nv events

ONTAP 9.11.1 EMS reference

NetApp
February 12, 2024

Table of Contents

nv events

nv.extension events

nv.extension.disabled

Severity

INFORMATIONAL

Description

This message occurs when NVRAM segments of a nvlog client are disabled in a NVRAM section.

Corrective Action

(None).

Syslog Message

%s segments have been disabled in %s NVRAM section.

Parameters

cid (STRING): Nvlog client ID.
nv_section (STRING): The NVRAM section in which the nvlog client segments are disabled.

nv.extension.enabled

Severity

INFORMATIONAL

Description

This message occurs when NVRAM segments of a nvlog client are enabled in a NVRAM section.

Corrective Action

(None).

Syslog Message

%s segments have been enabled in %s NVRAM section.

Parameters

cid (STRING): Nvlog client ID.
nv_section (STRING): The NVRAM section in which nvlog client segments are enabled.

nv.extension.failed

Severity

ERROR

Description

This message occurs when nvlog client segments cannot be enabled in a partner NVRAM section following a controller failover. When this event occurs, the system continues to operate, but with diminished performance due to the increased failover load coupled with decreased NVRAM capacity for logging.

Corrective Action

For a System ID-related failure message, verify that each member node in this configuration is assigned a valid and unique system ID by using the "system show -fields systemid" command. Do not physically move a controller or NVRAM card in an HA or MetroCluster(tm) configuration. A failure message of "Configuration Recovery Needed" means that a reboot is needed to recover persistent MetroCluster configuration at a switchover site.

Syslog Message

Client segments cannot be enabled in the %s NVRAM section, because of %s.

Parameters

nv_section (STRING): NVRAM section in which nvlog client segments cannot be enabled.
failure_reason (STRING): Reason client segments cannot be enabled in this partner NVRAM section.

nv.fake events

nv.fake

Severity

NOTICE

Description

This message occurs when the nonvolatile (NV) driver detects that system memory is being used to simulate NVRAM.

Corrective Action

Reset the 'fake-nvram?' boot environment variable from the boot loader: 'unsetenv fake-nvram?'.

Syslog Message

%u MB system memory being used to simulate NVRAM.

Parameters

memory_size (INT): Memory size (in MB) being used to simulate NVRAM.

nv.fio events

nv.fio.write.err

Severity

ERROR

Description

This message occurs when the write to VNVRAM fails and the retry count has been exhausted.

Corrective Action

(None).

Syslog Message

The write to VNVRAM failed with error %u; retry limit exhausted.

Parameters

    error (INT): Error returned by the last write.

nv.fio.write.retry

Severity

    NOTICE

Description

    This message occurs when the write to VNVRAM fails. The write will be retried.

Corrective Action

    (None).

Syslog Message

    The write to VNVRAM failed with error %u; will retry.

Parameters

    error (INT): Error returned by the write.

nv.flash events

nv.flash.predict.fail

Severity

    ALERT

Description

    This message occurs when ONTAP® determines that failure is forthcoming or has occurred for the associated flash device on the nonvolatile memory (NVRAM) module.

Corrective Action

    Replace the device to prevent future failures.

Syslog Message

    %s

Parameters

    reason (STRING): Reason for failure.

nv.flash.unable.to.monitor

Severity

    ALERT

Description

    This message occurs when the ONTAP® module that is responsible for monitoring the health of the NVRAM device cannot extract health information. This failure might indicate the NVRAM device is not operating properly.

Corrective Action

Use the "system environment sensors show" command to verify the device's status. If the failure still exists, contact technical support for assistance.

Syslog Message

Unable to monitor NVRAM device "%s".

Parameters

device (STRING): Name of the device.

nv.none events

nv.none

Severity

EMERGENCY

Description

This message occurs when the system cannot detect a nonvolatile (NV) device.

Corrective Action

Contact NetApp technical support.

Syslog Message

No NV device has been detected.

Parameters

(None).

nv.partner events

nv.partner.disabled

Severity

INFORMATIONAL

Description

This message occurs when checking the partner nonvolatile RAM (NVRAM) and the partner NVRAM is disabled. This event most commonly occurs during the takeover or switchover process after the partner has gone down.

Corrective Action

(None).

Syslog Message

NVRAM validate: %s NVRAM was disabled.

Parameters

host (STRING): Name of the partner host.

nv.partner.nvcheck.failure

Severity

ALERT

Description

This message occurs when nonvolatile RAM (NVRAM) inconsistencies are detected during takeover. Takeover is continued only if the option for consistent NVRAM mirroring is disabled or if the takeover is forced.

Corrective Action

When the partner node recovers, NVRAM will be reinitialized to a consistent state. The error string provides additional information to assist NetApp technical support in identifying the inconsistency and subsystem that caused the failure.

Syslog Message

NVRAM validate: %s

Parameters

error (STRING): Error string describing which subsystem caused the failure and what the mismatching values are.

nv.partner.size.mismatch

Severity

ALERT

Description

This message occurs when the HA pair nonvolatile RAM (NVRAM) sizes do not match. In this case, an HA pair cannot be formed.

Corrective Action

Check to make sure that the local NVRAM hardware size matches the partner NVRAM hardware size. Verify that the same bootargs are in use on both nodes. One or both nodes might need to be rebooted. Contact NetApp technical support if the problem persists.

Syslog Message

CF monitor: NVRAM size mismatch between nodes detected; node requires %llu bytes, partner exported %llu bytes.

Parameters

localNVSize (LONGINT): Size of the local NVRAM.
partnerNVSize (LONGINT): Size of the partner NVRAM.

nv.partner.takeover.continued

Severity

ALERT

Description

This message occurs when takeover proceeds even when nonvolatile RAM (NVRAM) inconsistencies are detected in the HA pair. This most commonly occurs when the NVRAM mirror consistency has been

disabled or if the takeover is forced.

Corrective Action

(None).

Syslog Message

NVRAM validate: Error encountered (%s), but continuing takeover; some data might be lost.

Parameters

error (STRING): Error string.

nv.rename events

nv.rename.err

Severity

INFORMATIONAL

Description

This message occurs when there is an error while renaming the files specified in /etc/nvfail_rename.

Corrective Action

(None).

Syslog Message

nvfail_rename: %s: %s.

Parameters

fileName (STRING): File name.
error (STRING): Error string.

nv.rename.files

Severity

INFORMATIONAL

Description

This message occurs while renaming the files specified in /etc/nvfail_rename.

Corrective Action

(None).

Syslog Message

Renaming files specified in /etc/nvfail_rename.

Parameters

(None).

nv.rename.longName

Severity

INFORMATIONAL

Description

This message occurs while renaming the files specified in /etc/nvfail_rename, when the file name is too long.

Corrective Action

(None).

Syslog Message

nvfail_rename: %s: File name too long.

Parameters

fileName (STRING): File name.

nv.switchover events

nv.switchover.continued

Severity

ALERT

Description

This message occurs when switchover proceeds even when nonvolatile RAM (NVRAM) inconsistencies are detected in the DR partner sections.

Corrective Action

(None).

Syslog Message

NVRAM validate: Error encountered (%s), but continuing switchover; some data might be lost.

Parameters

error (STRING): Error string.
