Relying Party ID: myontap.example.com
                                SHA-256 Hashed Credential ID: aaaaaaaaaaaaaaaaaaaaaaaaaaaaaa
                                Public Key Algorithm: ES256
                                Public Key: abcd=
                                Display Name: admin
                                Credential Type: public-key
                                Relying Party Name: myontap.example.com
                                Creation Time: 6/10/2024 15:01:00
                                Last Used: 6/10/2024 15:01:00
```

security webauthn supported-algorithms show

Show WebAuthn Supported Algorithms

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `security webauthn supported-algorithms show` displays information on the FIDO2/WebAuthn supported algorithms.

Parameters

{ [*-fields* <fieldname>,...]

Selects the fields that you specify.

| [*-instance*] }

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

[-vserver <vserver name>] - Vserver

Selects the FIDO2/WebAuthn settings that match this parameter value. If not specified, all cluster-level and Vserver-level settings are displayed.

[-alg-name <text>] - Algorithm Name

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

[-alg-id <integer>] - Algorithm ID

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

[-alg-type <public-key>] - Algorithm Type

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

[-scope {svm|cluster}] - Cluster or SVM

Displays all the fields for the FIDO2/WebAuthn supported algorithms.

Examples

The example below displays information on the FIDO2/WebAuthn supported algorithms:

```
cluster1::> security webauthn supported-algorithms show
```

```
Vserver: cluster1
```

ID	Name	Type
-7	ES-256	public-key
-35	ES-384	public-key
-257	RS-256	public-key

```
3 entries were displayed.
```

snaplock commands

snaplock compliance-clock commands

snaplock compliance-clock initialize

Initializes the node ComplianceClock

Availability: This command is available to *cluster* administrators at the *admin* privilege level.

Description

`snaplock compliance-clock initialize` command is used to initialize System ComplianceClock from the system clock. User should ensure that the system clock is correct before initializing the System ComplianceClock. System ComplianceClock can be initialized multiple times as long as all nodes in the cluster are healthy, all volumes are in online state, no volumes are present in the volume recovery queue and there are no SnapLock volumes or volumes with "snapshot-locking-enabled" parameter set to true or S3 buckets with object locking enabled.

Parameters

-node {<nodename>|local} - Node

Specifies the name of the node on which System ComplianceClock needs to be initialized.

[-force <true>] - Forces Initialization

If you use this parameter, it will suppress the warning message during `snaplock compliance-clock initialize` operation.

Examples

```
cluster-1::> snaplock compliance-clock initialize -node node1
```

```
Warning: You are about to initialize the secure ComplianceClock of the
node
```

```
node1 to the current value of the node's system clock. This
procedure can be performed only once on a given node, so you
should
```

```
ensure that the system time is set correctly before proceeding.
```

```
The current node's system clock is: Wed Nov 26 16:18:30 IST 2014
```

```
Do you want to continue? {y|n}: y
```

```
cluster-1::>
```

snaplock compliance-clock show

Displays the node ComplianceClock

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The ``snaplock compliance-clock show`` command will display System ComplianceClock of the nodes in the cluster. It will display the following information:

- Node name
- ComplianceClock Time

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-node {<nodename>|local}] - Node

If this parameter is specified, the command will display ComplianceClock for that particular node only.

[-time <text>] - ComplianceClock Time of the Node

If this parameter is specified, the command will display nodes having the same `-time` value.

Examples

```
cluster1::> snaplock compliance-clock show
Node                               ComplianceClock Time
-----
node1                             Mon Jan 12 11:34:15 IST 2015 +05:30
node2                             Mon Jan 12 11:34:10 IST 2015 +05:30
2 entries were displayed.
```

```
cluster1::> snaplock compliance-clock show -node node1
Node                               ComplianceClock Time
-----
node1                             Mon Jan 12 11:34:45 IST 2015 +05:30
```

snaplock compliance-clock ntp modify

Modify SnapLock ComplianceClock synchronization setting

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snaplock compliance-clock ntp modify` command modifies the option to enable or disable the SnapLock ComplianceClock synchronization with the system time. The ComplianceClock is synchronized only when an NTP server has been configured so that the system time follows the NTP time and the skew between the ComplianceClock time and the system time is greater than 1 day.

Parameters

`[-is-sync-enabled {true|false}]` - Enable ComplianceClock sync to NTP system time (privilege: advanced)

Specifies whether synchronization should be enabled or not. This is a cluster wide option.

Examples

```
cluster1:> snaplock compliance-clock ntp modify -is-sync-enabled true
```

snaplock compliance-clock ntp show

Display SnapLock ComplianceClock synchronization setting

Availability: This command is available to *cluster* administrators at the *advanced* privilege level.

Description

The `snaplock compliance-clock ntp show` command will display ComplianceClock synchronization setting. It will display the following information:

- `is-sync-enabled` - Displays if the option to synchronize the ComplianceClock with system time has been enabled or not.

Examples

```
cluster1:> snaplock compliance-clock ntp show
Enable clock sync to NTP system time: true
```

snaplock event-retention commands

snaplock event-retention abort

Abort an Event Based Retention policy operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention abort` is used to abort an ongoing Event Based Retention (EBR) operation. This command only aborts the operations that have not yet completed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the vservers on which the EBR operation is running.

-operation-id <integer> - Operation ID

Specifies the operation ID of the EBR operation that needs to be aborted.

Examples

The following example aborts an ongoing EBR operation with operation-id `16842754`:

```
vs1::> snaplock event-retention abort -operation-id 16842754
vs1::>
```

snaplock event-retention apply

Apply an Event Based Retention policy on all files within a user specified path.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention apply` command starts a new operation to apply the specified Event Based Retention (EBR) policy to all files in the specified path. If a file is a regular file, it will be made a WORM file and retained for a retention-period as defined by the specified policy name. If a file is already WORM, its retention time will be extended to a retention-period as defined by the specified policy name, starting from the current time. The retention time of a file will be extended only if the file's current retention time is less than the new retention time value to be set. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver which has the EBR policy defined to be applied on one or more files.

-policy-name <text> - Policy Name

Specifies the name of the EBR policy to be applied on one or more files.

-volume <volume name> - Volume

Specifies the name of the SnapLock volume containing a file path or a directory path as specified by the path parameter. The specified EBR policy is applied to one or more files depending on the value of path.

-path <text> - Path

Specifies the path relative to the output volume root, of the form `"/path"`. The path can be path to a file or a directory. The EBR policy is applied to all files under the specified path. To apply the EBR policy to all files in a volume, specify the path as `"/"`.

Examples

The following example starts an EBR operation to apply a policy on files for specified volume:

```
vs1::> snaplock event-retention apply -policy-name p1 -volume slc -path /
        SnapLock event based retention operation is queued. Run
"snaplock event-retention show -operation-id 16842754 -instance" to view
the operation status.
```

snaplock event-retention show-vservers

Show Vservers with SnapLock Event Based Retention policies

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention show-vservers` command is used to display the Vservers that have SnapLock Event Based Retention (EBR) policies created.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

Examples

The following example displays all Vservers that have SnapLock EBR policies:

```
cluster-1::*> snaplock event-retention show-vservers
Vserver
-----
vs1
```

snaplock event-retention show

Show status of Event Based Retention operation

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention show` command displays the status of an Event Based Retention (EBR) operation. Information about completed operations will be cleaned up after an hour after completion. Only a

user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all EBR operations that match the specified Vserver.

[-operation-id <integer>] - Operation ID

If this parameter is specified, the command displays all EBR operations that match the specified operation ID.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays all EBR operations that match the specified volume. The parameter specifies the volume on which EBR operation is running or has completed.

[-path <text>] - Path

If this parameter is specified, the command displays all EBR operations that match the specified path. The parameter specifies the path on which EBR operation is running or has completed.

[-policy-name <text>] - Policy Name

If this parameter is specified, the command displays all EBR operations that match the specified policy name. The parameter specifies the EBR policy name.

[-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Retention Period

If this parameter is specified, the command displays all EBR operations that match the specified retention period. The parameter specifies the retention period of the EBR policy.

[-num-files-processed <integer>] - Number of Files Processed

If this parameter is specified, the command displays all EBR operations that match the specified number of processed files. The parameter specifies the number of files on which EBR policy was applied successfully.

[-num-files-failed <integer>] - Number of Files Failed

If this parameter is specified, the command displays all EBR operations that match the specified number of failed files. The parameter specifies the number of files on which the application of EBR policy failed.

[-num-files-skipped <integer>] - Number of Files Skipped

If this parameter is specified, the command displays all EBR operations that match the specified number of skipped files. The parameter specifies the number of files on which the application of EBR policy was skipped. A file that is under legal-hold will be skipped. If the retention time of a file is being shortened as a result of applying the EBR policy, that file will also be skipped.

[`-num-inodes-ignored` <integer>] - Number of Inodes Ignored

If this parameter is specified, the command displays all EBR operations that match the specified number of ignored inodes. The parameter specifies the number of inodes on which the application of EBR policy was not attempted because they were not regular files.

[`-operation-status` {Unknown|In-Progress|Failed|Aborting|Completed}] - Operation Status

If this parameter is specified, the command displays all EBR operations that match the specified operation status. The parameter specifies the operation status of an EBR operation.

[`-status-details` <text>] - Status Details

If this parameter is specified, the command displays all EBR operations that match the specified status details. The parameter specifies the status details of an EBR operation.

Examples

The following examples show the status of EBR operations for Vserver "vs1" and volume "slc" and the status of event-retention operation for operation ID `16842753` respectively.

```
vs1::*> snaplock event-retention operation show -volume slc
      Operation ID   Vserver      Volume      Operation
Status
-----
16842753           vs1          slc          Completed
16842754           vs1          slc          In-progress
vs1::*> snaplock event-retention operation show -operation-id 16842753
Operation ID: 16842753
      Vserver: vs1
      Volume: slc
      Path: /vol/slc/d1
      Policy Name: p1
      Retention Period: 10 years
Number of Files Processed: 50
  Number of Files Failed: 0
  Number of Inodes Ignored: 2
      Operation Status: Completed
      Status Details: No error
```

snaplock event-retention policy create

Create SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy create` command is used to create Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which a policy needs to be created.

-name <text> - Policy Name

Specifies the name of the EBR policy to be created.

-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite} - Event Retention Period

Specifies the retention period for an EBR policy.

Examples

The following example creates a new EBR policy "p1" for Vserver "vs1" with a retention period of "10 years":

```
vs1::> snaplock event-retention policy create -name p1 -retention-period
"10 years"
```

snaplock event-retention policy delete

Delete SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy delete` command is used to delete Event Based Retention (EBR) policies for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

If this parameter is specified, the command deletes all EBR policies that match the specified Vserver.

-name <text> - Policy Name

If this parameter is specified, the command deletes all EBR policies that match the specified *name*.

Examples

The following example deletes retention policy "p1" for Vserver "vs1":

```
vs1::> snaplock event-retention policy delete -name p1
```

snaplock event-retention policy modify

Modify SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy modify` command is used to modify the retention period of an Event Based Retention (EBR) policy for a Vserver. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which retention period of a policy needs to be modified.

-name <text> - Policy Name

Specifies the name of the EBR policy for which the retention period needs to be modified.

[-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Event Retention Period

Specifies the new value of retention period.

Examples

The following example modifies the retention period of policy "p1" for Vserver "vs1" to "5 years":

```
vs1::> snaplock event-retention policy modify -name p1 -retention-period  
"5 years"
```

snaplock event-retention policy show

Show SnapLock Event Based Retention policies for a Vserver

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock event-retention policy show` command is used to show Event Based Retention (EBR) policies for a Vserver. A policy consists of a *policy-name* and a *retention-period*. The command output depends on the parameter or parameters specified. If no parameters are specified, all policies for all vservers will be displayed. If one or more parameters are specified, only those entries matching the specified values will be displayed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>`, ... parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all EBR policies that match the specified Vserver.

[-name <text>] - Policy Name

If this parameter is specified, the command displays all EBR policies that match the specified *name* .

[-retention-period [{<integer> seconds|minutes|hours|days|months|years} | infinite]] - Event Retention Period

If this parameter is specified, the command displays all EBR policies that match the specified *retention-period* .

Examples

The following example displays all event-retention policies for vservers "vs1":

```
vs1::> snaplock event-retention policy show
```

Vserver	Name	Retention Period
vs1	p1	10 years
vs1	p2	5 years

snaplock legal-hold commands

snaplock legal-hold abort

Abort Snaplock legal-hold operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold abort` is used to abort an ongoing legal-hold operation. The type of legal-hold operations that can be aborted using this command are begin, end and dump-files. This command only aborts operations that have not yet completed. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the vservers on which the legal-hold operation is running.

-operation-id <integer> - Operation ID

Specifies the operation ID of the legal-hold operation to be aborted.

Examples

The following example aborts an ongoing legal-hold operation with operation-id *16842754* :

```
vs1::> snaplock legal-hold abort -operation-id 16842754
vs1::>
```

snaplock legal-hold begin

Starts an operation to place files under legal-hold in the user specified path on a SnapLock compliance volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold begin` command is used to place specified file or files under legal-hold for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver which owns the volume. The specified file or files to be placed under legal-hold reside on this volume.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the file or files have to be placed under legal-hold.

-volume <volume name> - Volume

Specifies the name of the SnapLock compliance volume on which the file or files to be placed under legal-hold reside.

-path <text> - Path

Specifies a path relative to the volume root. The path can be either a file path of the single file to be placed under legal-hold or a directory path where all regular files under it must be placed under legal-hold.

Examples

The following example starts a legal-hold begin operation on file *file1* in volume *slc_vol1* :

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /file1
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold
show -operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold begin operation on all files in the volume *slc_voll*:

```
vs1::> snaplock legal-hold begin -litigation-name litigation1 -volume
slc_voll -path /
SnapLock legal-hold begin operation is queued. Run "snaplock legal-hold
show -operation-id 16842775 -instance" to view the operation status.
```

snaplock legal-hold dump-files

Dump list of files under legal-hold to specified output path.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold dump-files` is used to dump the list of files under legal-hold for a given vservers, volume and litigation to an auto-generated file in the user specified path. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which the list of files under legal-hold is to be dumped.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the list of files under legal-hold is to be dumped.

-volume <volume name> - Volume Name

Specifies the name of the SnapLock compliance volume for which the list of files under legal-hold is to be dumped.

-output-volume <volume name> - Output Volume Name

Specifies the name of the output volume containing the output directory path where the list of files under legal-hold is to be dumped. The output volume must be a regular read-write volume.

-output-directory-path <text> - Path Relative to Output Volume Root

Specifies the output directory path relative to the output volume root, where the list of files under legal-hold is to be dumped. The output directory path should be of the form `"/directory-path"`. If output needs to be dumped on the volume root, specify the path as `"/"`.

Examples

The following example starts a legal-hold dump-files operation:

```
vs1::> snaplock legal-hold dump-files -volume vol1_slc -litigation-name
lit1 -output-volume vol1 -output-directory-path /d1
        SnapLock legal-hold dump-files operation is queued. Run
"snaplock legal-hold show -operation-id 16842754 -instance" to view the
operation status.
        vs1::>
```

snaplock legal-hold dump-litigations

Dump list of litigations for a given Vserver to specified output path.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold dump-litigations` is used to dump the list of litigations for a given vservers to a user specified path. Under the user specified path, we create a directory with a unique name. Under the user specified path, a directory with an auto-generated name is created. Under this directory, multiple files are created. Each file represents a unique litigation name that was found in the given vservers. Each file contains a list of volume names that have files under legal-hold for that given litigation. For example, if the file name is "lit1" and the contents of the file are "volume1" and "volume2", then it indicates that both these volumes have files under legal-hold for litigation "lit1". Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vservers <vservers name> - Vserver Name

Specifies the name of the Vserver for which the list of litigations is to be dumped.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays the list of litigations for volume that matches the specified value. The volume must be of type SnapLock compliance.

-output-volume <volume name> - Output Volume Name

Specifies the name of the output volume containing the output directory path where the list of litigations is to be dumped. The output volume must be a regular read-write volume.

-output-directory-path <text> - Path Relative to Output Volume Root

Specifies the output directory path relative to the volume root, where the list of litigations is to be dumped. The output directory path should be of the form `"/directory-path"`. If output needs to be dumped to the volume root, specify the path as `"/"`.

Examples

The following example starts a legal-hold dump-litigations job:

```
vs1::> snaplock legal-hold dump-litigations -output-volume voll1 -output
-directory-path /d1
        Dump Litigations job for Vserver "vs1" has been queued. Run
"job show -id 22 -instance" to view the status.
        vs1::>
```

snaplock legal-hold end

Starts an operation to release legal-hold on files in the user specified path on a SnapLock compliance volume.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold end` command is used to release legal-hold on specified file or files for a given litigation. Only a user with security login role *vsadmin-snaplock* is allowed to perform this operation.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver which owns the volume. The specified file or files to be released from legal-hold reside on this volume.

-litigation-name <text> - Litigation Name

Specifies the name of the litigation for which the file or files have to release from legal-hold.

-volume <volume name> - Volume

Specifies the name of the SnapLock compliance volume on which the file or files to be released from legal-hold reside.

-path <text> - Path

Specifies a path relative to the volume root. The path can be either a file path of the single file to be released from legal-hold or a directory path where all regular files under it must be released from legal-hold.

Examples

The following example starts a legal-hold end operation on file *file1* in volume *slc_voll*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume
slc_voll -path /file1
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show
-operation-id 16842773 -instance" to view the operation status.
```

The following example starts a legal-hold end operation on all files in the volume *slc_voll*:

```
vs1::> snaplock legal-hold end -litigation-name litigation1 -volume
slc_voll -path /
SnapLock legal-hold end operation is queued. Run "snaplock legal-hold show
-operation-id 16842775 -instance" to view the operation status.
```

snaplock legal-hold show

Show status of a legal-hold operation.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock legal-hold show` command displays the status of a legal-hold operation. Information about completed operations will be cleaned up after an hour of completion. Only a user with security login role `vsadmin-snaplock` is allowed to perform this operation.

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `'-fields ?'` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays all legal-hold operations that match the specified Vserver.

[-operation-id <integer>] - Operation ID

If this parameter is specified, the command displays all legal-hold operations that match the specified operation ID.

[-volume <volume name>] - Volume Name

If this parameter is specified, the command displays all legal-hold operations that match the specified volume. The parameter specifies the volume on which legal-hold operation is running or has completed.

[-path <text>] - Path

If this parameter is specified, the command displays all legal-hold operations that match the specified path. The parameter specifies the path on which legal-hold operation is running or has completed.

[-litigation-name <text>] - Litigation Name

If this parameter is specified, the command displays all legal-hold operations that match the specified litigation name. The parameter specifies the legal-hold litigation name.

[-operation-type {unknown|begin|end|dump-files}] - Operation Type

If this parameter is specified, the command displays all legal-hold operations that match the specified

operation type. The parameter specifies the type of legal-hold operation.

[`-operation-status {Unknown|In-Progress|Failed|Aborting|Completed}`] - Operation Status

If this parameter is specified, the command displays all legal-hold operations that match the specified operation status. The parameter specifies the status of legal-hold operation.

[`-num-files-processed <integer>`] - Number of Files Processed

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files processed. The parameter specifies the number of files on which legal-hold operation was successful.

[`-num-files-failed <integer>`] - Number of Files Failed

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files failed. The parameter specifies the number of files on which legal-hold operation failed.

[`-num-files-skipped <integer>`] - Number of Files Skipped

If this parameter is specified, the command displays all legal-hold operations that match the specified number of files skipped.

The parameter specifies the number of files on which legal-hold begin operation was skipped. The legal-hold begin operation is skipped on a file if it is already under hold for a given litigation or if it is a hard link to a file that is already under hold for a given litigation.

[`-num-inodes-ignored <integer>`] - Number of Inodes Ignored

If this parameter is specified, the command displays all legal-hold operations that match the specified number of inodes ignored. The parameter specifies the number of inodes on which the legal-hold operation was not attempted because they were not regular files.

[`-status-details <text>`] - Status Details

If this parameter is specified, the command displays all legal-hold operations that match the specified status details. The parameter specifies the status details of an legal-hold operation.

Examples

The following examples show the status of legal-hold operations for Vserver `vs1` and volume `slc_vol1` and the status of legal-hold operation for operation ID `16842786` respectively:

```
vs1::> snaplock legal-hold show -volume slc_voll
```

Operation	Operation ID	Vserver	Volume	Operation Status
begin	16842784	vs1	slc_voll	Completed
begin	16842786	vs1	slc_voll	Completed
begin	16842788	vs1	slc_voll	In-Progress
dump-files	16842790	vs1	slc_voll	Completed
end	16842794	vs1	slc_voll	Completed

5 entries were displayed.

```
vs1::> snaplock legal-hold show -operation-id 16842786
```

```
Vserver: vs1
      Volume: slc_voll
      Operation ID: 16842786
      Litigation Name: litigation1
      Path: /
      Operation Type: begin
      Status: Completed
Number of Files Processed: 100
      Number of Files Failed: 15
      Number of Files Skipped: 20
      Number of Inodes Ignored: 0
      Status Details: No error
```

snaplock log commands

snaplock log create

Create audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log create` command is used to create a SnapLock log configuration for the Vserver. A SnapLock log configuration consists of volume to store the log, the maximum size of the log file, and the default period of time for which the log file should be retained.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which the configuration needs to be created.

-volume <volume name> - Log Volume Name

Specifies the name of the volume that is used for logging. This must be a SnapLock Compliance volume.

[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File

Specifies the maximum size of the log file. Once a log file reaches this limit, it is archived and a new log file is created. This parameter is optional. The default value is *10MB*.

[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Default Log Record Retention Period

Specifies the default period of time a record (which is logged) is retained. This parameter is optional. The default value is *"6 months"*.

Examples

```
cluster1::> snaplock log create -volume voll -max-log-size 50MB -default
-retention-period "1 year" -vserver vs1
[Job 47] Job succeeded: SnapLock log created for Vserver "vs1".
```

snaplock log delete

Delete audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log delete` command deletes the SnapLock log configuration associated with the Vserver. This command closes all the active log files in the log volume and mark the volume as disabled for SnapLock logging.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver whose SnapLock log configuration is deleted.

Examples

```
cluster1::> snaplock log delete -vserver vs1
[Job 47] Job succeeded: SnapLock log deleted for Vserver "vs1".
```

snaplock log modify

Modify audit log configuration for a Vserver.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log modify` command modifies the SnapLock log configuration of the Vserver. Log volume, maximum size of log file, and default retention period can be modified. If the log volume is modified, then the active log files in the existing log volume is closed and the log volume is marked as disabled for logging. The new log volume is enabled for logging.

Parameters

-vserver <vserver name> - Vserver Name

Specifies the name of the Vserver for which the SnapLock log configuration needs to be modified.

[-volume <volume name>] - Log Volume Name

Specifies the new log volume that is configured for this Vserver for logging.

[-max-log-size {<integer>[KB|MB|GB|TB|PB]}] - Maximum Size of Log File

Specifies the new value for maximum log file size.

[-default-retention-period {{<integer> seconds|minutes|hours|days|months|years} | infinite}] - Default Log Record Retention Period

Specifies the new value for default retention period.

Examples

```
cluster1::> snaplock log modify -volume vol1 -vserver vs1 -max-log-size 15MB
[Job 48] Job succeeded: SnapLock log modified for Vserver "vs1".
```

snaplock log show

Display audit log configuration.

Availability: This command is available to *cluster* and *Vserver* administrators at the *admin* privilege level.

Description

The `snaplock log show` command displays the following information about the SnapLock log infrastructure:

- Vserver name
- Volume name
- Maximum log size
- Default retention period

Parameters

{ [-fields <fieldname>,...]

If you specify the `-fields <fieldname>, ...` parameter, the command output also includes the specified field or fields. You can use `-fields ?` to display the fields to specify.

| [-instance] }

If you specify the `-instance` parameter, the command displays detailed information about all fields.

[-vserver <vserver name>] - Vserver Name

If this parameter is specified, the command displays the log information for Vservers that match the specified value.

[-volume <volume name>] - Log Volume Name

If this parameter is specified, the command displays the log configuration for volumes that match the specified value.
