# ONTAP 9.14.1 EMS reference

# accesscache events

## accesscache.cfg events

### accessCache.cfg.updateFailed

#### Severity

ERROR

#### Description

This message occurs when exports access cache configuration is modified but the new configuration could not be updated in the Nblade. The access cache is therefore operating with the older configuration.

#### Corrective Action

Retry the exports access cache configuration modification. If it continuously fails, restart management gateway. If the problem persists, contact NetApp technical support.

#### Syslog Message

Access cache configuration change for Vserver "%s" on node "%s" could not be updated. Failure reason is "%s".

#### Parameters

**vserver** (STRING): Name of the Vserver on which the problem is occurring.

**node** (STRING): Name of the Node on which the problem is occurring.

**reason** (STRING): The reason for the failure.

## accesscache.nearlimits events

### AccessCache.NearLimits

#### Severity

ALERT

#### Description

This message occurs when the access cache module is near its limits for entries or export rules. Reaching these limits can prevent new clients from being able to mount and perform I/O on the storage system, and can also cause clients to be granted or denied access based on stale cached information.

#### Corrective Action

Ensure that the number of clients accessing the storage system continues to be below the limits for access cache entries and export rules across those entries. If the set of clients accessing the storage system is constantly changing, consider using the "vserver export-policy access-cache config modify" command to reduce the harvest timeout parameter so that cache entries for clients that are no longer accessing the storage system can be evicted sooner.

#### Syslog Message

The exports access cache module is near its limits for entries (current count : %u, warning threshold : %u, limit : %u) or export rules across entries (current count : %u, warning threshold : %u, limit : %u).

## Parameters

**numEntriesCurrent** (INT): Current number of entries in the cache.  
**numEntriesWarningThreshold** (INT): Warning threshold for number of entries.  
**numEntriesLimit** (INT): Limit on the number of entries.  
**numRulesCurrent** (INT): Current number of export rules in the cache.  
**numRulesWarningThreshold** (INT): Warning threshold for number of export rules.  
**numRulesLimit** (INT): Limit on the number of export rules.

# accesscache.reachedlimits events

## AccessCache.ReachedLimits

### Severity

EMERGENCY

### Description

This message occurs when the access cache module reaches its limit for entries or export rules. This condition can prevent new clients from being able to mount and perform I/O on the storage system. This condition can also cause clients to be granted or denied access based on stale information.

### Corrective Action

Ensure that the number of clients accessing the storage system is below the limits for access cache entries and export rules across those entries. If the set of clients accessing the storage system is constantly changing, consider using the "vserver export-policy access-cache config modify" command to reduce the harvest timeout parameter so that cache entries for clients that are no longer accessing the storage system can be evicted sooner.

### Syslog Message

The exports access cache module on this node reached its limits while trying to add %d new entries (current count : %u, limit : %u) and/or %d export rules (current count : %u, limit : %u).

## Parameters

**numEntriesDelta** (INT): Number of new entries to be added.  
**numEntriesCurrent** (INT): Current number of entries in the cache.  
**numEntriesLimit** (INT): Limit on the number of entries.  
**numRulesDelta** (INT): Number of new export rules to be added.  
**numRulesCurrent** (INT): Current number of export rules in the cache.  
**numRulesLimit** (INT): Limit on the number of export rules.

# acp events

## acp.auto events

### acp.auto.upgrade

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP Processor has an older firmware image compared to the file revision present in '/etc/acp/acpp\_fw'. The ACP Administrator is performing an automatic firmware upgrade.

#### Corrective Action

(None).

#### Syslog Message

Performing automatic firmware upgrade (image: %s) on %s (%s).

#### Parameters

**file** (STRING): Command issued.

**inband\_id** (STRING): Inband ID of the module.

**ip** (STRING): IP address of the module.

## acp.bind events

### acp.bind.error

#### Severity

ERROR

#### Description

This message occurs when the system encounters a socket binding error while setting up the Alternate Control Path (ACP) Management Ethernet port. ACP functionality is inactive after encountering this.

#### Corrective Action

Verify that the Ethernet cable is properly attached to the ACP port and the green LED is on. Reenable the ACP port using the "options acp.enabled" command.

#### Syslog Message

An error was encountered while configuring the ACP Management Ethernet Port: %s.

#### Parameters

**ErrorString** (STRING): Error string.

## acp.commerr events

## acp.commErr

### Severity

ALERT

### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the SAS shelf I/O module (IOM) that is configured for in-band ACP is experiencing communication errors.

### Corrective Action

Examine the event log for I/O errors that might have a common source such as faulty cabling, and correct them. If the errors persist, the IOM might need to be replaced. Contact NetApp technical support.

### Syslog Message

IOM %s is reporting multiple in-band ACP communication errors. Shelf serial number: %s.

### Parameters

**inband\_id** (STRING): Inband ID of the module.

**shelf\_sno** (STRING): Storage shelf serial number of the shelf where the I/O module is seated.

## acp.commerrpersist events

### acp.commErrPersist

### Severity

ALERT

### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that a SAS shelf I/O module (IOM) configured for in-band ACP is experiencing persistent communication errors.

### Corrective Action

Examine the event log for I/O errors that might have a common source with this problem, such as faulty cabling. If other devices are not experiencing failures, then contact NetApp technical support to replace the IOM.

### Syslog Message

IOM %s has failed after reporting multiple in-band ACP errors. Shelf serial number: %s.

### Parameters

**inband\_id** (STRING): Inband ID of the module.

**shelf\_sno** (STRING): Storage shelf serial number of the shelf where the IOM is seated.

## acp.dev events

### acp.dev.notify

### Severity

ERROR

## Description

This message occurs when the Alternate Control Path (ACP) Administrator encounters an error event in a development-only kernel.

## Corrective Action

Notify ACP development. No user action is needed.

## Syslog Message

ACP error: %s

## Parameters

**debug\_string** (STRING): Error statement that occurred in a development kernel.

# acp.downrev events

## acp.downrev.acpp

### Severity

ERROR

### Description

This message occurs when the Alternate Control Path Administrator cannot successfully download up-to-date firmware to an Alternate Control Path Processor (ACPP) or when the most up-to-date firmware image is not present in the `/etc/acpp_fw/` directory.

### Corrective Action

Verify that the latest ACPP firmware is available in the firmware directory. If the firmware update continually fails to download up-to-date firmware, then replace the ACPP I/O module.

### Syslog Message

ACPP module %s (%s) has downrev firmware.

### Parameters

**inband\_id** (STRING): In-band ID of the ACPP module.

**ip** (STRING): IP address of the ACPP module.

# acp.exp events

## acp.exp.power.cycle

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to power-cycle the SAS expander.

### Corrective Action

(None).

## Syslog Message

SAS expander power-cycle request sent to %s (%s), (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Status code returned by the 'expander power cycle' command.

## acp.exp.power.cycle.failed

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to power-cycle the SAS expander.

### Corrective Action

(None).

## Syslog Message

SAS expander power-cycle request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Reason for the 'expander power-cycle' failure.

**shelf\_sno** (STRING): Shelf serial number of the shelf where this I/O module is seated.

## acp.exp.power.cycle.success

### Severity

INFORMATIONAL

### Description

This message occurs when an 'expander power cycle' command sent to the Alternate Controller Path (ACP) Processor succeeds.

### Corrective Action

(None).

## Syslog Message

SAS expander power cycle command sent to %s (%s) was successful, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## **acp.exp.reset**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the Alternate Control Path (ACP) Processor receives a command to reset a SAS expander.

### **Corrective Action**

(None).

### **Syslog Message**

SAS expander reset issued to %s (%s), (disk shelf serial number: %s).

### **Parameters**

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Status code returned by the 'expander reset' command.

## **acp.exp.reset.failed**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the Alternate Controller Path Administrator fails in its attempt to reset the SAS expander.

### **Corrective Action**

(None).

### **Syslog Message**

SAS expander reset request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

### **Parameters**

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Reason for the 'expander reset' failure.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## **acp.exp.reset.success**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when an 'expander reset' command sent to the Alternate Controller Path (ACP) Processor succeeds.

## Corrective Action

(None).

## Syslog Message

SAS expander reset command sent to %s (%s) was successful, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.exp.vpd.failed

### Severity

INFORMATIONAL

### Description

This message occurs when an attempt to get SAS expander VPD (Vital Product Data) data from the Alternate Control Path Processor fails.

### Corrective Action

(None).

### Syslog Message

An 'expander vpd' request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

### Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Reason for the failure to get the SAS expander vpd data.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.fw events

### acp.fw.download

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to initiate a firmware download.

#### Corrective Action

(None).

#### Syslog Message

Firmware image %s will be downloaded to %s (%s), (disk shelf serial number: %s).

## Parameters

**command** (STRING): Firmware image name.  
**inband\_id** (STRING): In-band ID of the module.  
**ip** (STRING): IP address of the module.  
**status** (STRING): Status code returned by the 'initiation' command.

## acp.fw.download.failed

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to download firmware.

### Corrective Action

(None).

### Syslog Message

Firmware download on %s (%s) failed with status (%s), (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.  
**ip** (STRING): IP address of the module.  
**status** (STRING): Type of failure that occurred during the firmware download.  
**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.fw.download.success

### Severity

INFORMATIONAL

### Description

This message occurs when a 'firmware download' command sent to the Alternate Controller Path Processor succeeds.

### Corrective Action

(None).

### Syslog Message

Firmware download on %s (%s) was successful, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): In-band ID of the module.  
**ip** (STRING): IP address of the module.  
**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.init events

## acp.init.configIP

### Severity

ERROR

### Description

This message occurs when ONTAP® software cannot configure the Ethernet port designated for the Alternate Control Path (ACP) with 30 seconds, and marks the ACP as inactive.

### Corrective Action

Verify the connection to the disk shelf ACP port, and make sure that it is not connected to a public network. Try plugging it into another Ethernet port with no devices.

### Syslog Message

Could not configure the ACP Ethernet port within 30 seconds.

### Parameters

(None).

## acp.init.netmask

### Severity

INFORMATIONAL

### Description

This message occurs during initialization state, when the Alternate Control Path (ACP) Administrator netmask was configured incorrectly. The system sets the netmask to a default value.

### Corrective Action

(None).

### Syslog Message

Setting ACP Administrator netmask value to %s (reason: %s).

### Parameters

**value** (STRING): Default netmask.

**reason** (STRING): Reason to choose the default.

## acp.init.ssl

### Deprecated

Deprecated as of ONTAP® version 9.2. The ACP process was never really responsible for initializing SSL, and has not tried to do so for a very long time.

### Severity

ERROR

### Description

This message occurs when the Alternate Control Path (ACP) process cannot initialize the underlying Secure Socket Library (SSL). The ACP Administrator will be inactive.

**Corrective Action**

(None).

**Syslog Message**

Could not initialize SSL.

**Parameters**

(None).

## acp.invalid events

### acp.invalid.vpd.info

**Severity**

ALERT

**Description**

This message occurs when the Alternate Control Path (ACP) system detects that an Alternate Control Path Processor (ACPP) has invalid VPD (Vital Product Data) info.

**Corrective Action**

Replace the Alternate Control Path Processor (ACPP).

**Syslog Message**

ACPP module %s (%s) has invalid VPD.

**Parameters**

**inband\_id** (STRING): In-band ID of the ACPP module.

**ip** (STRING): IP address of the ACPP module.

## acp.ioxm events

### acp.ioxm.port.down

**Severity**

INFORMATIONAL

**Description**

This message occurs when the link status of one or more ports from the IOXM switch changes from "up" to "down".

**Corrective Action**

Verify that all cables in the IOXM switch ports are seated properly.

**Syslog Message**

IOXM switch port %d is down.

**Parameters**

**port\_num** (INT): Switch port number of the IOXM switch.

## acp.ioxm.port.up

### Severity

INFORMATIONAL

### Description

This message occurs when the link status of one or more ports from the IOXM switch changes from "down" to "up".

### Corrective Action

(None).

### Syslog Message

IOXM switch port %d is up.

### Parameters

**port\_num** (INT): Switch port number of the IOXM switch.

## acp.locked events

### acp.locked.wrench.link.down

### Severity

INFORMATIONAL

### Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "up" to "down".

### Corrective Action

Verify that the cable in the port is seated properly.

### Syslog Message

The on-board locked wrench port is down.

### Parameters

(None).

### acp.locked.wrench.port.down

### Severity

ERROR

### Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "up" to "down".

### Corrective Action

Verify that the cable in the port is seated properly.

## Syslog Message

The on-board locked wrench port is down; Alternate Control Path (ACP) management is inactive.

## Parameters

(None).

## acp.locked.wrench.port.up

## Severity

INFORMATIONAL

## Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "down" to "up".

## Corrective Action

(None).

## Syslog Message

The on-board locked wrench port is up.

## Parameters

(None).

## acp.need events

## acp.need.firmware.update

## Severity

ERROR

## Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP processor is running an older firmware revision that supports only the Secure Socket Library (SSL) channel. The "/etc/acpp\_fw" directory requires the latest firmware file for the update to succeed. This module is marked as inactive.

## Corrective Action

Copy the latest firmware file for this module into "/etc/acpp\_fw", and then use the "system node run -node <nodename> -command storage download acp" command to download the firmware.

## Syslog Message

ACP module %s (%s) needs a firmware upgrade, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): Inband ID of the module.

**ip** (STRING): IP address of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.need.module.upgrade

### Severity

ERROR

### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the I/O module (IOM) does not support InBand ACP.

### Corrective Action

Upgrade the IOM to IOM6 or later.

### Syslog Message

IOM %s does not support InBand ACP. Upgrade the IOM to IOM6 or later for supportability (disk shelf serial number: %s).

### Parameters

**inband\_id** (STRING): Inband ID of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this IOM is seated.

## acp.no events

### acp.no.ip

### Severity

ERROR

### Description

This message occurs when the node cannot find a free IP address for the Alternate Control Path (ACP) Management port. ACP functionality is disabled.

### Corrective Action

Check the connection to the disk shelf ACP port and verify that it is not connected to a public network. Try plugging it into another Ethernet port with no devices, to see whether it is changed.

### Syslog Message

Could not assign a free IP address to the ACP Management Ethernet port, disabling ACP functionality.

### Parameters

(None).

## acp.post events

### acp.post.data.failed

### Severity

INFORMATIONAL

### Description

This message occurs when a 'post data' request that was sent to the Alternate Controller Path Processor

fails.

### Corrective Action

(None).

### Syslog Message

A 'post data' request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

### Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Reason for the 'post data' failure.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

## acp.shelf events

### acp.shelf.power.cycle.failed

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Alternate Control Path (ACP) Processor fails to complete a power cycle of the disk shelf.

#### Corrective Action

(None).

#### Syslog Message

Disk shelf power cycle request issued to %s failed because %s.

#### Parameters

**shelf\_id** (STRING): In-band ID or Shelf Serial Number of the module.

**status** (STRING): Reason for failure.

### acp.shelf.power.cycle.success

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Alternate Control Path (ACP) Processor successfully completes a power cycle of the disk shelf.

#### Corrective Action

(None).

#### Syslog Message

Disk shelf power cycle request issued to %s is successful.

## Parameters

**shelf\_id** (STRING): In-band ID or Shelf Serial Number of the module.

## acp.shelf.power.off

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to power off the disk shelf.

### Corrective Action

(None).

### Syslog Message

Disk shelf power off request issued to %s

### Parameters

**shelf\_id** (STRING): In-band ID of the module or Shelf Serial Number.

## acp.shelf.power.off.failed

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to power-off the SAS disk shelf.

### Corrective Action

(None).

### Syslog Message

Disk shelf power off request sent to %s failed with status %s

### Parameters

**shelf\_id** (STRING): In-band ID of the module.

**status** (STRING): Reason for the power-off failure.

## acp.shelf.power.off.success

### Severity

INFORMATIONAL

### Description

This message occurs when a 'shelf power off' command sent to the Alternate Controller Path (ACP) Processor succeeds.

**Corrective Action**

(None).

**Syslog Message**

Disk shelf power off command sent to %s was successful

**Parameters**

**shelf\_id** (STRING): In-band ID of the module or Shelf Serial Number.

**acp.shelf.power.on****Severity**

INFORMATIONAL

**Description**

This message occurs when the Alternate Control Path (ACP) Processor receives a command to power on a disk shelf.

**Corrective Action**

(None).

**Syslog Message**

Disk shelf power up request issued to %s

**Parameters**

**shelf\_id** (STRING): In-band ID of the module or Shelf Serial Number.

**acp.shelf.power.on.failed****Severity**

INFORMATIONAL

**Description**

This message occurs when the Alternate Controller Path Administrator fails in its attempt to power on the SAS disk shelf.

**Corrective Action**

(None).

**Syslog Message**

Disk shelf power on request sent to %s failed with status %s

**Parameters**

**shelf\_id** (STRING): In-band ID or Shelf Serial Number of the module.

**status** (STRING): Reason for the 'power-on' failure.

**acp.shelf.power.on.success****Severity**

INFORMATIONAL

## Description

This message occurs when a 'shelf power on' command sent to the Alternate Controller Path (ACP) Processor succeeds.

## Corrective Action

(None).

## Syslog Message

Disk shelf power on command sent to %s was successful

## Parameters

**shelf\_id** (STRING): In-band ID of the module or Shelf Serial Number.

# acp.sock events

## acp.sock.error

### Severity

ERROR

### Description

This message occurs when the system encounters a socket error while setting up the Alternate Control Path (ACP) Management Ethernet port. ACP functionality is subsequently inactive.

### Corrective Action

Verify that the Ethernet cable is properly attached to the ACP port and that the green LED is on. Reenable the ACP using the "options acp.enabled on" command.

### Syslog Message

An error was encountered while configuring the ACP Management Ethernet Port: %s.

### Parameters

**ErrorString** (STRING): Error string.

# acp.update events

## acp.update.failed

### Severity

ERROR

### Description

This message occurs when the Alternate Control Path (ACP) Administrator receives notification from the ACP Processor that it cannot upgrade the firmware because it is in some faulty state or the firmware file is not valid. The ACP processor will continue to run with the older firmware version.

### Corrective Action

Try issuing the firmware download again using the "system node run -node <nodename> -command storage download acp" command.

## Syslog Message

ACP module %s (%s) failed to upgrade firmware, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): Inband ID of the module.

**ip** (STRING): IP address of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

# acp.updateconfiguration events

## acp.updateConfiguration

### Severity

ALERT

### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the SAS shelf I/O module (IOM) supports only the in-band ACP configuration.

### Corrective Action

> Use the "storage shelf acp configure -channel in-band -is-enabled true" command to enable in-band ACP.

## Syslog Message

IOM %s in shelf S/N: %s does not support out-of-band ACP.

## Parameters

**inband\_id** (STRING): Inband ID of the module.

**shelf\_sno** (STRING): Storage shelf serial number of the shelf where the IOM is seated.

# acp.upgrade events

## acp.upgrade.successful

### Severity

INFORMATIONAL

### Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP Processor has successfully upgraded the firmware.

### Corrective Action

(None).

## Syslog Message

ACP module %s (%s) successfully upgraded firmware, (disk shelf serial number: %s).

## Parameters

**inband\_id** (STRING): Inband ID of the module.

**ip** (STRING): IP address of the module.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

# acp.voltage events

## acp.voltage.status.failed

### Severity

INFORMATIONAL

### Description

This message occurs when a 'voltage status' request that was sent to the Alternate Controller Path Processor fails.

### Corrective Action

(None).

### Syslog Message

A voltage status request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

### Parameters

**inband\_id** (STRING): In-band ID of the module.

**ip** (STRING): IP address of the module.

**status** (STRING): Reason for the 'voltage status' failure.

**shelf\_sno** (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

# adminapi events

## adminapi.input events

### adminapi.input.badXml

**Severity**

ERROR

**Description**

This message occurs when the Data ONTAP server receives a bad XML request that does not contain the API name to be executed.

**Corrective Action**

Correct the input XML with the API name to be executed.

**Syslog Message**

Input XML does not contain the API name to be executed.

**Parameters**

(None).

## adminapi.xml events

### adminapi.xml.encoding

**Severity**

ERROR

**Description**

This event is generated in case of a mismatched XML encoding received by ONTAP server.

**Corrective Action**

Correct the mismatched encoding and retry the API.

**Syslog Message**

ONTAP server got unexpected encoding (expected %s, got %s

**Parameters**

**expEnco** (STRING): The expected xml encoding.

**recvEnco** (STRING): The actual received encoding.

### adminapi.xml.namespace

**Severity**

ERROR

**Description**

This event is generated in case of a mismatched xml namespace received by ONTAP server.

**Corrective Action**

Correct the XML namespace and retry the API.

**Syslog Message**

ONTAP server namespace (expected %s, got %s

**Parameters**

**expNamesp** (STRING): The expected xml namespace.

**uri** (STRING): The received uri

# adt events

## adt.aggrcb events

### adt.aggrcb.unlinkfail

#### Severity

ALERT

#### Description

This message occurs when the auditing subsystem cannot remove a stale aggregate control block entry from the Audit aggregate hash table. This could happen if the hash table rearrangement fails because of insufficient memory. In this condition, the auditing subsystem might not function or data access might be denied.

#### Corrective Action

Reboot the node. For high-availability (HA) configurations, perform a takeover and giveback from the partner to reduce the impact on system availability

#### Syslog Message

Auditing subsystem internal error: Aggregate Control Block: %s unlink failed for SVM with UUID: %s because of insufficient memory.

#### Parameters

**AggregateUuid** (STRING): UUID of the aggregate with a stale file handle.

**VserverUuid** (STRING): UUID of the Storage Virtual Machine(SVM, formerly Vserver).

## adt.aucb events

### adt.aucb.overwrite

#### Severity

INFORMATIONAL

#### Description

This message occurs in the auditing subsystem, when the subsystem overwrite an existing audit control block during audit control block creation. The overwriting of the audit control block is because of a failure in audit control block deletion.

#### Corrective Action

(None).

#### Syslog Message

Overwriting of audit control block occurred.

#### Parameters

(None).

# adt.cmdq events

## adt.cmdq.init.fail

### Severity

ALERT

### Description

This message occurs when an internal audit command queue fails to initialize.

### Corrective Action

Available system resources are required for this feature to function. The audit subsystem might not function, or might function with reduced performance. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

### Syslog Message

Audit subsystem internal error: Audit command queue failed to initialize, system reboot might be required.

### Parameters

(None).

# adt.cmdthrd events

## adt.cmdthrd.create.fail

### Severity

ALERT

### Description

This message occurs when audit initialization fails because the necessary execution threads cannot be created.

### Corrective Action

Available system resources are required for this feature to function. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

### Syslog Message

Audit subsystem internal error: Could not start required audit command threads, system reboot might be required.

### Parameters

(None).

# adt.dest events

## adt.dest.access.fail

### Severity

ERROR

### Description

This message occurs when the audit consolidation job fails to write audit logs to the destination directory because the destination directory is not available. This event can lead to denial of service on Security Access Control List (SACL) enabled objects.

### Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to bring the volume online, or increase volume size. Use the "vserver audit modify" command to modify the destination volume.

### Syslog Message

Audit consolidation job failed to access destination directory "%s" of Vserver "%s"; consolidation job type is "%s".

### Parameters

**destination** (STRING): Destination directory of the Vserver into which the consolidation job failed to write audit logs.

**vserver** (STRING): Vserver name whose consolidation job failed to write audit logs to the destination directory.

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

## adt.dest.directory.full

### Severity

EMERGENCY

### Description

This message occurs when the audit consolidation process fails to write audit logs to the destination directory because the destination directory is full. This event can lead to denial of service on Security Access Control List (SACL) enabled objects.

### Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to increase volume size. Use the "vserver audit modify" command to modify the destination volume path.

### Syslog Message

Audit destination directory "%s" of Vserver "%s" is full; consolidation job type is "%s".

### Parameters

**destination** (STRING): Destination directory of the Vserver that is full.

**vserver** (STRING): Vserver name whose audit consolidation process failed to write audit logs to the destination directory.

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

## adt.dest.directory.unavail

### Severity

EMERGENCY

### Description

This message occurs when the audit consolidation job fails to write audit logs to the destination directory because the destination directory has become unavailable or has run out of space. This event can lead to denial of service for Security Access Control List (SACL) enabled objects.

### Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to bring the volume online, or increase volume size. Use the "vserver audit modify" command to modify the destination volume.

### Syslog Message

Audit destination directory "%s" of Vserver "%s" is unavailable or out of space; consolidation job type is "%s".

### Parameters

**destination** (STRING): Destination directory of the Vserver to which the consolidation job failed to write audit logs.

**vserver** (STRING): Name of the Vserver name whose consolidation job failed to write audit logs to the destination directory.

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

## adt.max events

### adt.max.record.size.exceeded

### Severity

ERROR

### Description

This message occurs when a management command or file operation tries to generate an audit record, that is greater than the max\_audit\_record\_size value. The File Services Auditing subsystem might fail the operation or truncate the record.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

File Services Auditing subsystem failed the operation or truncated an audit record because it was greater than max\_audit\_record\_size value. Vserver UUID=%s, event\_id=%u, size=%u

### Parameters

**VserverUuid** (STRING): UUID of then Vserver.

**eventId** (INT): Event ID for internal use.

**size** (INT): Record size.

# adt.nfs events

## adt.nfs.root.access.no.map

### Severity

ERROR

### Description

This message occurs in the auditing subsystem, when the NFS root user is accessing the file without a valid CIFS credential. Access is being allowed because the "ignore-nt-acl-for-root" NFS option is set, and hence the BUILTIN\Administrator credential is used for auditing.

### Corrective Action

If NFS root user access to the file without NT ACL check should be prohibited, disable the "ignore-nt-acl-for-root" option by using the "nfs modify -ignore-nt-acl-for-root" command. If a more appropriate CIFS credential should be used for auditing, configure the SVM name-mapping by using the "vserver name-mapping" command.

### Syslog Message

NFS root user is accessing the file without a valid CIFS credential. Access is being allowed because the "ignore-nt-acl-for-root" NFS option is set, and hence the BUILTIN\Administrator credential is used for auditing.

### Parameters

**VserverUuid** (STRING): UUID of the Storage Virtual Machine (SVM, formerly Vserver).

# adt.service events

## adt.service.block

### Severity

EMERGENCY

### Description

This message occurs when the volume that hosts the destination path where the final audit logs are stored is not accessible or does not have sufficient space and the audit consolidation service is not able to write to the volume. This prevents the audit service from working properly. File access and file audit logging is blocked.

### Corrective Action

Use the "vserver audit show" command to get the name of the volume that hosts the destination path. Use the "volume show" command to check whether the volume exists, is online, and has sufficient free space. Use the "volume modify" command to increase volume size. Use the "vserver audit modify" command to modify the destination path.

### Syslog Message

Audit destination directory "%s" of Vserver "%s" is either not accessible or full for the consolidation job type "%s". File-Operations which need to be audited will be denied. File Audit Logging will also fail.

## Parameters

**destinationPath** (STRING): Destination path.

**vserverName** (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

## adt.service.ro.filesystem

### Severity

EMERGENCY

### Description

This message occurs when the volume that hosts the destination path where the final audit logs are stored is of type Data protection (DP) or Load sharing (LS). These volume types are read-only for the purposes of audit logging and logging will fail.

### Corrective Action

Use the "vserver audit modify" command to modify the destination volume.

### Syslog Message

Auditing and file-ops failing on SVM %s, the volume containing %s for consolidation job of type %s is read only filesystem.

## Parameters

**vserverName** (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).

**destinationPath** (STRING): Destination path.

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

## adt.service.unblock

### Severity

INFORMATIONAL

### Description

This message occurs when the volume that hosts the destination path where the final audit logs are stored was resized or cleaned up and the audit consolidation service is able to write to the volume thereby unblocking the audit service. File access and file audit logging is unblocked.

### Corrective Action

(None).

### Syslog Message

Audit destination directory "%s" of Vserver "%s" for consolidation job of type "%s" is now accessible and File-Operations which need to be audited will be unblocked. File Audit Logging will also be unblocked.

## Parameters

**destinationPath** (STRING): Destination path.

**vserverName** (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).

**descriptor** (STRING): Type of consolidation job - CIFS/S3.

# adt.stgvol events

## adt.stgvol.info.notavailable

### Severity

ERROR

### Description

This message occurs when retrieving staging volume information fails. This might be due to an internal system problem or the staging volume creation failed.

### Corrective Action

Contact Cserver admin to check if staging volume has been created.

### Syslog Message

Audit subsystem internal error: Either staging volume %s is not created or unable to retrieve staging volume information.

### Parameters

**volName** (STRING): The Name of the staging volume.

## adt.stgvol.missing

### Severity

ALERT

### Description

This message occurs when retrieving staging volume information fails. Either the staging volume was not created or information cannot be retrieved due to some internal error. As a result, auditing is not performed for operations on the corresponding volume.

### Corrective Action

Use the command "vserver audit repair" in diagnostic mode to correct the problem.

### Syslog Message

Audit subsystem internal error: Staging volume "%s" is either not created or not available.

### Parameters

**volName** (STRING): Name of the volume that is missing.

## adt.stgvol.nospace

### Severity

EMERGENCY

### Description

This message occurs when a staging volume does not have enough space and the audit service tries to create a new staging file or directory for writing audit logs.

### **Corrective Action**

Check the volume for older staging files that are no longer required and remove those files. Then retry the operation.

### **Syslog Message**

Audit subsystem internal error: Staging volume %s is full.

### **Parameters**

**volName** (STRING): Name of the volume that is full.

## **adt.stgvol.offline**

### **Severity**

EMERGENCY

### **Description**

This message occurs when a staging volume is offline and the audit service tries to write an audit log into the staging volume.

### **Corrective Action**

Contact the Cserver administrator to set the staging volume status to online.

### **Syslog Message**

Audit subsystem internal error: Staging volume %s is offline.

### **Parameters**

**volName** (STRING): The Name of the volume which is offline.

## **adt.wrkrq events**

### **adt.wrkrq.init.fail**

### **Severity**

ALERT

### **Description**

This message occurs when an internal audit worker queue fails to initialize.

### **Corrective Action**

Available system resources are required for this feature to function. The Audit subsystem might not function, or might function with reduced performance. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

### **Syslog Message**

Audit subsystem internal error: Audit worker queue failed to initialize; system reboot might be required.

### **Parameters**

(None).

# adt.wrkrthrd events

## adt.wrkrthrd.create.fail

### Severity

ALERT

### Description

This message occurs when audit initialization fails because the necessary execution threads cannot be created.

### Corrective Action

Available system resources are required for this feature to function. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

### Syslog Message

Audit subsystem internal error: Could not start required audit worker threads; system reboot might be required.

### Parameters

(None).

# aggr events

## aggr.full events

### aggr.full

#### Severity

ALERT

#### Description

This message occurs when an aggregate is full.

#### Corrective Action

Ensure that all containers in the pod are online and healthy. Check if the REST server is up and responding.

#### Syslog Message

Aggregate "%s" is full.

#### Parameters

**aggr\_name** (STRING): Name of the aggregate.

## aggr.grow events

### aggr.grow.completed

#### Severity

NOTICE

#### Description

This message occurs when request to grow an aggregate is completed successfully. The request to grow the aggregate could be DMAP-triggered or SDE-triggered.

#### Corrective Action

(None).

#### Syslog Message

Request to grow aggregate "%s" is complete. Old size: %lu, new size: %lu, old state: %d, new state: %d.

#### Parameters

**aggr\_name** (STRING): Name of the aggregate.

**old\_size** (LONGINT): Size of the aggregate before it is grown.

**new\_size** (LONGINT): Size of the aggregate after it is grown.

**previous\_state** (INT): State of the aggregate before it is grown.

**current\_state** (INT): State of the aggregate after it is grown.

## aggr.inconsistent events

## aggr.inconsistent.modify

### Severity

INFORMATIONAL

### Description

This message occurs when the 'aggr inconsistent' command is used to modify a state of an aggregate.

### Corrective Action

(None).

### Syslog Message

Aggregate %s: 'aggr inconsistent' command used to change inconsistent state to '%s'.

### Parameters

**aggr** (STRING): Name of the aggregate.

**state** (STRING): State of the action: "set" or "clear".

## aggr.max events

### aggr.max.size.increased

### Severity

INFORMATIONAL

### Description

This message occurs as a reminder that the maximum aggregate size limit is increased from the default value defined in the Platform Specific Module (PSM) table.

### Corrective Action

(None).

### Syslog Message

Maximum aggregate size limit is increased from %ld TB to %ld TB.

### Parameters

**old\_limit** (LONGINT): Original aggregate size limit as defined in the PSM table.

**new\_limit** (LONGINT): New maximum aggregate size limit.

## aggr.provisioning events

### aggr.provisioning.unassigned.detected

### Severity

NOTICE

### Description

This message is issued when the aggregate provisioning recommendation generated for the cluster is found to be incomplete due to the presence of unassigned disks. Any spare disks that are not owned by a node in the cluster cannot contribute to the usable capacity of new aggregates.

## Corrective Action

Use the following steps to resolve the issue: - Run 'storage disk show -container-type unassigned' to list all the unassigned disks in the cluster. To assign all unassigned disks, run 'storage disk assign -auto true -node [node-name]'. - If there are still unassigned disks in the cluster, refer to the Storage Management Guide for manual disk assignment best practices. - For further information or assistance, contact NetApp technical support.

## Syslog Message

The generated aggr provisioning recommendation might be incomplete because of the following reason: %s

## Parameters

**details** (STRING): Details of the number of unassigned disks visible to a given node

**source** (STRING): The source that generated this warning.

# aggr.relocation events

## aggr.relocation.failed

### Severity

ERROR

### Description

This message occurs when relocation of an aggregate fails.

### Corrective Action

Refer to other generated error messages to identify the exact cause of failure and the corrective action.

### Syslog Message

Relocation of aggregate %s failed by node %s because %s.

### Parameters

**aggr** (STRING): Name of the aggregate that was not relocated.

**node** (STRING): Name of the node that failed the relocation.

**msg** (STRING): Error that prevented relocation.

# aggr.resize events

## aggr.resize.request.sent

### Severity

NOTICE

### Description

This message occurs when a request to resize an aggregate is sent to the REST server as part of the storage thin provisioning feature in Quark.

### Corrective Action

(None).

## Syslog Message

Triggering resizing of aggregate for %s. Current size: %lu, new size: %lu.

## Parameters

**aggr\_name** (STRING): Name of the aggregate.

**current\_size** (LONGINT): Current size of the aggregate.

**new\_size** (LONGINT): New size of the aggregate after being resized.

## aggr.resize.response.failure

### Severity

ALERT

### Description

This message occurs when the REST server returns an error for a request to resize an aggregate.

### Corrective Action

Ensure that all containers in the pod are online and healthy. Check if the REST server is up and responding.

## Syslog Message

Server returned error: %d for the resizing request. Aggregate: %s, current size: %lu, new size: %lu".

## Parameters

**error** (INT): Error returned from REST server.

**aggr\_name** (STRING): Name of the aggregate.

**current\_size** (LONGINT): Current size of the aggregate.

**new\_size** (LONGINT): New size of the aggregate after being resized.

## aggr.resize.response.success

### Severity

NOTICE

### Description

This message occurs when the REST server returns "success" as a response to the request to resize an aggregate.

### Corrective Action

(None).

## Syslog Message

Server returned "success" as a response to a resizing request. Aggregate: %s, current size: %lu, new size: %lu.

## Parameters

**aggr\_name** (STRING): Name of the aggregate.

**current\_size** (LONGINT): Current size of the aggregate.

**new\_size** (LONGINT): New size of the aggregate after being resized.

# aggr.wafliron events

## aggr.wafliron.attemptStart

### Severity

INFORMATIONAL

### Description

This message occurs when wafliron is started. A later message indicates the success or failure of wafliron.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**volname** (STRING): Volume name.

**arguments** (STRING): Arguments supplied to wafliron on the command line.

# aggrcopy events

## aggrcopy.dst events

### aggrcopy.dst.autoRestrictMsg

**Severity**

NOTICE

**Description**

This event is issued when an aggregate copy start is issued on an aggregate which is offline.

**Corrective Action**

Aggr copy start is issued on a restricted aggregate use "aggr restrict" to restrict the destination aggregate.

**Syslog Message**

Aggr copy automatically restricting destination aggregate %s (currently offline).

**Parameters**

**dst** (STRING): The aggr copy destination aggregate

### aggrcopy.dst.noMemory

**Severity**

ERROR

**Description**

This event is issued when there is insufficient memory on the aggr copy destination for the transfer to continue.

**Corrective Action**

(None).

**Syslog Message**

System is low on memory, aborting aggr copy destination transfer.

**Parameters**

(None).

### aggrcopy.dst.revert

**Severity**

NOTICE

**Description**

This event is issued when an aggr copy start operation has to revert the checksum state of the destination volume aggregate because the source and destination aggregates have differing checksum states.

## Corrective Action

No corrective action required.

## Syslog Message

An aggr copy transfer to destination aggregate %s has found that the source and destination aggregates have differing checksum states. Data ONTAP is aborting the transfer and reverting the checksum state for the destination aggregate. After Data ONTAP displays a message showing the revert is complete, you will need to retry the operation. You can use the "aggr status -c" command to see the progress of the reversion.

## Parameters

**dst** (STRING): The aggr copy destination volume

## aggrcopy.dst.revertErr

### Severity

NOTICE

### Description

This event is issued when a aggr copy start operation is not able to revert the checksum state of the destination aggregate.

### Corrective Action

(None).

## Syslog Message

Data ONTAP cannot revert the checksum state of destination aggregate %s.

## Parameters

**dst** (STRING): The aggr copy destination

## aggrcopy.dst.reverting

### Severity

NOTICE

### Description

This event is issued when an aggr copy start operation is issued on an aggregate which is reverting its checksum state.

### Corrective Action

(None).

## Syslog Message

Aborting aggr copy transfer to aggregate %s because it is reverting its checksum state.

## Parameters

**dst** (STRING): The aggr copy destination aggregate

# aggrcopy.restart events

## aggrcopy.restart.dst.chkFail

### Severity

NOTICE

### Description

This message occurs when 'aggr copy' checks for restart capability on the destination storage system fail. The 'aggr copy' transfer operation cannot be restarted. It starts as usual from the beginning (0 %) without any further user action.

### Corrective Action

No action necessary

### Syslog Message

Destination side checks fail; 'aggr copy' transfer starts from 0%%.

### Parameters

(None).

# aggrcopy.src events

## aggrcopy.src.snapshotErr

### Severity

ERROR

### Description

This event is issued when we are not able to obtain all the snapshot information, from the vol copy source volume, required for a vol copy transfer.

### Corrective Action

(None).

### Syslog Message

Aggr copy not able to obtain snapshot information from source aggregate %s

### Parameters

**srcaggr** (STRING): The aggr copy source volume

# air events

## air.certify events

### air.certify.cancel

#### Severity

ALERT

#### Description

This message occurs when a metadata inconsistency is discovered inside a file system feature that is read-only and therefore cannot be immediately corrected. One or more processes in ONTAP® software might have been canceled when they encountered the inconsistency.

#### Corrective Action

No immediate corrective action is necessary, because the ONTAP process that encountered the inconsistency has been automatically canceled. If the condition persists, contact NetApp technical support for assistance.

#### Syslog Message

AIR certification of %s failed: %s, %s ; message %s canceled for subtype %d

#### Parameters

**fh** (STRING): File handle of the object with an inconsistency.  
**condition** (STRING): Specific metadata validation test that failed.  
**source** (STRING): Location of the failing metadata validation test.  
**msg** (STRING): The ONTAP process that encountered the inconsistency.  
**subtype** (INT): Subtype of the inode encountering the inconsistency.

## air.cleared events

### air.cleared.qtm.entry

#### Severity

NOTICE

#### Description

This message occurs when the Automated Incremental Repair (AIR) subsystem clears an entry in the qtree metafile because of inconsistent data within that entry.

#### Corrective Action

(None).

#### Syslog Message

Qtree entry certification failed at %s. In the qtree metafile %d, AIR cleared an entry that corresponds to the TID %d in volume %s.

#### Parameters

**source** (STRING): Location where qtree entry certification failed.  
**inode** (INT): Inode number of qtree metafile.

**tid** (INT): TID.

**volume** (STRING): Name of the volume.

## air.corrected events

### air.corrected.qtree.tid

#### Severity

NOTICE

#### Description

This message occurs when the Automated Incremental Repair (AIR) subsystem repairs an inode having a corrupted qtree ID.

#### Corrective Action

(None).

#### Syslog Message

Qtree entry certification failed at %s. AIR repaired qtree inode %d: old TID %d, new TID %d, fgindex %d.

#### Parameters

**source** (STRING): Location where qtree entry certification failed.

**inode** (INT): Inode number.

**old\_tid** (INT): Old TID.

**new\_tid** (INT): New TID.

**fgindex** (INT): Fgindex of the qtree root.

## air.disable events

### air.disable.async.delete.cli

#### Severity

ALERT

#### Description

This message occurs when any inconsistency is found with the async delete trashbin directory of a volume.

#### Corrective Action

The "asynchronous directory delete from the client" feature has been disabled on this volume. To re-enable the feature, use the (privilege: advanced) "volume file async-delete client enable" command

#### Syslog Message

The "async directory delete from the client" feature was disabled in volume %s, after an inconsistency was detected with the trashbin directory.

#### Parameters

**volume** (STRING): Name of the volume.

**source** (STRING): Location of the failing metadata validation.

## air.disable.preserve.unlink

### Severity

NOTICE

### Description

This message occurs when any inconsistency is found with the trash directory that is used for the preserve unlink option of a volume. Then, the preserve unlink option is disabled for that volume. The trash directory that is used for the preserve unlink option is used to preserve deleted files for NFSv41 when they have existing share locks.

### Corrective Action

None. The system reverts to the behavior it used before the preserve unlink option was enabled; that is, it will not preserve deleted files with share locks.

### Syslog Message

The preserve unlink option of volume "%s", was disabled after an inconsistency with the trash directory was detected.

### Parameters

**volume** (STRING): Name of the volume.  
**source** (STRING): Location of the failing metadata validation.

## air.enabled events

### air.enabled.fg.qtree

### Severity

NOTICE

### Description

This message occurs in a FlexGroup, when the qtree support is enabled on the volume, but disabled on one or more constituent volumes. ONTAP® software automatically enabled the qtree support on the relevant constituent volumes.

### Corrective Action

This message indicates that the qtree support is enabled on the volume, but disabled in one or more constituents within the FlexGroup. ONTAP® software automatically enabled the qtree support in the relevant constituent FlexGroup volumes.

### Syslog Message

Enabled qtree support in FlexGroup constituent volume %s after detecting inconsistency in %s.

### Parameters

**volume** (STRING): Name of the volume.  
**source** (STRING): Location of the failing metadata validation.

## air.evicted events

## air.evicted.qtm.entry

### Severity

NOTICE

### Description

This message occurs when the Automated Incremental Repair (AIR) subsystem evicts an entry in the qtree metafile because of inconsistent data within that entry.

### Corrective Action

(None).

### Syslog Message

Qtree entry certification failed at %s. In the qtree metafile %d, AIR evicted an entry that corresponds to the TID %d in volume %s.

### Parameters

**source** (STRING): Location where qtree entry certification failed.

**inode** (INT): Inode number of the qtree metafile.

**tid** (INT): TID.

**volume** (STRING): Name of the volume.

## air.fc events

### air.fc.origin.corrupt

#### Severity

ALERT

#### Description

This message occurs when inconsistencies are detected in the origin of this FlexCache® volume. The affected files remain inaccessible from this FlexCache volume until the corrective action is taken.

#### Corrective Action

If the origin of this FlexCache volume is a FlexVol® volume, then run wafiron on the origin FlexVol volume.

If the origin is a FlexGroup volume, then list the affected files from a NFS or a CIFS client on the origin volume. For more information or assistance, contact NetApp technical support.

#### Syslog Message

The fh %s in Origin of this FlexCache volume %s%s contains inconsistencies.

#### Parameters

**fh** (STRING): File handle of the affected inode.

**vol** (STRING): FlexCache volume name.

**volident** (STRING): Unique identifier for the volume if volume name alone is insufficient.

## air.qtm events

## air.qtm.rebuild.scan.state

### Severity

NOTICE

### Description

This message occurs when the state of a scanner used to rebuild the qtree metafile changes.

### Corrective Action

(None).

### Syslog Message

Scanner to rebuild the qtree metafile is %s.

### Parameters

**state** (STRING): State of the scanner.

## air.removed events

### air.removed.remote.lck.entry

### Severity

NOTICE

### Description

This message occurs when there is an inconsistency in the remote lock entry metafile. The inconsistent entry is removed upon detection.

### Corrective Action

(None).

### Syslog Message

Remote lock entry %s certification failed: expression %s, source %s, state (%s).

### Parameters

**entry** (STRING): Lock entry type and origin file ID pair describing the entry.

**rlem** (STRING): Describes the metafile to which this lock entry belongs to.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

**state** (STRING): Description of the remote lock entry metafile metadata state that was found to be inconsistent.

## air.repair events

### air.repair.prsist.lock.entry

### Severity

NOTICE

## Description

This message occurs when there is an inconsistency in the persistent lock entry metafile. The inconsistent entry is repaired upon detection if there is a corresponding in-core record.

## Corrective Action

(None).

## Syslog Message

Persistent lock entry %s certification failed: Condition: %s, source: %s, state: %s.

## Parameters

**entry** (STRING): Lock entry type and origin file ID pair describing the entry.

**condition** (STRING): Initial validation test that fails.

**source** (STRING): Location of the failing metadata validation test.

**state** (STRING): Description of the remote lock entry metafile metadata state that is found to be inconsistent.

# air.repaired.events

## air.repaired.bucket.header

### Severity

NOTICE

### Description

This message occurs when ONTAP® discovers an inconsistency in a metadata bucket header record. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

TOC metadata (%s) has an inconsistent record for the bucket upload table (%s). %s.

### Parameters

**toc\_fh** (STRING): File handle of the TOC metadata file.

**upload\_table\_fh** (STRING): File handle of the bucket upload table file.

**state** (STRING): Description of the metadata that was found to be inconsistent.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.cbmap

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the type/subtype of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

**Corrective Action**

(None).

**Syslog Message**

CloudBlockMap metafile %s certification failed: %s, %s (%s)

**Parameters**

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the CloudBlockMap metafile that was found to be inconsistent.

**air.repaired.cbmap.entry****Severity**

NOTICE

**Description**

This message occurs when context mismatch is discovered in any entry of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

**Corrective Action**

(None).

**Syslog Message**

%s certification failed: %s, %s (%s)

**Parameters**

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the metafile that was found to be inconsistent.

**pvbn** (LONGINT): Inconsistency found in cbmap entry of this PVBN.

**air.repaired.cbmap.header****Severity**

NOTICE

**Description**

This message occurs when an inconsistency is discovered in the header of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

**Corrective Action**

(None).

**Syslog Message**

%s certification failed: %s, %s (%s)

**Parameters**

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.  
**source** (STRING): The location of the failing metadata validation test.  
**state** (STRING): A description of the metafile that was found to be inconsistent.

## air.repaired.chapter.entry

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Chapter metadata (%s) has inconsistent record for object (%s). Source %s (%s).

### Parameters

**chapter\_fh** (STRING): File handle of the metadata file.  
**object\_fh** (STRING): File handle of the object.  
**source** (STRING): Location of the failing metadata validation test.  
**condition** (STRING): Initial metadata validation test that failed.  
**state** (STRING): Description of the metadata that was found to be inconsistent.

## air.repaired.dir.hole

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the hole list of a directory. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

Directory hole list %s certification failed: %s, %s.

### Parameters

**fh** (STRING): File handle of the affected directory.  
**condition** (STRING): Initial metadata validation test that failed.  
**source** (STRING): Location of the failing metadata validation test.

## air.repaired.dir.inode

### Severity

NOTICE

## Description

This message occurs when an inconsistency is discovered in a directory. The inconsistency is repaired automatically as soon as it is detected.

## Corrective Action

(None).

## Syslog Message

Directory %s certification failed: %s, %s.

## Parameters

**fh** (STRING): File handle of the affected directory.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.enc.vvol.info

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the encryptable aggregate metafile inodes encrypted flexvol information which stores vvol\_bt看id and vvol\_fid. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

Inode %s certification failed: %s, %s.

### Parameters

**fh** (STRING): File handle of the affected inode.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.fabriclink

### Severity

NOTICE

### Description

This message occurs when a metadata inconsistency is discovered and repaired within an object storage replication data structure.

### Corrective Action

(None).

### Syslog Message

AIR repaired %s, condition %s at %s, object "%s"

## Parameters

**fh** (STRING): File handle of the replication data structure that was found to be inconsistent.  
**expr** (STRING): The nature of the inconsistency that was discovered and repaired.  
**source** (STRING): Location where the metadata inconsistency was detected.  
**object** (STRING): Optionally represents the name of a particular object whose replication state was affected.

## air.repaired.fc.dir

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in any directory in the volume. The inconsistency is repaired automatically as soon as it is discovered.

### Corrective Action

(None).

### Syslog Message

Evicted inconsistent directory with fh %s due to corruption in volume %s.

## Parameters

**fh** (STRING): File handle of the affected inode.  
**volume** (STRING): Name of the volume.

## air.repaired.fc.qtree.id

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the qtree ID of an inode. The inconsistent inode is evicted automatically as soon as it is discovered.

### Corrective Action

(None).

### Syslog Message

Evicted inconsistent inode with fh %s due to a corrupted qtree ID: qtree ID %d, volume %s.

## Parameters

**fh** (STRING): File handle of the affected inode.  
**tid** (INT): Qtree ID.  
**volume** (STRING): Name of the volume.

## air.repaired.hardlink.i2p

### Severity

NOTICE

## Description

This message occurs when the AIR subsystem repairs an inconsistent inode and previously unreachable hard links are returned to availability.

## Corrective Action

(None).

## Syslog Message

AIR repaired inconsistent hardlink for inode %d: %d %d %s

## Parameters

**inode** (INT): Inode number.  
**parent\_inode** (INT): Parent inode number.  
**link\_count** (INT): Inode link count.  
**volume** (STRING): Name of the volume.

## air.repaired.label.database

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered within a WAFL label database. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Label database %s certification failed: %s, %s (%s)

### Parameters

**fh** (STRING): File handle of the affected metafile.  
**condition** (STRING): The initial metadata validation test that failed.  
**source** (STRING): The location of the failing metadata validation test.  
**state** (STRING): A description of the metadata that was found to be inconsistent.

## air.repaired.lsm.bfc.lkp

### Severity

NOTICE

### Description

This message occurs when the system detects an inconsistency in the LSM BFC Lookup file. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

LSM BFC Lookup file %s was corrected at block %d. Source %s.

## Parameters

**fh** (STRING): File handle of the affected file.  
**block** (LONGINT): Block number of the inconsistent block.  
**source** (STRING): Location of the failing metadata validation test.

## air.repaired.lsm.bloom.file

### Severity

NOTICE

### Description

This message occurs when the system detects an inconsistency in the LSM Bloomfilter file. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

LSM Bloomfilter file %s was corrected at block %d. Source %s.

## Parameters

**fh** (STRING): File handle of the affected file.  
**block** (LONGINT): Block number of the inconsistent block.  
**source** (STRING): Location of the failing metadata validation test.

## air.repaired.lsm.info.file

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the LSM Info file. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

LSM Info file %s was corrected at block %d. Source %s.

## Parameters

**fh** (STRING): File handle of the affected file.  
**block** (INT): Block number of the inconsistent block.  
**source** (STRING): Location of the failing metadata validation test.

## air.repaired.lsm.keyspc.file

### Severity

NOTICE

## Description

This message occurs when the system detects an inconsistency in the LSM Keyspace Information file. The inconsistency is repaired automatically as soon as it is detected.

## Corrective Action

(None).

## Syslog Message

Inconsistent LSM Keyspace Information metafile on aggregate "%s" was repaired. Source %s.

## Parameters

**aggregate** (STRING): Name of the aggregate.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.lsm.lookup.file

### Severity

NOTICE

### Description

This message occurs when the system detects an inconsistency in the LSM Lookup file. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

LSM Lookup file %s was corrected at block %d. Source %s.

### Parameters

**fh** (STRING): File handle of the affected file.

**block** (LONGINT): Block number of the inconsistent block.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.merkle

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the metadata (Merkle tree file). Repairs to the Merkle tree file have automatically been started.

### Corrective Action

(None).

### Syslog Message

Merkle file "%s" certification failed: %s, directory ID (%llu), branch ID (%llu), buffer level %d, fbn (%llu), Merkle tree level (%d)

## Parameters

**fh** (STRING): File handle of the Merkle file that needs repairs.  
**condition** (STRING): Initial validation test that failed.  
**dir\_id** (LONGINT): Slice directory ID of the Merkle file.  
**branch\_id** (LONGINT): Slice branch ID of the Merkle file.  
**level** (INT): Buffer level of the Merkle file block.  
**fbn** (LONGINT): File block number (FBN) of the Merkle file.  
**merkle\_level** (INT): Merkle checksum level of the Merkle file.  
**source** (STRING): The location of the failing validation test.

## air.repaired.mpu.catalog

### Severity

NOTICE

### Description

This message occurs when ONTAP® discovers an inconsistency in a multipart upload catalog record of a bucket upload table. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Bucket upload table (%s) has an inconsistent record for the multipart upload catalog (%s). %s.

## Parameters

**upload\_table\_fh** (STRING): File handle of the bucket upload table file.  
**mp\_catalog\_fh** (STRING): File handle of the multipart catalog file.  
**state** (STRING): Description of the metadata that was found to be inconsistent.  
**condition** (STRING): Initial metadata validation test that failed.  
**source** (STRING): Location of the failing metadata validation test.

## air.repaired.multipart.database

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the metadata of a multipart inode. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected file.  
**condition** (STRING): The database validation test that failed.  
**source** (STRING): The location of the failing database validation test.  
**state** (STRING): A description of the metadata that was found to be inconsistent.

## air.repaired.multipart.inode

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in a multipart inode. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Multipart inode %s certification failed: %s, %s

### Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): The initial multipart inode validation test that failed.

**source** (STRING): The location of the failing multipart inode validation test.

## air.repaired.multipart.record

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the metadata of the multipart inode. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

### Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): The initial record validation test that failed.

**source** (STRING): The location of the failing record validation test.

**state** (STRING): A description of the record that was found to be inconsistent.

## air.repaired.multipart.rectify

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the rectification metadata for a multipart file. The inconsistency is automatically repaired immediately upon detection.

## Corrective Action

(None).

## Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): The initial record validation test that failed.

**source** (STRING): The location of the failing record validation test.

**state** (STRING): A description of the record that was found to be inconsistent.

## air.repaired.multipart.userheader

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the userheader section of a multipart file. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Multipart inode %s userheader certification failed: %s, %s

### Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): The initial userheader validation test that failed.

**source** (STRING): The location of the failing userheader validation test.

## air.repaired.name.info.flags

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the name information flags of a directory. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

Name information flags for directory entry %s corrected at block %d and index %d. Source %s.

### Parameters

**fh** (STRING): File handle of the affected directory.

**block** (INT): Block number that contains the affected entry

**index** (INT): Location within the block that holds the affected entry

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.pct.entry

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

PCT metadata has inconsistent record for bucket (%u) file (%u). Source %s (%s, %s).

### Parameters

**bucketid** (INT): Bucket identifier.

**fileid** (INT): File identifier.

**source** (STRING): Location of the failing metadata validation test.

**condition** (STRING): Initial metadata validation test that failed.

**state** (STRING): Description of the metadata that was found to be inconsistent.

## air.repaired.qtree.id

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the qtree ID of an inode. The inconsistency is repaired automatically as soon as it is discovered.

### Corrective Action

(None).

### Syslog Message

Repaired inconsistent inode with fh %s due to a corrupted qtree ID: Old qtree ID %d, new qtree ID %d, volume %s.

### Parameters

**fh** (STRING): File handle of the affected inode.

**old\_tid** (INT): Old qtree ID.

**new\_tid** (INT): New qtree ID.

**volume** (STRING): Name of the volume.

## air.repaired.qtree.metafile

### Severity

NOTICE

**Description**

This message occurs when an inconsistency is discovered in a qtree metafile. The inconsistency is repaired automatically as soon as it is detected.

**Corrective Action**

(None).

**Syslog Message**

Qtree metafile %s

**Parameters**

**details** (STRING): Description of the metadata failure that has been fixed.

**air.repaired.qtree.root****Severity**

NOTICE

**Description**

This message occurs when the system discovers an inconsistency between the qtree file root and a qtree metafile entry. The system repairs this inconsistency automatically, as soon as it detects it.

**Corrective Action**

(None).

**Syslog Message**

Qtree root %s certification failed: %s, %s corrections: %s.

**Parameters**

**fh** (STRING): File handle of the affected qtree root.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

**state** (STRING): Description of the metadata that has been fixed.

**air.repaired.ral.clone.exp****Severity**

NOTICE

**Description**

This message occurs when an inconsistency is discovered between the source, clone created via ral retrieve and the clone expansion structure in source's remote state.

**Corrective Action**

(None).

**Syslog Message**

Remote RAL Clone %s certification failed: %s, %s (%s)

**Parameters**

**fh** (STRING): File handle of the affected clone.

**condition** (STRING): The initial metadata validation test that failed.  
**source** (STRING): The location of the failing metadata validation test.  
**state** (STRING): A description of the source and clone files.

## **air.repaired.rclone.database**

### **Severity**

NOTICE

### **Description**

This message occurs when an inconsistency is discovered within the WAFL Remote Clone Database. The inconsistency is automatically repaired immediately upon detection.

### **Corrective Action**

(None).

### **Syslog Message**

Remote Clone Database %s certification failed: %s, %s (%s)

### **Parameters**

**fh** (STRING): File handle of the affected metafile.  
**condition** (STRING): The initial metadata validation test that failed.  
**source** (STRING): The location of the failing metadata validation test.  
**state** (STRING): A description of the metafile that was found to be inconsistent.

## **air.repaired.rclone.record**

### **Severity**

NOTICE

### **Description**

This message occurs when an inconsistency is discovered in any record of the WAFL Remote Clone Database. The inconsistency is automatically repaired immediately upon detection.

### **Corrective Action**

(None).

### **Syslog Message**

Remote Clone Record %s certification failed: %s, %s (%s)

### **Parameters**

**fh** (STRING): File handle of the affected record.  
**condition** (STRING): The initial record validation test that failed.  
**source** (STRING): The location of the failing record validation test.  
**state** (STRING): A description of the entry that was found to be inconsistent.

## **air.repaired.remote.index**

### **Severity**

NOTICE

## Description

This message occurs when an inconsistency is discovered within the WAFL RAL index. The inconsistency is automatically repaired immediately upon detection.

## Corrective Action

(None).

## Syslog Message

Remote index %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): The RAL index record that was discovered to be incorrect.

## air.repaired.remote.inode

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered between a file and its RAL state within WAFL. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Remote inode %s certification failed: %s, %s (%s)

### Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the RAL state metadata that was found to be inconsistent.

## air.repaired.remote.metafile

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered within a WAFL RAL metafile. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Remote metafile %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the RAL metafile that was found to be inconsistent.

## air.repaired.remote.tallies

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the tallies in Remote Entry metafile. The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Remote metafile %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the RAL metafile that was found to be inconsistent.

## air.repaired.rlem.tallies

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the tallies in Remote Lock Entry metafile(RLEM). The inconsistency is automatically repaired immediately upon detection.

### Corrective Action

(None).

### Syslog Message

Remote lock entry metafile %s certification failed: %s, %s (%s)

## Parameters

**fh** (STRING): File handle of the affected metafile.

**rlem** (STRING): Describes the metafile to which this lock entry belongs to.

**condition** (STRING): The initial metadata validation test that failed.

**source** (STRING): The location of the failing metadata validation test.

**state** (STRING): A description of the RLEM that was found to be inconsistent.

## air.repaired.slice

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in the metadata (slice file). Repairs to the slice file from the secondary copy have automatically been started.

### Corrective Action

(None).

### Syslog Message

Slice file "%s" certification failed: %s, dir ID (%llu), branch ID (%llu), level %d, fbn (%llu)

### Parameters

**fh** (STRING): File handle of the slice file that needs repairs.  
**condition** (STRING): The initial validation test that failed.  
**dir\_id** (LONGINT): Slice directory ID of the slice file.  
**branch\_id** (LONGINT): Slice branch ID of the slice file.  
**level** (INT): Buffer level of the slice file block.  
**fbn** (LONGINT): File block number (FBN) of the slice file.  
**source** (STRING): The location of the failing validation test.

## air.repaired.snapinfo.block

### Severity

NOTICE

### Description

This message occurs when the system detects an inconsistency in the persistent lock entry metafile. The inconsistent entry has been removed.

### Corrective Action

(None).

### Syslog Message

Repaired inconsistent block (%s) found in Snapinfo metafile on volume "%s".

### Parameters

**state** (STRING): Description of the Snapinfo metafile block that was found to be inconsistent.  
**volume** (STRING): Name of the volume.

## air.repaired.ssm.iftp.inode

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered in ssm iftp metafile. The inconsistency is repaired automatically as soon as it is detected.

### Corrective Action

(None).

### Syslog Message

AIR vlist metafile %s certification failed: %s, %s.

### Parameters

**fh** (STRING): File handle of the affected metafile.

**condition** (STRING): Initial metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.toc.entry

### Severity

ALERT

### Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection. But it can leave behind lost objects that are no longer pointed to by the namespace.

### Corrective Action

The command "object-store-server lost-object-recovery start" under diag privilege can be used to add lost objects back into namespace. The progress of this command can be monitored using "object-store-server lost-object-recovery show" command.

### Syslog Message

TOC metadata (%s) has inconsistent record for chapter (%s). %s (%s).

### Parameters

**toc\_fh** (STRING): File handle of the TOC metadata file.

**chapter\_fh** (STRING): File handle of the chapter metadata file.

**state** (STRING): Description of the metadata that was found to be inconsistent.

**condition** (STRING): Initial metadata validation test that failed.

## air.repaired.user.ind

### Severity

ERROR

### Description

This message occurs when an inconsistency is discovered in the user indirect block. The inconsistency is repaired automatically immediately upon detection.

### Corrective Action

(None).

### Syslog Message

User indirect %s certification failed: %s (%s)

## Parameters

**fh** (STRING): File handle of the affected file.

**condition** (STRING): Initial metadata validation test that failed.

**state** (STRING): Description of the user indirect block that was found to be inconsistent.

**source** (STRING): Location of the failing metadata validation test.

## air.repaired.vplus

### Severity

NOTICE

### Description

This message occurs when an indexed storage tree is rebuilt to repair a metadata inconsistency that was discovered.

### Corrective Action

(None).

### Syslog Message

AIR vplus rebuild of %s completed for subtype %d

## Parameters

**fh** (STRING): File handle of the storage tree.

**subtype** (INT): Subtype of the inode encountering the inconsistency.

## air.vplus events

### air.vplus.certify.issue

#### Severity

NOTICE

#### Description

This message occurs when an inconsistency is discovered inside an indexed storage tree. The inconsistency is automatically repaired immediately upon detection.

#### Corrective Action

(None).

#### Syslog Message

AIR vplus certification of %s failed: %s, %s for subtype %d

## Parameters

**fh** (STRING): File handle of the storage tree.

**condition** (STRING): Specific metadata validation test that failed.

**source** (STRING): Location of the failing metadata validation test.

**subtype** (INT): Subtype of the inode encountering the inconsistency.

# am events

## am.dest events

### am.dest.check.failed

#### Severity

NOTICE

#### Description

Relocation of aggregates fails at the destination as we no longer accept aggregates from versions 8.2.0 or lower.

#### Corrective Action

User needs to upgrade to 8.2.1 before attempting ARL to 8.3.0 or higher. `

#### Syslog Message

Relocation of aggregates failed from node %s to current node as ARL is no longer supported from releases 8.2.0 or lower to 8.3.0 or higher.

#### Parameters

**partner\_node** (STRING): Source of the aggregate migration

# api events

## api.engine events

### api.engine.killed

#### Severity

EMERGENCY

#### Description

This event is posted when the ONTAPI® engine is unexpectedly terminated. The ONTAPI APIs cannot be executed until the system is rebooted.

#### Corrective Action

Reboot the controller. If the problem persists, contact Contact NetApp technical support.

#### Syslog Message

Error in API Engine. Engine name: %s.

#### Parameters

**engineName** (STRING): Name of the execution engine (e.g., "m" or "d").

## api.fileio events

### api.fileio

#### Severity

NOTICE

#### Description

This message occurs after a file I/O error that typically causes a Data ONTAP® API to fail. While processing Data ONTAP API requests, the system might write intermediate results to files. For example, a long running command returning quantities of data might send a batch of data and save remaining data in a file for subsequent delivery. An I/O error occurred during one of these operations.

#### Corrective Action

If the problem is related to creating a file, use the system's "df" and "df -i" commands to determine whether the root volume is full or all inodes are in use. If so, it might be possible to remove unneeded files to release space or inodes needed for Data ONTAP API operations. If the problem is that an intermediate file is being deleted because of its age, no action is needed. Probably the client that requested the API did not complete the API processing.

#### Syslog Message

(None).

#### Parameters

**errorDescription** (STRING): Description of the I/O error that occurred.

**targetDescription** (STRING): Description of the file or directory in which the error occurred.

**errorCode** (INT): Numeric error code.

**errorDetail** (STRING): Description of the error code.

# api.input events

## api.input.invalidSchema

### Severity

ERROR

### Description

This message occurs when an ONTAPI(tm) API receives extra input parameters as part of the API request or when a required input parameter is missing in the API request. Most often this is due to a bug in the application that initiates the API request.

### Corrective Action

The error is due to strict schema validation. You can turn off the input schema validation by using the following CLI commands: `$priv set advanced $registry set state.api.schema_input_validate.enable off`

### Syslog Message

Error in API input schema validation. API name: %s. Detailed error: %s.

### Parameters

**apiName** (STRING): Name of the ONTAPI API in which something invalid was detected.

**detailInfo** (STRING): Description of the error in the API input, such as an extra input value or a missing input value.

# api.output events

## api.output.invalid

### Severity

NOTICE

### Description

This message occurs when An invalid character was detected while checking the output for a Data ONTAP® API. All Data ONTAP API output must be valid UTF-8 characters. From time to time invalid output is detected. Most often this is due to hardware errors, for example, a disk-list-info API might query a disk drive for its serial number but receive invalid data from a malfunctioning drive.

### Corrective Action

Examine the information in detailInfo to see if it pinpoints defective hardware. If an API name is provided, that API can be executed to determine which field in the API output is being given invalid data.

### Syslog Message

(None).

### Parameters

**detailInfo** (STRING): Information regarding the circumstances in which the error was detected, for example, the API name and/or the piece of hardware that provided invalid data.

**invalidValue** (INHEX): The character in the string that was invalid, printed as a hexadecimal number.

## api.output.invalidSchema

### Severity

ERROR

### Description

This message occurs when an ONTAPI(tm) API generates output that violates the declared schema of the API. Most often this is due to a bug in the API handler.

### Corrective Action

The error is due to strict schema validation. You can turn off the output schema validation by using the following CLI commands: `$priv set advanced $registry set state.api.schema_output_validate.enable off`

### Syslog Message

Error in API output schema validation. API name: %s. Detailed error: %s.

### Parameters

**apiName** (STRING): Name of the ONTAPI API in which something invalid was detected.

**detailInfo** (STRING): Description of the error in the API output, such as an extra output value or a missing output value.

# app events

## app.cg events

### app.cg.snap.smbc.lookup.fail

#### Severity

ERROR

#### Description

This message occurs when a consistency group on either side of a SnapMirror® Business Continuity (SMBC) relationship cannot be resolved to the remote consistency group for correctly replicating consistency group Snapshot copies.

#### Corrective Action

Use the "volume snapshot show" command on the destination cluster to view the consistency group Snapshot copy and "volume snapshot restore" for restoring each individual volume instead of the consistency group REST interface.

#### Syslog Message

Failed to resolve Snapshot copy "%s" in consistency group "%s" on Vserver %s to the remote consistency group. Error: "%s".

#### Parameters

**snapshot\_name** (STRING): Name of the consistency group's Snapshot copy.

**consistency\_group** (STRING): Name of the consistency group.

**vserver** (STRING): Name of the Vserver.

**error** (STRING): The error that was encountered while resolving the local consistency group to its corresponding remote consistency group.

## app.log events

### app.log.alert

#### Severity

ALERT

#### Description

This event is issued when an application is in a condition that should be corrected immediately.

#### Corrective Action

(None).

#### Syslog Message

%s: %s %s: (%u) %s: %s

#### Parameters

**computerName** (STRING): Client Computer connected to the Filer.

**eventSource** (STRING): Client application that generated this event.

**appVersion** (STRING): Client application version.

**eventID** (INT): Application eventID.  
**category** (STRING): Event category.  
**subject** (STRING): Event description.

## app.log.emerg

### Severity

EMERGENCY

### Description

This message occurs when an application encounters a fatal error and requires immediate attention.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

%s: %s %s: (%u) %s: %s

### Parameters

**computerName** (STRING): Client Computer connected to the Filer.  
**eventSource** (STRING): Client application that generated this event.  
**appVersion** (STRING): Client application version.  
**eventID** (INT): Application eventID.  
**category** (STRING): Event category.  
**subject** (STRING): Event description.

## app.log.err

### Severity

ERROR

### Description

This event is issued when an application encounters an error condition.

### Corrective Action

(None).

### Syslog Message

%s: %s %s: (%u) %s: %s

### Parameters

**computerName** (STRING): Client Computer connected to the Filer.  
**eventSource** (STRING): Client application that generated this event.  
**appVersion** (STRING): Client application version.  
**eventID** (INT): Application eventID.  
**category** (STRING): Event category.  
**subject** (STRING): Event description.

## app.log.info

**Severity**

INFORMATIONAL

**Description**

This event is issued when an application's message is meant for informational purposes.

**Corrective Action**

(None).

**Syslog Message**

%s: %s %s: (%u) %s: %s

**Parameters**

**computerName** (STRING): Client Computer connected to the Filer.  
**eventSource** (STRING): Client application that generated this event.  
**appVersion** (STRING): Client application version.  
**eventID** (INT): Application eventID.  
**category** (STRING): Event category.  
**subject** (STRING): Event description.

**app.log.notice****Severity**

NOTICE

**Description**

This event is issued when an application is notifying of a certain event.

**Corrective Action**

(None).

**Syslog Message**

%s: %s %s: (%u) %s: %s

**Parameters**

**computerName** (STRING): Client Computer connected to the Filer.  
**eventSource** (STRING): Client application that generated this event.  
**appVersion** (STRING): Client application version.  
**eventID** (INT): Application eventID.  
**category** (STRING): Event category.  
**subject** (STRING): Event description.

**app.temp events****app.temp.delete.s3bucket.fail****Severity**

ERROR

## Description

This message occurs when a S3 Bucket cannot be deleted as a part of an application destroy operation.

## Corrective Action

Use the "object-store-server bucket delete" command to delete the S3 bucket manually. Retry the "application destroy" command on the specified application.

## Syslog Message

Failed to delete S3 Bucket %s of application %s on Vserver %s. Error %s.

## Parameters

**s3bucket** (STRING): Name of the S3 Bucket.

**application\_name** (STRING): Name of the application that contains this S3 bucket.

**vserver** (STRING): Name of the Vserver.

**error** (STRING): The error that the application destroy service encountered while destroying the S3 bucket.

## app.temp.destroy.flexcache.fail

### Severity

ERROR

### Description

This message occurs when a flexcache cannot be destroyed as a part of an application destroy operation.

### Corrective Action

Use the "volume offline" command to take the flexcache offline, and then use the "flexcache delete" command to delete the flexcache manually. Retry the "application destroy" command on the specified application.

### Syslog Message

Failed to destroy flexcache %s of application %s on Vserver %s. Error %s.

### Parameters

**flexcache** (STRING): Name of the flexcache.

**application\_name** (STRING): Name of the application that contains this volume.

**vserver** (STRING): Name of the Vserver.

**error** (STRING): The error that the application destroy service encountered while destroying the flexcache.

## app.temp.destroy.volume.fail

### Severity

ERROR

### Description

This message occurs when a volume cannot be destroyed as a part of an application destroy operation.

### Corrective Action

Use the "volume offline" command to take the volume offline, and then use the "volume delete" command to delete the volume manually. Retry the "application destroy" command on the specified application.

## Syslog Message

Failed to destroy volume %s of application %s on Vserver %s. Error %s.

## Parameters

**volume** (STRING): Name of the volume.

**application\_name** (STRING): Name of the application that contains this volume.

**vserver** (STRING): Name of the Vserver.

**error** (STRING): The error that the application destroy service encountered while destroying the volume.

## app.temp.mcc.sb.modify.abort

### Severity

ERROR

### Description

This message occurs on MetroCluster(tm) systems, as part of a failed "application modify" command. For this to happen, the primary site must be in the midst of modifying application provisioning when an unplanned MetroCluster switchover occurs. The secondary site must then successfully modify the same application. During MetroCluster switchback, the state of the original application provisioning job is checked before allowing the originally issued "application modify" command from the primary site to continue. If the state of the application has changed due to it being modified by the secondary site during switchover, the original "application modify" command is canceled during switchback. This is to prevent possible corruption to the application provisioning modifications from the secondary site.

### Corrective Action

Verify that the changes made by the MetroCluster secondary site are acceptable by using the "application show" command. If the changes are acceptable, no further action is required. Otherwise, rerun the "application modify" command as necessary.

## Syslog Message

Failed to modify application %s on Vserver %s.

## Parameters

**app\_name** (STRING): Name of the application being modified.

**vserver** (STRING): Name of the Vserver.

## app.temp.mcc.veto.fail

### Severity

ERROR

### Description

This message occurs when a metrocluster switchover or switchback command fails due to unfinished application jobs running on the node.

### Corrective Action

Run the "job show -category APS" command to first verify that there are no application provisioning jobs running. Then Retry the metrocluster switchover or switchback command.

## Syslog Message

A metrocluster switchover or switchback command was vetoed due to application provisioning jobs still in progress: %s.

**Parameters**

**error** (STRING): Error returned by Metrocluster application provisioning.

**app.temp.remove.app.fail****Severity**

ERROR

**Description**

This message occurs when an application cannot be removed from the persistent database during an "application destroy" operation.

**Corrective Action**

Retry the "application destroy" command. Contact NetApp technical support if the failure persists.

**Syslog Message**

Failed to remove application %s on Vserver %s from the persistent database. Error %s.

**Parameters**

**application\_name** (STRING): Name of the application.

**vserver\_name** (STRING): Name of the Vserver.

**error** (STRING): The error that the application destroy service encountered while removing the application from the persistent database.

# application events

## application.volume events

### application.volume.removed

#### Severity

ERROR

#### Description

This message occurs when an application is destroyed, but a member volume was not deleted after an error was encountered. This volume is no longer associated with the application and must be deleted manually.

#### Corrective Action

Delete the volume using the "volume delete" command.

#### Syslog Message

Failed to destroy member volume %s in Vserver %s during an application destroy operation. The volume must be deleted manually. The volume was previously associated with an application with UUID %s.

#### Parameters

**volumeName** (STRING): Name of the volume.

**vserver** (STRING): Vserver containing the volume.

**applicationUUID** (STRING): UUID of the application.

# arl events

## arl.abort events

### arl.abort.raid

#### Severity

ERROR

#### Description

This message occurs when a relocation of an aggregate is canceled due to activity in RAID.

#### Corrective Action

Reissue the "storage aggregate relocation start" command to initiate relocation of an aggregate to the specified destination node after the pending or in-progress operation on the aggregate is complete.

#### Syslog Message

Aggregate %s%s is %s; canceling 'storage aggregate relocation start' operation.

#### Parameters

**owner** (STRING): String indicating the owner of the affected aggregate.

**vol** (STRING): Name of the aggregate.

**reason** (STRING): Activity that is preventing the aggregate relocation operation.

## arl.aggrdesttimeout events

### arl.aggrDestTimeout

#### Severity

NOTICE

#### Description

This message occurs during an aggregate relocation operation, when the source node does not receive notification from the destination node, within the specified time, that the aggregate is online.

#### Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online on the destination node.

#### Syslog Message

Node did not receive notification from the destination in %llu milliseconds that aggregate %s is online after relocation.

#### Parameters

**time** (LONGINT): Timeout, in milliseconds, for notification from the destination node that an aggregate is online after relocation.

**aggrName** (STRING): Name of the aggregate that was relocated.

# arl.aggronlinefailed events

## arl.aggrOnlineFailed

### Severity

EMERGENCY

### Description

This message occurs when the RAID or WAFL® subsystem fails to bring online the aggregate or its containing volumes after relocation.

### Corrective Action

Check the EMS logs for messages from the RAID and WAFL subsystems to determine the exact cause of the failure and the corrective action.

### Syslog Message

Bringing online of aggregate %s or its volumes failed after relocation with error %d.

### Parameters

**aggrName** (STRING): Name of the aggregate that was relocated.

**error** (INT): Error that occurred while bringing online the aggregate or its volumes after relocation.

# arl.aggronlinetimeout events

## arl.aggrOnlineTimeout

### Severity

ALERT

### Description

This message occurs when a node fails to bring online the aggregate and its containing volumes within the specified time after relocation.

### Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online.

### Syslog Message

Node did not bring online the aggregate %s and its volumes after relocation for %llu milliseconds.

### Parameters

**aggrUUID** (STRING): UUID of the aggregate that was relocated.

**time** (LONGINT): Timeout, in milliseconds, to bring online the aggregate and its volumes after relocation.

# arl.aggrstart events

## arl.aggrStart

### Severity

NOTICE

## Description

This message occurs when relocation of a storage failover aggregate starts.

## Corrective Action

(None).

## Syslog Message

Starting relocation of aggregate %s at time %llu.

## Parameters

**aggrName** (STRING): Name of the aggregate being relocated.

**time** (LONGINT): Time at which relocation of the aggregate started.

**aggrUUID** (STRING): UUID of the aggregate being relocated.

# arl.connecttoDestFailed events

## arl.connectToDestFailed

### Severity

ALERT

### Description

This message occurs when the local node cannot connect over the cluster network to the d-blade of the destination node while relocating an aggregate.

### Corrective Action

1. Verify that the destination node is up.
2. Use the "network interface show" command to verify that the cluster network interfaces on the local node and the destination node are both up.
3. Retry the aggregate relocation command.

### Syslog Message

Failed to connect with the destination node %s (d-blade ID: %s) over the cluster network while relocating aggregate %s.

### Parameters

**destName** (STRING): Name of the destination node.

**destDbladeid** (STRING): D-blade ID of the destination node.

**aggrName** (STRING): Name of the aggregate being relocated.

# arl.netra events

## arl.netra.ca.check.failed

### Severity

ERROR

### Description

This message occurs during the relocation of an aggregate, when the destination node cannot reach the object stores.

## Corrective Action

Verify that your intercluster LIF is online and functional by using the 'network interface show' command. Also, check network connectivity to the object store server by using the 'ping' command over the destination node intercluster LIF. Additionally, verify that the configuration of your object store has not changed and that login and connectivity information is still accurate by using the 'aggregate object-store config show' command. It is possible to override this error by using the 'override-destination-checks' parameter of the relocation command. For more information or assistance, contact NetApp technical support.

## Syslog Message

Relocation of aggregate '%s' (uuid: %s) failed due to %s preventing object store access on the destination node.

## Parameters

**vol** (STRING): Name of the aggregate.  
**aggr\_uuid** (STRING): UUID of the aggregate.  
**reason** (STRING): Activity that is preventing the aggregate relocation operation.

## arl.netra.ha.dskChkFailed

### Severity

ALERT

### Description

This message occurs when relocation of an aggregate fails because the destination node cannot see all disks belonging to the aggregate.

### Corrective Action

If the destination is the source node's high-availability (HA) partner, identify the missing disks by using the "storage failover show -fields local-missing-disks, partner-missing-disks" command. If the destination is not the source node's HA partner, use the "storage disk show -aggregate" command to list the disks belonging to the aggregate, and then verify that those disks are visible from the destination by using the "storage disk show" command.

### Syslog Message

Relocation of aggregate %s failed from node %s because the destination node cannot see all disks belonging to the aggregate.

### Parameters

**aggr** (STRING): Name of the aggregate that was not relocated.  
**node** (STRING): Name of the node that failed the relocation.

## arl.netra.lmgr.limit.failed

### Severity

ERROR

### Description

This message occurs during the relocation of an aggregate, when the destination node fails the lock count limit checks.

## Corrective Action

Ensure that the destination node supports the identified lock count limits, or select a different destination node and retry the operation.

## Syslog Message

Aggregate '%s': Lock limits check failed on destination node. %s

## Parameters

**vol** (STRING): Name of the aggregate.

**reason** (STRING): Activity that is preventing the aggregate relocation operation.

## arl.netra.lmgr.reserve.fail

### Severity

ERROR

### Description

This message occurs when an aggregate is being relocated, and the partner node fails to reserve lock resources needed for this aggregate.

### Corrective Action

Take the appropriate action based on the reason supplied in the logged message: - 'Partner reconstructing locks': Retry the relocation after reconstruction is complete on the partner node. You can check the reconstruction progress by using the 'debug locks reconstruction show' diagnostic privilege command. - 'Partner does not have sufficient lock resources': Free up lock resources on the partner and retry the relocation. You can free lock resources on the partner as client applications using locks are closed for volumes contained on that node. You can also free lock resources by moving volumes with locks from the partner node to a different node in the cluster. - 'Memory allocation failure': The system is running low on memory. Monitor memory statistics on the node and retry the relocation when more memory is available. - For other reason messages, or for further assistance, contact NetApp technical support.

## Syslog Message

Aggregate '%s': Lock reservation failed. Reason: %s.

## Parameters

**aggr** (STRING): Name of the aggregate being relocated.

**reason** (STRING): Reason the lock reservation failed.

## arl.netra.raid.failed

### Severity

ERROR

### Description

This message occurs during migration of an aggregate as part of aggregate relocation, when one of the aggregate checks fails on the destination node, which include duplicate aggregate name, duplicate Universally Unique Identifier (UUID), aggregate count, and capacity limits.

### Corrective Action

1. If checks fail due to aggregate count or capacity limits, then relocate this aggregate to an alternate destination node that has enough capacity to receive the aggregate.
2. If checks fail due to duplicate aggregate name or UUID, delete the duplicate aggregate created from previous "storage failover"

giveback" or "storage aggregate relocation" operations. Contact NetApp technical support for assistance with deletion of the unwanted duplicate aggregate.

### Syslog Message

Aggregate '%s' (UUID = %s, type = %s, home\_owner\_id = %llu, dr\_home\_owner\_id = %llu): RAID aggregate migration checks failed on destination node %s.

### Parameters

**vol** (STRING): Name of the aggregate.  
**aggregate\_uuid** (STRING): UUID of the aggregate.  
**raid\_type** (STRING): RAID type of the volume.  
**home\_owner\_id** (LONGINT): NVRAM system ID of the aggregate's home owner.  
**dr\_home\_owner\_id** (LONGINT): NVRAM system ID of the aggregate's disaster recovery (DR) home owner.  
**reason** (STRING): Activity that is preventing the aggregate relocation or giveback operation.

## arl.netra.wafl.mcc.veto

### Severity

ERROR

### Description

This message occurs during the relocation of an aggregate, when one or more online left-behind disaster recovery(DR) aggregates are found on the destination node and the "node-object-limit" option is set to off.

### Corrective Action

Check whether there exists any online left-behind DR aggregates on the destination node from a previous switchover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner, and then retry the operation. If you cannot perform the corrective action, then use the "override-destination-checks" option in the "relocation" command to force the relocation.

### Syslog Message

Aggregate '%s': One or more online left-behind DR aggregates were found on the destination node and the "node-object-limit" option is set to off.

### Parameters

**vol** (STRING): Name of the aggregate.

## arl.opaborted events

### arl.OpAborted

### Severity

ERROR

### Description

This message occurs when an aggregate relocation operation is aborted.

### Corrective Action

Refer to other generated error messages to identify the exact cause of failure and the corrective action.

## Syslog Message

Aggregate relocation operation aborted by node %s because %s.

## Parameters

**node** (STRING): Name of the node that aborted relocation.

**msg** (STRING): Error that prevented relocation.

# arl.opfinished events

## arl.OpFinished

### Severity

NOTICE

### Description

This message occurs when the aggregate relocation operation from the source node to the specified destination is finished. Use the "storage aggregate relocation show" command to check whether all aggregates were relocated successfully.

### Corrective Action

(None).

## Syslog Message

Aggregate relocation operation from the source node %s to the destination node %s finished in %llu milliseconds. 'override-vetoes' set to %s, and 'override-destination-checks' set to %s.

## Parameters

**srcName** (STRING): Name of the source node.

**destName** (STRING): Name of the destination node.

**time** (LONGINT): Time, in milliseconds, taken to complete the relocation operation.

**override\_vetoes** (STRING): Flag that indicates whether the system should override veto checks for a relocation operation. This flag corresponds to the "-override-vetoes" parameter of the "storage aggregate relocation start" command. When set to true, it might result in the relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive.

**override\_dest\_checks** (STRING): Flag that indicates whether the system should override checks done on the destination node. This flag corresponds to the "-override-destination-checks" parameter of the "storage aggregate relocation start" command. When set to true, it can be used to force relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive.

# arl.opstart events

## arl.OpStart

### Severity

NOTICE

### Description

This message occurs when the aggregate relocation operation starts. After this message is displayed, aggregates are relocated to the specified destination serially.

## Corrective Action

(None).

## Syslog Message

Starting relocation to destination %s at time %llu. 'override-vetoes' set to %s, and 'override-destination-checks' set to %s.

## Parameters

**destName** (STRING): Name of the destination node.

**time** (LONGINT): Time at which relocation started.

**override\_vetoes** (STRING): Flag that indicates whether the system should override veto checks for a relocation operation. This flag corresponds to the "-override-vetoes" parameter of the "storage aggregate relocation start" command. When set to true, it might result in the relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive.

**override\_dest\_checks** (STRING): Flag that indicates whether the system should override checks done on the destination node. This flag corresponds to the "-override-destination-checks" parameter of the "storage aggregate relocation start" command. When set to true, it can be used to force relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive.

# arl.postmigrnotok events

## arl.postMigrNotOk

### Severity

ERROR

### Description

This message occurs when the specified subsystem encounters an error during the post-migration phase of the aggregate relocation (ARL) operation.

### Corrective Action

Check the event log for a subsystem-specific reason as to why the subsystem failed the post-migration phase of the relocation operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by that message.

### Syslog Message

Relocation of aggregate '%s' encountered an error during post-migration processing. The error was encountered by the subsystem '%s'.

### Parameters

**aggr** (STRING): Name of the aggregate on which the subsystem attempted the relocation operation.

**subsystem** (STRING): Name of the subsystem that failed the relocation operation.

# arl.precmt events

## arl.precmt.lmgr.resync.abrt

### Severity

NOTICE

## Description

This message occurs during aggregate relocation, when automatic lock resynchronization with the node's high-availability (HA) partner for files on this aggregate was aborted.

## Corrective Action

(None).

## Syslog Message

Automatic lock resynchronization was aborted for aggregate %s on forced relocation.

## Parameters

**aggr** (STRING): Name of the aggregate for which resynchronization was aborted.

## arl.precmt.lmgr.resyncing

### Severity

ERROR

### Description

This message occurs during aggregate relocation, when automatic lock resynchronization with the node's high-availability (HA) partner is in progress for files on this aggregate.

### Corrective Action

Retry the relocation after verifying that lock synchronization is complete by using the 'debug locks auto-resync-status -aggregate <aggregate>' diagnostic privilege command. If lock state disruption for all CA locks on the aggregate is acceptable, retry the aggregate relocation with the '-override-vetoes true' option.

### Syslog Message

Could not relocate aggregate %s because automatic lock resynchronization was in progress.

### Parameters

**aggr** (STRING): Name of the aggregate with locks not yet in sync.

## arl.precmt.lmgr.sync.failed

### Severity

ERROR

### Description

This message occurs when relocation of an aggregate has started but mirrored lock state cannot be created locally for the relocating aggregate. The relocate operation is aborted.

### Corrective Action

Take the appropriate action based on the reason supplied in the logged message: - 'Timed Out': Retry the aggregate relocation with the '-override-destination-checks' option. Overriding the check might result in a longer administrative outage period during which no administrative operations can be performed for volumes on this aggregate. - 'Fatal Error': Contact NetApp technical support.

### Syslog Message

Could not relocate the aggregate %s because creating locally mirrored lock state failed.

## Parameters

**aggr** (STRING): Name of the aggregate being relocated.  
**reason** (STRING): Reason the local mirrored lock state creation failed.

## arl.precmt.lmgr.sync.forced

### Severity

NOTICE

### Description

This message occurs during aggregate relocation, when local mirrored lock state creation is allowed to proceed without any time restrictions. This might result in a longer administrative outage period during which no administrative operations can be performed for volumes on this aggregate.

### Corrective Action

(None).

### Syslog Message

Local mirrored lock state creation for relocating aggregate %s is proceeding without time restrictions.

## Parameters

**aggr** (STRING): Name of the aggregate being relocated.

## arl.precmt.repl

### Severity

NOTICE

### Description

This message occurs when all replication transfers are aborted because of aggregate relocation.

### Corrective Action

(None).

### Syslog Message

Replication transfers aborted due to aggregate relocation.

## Parameters

(None).

## arl.precmt.vdom.lowMem

### Severity

ERROR

### Description

This message occurs when an aggregate relocation fails due to the unavailability of Data ONTAP® memory on the source node.

### **Corrective Action**

Free some memory and retry the aggregate relocation.

### **Syslog Message**

Relocation of aggregate %s failed due to unavailability of Data ONTAP® memory on the source node.

### **Parameters**

**aggr** (STRING): Name of the aggregate that was not relocated.

## **arl.precmt.wafl.volconversion**

### **Severity**

ERROR

### **Description**

This message occurs when an active volume conversion is running on one or more volumes on the source aggregate. Pre-commit is aborted.

### **Corrective Action**

When volume conversion is complete, re-run the command 'storage aggregate relocation start'.

### **Syslog Message**

Aggregate relocation/takeover is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

### **Parameters**

**aggregate\_name** (STRING): The name of the aggregate containing the volume on which conversion is in progress.

## **arl.subsystemabort events**

### **arl.subsystemAbort**

### **Severity**

ERROR

### **Description**

This message occurs when the specified subsystem aborts relocation of the aggregate.

### **Corrective Action**

Check the syslog/EMS output for a subsystem-specific reason for aborting the relocation operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the 'relocation' command. If you cannot perform the corrective action, then use the 'override-vetoes' option in the 'relocation' command to force the relocation.

### **Syslog Message**

The relocation operation of '%s' was aborted by '%s'.

## Parameters

**aggr** (STRING): Name of the aggregate on which the subsystem attempted the relocation operation.

**subsystem** (STRING): Name of the subsystem that aborted the relocation operation.

# arl.veto events

## arl.veto.coredump.saveinprog

### Severity

INFORMATIONAL

### Description

This message occurs when the coredump subsystem vetoes the use of storage failover (SFO) during takeover because a coredump save is in progress; cluster failover (CFO) will be used instead. The coredump save must be complete before the system can perform a takeover.

### Corrective Action

(None).

### Syslog Message

Takeover use of SFO vetoed because a coredump save was in progress.

### Parameters

(None).

## arl.veto.coredump.unsavedcor

### Severity

ERROR

### Description

This message occurs when aggregate relocation (ARL) is vetoed because there is an unsaved kernel core file on one of the aggregate disks.

### Corrective Action

Use the "node coredump save" command to save any unsaved cores, or use the "-override-vetoes true" option when relocating aggregates.

### Syslog Message

Aggregate relocation vetoed due to an unsaved coredump %s on disk %s ("%s").

### Parameters

**corefile** (STRING): Name of the kernel core file.

**disk** (STRING): Name of the disk containing the kernel core file.

**panic** (STRING): Panic string of the unsaved kernel core file that caused the aggregate relocation (ARL) veto.

## arl.veto.kmgr.keysmissing

## Severity

ERROR

## Description

This message occurs when an aggregate relocation fails due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the destination node.

## Corrective Action

Wait a few minutes, and then try the aggregate relocation again. If the problem persists, run the "security key-manager external restore" command for external key manager, or the "security key-manager onboard sync" command for Onboard Key Manager. The commands retrieve the encryption keys for the encrypted volumes of the aggregate from the key manager. Then try the aggregate relocation again.

## Syslog Message

Relocation of aggregate %s failed due to unavailability of volume encryption keys for the encrypted volumes of the aggregate on the destination node %s.

## Parameters

**aggr** (STRING): Name of the aggregate that was not relocated.

**node** (STRING): Name of the destination node that is missing encryption keys.

## arl.veto.lmgr.CA.volmove

## Severity

ERROR

## Description

This message occurs when an aggregate relocation has started but cannot proceed because a volume move to or from this aggregate is in the cutover phase and the volume being moved has continuously available (CA) locks. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

## Corrective Action

Retry the relocation after volume move exits the cutover phase. To check for volume move state, run the 'volume move show' command.

## Syslog Message

Could not complete aggregate relocation because volume move of '%s%s%s%s' is in the cutover phase and this volume has CA locks.

## Parameters

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

## arl.veto.lmgr.nonCA.broken

**Severity**

NOTICE

**Description**

This message occurs when an aggregate relocation is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

**Corrective Action**

(None).

**Syslog Message**

Dropped non-CA locks on volume %s%s%s%s due to forced aggregate relocation of aggregate %s.

**Parameters**

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.

**aggrname** (STRING): Aggregate name.

**arl.veto.lmgr.nonCA.locks****Severity**

ERROR

**Description**

This message occurs when an aggregate relocation has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

**Corrective Action**

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate name" -continuously-available No' command. "aggregate name" is the aggregate for which relocation is being attempted. If lock state disruption for all existing non-CA locks is acceptable, retry the aggregate relocation by using the '-override-vetoes true' option.

**Syslog Message**

Could not complete aggregate relocation because of non-CA locks on volume %s%s%s%s aggregate %s.

**Parameters**

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.

**aggrname** (STRING): Aggregate name.

## **arl.veto.lmgr.recons.left**

### **Severity**

ERROR

### **Description**

This message occurs when an aggregate relocation has started, but cannot proceed because reconstruction of client file locks from mirrored lock information is not yet complete.

### **Corrective Action**

Retry the relocation a few times after checking the status of reconstruction by using the 'debug locks reconstruction show' diagnostic privilege command. If the locks reconstruction operation is not completed, contact NetApp technical support.

### **Syslog Message**

Could not relocate aggregate '%s' because lock reconstruction on node %s is in progress.

### **Parameters**

**aggregate** (STRING): Name of the aggregate being relocated.

**node** (STRING): Name of the node reconstructing locks.

## **arl.veto.lmgr.syncing**

### **Severity**

ERROR

### **Description**

This message occurs when an aggregate relocation has started but cannot proceed because synchronization of client file locks ("locks sync") with the partner is not yet complete.

### **Corrective Action**

Retry the relocation after verifying that lock synchronization is complete, by using the 'debug locks lock-sync show' diagnostic privilege command.

### **Syslog Message**

Could not relocate aggregate '%s' because locks sync from node %s to its partner node %s is in progress.

### **Parameters**

**aggregate** (STRING): Name of the aggregate being relocated.

**node** (STRING): Name of the node performing locks sync with its partner.

**partner** (STRING): Name of the partner node with which locks sync is being performed.

## **arl.veto.repl**

### **Severity**

NOTICE

### **Description**

This message occurs when an aggregate relocation is vetoed by a critical replication transfer (for example,

volume move in the cutover phase).

### Corrective Action

Either abort the replication transfer that is preventing the aggregate relocation from being completed, retry the 'aggregate relocation start' command with the '-override-vetoes true' option, or wait for the transfer to finish.

### Syslog Message

Could not complete giveback because a replication transfer with UUID %s involving the aggregate %s is in progress.

### Parameters

**transferId** (STRING): UUID of the SnapMirror® replication transfer that vetoed the aggregate relocation.  
**aggr** (STRING): Name of the aggregate.

## arl.veto.snaprestore

### Severity

ERROR

### Description

This message occurs when the system cannot perform an aggregate relocation because a volume snaprestore operation is active. The relocation is aborted.

### Corrective Action

Retry aggregate relocation after the snaprestore operation is finished.

### Syslog Message

%s %s%s%s%s is running snaprestore. Canceling aggregate relocation.

### Parameters

**type** (STRING): Type of object (volume or aggregate).  
**owner** (STRING): Volume owner.  
**vol** (STRING): Volume name.  
**app** (STRING): Application UUID.  
**volident** (STRING): Unique volume identity when the volume name itself is insufficient.

## arl.veto.volmove

### Severity

ERROR

### Description

This message occurs when an active volume move operation that cannot be automatically aborted prevents aggregate relocation from starting. When the volume move operation is completed, aggregate relocation can be retried using the 'storage aggregate relocation start' command.

### Corrective Action

When the volume move operation is complete, reissue the 'storage aggregate relocation start' command. To abort the volume move immediately, include the '-override-vetoes true' command option.

### **Syslog Message**

Unable to relocate aggregate while volume move for volume (DSID: %llu, NAME: %s) on aggregate %s is in progress.

### **Parameters**

**volume\_dsid** (LONGINT): Source/destination volume Data Set ID (DSID).

**vol\_name** (STRING): The name of the volume.

**aggr\_name** (STRING): The name of the containing aggregate.

## **arl.veto.wafl.volconversion**

### **Severity**

ERROR

### **Description**

This message occurs when an active volume conversion against one or more of the volumes on the source aggregate vetoed aggregate relocation.

### **Corrective Action**

When volume conversion is complete, re-run the command 'storage aggregate relocation start'.

### **Syslog Message**

Aggregate relocation is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

### **Parameters**

**aggregate\_name** (STRING): The name of the aggregate containing the volume on which conversion is in progress.

# arw events

## arw.analytics events

### arw.analytics.ext.report

#### Severity

NOTICE

#### Description

This message occurs when anti-ransomware analytics generates or updates the "suspicious file extensions" report for a volume.

#### Corrective Action

(None).

#### Syslog Message

Anti-ransomware file extension analytics has found %s across high entropy data on the volume "%s" in Vserver "%s". Report location: %s.

#### Parameters

**fileExtension** (STRING): Previously unseen file extension or suspicious file extension

**volumeName** (STRING): Name of the volume.

**vserverName** (STRING): Name of the Vserver.

**fileExtensionReport** (STRING): Link to report run after file extension analysis.

### arw.analytics.high.entropy

#### Severity

ERROR

#### Description

This message occurs when the number of high entropy data log messages (pertaining to ransomware detection and analysis) that were generated for a volume cross the predefined threshold.

#### Corrective Action

To correct this issue: 1) Restore data from the last Snapshot copy that were saved before high entropy data was detected. 2) Refer to the anti-ransomware documentation to learn how to implement ransomware protection and mitigation strategies.

#### Syslog Message

A large amount of high entropy data was found on volume "%s" in Vserver "%s".

#### Parameters

**volumeName** (STRING): Name of the volume.

**vserverName** (STRING): Name of the Vserver.

### arw.analytics.probability

**Severity**

ERROR

**Description**

This message occurs when an anti-ransomware attack probability has changed from "low" to "high" on a volume.

**Corrective Action**

To correct this issue: 1) Restore to the last safe Snapshot copy before attack probability became high. 2) Refer to the anti-ransomware documentation to diagnose further and take remedial measures.

**Syslog Message**

Anti-ransomware attack probability changed from low to high on volume "%s" in Vserver "%s".

**Parameters**

**volumeName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

**arw.analytics.report****Severity**

NOTICE

**Description**

This message occurs when an anti-ransomware analytics report is generated or updated for a volume.

**Corrective Action**

(None).

**Syslog Message**

Anti-ransomware analytics report has been generated for volume %s of Vserver %s. The report is available at %s.

**Parameters**

**volumeName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**report\_path** (STRING): Path to anti-ransomware report.

**arw.analytics.suspects****Severity**

ERROR

**Description**

This message occurs when a list of suspects generated by anti-ransomware analytics grows to a point where further investigation is needed.

**Corrective Action**

(None).

## Syslog Message

Anti-ransomware analytics on volume "%s" in Vserver "%s" has outstanding suspect files.

## Parameters

**volumeName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

# arw.auto events

## arw.auto.switch.enabled

### Severity

NOTICE

### Description

This message occurs when anti-ransomware has been automatically switched from learning mode to enabled after various conditions have been satisfied, such as learning period, file creation, file write, and file extension discovery activities.

### Corrective Action

(None).

## Syslog Message

Anti-ransomware has been automatically switched from learning mode to enabled on volume "%s" in SVM "%s".

## Parameters

**VolumeName** (STRING): Name of the volume.  
**VserverName** (STRING): Name of the SVM.  
**LearningPeriod** (INT): Number of days needed for learning.  
**IncomingWrite** (INT): Amount of write (in MB) received during Learning mode.  
**DurationWithoutNewExtension** (INT): Number of days without a new file extension being discovered.  
**FileCount** (INT): Number of new files created in a volume.  
**FileExtensionCount** (INT): Number of new file extensions discovered in a volume.

# arw.new events

## arw.new.file.extn.seen

### Severity

NOTICE

### Description

This message occurs when a new file extension is observed in anti-ransomware enabled volume. Its purpose is to promptly notify about the extension seen and enabling timely investigation.

### Corrective Action

(None).

## Syslog Message

A new file-extension "%s" is observed on volume "%s" (UUID: "%s") in SVM "%s" (UUID: "%s") at "%s".

## Parameters

**fileExtension** (STRING): Name of the File-Extension seen.  
**volumeName** (STRING): Name of the volume.  
**volumeUuid** (STRING): UUID of the Volume.  
**vserverName** (STRING): Name of the SVM.  
**vserverUuid** (STRING): UUID of the SVM.  
**time** (STRING): Time when new extension is seen.

# arw.snapshot events

## arw.snapshot.created

### Severity

NOTICE

### Description

This message occurs when a new ARP snapshot is created in anti-ransomware enabled volume. Additionally, it provides information about the reason behind the creation of the snapshot.

### Corrective Action

(None).

## Syslog Message

ARP snapshot created on volume "%s" (UUID: "%s") in SVM "%s" (UUID: "%s") at "%s". Reason: "%s".

## Parameters

**volumeName** (STRING): Name of the volume.  
**volumeUuid** (STRING): UUID of the Volume.  
**vserverName** (STRING): Name of the SVM.  
**vserverUuid** (STRING): UUID of the SVM.  
**time** (STRING): Time when new ARP snapshot is created.  
**reason** (STRING): Reason for snapshot creation.

# arw.volume events

## arw.volume.state

### Severity

NOTICE

### Description

This message occurs when the anti-ransomware state of a volume is changed.

### Corrective Action

(None).

## Syslog Message

Anti-ransomware state was changed to "%s" on volume "%s" (UUID: "%s") in Vserver "%s" (UUID: "%s").

## Parameters

**op** (STRING): Monitoring state (enabled, disabled, dry-run).  
**volumeName** (STRING): Name of the volume.  
**volumeUuid** (STRING): UUID of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**vserverUuid** (STRING): UUID of the Vserver.

# arw.vserver events

## arw.vserver.state

### Severity

NOTICE

### Description

This message occurs when the anti-ransomware state of a Vserver is changed.

### Corrective Action

(None).

## Syslog Message

Anti-ransomware was changed to "%s" on Vserver "%s" (UUID: "%s").

## Parameters

**op** (STRING): Anti-ransomware state (enabled, disabled, or dry-run).  
**vserverName** (STRING): Name of the Vserver.  
**vserverUuid** (STRING): UUID of the Vserver.

# asa events

## asa.personality events

### asa.personality.enable.end

**Severity**

NOTICE

**Description**

This message occurs when the cluster personality has been changed to an All SAN Array.

**Corrective Action**

(None).

**Syslog Message**

The cluster personality is now an All SAN Array.

**Parameters**

**job\_id** (LONGINT): ID of the conversion job.

### asa.personality.enable.fail

**Severity**

ERROR

**Description**

This message occurs when the job to change the cluster personality to an All SAN Array has failed.

**Corrective Action**

Attempt the failed command again. If the problem persists, contact NetApp technical support.

**Syslog Message**

The cluster personality was not changed to an All SAN Array. For more information, use the command "job show -id %llu" to see the job details.

**Parameters**

**job\_id** (LONGINT): ID of the conversion job.

### asa.personality.enable.start

**Severity**

NOTICE

**Description**

This message occurs when the cluster personality is being changed to All SAN Array.

**Corrective Action**

(None).

**Syslog Message**

The cluster personality is changing to All SAN Array.

**Parameters**

**job\_id** (LONGINT): ID of the conversion job.

# asup events

## asup.aods events

### asup.aods.response.overLimit

#### Severity

ERROR

#### Description

This message occurs when the size of the response from the AutoSupport OnDemand Server (AODS) goes over the AOD response buffer size limit in ONTAP.

#### Corrective Action

Contact Contact NetApp technical support. for assistance.

#### Syslog Message

AutoSupport OnDemand Server (AODS) response went over the response buffer size limit in ONTAP. Size limit: %u bytes.

#### Parameters

**SizeLimit** (INT): AOD response buffer size limit in bytes.

### asup.aods.response.timeOut

#### Severity

ERROR

#### Description

This message occurs when a response is not received from the AutoSupport OnDemand Server (AODS) before the system time limit.

#### Corrective Action

Check AOD Server connectivity using the "autosupport check show-details -check-type ondemand-server" command. If the issue persists, contact NetApp technical support.

#### Syslog Message

AutoSupport OnDemand Server (AODS) response was not received before the %u second time limit.

#### Parameters

**TimeLimit** (INT): System AODS response time limit in seconds.

## asup.config events

### asup.config.minimal.parse

#### Severity

INFORMATIONAL

## Description

This event is issued when we are unable to parse `/etc/asup_content.conf`

## Corrective Action

Either the `/etc/asup_content.conf` file was corrupt or it may have been accidentally modified, compare the file to the released version of the file and make the appropriate modifications.

## Syslog Message

AutoSupport could not parse section %s in `/etc/asup_content.conf`

## Parameters

**section** (STRING): The section that failed to parse.

## asup.config.minimal.unavailable

### Severity

ERROR

### Description

This event is issued when we are unable to access `/etc/asup_content.conf`

### Corrective Action

Either the `/etc/asup_content.conf` file does not exist or the permissions don't allow it to be accessed. Verify that the file is in the correct location and that the system has access to it.

### Syslog Message

Minimal AutoSupports unavailable. Could not read `/etc/asup_content.conf`

### Parameters

(None).

## asup.general events

### asup.general.drop

#### Severity

NOTICE

#### Description

This message occurs when the system cannot generate an AutoSupport message from a callhome EMS event.

#### Corrective Action

(None).

#### Syslog Message

Could not create AutoSupport message (sequence #: %u, ID: %s). %s.

#### Parameters

**sequence** (LONGINT): AutoSupport sequence number assigned to the callhome event.  
**trigger** (STRING): AutoSupport callhome EMS event ID.

**detail** (STRING): Additional details about why an AutoSupport message could not be created for the callhome EMS event.

**parameters** (STRING): A comma-delimited list of the parameter name and value pairs passed to the callhome EMS event.

## **asup.general.optout**

### **Severity**

NOTICE

### **Description**

This message occurs when an opt-out condition exists to notify you that you can turn off AutoSupport® reporting to NetApp, if desired. To disable AutoSupport reporting to NetApp, run the "system node autosupport modify -support disable" command within 24 hours of system initialization. Enabling AutoSupport can significantly speed problem determination and resolution, should a problem occur on your system.

### **Corrective Action**

(None).

### **Syslog Message**

AutoSupport will be enabled 24 hours after system initialization.

### **Parameters**

(None).

## **asup.general.queue.deleted**

### **Severity**

INFORMATIONAL

### **Description**

This event is issued when all entries have been deleted from the AutoSupport queue and the disk file spool. This should only occur when the autosupport.content option is changed from complete to minimal.

### **Corrective Action**

(None).

### **Syslog Message**

All AutoSupport message queue entries have been deleted.

### **Parameters**

(None).

## **asup.general.reminder**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when AutoSupport is not configured to send messages to NetApp.

## Corrective Action

(None).

## Syslog Message

AutoSupport is not configured to send messages to NetApp. Enabling AutoSupport can significantly speed problem determination and resolution should a problem occur on your system. More information about AutoSupport is available at <http://support.netapp.com/autosupport/>.

## Parameters

(None).

# asup.post events

## asup.post.drop

### Severity

ERROR

### Description

This message occurs when the AutoSupport® mechanism quits trying to post to the NetApp URL after having retried for the specified number of times.

### Corrective Action

Use the "system node autosupport check show-details" command to check for connectivity or certificate errors. If the connectivity check shows no errors and if the problem persists, contact NetApp technical support for further assistance.

### Syslog Message

AutoSupport message (%s) was not posted to NetApp. The system will drop the message.

### Parameters

**subject** (STRING): AutoSupport message title.

# asup.smtp events

## asup.smtp.drop

### Severity

ERROR

### Description

This message occurs when the AutoSupport® mechanism drops email messages after having retried for the specified times.

### Corrective Action

Use the "system node autosupport check show-details" command to check for connectivity errors with the configured mailhost. If the connectivity check shows no errors and if the problem persists, contact NetApp technical support for further assistance.

**Syslog Message**

AutoSupport mail (%s) was not sent. The system will drop the message.

**Parameters**

**subject** (STRING): AutoSupport message title.

## asup.throttle events

**asup.throttle.drop****Severity**

NOTICE

**Description**

This message occurs when an AutoSupport message is dropped because it is believed to be spam.

**Corrective Action**

To disable AutoSupport throttling, run the (privilege: diagnostic) "system node autosupport modify -throttle false -node <node name>" command.

**Syslog Message**

Too many AutoSupport messages in too short a time, throttling AutoSupport: %s

**Parameters**

**subject** (STRING): AutoSupport message title.

# asyncdelcli events

## asyncdelcli.message events

### asyncDelCli.message.finish

**Severity**

NOTICE

**Description**

This message occurs when an async-delete job has finished on the specified path.

**Corrective Action**

(None).

**Syslog Message**

Async-delete "%s" has finished on inode: %llu in volume (DSID: %llu, MSID: %llu).

**Parameters**

**Job\_Id** (STRING): Async-delete job ID.

**Inode** (LONGINT): Inode to be deleted.

**volume\_dsid** (LONGINT): DSID of the volume containing the directory.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

### asyncDelCli.message.start

**Severity**

NOTICE

**Description**

This message occurs when an async-delete job starts on the specified path.

**Corrective Action**

(None).

**Syslog Message**

Async-delete "%s" has started on inode: %llu in volume (DSID: %llu, MSID: %llu).

**Parameters**

**Job\_Id** (STRING): Async-delete job ID.

**Inode** (LONGINT): Inode to be deleted.

**volume\_dsid** (LONGINT): DSID of the volume containing the directory.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

## asyncdelcli.permscheck events

### asyncDelCli.permsCheck.fail

**Severity**

ALERT

**Description**

This message occurs when an async-delete job fails to delete file/directory due to permission issues.

**Corrective Action**

Verify that the user has permission to delete the inode.

**Syslog Message**

Async-delete %s encountered permission failures for user (%s) when deleting inode: %llu in volume (DSID: %llu, MSID: %llu).

**Parameters**

**Job\_Id** (STRING): Async-delete Job ID.

**User\_Id** (STRING): User Identifier.

**Path\_Inode** (LONGINT): Inode that has permission issues for deletion.

**volume\_dsid** (LONGINT): DSID of the volume containing the directory.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

# asyncdelete events

## asyncdelete.cancel events

### asyncDelete.cancel.start

#### Severity

NOTICE

#### Description

This message occurs when cancellation of async delete jobs is started on a node due to Vserver migrate operation. The administrator will need to restart the jobs after the migration is complete or aborted.

#### Corrective Action

The administrator will need to restart the cancelled async delete jobs after the migration is complete or aborted. Command to start an async-delete job: "volume file async-delete start -volume <volume-name> -vserver <vserver-name> -path <directory path>".

#### Syslog Message

Cancellation of async delete jobs was started on node "%s" because of Vserver migration. The administrator will need to restart the jobs after the migration is complete or aborted.

#### Parameters

**Node** (STRING): Node where async delete jobs are running.

## asyncdelete.message events

### asyncDelete.message.fail

#### Severity

ALERT

#### Description

This message occurs when an async delete job fails.

#### Corrective Action

Ensure that all nodes in the cluster are online and healthy, and that all volumes needed for the directory traversal are online. Then retry the operation.

#### Syslog Message

Async delete job on path %s of volume (MSID: %llu) failed: %s.

#### Parameters

**path** (STRING): Path to be deleted.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

**error** (STRING): Description of the error that occurred.

## **asyncDelete.message.start**

### **Severity**

NOTICE

### **Description**

This message occurs when an async delete job starts on the path specified.

### **Corrective Action**

(None).

### **Syslog Message**

Async delete job started on path %s of volume (MSID: %llu).

### **Parameters**

**path** (STRING): Path to be deleted.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

## **asyncDelete.message.success**

### **Severity**

NOTICE

### **Description**

This message occurs when an async delete job finishes successfully on the specified path.

### **Corrective Action**

(None).

### **Syslog Message**

Async delete job on path %s of volume (MSID: %llu) was completed. Number of files deleted: %llu, Number of directories deleted: %llu. Total number of bytes deleted: %llu.

### **Parameters**

**path** (STRING): Path to be deleted.

**volume\_msid** (LONGINT): MSID of the volume containing the directory.

**file\_count** (LONGINT): Total number of files deleted.

**dir\_count** (LONGINT): Total number of directories deleted.

**deleted\_size** (LONGINT): Total number of bytes deleted.

# ata events

## ata.excessive events

### ata.excessive.latency

**Severity**

NOTICE

**Description**

This message occurs when an I/O request to the ATA driver in ONTAP® Select takes longer than five seconds. This might be an indication of an overloaded or misconfigured back-end storage subsystem.

**Corrective Action**

If possible, reduce the I/O load on the system. Verify that the device is configured correctly and is functioning correctly.

**Syslog Message**

Excessive latency on ATA device %s

**Parameters**

`ata_latency_message` (STRING): ATA high latency message

## ata.timeout events

### ata.timeout.failed

**Deprecated**

Last used 9.2

**Severity**

NOTICE

**Description**

This message occurs when an I/O request to the ATA driver times out. This might be indicative of an overloaded back-end storage subsystem. The retries for this I/O operation have been exhausted; the I/O operation has failed and will not be retried.

**Corrective Action**

(None).

**Syslog Message**

ATA device timeout (%s).

**Parameters**

`ata_timeout` (STRING): Timeout message from the ATA driver.

## **ata.timeout.retry**

### **Deprecated**

This event is no longer used because of misleading text. See new EMS of EMS\_cam\_timeout\_retry. Last used 9.7.

### **Severity**

NOTICE

### **Description**

This message occurs when an I/O request to the ATA driver times out. This might be indicative of an overloaded back-end storage subsystem. The I/O operation will be retried; this message does not indicate failure.

### **Corrective Action**

(None).

### **Syslog Message**

ATA device timeout (%s).

### **Parameters**

**ata\_timeout** (STRING): Timeout message from the ATA driver.

# audit events

## audit.cap events

### audit.cap.staging.event.failure

**Severity**

NOTICE

**Description**

This message occurs when the system fails to generate an audit staging event as a part of the Central Access Policy (CAP) evaluation during access checks.

**Corrective Action**

(None).

**Syslog Message**

Failed to generate an audit staging event when evaluating CAPs for the Vserver "%s". Reason: "%s".

**Parameters**

**vserverUuidStr** (STRING): UUID of the Vserver.

**errorStr** (STRING): Error encountered.

## audit.log events

### audit.log.event

**Severity**

NOTICE

**Description**

This message occurs when there is an issue during message auditing. The system recovers by itself.

**Corrective Action**

(None).

**Syslog Message**

Auditing error (%s) occurred at %s.

**Parameters**

**error** (STRING): Error encountered during message auditing.

**time** (STRING): Time that this error occurred.

### audit.log.file.recovered

**Severity**

NOTICE

## Description

This message occurs when the system recovers a previously deleted log file as part of audit log policy.

## Corrective Action

(None).

## Syslog Message

Recovered previously deleted audit log file "%s".

## Parameters

**log\_name** (STRING): Log file name.

**recovered\_time** (STRING): File recovery timestamp.

## audit.log.queue.high

### Severity

NOTICE

### Description

This message occurs when the syslog queue reaches 75% of its maximum size.

### Corrective Action

Verify remote server network reachability and processing performance.

### Syslog Message

Log queue for destination %s, protocol %s has exceeded 75%% of capacity. Last audit log was sent successfully at %s, number of pending messages: %d.

### Parameters

**syslog\_dest** (STRING): Log forwarding destination for which messages are being dropped.

**protocol** (STRING): Protocol used for syslog destination.

**last\_sent** (STRING): Time that the audit log was last successfully sent to the syslog destination.

**pending\_msg** (INT): Number of pending messages in queue.

## audit.log.queue.overflow

### Severity

NOTICE

### Description

This message occurs when an internal queue overflow causes the audit logging mechanism to drop messages destined for a particular log forwarding destination.

### Corrective Action

Verify remote server network reachability and processing performance.

### Syslog Message

Log queue overflowed for destination %s, protocol %s. Current drop count: %ld.

## Parameters

**syslog\_dest** (STRING): Log forwarding destination for which messages are being dropped.

**protocol** (STRING): Protocol used for syslog destination.

**drop\_count** (LONGINT): Number of messages dropped since the last drop was reported.

## audit.log.queue.recovered

### Severity

NOTICE

### Description

This message occurs when the audit logging queue recovers after earlier message drops, and the current queue is less than 75% full.

### Corrective Action

(None).

### Syslog Message

Log queue recovered for destination %s, protocol %s. Issue start time: %s, end time: %s, total number of drops during this period: %ld.

## Parameters

**syslog\_dest** (STRING): Log forwarding destination for which the queue has recovered.

**protocol** (STRING): Protocol used for the syslog destination.

**issue\_start\_time** (STRING): Time that the queue overflowed.

**recovered\_time** (STRING): Time that the queue recovered.

**drop\_count** (LONGINT): Total number of drops since the last time the queue overflowed.

## audit.log.rotate.size.limit

### Severity

NOTICE

### Description

This message occurs when the system rotates a log file that has reached its size limit.

### Corrective Action

(None).

### Syslog Message

Log file %s has been rotated because size limit %ld was reached.

## Parameters

**log\_name** (STRING): Log file name.

**max\_log\_size** (LONGINT): Maximum log file size.

# auditlog events

## auditlog.change events

### auditlog.change.detected

#### Severity

ERROR

#### Description

This message occurs when the system detects that audit log files have been tampered with.

#### Corrective Action

Contact Contact NetApp technical support. for assistance.

#### Syslog Message

Audit log file "%s" was tampered with.

#### Parameters

**file\_name** (STRING): Name of the audit log file which was tampered with.

# auto events

## auto.cds events

### auto.cds.feature.disable.failed

#### Severity

INFORMATIONAL

#### Description

This message occurs during upgrade to Data ONTAP® 9.11.1 or later, when volume efficiency inactive data compression scan disablement failed on the existing compatible volumes.

#### Corrective Action

Manually try disabling the inline Volume Efficiency Inactive data compression on the volume using the "volume efficiency inactive-data-compression" command.

#### Syslog Message

Volume Inactive Data Compression disablement failed on Volume %s of Vserver %s.

#### Parameters

**volume** (STRING): Volume name.

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for failure.

### auto.cds.feature.disable.success

#### Severity

INFORMATIONAL

#### Description

This message occurs during upgrade to Data ONTAP® 9.11.1 or later, when volume efficiency inactive data compression scan is disabled on the existing compatible volumes.

#### Corrective Action

(None).

#### Syslog Message

Volume Inactive Data Compression disabled on Volume %s of Vserver %s.

#### Parameters

**volume** (STRING): Volume name.

**vserver** (STRING): Vserver name.

## auto.policy events

### auto.policy.feature.enable

**Severity**

NOTICE

**Description**

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we start enabling the "auto" efficiency policy on the existing compatible volumes on All-Flash Optimized nodes in the background.

**Corrective Action**

(None).

**Syslog Message**

Volume efficiency features will be enabled on Volumes of All-Flash Optimized nodes in the Cluster.

**Parameters**

(None).

**auto.policy.feature.enable.done****Severity**

NOTICE

**Description**

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we have completed enabling the "auto" efficiency policy on the existing compatible volumes.

**Corrective Action**

(None).

**Syslog Message**

Volume efficiency features were enabled on Volumes of All-Flash Optimized nodes in the Cluster.

**Parameters**

(None).

**auto.policy.feature.enable.fail****Severity**

INFORMATIONAL

**Description**

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we fail to enable the "auto" efficiency policy on the existing compatible volume on All-Flash Optimized nodes.

**Corrective Action**

Manually try enabling the inline Volume Efficiency features on the volume using the "volume efficiency modify" command.

**Syslog Message**

Could not enable Volume Efficiency features for Volume %s of vserver %s.%s

## Parameters

**volume** (STRING): Volume name.  
**vserver** (STRING): Vserver name.  
**reason** (STRING): Reason for failure.

## auto.policy.feature.enabled

### Severity

INFORMATIONAL

### Description

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we enable the "auto" efficiency policy on the existing compatible volume on All-Flash Optimized nodes.

### Corrective Action

(None).

### Syslog Message

Volume Efficiency features enabled on Volume %s of Vserver %s.

## Parameters

**volume** (STRING): Volume name.  
**vserver** (STRING): Vserver name.

## auto.update events

### auto.update.action

#### Severity

NOTICE

#### Description

This message occurs when an action is applied to an automatic update request. This step requires input from the customer or a pre-configured default setting.

#### Corrective Action

(None).

#### Syslog Message

Automatic update: Applied the action "%s" to package: %s.

#### Parameters

**action** (STRING): Action selected for the automatic update request. Possible actions are "install", "schedule", or "dismiss".  
**package\_description** (STRING): Information about the package.  
**package\_id** (STRING): Unique identifier for the package.

### auto.update.eula.accepted

**Severity**

NOTICE

**Description**

This message occurs when the customer has accepted the End User License Agreement (EULA). This is required before the Automatic update feature is enabled.

**Corrective Action**

(None).

**Syslog Message**

Automatic update: End User License Agreement accepted by "%s".

**Parameters**

**user** (STRING): Name of the user account that accepted the EULA.

**auto.update.eula.reset****Severity**

NOTICE

**Description**

This message occurs when the Automatic update feature is disabled and the End User License Agreement (EULA) is no longer considered accepted.

**Corrective Action**

(None).

**Syslog Message**

Automatic update: Feature has been disabled by "%s".

**Parameters**

**user** (STRING): Name of the user account that disabled the EULA.

**auto.update.expired****Severity**

NOTICE

**Description**

This message occurs when an automatic update request has not been acted upon before the request expiration date.

**Corrective Action**

(None).

**Syslog Message**

Automatic update: Request expired on %s for package: %s.

**Parameters**

**expired\_date\_time** (STRING): Date and time when the request expired.

**package\_description** (STRING): Information about the package.

**package\_id** (STRING): Unique identifier for the package.

## auto.update.failure

### Severity

ERROR

### Description

This message occurs when an automatic update has failed to complete.

### Corrective Action

Fix the issues causing the failure and retry the automatic update. If the issue persists, contact NetApp technical support.

### Syslog Message

Automatic update: Failed update for package: %s. Error: %s.

### Parameters

**package\_description** (STRING): Information about the package.

**error\_msg** (STRING): String containing details regarding the cause of the failure.

**package\_id** (STRING): Unique identifier for the package.

**stage** (STRING): Stage at which the update failed.

## auto.update.received

### Severity

NOTICE

### Description

This message occurs when the automatic update information is received from the AutoSupport OnDemand server.

### Corrective Action

(None).

### Syslog Message

Automatic update: Received update for package: %s.

### Parameters

**package\_description** (STRING): Information about the package.

**package\_id** (STRING): Unique identifier for the package.

## auto.update.retracted

### Severity

NOTICE

### Description

This message occurs when an automatic update request has been superseded, retracted or otherwise considered unnecessary.

**Corrective Action**

(None).

**Syslog Message**

Automatic update: Request retracted for package: %s.

**Parameters**

**package\_description** (STRING): Information about the package.

**package\_id** (STRING): Unique identifier for the package.

**auto.update.success****Severity**

NOTICE

**Description**

This message occurs when an automatic update has completed successfully.

**Corrective Action**

(None).

**Syslog Message**

Automatic update: Successfully updated package: %s.

**Parameters**

**package\_description** (STRING): Information about the package.

**package\_id** (STRING): Unique identifier for the package.

# aws events

## aws.dev events

### aws.dev.diskFailure

#### Severity

ERROR

#### Description

This message occurs when ONTAP® is running as an instance in Amazon Web Services (AWS), and a data disk failure occurs because of an I/O hang. ONTAP marks the disk as broken and marks the data aggregate as partial or degraded.

#### Corrective Action

Detach the failed device from the AWS instance.

#### Syslog Message

Disk failure detected after I/O to device %s hung for %d seconds.

#### Parameters

**dev** (STRING): Name of the device.

**timeout** (INT): Number of seconds the disk is hung.

### aws.dev.diskNotUnique

#### Severity

ERROR

#### Description

This message occurs when Data ONTAP® is running as an instance in Amazon Web Services (AWS), and the volume being added has a UUID that is already used by the attached volumes. This usually happens when the user creates a Snapshot® copy from a volume, creates the volume from this copy and then tries to attach the volume to the instance.

#### Corrective Action

Detach the being added duplicate UUID device from the AWS instance.

#### Syslog Message

The volume #%d(%s) being added has a duplicate UUID which is already used by the attached volume #%d(%s).

#### Parameters

**curr\_unit** (INT): Unit number of the device which is being attached.

**curr\_devname** (STRING): Name of the device which is being attached.

**orig\_unit** (INT): Unit number of the original device which is being duplicated.

**orig\_devname** (STRING): Name of the original device which is being duplicated.

## aws.dev.limitExceeded

### Severity

ERROR

### Description

This message occurs when Data ONTAP® is running as an instance in Amazon Web Services (AWS), and the volume being added is attached to an unsupported device name. Data ONTAP supports attaching a maximum of 51 Elastic Block Storage (EBS) volumes to a single instance. Supported device names are xvdf-xvdz, xvdaa-xvdaz, and xvdba-xvdbd.

### Corrective Action

Detach the unsupported device from the AWS instance.

### Syslog Message

The volume being added is attached to an unsupported device name `##d(%)s`. Data ONTAP supports attaching a maximum of 51 device volumes to a single instance. Supported device names are xvdf-xvdz, xvdaa-xvdaz, and xvdba-xvdbd.

### Parameters

**unit** (INT): Device unit number.  
**devname** (STRING): Device name.

## aws.instance events

### aws.instance.metadata.fail

### Severity

ERROR

### Description

This message occurs when instance metadata retrieval fails on a hypervisor hosting an Amazon Web Services (AWS) ONTAP instance. The Instance Metadata Service (IMDS) is not reachable at this time. Failure to retrieve the instance metadata indicates issues with the hypervisor.

### Corrective Action

This error indicates an issue with the AWS environment. Contact AWS technical support for further assistance. Stopping and starting the instance can also resolve the issue because the instance will typically be relaunched on a different host.

### Syslog Message

IMDS%s request fails to retrieve AWS instance metadata: %s.

### Parameters

**IMDS\_Version** (STRING): Metadata request version that generates this event.  
**metadataType** (STRING): Metadata request type that generates this event.

## aws.nic events

## aws.nic.noTxIntr

### Severity

ALERT

### Description

This message occurs when Data ONTAP® is running in Amazon Web Services (AWS) and a network interface stops processing packets at the beginning of system boot.

### Corrective Action

If the issue persists, reboot the node. If reboot does not help, contact NetApp technical support for troubleshooting assistance.

### Syslog Message

No TX interrupt on NIC '%s' for %u seconds.

### Parameters

**nicName** (STRING): Network interface or port name.  
**secElapsed** (INT): Seconds elapsed since the last send interrupt.  
**sigCnt** (INT): Number of signals sent to the back-end host OS.  
**reqPending** (INT): Number of outstanding send requests.  
**reqTotal** (INT): Number of total send requests.  
**respPending** (INT): Number of outstanding responses.  
**respTotal** (INT): Number of total responses.  
**evtBackend** (INT): Number of back-end events.  
**evtFrontend** (INT): Number of front-end events.

# backup events

## backup.abort events

### backup.abort.ROOLR

**Severity**

NOTICE

**Description**

This event is generated when backup event like dump has been aborted and currently ROOLR (Read Only On Line Replica) is running on the Filer. This event might have been aborted because of user intervention or device like bad tape has encountered backup failure.

**Corrective Action**

(None).

**Syslog Message**

The abort event, %s, is just notified.

**Parameters**

**errmsg** (STRING): Error Description

### backup.abort.STSP

**Severity**

NOTICE

**Description**

This event is generated when a backup started by VERITAS NBU STSP Protocol has been aborted. This event might have been aborted because of user intervention or device like bad tape has encountered backup failure.

**Corrective Action**

(None).

**Syslog Message**

The abort event, %s, is just notified.

**Parameters**

**errmsg** (STRING): Error Description

## backup.fail events

### backup.fail.giveback

**Severity**

ERROR

## Description

This message occurs during a giveback operation, when there are active dump or restore processes running on cfo aggregates of the partner node.

## Corrective Action

Wait for backup operations like dump or restore running on cfo aggregates of the partner node to finish before retrying the giveback operation. To kill the active backup operations and proceed, retry the giveback operation with the `-override-vetoes` option set to true.

## Syslog Message

Backup/restore services: There are active backup/restore sessions on the partner.

## Parameters

(None).

## backup.fail.logopen

### Severity

ERROR

### Description

This event is generated when we tried to open up the log file and it failed while opening the file

### Corrective Action

Make sure that the log file exists with proper permission and the file is not corrupted.

### Syslog Message

Failed to open backup log file: %s

### Parameters

`log_file_open_err` (STRING): The error encountered during log file open

## backup.fail.logwrite

### Severity

ERROR

### Description

This event is generated when we tried to write a log event to the log file and it failed while writing it to the file.

### Corrective Action

Make sure that the log file exists with proper permission and the file is not corrupted.

### Syslog Message

Failed to write to backup log file: %s

### Parameters

`log_file_write_err` (STRING): The error encountered during log file write

# backup.flip events

## backup.flip.inodemap

### Severity

INFORMATIONAL

### Description

This message is generated while flipping inodemap.

### Corrective Action

(None).

### Syslog Message

Took %u seconds to flip inodemap.

### Parameters

**time** (INT): Time in seconds taken to flip inodemap.

# bcomd events

## bcomd.fcNvmelifadded events

### bcomd.fcNvmeLifAdded

#### Severity

NOTICE

#### Description

This message occurs when an FC NVMe (Nonvolatile Memory Express) logical interface (LIF) is added.

#### Corrective Action

(None).

#### Syslog Message

LIF %s (on Vserver %s), WWPN %s, was added to node %s, port %s.

#### Parameters

**lifname** (STRING): Name of the LIF that was added.  
**vserver** (STRING): Name of the Vserver on which the LIF resides.  
**wwpn** (STRING): WWPN that was added.  
**node** (STRING): Name of the node on which the LIF is hosted.  
**port** (STRING): Name of the port on which the LIF is hosted.

## bcomd.fcNvmelifmovefail events

### bcomd.fcNvmeLifMoveFail

#### Severity

EMERGENCY

#### Description

This message occurs when a LIF move failed and the recovery action to restore the LIF has also failed. Namespaces are no longer accessible through this LIF. The LIF must be recovered manually.

#### Corrective Action

Contact NetApp technical support.

#### Syslog Message

Moving FC-NVMe LIF %s of vserver %s from %s:%s to %s:%s failed. Manual recovery required.

#### Parameters

**lif\_name** (STRING): LIF name.  
**vserver\_uuid** (STRING): Vserver Uuid.  
**src\_node** (STRING): LIF was moving from this node.  
**src\_port** (STRING): LIF was moving from this port.  
**dest\_node** (STRING): LIF was moving to this node.  
**dest\_port** (STRING): LIF was moving to this port.

## bcomd.fcNvmelifremoved events

### bcomd.fcNvmeLifRemoved

#### Severity

NOTICE

#### Description

This message occurs when an FC NVMe (Nonvolatile Memory Express) logical interface (LIF) is removed.

#### Corrective Action

(None).

#### Syslog Message

LIF %s (on Vserver %s), WWPN %s, was removed from node %s, port %s.

#### Parameters

**lifname** (STRING): Name of the LIF that was removed.

**vserver** (STRING): Name of the Vserver on which the LIF resided.

**wwpn** (STRING): WWPN that was removed.

**node** (STRING): Name of the node on which the LIF had been hosted.

**port** (STRING): Name of the port on which the LIF had been hosted.

## bcomd.fcplifadded events

### bcomd.fcpLifAdded

#### Severity

NOTICE

#### Description

This message occurs when a Fibre Channel logical interface (LIF) is added.

#### Corrective Action

(None).

#### Syslog Message

LIF %s (on Vserver %s), WWPN %s, was added to node %s, port %s.

#### Parameters

**lifname** (STRING): Name of the LIF that was added.

**vserver** (STRING): Name of the Vserver on which the LIF resides.

**wwpn** (STRING): WWPN that was added.

**node** (STRING): Name of the node on which the LIF is hosted.

**port** (STRING): Name of the port on which the LIF is hosted.

## bcomd.fcplifremoved events

## bcomd.fcpLifRemoved

### Severity

NOTICE

### Description

This message occurs when a Fibre Channel logical interface (LIF) is removed.

### Corrective Action

(None).

### Syslog Message

LIF %s (on Vserver %s), WWPN %s, was removed from node %s, port %s.

### Parameters

**lifname** (STRING): Name of the LIF that was removed.

**vserver** (STRING): Name of the Vserver on which the LIF resided.

**wwpn** (STRING): WWPN that was removed.

**node** (STRING): Name of the node on which the LIF had been hosted.

**port** (STRING): Name of the port on which the LIF had been hosted.

## bcomd.igroup events

### bcomd.igroup.auto.delete.fail

### Severity

ERROR

### Description

This message occurs when an initiator group marked with the delete-on-unmap flag is not automatically deleted when it is no longer part of a LUN mapping relationship.

### Corrective Action

Use the "lun igroup delete" command to delete the initiator group manually.

### Syslog Message

Failed to delete initiator group %s on Vserver %s: %s

### Parameters

**igroup** (STRING): Name of the initiator group.

**vserver** (STRING): Name of the Vserver.

**error** (STRING): The error encountered when deleting the initiator group.

## bcomd.lun events

### bcomd.lun.update.lost

### Severity

ERROR

## Description

This message occurs when the SAN Kernel Agent is unable to process a LUN metadata update resulting from a Snapshot® copy restore operation or other LUN event.

## Corrective Action

Resolve the error and then reload the indicated Vserver with the command "debug san vserver reload".

## Syslog Message

A metadata change notification for a LUN in VServer %s on volume %llu has been lost due to error: %s

## Parameters

**vserver** (STRING): Name of the Vserver.

**volume** (LONGINT): MSID of the volume.

**error** (STRING): Error preventing the update from being processed.

# bcomd.vdisk events

## bcomd.vdisk.repl.failed

### Severity

ERROR

### Description

This message occurs after a replication failure of a LUN or an NVMe namespace configuration in a MetroCluster™ configuration.

### Corrective Action

Use the "metrocluster vserver resync" command to resynchronize the Vserver configuration for the affected Vserver.

### Syslog Message

Replication of a LUN or an NVMe namespace configuration failed on Vserver "%s". Reason: %s.

### Parameters

**vserver** (STRING): Name of the Vserver.

**error** (STRING): Error encountered while replicating the configuration.

## bcomd.vdisk.transition

### Severity

NOTICE

### Description

This message occurs when a user attempts to convert a LUN into an NVMe namespace or vice-versa.

### Corrective Action

(None).

### Syslog Message

Conversion for "%s", Vserver "%s" to type "%s" completed with status "%s".

## Parameters

**source\_vdisk\_path** (STRING): Path to the LUN or NVMe namespace to be converted.  
**vserver** (STRING): Name of the Vserver.  
**destination\_vdisk\_type** (STRING): Destination vdisk type after conversion.  
**status** (STRING): Status of conversion operation.

# bcomd.volume events

## bcomd.volume.update.lost

### Severity

ERROR

### Description

This message occurs when the SAN Kernel Agent is unable to process a volume LUN inventory update resulting from a Snapshot® copy restore operation.

### Corrective Action

Resolve the error and then delete stale maps in the volume with the command "lun mapping delete-stale".

### Syslog Message

A volume LUN inventory change notification for Vserver %s volume %llu has been lost due to error: %s

## Parameters

**vserver** (STRING): Name of the Vserver.  
**volume** (LONGINT): MSID of the volume.  
**error** (STRING): Error preventing the update from being processed.

# bdfu events

## bdfu.selected events

### bdfu.selected

#### Severity

INFORMATIONAL

#### Description

This message occurs when background disk firmware update selects a disk for firmware download. The disk contents will be copied to a suitable spare, the disk will be removed from the raid group and then firmware will be downloaded to it. After the firmware download is complete, the contents of the disk will be restored.

#### Corrective Action

(None).

#### Syslog Message

Disk %s [%s %s %s] S/N [%s] selected for background disk firmware update.

#### Parameters

**diskName** (STRING): Name of the disk.

**vendorName** (STRING): Vendor name of the disk.

**productId** (STRING): Product ID of the disk.

**fwVersion** (STRING): Firmware version of the disk.

**serialno** (STRING): Serial number of the disk.

# block events

## block.giveback events

### block.giveback.during.aufo

#### Severity

ALERT

#### Description

This message occurs during a storage failover (SFO) aggregate giveback, when a SnapMirror® Business Continuity (SMBC) automatic unplanned failover operation is in progress.

#### Corrective Action

Wait for the operation to finish. If giveback is required immediately, use the "override-veto true" parameter with the giveback command, or retry the operation with the "override-vetoes true" parameter. Note: Using this option might cause an I/O disruption.

#### Syslog Message

Storage Failover giveback cannot complete for aggregate "%s" because an SMBC automatic unplanned failover is in progress.

#### Parameters

**aggrname** (STRING): Name of the aggregate.

# boot events

## boot.bootmenu events

### boot.bootmenu.issue

#### Severity

EMERGENCY

#### Description

This message occurs when an error is detected while booting into, or using, the system boot menu.

#### Corrective Action

Retry the boot. If the problem persists, contact NetApp technical support for assistance in replacing the boot device media.

#### Syslog Message

Failed to boot the system. Error: %s

#### Parameters

`err_str` (STRING): Error string.

## boot.shutdown events

### boot.shutdown.issue

#### Severity

ALERT

#### Description

This message occurs when an error is detected while shutting down the system.

#### Corrective Action

Contact NetApp technical support.

#### Syslog Message

Failed to shutdown the system. Error: %s

#### Parameters

`err_str` (STRING): Error string.

## boot.varfs events

### boot.varfs.backup.issue

#### Severity

EMERGENCY

**Description**

This message occurs when an error is detected while trying to back up the /var file system to the boot media or node root volume (mroot).

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Backup of the /var file system failed (%s)

**Parameters**

**err\_str** (STRING): Error string.

**boot.varfs.backup.success****Severity**

NOTICE

**Description**

This message occurs when a subsequent backup is successful following a failure.

**Corrective Action**

(None).

**Syslog Message**

Backup of the /var file system is successful after previous failures.

**Parameters**

(None).

**boot.varfs.repair.partial****Severity**

ERROR

**Description**

This message occurs when the system is unable to restore all missing files detected by a scan of the /var file system during boot.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Unable to restore all missing files in /var file system.

**Parameters**

(None).

**boot.varfs.repair.success**

**Severity**

NOTICE

**Description**

This message occurs when missing files are restored during a scan of the /var file system during boot.

**Corrective Action**

(None).

**Syslog Message**

All missing files in /var are restored.

**Parameters**

(None).

**boot.varfs.restore.issue****Severity**

ALERT

**Description**

This message occurs when an error is detected while restoring the /var file system from a shutdown.

**Corrective Action**

The file system is automatically restored from the boot media. If the problem persists, contact NetApp technical support.

**Syslog Message**

Failed to restore the /var file system. Error: %s

**Parameters**

**err\_str** (STRING): Error string.

**boot.varfs.restore.success****Severity**

NOTICE

**Description**

This message occurs when, following a failure, a subsequent restore of the /var file system is successful.

**Corrective Action**

(None).

**Syslog Message**

Successfully restored the /var file system.

**Parameters**

(None).

# boot.verify events

## boot.verify.kmods.disabled

### Severity

ALERT

### Description

This message occurs when the verification of digitally signed kernel modules has been disabled.

### Corrective Action

Contact NetApp technical support immediately.

### Syslog Message

The verification of digitally signed kernel modules has been disabled.

### Parameters

(None).

## boot.verify.kmods.success

### Severity

NOTICE

### Description

This message occurs when the verification of digitally signed kernel modules succeeds.

### Corrective Action

(None).

### Syslog Message

The verification of digitally signed kernel modules has completed.

### Parameters

(None).

# bootfs events

## bootfs.env events

### bootfs.env.issue

#### Severity

ERROR

#### Description

This message occurs when an error is detected while trying to access the environment file stored on the boot device. Environment variables on the system cannot be changed or saved.

#### Corrective Action

Reformat or replace the boot media. If the problem persists, contact NetApp technical support.

#### Syslog Message

Environmental variables cannot be accessed or saved on the boot device (%s).

#### Parameters

**err\_str** (STRING): Error string.

# bridge events

## bridge.discovered events

### bridge.discovered

#### Severity

INFORMATIONAL

#### Description

This message occurs when the system discovers an FC-to-SAS bridge.

#### Corrective Action

(None).

#### Syslog Message

FC-to-SAS bridge %s [%s %s %s] S/N [%s] was discovered.

#### Parameters

**bridgeName** (STRING): Name of the bridge.  
**bridgeVendor** (STRING): Vendor name of the bridge.  
**bridgeModel** (STRING): Model name of the bridge.  
**bridgeRevision** (STRING): Firmware revision of the bridge.  
**bridgeSerialNum** (STRING): Serial number of the bridge.

## bridge.duplicate events

### bridge.duplicate.ip.address

#### Severity

ALERT

#### Description

This message occurs when the system discovers an ATTO FibreBridge using the same IP address as some other device in the network.

#### Corrective Action

Using the IP and MAC addresses from the alert, attempt to locate the other device in the network, and change one of the IP addresses. If unsuccessful, contact NetApp support for assistance with this issue.

#### Syslog Message

FC-to-SAS bridge %s [%s] %s %s %s.

#### Parameters

**bridgeName** (STRING): Name of the bridge that detected the duplicate IP address.  
**bridgeSerialNum** (STRING): Serial number of the bridge that detected the duplicate address.  
**duplicateIPAddress** (STRING): Duplicate IP address detection message from the bridge log.  
**duplicateMAC** (STRING): Duplicate MAC address detection message from the bridge log.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## bridge.duplicate.wwn

### Severity

ALERT

### Description

This message occurs when the system discovers two FC-to-SAS bridges reporting the same WWN.

### Corrective Action

Contact NetApp support for assistance with this issue.

### Syslog Message

FC-to-SAS bridge %s [%s] and bridge %s [%s] are presenting a duplicate WWN [%s] %s.

### Parameters

**bridgeName1** (STRING): Name of the first bridge.

**bridgeSerialNum1** (STRING): Serial number of the first bridge.

**bridgeName2** (STRING): Name of the second bridge.

**bridgeSerialNum2** (STRING): Serial number of the secondbridge.

**bridgeWWN** (STRING): World wide name of the bridges.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## bridge.removed events

### bridge.removed

### Severity

INFORMATIONAL

### Description

This message occurs when an FC-to-SAS bridge is removed from the system.

### Corrective Action

(None).

### Syslog Message

FC-to-SAS bridge %s [%s %s %s] S/N [%s] was removed.

### Parameters

**bridgeName** (STRING): Name of the bridge.

**bridgeVendor** (STRING): Vendor name of the bridge.

**bridgeModel** (STRING): Model name of the bridge.

**bridgeRevision** (STRING): Firmware revision of the bridge.

**bridgeSerialNum** (STRING): Serial number of the bridge.

## bridge.sas events

### bridge.SAS.invalidTransition

**Severity**

ERROR

**Description**

This message occurs when the SAS disk shelves behind an FC-to-SAS bridge are not cabled correctly, indicating an invalid SAS2 to SAS3 transition.

**Corrective Action**

Follow the defined Fabric-attached or stretch MetroCluster cabling guide.

**Syslog Message**

An invalid SAS2 to SAS3 transition exists on FC-to-SAS bridge %s S/N [%s]: %s

**Parameters**

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeError** (STRING): Error string from the FC-to-SAS bridge.

## bridge.timestamp events

### bridge.timestamp.noSync

**Severity**

NOTICE

**Description**

This message occurs when the max number of retries is exceeded when attempting to apply SCSI SET TIMESTAMP command on one or more attached FC-to-SAS bridges. A timestamp that is not in sync does not affect the functional operation of the bridge. The SET TIMESTAMP operation is only used to synchronize timestamps between ONTAP® and the bridge to assist with correlating log events.

**Corrective Action**

A timestamp operation will always retry in 24 hours. If this notice persists, contact NetApp technical support.

**Syslog Message**

ONTAP timestamp sync did not complete on FC-to-SAS bridge with S/N: %s WWN: %s.

**Parameters**

**bridgeSerialNum** (STRING): Serial number of the bridge.

**bridgeWWN** (STRING): World Wide Name of the bridge.

# bsdsocket events

## bsdsocket.queueLimit events

### bsdsocket.queueLimit.reached

#### Severity

ERROR

#### Description

This message occurs when the number of connection requests for a socket reaches the maximum. These connection requests include partially completed connections and connections that are ready to be accepted.

#### Corrective Action

Network misconfigurations can cause connectivity issues such as asymmetric routing, which causes loss of ACKs. Check the network for any such misconfigurations. A Denial of Service attack and an overloaded system can also be reasons for such an event. Contact NetApp technical support.

#### Syslog Message

Number of connection requests for the socket bound to port %d having the IP address %s has reached the limit of %d connections. The socket uses %s protocol. This event has occurred %llu times since the last warning.

#### Parameters

**port** (INT): Local port bound to the socket.

**ipAddress** (STRING): IP address of the socket.

**limit** (INT): Maximum number of connection requests per socket.

**protocol** (STRING): Protocol used by the socket.

**count** (LONGINT): Number of occurrences for this event since the last warning.

# bucket events

## bucket.soft events

### bucket.soft.limit.exceeded

#### Severity

NOTICE

#### Description

This message occurs when a bucket exceeds the soft quota limit (block).

#### Corrective Action

(None).

#### Syslog Message

Bucket "%s" on volume "%s%s%s" has exceeded the soft block limit and is at %s capacity.

#### Parameters

**whom** (STRING): Entity for which this event is generated.

**volname** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.

**capacity** (STRING): Capacity percentage.

### bucket.soft.limit.normal

#### Severity

NOTICE

#### Description

This message occurs when a bucket's soft quota limit (block) returns to normal.

#### Corrective Action

(None).

#### Syslog Message

Bucket "%s" on volume "%s%s%s" is below the soft block limit and is at %s capacity.

#### Parameters

**whom** (STRING): Entity for which this event is generated.

**volname** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.

**capacity** (STRING): Capacity percentage.

# cache events

## cache.ttl events

### cache.ttl.settings.change

**Severity**

ERROR

**Description**

This message occurs on the last node during the upgrade to ONTAP® 9.3, if the default TTL values of any of the SecD or NFS export caches are changed.

**Corrective Action**

Use the "vserver services name-service cache" commands to configure TTL values after the system is fully upgraded to ONTAP 9.3.

**Syslog Message**

One or more default cache TTL values for SecD and NFS export caches have been changed.

**Parameters**

(None).

# cachemirror events

## cachemirror.offline events

### cacheMirror.offline

#### Severity

ERROR

#### Description

This message occurs when Cache Mirror encounters an error and has to be taken offline. The system functions normally except that takeover and giveback operation times will be negatively affected.

#### Corrective Action

Reboot the node by performing a planned takeover and giveback. Contact NetApp technical support if the problem persists.

#### Syslog Message

Cache Mirror was taken offline because of an unrecoverable error. %s.

#### Parameters

**error\_reason** (STRING): String providing information about why Cache Mirror was taken offline.

# callhome events

## callhome.aggr events

### callhome.aggr.meta.repair

#### Severity

ERROR

#### Description

This message occurs after WAFL® Iron (wafliron) detects and repairs corruption in an aggregate metafile. Wafliron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Wafliron might need to be run on other volumes in aggregate or complete aggregate. Check for wafl.iron.cont.corrupt messages in the node's event log to find other corrupt volumes. Run wafliron on all corrupt volumes. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for WAFLIRON AGGREGATE METAFILE REPAIRED

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.aggr.offline

#### Severity

ALERT

#### Description

This message occurs when an aggregate is inconsistent and is taken offline. The inconsistency might stem from one or more sources and might be related to previous operations or to current operations. Disabling access is a protective measure to ensure that further inconsistencies are avoided. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

If the operating environment for the system, storage, or associated cabling has changed in terms of temperature, humidity, vibration, unstable electrical power, or other physical factors, gracefully shut down and power off the system until the environment is restored to normal operations. If the operating environment has not changed, identify the source of the inconsistency by checking for previous errors and warnings. Also check for hardware statistics from Fibre Channel, SCSI, disk drives, other communications mechanisms, and previous administrative activities. Another approach is to consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the aggregate to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

## Syslog Message

Call home for AGGREGATE INCONSISTENT AND TAKEN OFFLINE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.aggr.restricted

### Severity

ERROR

### Description

This message occurs when a medium error is encountered during a reconstruction. Medium errors during reconstruction automatically invoke waflliron if your system's 'raid.reconstruct.waflliron.enable' option is set to "on". If the option is set to "off", the aggregate is moved offline. In this case, the option was set to "off" and the aggregate was moved offline. The failed disk drive's reconstruction continues and the aggregate stays offline until you repair it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run waflliron manually to bring this aggregate online. It is recommended that you contact NetApp technical support before attempting this. If you need further assistance, contact NetApp technical support.

## Syslog Message

Call home for MEDIUM ERROR DURING RECONSTRUCTION (aggregate restricted)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.aggr.waflliron

### Severity

ERROR

### Description

This message occurs when a medium error is encountered during a reconstruction. Medium errors during reconstruction automatically invoke waflliron if your system's 'raid.reconstruct.waflliron.enable' option is set to "on". If the option is set to "off", the aggregate is moved offline. In this case, the option was set to "on" and the aggregate remains online. The failed disk drive's reconstruction continues and waflliron begins repairing the aggregate. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The corrective process of running waflliron has already begun. Wait until you see a message indicating that the waflliron process is complete and the inconsistency status of the aggregate is cleared. If this doesn't happen, or if you see subsequent error messages, contact NetApp technical support. If you need assistance in bringing the aggregate online, contact NetApp technical support.

## Syslog Message

Call home for MEDIUM ERROR DURING RECONSTRUCTION (wafliron started)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.andu events

## callhome.andu.completed

### Severity

NOTICE

### Description

This message occurs when the automated update of the cluster has been completed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.andu.pausederr

### Severity

ALERT

### Description

This message occurs when the automated update of the cluster has been paused due to an error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The automated update of the cluster has been paused due to an error. Determine the cause of the error by using the "cluster image show-update-progress" command. Correct the cause of the error, and then issue the "cluster image resume-update" command to continue the automated update of the cluster.

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multinode AutoSupport.

# callhome.appdm events

## callhome.appdm.snaprest.fail

### Severity

ALERT

### Description

This message occurs when the Application Data Management feature encounters an error while attempting to restore an application from a Snapshot copy. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "application snapshot show -vserver <vserver> -application <app> -protection-group <pg>" command to determine if the snapshot exists. If it does, retry the operation. Contact NetApp technical support for assistance with reviewing the event log to determine the cause of the application snapshot restore failure.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**vserver\_name** (STRING): Vserver name related to this event.

**application\_name** (STRING): Application name related to this event.

**protection\_group\_name** (STRING): Protection group name related to this event.

**snapshot\_name** (STRING): Snapshot name related to this event.

# callhome.arw events

## callhome.arw.activity.seen

### Severity

ALERT

### Description

This message occurs when ransomware activity is detected. To protect the data, a Snapshot copy has been created, which can be used to restore the original data. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Refer to the anti-ransomware documentation to take remedial measures for ransomware activity. If you need assistance, contact NetApp technical support.

### Syslog Message

Call-home message for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**volName** (STRING): Name of the volume.

**volUuid** (STRING): UUID of the volume.

**vserverName** (STRING): Name of the Vserver.

**vserverUuid** (STRING): UUID of the Vserver.

# callhome.bad events

## callhome.bad.ram

### Severity

ERROR

### Description

This message occurs when correctable ECC errors are masked off, possibly due to bad or poorly seated memory or a faulty motherboard. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If anyone recently installed memory, try removing and reseating it. If problems persist, replace the memory module. If problems still persist, replace the motherboard. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for POSSIBLE BAD RAM

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.battery events

## callhome.battery.failure

### Severity

EMERGENCY

### Description

This message occurs when the battery is either incapable of maintaining data during a power-outage, or is experiencing a failure that poses a physical threat. To prevent data loss and/or damage, the system will shut down momentarily. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s CRITICAL.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.battery.low

### Severity

ALERT

### Description

This message occurs when the NVRAM battery capacity is critically low. If your system is configured to do so, it generates and transmits an AutoSupport® (or 'call home') message to NetApp® technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "system node environment sensors show" command to view the battery's current status, capacity, and charging state. If the battery was recently replaced or the system was nonoperational for an extended period of time, monitor the battery to verify that it is charging properly. If the battery run time continues to decrease below critical levels, the storage system will automatically shut down. Contact NetApp technical support for assistance.

## Syslog Message

Call home for BATTERY\_LOW.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**object\_type** (STRING): Type of resource object under notification. For this EMS, the object\_type will always be NODE.

**object\_uuid** (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

## callhome.battery.notice

### Severity

NOTICE

### Description

This message occurs when the battery is operating near the limit of its supported environment. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery in the next three months. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s NOTICE.

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.battery.overchg****Severity**

ALERT

**Description**

This message occurs when the NVRAM card lithium battery is overcharged and is at risk of failure. The system is currently serving data but will shut down shortly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Replace the NVRAM card/battery and start the system back up. The system will not boot with the battery in this state. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for BATTERY OVERCHARGED

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.battery.overtemp****Severity**

ALERT

**Description**

This message occurs when the sensor for the NVRAM card lithium battery over the intended temperature limit. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

If the system is excessively warm, allow it to cool gradually. If the battery temperature is still too high, replace the battery pack. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for BATTERY OVERTEMP

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.battery.warning****Severity**

ALERT

## Description

This message occurs when the battery is operating outside the limit of its supported environment. Under these conditions, the battery might not be capable of maintaining data during a power-loss event. To prevent data loss, the system will automatically shut down in 24 hours. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s WARNING.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.bcom events

## callhome.bcom.vsinit.failed

### Severity

ALERT

### Description

This message occurs when multiple attempts to initialize the SAN Kernel Agent for a Vserver have failed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "cluster kernel-service show" (advanced) command to verify the cluster kernel quorum service is "in-quorum" on the source node. Contact NetApp technical support for assistance determining the root cause of the failed Vserver initialization.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**source** (STRING): The name of the node that failed to initialize.  
**vserver** (STRING): The name of the Vserver that failed to initialize.  
**vserver\_uuid** (STRING): The UUID of the Vserver that failed to initialize.  
**error** (STRING): The error of the last failed initialization.

# callhome.bdfu events

## callhome.bdfu.suspended

### Severity

ALERT

### Description

This message occurs when drive unlock fails for firmware download on a FIPS-certified NetApp Storage Encryption SAS drive.

### Corrective Action

Contact NetApp technical support for assistance with restoring valid authentication keys on the disk.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.bootfs events

### callhome.bootfs.chkdisk

### Severity

ALERT

### Description

This message occurs when a consistency check of the boot media (compact flash or other type) has shown a problem and has not been corrected automatically. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The boot media should be reformatted and/or replaced. After corrective steps have been taken, the "bootfs chkdisk" command should be used to confirm the recovery has been successful. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for BOOTFS CHKDSK

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.bridge events

### callhome.bridge.reboot.unexp

### Severity

ALERT

## Description

This message occurs when a bridge reboots unexpectedly. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Analyze the bridge event log to determine the cause of the reboot. If you need further assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**bridgeName** (STRING): Name of the bridge.

**bridgeVendor** (STRING): Vendor name of the bridge.

**bridgeModel** (STRING): Model name of the bridge.

**bridgeRevision** (STRING): Firmware revision of the bridge.

**bridgeSerialNum** (STRING): Serial number of the bridge.

**rebootReason** (STRING): Reason for the bridge reboot.

# callhome.c events

## callhome.c.fan

### Severity

ERROR

### Description

This message occurs when there is an unexpected decrease in a chassis fan's spin rate, possibly due to a slight decrease in revolutions or to a failed chassis fan. A failed chassis fan can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. If a slight decrease in revolutions seems to have caused this event, and if this has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.c.fan.fru.degraded

### Severity

ERROR

### Description

This message occurs when a chassis fan might be operating in a degraded state. This condition can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.c.fan.fru.fault

### Severity

ERROR

### Description

This message occurs when a chassis fan might have failed. This failure can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.c.fan.fru.rm

**Severity**

ERROR

**Description**

This message occurs when a chassis fan is removed. You have two minutes to install a replacement chassis fan or the system shuts down automatically to avoid overheating. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Install a replacement chassis fan within two minutes of removing the original to complete the hot-swap. Otherwise, install the replacement chassis fan when you are ready. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.c.fan.fru.shut****Severity**

ERROR

**Description**

This message occurs when multiple chassis fans have failed. This failure can lead to overheating and can cause damage to your equipment. It is sent just before the system shutdown. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Check the chassis fans to determine whether they are spinning. Replace the chassis fans if any have failed or they are not operating correctly. You might need to replace the motherboard to replace the chassis fans. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.carrier events****callhome.carrier.fault**

**Severity**

ERROR

**Description**

This message occurs when all the disks in the carrier, that contains more than one disk in it, have failed. The carrier should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate the carrier with the failed disks by looking for the carrier whose amber LED is on and the green LED does not indicate any disk activity. Replace the carrier with the failed disks. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ch events

### callhome.ch.ps.degraded

**Severity**

ERROR

**Description**

This message occurs when a degraded chassis power supply unit (PSU) state exists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.ch.ps.fan.bad.xmin

**Severity**

EMERGENCY

**Description**

This message occurs when a power supply fan has been detected as no longer working and the overheating is expected shortly. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Replace the power supply unit or the power supply unit's fan. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ch.ps.fault****Severity**

ERROR

**Description**

This message occurs when one chassis power supply unit (PSU) fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ch.ps.wrong.in****Severity**

ERROR

**Description**

This message occurs when a power supply is not connected to the correct type of power source (voltage, amperage, type, etc. difference). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Connect the power supply to the proper power source or replace the power supply with the appropriate one for the available power source. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.chassis.events

## callhome.chassis.hitemp

### Severity

ERROR

### Description

This message occurs when the chassis temperature is too warm and might cause an environmental problem, or when there is faulty hardware in the system, such as a fan failure or a malfunctioning temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for CHASSIS OVER TEMPERATURE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.chassis.overtemp

### Severity

EMERGENCY

### Description

This message occurs when the chassis temperature is too hot. It is sent just before system shutdown and indicates a potential environmental problem or faulty hardware in the system, such as a fan failure or a malfunctioning temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If the environment is too hot, shut down and power off your system until the environmental conditions are restored to the normal operating temperature range. If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If

you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CHASSIS OVER TEMPERATURE SHUTDOWN

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

### **callhome.chassis.power**

### **Severity**

ERROR

### **Description**

This message occurs when power is in a degraded state because of bad power supply units (PSUs), bad wall power, or bad components on the motherboard. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

If spare PSUs are available, try exchanging them to see whether that alleviates the problem. If not, you might need to replace motherboard components or the motherboard. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for %s

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

### **callhome.chassis.power.down**

### **Severity**

ERROR

### **Description**

This message occurs when voltage and other power sensors for the system power show critical values. A power supply unit (PSU) might have failed or the sensors might be malfunctioning. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Replace the faulty hardware. Most likely, you need to replace a PSU. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.chassis.ps.degraded****Severity**

ERROR

**Description**

This message occurs when a degraded chassis power supply unit (PSU) state exists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

Call home for CHASSIS UNDER TEMPERATURE SHUTDOWN

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.checksum events

## callhome.checksum

### Severity

ALERT

### Description

This message occurs when the system detects a RAID level checksum error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for CHECKSUM ERROR

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.checksum.multiple

### Severity

ALERT

### Description

This message occurs when the system detects a RAID checksum error involving multiple disk drives. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for CHECKSUM ERROR (multiple disks)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.clam events

## callhome.clam.node.ooq

**Severity**

EMERGENCY

**Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, Availability Monitor (CLAM) determines that one of the nodes is out of "cluster quorum".

**Corrective Action**

One or more of the following actions may be needed: - Check if the node that is out of quorum is administratively down; if it is, enable it with: "cluster modify -node node\_name -eligibility true"; - Check if the node that is out of quorum has panicked or hung; if it is, troubleshoot and resolve that problem. - Check the connectivity of the node that is out of quorum to the cluster interconnect. Fix any issues, if needed. - Check if there is a version incompatibility between the node that is out of quorum and the rest of the nodes in the cluster; if there is, upgrade nodes as needed so that they are compatible.

**Syslog Message**

Call home for %s.

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.client events

### callhome.client.app.alert

**Severity**

ALERT

**Description**

This message occurs when a remote client accesses the node using Manage ONTAP® and triggers an event using the ems-autosupport-log API call with "auto-support" field set to "true". If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Identify and resolve the issue on the remote client that is using the Manage ONTAP API to trigger this event. If you need assistance, contact NetApp technical support.

### Corrective Action

Identify and resolve the issue on the remote client that is using the Manage ONTAP API to trigger this event. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.clus events

### callhome.clus.net.degraded

### Severity

ALERT

### Description

This message occurs when the cluster network has experienced an issue that could potentially affect connectivity, reliability, redundancy, or performance, as observed from the local node. A degraded cluster network might cause a cluster-wide outage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

See the EMS event log for additional information related to the issue. If the `event_type` is "Frequent Link Flapping", check the network cables that are connected to the specified port for any loose connections. If the `event_type` is "Large MTU Packet Loss", verify cluster switch MTU settings and ensure that all cluster

network ports are configured with the same MTU. If the event\_type is "Total Packet Loss", verify all cluster network connectivity and configuration and ensure that all cluster network ports are reachable from one another. If the event\_type is "Cluster LIF Not Assigned to Any Port" and the cluster ports are link "down", check the network cables that are connected to the specified port for any loose connections. Ensure that the cluster ports are administratively configured link "up". If the cluster ports are link "up", attempt to manually migrate the cluster LIF to another cluster port. If the event\_type is "Cluster LIF Administratively Down", use the "network interface modify" command to change the status-admin state of the cluster LIF to "up". If the event\_type is "Insufficient L2 Reachability", verify that the network topology is correct and the ports are correctly assigned to the right broadcast domain. If the problem persists after correcting any issues, call NetApp technical support.

### Syslog Message

Call home for %s: %s - %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**event\_type** (STRING): The type of the event that signaled that the cluster network might be operating in a degraded state from the perspective of the local node.

**event\_details** (STRING): Details of the event that signaled that the cluster network might be operating in a degraded state from the perspective of the local node.

## callhome.clus.vol.cre.fail

### Severity

ERROR

### Description

This message occurs when the active volume required to store the system data needed for cluster-wide storage cannot be created. This is typically due to not finding an aggregate with the specified size or mirrored attribute to create the volume. The specified feature cannot function without this volume. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume create failed because the aggregate is offline, use the 'aggr online -aggregate' command to bring it back online. If the error message does not indicate an obvious problem, run the 'aggregate show' command to find the state of the aggregate and 'metrocluster check config-replication show-aggregate-eligibility' command to find the eligibility of aggregates for configuration replication. If the aggregate is full, try to create space on it. Otherwise, if possible, create an aggregate with the specified mirror attribute and size by using the 'aggregate create -aggregate name -diskcount diskcount -disksize size -mirror mirrorattribute' command. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s. Could not create volume after %d attempts for feature %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**AttemptsMade** (INT): Count of failed attempts to create the volume.

**Feature** (STRING): Feature using the cluster-wide storage.

**ErrorMessage** (STRING): Error message on create failure at time of event generation

**Size** (STRING): Size of the volume to be created.

**Mirror** (STRING): Mirrored attribute of the aggregate.

## callhome.clus.vol.del.fail

### Severity

ERROR

### Description

This message occurs when the volumes that were used for cluster-wide storage cannot be deleted. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume delete failed because the aggregate is offline, use the 'aggr online -aggregate aggregate\_name' command to bring it back online. If the error message does not indicate an obvious problem, contact NetApp technical support

### Syslog Message

Call home for %s. Could not delete volumes "%s" and "%s" for feature %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**ActiveVolume** (STRING): Active volume name.

**StandbyVolume** (STRING): Standby volume name.

**Feature** (STRING): Feature using the cluster-wide storage.

## callhome.config events

### callhome.config

### Severity

ALERT

### Description

This message occurs when the system detects a disk shelf configuration error for one or more disk shelves. The system continues to report this error until you resolve the problem. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the command "storage errors show" to display outstanding storage errors in the system. Use the "event log show" command to identify earlier EMS messages related to shelf configuration errors. Correct the cause of the configuration error. Common causes of configuration errors are as follows: - A previously attached disk shelf was removed - A loss of disk shelf enclosure services occurred - A disk shelf fan module failed - An invalid disk shelf drive configuration was created - An operating environment temperature was 50C (122F) degrees or higher - A disk shelf environment module failure occurred If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for CONFIGURATION\_ERROR

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.coredump events

## callhome.coredump.save.done

### Severity

NOTICE

### Description

This message occurs when all the core segments belonging to a coredump have been saved. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "system node coredump show" command to obtain coredump file details.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**file** (STRING): Primary core segment file that was created.

**node** (STRING): Name of the node whose core was saved.

**size** (LONGINT): Size of primary core segment in bytes.

**chksum** (STRING): Checksum of primary core segment file's data.

**ancillary\_segment\_directory** (STRING): Directory which holds ancillary core segments.

**ancillary\_segments** (STRING): List of ancillary segments.

# callhome.corefile events

## callhome.corefile.upload

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport for corefile upload. This Autosupport collects and sends only the corefile specified as part of the payload. This autosupport is sent only when the transport is set to http or https. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

## Syslog Message

corefile upload callhome for %s

### Parameters

**subject** (STRING): AutoSupport message subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this coredump AutoSupport message.

**core\_filename** (STRING): Coredump filename to be included in the coredump AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

## callhome.cpu events

### callhome.cpu.fan

#### Severity

ERROR

#### Description

This message occurs when a CPU fan failed or the fan is spinning too slowly or too fast. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Analyze whether you need to replace the CPU fan. CPU fan replacement might require that you replace the motherboard as well. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for %s

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.cpu.fan.fault

#### Severity

ERROR

#### Description

This message occurs when a CPU fan failed or the fan is spinning too slowly or too fast. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Analyze whether you need to replace the CPU fan. CPU fan replacement might require that you replace the motherboard as well. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.css events

### callhome.css.toc.repair

#### Severity

ALERT

#### Description

This message occurs when an inconsistency is discovered in a metadata record of the Cloud Storage Service (CSS). The inconsistency is automatically repaired immediately upon detection. But it can leave behind lost objects that are no longer pointed to by the namespace. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

The (privilege: diag) "object-store-server lost-object-recovery start" command can be used to add lost objects back into the namespace. The progress of this operation can be monitored with the "object-store-server lost-object-recovery show" command. If you need further assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ctran events

### callhome.ctran.gcror.timeout

#### Severity

ALERT

#### Description

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that one or more newly selected Group Coordinators (GCs) are taking too long to successfully complete the GC Ready on Reselect procedure. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Call NetApp technical support immediately for further assistance.

### **Syslog Message**

Call home for GROUP COORDINATOR ROR TIMEOUT.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## **callhome.ctran.jpc.splitbrain**

### **Severity**

ALERT

### **Description**

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that there is a disagreement in the cluster - a split brain - about which node has the Join Proposal Coordinator (JPC). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Call NetApp technical support immediately for further assistance.

### **Syslog Message**

Call home for CTRAN JPC SPLIT BRAIN DETECTED.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## **callhome.dafs events**

### **callhome.dafs.nic.stop**

### **Severity**

ALERT

### **Description**

This message occurs when the DAFS (Direct Access File System) NIC (Network Interface Controller) has stopped while DAFS was running. This is caused by a failure of the NIC processor firmware during heavy and complex workloads. DAFS can usually recover and continue. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Reboot the system to recover the NIC. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DAFS VI NIC HALTED - DAFS SERVICE MAY BE INACCESSIBLE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.dbs events

## callhome.dbs.assign.error

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) assignments reports a validation error. An assignment validation error may indicate that data is inaccessible or data loss has occurred. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for assistance.

## Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**evtMessage** (STRING): Description of the data event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.

**driveUuid** (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**evtDetails** (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

## callhome.dbs.block.repair

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) attempts a new block repair or fails to repair block in maximum number of repair attempts allowed. See event details for more information. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate inconsistent

data are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for help immediately.

### Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**evtMessage** (STRING): Description of the data event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.

**driveUuid** (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**evtDetails** (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

## callhome.dbs.cannot.sync.blk

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects the cluster Block data is in a degraded state, and the auto-heal process to restore full Block data redundancy cannot proceed. Block resources need to be added or restored to the cluster. Too many nodes, Block services, FireStorm services or aggregates may be offline; or possibly the cluster Block services are full. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Evaluate the storage capacity of the cluster. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

### Syslog Message

The DBS cluster Block data cannot be made fully redundant.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.clcap.full

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects the cluster (or node in the cluster) has completely consumed its capacity. The DBS is responsible for managing the data that backs the FlexVols®. The cluster data is now read-only. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Evaluate the available capacity of this cluster relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes. If the cluster's available capacity appears inconsistent with the calculated expected capacity, then contact NetApp technical support.

### Syslog Message

The DBS cluster capacity is 100%% full.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.clcap.near.full

### Severity

ALERT

## Description

This message occurs when the Distributed Block Store (DBS) detects the cluster (or node in the cluster) has consumed nearly all of its capacity. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Evaluate the available capacity of this cluster relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

## Syslog Message

The DBS cluster capacity is nearly full.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.clst.ekm.server

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects one or more of the following: 1. An External Key Management server cannot be reached by any node and is considered down. 2. A fatal communication error has occurred with an External Key Management server. Seek corrective-action immediately.

### Corrective Action

Verify that the External Key Management server is running and can be reached by the management network. Verify that the correct root CA certificate and client certificate are configured for the Key Server (use openssl s\_client to assist with troubleshooting). Check the logs on the External Key Management server for additional troubleshooting help. Contact NetApp technical support for assistance.

### Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.data.unavail

### Severity

EMERGENCY

### Description

This message occurs when some portion of the Distributed Block Store (DBS) data cannot be accessed. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate data is unavailable are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for help immediately.

### Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**evtMessage** (STRING): Description of the data event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.

**driveUuid** (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**evtDetails** (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

## callhome.dbs.dup.master

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects an internal database inconsistency. Master services have multiple entries for cluster master candidacy. Manual intervention is required.

## Corrective Action

Contact NetApp technical support immediately.

## Syslog Message

Callhome for %s. DBS has detected a critical issue. Cluster fault type %s, fault ID %u, status %u, nodes %s. %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Details of the duplicate master candidates.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ekm.cert.emer

## Severity

EMERGENCY

## Description

This message occurs when the Distributed Block Store (DBS) detects that an External Key Management server configuration contains a certificate that is invalid, is expired, or will expire in less than 3 days. Seek corrective-action immediately.

## Corrective Action

Renew or correct each listed certificate and update the associated Key Server configuration. Contact NetApp technical support for assistance.

## Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ensemble.emer

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) loses the database connection to over half of the ensemble nodes (of 3 or 5 total). DB quorum has been lost and the DB is down. The cluster cannot operate without access to the DB.

### Corrective Action

Bring offline nodes back online and/or restore node network connectivity. If that does not resolve the fault, contact NetApp technical support.

### Syslog Message

Callhome for %s. DBS has lost network connectivity or power on ensemble node. Cluster fault type %s, fault ID %u, status %u, nodes %s. %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the degraded ensemble.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ffmAggrFlagSet

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects one or more aggrs have a don't attach, don't mount or don't detach flag set.

### Corrective Action

Resolve the issue that required the flag to be set, then remove the flag using the SetAggrFlags API command.

### Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ffmFlexvolsOffl

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects one or more FlexVols are offline.

### Corrective Action

Solve any issue contributing to the FlexVols being taken offline.

### Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.generic.cfault

### Severity

EMERGENCY

### Description

This message occurs when a Distributed Block Store (DBS) emergency cluster fault is reported as a generic fault. The DBS is responsible for managing the data that backs the FlexVols®. Multiple faults are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for interpretation of this event.

## Syslog Message

Call home for %s, fault %s (%u), sev %u, service %u, node %u/%s, drives %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**cfCodeName** (STRING): Name of the original DBS cluster fault code.  
**cfCode** (INT): DBS cluster fault code number.  
**cfSeverity** (INT): Severity of the original DBS cluster fault. This is different than the EMS severity.  
**serviceID** (INT): Service ID that identifies the associated cluster service. It will be "0" if there is no associated service.  
**nodeID** (INT): Node ID number of the associated node. It will be "0" if there is no associated node.  
**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.  
**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.  
**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Description of the cluster fault, including context details.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.inv.block.data

### Severity

EMERGENCY

### Description

This message occurs when a block stored in the Distributed Block Store (DBS) has inconsistent data. The cluster is checking the compression, block ID and checksum of the block against expected values. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate inconsistent data are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for help immediately.

## Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**evtMessage** (STRING): Description of the data event, including context details.  
**evtType** (STRING): Type of the original DBS event.  
**serviceID** (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.  
**nodeID** (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.  
**driveID** (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.  
**driveUuid** (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.  
**evtID** (INT): DBS event ID number.  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**evtDetails** (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

## callhome.dbs.mem.thresh.emer

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects container memory 100 percent consumed.

### Corrective Action

Add additional nodes, or purge deleted volumes and run GC

### Syslog Message

Callhome for %s. DBS has detected free memory is completely consumed on a node's container. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**nodeID** (INT): Node ID number of the associated node.  
**nodeUUID** (STRING): Node UUID string of the associated node.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Details of the memory usage threshold.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.multSliceSvcDn

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects multiple unhealthy slice services. This may cause some data to be unavailable.

### Corrective Action

If multiple slice services are unhealthy, repair offline nodes and drives to bring slice services back online. Contact NetApp technical support.

## Syslog Message

Call home for %s. Fault type %s, fault id %u, status %u, nodes %s. %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Description of the cluster fault, including context details.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.node.ekm.server

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects that a node is unable to reach an External Key Management server that is not considered down (other nodes are able to reach it). Seek corrective-action immediately.

### Corrective Action

Perform troubleshooting at the network or node-specific level to determine why the listed node is unable to reach the External Key Management server. Contact NetApp technical support for assistance.

## Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**nodeID** (INT): Node ID number of the associated node.  
**nodeUUID** (STRING): Node UUID string of the associated node.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Description of the cluster fault, including context details.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.sec.cache.full

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects that Slice volume secondary write cache is full. This is caused when Slice service write requests to the Block service (and by extension the FireStorm service) are not receiving replies. Client write performance may be reduced while this condition exists. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Verify that all nodes are online. Verify that all Block and FireStorm services, and associated aggregates, are online. Attempt repairs needed to bring nodes and aggregates online. If the reason for this condition cannot be found, contact NetApp technical support.

### Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**serviceID** (INT): Service ID that identifies the associated cluster service.  
**nodeID** (INT): Node ID number of the associated node.  
**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.  
**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.  
**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Description of the cluster fault, including context details.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ssl.ndcert.exc

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects that a node has a missing or corrupted certificate.

### Corrective Action

Contact NetApp technical support for assistance.

## Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**nodeID** (INT): Node ID number of the associated node.

**nodeUUID** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.ssl.ndcert.exp

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects that a node contains an SSL certificate that has expired or will expire imminently.

### Corrective Action

Contact NetApp technical support for assistance.

## Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, fault type %s, fault ID %u, status %u, nodes %s. %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**nodeID** (INT): Node ID number of the associated node.

**nodeUUID** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.svcap.full

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects a service (Slice or Block) that has completely consumed its capacity. The DBS is responsible for managing the data that backs the FlexVols®. The data for this service is now read-only. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Evaluate the available capacity of this service relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes. If the services's available capacity appears inconsistent with the calculated expected capacity, then contact NetApp technical support.

### Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**serviceID** (INT): Service ID that identifies the associated cluster service.  
**nodeID** (INT): Node ID number of the associated node.  
**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.  
**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.  
**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.  
**cfDetails** (STRING): Description of the cluster fault, including context details.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.  
**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.svcap.near.full

### Severity

ALERT

### Description

This message occurs when the Distributed Block Store (DBS) detects a service (Slice or Block) that has consumed nearly all of its capacity. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Evaluate the available capacity of this service relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

## Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**serviceID** (INT): Service ID that identifies the associated cluster service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.

**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.dbs.volumes.offline

### Severity

EMERGENCY

### Description

This message occurs when the Distributed Block Store (DBS) detects that one or more volumes in the storage cluster are offline. For the volumes listed, both copies of volume slice data are unavailable. The volumes are degraded and the primary slice service becomes unresponsive, as detected by the Cluster Master. The VolumesDegraded fault will also be present. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check for network connectivity issues and hardware errors. There should be other faults if specific hardware components have failed. Attempt to resolve these issues. The fault will clear when the primary slice service is responsive. Contact Support if there are no associated hardware faults and this fault persists long enough to affect client applications.

### Syslog Message

Call home for %s. One or more DBS volumes offline.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

**skip\_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

## callhome.device events

### callhome.device.qual

#### Severity

ALERT

#### Description

This message occurs when the system detected a disk drive device that did not receive qualification from NetApp. Unqualified disk drives can cause serious damage to the system, and the system shuts down within 72 hours to prevent this potential damage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

To correct this situation, complete one of the following steps: 1. Download and install the latest Drive Qualification Package (DPQ) from NetApp technical support. This automatically qualifies any disk drives that were provided by NetApp. Search the support site knowledge base for the "DQP" keyword for further information. 2. Remove the unqualified disk drives from the system. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for DEVICE\_QUALIFICATION\_FAILED

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.disk events

### callhome.disk.carrier.evacuation.notpossible

#### Severity

ALERT

#### Description

This message occurs when a system does not contain enough spares to correct existing disk failures. This message is seen only on systems containing disk carriers capable of holding more than one disk. When this message occurs, manual intervention is required because ONTAP® cannot automatically correct the

existing issues with the system's disk configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

To correct this issue on systems that contain carriers with multiple disks, try the following (in the specified order): (1) Assign any unassigned disks that are contained within a multidisk carrier. (2) Add multidisk carriers. (3) If a replacement carrier is available, do the following: a) Fail ALL disks within the carrier. Do not remove a multidisk carrier that contains non-failed disks; doing so results in system degradation and might result in system failure. b) Wait until the disk's amber Attention LEDs stop flashing and are lit continuously. Do not remove a carrier while the shelf OPS panel is alternating between the shelf ID and the Attention Code H1, or while the disks within the carrier are flashing their amber Attention LEDs. c) Replace the carrier. (4) Reassign partner spare disks in the HA configuration. (5) If the problem persists, call NetApp technical support.

### **Syslog Message**

Call home for DISK\_CARRIER\_EVACUATION\_NOTPOSSIBLE

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.disk.low.io**

### **Severity**

NOTICE

### **Description**

This message occurs when the storage health monitor detected low disk drive throughput. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

(None).

### **Syslog Message**

Call home for DISK\_LOW\_THRUPUT

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.disk.orphan**

### **Severity**

NOTICE

### **Description**

This message occurs when RAID subsystem detects an orphan or broken drive and is processing it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for %s.

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.diskown events

### callhome.diskown.AssignExceeded

**Severity**

ERROR

**Description**

This message occurs when too many disks have been installed. An attempt is made to assign more disks than the maximum that can be supported on this node. This problem must be resolved before the system is rebooted. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Review the system capacity limits and the assigned disks on this system. If possible, unassign the unused array LUNs. If you need further assistance, contact NetApp technical support.

**Syslog Message**

Call home for ATTEMPTED TO ASSIGN MORE DISKS THAN MAXIMUM SUPPORTED.

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.disks events

### callhome.disks.missing

**Severity**

ERROR

**Description**

This message occurs when the system detected simultaneously that multiple disk drives were missing from the system. It generated a single "MULTIPLE DISKS MISSING" message rather than multiple "DISK MISSING" messages. The problem might be due to a Fibre Channel loop (connection) or a disk shelf or disk drive operating incorrectly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for MULTIPLE DISKS MISSING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.dr events

## callhome.dr.apply.failed

### Severity

ERROR

### Description

This message occurs when all attempts to replicate the configuration fails. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To troubleshoot further, search the event management system (EMS) logs on the destination cluster for events starting with "vsdr". Perform any provided corrective actions. For further assistance, contact NetApp technical support.

## Syslog Message

Call home for DR CONFIG REPLICATION FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**DestinationVserver** (STRING): Destination Vserver of the DR relationship.

**FailedReason** (STRING): Failed reason.

# callhome.dsk events

## callhome.dsk.bypass

### Severity

ERROR

### Description

This message occurs when a disk drive failure occurred and the Embedded Switched Hub (ESH) removed the disk drive from the loop electronically—bypassing the disk drive on one or possibly both ports. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Depending on your system configuration, you might need to place the disk drive software into a failed state to match what the ESH module did. Then locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for DISK\_FAIL - Bypassed by ESH

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.dsk.config**

### **Severity**

ERROR

### **Description**

This message occurs when the system detects a configuration problem with a disk drive, Fibre Channel switch, or host bus adapter (HBA). A cabling issue might be causing the problem. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Review and repair the cabling and SAN configuration. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for DISK CONFIGURATION ERROR

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.dsk.disable**

### **Severity**

ERROR

### **Description**

This message occurs when a disk drive failure occurred and the I/O Module (IOM) removed the disk drive from the system by disabling the PHY on one or possibly both ports. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Depending on your system configuration, you might need to place the disk drive software into a failed state to match what the IOM did. Then locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK\_FAIL - Disabled by IOM

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.fault

## Severity

ERROR

## Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.fw.needed

## Severity

ERROR

## Description

This message occurs when the system detects one or more disk drives with out of date or "downrev" disk firmware. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Check and update all the disk drive firmware levels to the current the disk drive firmware level. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK\_FIRMWARE\_NEEDED\_UPDATE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.init

### Severity

ERROR

### Description

This message occurs when a disk drive failed to initialize. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for DISK INIT FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.io.degraded

### Severity

ERROR

### Description

This message occurs when the storage health monitor detects degraded disk I/O (taking too long) that indicates a problem with a disk drive. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at a higher risk of failing. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Identify the disk drive that caused this event and verify that it is running the most recent firmware. If the firmware is not up to date, update it to ensure that problems do not continue. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for DISK\_IO\_DEGRADED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.label

### Severity

ALERT

## Description

This message occurs when a disk drive failed due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the “storage disk show -broken” command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK BAD LABEL

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.label.broken

## Severity

ERROR

## Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the “storage disk show -broken” command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK LABELED BROKEN

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.label.v

## Severity

ERROR

## Description

This message occurs when a disk drive failed due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Use the “storage disk show -broken” command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for DISK BAD LABEL VERSION

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.dsk.missing**

### **Severity**

ERROR

### **Description**

This message occurs when the system cannot detect a disk drive in the Fibre Channel network (or loop) that it previously discovered. The error might be caused by a failed disk drive in the chassis still awaiting replacement or a broken connection to the disk drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Locate and replace the defective disk drive. If you already replaced it, check the Fibre Channel network for network connectivity from the appliance to the disk drive. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for DISK MISSING

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.dsk.no.spin**

### **Severity**

ERROR

### **Description**

This message occurs when a disk drive fails to start. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Logged message 'disk.init.failure.spinup' identifies the failed disk drive. Locate and replace the disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK NOT SPINNING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.noio

## Severity

ERROR

## Description

This message occurs when disk drive device commands to a disk drive are failing with link errors, adapter errors, or timeouts. With this type of problem, the disk drives's red or amber LED fault light may not be lit. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK NOT RESPONDING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.predict

## Deprecated

Deprecated as of ONTAP 9.2. Last used in DOT 7.1.1.

## Severity

ALERT

## Description

This message occurs when the storage health monitor PFA (predictive failure analysis) determines that disk drive failure is forthcoming. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at higher risk of failing. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Identify the disk drive that caused this event and check whether the firmware is up-to-date. If the firmware is not up-to-date, update it to ensure that problems do not continue. If the firmware is up-to-date, manually fail the faulty disk drive and remove it from the system to ensure the integrity of data. At the earliest opportunity, install a replacement disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK\_FAILURE\_PREDICTED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.redun.fault

## Severity

ERROR

## Description

This message occurs when redundant access to disk storage is lost. This message and associated Autosupport are issued at most once per day. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Locate disks which have lost redundancy by using the following command: "storage disk show -fields disk,primary-port,secondary-name,secondary-port,shelf,bay" Note all channels with single path connectivity. Check for failures using these commands: "system health node-connectivity shelf show" and "system health system-connectivity shelf show". If a module or cable failure is identified, replace the failed module or cable. Confirm redundancy has been restored with the following command: "storage disk show -fields disk,primary-port,secondary-name,secondary-port,shelf,bay" If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK REDUNDANCY FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.scrub

## Severity

ALERT

## Description

This message occurs when the weekly scheduled disk scrub detects checksum errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Review the results of the disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK SCRUB CHECKSUM ERROR

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.dsk.scrub.done****Severity**

ERROR

**Description**

This message occurs when a disk scrub finishes bypassing media errors and places the aggregate in a normal state. This type of disk scrub is started automatically after wafiron when disk reconstruction is bypassing media errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Review the results of the disk reconstruction, wafiron, and disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for DISK SCRUB COMPLETED (bypassing media errors)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.dsk.scrub.parity****Severity**

ALERT

**Description**

This message occurs when the scheduled disk scrub detects parity inconsistencies. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Review the results of the disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for DISK SCRUB PARITY INCONSISTENCY

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.dsk.sense****Severity**

ERROR

## Description

This message occurs when storage health monitor detects a SCSI sense error that indicates a problem with a disk drive. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at a higher risk of failing. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Identify the disk drive that caused this event and verify that it is running the most recent firmware. If the firmware is not up-to-date, update it to ensure that problems do not continue. If the firmware is up-to-date, manually fail the faulty disk drive and remove it from the system to ensure the integrity of data. At the earliest opportunity, install a replacement disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK\_RECOVERED\_ERRORS

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dsk.shrank

### Severity

ALERT

## Description

This message occurs when either an aggregate or hot spare disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for DISK RAWSIZE SHRANK

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.dumptriage events

## callhome.dumptriage

### Severity

NOTICE

## Description

This message occurs when kernel dumptrriage files are collected for a coredump event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**core\_filename** (STRING): Coredump filename used to find the correct set of dumptrriage files.

# callhome.encl events

## callhome.encl.access

### Severity

ERROR

### Description

This message occurs when contact to one or more disk shelf enclosure services (environmental monitoring) is lost, possibly due to storage cabling, adapter, or configuration problems. The system uses the enclosure services to monitor the environment continuously to ensure that conditions remain at safe operating levels. If the system cannot contact the enclosure services, it cannot detect when operating conditions move into unsafe ranges and cannot minimize any damage that might result. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "storage errors show" command to display the current outstanding shelf error conditions. Use the "event log show" command to identify earlier EMS messages related to shelf connectivity errors. Restore connectivity to the disk shelf enclosure services. Check cabling for loose connections. Swap out adapters, if possible. Double-check the configuration. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for ENCLOSURE SERVICES ACCESS ERROR

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.ext events

## callhome.ext.cache.bad

**Severity**

ALERT

**Description**

This message occurs when a check of the external memory cache used for increasing system performance has failed and this cache has been disabled. System operations will continue with possibly reduced performance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

The external memory cache should be checked and possibly repaired to restore its service to the system. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for EXTERNAL CACHE FAILURE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fans events

### callhome.fans.failed

**Severity**

EMERGENCY

**Description**

This message occurs when multiple fans inside the appliance case fail. This failure can lead to overheating and cause damage to your equipment. The system shuts down within 10 minutes unless you resolve the fan problems. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Replace the fans within 10 minutes. If that is not possible, perform a graceful shutdown of the system and power it off. Then replace the fans when you can, power on the system, and restore it to normal operation. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for MULTIPLE FAN FAILURE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fc events

### callhome.fc.al.link

## Severity

ALERT

## Description

This message occurs when a Fibre Channel arbitrated loop (FC-AL) has link failures. You need to resolve this issue promptly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Check the FC-AL itself and the connections to the FC-AL for poor or broken connections and misconfigurations. Examine the event log for messages related to FC or disk I/O errors and take the corrective actions found there. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fc.al.poor

## Deprecated

Deprecated as of ONTAP 9.2. Last used in DOT 7.1.0.

## Severity

ALERT

## Description

This message occurs when the system detects that a Fibre Channel arbitrated loop (FC-AL) is unreliable or is too poor in quality for data exchange. You need to resolve this issue promptly. The link errors are recoverable in the sense that the system is up and running. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Check the FC-AL itself and the connections to the FC-AL for poor or broken connections and misconfigurations. Examine the event log for messages related to FC or disk I/O errors and take the corrective actions found there. Restore normal, error-free communication for the FC-AL as quickly as possible. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for FC-AL RECOVERABLE ERRORS

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fcp events

## callhome.fcp.adapter.failed

### Severity

ERROR

### Description

This message occurs when a Fibre Channel Protocol (FCP) HBA Host Bus Adapter (HBA) in this node has failed to read a critical setting from the adapter's internal configuration. The adapter should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Locate the FCP adapter in the slot specified in this message. Replace the adapter. If the adapter name starts with 0, the motherboard may need to be replaced. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fcp.sram.dump

### Severity

ERROR

### Description

This message occurs when a Fibre Channel Protocol (FCP) HBA Host Bus Adapter (HBA) in this node has recorded to disk a memory image from its Static Random Access Memory (SRAM). The SRAM dump has been performed as the result of several possible reasons, including a command directive and HBA firmware restart. Note that performing a dump of a HBA can disrupt data access operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If this event happens as a result of a command directive such as "fcp dump", the dump operation is expected. If this event happens as a result of HBA reset, the collected dump files can be used by technical support for subsequent analysis. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for FCP SRAM DUMP.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**portInstance** (INT): Instance number of the target port where the dump occurs.

**dumpDirName** (STRING): Directory location where the FC dumps are stored.

**portName** (STRING): FC HBA's name.

# callhome.fdisk events

## callhome.fdisk.admin

### Severity

NOTICE

### Description

This message occurs when you fail a file system disk drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for FILESYSTEM DISK ADMIN FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fdisk.fault

### Severity

ERROR

### Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fdisk.label

### Severity

ERROR

### Description

This message occurs when a disk drive fails due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp

technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for FILESYSTEM DISK BAD LABEL

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.fdisk.label.v**

### **Severity**

ERROR

### **Description**

This message occurs when a disk drive fails due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for FILESYSTEM DISK BAD LABEL VERSION

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.fdisk.missing**

### **Severity**

ERROR

### **Description**

This message occurs when the system detects that a disk drive is not in a loop or is missing. This might also occur when a failed disk drive is still in the chassis awaiting replacement. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for FILESYSTEM DISK MISSING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fdisk.noio

## Severity

ERROR

## Description

This message occurs when disk drive device commands to a file system disk drive are failing with link errors, adapter errors, or timeouts. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for FILESYSTEM DISK NOT RESPONDING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fdisk.shrank

## Severity

ERROR

## Description

This message occurs when an aggregate disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. After the automated e-mail is sent to you with the case# and instructions, the case is closed. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for FILESYSTEM DISK RAWSIZE SHRANK

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.flash events

## callhome.flash.cache.degraded

### Severity

ERROR

### Description

This message occurs when Flash Management Module (FMM) detects that a percentage of a Flash Cache is offline that is above a warning threshold. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

A Flash Cache has degraded. This is an indication or the cause of a performance degradation. Exact impact cannot be estimated. This Flash Cache needs to be repaired or replaced. Contact customer support for more details.

### Syslog Message

Call home for Flash Cache DEGRADED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.flash.cache.failed

### Severity

ALERT

### Description

This message occurs when Flash Management Module (FMM) detects that a Flash Cache has suffered a failure. Typically, this is the result of a hardware failure on the Flash Cache itself. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The Flash Cache can fail due to many reasons. If you see "iomem.dma.internal" in EMS log, reboot the system. If the state of the Flash Cache in system configuration shows 'Failed firmware', update the device (follow the corrective action of the "iomem.card.fail.fpga.rev" EMS message). For all other reasons, replace the Flash Cache. For further assistance, contact technical support.

### Syslog Message

Call home for Flash Cache FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.flash.cache.offlined

### Severity

ALERT

### Description

This message occurs when Flash Management Module (FMM) detects that a critical percentage of a Flash Cache is offline, beyond which the device cannot operate. FMM turned off this device. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

A Flash Cache was offlined. This is an indication or the cause of a performance degradation. Exact impact cannot be estimated. This Flash Cache needs to be repaired or replaced. Contact customer support for more details.

### Syslog Message

Call home for Flash Cache OFFLINED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.fs events

### callhome.fs.lun.resized

### Severity

ALERT

### Description

This message occurs when the system has detected that a filesystem logical disk array or LUN (Logical Unit Number) stored raw size no longer matches the reported physical size of the LUN. Resizing of a filesystem gateway LUN is not supported. Only gateway LUNs that are spare (not used in a filesystem) may be resized. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Restore the logical disk array or LUN raw size to the expected file system size that system expects. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for FILESYSTEM LUN RESIZED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.hainterconnect events

## callhome.hainterconnect.down

### Severity

ALERT

### Description

This message occurs when the high-availability (HA) interconnect is down. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Corrective action depends on the number and type of HA interconnect links supported by the platform, as well as the reason for which the interconnect is down. EMS event "ic.HAInterconnectDown" provides the reason information. a. If links are down: Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that the small form-factor pluggables (SFPs), if applicable, are seated properly on both controllers. For internally connected links, disable and reenabte the links one at a time by using the "ic link off" and "ic link on" commands. b. If links are disabled: Enable the links by using the "ic link on" command. c. If a peer is not connected: Disable and reenabte the links one at a time by using the "ic link off" and "ic link on" commands. Contact NetApp technical support if the problem persists.

### Syslog Message

Call home for %s due to %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**reason** (STRING): Reason for interconnect down.

# callhome.hba events

## callhome.hba.failed

### Severity

EMERGENCY

### Description

This message occurs when a HBA port is taken offline due to read-after-write verification errors. This AutoSupport message and associated EMS messages are issued once for a given port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Hardware components might need to be replaced. Contact NetApp technical support for assistance.

### Syslog Message

Call home for %s. Keep the adapter offline and contact NetApp technical support for assistance.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**adapterName** (STRING): Name of the adapter.

# callhome.hm events

## callhome.hm.alert.critical

### Severity

ALERT

### Description

This message occurs when an error is detected during the periodic health health monitoring of system health monitors. System health monitors create alerts for potential problems detected while monitoring the subsystem. The alerts contain information about probable cause along with recommended actions to rectify the problem. This message is generated after every polling interval if new alerts are detected during this interval. Polling interval is configurable. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run the "system health alert show" command to view details about new alerts in the system. Details of the alerts can be found in the AutoSupport. To correct the alert conditions, refer to the corrective actions described in the alert. Contact NetApp technical support for additional information.

### Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.hm.alert.major

### Severity

ALERT

### Description

This message occurs when an error is detected during the periodic health health monitoring of system health monitors. System health monitors create alerts for potential problems detected while monitoring the subsystem. The alerts contain information about probable cause along with recommended actions to rectify the problem. This message is generated after every polling interval if new alerts are detected during this interval. Polling interval is configurable. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run the "system health alert show" command to view details about new alerts in the system. Details of the alerts can be found in the AutoSupport. To correct the alert conditions, refer to the corrective actions described in the alert. Contact NetApp technical support for additional information.

## Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.hm.alert.minor

### Severity

ERROR

### Description

This message occurs when an error is detected during the periodic health monitoring of system health monitors. System health monitors create alerts for potential problems detected while monitoring the subsystem. The alerts contain information about probable cause along with recommended actions to rectify the problem. This message is generated after every polling interval if new alerts are detected during this interval. Polling interval is configurable. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run the "system health alert show" command to view details about new alerts in the system. Details of the alerts can be found in the AutoSupport. To correct the alert conditions, refer to the corrective actions described in the alert. Contact NetApp technical support for additional information.

## Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.hostport events

### callhome.hostport.bypass

### Severity

ALERT

### Description

This message occurs when an Embedded Switched Hub (ESH) bypasses a host port due to excessive errors on the port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Depending on your system configuration, you might need to replace the ESH Module or replace the Fibre Channel cable to the host port. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for HOST\_PORT\_FAIL - Bypassed by ESH

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.hostport.disable

## Severity

ALERT

## Description

This message occurs when an I/O Module (IOM) disables a host port due to excessive errors on the port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Depending on your system configuration, you might need to replace the IOM or ensure that a good cable is attached to the host port. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for HOST\_PORT\_FAIL - Disabled by IOM

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.hwaccel events

### callhome.hwaccel.reset

## Severity

NOTICE

## Description

This message occurs when the hardware accelerator is being reset and collects related diagnostic data concerning the device. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.ibretimerprog events

## callhome.ibretimerprog.fail

### Severity

EMERGENCY

### Description

This message occurs when InfiniBand (IB) retimer programming of the high-availability (HA) interconnect link failed after multiple retry attempts. The affected InfiniBand HA interconnect link is down. The failure can be due to any of the following reasons: InfiniBand device not found, GPIO read failure, QSFP register dump failure, QSFP parse failure, or retimer failure. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

This failure can be due to defective hardware or cabling. Contact NetApp technical support for further assistance.

### Syslog Message

Call home for INFINIBAND RETIMER PROGRAMMING FAILURE

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.invoke events

## callhome.invoke

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport® message, and the "type" of that message is set to "test". This message contains very little content and is intended for testing AutoSupport® end-to-end. When this message arrives at NetApp technical support, a confirmation email is sent to email destinations specified by the -to parameter. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate

destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.invoke.all

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport® message, and the "type" of that message is set to "all". For the benefit of technical support, the message also contains troubleshooting content, which might lengthen the collection time required. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

User triggered complete call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.invoke.remotesplog

### Severity

NOTICE

### Description

This message occurs when an administrator invokes an AutoSupport message on a node to collect the logs from the service processor of another node in the cluster. If the system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured destinations.

### Corrective Action

(None).

### Syslog Message

Call home (Remote SP LOG) for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.invoke.splog

### Severity

NOTICE

### Description

This message occurs when an administrator invokes an AutoSupport message for Service Processor (SP) log collection from ONTAP® CLI. If your system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured destinations.

### Corrective Action

(None).

### Syslog Message

Call home (SP LOG %s)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**for\_node\_id** (STRING): Node where the log is being collected (local or partner node).

## callhome.invoke.splog.full

### Severity

NOTICE

### Description

This message occurs when an administrator invokes an AutoSupport message for full Service Processor (SP) or baseboard management controller (BMC) log collection from ONTAP® CLI. If your system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured destinations.

### Corrective Action

(None).

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.iscsi events

## callhome.iscsi.hba.crash

### Severity

ALERT

### Description

This message occurs when the iSCSI host bus adapter (HBA) crashes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If the HBA is in use, reboot your system to reset the HBA and retrieve the crash-dump file. Contact NetApp technical support and provide the crash-dump file for support purposes.

## Syslog Message

Call home for ISCSI HBA CRASH

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.isp events

## callhome.isp.adapter.bad

### Deprecated

Deprecated as of ONTAP 9.2. Last used in R8.2.x.

### Severity

ERROR

### Description

This message occurs when the system detects multiple Static Random Access Memory (SRAM) parity errors within a 30 day period. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Replace the Fibre Channel adapter that is exhibiting subsequent parity errors to insure continued operations. Look for the "fci.adapter.parity:info" EMS message in the event log to identify the adapter that is encountering the SRAM parity error and needs to be replaced. You can also check the output of the "FC-

STATS" section in AutoSupport and look for the value of link state counter "adap\_sram\_parity\_error\_cnt" which will be more than one for the concerned adapter. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for SRAM PARITY ERRORS ON FIBRE CHANNEL ADAPTER - replace adapter

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.jpc events**

### **callhome.jpc.selection.fail**

#### **Severity**

ALERT

#### **Description**

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that the algorithm to reselect the Join Proposal Coordinator (JPC) is failing repeatedly. The JPC is reselected when the node that hosted the JPC goes out of quorum. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### **Corrective Action**

Call NetApp technical support immediately for further assistance.

#### **Syslog Message**

Call home for JOIN PROPOSAL COORDINATOR SELECTION FAILING.

#### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## **callhome.kernel events**

### **callhome.kernel.core**

#### **Deprecated**

Deprecated as of ONTAP 9.3. This event is replaced by the callhome.kernel.coreinfo event.

#### **Severity**

NOTICE

#### **Description**

This message occurs when you invoke an AutoSupport for kernel coredump files. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Kernel coredump callhome for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this coredump AutoSupport message.

**core\_filename** (STRING): Coredump filename to be included in the coredump AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.kernel.coreinfo

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport for kernel coredump files. It contains content relevant to userspace cores. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Kernel coredump callhome for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this coredump AutoSupport message.

**core\_filename** (STRING): Coredump filename to be included in the coredump AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

# callhome.link events

## callhome.link.change.stuck

### Severity

ALERT

### Description

This message occurs when a network port link state change cannot be confirmed for more than 5 minutes because another configuration task is still in progress. Network port states can change when the node reboots or is administratively changed by a system administrator. The affected port might still be operating in the state before the attempted change. While this condition exists, additional configuration changes or status queries will not be possible. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The link state change request will keep retrying until it succeeds. If the request does not succeed, it indicates that there is a configuration task that has not correctly completed and the node should be rebooted. For further assistance, contact NetApp technical support.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.management events

## callhome.management.log

### Severity

NOTICE

### Description

This message occurs when the MANAGEMENT\_LOG AutoSupport or 'call home' event is sent. This message occurs on a daily basis and is sent from clustered nodes only. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the node. If your node is configured to do so it generates and transmits an AutoSupport (or 'call home') to NetApp technical support and to the configured destinations on a daily basis. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for MANAGEMENT\_LOG

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.management.log.rotate

### Severity

NOTICE

### Description

This message occurs when the (MANAGEMENT\_LOG ROTATE) AutoSupport or 'call home' event is sent. This callhome message is a supplement to the daily callhome.management.log message. The callhome.management.log.rotate message occurs whenever a log file rotates due to size. This message avoids log information gaps when log files rotate. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the node. If your node is configured to do so it generates and transmits an AutoSupport (or 'call home') to NetApp technical support and to the configured destinations on a daily basis. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home %s for filename: %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**filename** (STRING): The name of the log file that rotated.

## callhome.mcc events

### callhome.mcc.auso.2min

### Severity

ALERT

### Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover operation has completed and the outage window was longer than 120 sec. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check why switchover was triggered by using the "event log show" command and search for event "mcc.auso.triggered". Use the "metrocluster operation show" command to view the details of the switchover operation. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multinode ASUP.

## callhome.mcc.auso.complete

### Severity

ALERT

### Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover operation has completed. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check why switchover was triggered by using the "event log show" command and search for event "mcc.auso.triggered". Use the "metrocluster operation show" command to view the details of the switchover operation. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multinode ASUP.

## callhome.mcc.auso.trig.fail

### Severity

EMERGENCY

### Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover trigger failed to initiate a switchover operation. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Verify the health of each node and that automatic unplanned switchover is enabled on both by using the "metrocluster node show" command. Use the "metrocluster switchover -forced-on-disaster true" command to switch over the DR-site storage manually. For further assistance, contact NetApp technical support.

## Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.mcc.auso.trig.shut**

### **Severity**

ALERT

### **Description**

This message occurs when automatic unplanned switchover (AUSO) in a MetroCluster(tm) IP configuration is triggered due to remote site shutdown.

### **Corrective Action**

Check the hardware conditions at the remote site for the cause of the environmental shutdown. Use the "metrocluster operation show" command to view the details the switchover operation. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Callhome for %s.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.mcc.clst.dm.wd.gvup**

### **Severity**

ALERT

### **Description**

This message occurs when the Cluster DM Watchdog thread has given up after retrying for over an hour. Cluster configuration replication services are affected and configuration updates might be lost. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Examine the event management system (EMS) logs for any related issues. Perform any provided corrective actions. For further assistance, contact NetApp technical support.

### **Syslog Message**

Call home for METROCLUSTER CLUSTER DM WATCHDOG GAVE UP

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.mcc.cluster\_dm.stream\_in\_error**

### **Severity**

ALERT

### **Description**

This message occurs when cluster-domain sender/receiver stream has an error. The stream type is indicated through the flag. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for METROCLUSTER CLUSTER\_DM SENDER/RECEIVER STREAM\_IN\_ERROR

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**stream** (STRING): Stream is sender or receiver.

**callhome.mcc.config.complete****Severity**

NOTICE

**Description**

This message occurs when the "metrocluster configure" operation is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for METROCLUSTER CONFIGURE COMPLETE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.mcc.fcvi.reset****Severity**

NOTICE

**Description**

This message occurs when fcvi adapter has been reset. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for METROCLUSTER FCVI RESET

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mcc.heal\_aggr.failed

### Severity

ALERT

### Description

This message occurs when metrocluster heal aggregates operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

### Syslog Message

Call home for METROCLUSTER HEAL\_AGGR FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.heal\_root.failed

### Severity

ALERT

### Description

This message occurs when metrocluster heal root-aggregates operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

### Syslog Message

Call home for METROCLUSTER HEAL\_ROOT FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.network.stats

### Severity

NOTICE

## Description

This message occurs when a MetroCluster over IP configuration detects network behavior change over the inter-cluster links (ISL) that connect sites. Diagnostic information is collected as part of this event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for %s. Number of times network changed since last callhome: %d.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**event\_count** (INT): Number of times network behavior change was flagged by the analysis engine since the last callhome message was sent.

## callhome.mcc.okm.sync.needed

### Severity

ALERT

## Description

This message occurs when clusters in a MetroCluster(tm) configuration have inconsistent Onboard Key Manager (OKM) data, including differing cluster passphrases or differing OKM hierarchies. The "security key-manager onboard sync" command should be run to prevent any failures in future switchover or switchback events. This message will be generated on both the local cluster and the peer cluster. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for METROCLUSTER OKM SYNC NEEDED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mcc.personality

### Severity

ALERT

## Description

This message occurs when the All-Flash Optimized node in a MetroCluster configuration detects that it has a different personality setting. This error can occur when a node loses its All-Flash Optimized setting. When this happens, the node may not function properly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination

and resolution.

### Corrective Action

A node configured with All-Flash Optimized personality recognizes only SSD disks and ignores hard disk drives(HDD). The personality is determined at boot time by checking the bootarg value "bootarg.init.flash\_optimized". If the intended configuration of the node is All-Flash Optimized, any HDDs need to be removed and the bootarg needs to be set to true using the "setenv bootarg.init.flash\_optimized true" command in maintenance mode. Otherwise, use the "unsetenv bootarg.init.flash\_optimized" command to support HDDs on the system.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mcc.sb.vetoed

### Severity

NOTICE

### Description

This message occurs when the system detects that a MetroCluster (tm) switchback operation has been vetoed, and creates an AutoSupport message for delivery to NetApp technical support for further analysis.

### Corrective Action

Enter "metrocluster operation show" to determine the failure reason and take appropriate corrective measures as indicated by the output of this command. Retry the operation following the corrective measure. If the failures persist, or you need further assistance, contact NetApp technical support

### Syslog Message

Call home for METROCLUSTER SWITCHBACK VETOED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Correlating tag value used in the AutoSupport message. Other cluster nodes that have detected related events may also have sent AutoSupport messages with this value to NetApp technical support.

## callhome.mcc.sbca

### Severity

NOTICE

### Description

This message occurs when metrocluster switchback continuation agent (SBCA) is run on the disaster site. This happens as part of the metrocluster switchback operation run on the surviving site. This ASUP provides troubleshooting information from the site which is being recovered (disaster hit). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for METROCLUSTER SWITCHBACK CONTINUATION AGENT

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

**callhome.mcc.so.vetoed****Severity**

NOTICE

**Description**

This message occurs when the system detects that a MetroCluster (tm) switchover operation has been vetoed, and creates an AutoSupport message for delivery to NetApp technical support for further analysis.

**Corrective Action**

Enter "metrocluster operation show" to determine the failure reason and take appropriate corrective measures as indicated by the output of this command. Retry the operation following the corrective measure. If the failures persist, or you need further assistance, contact NetApp technical support

**Syslog Message**

Call home for METROCLUSTER SWITCHOVER VETOED

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Correlating tag value used in the AutoSupport message. Other cluster nodes that have detected related events may also have sent AutoSupport messages with this value to NetApp technical support.

**callhome.mcc.switchback.complete****Severity**

NOTICE

**Description**

This message occurs when metrocluster switchback operation is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for METROCLUSTER SWITCHBACK COMPLETE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.switchback.failed

### Severity

EMERGENCY

### Description

This message occurs when metrocluster switchback operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

### Syslog Message

Call home for METROCLUSTER SWITCHBACK FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.switchover.2min

### Severity

NOTICE

### Description

This message occurs when MetroCluster(tm) switchover operation is complete and the client outage window has exceeded two minutes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.switchover.complete

### Severity

NOTICE

### Description

This message occurs when metrocluster switchover operation is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for METROCLUSTER SWITCHOVER COMPLETE

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mcc.switchover.failed

### Severity

EMERGENCY

### Description

This message occurs when metrocluster switchover operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

### Syslog Message

Call home for METROCLUSTER SWITCHOVER FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.mccip.events

### callhome.mccip.auso.disabled

### Severity

ALERT

## Description

This message occurs when automatic unplanned switchover (AUSO) in a MetroCluster(tm) IP configuration is disabled because the mediator mailbox disk is not healthy. If a site failure occurs, a manual switchover will be required to restore data access.

## Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that iSCSI connections to the mediator are up and healthy.

## Syslog Message

Callhome for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mccip.collectstats

### Severity

NOTICE

### Description

This message occurs when MetroCluster IP statistics are collected daily. TCP/IP networking statistics for diagnostic purposes are collected.

### Corrective Action

(None).

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mdb events

### callhome.mdb.recovery.unsuccessful

### Severity

EMERGENCY

### Description

This message occurs after an unsuccessful recovery of an inconsistent management database. The message is from the management processes identified by name in the auto-support subject line. The unsuccessful recovery results in the loss of all records contained in the 'job history' and 'rdb statistics' databases. Also, no additional records will be collected until the problem is resolved by NetApp technical support. The affected management process will function normally without these databases.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

Call home for %s WARNING.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.mhost events

## callhome.mhost.core

### Deprecated

Deprecated as of ONTAP 9.3. This event is replaced by the callhome.mhost.coreinfo event.

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport for userspace coredump files. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

## Syslog Message

User space coredump callhome for %s

## Parameters

**subject** (STRING): AutoSupport message subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this coredump AutoSupport message.

**core\_filename** (STRING): Coredump filename to be included in the coredump AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.mhost.coreinfo

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport for userspace coredump files. It contains content relevant to userspace cores. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport

message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

User space coredump callhome for %s

### Parameters

**subject** (STRING): AutoSupport message subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this coredump AutoSupport message.

**core\_filename** (STRING): Coredump filename to be included in the coredump AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

## callhome.micro events

### callhome.micro.core

#### Severity

NOTICE

#### Description

This message occurs when a "micro-core" file is available. A "micro-core" file is a very small and simple binary image representing some state of ONTAP® and can be collected and reported to support.

Transmission of a normal core file which can be several gigabytes or larger can take a significant time so isn't done. The subject line provides the filename of the micro- core file which is included as part of a special AutoSupport normally only sent to support. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Contact NetApp technical support.

#### Syslog Message

Call home for MICRO-CORE: %s

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.mlm events

## callhome.mlm.array.portOneController

### Severity

ALERT

### Description

This message occurs when all paths for an array LUN are connected to the same controller on the array. This configuration results in a single point of failure at the array. If an active-passive array is connected at the back end, then all the partner controller's paths go to the alternate controller, which results in a tug of war on mailbox I/O or other events that talk to the partner's array LUNs. If the system is running in Cluster-Mode, use the 'storage errors show' command to detect this error. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Reconfigure your back-end SAN so that array LUNs are presented from controllers in different fault domains on the target array. If you need further assistance, contact NetApp technical support.

### Syslog Message

Call home for ALL PATHS FOR THE ARRAY LUN ARE CONNECTED TO THE SAME CONTROLLER.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.mlm.lun.OnePath

### Severity

ALERT

### Description

This message occurs when the logical devices (LDEVs) on an array LUN or group of array LUNs are connected using only one path. A proper configuration requires the LDEVs to be connected to at least two paths; otherwise, there is the potential for data loss caused by a single path failure. If an array LUN is assigned, an EMS message is logged to the console at least once a day indicating that it is a single-path assigned array LUN. If the system is running in Cluster-Mode, use the 'storage errors show' command to identify the error. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Verify the configuration and identify the LDEVs that are connected to only one path. After you identify the LDEVs, change the system configuration to ensure that there are at least two paths to all these LDEVs. If you need further assistance, contact NetApp technical support.

### Syslog Message

Call home for ARRAY LUN CONNECTED USING ONLY ONE PATH.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.multi events

## callhome.multi.dsk.cksum.err

### Severity

EMERGENCY

### Description

This message occurs when checksum verification errors are seen on two or more disks connected to the same HBA port, and the port is not taken offline or the "disk.offline\_adapter.enable" option is disabled. This AutoSupport® message and associated EMS messages are issued once for a given port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for assistance with troubleshooting the reason for the write verification errors. Hardware components might need to be replaced.

### Syslog Message

Call home for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**adapterName** (STRING): Name of the adapter.

# callhome.ndo events

## callhome.ndo.cr.canceled

### Severity

NOTICE

### Description

This message occurs when the controller replacement operation has been canceled by the administrator. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

The controller replacement operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

### Syslog Message

(None).

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ndo.cr.complete****Severity**

NOTICE

**Description**

This message occurs when the controller replacement operation has been completed successfully in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for CONTROLLER REPLACEMENT COMPLETE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ndo.cr.dryrun.done****Severity**

NOTICE

**Description**

This message occurs when the dry run of the controller replacement operation has completed for the HA pair. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for CONTROLLER REPLACEMENT DRY RUN COMPLETE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ndo.cr.nso.canceled****Severity**

NOTICE

**Description**

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been canceled. If your system is configured to do so, it generates and

transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

The controller replacement NSO operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

### **Syslog Message**

(None).

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ndo.cr.nso.complete**

### **Severity**

NOTICE

### **Description**

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been completed successfully. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

(None).

### **Syslog Message**

Call home for CONTROLLER REPLACEMENT NSO COMPLETE

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ndo.cr.nso.mccip.canceled**

### **Severity**

NOTICE

### **Description**

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been canceled. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

The controller replacement NSO-MCCIP operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ndo.cr.nso.mccip.complete

## Severity

NOTICE

## Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been completed successfully. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for CONTROLLER REPLACEMENT NSO-MCCIP COMPLETE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ndo.cr.nso.mccip.paused.err

## Severity

ALERT

## Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been paused due to an error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

The controller replacement (NSO-MCCIP) operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ndo.cr.nso.mccip.started**

### **Severity**

NOTICE

### **Description**

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been started. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

The controller replacement NSO-MCCIP operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

### **Syslog Message**

(None).

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ndo.cr.nso.paused.err**

### **Severity**

ALERT

### **Description**

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been paused due to an error. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

The controller replacement (NSO) operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

### **Syslog Message**

(None).

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ndo.cr.nso.started**

### **Severity**

NOTICE

## Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been started. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

The controller replacement NSO operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ndo.cr.paused.err

### Severity

ALERT

## Description

This message occurs when the controller replacement operation has been paused due to an error in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

The controller replacement operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ndo.cr.started

### Severity

NOTICE

## Description

This message occurs when the controller replacement operation has started in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

The controller replacement operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

### **Syslog Message**

(None).

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.netif events**

### **callhome.netif.fatal.error**

#### **Severity**

ERROR

#### **Description**

This message occurs when Network Interface Card encountered a fatal error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### **Corrective Action**

Check for the following EMS message in the EMS log that has the EMS event name "netif.fatal.err". For example: "...netif.fatal.err:crit]: The network device in slot 1 Encountered Fatal Error" The netif.fatal.err EMS message provides the slot number of the NIC device which encountered fatal error. If you need assistance, contact NetApp technical support

#### **Syslog Message**

Call home for NETWORK INTERFACE CARD FATAL ERROR.

#### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

### **callhome.netif.init.failed**

#### **Severity**

ALERT

#### **Description**

This message occurs when initialization of a network interface failed due to an unexpected software error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### **Corrective Action**

Review the cabling and network configuration. Collect faulty NIC statistics. If you need assistance, contact NetApp technical support

## Syslog Message

Call home for NETWORK INTERFACE INITIALIZATION FAILURE, port %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.netif.uncorEccError

## Severity

ALERT

## Description

This message occurs when a network interface controller encountered an unrecoverable ECC error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Review the cabling and network configuration. Replace the faulty NIC device. If you need assistance, contact NetApp technical support

## Syslog Message

Call home for NETWORK INTERFACE UNRECOVERABLE ECC ERROR, port %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.netinet events

### callhome.netinet.dup.clustIP

## Severity

EMERGENCY

## Description

This message occurs when a new node that is trying to join the cluster is using the same IP address that is configured on this node's cluster interface. This can prevent data from being served to clients and potentially bring down the entire cluster. This event generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Use the Ethernet (MAC) address with the "network port show -mac <mac>" command to find network port. Use "network interface show -curr-port <port>" command to identify the cluster interface that is configured with the duplicate IP address. Remove the LIF on the cluster interface of the new node in the cluster network by using the **net int delete -vserver <vserver\_name > -lif <lif\_name** command. After removing the LIF, assign a new, unique IP address to the cluster interface.

## Syslog Message

Call home for DUPLICATE CLUSTER IP.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**ipaddr** (STRING): Duplicate IP address that was detected on the cluster network.

**ethaddr** (STRING): Ethernet (MAC) address that uniquely identifies the node configured with the duplicate IP address.

# callhome.nht events

## callhome.nht.data

### Severity

NOTICE

### Description

This message occurs when the weekly AutoSupport or 'call home' event is sent for any drive NHT data. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for DRIVE NHT DATA

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.no events

## callhome.no.inodes

### Severity

ERROR

### Description

This message occurs when a volume is out of inodes, which refer to individual files, other types of files, and directories. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Modify the volume's maxfiles (maximum number of files) to increase the inodes on the affected volume. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for OUT OF INODES

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.nse events

## callhome.nse.ak.check.failed

### Severity

EMERGENCY

### Description

This message occurs when the node's key-management database lacks authentication keys (AKs) needed by self-encrypting drives that are owned by the node. The affected drives can be FIPS-certified drives (variously called FIPS drives, NetApp Storage Encryption drives, and NSE drives) or non-FIPS-certified self-encrypting drives (SEDs). A FIPS drive or SED is at risk of permanent data loss if authentication fails repeatedly after it is power-cycled. When FIPS keys are missing, operations such as encrypting sanitize and firmware download might also not succeed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Display the available keyIDs for encrypting drives using the "security key-manager key query -key-type NSE-AK" command; ONTAP uses these values for all its encrypting drives, whether FIPS/NSE drives or SEDs. Display keyIDs that the drives need using the command "storage encryption disk show", and for FIPS drives, "storage encryption disk show -fips". Each keyID in the disk lists must be present in the key-manager output, except for the default "0x0" (MSID) and "" (null) keyIDs that are not maintained by the key management system. Contact NetApp technical support for assistance. Avoid drive power-cycles and AK modifications until the issue is corrected.

### Syslog Message

Call home for %s, disk "%s".

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**disk** (STRING): Name of the first affected drive detected.

# callhome.nvdimm events

## callhome.nvdimm.cecc

### Severity

ERROR

### Description

This event occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVDIMM. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Use the "system environment sensors show -hidden true" clustershell command to view the NVDIMM sensors values. Contact NetApp technical support for further assistance.

### **Syslog Message**

Call home for %s.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.nvdimm.failure**

### **Severity**

EMERGENCY

### **Description**

This event occurs when the NVDIMM card has experienced a critical hardware failure. The system may shut down to avoid potential data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Use the following clustershell commands to get more information about the failure: 1. "event log show -node localhost -event nvdimm\*" 2. "system fru-check show -node localhost -ftype nvdimm -instance" Contact NetApp technical support to replace the NVDIMM module.

### **Syslog Message**

Call home for %s.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.nve events**

### **callhome.nve.digest.mismatch**

### **Severity**

EMERGENCY

### **Description**

This message occurs when the digest of an NetApp Volume Encryption (NVE) or NetApp Aggregate Encryption (NAE) key being restored does not match the expected key digest. Because the key being restored is not the same key expected by the system, the volume associated with the NVE or NAE key will not be able to be onlined, resulting in data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Call home for %s. key ID: %s, Key Server: %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**keyId** (STRING): Key ID of the key being restored that had the digest mismatch.

**keyServer** (STRING): Address or name of the key server from which the key is being restored.

## callhome.nvme events

### callhome.nvme.exhausted

#### Severity

ALERT

#### Description

This message occurs when a directly attached NVMe module has worn out and is at the end of its write life. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Contact technical support for assistance with possible replacement of the module.

#### Syslog Message

Callhome for %s.

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**serial** (STRING): Serial number of the NVMe device.

**model** (STRING): Model number of the NVMe device.

**slot\_subslot** (STRING): PCI slot/subslot of the NVMe device.

### callhome.nvme.offline

#### Severity

ALERT

#### Description

This message occurs when a directly attached NVMe module goes offline. When a module goes offline, it has either had a critical failure or is no longer reliable. In either case, the card is no longer functioning properly and was taken offline. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact technical support for assistance with possible replacement of the module.

### Syslog Message

Callhome for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**serial** (STRING): Serial number of the NVMe device.

**model** (STRING): Model number of the NVMe device.

**slot\_subslot** (STRING): PCI slot/subslot of the NVMe device.

**code** (LONGINTEX): Bit-encoded error that caused the event.

## callhome.nvmem events

### callhome.nvmem.volt.hi

#### Severity

ALERT

#### Description

This message occurs when the sensor for the Non-Volatile memory (NVMEM) card lithium battery has an excessively high voltage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

First, correct any environmental or battery problems. If the problem continues, replace the controller module. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for NVMEM VOLTAGE HIGH

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.nvmem.volt.lo

#### Severity

ALERT

#### Description

This message occurs when the sensor for the Non-Volatile memory (NVMEM) card lithium battery has an excessively low voltage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

First, correct any environmental or battery problems. If the problem continues, replace the controller module. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for NVMEM VOLTAGE LOW

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.nvram events

## callhome.nvram.cecc

### Severity

ERROR

### Description

This message occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVRAM complex. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "system environment sensors show -hidden true" cluster shell command to view the current "NV Correctable ECC count" and "NV Correctable ECC rate" values. Contact NetApp technical support for further assistance.

## Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.nvram.failure

### Severity

EMERGENCY

### Description

This message occurs when the NVRAM card has experienced a critical hardware failure. The system will shut down to avoid potential data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support to replace the NVRAM card.

## Syslog Message

Call home for NVRAM FAILURE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.nvram.iofs.fail

### Severity

ERROR

### Description

This message occurs in a FireStorm instance when a read or write to its nonvolatile memory (NVRAM) device fails. The instance will panic. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Restart the FireStorm instance. If the issue persists, contact NetApp technical support.

### Syslog Message

Call home for NVRAM failure at %s, I/O type %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**io\_type** (STRING): Type of failed operation (read or write).

**tag** (STRING): Supplemental event identifier.

**error** (LONGINT): I/O error code.

## callhome.nvram.openfs.fail

### Severity

ERROR

### Description

This message occurs when a FireStorm instance is unable to open its nonvolatile memory (NVRAM) device. The instance will panic.

### Corrective Action

Restart the instance. If the issue persists, contact NetApp technical support.

### Syslog Message

Call home for open failure at %s on NVRAM file %s, error %d.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**nvram\_backing** (STRING): Name of the NVRAM backing file.

**fileio\_error** (LONGINT): Open error code.

## callhome.okm events

### callhome.okm.sync.needed

### Severity

ALERT

## Description

This message occurs when the cluster has reached an inconsistent state with respect to the onboard key hierarchy. This is an alert that the "security key-manager onboard sync" command should be run on the local cluster to prevent any future usage failures with onboard key management. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to Netapp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for CLUSTER OKM SYNC NEEDED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.ondemand events

## callhome.ondemand.invoke

## Severity

NOTICE

## Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type TEST. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect only the information necessary to understand the configuration of the system and quickly deliver it. For this reason, the data collection is bounded by time taken to collect data and quantity of data collected. With less data collected, delivery over the internet is expected to be faster. The overall process from remote activation to delivery should be measurable in minutes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

## callhome.ondemand.invoke.all

### Severity

NOTICE

### Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type ALL. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect more data to aid in problem resolution. The collection is bounded by time and size limits but these are much larger as compared to most other AutoSupport messages. Collecting a larger amount of AutoSupport data can help support personnel diagnose difficult problems. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

## callhome.ondemand.perf.snap

### Severity

NOTICE

### Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type PERFORMANCE. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect statistics and other information to aid in understanding operations and other usage analysis related to networking, storage, memory and processor. This analysis might result in recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

# callhome.partner events

## callhome.partner.down

### Severity

EMERGENCY

### Description

This message occurs when the storage failover partner is down and takeover cannot begin. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Call home for PARTNER DOWN, TAKEOVER IMPOSSIBLE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.performance events

## callhome.performance.archive

### Severity

NOTICE

### Description

This message occurs when you invoke an AutoSupport for performance archives. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Performance archive callhome for %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If 0 then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**case\_number** (STRING): Case number to be associated with this performance archive AutoSupport message.

**temp\_tar\_path** (STRING): Tared performance archives to be included in this performance archive AutoSupport message.

**aod\_initiated** (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

**aod\_req\_id** (STRING): AOD request ID

## callhome.performance.data

### Severity

NOTICE

### Description

This message occurs when the weekly AutoSupport or 'call home' event is sent for performance data. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for PERFORMANCE DATA

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.performance.snap

### Severity

NOTICE

### Description

This message occurs some minutes after a reboot or storage takeover operation occurs so that performance information can be sent. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations.

Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for PERFORMANCE SNAPSHOT

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**URI** (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.

**force** (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.

**sequence** (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

## callhome.pool events

### callhome.pool.aggr.noncomp

#### Severity

ALERT

#### Description

This message occurs when an aggregate does not comply with the current Capacity Pool entitlement, as determined by the Licensing Manager. In an HA configuration, noncompliant aggregates are prevented from being sent home during an HA takeover/giveback situation. In a non-HA configuration, these aggregates cannot be brought online if they are already offline. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Use the "system license license-manager check" command to determine whether the License Manager is accessible. Use the "system license show-aggregates -compliant false" command to find all aggregates that do not comply. From the web interface of the ONTAP® Select Deploy® instance, check the Capacity Pool licensing status, and ensure that sufficient capacity remains within the capacity pool used by this instance of ONTAP. If the capacity is insufficient, reduce the usage by instances of ONTAP that use the pool (for example, by deleting aggregates). If no reduction is possible, Contact NetApp technical support..

#### Syslog Message

Call home for %s.

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.raid events

## callhome.raid.adp.disabled

### Severity

NOTICE

### Description

This message occurs when auto-partitioning for root aggregate creation is disabled on a system. When auto-partitioning is disabled, the root aggregate is created on whole disks. Systems with a root aggregate on partitioned disks can devote more space to non-root aggregates than systems with a root aggregate on whole disks. If this message occurs after root aggregate creation, then further partitioning of the disks is disabled.

### Corrective Action

If the system is already initialized with root aggregate on partitioned disks, ONTAP will try to re-enable auto-partitioning after the system boots up and the root aggregate is online. The event `raid.autoPart.enabled` will be logged when auto-partitioning is re-enabled. To create a root aggregate on partitioned disks: 1. Halt the controller. 2. Replace any failed internal disks (see the "reason" field in the EMS message). 3. Reboot the controller. 4. Re-initialize the system. If this message is seen after the system initialization and the root aggregate is already created on partitioned disks, then the system will continue to function, as follows: 1. Expansion of existing aggregates created from partitioned disks may not work. 2. If a disk fails in a RAID group created out of partitioned disks, then a spare will fail to be partitioned and disk reconstruction will not start. 3. If a disk is marked for predictive failure in a RAID group created out of partitioned disks, then a spare will fail to be partitioned and the sick disk copy will not start. 4. If disks are available, then manually partition the disks and keep them as spares. 5. If you were previously directed to disable ADP by NetApp technical support, reach out to NetApp technical support to re-enable ADP.

### Syslog Message

Disk auto-partitioning is disabled on this system: %s.

### Parameters

**subject** (STRING): Reason that auto-partitioning was disabled.

## callhome.raid.no.recover

### Severity

EMERGENCY

### Description

This message occurs when too many errors have been detected by the RAID (Redundant Array of Inexpensive Disks) software protection and recovery is not possible. The detected errors could be related to checksum calculations, lost write detection and on disk medium errors in combinations with disk and NVRAM failures. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Immediately contact NetApp technical support for assistance to help diagnose the failures. If the diagnosis points to malfunctioning hardware components, these should be replaced.

## Syslog Message

Call home for RAID DETECTED UNRECOVERABLE ERRORS

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.raid.over.max

## Severity

ALERT

## Description

This message occurs when the maximum raw capacity of the file system (aggregate or RAID file system) is reached for this software release. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

Call home for Exceeded maximum raw capacity

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.raidtree events

### callhome.raidtree.assim

## Severity

EMERGENCY

## Description

This message occurs when an aggregate experiences a configuration corruption error during assimilation of aggregate structures. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

Call home for RAIDTREE ASSIMILATION FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.reboot events

## callhome.reboot

### Severity

NOTICE

### Description

This message occurs after an appliance reboot—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If reboots continue to occur, contact NetApp technical support.

### Syslog Message

Call home for REBOOT

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.agentwatchdog

### Severity

ALERT

### Description

This message occurs when the system experiences an internal hardware watchdog timer reset. The system reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If you continue to experience watchdog timer resets, contact NetApp technical support.

### Syslog Message

Call home for REBOOT (agent watchdog reset).

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.fw

### Severity

NOTICE

### Description

This message occurs when the appliance reboots after loading firmware—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for REBOOT (after entering firmware)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.reboot.giveback****Severity**

NOTICE

**Description**

This message occurs when the node boots to normal operations because of a successful storage giveback from the partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for REBOOT (after giveback)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.reboot.glitch****Severity**

NOTICE

**Description**

This message occurs when the appliance halts and reboots due to problems with inconsistent power. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

If you continue to experience 'power glitch' reboots, contact NetApp technical support.

**Syslog Message**

Call home for REBOOT (power glitch)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.reboot.halt****Severity**

NOTICE

**Description**

This message occurs when the appliance reboots after you use the 'halt' command to shut it down. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for REBOOT (halt command)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.reboot.ioxm.removal****Severity**

NOTICE

**Description**

This message occurs when the appliance halts and reboots due to the removal of the IOXM without powering down the appliance first. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Do not remove the IOXM without powering down the appliance first.

**Syslog Message**

Call home for REBOOT (IOXM removal)

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.reboot.panic****Severity**

ALERT

## Description

This message occurs when the appliance reboots after a panic (also known as a 'system crash'). The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

Call home for REBOOT (panic)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.poweron

### Severity

NOTICE

## Description

This message occurs when the appliance reboots when it is powered on. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you continue to experience 'power on' reboots, contact NetApp technical support.

## Syslog Message

Call home for REBOOT (power on)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.reboot

### Severity

NOTICE

## Description

This message occurs when you reboot the appliance with the 'reboot' command. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for REBOOT (reboot command)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.sk.halt

## Severity

NOTICE

## Description

This message occurs when the system is halted automatically to prevent damage or possible loss of data. The system reports this event after the reboot is complete. An internal halt might be caused by one of the following reasons: 1. If a disk drive fails and there are no available spares, the system enters degraded mode. The appliance halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If a spare disk drive becomes available while the system is running in degraded mode, the system immediately begins rebuilding the failed disk drive. 2. The system also halts automatically if the environmental conditions, such as temperature or power, are not within the safe operating limits or are inadequate to prevent possible damage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you continue to experience 'internal halt' reboots, contact NetApp technical support.

## Syslog Message

Call home for REBOOT (internal halt)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.sk.reboot

## Severity

NOTICE

## Description

This message occurs when you halt, reset, or turn off power to the appliance without completing an orderly halt or shutdown sequence before rebooting. The appliance reports this event after the reboot is complete. To keep your data safe, always use the 'halt' command to halt the appliance, and then wait for an orderly halt or shutdown to be complete before you power down the appliance or perform any hardware maintenance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you continue to experience 'internal reboot' reboots, contact NetApp technical support.

## Syslog Message

Call home for REBOOT (internal reboot)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.sp.rst

## Severity

NOTICE

## Description

This message occurs when the appliance reboots when it has been reset through the Service Processor (SP) 'system reset' command. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

(None).

## Syslog Message

Call home for REBOOT (sp system reset)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.takeover

## Severity

NOTICE

## Description

This message occurs when the partner appliance storage is taken over successfully by this appliance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for PARTNER REBOOT (CONTROLLER TAKEOVER)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.takeover.p

## Severity

NOTICE

## Description

This message occurs when the partner appliance storage is taken over successfully by this appliance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for PARTNER REBOOT (CONTROLLER TAKEOVER ON PANIC)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.unknown

### Severity

NOTICE

## Description

This message occurs after an appliance reboot—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If reboots continue to occur, contact NetApp technical support.

## Syslog Message

Call home for REBOOT

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.reboot.watchdog

### Severity

ALERT

## Description

This message occurs when the appliance experiences an internal hardware watchdog timer reset. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If you continue to experience watchdog timer resets, contact NetApp technical support.

## Syslog Message

Call home for REBOOT (watchdog reset)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.rnode events

## callhome.rnode.splog

### Severity

NOTICE

### Description

This messages occurs when a new set of log files has been collected from a Service Processor (SP) of one or more non-operational nodes in the cluster. When an abnormal node reboot is detected by its SP, log files are created. When this node is operational again, the SP log files are collected and included in subsequent AutoSupport messages sent by the node. In cases where nodes cannot return to operation immediately, the SP's log files are collected by another node in the cluster and sent via this AutoSupport message. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

## Syslog Message

Call home for REMOTE NODE SP LOG %s %s %s %s %s %s %s %s %s %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**node1\_down\_fn** (STRING): Node-specific filename for the downfiler splog from the first node. If NULL is specified, this downfiler splog is not available.

**node1\_latest\_fn** (STRING): Node-specific filename for the latest splog from the first node.

**node2\_down\_fn** (STRING): Node-specific filename for the downfiler splog from the second node. If NULL is specified, this downfiler splog is not available.

**node2\_latest\_fn** (STRING): Node-specific filename for the latest splog from the second node.

**node3\_down\_fn** (STRING): Node-specific filename for the downfiler splog from the third node. If NULL is specified, this downfiler splog is not available.

**node3\_latest\_fn** (STRING): Node-specific filename for the latest splog from the third node.

**node4\_down\_fn** (STRING): Node-specific filename for the downfiler splog from the fourth node. If NULL is specified, this downfiler splog is not available.

**node4\_latest\_fn** (STRING): Node-specific filename for the latest splog from the fourth node.

**node5\_down\_fn** (STRING): Node-specific filename for the downfiler splog from the fifth node. If NULL is specified, this downfiler splog is not available.

**node5\_latest\_fn** (STRING): Node-specific filename for the latest splog from the fifth node.

# callhome.root events

## callhome.root.vol.recovery.reqd

### Severity

EMERGENCY

### Description

This message occurs when the root volume is not working properly and its recovery is required. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support to obtain the root volume recovery procedures and further assistance.

### Syslog Message

Call home for ROOT VOLUME NOT WORKING PROPERLY: RECOVERY REQUIRED.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.rtc events

### callhome.rtc.battery.low

### Severity

ERROR

### Description

This message occurs when the voltage for the Real-Time Clock (RTC) battery is low. The message is repeated once every hour until you replace the battery. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Replace the RTC battery as soon as possible. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for RTC BATTERY LOW

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sas events

### callhome.sas.init.failed

### Severity

ERROR

## Description

This message occurs when the SAS adapter fails to initialize the link. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp Global Services and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

If the adapter is in use, check cabling and connected equipment. If the adapter is connected to storage shelves, check connected I/O modules (IOM).

## Syslog Message

Callhome for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**adapterName** (STRING): Name of the associated SAS host bus adapter.

# callhome.sb events

## callhome.sb.pp.fcp.failo.err

### Severity

ERROR

### Description

This message occurs when the persistent port feature is not working during non-disruptive operations (NDO) such as takeover or giveback due to configuration errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sb.pp.fcp.init.err

### Severity

ERROR

### Description

This message occurs when persistent port object for a SAN FCP LIF fails to be configured during a LIF create operation. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sblade events

### callhome.sblade.import.susp

**Severity**

ERROR

**Description**

This message occurs when LUN import cannot resume after takeover/giveback. All LUN import sessions have been suspended. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Call home for LUN IMPORT SESSIONS SUSPENDED

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multinode AutoSupport.

### callhome.sblade.lif.init

**Severity**

NOTICE

**Description**

This message occurs during Vserver initialization when partially initialized volumes do not complete initialization within the specified maximum timeout value. On timer expiration the Vserver data LIFs are brought online regardless of the volume initialization status. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for SCSIBLADE LIF INIT TIMEOUT

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sblade.lu.resync.to****Severity**

EMERGENCY

**Description**

This message occurs when the SCSI target internal resynchronization of a LUN times out. This LUN is unavailable until one or more nodes that could not complete the internal resynchronization are taken over and given back or rebooted. If your system is configured to do so, it generates and transmits an AutoSupport® (or "call home") message. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Call NetApp technical support for further assistance.

**Syslog Message**

Call home for SCSIBLADE LU RESYNC TIMEOUT

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sblade.lu.rst.hung****Severity**

EMERGENCY

**Description**

This message occurs when the SCSI target cannot complete an internal reset of a LUN. This LUN is unavailable until one or more nodes that could not complete the internal reset are taken over and given back or rebooted. If your system is configured to do so, it generates and transmits an AutoSupport® (or "call home") message. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Call NetApp technical support for further assistance.

**Syslog Message**

Call home for SCSIBLADE LU INTERNAL RESET HUNG

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sblade.mgmt.wedged****Severity**

EMERGENCY

## Description

This message occurs when the SAN management plane encounters an error that prevents further SAN management commands from being processed. This usually means that all the threads of one (or more) of the SAN management plane modules are stuck. SAN configuration changes on this node and other nodes in the cluster will fail with timeout errors until corrected. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Call NetApp technical support immediately for further assistance.

## Syslog Message

Call home for SCSIBLADE MGMT WEDGED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sblade.prop.fail

## Severity

EMERGENCY

## Description

This message occurs when an internal SAN management command fails. SAN management commands is not able to be completed for the Vserver which fails until the node is rebooted. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Refer to Knowledgebase article: 2017459 for recovery instructions.

## Syslog Message

Call home for SCSIBLADE PROPOSAL FAIL

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sblade.unavailable

## Severity

ERROR

## Description

This message occurs when the node has lost connectivity with the majority of the cluster and is unable to recover automatically. When this occurs both FCP and iSCSI traffic have been disabled on this node. Manual recovery is required to come back into service. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Reboot the node, and if the node is waiting for giveback then perform a giveback.

**Syslog Message**

Call home for SCSIBLADE SERVICE UNAVAILABLE

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sblade.vol.ev.lost****Severity**

ERROR

**Description**

This message occurs when LUNs (Logical Unit Numbers) in a volume are not accessible on all paths. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Call NetApp technical support for further assistance.

**Syslog Message**

Call home for SCSIBLADE VOLUME EVENT LOST

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

**callhome.sblade.vs.op.tt****Severity**

ERROR

**Description**

This message occurs when a management command or other internal operation takes too long for a LUN (Logical Unit Number). When this situation occurs, the corresponding Vserver cannot handle any other management changes for the LUN until this condition no longer persists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Call NetApp technical support immediately for further assistance.

**Syslog Message**

Call home for SCSIBLADE VSERVER OPERATION TIMEOUT

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi node ASUP.

## callhome.scsi events

### callhome.scsi.tgt.misconfig

#### Severity

ERROR

#### Description

This message occurs when a LUN (Logical Unit Number) mapping or igroup type misconfiguration has been detected when the cluster interconnect has transitioned from down to up. The detected misconfiguration problems will typically include cases of having a LUN on each storage controller mapped to the same LUN for the same initiator. When the cluster interconnect is down, LUN mapping changes are prevented unless overridden. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Run the "lun config\_check" command which will list out the problems that caused this event and resolve this problem list. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for FILER SCSI TARGET MISCONFIGURED

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sdisk events

### callhome.sdisk.admin

#### Severity

NOTICE

#### Description

This message occurs when you fail a hot spare disk drive.

#### Corrective Action

(None).

#### Syslog Message

Call home for SPARE DISK ADMIN REMOVED

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.sdisk.fault

**Severity**

ERROR

**Description**

This message occurs when a spare disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sdisk.label****Severity**

ERROR

**Description**

This message occurs when a disk drive fails due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for SPARE DISK BAD LABEL

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sdisk.label.v****Severity**

ERROR

**Description**

This message occurs when a disk drive fails due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for SPARE DISK BAD LABEL VERSION

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sdisk.missing****Severity**

ERROR

**Description**

This message occurs when the system detects that a spare disk drive is not in a loop or is missing. This might also be due to a failed disk drive that is still in the chassis awaiting replacement. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for SPARE DISK MISSING

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sdisk.noio****Severity**

ERROR

**Description**

This message occurs when disk drive device commands to a hot spare disk drive are failing with link errors, adapter errors, or timeouts. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for SPARE DISK NOT RESPONDING

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sdisk.shrank

### Severity

ERROR

### Description

This message occurs when a hot spare disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SPARE DISK RAWSIZE SHRANK

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ses events

### callhome.ses.drive.missing

### Severity

ERROR

### Description

This message occurs when the storage adapter detects a disk on the Fibre Channel loop or the SCSI bus, but enclosure services in the disk shelf does not report a disk with that address. This error indicates that the disk took an address other than what the disk shelf should have provided, or that enclosure services in the disk shelf cannot be contacted for address information. (Note: If the message "ses.drive.possShelfAddr" subsequently appears, follow the corrective actions in that message.) In this condition, the SCSI Enclosure Services (SES) process in the system might be unable to perform certain operations on the disk, such as setting failure LEDs or detecting disk swaps. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If the disk is not part of an active aggregate or volume, pull out the disk and push it back into the slot to ensure that the disk is in place. If the problem persists, insert a spare disk into the slot. If the problem is then gone, replace the original disk with the spare one. If the problem occurs to multiple disks on the same loop, check the I/O modules at the back of the disk shelves on that loop for errors.

### Syslog Message

Call home for SES: DRIVE MISSING

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**ChannelName** (STRING): Channel the disk shelf is on.

**LoopIds** (STRING): Loop or SCSI IDs of the missing disks.

## callhome.sfo events

### callhome.sfo.downrev

#### Severity

ERROR

#### Description

This message occurs when the appliance software boots and detects out-of-date motherboard firmware, which can cause serious issues. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Upgrade the motherboard open firmware (OFW) version to the recommended version for this software and appliance as soon as possible. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for HA GROUP DOWNREV BOOT FIRMWARE

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.sfo.giveback

#### Severity

NOTICE

#### Description

This message occurs when this appliance successfully completed a giveback of the storage to its partner appliance. The partner appliance is expected to be performing normal operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

(None).

#### Syslog Message

Call home for CONTROLLER GIVEBACK COMPLETE

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

### callhome.sfo.miscount

**Severity**

ERROR

**Description**

This message occurs when each partner in the High Availability (HA) storage configuration detects a different number of disk drives than its partner. This error is typically transient, and can occur for the following reasons: 1) A disk drive failed. 2) A disk drive was replaced. 3) One or more disk drives were added. The problem is usually corrected automatically within 60 seconds, requiring no action from you. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

If the problem persists, check the cabling on or reseal any replaced or added disk drives, and check for failed disk drives. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for HA GROUP ERROR: DISK/SHELF COUNT MISMATCH

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.sfo.personality****Severity**

ALERT

**Description**

This message occurs when an All Flash Optimized node in a high-availability (HA) configuration detects its partner having a different personality setting. This mismatch might be due to either one node not being configured as All Flash Optimized, or the nodes being configured for different personalities (performance optimized or capacity optimized). Storage failover might be at risk of not functioning properly. HDDs taken over during failover events might not be able to serve data. If your system is configured to do so, it generates and transmits an AutoSupport® (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

An All-Flash Optimized node only recognizes SSDs and ignores HDDs. For the HA pair to be considered All-Flash Optimized, both nodes must be configured with the same personality (performance optimized or capacity optimized). Use the "system node show -instance" command to display each node's personality and optimization settings. If both nodes are configured with the same personality, all HDDs should be removed from the HA pair, because they will not be able to serve data. Contact NetApp technical support for assistance.

**Syslog Message**

Call home for %s

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sfo.takeover

### Severity

ALERT

### Description

This message occurs when automatic takeover of the cluster partner is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Address the issue that caused the takeover, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sfo.takeover.failed

### Severity

ALERT

### Description

This message occurs when automatic takeover of the cluster partner is not successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Determine why the takeover did not succeed. Restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for CONTROLLER TAKEOVER FAILED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sfo.takeover.halt

### Severity

NOTICE

### Description

This message occurs when takeover of the HA partner is successful. The takeover occurred because of an administrative halt on the HA partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and

resolution.

### **Corrective Action**

Address the issue that caused you to halt the HA partner and then restore it to normal operations. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CONTROLLER TAKEOVER COMPLETE HALT

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.sfo.takeover.m**

### **Severity**

NOTICE

### **Description**

This message occurs when manual takeover of the cluster partner is successful.

### **Corrective Action**

Address the issue that caused you to take over the cluster partner manually, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CONTROLLER TAKEOVER COMPLETE MANUAL

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.sfo.takeover.m.dr**

### **Severity**

ERROR

### **Description**

This message occurs when manual takeover of the High Availability (HA) partner for disaster recovery (DR) is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Address the issue that required you to perform a DR takeover of the HA partner. After the issue is resolved, restore the HA partner to normal operations. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CONTROLLER TAKEOVER COMPLETE MANUAL(DR)

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.sfo.takeover.panic**

### **Severity**

EMERGENCY

### **Description**

This message occurs when automatic takeover of the HA partner is successful. The controller takeover occurred because of a HA partner software failure or panic.

### **Corrective Action**

Address the cause of the cluster partner software failure or panic, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CONTROLLER TAKEOVER COMPLETE PANIC

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.sfo.takeover.reboot**

### **Severity**

NOTICE

### **Description**

This message occurs when takeover of the HA partner is successful. The takeover occurred because of an administrative reboot on the HA partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Address the issue that caused you to reboot the HA partner and then restore it to normal operations. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for CONTROLLER TAKEOVER COMPLETE REBOOT

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.sfo.to.comm.loss**

### **Severity**

EMERGENCY

### **Description**

This message occurs when automatic takeover of the HA partner is successful. The controller takeover occurred because of a HA partner lost communication. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Address the cause of the cluster partner lost communication, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.shlf events

### callhome.shlf.fan

#### Severity

EMERGENCY

#### Description

This message occurs when the system detects faulty hardware on the disk shelf, such as a fan, power supply unit (PSU), or failing temperature sensor. The problem might be environmental (temperature or faulty power) or hardware-related. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

#### Syslog Message

Call home for SHELF COOLING UNIT FAILED

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## Syslog Message

Call home for SHELF\_FAULT

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.shlf.overtemp

### Severity

ERROR

### Description

This message occurs when the system detects a disk shelf problem. The problem might be due to environmental issues, such as temperature or faulty power, or by faulty hardware, such as a fan, power supply, or failing temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C

to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for %s

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.shlf.power.intr**

### **Severity**

ERROR

### **Description**

This message occurs when your system detects that a disk shelf power supply reported either a sustained loss of DC voltage output for about 20 seconds or a failure condition. This issue can occur for a number of reasons: 1. The power supply was turned off or unplugged. 2. The power to the server room failed or fluctuated. 3. The disk shelf power supply malfunctioned and should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

If necessary, replace the disk shelf power supply. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for SHELF POWER INTERRUPTED

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.shlf.ps.fault**

### **Severity**

ERROR

### **Description**

This message occurs when your system detects that a disk shelf power supply reported a loss of DC voltage. This might be a transient issue. This issue can occur for a number of reasons: 1. The power supply was turned off or unplugged. 2. The power to the server room failed or fluctuated. 3. The shelf power supply malfunctioned and should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

If necessary, replace the shelf power supply. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for SHELF POWER SUPPLY WARNING

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.shutdown events

## callhome.shutdown.pending

### Severity

ALERT

### Description

This message occurs when a disk drive fails but there are no suitable spares available for reconstruction. To protect your data, the system enters degraded mode. The system halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If a spare drive becomes available while the system is running in degraded mode, the system immediately begins rebuilding the failed drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To prevent the system from shutting down in 24 hours, perform either of the following actions: 1. Add a spare disk drive suitable for reconstructing the failed disk drive. 2. Change the timeout period with the following command: "storage raid-options modify -name raid.timeout -node local -value X" where X equals the number of hours for the new timeout value. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SHUTDOWN PENDING (degraded mode)

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.sm events

## callhome.sm.vsd.break.fail

### Severity

ERROR

### Description

This message occurs when a break operation on a SnapMirror® relationship that is a part of VserverDR fails. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Contact NetApp technical support for additional information.

## Syslog Message

Call home for SNAPMIRROR BREAK FAILURE.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**SourceVserver** (STRING): Source Vserver of the SnapMirror relationship.

**DestVserver** (STRING): Destination Vserver of the SnapMirror relationship.

# callhome.snapmirror events

## callhome.snapmirror.oos

### Severity

NOTICE

### Description

This message occurs when a sync-granular consistency group (CG) transitions from in-sync status to out-of-sync status. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Look for the sm.syncmirror.out.of.sync event concerning this relationship in the EMS log file. The event provides the reason why the relationship has been transitioned to out-of-sync and an appropriate corrective action, if applicable.

## Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.snapmirror.oos.pers

### Severity

ALERT

### Description

This message occurs when a sync-granular consistency group (CG) relationship transitions from in-sync status to out-of-sync status and remains out-of-sync for longer than expected. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Look for the sm.syncmirror.out.of.sync event concerning this relationship in the EMS log file on source node of SnapMirror relationship. The event provides the reason why the relationship has been transitioned to out-of-sync. Verify network connections between the primary cluster and the secondary cluster. Check for error information in the "snapmirror show" command output for the relationship. Quiesce the relationship if the condition cannot be addressed immediately.

## Syslog Message

Call home for %s.

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.sp events

## callhome.sp.hbt.missed

### Severity

NOTICE

### Description

This message occurs when ONTAP® does not receive an expected "heartbeat" signal from the Service Processor (SP). Along with this message, log files from SP will be sent out for debugging. ONTAP will reset the SP to attempt to restore communication. The SP will be unavailable for up to two minutes while it reboots.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

Call home for SP HBT MISSED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sp.hbt.stopped

### Severity

ALERT

### Description

This message occurs when ONTAP® is no longer receiving heartbeats from the Service Processor (SP). Depending on the hardware design, the system may continue to serve data or may determine to shut down to prevent data loss or hardware damage. The system continues to serve data, but because the SP might not be working, the system cannot send notifications of down appliances, boot errors, or Open Firmware (OFW) Power-On Self-Test (POST) errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If the system has shut down, attempt a hard power cycle: Pull the controller out from the chassis, push it back in then power on the system. Contact NetApp technical support if the problem persists after the power cycle, or for any other condition that may warrant attention.

## Syslog Message

Call home for SP HBT STOPPED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.spares events

## callhome.spares.low

### Severity

ERROR

### Description

This message occurs when one or more RAID groups do not have an eligible spare disk drive available in case of a disk drive failure. An eligible spare disk drive must be the correct size and capacity, and must be in the appropriate pool. If a disk drive fails without a spare to reconstruct on, the system enters degraded mode. The system halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Add suitable spare disk drives for all RAID groups to ensure that you have at least one spare disk drive. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for %s: %s

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**rg** (STRING): RAID groups on which spares low is identified.

# callhome.spm events

## callhome.spm.process.maxexit

### Severity

ERROR

### Description

This message occurs when a subsystem is not fully operational after one or more restarts and a restart threshold has been reached by the Service Process Manager (SPM). The inconsistency might be caused by external events such network data, previous configuration changes, software changes, firmware changes, or hardware changes. The message should not occur more than once per day. The underlying subsystem might be related to one or more operational systems such as management, authentication, network access, and so on. Performance issues and operational difficulties might have been exhibited before this event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

If necessary, undo recent changes to the system and to external services that the system uses to stabilize operations, and then contact NetApp technical support. They will help to identify the underlying issue and whether a software upgrade has been made available to resolve the issue. You might need to isolate the system from any suspect network traffic.

### Syslog Message

Call home for MAXIMUM EXITS THRESHOLD OF A PROCESS MANAGED BY SPM IS REACHED

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.stackmon events

### callhome.stackmon.recon.failed

#### Severity

ALERT

#### Description

This message occurs when the system fails to assign the correct stack-id to one or more disk shelves. The shelf and disk names might not correctly reflect the storage topology. Shelf and disk operations might fail if multiple disks share the same name. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### Corrective Action

Verify that the storage topology is correct. The (privilege: advanced) "storage stackmon repair" command can be used to diagnose and repair the issue. If you need further assistance, contact NetApp technical support.

#### Syslog Message

Call home for %s

#### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.svm events

### callhome.svm.mig.abort.fail

#### Severity

ERROR

#### Description

This message occurs when a Vserver migration failed to be aborted. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Run the "vserver migrate show" command to view the description of the error and the corrective action.

### **Syslog Message**

Call home for %s

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi-node AutoSupport.

## **callhome.svm.mig.aborted**

### **Severity**

NOTICE

### **Description**

This message occurs when a Vserver migration is successfully aborted. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

(None).

### **Syslog Message**

Call home for %s

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi-node AutoSupport.

## **callhome.svm.mig.clean.fail**

### **Severity**

ERROR

### **Description**

This message occurs when the cleanup phase of a Vserver migration has failed. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Run the "vserver migrate show" command to view the description of the error and the corrective action.

### **Syslog Message**

Call home for %s

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**epoch** (STRING): Identifying tag for multi-node AutoSupport.

## callhome.svm.mig.complete

### Severity

NOTICE

### Description

This message occurs when a Vserver migration has completed. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for %s

**subject** (STRING): AutoSupport subject or title for this event.  
**epoch** (STRING): Identifying tag for multi-node AutoSupport.

## callhome.svm.mig.started

### Severity

NOTICE

### Description

This message occurs when a Vserver migration has started successfully. If the system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for %s

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.  
**epoch** (STRING): Identifying tag for multi-node AutoSupport.

## callhome.svo events

### callhome.svo.prevented

### Severity

ERROR

## Description

This message occurs when a write to a SnapValidator enabled volume failed to be validated and was rejected by the server. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Check the configuration of the server to insure correct 'svf\_offset' setting on the lun (if applicable) and correct use of svo\_options. This includes making sure that RMAN data is not being stored on a volume that does not have the svo\_allow\_rman option set. If the server appears to be correctly configured, the problem may exist at any point between Oracle client and the server. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for SNAPVALIDATOR ERROR PREVENTED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.sync events

## callhome.sync.mirror.nospc

### Severity

ALERT

### Description

This message occurs when ONTAP® cannot create a new base Snapshot copy in a SyncMirror aggregate after multiple attempts. Systems using RAID SyncMirror require aggregate Snapshot copies for normal operation. Periodically, ONTAP creates a new base Snapshot copy with a name similar to "mirror\_resync.1201023128(filer\_name)." Once created, ONTAP deletes the old base Snapshot copy. The base Snapshot copy is used to optimize resynchronization when one plex goes offline. Short-lived circumstances when a new aggregate Snapshot copy cannot be created are not unusual. ONTAP initiates background processes to reclaim space and allow creation of new aggregate Snapshot copies. This message is issued when ONTAP cannot create a new base Snapshot copy after waiting a reasonable time. If the aggregate lacks an existing SyncMirror base Snapshot copy, then if one plex goes offline, subsequent resynchronization must copy all data in the aggregate - this can be a very long process. ONTAP issues this message when there is no SyncMirror base Snapshot copy and a new one cannot be created in repeated attempts in the last ten minutes (by default). If an old base Snapshot copy is present, this condition is less urgent. However, since space reclamation is likely to be slower, ONTAP waits up to two hours (by default) before issuing this message. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

ONTAP continually retries to create a new SyncMirror Snapshot copy. This condition might autocorrect, even after issuing this message. If it does not, contact NetApp technical support.

### Syslog Message

Call home for SYNCMIRROR SNAPSHOTS NOT ROTATING PROPERLY

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.syncm events

## callhome.syncm.isolation

### Severity

ALERT

### Description

This message occurs when both plexes of a SyncMirror® configuration have disk drives in the same hardware-based disk pool; that is, the plexes are not hardware-fault isolated. Therefore, a single hardware failure can cause both plexes to fail. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To resolve this issue, complete the following steps: 1. Identify the problem aggregate from the system logs. 2. Determine which mirror plexes have disk drives in mixed pools. 3. Determine how this occurred: possible causes include a wiring problem, a reconstruction forced mixed pools, or the mirror was created explicitly so that the plexes have disk drives in mixed pools. 4. Based on the information you gather, determine how to correct the issue. For example, recable the disk drives to restore hardware-fault isolation. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYNCMIRROR FAULT ISOLATION

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.syncm.plex

### Severity

ALERT

### Description

This message occurs when a SyncMirror® plex fails. Therefore, the SyncMirror plex is in a degraded mode. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem aggregate and failed plex from the system logs. 2. Determine the reason for the plex failure, such as disk drive, disk shelf, or loop failure. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYNCMIRROR PLEX FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.syncm.plex.offlined

### Severity

ALERT

### Description

This message occurs when a SyncMirror® plex is offlined. Therefore, the Syncmirror aggregate is in a degraded mode. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem aggregate and offlined plex from the system logs. 2. Determine the reason for the plex being offlined: a. Issue with backend array or adapter b. IO timeout errors on multiple disks c. SCSI errors 3. Replace any faulty components that you discover. 4. Online the plex manually. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYNCMIRROR PLEX OFFLINED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.syncm.verify

### Severity

ERROR

### Description

This message occurs when the system finds one or more block inconsistencies between plexes of a SyncMirror® configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

To resolve this issue, complete the following steps: 1. Determine the problem aggregate and failed plex from the system logs. 2. Take the aggregate offline. 3. Split the plexes into two aggregates. 4. Contact NetApp technical support for assistance, and then run WAFL® Iron (wafliron) on both aggregates. 5. Determine which is the 'good' aggregate by inspection. 6. Take offline and then destroy the 'bad' aggregate. 7. Re-mirror the 'good' aggregate. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYNCMIRROR VERIFY FAILED

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.syncsm events

## callhome.syncsm.exception

### Severity

ERROR

### Description

This message occurs when critical thresholds are breached for a SnapMirror® Synchronous relationship. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Use the "snapmirror show" command to check for current status. Contact support personnel if this problem occurs repeatedly and prevents the relationship from moving to the InSync status.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.syncsm.oos.fatal

### Severity

ALERT

### Description

This message occurs when a resynchronize operation between the source volume and destination volume fails for a SnapMirror® Sync relationship. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Look for the sms.resync.attempt.failed event concerning this relationship in the EMS log file. The event provides the reason why the relationship has been transitioned to out-of-sync and an appropriate corrective action, if applicable.

### Syslog Message

Call home for %s.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.sys events

## callhome.sys.config

### Severity

ERROR

### Description

This message occurs when the appliance has an unsupported PCI slot configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Examine the command-line interface and System Configuration Guide for more information about slot assignments and hardware configuration, and then correct the unsupported configuration. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYSTEM CONFIGURATION WARNING

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.sys.config.crit

### Severity

ERROR

### Description

This message occurs when the appliance has an unsupported PCI slot configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Examine the command-line interface and System Configuration Guide for more information about slot assignments and hardware configuration, and then correct the unsupported configuration. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for SYSTEM CONFIGURATION ERROR

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.tgt events

### callhome.tgt.lun.nospc

### Severity

ERROR

## Description

This message occurs when the SCSI Target subsystem begins failing SCSI Write commands due to an out of space (ENOSPC) condition on the appliance. This event is seen only when thin provisioning is used together with FCP or iSCSI. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

When this event occurs the customer should verify that all volumes containing luns on the appliance are properly configured for thin provisioning. Under some conditions additional disks may need to be added to the volume/aggregate. Contact NetApp support for more information. If you need assistance, contact NetApp technical support.

## Syslog Message

Call home for LUN OUT OF SPACE

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.unsupported events

## callhome.unsupported.snaplock

### Severity

ALERT

### Description

This message occurs when the system generates an AutoSupport event to notify you that a SnapLock® disk is attached to a system running a release of ONTAP® that does not support SnapLock.

### Corrective Action

Remove the SnapLock disks from this system and attach them to a system that supports SnapLock. You can also revert or upgrade this system to a release that supports SnapLock.

### Syslog Message

Call home for SNAPLOCK DISKS IN UNSUPPORTED RELEASE

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.ups events

## callhome.ups.line

### Severity

NOTICE

### Description

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored and

the battery power is normal.

### **Corrective Action**

Maintain the environment and ensure that the line power to the UPS continues to be normal. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for UPS LINE POWER RESTORED

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ups.low.battery**

### **Severity**

ALERT

### **Description**

This message occurs when battery power for an Uninterruptible Power Supply (UPS) system has under 5 minutes of charge left. The system is currently serving data but will eventually shut down if the UPS continues to run without line power. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Check the environment and restore the line power to the UPS as soon as possible to avoid system shutdown. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for UPS LOW BATTERY

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.ups.ok.low.battery**

### **Severity**

NOTICE

### **Description**

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored but the battery power is low. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Maintain the environment and ensure that the line power to the UPS continues to be normal. As line power continues to be normal, the battery is recharged. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for UPS PWR GOOD LOW BATTERY

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ups.ok.no.battery****Severity**

NOTICE

**Description**

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored but the battery power is very low. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Maintain the environment and ensure that the line power to the UPS continues to be normal. As line power continues to be normal, the battery is recharged. If line power is disrupted or leaves the normal range, the system might shut down immediately to protect your data. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for UPS PWR GOOD CRITICAL BATTERY

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

**callhome.ups.on.battery****Severity**

ALERT

**Description**

This message occurs when line power for an Uninterruptible Power Supply (UPS) system fails and the system is running on battery power. The server is currently serving data but will eventually shut down if the UPS continues to run without line power. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

Check the environment and restore line power to the UPS as soon as possible to avoid system shutdown. If you need assistance, contact NetApp technical support.

**Syslog Message**

Call home for UPS ON BATTERY

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.ups.shutting.down

### Severity

ALERT

### Description

This message occurs when battery power for an Uninterruptible Power Supply (UPS) system is almost depleted and the system is shutting down to protect your data. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Restore the line power to the UPS immediately to prevent system shutdown. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for UPS SHUTTING DOWN

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.user.events

### callhome.user.snmp.trap

### Severity

NOTICE

### Description

This message occurs when a SNMP (Simple Network Management Protocol) has been configured to cause an SNMP trap. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for SNMP USER DEFINED TRAP

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.vdom.events

## callhome.vdom.reconcile

### Severity

ERROR

### Description

This message occurs when the virtual disk infrastructure (vdom) unsuccessfully reconciles the Out Of Volume Container (OOVC) and the Vdisk Table Of Contents (VTOC). The Out Of Volume Container or OOVC is an area of storage that resides in a per-vvol aggregate metadir and provides storage for LUN configuration (override) and metadata (PR, mode page, log page). OOVC will have a LUN inventory that is identical to the LUN inventory in the AFS. Therefore the VTOC and OOVC must contain the same set of LUNs. As a result of data management operations like volume snapstore, the LUN inventory can differ between VTOC and OOVC. For these operations that affect LUN inventory, VDOM will need to reconcile the OOVC with the VTOC as part of the operation. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

(None).

### Syslog Message

Call home for %s Could not reconcile vtoc and oovc for volume associated with DSID: %llu, due to VDOM error: %u.

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

**vdom\_error** (INT): The vdom error code associated with the reconcile.

## callhome.vfiler events

### callhome.vfiler.move.to.dst

### Severity

ALERT

### Description

This message occurs on the destination controller during the final phase of migrating a vfiler when the 120 second time limit has been reached . During the final phase of migrating a vfiler from a source controller to a destination controller, input/output data access is stalled until the destination is ready. The amount of time spent with I/O data access stalled within 120 seconds, since many pre-checks have been done to ensure this can be achieved. With the time limit reached, operations will resume to using the vfiler on the source controller. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check that service has been restored to the vfiler on the source controller. If not, contact NetApp technical support. Many pre-checks have been done to ensure timely migration of the vfiler from one controller to another. It is unclear whether network or other conditions have changed, such as changes in controller loads have prevented successful vfiler migration. Check the network connectivity, network bandwidth, load on the source controller and load on the destination controller. If they are not within normal expectations,

resolve the issue. If they are within normal expectations, consult with NetApp technical support. If you need further assistance, contact NetApp technical support.

### **Syslog Message**

Call home for VFILER MIGRATION EXCEEDED 120 SECONDS ON DESTINATION

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.vfiler.move.to.src**

### **Severity**

NOTICE

### **Description**

This message occurs on the source controller at the request of the destination controller. The destination controller has exceeded a 120 second time limit during the final phase of migrating a vfiler. During the final phase of migrating a vfiler from a source controller to a destination controller, input/output data access is stalled until the destination is ready. The amount of time spent with I/O data access stalled within 120 seconds, since many pre-checks have been done to ensure this can be achieved. With the time limit reached, operations will resume to using the vfiler on the source controller. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Check that service has been restored to the vfiler on this controller. If not, contact NetApp technical support. Many pre-checks have been done to ensure timely migration of the vfiler from one controller to another. It is unclear whether network or other conditions have changed, such as changes in controller loads have prevented successful vfiler migration. Check the network connectivity, network bandwidth, load on the source controller and load on the destination controller. If they are not within normal expectations, please resolve. If they are within normal expectations, consult with NetApp technical support. If you need further assistance, contact NetApp technical support.

### **Syslog Message**

Call home for VFILER MIGRATION TIME OUT EXCEEDED BY DESTINATION

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.vol events**

### **callhome.vol.offline**

### **Severity**

ALERT

### **Description**

This message occurs when the system detects an inconsistent volume and takes it offline. The file system inconsistency could be from one or more sources. The inconsistency might be related to previous operations or to current operations. Disabling access is a protective measure to ensure that further inconsistencies are avoided. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

If the operating environment for the system, storage, or associated cabling has changed in terms of temperature, humidity, vibration, unstable electrical power, or other physical factors, gracefully shut down and power off the system until the environment is restored to normal operations. If the operating environment has not changed, identify the source of the inconsistency by checking for previous errors and warnings. Also check for hardware statistics from Fibre Channel, SCSI, disk drives, other communications mechanisms, and previous administrative activities. Another approach is to consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the volume to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

### **Syslog Message**

Call home for VOLUME INCONSISTENT AND TAKEN OFFLINE

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.vol.space.crit**

### **Severity**

EMERGENCY

### **Description**

This message occurs when a volume has overallocated space. It will be taken offline soon and the node will reboot. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Create space by increasing volume/aggregate size or deleting data. While changing the provisioning from thick to thin will prevent further utilization of space, it is no longer sufficient to prevent the volume/aggregate from being offlined. In a volume, size can be increased with the "volume size" command. To change provisioning in a volume, reserved files can be unreserved using the "volume file reservation" command. In an aggregate, size can be increased by adding disks. To change provisioning in an aggregate, volume guarantees can be changed from "volume" to "none" using the space-guarantee parameter in the "volume modify" command. The nodeshell "vol status -S" and "aggr status -S" commands display "Total Used" and "Total Physical Used" values greater than 100% when the reserve is being used. The "vol.log.overalloc" and "volume.phys.overalloc" EMS events and their associated SNMP traps of "volumeLogicalOverallocated" and "volumePhysicalOverallocated" are issued when the volume or aggregate is consuming more than the recommended amount of reserve.

### **Syslog Message**

Call home for VOLUME CRITICALLY OUT OF SPACE ERROR.

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

# callhome.wafl events

## callhome.wafl.check

### Severity

ALERT

### Description

This message occurs after a WAFL® check (wack) operation runs. WAFL check is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Check the appliance's log for valuable information that WAFL check might have reported. If you need assistance, contact NetApp technical support.

### Syslog Message

Call home for WAFL\_check

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.wafl.inconsistent

### Severity

ALERT

### Description

This message occurs when the system detects that a volume is inconsistent. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous operations or to current operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### Corrective Action

Consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the volume to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

### Syslog Message

Call home for WAFL INCONSISTENT

### Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.wafl.inconsistent.block

### Severity

ALERT

## Description

This message occurs when the system detects a volume that contains an inconsistent block. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous data operations or to current data operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Contact NetApp technical support for further assistance.

## Syslog Message

Call home for WAFL INCONSISTENT BLOCK

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.wafl.inconsistent.user.block

## Severity

ALERT

## Description

This message occurs when the system detects inconsistent user data within a volume. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous data operations or to current data operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

## Corrective Action

Contact NetApp technical support for further assistance.

## Syslog Message

Call home for WAFL INCONSISTENT USER BLOCK

## Parameters

**subject** (STRING): AutoSupport subject or title for this event.

## callhome.wafl.iron.done

## Severity

NOTICE

## Description

This message occurs after a WAFL® Iron (wafiliron) operation runs. WAFL® Iron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

### **Corrective Action**

Check the appliance's log for valuable information that WAFL Iron might have reported. If you need assistance, contact NetApp technical support.

### **Syslog Message**

Call home for WAFL IRON COMPLETED

### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.wafliron events**

### **callhome.wafliron.chg.pending**

#### **Severity**

NOTICE

#### **Description**

This message occurs when WAFL® Iron (wafliron) Optional Commit changes are pending. WAFL® Iron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

#### **Corrective Action**

Work with NetApp technical support on this issue. If you decide against this, it is recommended that the pending changes be committed.

#### **Syslog Message**

Call home for WAFLIRON CHANGES PENDING

#### **Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

## **callhome.weekly events**

### **callhome.weekly**

#### **Severity**

NOTICE

#### **Description**

This message occurs when the weekly AutoSupport or 'call home' event is sent. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

**Corrective Action**

(None).

**Syslog Message**

Call home for WEEKLY\_LOG

**Parameters**

**subject** (STRING): AutoSupport subject or title for this event.

# cam events

## cam.dev events

### cam.dev.fuaNotSupported

#### Severity

ALERT

#### Description

This message occurs when the disk does not support the Forced Unit Access (FUA) feature bit. Using this disk with the write cache enabled can lead to data corruption.

#### Corrective Action

Use disks with the write cache disabled or disks where the FUA feature is supported.

#### Syslog Message

FUA feature is not supported for disk %s%d with target address %s.

#### Parameters

**periph\_name** (STRING): Disk name.

**unit** (INT): Unit number.

**target\_addr** (STRING): Disk target address.

### cam.dev.fuaNotVerified

#### Severity

ALERT

#### Description

This message occurs when ONTAP® software fails to read the SCSI page containing the Forced Unit Access (FUA) feature bit. Using the disk with the write cache enabled and FUA not supported can lead to data corruption.

#### Corrective Action

Because ONTAP cannot determine the state of the FUA feature bit, disable the disk write cache if it is enabled by default. If the write cache cannot be disabled, replace the disk to avoid corruption.

#### Syslog Message

Unable to read the FUA settings for disk %s%d with target address %s.

#### Parameters

**periph\_name** (STRING): Disk name.

**unit** (INT): Unit number.

**target\_addr** (STRING): Disk target address.

## cam.timeout events

## **cam.timeout.retry**

### **Severity**

NOTICE

### **Description**

This message occurs when an I/O request to a Common Access Method (CAM) device driver times out. This might be indicative of an overloaded back-end storage subsystem. The I/O operation will be retried; this message does not indicate failure.

### **Corrective Action**

(None).

### **Syslog Message**

CAM device driver I/O timeout. %s%s%s.

### **Parameters**

**cam\_timeout** (STRING): Timeout message for an I/O request from a CAM device driver.

**uuid** (STRING): Unique identifier for the device.

**outstanding** (STRING): Command that timed out and its elapsed time.

# cap events

## cap.cache events

### cap.cache.corrupt

#### Severity

ERROR

#### Description

This message occurs when a corrupt Central Access Policy (CAP) is encountered during access checks.

#### Corrective Action

Fix the CAP definitions on the Active Directory, and use the 'vserver cifs group-policy update' command to refresh the cache on the cluster.

#### Syslog Message

Encountered a corrupt CAP for Vserver %s.

#### Parameters

**vserverUuidStr** (STRING): UUID of the Vserver.

### cap.cache.not.ready

#### Severity

ERROR

#### Description

This message occurs when the system attempts to access a Central Access Policy (CAP) for evaluation during access checks and finds the CAP cache database (DB) is not ready for access.

#### Corrective Action

Make sure that group-policy is enabled for the given Vserver and the Central Access Policies (CAPs) from the Active Directory (AD) can be applied to file system objects.

#### Syslog Message

CAP Cache DB not ready for Vserver %s.

#### Parameters

**vserverUuidStr** (STRING): UUID of the Vserver.

### cap.cache.update.failed

#### Severity

ERROR

#### Description

This message occurs when refresh of the Central Access Policy (CAP) Cache database (DB) fails.

**Corrective Action**

Use the "vserver cifs group-policy update" command with the "force" flag to retry the operation manually.

**Syslog Message**

Failed to update the CAP cache DB for Vserver %s. (Reason: %s.)

**Parameters**

**vserverUuidStr** (STRING): UUID of the Vserver.

**errString** (STRING): Error string.

# ccma events

## ccma.disabled events

### ccma.disabled

#### Severity

ERROR

#### Description

This message occurs when the Performance Archive has been disabled for more than an hour. This is caused by setting the `-is-enabled` flag to false. This message will be repeated every hour that the archiver is turned off. The messages will only displayed once a day.

#### Corrective Action

Run the `'statistics archive config modify -is-enable true'` command. This will enable the Performance Archive.

#### Syslog Message

The Performance Archive has been disabled for more than an hour. It is Important for the analysis and diagnoses of performance related issues. Consider enabling it.

#### Parameters

(None).

## ccma.perfstatd events

### ccma.perfstatd.disabled

#### Severity

ERROR

#### Description

This message occurs when the Perfstat daemon (`perfstatd`) has been disabled for more than an hour. This is caused by setting the `-perfstat-sampling-period` value to 0. This message will be repeated every hour `perfstatd` is turned off. The messages will only displayed once a day.

#### Corrective Action

Run the `'statistics archive config modify -perfstat-sampling-period 5'` command. This will enable the `perfstatd` and it will set the Perfstat sampling period to the default value of 5 minutes.

#### Syslog Message

The Perfstat daemon (`perfstatd`) has been disabled for more than an hour. It is important for the analysis and diagnoses of performance related issues. Consider enabling it.

#### Parameters

(None).

# ccma.quota.events

## ccma.quota.datastore.leak

### Severity

ERROR

### Description

This message occurs when a datastore has been orphaned due to the system not having sufficient memory to keep track of it in the quota system. Orphaned datastores will take up disk space and may build up over time if this problem recurs.

### Corrective Action

Delete the orphaned datastore and/or restart the CM daemon once the out of memory condition has been resolved.

### Syslog Message

A datastore may have been orphaned due to the system being out of memory. Please delete this datastore: %s

### Parameters

**datastore** (STRING): Name of the datastore that has been orphaned and needs to be deleted.

## ccma.quota.file.leak

### Severity

ERROR

### Description

This message occurs when an archiver file has been orphaned due to the system not having sufficient memory to keep track of the file in the quota system. Orphaned files will take up disk space and may build up over time if this problem recurs.

### Corrective Action

Delete the orphaned file and/or restart the CM daemon once the out of memory condition has been resolved.

### Syslog Message

An archiver file may have been orphaned due to the system being out of memory. Please delete this file: %s

### Parameters

**filename** (STRING): Name of the archiver file that has been orphaned and needs to be deleted.

## ccma.quota.throughput

### Severity

NOTICE

### Description

This message occurs when the performance archive data collection rate is too high for the amount of reserved disk space, possibly resulting in a shortened history of the system's performance (less than the

configured `datastore-max-retention` value). A shortened history might limit the ability of support staff to triage performance problems.

### Corrective Action

Using the (diagnostic privilege) "statistics archive config" commands, increase the performance archive's `datastore-max-percent` configuration parameter so that the reported `datastore-max-size` value on this node is increased by the stated "size" amount.

### Syslog Message

The performance archive data collection rate is too high for the amount of space available. The system can only keep %ld days of performance archive data at this rate, and needs %ld MB of additional space to maintain a system performance history equal to the `datastore-max-retention` configuration value.

### Parameters

**days** (LONGINT): Number of days of performance archive data that can be stored at the current rate.

**size** (LONGINT): Size increase (in MB) needed to maintain a system performance history equal to the `datastore-max-retention` configuration value.

# cde events

## cde.undo events

### cde.undo.abort

**Severity**

NOTICE

**Description**

This message occurs when undo of cde has to abort.

**Corrective Action**

(None).

**Syslog Message**

Undo of auto adaptive compression on volume %s%s aborted.

**Parameters**

**vvol\_name** (STRING): Volume name.

**volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

### cde.undo.done

**Severity**

NOTICE

**Description**

This message occurs when cde undo is done.

**Corrective Action**

(None).

**Syslog Message**

Auto adaptive compression undo is done for volume %s%s.

**Parameters**

**volume** (STRING): Volume name.

**volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

# cdpd events

## cdpd.recv events

### cdpd.recv.cacheOverflow

#### Severity

ERROR

#### Description

This message occurs when the CDP (Cisco Discovery Protocol) daemon running on the storage controller receives more unique neighbor advertisements than it can cache. The storage controller stops saving incoming CDP advertisements after the CDP neighbor cache has the maximum allowed neighbor entries. The CDP daemon will start processing new advertisements again after entries in the CDP neighbor cache start timing out.

#### Corrective Action

Use the 'cdpd show-stats' CLI command under the "Cache overflow" receive statistic to view the number of unique advertisements in excess of the maximum. Check the traffic statistics on the neighboring switches and bridges. If the storage controller has more than 64 CDP neighbors, you can ignore this message. Otherwise, take a packet trace on the network or on each network port of the storage controller to check the source of the CDP advertisements.

#### Syslog Message

The CDP neighbors table is full.

#### Parameters

(None).

# cecc\_log events

## cecc\_log.dropped events

### cecc\_log.dropped

#### Severity

NOTICE

#### Description

This message occurs when the ECC error logger dropped some correctable ECC errors without logging them. Typically, correctable ECC errors are logged in the system even though they are automatically corrected. They are dropped due to lack of buffer space in the ECC error logger. This might be a sign of high frequency of ECC errors. If the number of ECC errors dropped crosses a certain predefined threshold, the ECC error logger issues a `cecc_log.masked` message.

#### Corrective Action

(None).

#### Syslog Message

Dropped %lld additional correctable ECC error details.

#### Parameters

`num_cecc_batch_dropped` (LONGINT): Number of correctable ECC errors dropped without being logged.

## cecc\_log.entry events

### cecc\_log.entry

#### Severity

NOTICE

#### Description

Correctable ECC errors occurred in the system memory. The system automatically corrects these errors. All the corrected errors are reported by the ECC error logger to track the history of occurrence of these errors.

#### Corrective Action

(None).

#### Syslog Message

%lld: %s

#### Parameters

`cecc_entry_num` (LONGINT): Number of correctable ECC errors since boot.

`cecc_msg` (STRING): Information about the ECC error.

## cecc\_log.entry\_no\_syslog events

## **cecc\_log.entry\_no\_syslog**

### **Severity**

NOTICE

### **Description**

Correctable ECC errors occurred in the system memory. The system automatically corrects these errors. All the corrected errors are reported by the ECC error logger to track the history of occurrence of these errors.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

**cecc\_entry\_num** (LONGINT): Number of correctable ECC errors since boot.

**cecc\_msg** (STRING): Information about the ECC error.

## **cecc\_log.masked events**

### **cecc\_log.masked**

### **Severity**

ERROR

### **Description**

This message occurs when the ECC error logger stops reporting the occurrence of correctable ECC errors because the frequency of their occurrence is too high. The ECC logger crossed the predefined threshold of ECC errors that can be dropped. Reporting is suppressed to control the log traffic, but the system sends out a periodic message as a reminder.

### **Corrective Action**

Use the "system controller memory dimm show" command to check system memory.

### **Syslog Message**

Error logging temporarily suspended due to excessive CECC errors.

### **Parameters**

(None).

## **cecc\_log.summary events**

### **cecc\_log.summary**

### **Severity**

NOTICE

### **Description**

This message occurs when the ECC error logger reports its periodic summary of new correctable ECC

errors that occurred after the last report and the total number of ECC errors that occurred since boot. These errors were corrected by the system.

### **Corrective Action**

(None).

### **Syslog Message**

Total of %lld new correctable ECC errors just reported. You might want to check system memory. %lld correctable ECC errors reported since booting.

### **Parameters**

**num\_ceccs** (LONGINT): Number of new correctable ECC errors after the last summary.

**total\_num\_ceccs** (LONGINT): Number of correctable ECC errors since boot.

# certificate events

## certificate.insecure events

### certificate.insecure.hash

#### Severity

ERROR

#### Description

This message occurs when an installed certificate uses a hash function that is no longer considered secure. Client-server communication using this certificate should be presumed insecure, and could be disrupted.

#### Corrective Action

Delete the insecure certificate by using the "security certificate delete" command. Install an appropriate replacement by using the "security certificate install" command or "security certificate create" command.

#### Syslog Message

A digital certificate with UUID %s in Vserver %s with name %s is using the insecure hash function %s.

#### Parameters

**uuid** (STRING): UUID of the offending certificate.

**vserver** (STRING): Name of the Vserver in which the offending certificate is installed.

**cert\_name** (STRING): Name (unique within a Vserver) of the offending certificate.

**hash\_function** (STRING): Hash function used by the offending certificate.

### certificate.insecure.key

#### Severity

ERROR

#### Description

This message occurs when an installed certificate uses a key length that is no longer considered secure for the corresponding key algorithm. Client-server communication using this certificate should be presumed insecure, and could be disrupted.

#### Corrective Action

Delete the insecure certificate by using the "security certificate delete" command. Install an appropriate replacement by using the "security certificate install" command or "security certificate create" command.

#### Syslog Message

A digital certificate with UUID %s in Vserver %s with name %s has an insecure key of type %s and length %d.

#### Parameters

**uuid** (STRING): UUID of the offending certificate.

**vserver** (STRING): Name of the Vserver in which the offending certificate is installed.

**cert\_name** (STRING): Name (unique within a Vserver) of the offending certificate.

**key\_algorithm** (STRING): Algorithm (e.g., RSA) of the key for the corresponding certificate.

**key\_length** (INT): Length of the key in bits for the corresponding certificate.

# certificate.invalid events

## certificate.invalid.chain

### Severity

ERROR

### Description

This message occurs when an installed certificate record contains multiple X.509 certificates. Such records are not treated consistently by the system, but were unintentionally permitted in prior releases.

### Corrective Action

Delete the problematic record by using the "security certificate delete" command. Install the constituent certificates separately by using the "security certificate install" command once for each certificate.

### Syslog Message

The certificate record with UUID %s, named "%s" in Vserver "%s", contains multiple certificates.

### Parameters

**uuid** (STRING): UUID of the offending record.

**cert\_name** (STRING): Name (unique within a Vserver) of the offending record.

**vserver** (STRING): Name of the Vserver in which the offending record is installed.

# certificate.node events

## certificate.node.vserver

### Severity

ERROR

### Description

This message occurs when an installed certificate record exists in a node Vserver. Such records are not treated consistently by the system, but were unintentionally permitted in prior releases.

### Corrective Action

Delete the problematic record by using the "security certificate delete" command.

### Syslog Message

The certificate record with UUID %s, named "%s" is installed in the node Vserver "%s".

### Parameters

**uuid** (STRING): UUID of the offending record.

**cert\_name** (STRING): Name (unique within a Vserver) of the offending record.

**vserver** (STRING): Name of the node Vserver in which the offending record is installed.

# cf events

## cf.autogbcanceled events

### cf.autoGBCanceled.headswap

**Severity**

INFORMATIONAL

**Description**

This message occurs when an automatic giveback is canceled because of a headswap.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

## cf.badshelfcountmsg events

### cf.badShelfCountMsg

**Severity**

ERROR

**Description**

This event occurs if we are sent an invalid negotiated failover shelf count message. The message size is incorrect. This is likely due to an InterConnect problem.

**Corrective Action**

Check for and resolve any interconnect errors. If the nodes are on different releases, upgrade the down-rev node.

**Syslog Message**

Invalid disk shelf count message was received from partner.

**Parameters**

(None).

## cf.badshelfcountversion events

### cf.badShelfCountVersion

**Severity**

ERROR

## Description

This event occurs if we are sent a negotiated failover shelf count message with a version which we don't support. As a result, disk shelf count negotiated failover will not work. This is likely due to a kernel version mismatch.

## Corrective Action

Upgrade the down-rev node so both nodes are on the same version.

## Syslog Message

Disk shelf count message with unsupported version received from partner.

## Parameters

(None).

# cf.boot events

## cf.boot.continuing

### Severity

INFORMATIONAL

### Description

This message occurs when the failover monitor continues booting after waiting for giveback.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

(None).

# cf.cdo events

## cf.cdo.badMsg

### Severity

ERROR

### Description

This event is issued when the filer receives a disk operation message over the High Availability (HA) interconnect that it does not recognize. This is likely due to a change in the message protocol that the down-revision partner does not recognize. Fix this problem by upgrading the partner to a compatible version of Data ONTAP®. This message is not emitted for every message received to avoid spamming the console.

### Corrective Action

Upgrade both nodes to the same release.

## Syslog Message

unknown message %d received from partner (%d unknown messages since boot).

## Parameters

**msg** (INT): Message which was not known.  
**count** (INT): Number of unknown messages.

## cf.cdo.reportOp

### Severity

NOTICE

### Description

This event is issued when the filer bypasses or unbypasses a disk after being requested to do so by its partner. The bypassing of a drive on a particular port may only be done by the host which is attached to that port; the High Availability (HA) software ensures that both ports of the drive are bypassed by communicating bypass requests to the partner.

### Corrective Action

(None).

## Syslog Message

%s disk %s on behalf of the partner.

## Parameters

**op** (STRING): Operation description  
**driveName** (STRING): Drive name

## cf.disk events

### cf.disk.invent.mismatchalt

### Severity

ALERT

### Description

This message occurs when one of the nodes in a high-availability (HA) pair reports that multiple disks in the disk inventory do not match what the partner node reported. This only occurs when sufficient mismatches have occurred to throttle the specific disk inventory mismatch message. The issue might be due to one of following reasons: (1) One node can see disks that the other node cannot. (2) Ownership of multiple disks has changed. (3) Multiple disks have been failed or unfailed. (4) Multiple disks have been inserted or removed.

### Corrective Action

Rescan the disks on both nodes in the HA pair to determine the latest ownership by using the "storage disk refresh-ownership" command. If the inventory mismatch is not resolved, remove and replace any failed disks. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disks are not included in the inventory.

## Syslog Message

Status of some of the disks has changed or the node (%s) is missing %u disks (detailed logs have been throttled).

## Parameters

**host** (STRING): Name of the node not reporting the disks in its disk inventory.  
**nummissing** (INT): Number of disks not reported in the disk inventory.

## cf.disk.invent.mismatchOKalt

### Severity

INFORMATIONAL

### Description

This message occurs when previously detected disk inventory mismatches have been resolved and the detailed match events have been throttled.

### Corrective Action

(None).

## Syslog Message

%u disks now included in the inventory of node (%s) (detailed logs have been throttled).

## Parameters

**nummatches** (INT): Number of disks found to match the partner disk inventory so far.  
**host** (STRING): Name of the host where the disk is included in the inventory.

## cf.disk.inventory.mismatch

### Severity

ERROR

### Description

This message occurs when one of the nodes in a high-availability (HA) pair has reported this disk in its disk inventory, but the HA partner node has not. This might be due to one of following reasons: (1) One node can see the disk, but the other node cannot. (2) Ownership of the disk has changed. (3) The disk has either been failed or unfailed. (4) The disk has been inserted or removed.

### Corrective Action

Use the "storage disk refresh-ownership" command on both nodes in the HA pair to rescan the disks and to determine the latest ownership. If the inventory mismatch is not resolved, remove and replace any failed disks. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disk is not included in the inventory.

## Syslog Message

Status of the disk %s (%s) has recently changed or the node (%s) is missing the disk.

## Parameters

**diskname** (STRING): Name of the disk not reported in the inventory.  
**uid** (STRING): Unique identifier of the disk that was not included in the inventory.  
**host** (STRING): Name of the node not reporting the disk in its disk inventory.

## **cf.disk.inventory.mismatchOK**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when a previously detected disk inventory mismatch is resolved.

### **Corrective Action**

(None).

### **Syslog Message**

The node (%s) included the disk %s (%s) in its inventory.

### **Parameters**

**host** (STRING): Name of the host where the disk is included in the inventory.

**diskname** (STRING): Name of the disk included in the inventory.

**uid** (STRING): Unique identifier of the disk.

## **cf.disk.inventory.ver.notok**

### **Severity**

ERROR

### **Description**

This message occurs when the local node does not support the partner's disk inventory message version.

### **Corrective Action**

Upgrade the partner to the same Data ONTAP® version.

### **Syslog Message**

cfdisk: The local node did not support the partner's disk inventory message version. The disk inventory check will not be performed during giveback.

### **Parameters**

(None).

## **cf.disk.inventoryChange**

### **Severity**

INFORMATIONAL

### **Description**

This event is issued when High Availability (HA) disk inventory is enabled/disabled.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: disk inventory %s

## Parameters

**state** (STRING): Parameter which describes if enabled or disabled.

## cf.disk.releaseFailed

### Severity

ERROR

### Description

This message occurs when the release of reservation request on a disk fails. The error indicates that a disk is not ready, that it failed, or that it does not exist.

### Corrective Action

Use the "disk show -broken" CLI command to check whether the disk is reporting a "FAILED" state, or use the "disk show -disk diskname" command to check the status of the disk. Also check the syslog for other errors pertaining to the same disk. The disk might need to be reseated or replaced.

### Syslog Message

Disk reservation failed to release on disk %s because the error %d was encountered.

## Parameters

**diskname** (STRING): Disk that reported the failure when a release of reservation request was attempted on it.

**force** (INT): Type of reservation release request. If non-zero, then the system was instructed to release reservations owned by the other systems. Otherwise, it only releases the reservation on the disks reserved by the local system.

**error** (INT): Error encountered while attempting to release the reservation on disk.

**errortext** (STRING): Error description as text.

## cf.disk.reserveFailed

### Severity

ERROR

### Description

This message occurs when a disk reserve fails. The error indicates that a disk is not ready, that it failed, or that it does not exist.

### Corrective Action

Check the specified disk for failure. You might need to replace it or reseat it. Then check the syslog for other errors pertaining to the same disk.

### Syslog Message

(None).

## Parameters

**diskname** (STRING): Disk that reported the failure when a reserve was attempted on it.

**preempt** (INT): Type of reservation request. If non-zero, then the system was instructed to preempt reservations from the other systems. Otherwise, it only reserves disks without existing reservations.

**error** (INT): Error encountered while attempting to reserve the disk.

**errortext** (STRING): Error description as text.

## cf.disk.resumeDisks

### Severity

NOTICE

### Description

This message occurs when a node resumes partner disks after a takeover. If any disks fail to be resumed, the node makes another attempt to resume them after short delay.

### Corrective Action

(None).

### Syslog Message

Node attempted to resume %d disks, but failed with %d disks.

### Parameters

**fmdisk\_count** (INT): Number of disks resumed.

**fmdisk\_error\_count** (INT): Number of disks that had resume errors.

## cf.disk.ResvFail

### Severity

ALERT

### Description

This message occurs when a node attempts to access a disk that has been reserved by the HA partner node. A node performing a takeover reserves the HA partner node's disks as part of a takeover operation. It is possible that the node being taken over can attempt to access a reserved disk before it has shut down as part of being taken over. The takeover node will automatically release the reservation prior to a giveback operation.

### Corrective Action

The takeover node will automatically release the disk reservation before a giveback operation.

### Syslog Message

Disk %s has been reserved by the High Availability (HA) partner as part of a takeover operation.

### Parameters

**DiskName** (STRING): Name of the disk.

## cf.disk.ResvTakeOver

### Severity

NOTICE

### Description

This event is issued when we find disks with reservation conflicts.

### Corrective Action

(None).

### **Syslog Message**

This node will wait for giveback and the disk reservations to be released.

### **Parameters**

(None).

## **cf.disk.skipped**

### **Severity**

NOTICE

### **Description**

This message occurs when the failover monitor skips an unresponsive disk.

### **Corrective Action**

Use the "storage disk show" command to check whether the disk failed. Replace the disk if needed.

### **Syslog Message**

The disk %s was skipped because it reported the status %s.

### **Parameters**

**diskname** (STRING): Name of the disk that was skipped.

**status** (STRING): Status reported by the disk.

## **cf.diskinventory events**

### **cf.diskinventory.cksum.fail**

### **Severity**

ALERT

### **Description**

This message occurs when the computed checksum of the disk inventory message is different from the checksum sent as part of the disk inventory message.

### **Corrective Action**

(None).

### **Syslog Message**

Disk inventory checksum mismatch: old %d new %d.

### **Parameters**

**oldCkSum** (INT): Old checksum, sent as part of the message.

**newCkSum** (INT): Checksum of the disk inventory message computed locally.

### **cf.diskinventory.many.disks**

### **Severity**

INFORMATIONAL

## Description

This message occurs when a node receives more than maximum supported disks in the disk inventory message.

## Corrective Action

(None).

## Syslog Message

disk inventory: ndisks %d max\_disks %d

## Parameters

**ndisks** (INT): Number of disk descriptions sent in the inventory message.

**maxdisks** (INT): Maximum number of disks supported.

# cf.fm events

## cf.fm.cpuUtilDuringTOAndGB

### Deprecated

Deprecated as of version 9.0.

### Severity

NOTICE

### Description

This message occurs at the start of a takeover, end of a successful takeover, start of a CFO giveback, and completion of an SFO giveback. It records the maximum, minimum, and average CPU and disk utilization on the node executing the takeover or giveback.

### Corrective Action

(None).

### Syslog Message

CPU and disk utilization during the %d seconds %s: cpu\_util\_high: %lld; cpu\_util\_low: %lld; cpu\_util\_avg: %lld; disk\_util\_high: %lld; disk\_util\_low: %lld; disk\_util\_avg: %lld

### Parameters

**window\_sz** (INT): Duration, in seconds, over which CPU and disk utilization are tracked.

**when** (STRING): Event during which CPU and disk utilization are tracked.

**cpu\_util\_high** (LONGINT): Maximum CPU utilization.

**cpu\_util\_low** (LONGINT): Minimum CPU utilization.

**cpu\_util\_avg** (LONGINT): Average CPU utilization.

**disk\_util\_high** (LONGINT): Maximum disk utilization.

**disk\_util\_low** (LONGINT): Minimum disk utilization.

**disk\_util\_avg** (LONGINT): Average disk utilization.

## cf.fm.discardNvram

### Severity

NOTICE

**Description**

This event is issued when we discover that the partner has previously taken us over, forcing us to invalidate our own nvram contents. This is a normal condition, subsequent to a takeover/giveback.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: node was previously taken over, nvram may be discarded

**Parameters**

(None).

**cf.fm.diskInventoryOff****Severity**

ERROR

**Description**

This message occurs when the system discovers that disk inventory gathering has been disabled. During normal operation, the high-availability (HA) nodes transmit their disk inventory data at regular intervals. This is intended to prevent a situation in which loop connectivity problems are unnoticed until a takeover event occurs. If this event occurs, contact NetApp technical support.

**Corrective Action**

Use the "sysconfig" and "storage" nodeshell commands to determine whether there are problems with the loop, adapter, or shelf. Resolve those problems.

**Syslog Message**

Failover monitor: HA disk inventory disabled.

**Parameters**

(None).

**cf.fm.diskRelease****Severity**

INFORMATIONAL

**Description**

This event is issued when we're using a debug build and failover monitor reservations are released.

**Corrective Action**

n/a

**Syslog Message**

Failover monitor: released disk reservations.

**Parameters**

(None).

## **cf.fm.diskReleaseFail**

### **Severity**

NOTICE

### **Description**

This message occurs when the release of a reservation on a disk fails in preparation for a giveback event. The error indicates that a disk is not ready, that it failed, or that it does not exist. If the reservation is detected by the partner node, it will reboot.

### **Corrective Action**

Look for the cf.disk.releaseFailed event in the EMS log to find the name of the disk where the reservation could not be released. Follow the corrective action described in the cf.disk.releaseFailed event to address any problems with the disk.

### **Syslog Message**

Could not release disk reservations of at least one disk.

### **Parameters**

(None).

## **cf.fm.duplicateId**

### **Severity**

ALERT

### **Description**

This message occurs when the local node system identifier is the same as the partner's. This could happen if the HA-Interconnect is configured for loopback in maintenance mode systems or if the system was not properly configured. The local node will halt in this case and the partner node will do a takeover of the local node resources, provided takeover is enabled.

### **Corrective Action**

If this message occurs only while the system is configured in maintenance mode, it can be ignored as HA-interconnect loopback tests send a message with a node's own system identifier to itself. If this message occurs while a system is not in maintenance mode, check if the HA-interconnect cables are properly connected. If cabling is correct, contact NetApp technical support for assistance.

### **Syslog Message**

Partner ID %u is the same as that of this node. This node will halt and the partner will perform a takeover, if takeover is enabled.

### **Parameters**

id (INT): System ID.

## **cf.fm.earlyGivebackDone**

### **Severity**

NOTICE

## Description

This event occurs when we are aborting a takeover that was initiated during a previous boot sequence. This event should only occur under unusual circumstances, indicating successful recovery from a software failure.

## Corrective Action

(None).

## Syslog Message

Failover monitor: giveback of previous takeover complete

## Parameters

(None).

## cf.fm.earlyTakeoverFailed

### Severity

ALERT

### Description

This message occurs when an error during early takeover prevents the node from booting into takeover mode. The node instead boots up without taking over its partner and also releases its partner resources, allowing the partner node to boot up. Note: Early takeover occurs when a node boots up after rebooting while in takeover mode.

### Corrective Action

Check the EMS log for the cf.rsrc.takeoverFail error or other errors indicating why the node could not boot into takeover mode.

### Syslog Message

Early takeover failed; node will boot without taking over partner node. Partner resources released, allowing partner node to boot.

### Parameters

(None).

## cf.fm.fastTimeoutBlocked

### Severity

ERROR

### Description

This event is issued if the monitor fast timeout thread has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected (false) takeover.

### Corrective Action

Check CPU load and make sure system is not over subscribed.

### Syslog Message

WARNING failover monitor fast timeout was blocked for %lld secs

## Parameters

**secs** (LONGINT): Number of seconds that the High Availability (HA) node has been blocked

## cf.fm.gbCancelledDuetoDR

### Severity

ERROR

### Description

This event is issued when a giveback has been cancelled due to an ongoing metrocluster disaster recovery operation.

### Corrective Action

Check the status of metrocluster disaster recovery operation by executing command 'metrocluster operation show'. If the command reports metrocluster disaster recovery operation is in progress wait for it to complete and then issue a manual giveback.

### Syslog Message

Failover monitor: giveback cancelled

### Parameters

(None).

## cf.fm.givebackCancelled

### Severity

NOTICE

### Description

This message occurs when a giveback is canceled due to a preexisting state, such as an active CIFS session, a reconstruction, and so on.

### Corrective Action

To override, use the "storage failover giveback -override-vetoes true" command.

### Syslog Message

Failover monitor: giveback canceled.

### Parameters

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.givebackComplete

### Severity

NOTICE

### Description

This message occurs when giveback succeeds.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: giveback completed

**Parameters**

**token** (STRING): Unique token that identifies a failover instance.

**partner\_node\_uuid** (STRING): UUID of the partner node.

**cf.fm.givebackDuration****Severity**

NOTICE

**Description**

This message occurs when a giveback is completed successfully.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: giveback duration time is %llu seconds.

**Parameters**

**giveback\_duration** (LONGINT): Giveback duration time.

**cf.fm.givebackFailed****Severity**

ALERT

**Description**

This message occurs when the failover monitor determines that a giveback has failed. The reason code is a string that describes the reason for the failure.

**Corrective Action**

Resolve the issue based on the reason logged in the message.

**Syslog Message**

Failover monitor: giveback failed '%s'

**Parameters**

**reason** (STRING): Internal reason code for the failure.

**token** (STRING): Unique token that identifies a failover instance.

**partner\_node\_uuid** (STRING): UUID of the partner node.

**cf.fm.givebackForced**

## Severity

ALERT

## Description

This message occurs when the takeover node detects that the takeover process has not been completed within the expected time, and/or normal attempts to give back partner resources also fail. Subsequent to this event, the takeover node will panic and reboot.

## Corrective Action

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: <http://mysupport.netapp.com/NOW/cgi-bin/pmsg/>. Contact NetApp technical support to confirm the analysis.

## Syslog Message

Failover monitor: forcing reboot to clear state.

## Parameters

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.givebackStarted

### Severity

NOTICE

### Description

This message occurs when the failover monitor initiates a giveback.

### Corrective Action

(None).

### Syslog Message

Failover monitor: giveback started with token %s. "override-vetoes" set to %s, and "require-partner-waiting" set to %s.

### Parameters

**token** (STRING): Unique token that identifies a failover instance.

**override\_vetoes** (STRING): Flag that indicates whether the system overrides veto checks during a giveback operation. This flag corresponds to the "-override-vetoes" parameter of the "storage failover giveback" command. When the parameter is set to true, some veto checks made by subsystems on the source node might be overridden.

**require\_partner\_waiting** (STRING): Flag that indicates whether, during a giveback, the storage is given back regardless of whether the partner node is available to take back the storage. This flag corresponds to the "-require-partner-waiting" parameter of the "storage failover giveback" command. When set to true, the parameter might cause the giveback to proceed, even if the destination node is not ready to receive the aggregate being migrated.

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.givebackUpdateFail

### Severity

ALERT

## Description

This message occurs when GIVEBACK\_DONE is not written to the backup mailbox after all other giveback processing is done. The issuing node is no longer in takeover mode, but the partner node cannot boot (without operator intervention) because the partner mailbox claims it has been taken over.

## Corrective Action

Boot the previously taken over node. During the boot operation, the node requests confirmation to proceed.

## Syslog Message

Failover Monitor: Unexpected error %d while trying to update backup mailbox during giveback

## Parameters

**errcode** (INT): Error code.

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.haltUpdateFail

### Severity

INFORMATIONAL

### Description

This event is issued if we are unable to update the partner state as part of halt processing. This occurrence of this event should not affect the operation of the High Availability (HA) pair.

### Corrective Action

(None).

### Syslog Message

halt: Unable to update failover monitor with NoTakeover state

### Parameters

(None).

## cf.fm.hogger

### Severity

ERROR

### Description

This message occurs when the fast timeout thread is blocked for a very long time and the system can identify threads that might have been responsible for the fast timeout thread not being scheduled.

### Corrective Action

Determine why the process is consuming the CPU, and either correct the problem, or end the offending process.

### Syslog Message

Failover monitor: Process %s ran continuously for %llu ms.

### Parameters

**procName** (STRING): Name of the process that is consuming the CPU.

**schedTime** (LONGINT): Time for which the process ran without releasing the CPU.

## **cf.fm.initError**

### **Severity**

ALERT

### **Description**

This message occurs when failover monitor initialization fails. If this event occurs, the failover monitor cannot be started. The node will reboot after this event.

### **Corrective Action**

Check the logs for other messages from the failing component listed in the message by using the "event log show" command from the CLI. Also check for errors from other components or errors indicating hardware failures. If the problem occurs again after the node reboots, contact NetApp technical support.

### **Syslog Message**

Failover monitor: initialize(%s) fails.

### **Parameters**

**component** (STRING): Software component that has failed to initialize.

## **cf.fm.kernelMismatch**

### **Severity**

ERROR

### **Description**

This event is issued when we detect a possible mismatch of kernel versions in the High Availability (HA) pair. This situation is allowed, although takeover may be disabled if the mismatch imposes version differences in the metadata formats (nvram, filesystem, etc.) of the system.

### **Corrective Action**

Upgrade both nodes to the same release.

### **Syslog Message**

Failover monitor: possible kernel mismatch detected local '%s', partner '%s'

### **Parameters**

**myVersion** (STRING): My version

**partnerVersion** (STRING): The partner's version

## **cf.fm.kernelMismatchOk**

### **Severity**

INFORMATIONAL

### **Description**

This event is issued when we detect a possible mismatch of kernel versions in the High Availability (HA) pair has been resolved.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: possible kernel mismatch resolved

**Parameters**

(None).

**cf.fm.launch****Severity**

INFORMATIONAL

**Description**

This event is issued when the failover monitor is launched. It occurs very early in the system startup sequence.

**Corrective Action**

(None).

**Syslog Message**

Launching failover monitor

**Parameters**

(None).

**cf.fm.ImgrVetoOverride****Deprecated**

Deprecated as of version 9.7.

**Severity**

NOTICE

**Description**

This message occurs during an SFO aggregate giveback, when system settings indicate that giveback should be vetoed but the veto was overridden by the automated nondisruptive update procedure. The automated nondisruptive update procedure verifies the expected state of aggregate.

**Corrective Action**

(None).

**Syslog Message**

"%s" subsystem veto was overridden during giveback operation of "%s" aggregate.

**Parameters**

**subsystem** (STRING): Name of the vetoed subsystem.

**aggregate** (STRING): Name of the aggregate.

## **cf.fm.localmbReadStatus**

### **Severity**

INFORMATIONAL

### **Description**

This message reports the status of a local mailbox disk read.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

**returncode** (INT): Status returned by the read of the local mailbox disk.

## **cf.fm.lowMemory**

### **Severity**

ALERT

### **Description**

This message occurs when the local node does not have sufficient memory to run failover monitor services.

### **Corrective Action**

Verify that the recommended amount of memory is installed on the system. If there is sufficient memory, the error might be related to hardware issues. In this case, capture the console logs, and then call NetApp technical support.

### **Syslog Message**

Takeover is disabled due to insufficient memory.

### **Parameters**

(None).

## **cf.fm.MBstatusOnBoot**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs on system boot when the failover monitor detects that no takeover is in progress.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

**Parameters**

**status** (INT): Failover monitor status as reported by the mailbox disk.

**cf.fm.mirrorConsistencyOff****Severity**

ERROR

**Description**

This message occurs when the system discovers that the NVRAM mirror consistency option has been disabled. This option should ONLY be disabled under operator control. If mirror consistency is disabled, a takeover can result in a loss of recently logged data.

**Corrective Action**

Run the "cf enable mirrorconsistency" advanced privilege nodeshell command to reenable mirror consistency.

**Syslog Message**

Failover monitor: NVRAM mirror consistency is disabled.

**Parameters**

(None).

**cf.fm.missingAdapter****Severity**

ERROR

**Description**

This message occurs when the HA mode is set to "ha" but no interconnect adapter is found. This is an error indicating a misconfiguration of the system.

**Corrective Action**

Install the high-availability (HA) interconnect adapter or set the HA mode to "non\_ha" by using the "storage failover modify -mode non\_ha" command.

**Syslog Message**

Warning: HA mode is set to "ha" but the interconnect adapter was not found.

**Parameters**

(None).

**cf.fm.monitorBlocked****Severity**

ERROR

**Description**

This event is issued if the failover monitor has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected (false) takeover.

**Corrective Action**

Check CPU load and make sure system is not over subscribed.

**Syslog Message**

WARNING failover monitor was blocked for %lld secs

**Parameters**

**secs** (LONGINT): Number of seconds that the failover monitor has been blocked

**cf.fm.noearlyrelease****Severity**

INFORMATIONAL

**Description**

This message occurs when an early release of reservations is not done.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**state** (INT): Partner firmware state.

**version** (INT): Partner firmware version.

**cf.fm.nofwUpdateinTO****Severity**

INFORMATIONAL

**Description**

This message occurs when there is no progress in the firmware status received from the partner.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**cf.fm.noICbutFoundMb****Severity**

INFORMATIONAL

**Description**

This message occurs when no firmware state is obtained over the High Availability (HA) interconnect but the mailbox disks are found.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**status** (INT): Status of the active/active configuration based on the mailbox disks.

**cf.fm.nombdisks****Severity**

INFORMATIONAL

**Description**

This messages indicates the status of the local mailbox disks.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**returncode** (INT): Return value from the call to read the local mailbox disks.

**mbstatus** (INT): Current status of the active/active configuration.

**cf.fm.noMBdisksOnSFUP****Severity**

ERROR

**Description**

This message occurs when no local mailbox disks are detected, even though the partner performed a giveback.

**Corrective Action**

Check connectivity to all disks by running the "run local storage show" command on each partner, and then comparing the results.

**Syslog Message**

Could not find the local mailbox disks after a giveback. Check connectivity to all disks.

**Parameters**

(None).

## cf.fm.noMBDisksOrlc

### Severity

ERROR

### Description

This message occurs when Data ONTAP® cannot access the local mailbox disks and cannot determine partner status through the high-availability (HA) interconnect.

### Corrective Action

Check connectivity to all disks by running the "run local storage show" command on each partner, and then comparing the results. Verify that the interconnect cables are properly cabled.

### Syslog Message

Could not find the local mailbox disks. Could not determine the firmware state of the partner through the HA interconnect.

### Parameters

(None).

## cf.fm.noPartnerVariable

### Severity

ERROR

### Description

This message occurs when the system cannot identify the serial number of the partner because the firmware variable is not set.

### Corrective Action

1) Use the "storage failover show" command to verify that that high-availability (HA) is enabled. 2) If HA is enabled, there might be too many environment variables defined. Halt the system, and then enter the "printenv" command at the LOADER prompt. Use the "unsetenv" command to remove unneeded environment variables.

### Syslog Message

Unknown partner serial number: firmware %s variable is not set.

### Parameters

**variable** (STRING): Name of the firmware variable.

## cf.fm.noTakeoverNoRc

### Severity

ERROR

### Description

This message indicates that we cannot do takeover during a no-rc boot.

### Corrective Action

Reboot the node normally

**Syslog Message**

Failover monitor: reboot normally to enable takeover

**Parameters**

(None).

**cf.fm.notkoverBadMbox****Severity**

NOTICE

**Description**

This event is issued when we discover that a mailbox is uninitialized.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: uninitialized %s mailbox data detected

**Parameters**

**whose** (STRING): Indicates which mailbox is uninitialized

**cf.fm.notkoverClusterDisable****Severity**

ERROR

**Description**

This event is issued when we discover that failover between the High Availability (HA) pair has been disabled. Failover may be disabled under operator control or when a condition has been discovered (e.g., kernel mismatch) that necessitates disabling of the HA pair.

**Corrective Action**

Resolve the reason provided in the message.

**Syslog Message**

Failover monitor: takeover disabled (%s)

**Parameters**

**reason** (STRING): The reason code for disabling the HA pair

**cf.fm.notkoverOperatorDeny****Severity**

ERROR

**Description**

This event is issued when we discover that the operator has disabled takeover-by-partner.

**Corrective Action**

If takeover by the partner is desired, re-enable takeover.

**Syslog Message**

Failover monitor: takeover by partner disabled

**Parameters**

(None).

**cf.fm.notkoverOperatorDisableNvram****Severity**

ERROR

**Description**

This event is issued when we discover that the operator has disabled the nvram mirror.

**Corrective Action**

Re-enable NVRAM mirroring

**Syslog Message**

Failover monitor: nvram mirror disabled

**Parameters**

(None).

**cf.fm.overwriteState****Severity**

NOTICE

**Description**

This event is issued when the operator has manually intervened and has forced an overwrite of failover monitor state.

**Corrective Action**

(None).

**Syslog Message**

System continuing after overwriting failover monitor state!

**Parameters**

(None).

**cf.fm.panicAfterToDone****Severity**

ALERT

## Description

This message occurs when a node panics too soon after the completion of a takeover. The node reboots in normal mode to avoid recursive panics.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

Failover monitor: Panic occurred too soon after takeover was completed (currentTime %llu ms, Takeover completed %llu ms).

## Parameters

**currentTime** (LONGINT): Time when the panic occurred.

**ToDoneTime** (LONGINT): Time when the takeover was completed.

## cf.fm.panicInToMode

### Severity

EMERGENCY

### Description

This message occurs when the node panics after taking over the partner node. When the node comes back up, it will do so in takeover mode.

### Corrective Action

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: <http://mysupport.netapp.com/NOW/cgi-bin/pmsg/>. Contact NetApp technical support to confirm the analysis.

### Syslog Message

Failover monitor: Panic in takeover mode; takeover will occur on reboot.

### Parameters

(None).

## cf.fm.panicOnGBforced

### Severity

ALERT

### Description

This message occurs when a node panics while a forced giveback is in progress. The node performs giveback and releases partner resources on reboot.

### Corrective Action

Capture the console log and contact NetApp technical support.

### Syslog Message

Failover monitor: Panic during forced giveback; node will release partner resources on reboot.

**Parameters**

(None).

**cf.fm.panicToInProgress****Severity**

ALERT

**Description**

This message occurs when a node panics while the takeover is in progress. The node reboots in normal mode with takeover disabled.

**Corrective Action**

Capture the console log and contact NetApp technical support.

**Syslog Message**

Failover monitor: Panic during takeover; takeover will be disabled on reboot.

**Parameters**

(None).

**cf.fm.partner****Severity**

INFORMATIONAL

**Description**

This event is issued to announce the name of the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner '%s'

**Parameters**

**partner** (STRING): The name of the High Availability (HA) partner

**cf.fm.partnerChange****Severity**

INFORMATIONAL

**Description**

This event is issued to announce a change in the name of the partner.

**Corrective Action**

(None).

### Syslog Message

Failover monitor: partner hostname has changed: '%s'

### Parameters

**partner** (STRING): The name of the High Availability (HA) partner

## cf.fm.partnerFwState

### Severity

INFORMATIONAL

### Description

This message reports the firmware status of the partner.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**state** (INT): Partner firmware status.

## cf.fm.partnerFwTransition

### Severity

INFORMATIONAL

### Description

This message occurs when there is a change in the partner firmware state.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**prevstate** (STRING): Previously reported partner firmware state.

**newstate** (STRING): New firmware state, as reported by the partner.

**progresscounter** (LONGINT): New progress counter, as reported by the partner.

## cf.fm.partnerICFwVersion

### Severity

INFORMATIONAL

### Description

This message occurs when the partner is using a different version of the interconnect firmware.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**version** (INT): Partner firmware version.

**cf.fm.partnerSysid****Severity**

INFORMATIONAL

**Description**

This event is issued to announce the system id of the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner system id: %u

**Parameters**

**sysid** (LONGINT): The sysid of the High Availability (HA) partner

**cf.fm.partnerSysidChange****Severity**

INFORMATIONAL

**Description**

This event is issued to announce a change in the system id of the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner system id has changed: %u

**Parameters**

**sysid** (LONGINT): The sysid of the High Availability (HA) partner

**cf.fm.partnerVolumesOnline****Severity**

NOTICE

**Description**

This event is issued to indicate that the partner's volumes have been brought on-line as part of early takeover processing.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner volumes on-line

**Parameters**

(None).

**cf.fm.replayOnlyTakeover****Severity**

INFORMATIONAL

**Description**

This event is issued when the failover monitor initiates a replay-only takeover, which essentially means performing takeover till the partner logs have been replayed, and then initiating a giveback.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Starting replay-only takeover. A giveback will be initiated after the partner logs have been replayed.

**Parameters**

(None).

**cf.fm.replayOnReboot****Severity**

INFORMATIONAL

**Description**

This message occurs if a node panics in takeover mode and replay of the partner logs will be attempted on reboot.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: replay of partner logs will be attempted on reboot.

**Parameters**

(None).

**cf.fm.reserveDisksOff****Severity**

EMERGENCY

## Description

This event is issued if we discover that disk reservations have been disabled. If this event occurs, contact NetApp technical support.

## Corrective Action

(Call support).

## Syslog Message

Failover monitor: disk reservations disabled

## Parameters

(None).

## cf.fm.reserveMBproblem

### Severity

ERROR

### Description

This message occurs when ONTAP® cannot reserve a high-availability (HA) partner mailbox disk during a takeover.

### Corrective Action

Check connectivity to all disks by using the "storage disk show -fields diskpathnames" command to verify each node in the HA pair has access to all disks. If some disks are not fully accessible, confirm the disks are correctly cabled. To check whether one HA node cannot access disks that are visible to the HA partner node, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command.

### Syslog Message

Takeover has been aborted because the partner mailbox disk: %s could not be reserved. Error: %u.

### Parameters

**diskname** (STRING): Partner mailbox disk that ONTAP could not reserve.

**disk\_error** (INT): Disk reservation error that was encountered.

## cf.fm.slowTimeoutBlocked

### Severity

NOTICE

### Description

This message occurs when the High Availability slow timeout thread has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected takeover.

### Corrective Action

Check CPU load and make sure system is not over subscribed. Contact NetApp technical support for further assistance.

### Syslog Message

High Availability slow timeout was blocked for %lld secs.

**Parameters**

**secs** (LONGINT): Number of seconds that the High Availability (HA) slow timeout thread has been blocked.

**cf.fm.smsVetoOverride****Deprecated**

Deprecated as of version 9.7.

**Severity**

NOTICE

**Description**

This message occurs during an SFO aggregate giveback, when the SnapMirror® subsystem indicates that giveback should be vetoed but the veto was overridden by the automated nondisruptive update procedure. The automated nondisruptive update procedure verifies the expected state of the aggregate.

**Corrective Action**

(None).

**Syslog Message**

"%s" subsystem veto was overridden during giveback operation of "%s" aggregate.

**Parameters**

**subsystem** (STRING): Name of the vetoed subsystem.

**aggregate** (STRING): Name of the aggregate.

**cf.fm.softError****Severity**

ERROR

**Description**

This event is issued when a "soft error" has occurred in the failover monitor.

**Corrective Action**

Resolve the failure listed in the message.

**Syslog Message**

Failover monitor: %s

**Parameters**

**reason** (STRING): Description of the failure.

**cf.fm.takeoverComplete****Severity**

NOTICE

**Description**

This message occurs when a takeover succeeds.

## Corrective Action

(None).

## Syslog Message

Failover monitor: takeover completed

## Parameters

**token** (STRING): Unique token that identifies a failover instance.

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.takeoverDetectionSeconds.Default

### Severity

ERROR

### Description

This message occurs when the takeover detection time is set to a value less than the `DEFAULT_FIRMWARE_TIMEOUTS` setting. This can result in false takeovers and takeovers without diagnostic core dumps.

### Corrective Action

Modify the takeover detection time to the recommended value by using the "storage failover modify -detection-time" command.

### Syslog Message

Takeover detection time is set to %d seconds, which is below the recommended value of %d seconds. False takeovers and takeovers without diagnostic core dumps might occur.

### Parameters

**SECONDS** (INT): Value that the takeover detection time is set to.

**FIRMWARE\_TIMEOUT\_DEF** (INT): Recommended value.

## cf.fm.takeoverDetectionSeconds.Kernel

### Severity

ERROR

### Description

This message occurs when the takeover detection time is set to a value less than the `KERNEL_TIMEOUT` setting (as specified by the "sk.process.timeout.override" option). This can result in takeovers without accompanying diagnostic core dumps of the taken over node.

### Corrective Action

Set the takeover detection time to the recommended value by using the "storage failover modify -detection-time" command.

### Syslog Message

Takeover detection time is set to %d seconds, which is below %d (= sk.process.timeout.override + 5) seconds. Takeovers without diagnostic core dumps might occur.

## Parameters

**SECONDS** (INT): Value that the takeover detection time is set to.

**KERNEL\_TIMEOUT** (INT): Minimum value that should be used.

## cf.fm.takeoverDuration

### Severity

INFORMATIONAL

### Description

This message occurs when a takeover is completed successfully.

### Corrective Action

(None).

### Syslog Message

Failover monitor: takeover duration time is %llu seconds.

## Parameters

**takeover\_duration** (LONGINT): Takeover duration time.

## cf.fm.takeoverFailed

### Severity

ALERT

### Description

This message occurs when the failover monitor determines that a takeover has failed. The reason code is a string that describes the reason for the failure. Any data LIFs that were migrated as part of the takeover operation are not automatically reverted.

### Corrective Action

Resolve the issue based on the reason logged in the message.

### Syslog Message

Failover monitor: takeover failed '%s'

## Parameters

**reason** (STRING): Internal reason code for the failure.

**token** (STRING): Unique token that identifies a failover instance.

**partner\_node\_uuid** (STRING): UUID of the partner node.

## cf.fm.takeoverStarted

### Severity

NOTICE

### Description

This message occurs when the failover monitor initiates a takeover.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover started

**Parameters**

**token** (STRING): Unique token that identifies a failover instance.

**partner\_node\_uuid** (STRING): UUID of the partner node.

**cf.fm.timeMasterStatus****Severity**

INFORMATIONAL

**Description**

This event is when we determine our status as time master or slave.

**Corrective Action**

(None).

**Syslog Message**

Acting as time %s

**Parameters**

**masterOrSlave** (STRING): Master or Slave

**cf.fm.TODetectionSecs.reset****Severity**

INFORMATIONAL

**Description**

This message occurs when the current setting of takeover detection time is shorter than the minimum takeover detection time allowed by this version of Data ONTAP®. This can result in false takeovers or takeovers without diagnostic core dumps. Data ONTAP resets the takeover detection time to the new minimum.

**Corrective Action**

(None).

**Syslog Message**

Takeover detection time was set to %d seconds, shorter than the minimum allowed. Reset the detection time to a new minimum of %d seconds.

**Parameters**

**SECONDS** (INT): Current takeover detection seconds.

**FIRMWARE\_TIMEOUT\_DEF** (INT): New default takeover detection seconds.

## cf.fm.transitTimeChange

### Severity

INFORMATIONAL

### Description

This message occurs when you set the takeover or giveback transit timeout to a value other than the default value. During takeover or giveback, if the timeout is exceeded by a subsystem during the takeover/giveback processing, a panic occurs. If the timeout is set too high, longer client outages might occur instead of aborting the takeover/giveback.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**SECONDS** (INT): Transit timeout value (in seconds).

**DEFAULT\_VAL** (INT): Default transit timeout value (in seconds).

## cf.fm.undoFailedTakeover

### Severity

NOTICE

### Description

This event is issued when we initiate an undo of a failed takeover.

### Corrective Action

(None).

### Syslog Message

Failover monitor: initiate giveback due to failed takeover

### Parameters

(None).

## cf.fm.unexpectedPartner

### Severity

ERROR

### Description

This message occurs when the HA mode is set to "non\_ha" but the HA mode was set to "ha" previously. This is not an error, but indicates a possible misconfiguration of the system.

### Corrective Action

Determine whether the HA mode should be set to "ha", and if so, set it.

## Syslog Message

Warning: HA mode is set to "non\_ha" but the node once had a storage failover partner.

## Parameters

(None).

## cf.fm.versionMismatch

### Severity

ALERT

### Description

This event occurs when a version mismatch is detected during internode initialization. Each node transmits its version information to its partner. If a mismatch is detected, the High Availability (HA) takeover capability is disabled.

### Corrective Action

Boot both nodes on the same release.

## Syslog Message

Failover monitor: %s version mismatch detected: %d/%d

## Parameters

**subsystem** (STRING): The name of the versioned subsystem

**myVersion** (INT): My version

**partnerVersion** (INT): The partner's version

## cf.fm.waitBeforeWFG

### Severity

INFORMATIONAL

### Description

This message occurs when a system waits, during boot, for a module to come up before declaring itself ready for giveback. Examples include waiting for the NVRAM battery to be charged.

### Corrective Action

(None).

## Syslog Message

Failover monitor: waited %llu seconds for module %s.

## Parameters

**secs** (LONGINT): Amount of time spent waiting, in seconds.

**module\_name** (STRING): Name of the module the system is waiting for.

## cf.fmmbx events

## cf.fmmbx.mccip.policy.enabled

### Severity

NOTICE

### Description

This message occurs when the system has enabled MCCIP mailbox disk IO policy

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

(None).

## cf.fmns events

### cf.fmns.skipped.disk

### Severity

NOTICE

### Description

This message occurs when a node is in "Waiting For Giveback" state and the Failover Monitor Node State (fmns) module skips a local disk while releasing the reservations in that state.

### Corrective Action

(None).

### Syslog Message

While releasing the reservations in "Waiting For Giveback" state Failover Monitor Node State(fmns) module skipped the disk %s that is owned by %u and reserved by %u.

### Parameters

**uid\_string** (STRING): Name of the disk which was skipped by fmns.

**down\_owner** (INT): The system ID of the node that owns this disk.

**resvn\_owner** (INT): The system ID of the node that has a reservation on this disk.

## cf.fsm events

### cf.fsm.autoGBTkoverOnPanic

### Severity

INFORMATIONAL

### Description

This message occurs when a node initiates an automatic giveback to its partner following a takeover that was due to a panic on the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Automatic giveback was initiated following a takeover that was caused by a panic on the partner.

**Parameters**

(None).

**cf.fsm.autoGBTkoverOnReboot****Severity**

INFORMATIONAL

**Description**

This message occurs when a node initiates an automatic giveback to its partner following a takeover that was due to a reboot of the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Automatic giveback was initiated following a takeover that was caused by the partner reboot.

**Parameters**

(None).

**cf.fsm.autoGivebackAttemptsExceeded****Severity**

EMERGENCY

**Description**

This event is issued when auto giveback is disabled due to a ping-pong situation (autoGB followed by t/o followed by autoGB...)

**Corrective Action**

Examine the logs and/or console output from the partner node. Resolve the issue which prevents the node from staying up.

**Syslog Message**

Failover monitor: Automatic giveback is being disabled due to exceeding %d attempts in %d minutes.

**Parameters**

**attempts** (INT): Number of automatic givebacks attempted

**minutes** (INT): Time period where the automatic givebacks were attempted

## cf.fsm.autoGivebackDelayed

### Severity

INFORMATIONAL

### Description

This message occurs when an automatic giveback is delayed because 'Delay Before Auto Giveback' is set to a non-zero number. If you want to eliminate the delay before automatic giveback occurs, you can use the command "storage failover modify -delay-seconds" to set it to zero.

### Corrective Action

(None).

### Syslog Message

Failover monitor: Automatic giveback was delayed by %d seconds due to a non-zero value of 'Delay Before Auto Giveback'.

### Parameters

**seconds** (INT): Number of seconds by which automatic giveback was delayed.

## cf.fsm.autoGivebackReleasingReservations

### Severity

NOTICE

### Description

This event is generated when we release the disk reservations in preparation for an automatic giveback.

### Corrective Action

(None).

### Syslog Message

Failover monitor: Releasing disk reservations in preparation for an automatic giveback

### Parameters

(None).

## cf.fsm.autoGivebackStarted

### Severity

INFORMATIONAL

### Description

This event is issued when an automatic giveback is initiated.

### Corrective Action

(None).

### Syslog Message

Failover monitor: Automatic giveback started

**Parameters**

(None).

**cf.fsm.autoGivebackVetoed****Severity**

ERROR

**Description**

This event is issued when one or more subsystems have vetoed the automatic giveback.

**Corrective Action**

Terminate the long-running jobs and auto giveback will be successful next time it is attempted.

**Syslog Message**

Failover monitor: Automatic giveback has been deferred due to long running operations

**Parameters**

(None).

**cf.fsm.autoTakeoverCancelled****Severity**

NOTICE

**Description**

This event is issued when the failover monitor cancels a pending takeover.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: pending takeover cancelled

**Parameters**

(None).

**cf.fsm.backupMailboxError****Severity**

ERROR

**Description**

This message occurs when the failover monitor determines that an error was observed in the partner's mailbox.

**Corrective Action**

Correct the issues preventing the node from accessing the partner's mailbox disks. Check for cabling, host bus adapter (HBA), storage controller or drive/LUN issues. You can also use Multipathing to provide a redundant connection to the mailbox disk.

**Syslog Message**

Failover monitor: partner mailbox error detected.

**Parameters**

(None).

**cf.fsm.backupMailboxOk****Severity**

NOTICE

**Description**

This event is issued when the failover monitor has determined that an error in the backup's mailbox has been fixed.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: backup mailbox OK

**Parameters**

(None).

**cf.fsm.checkingForBigJobs****Severity**

INFORMATIONAL

**Description**

This event is generated when we want to initiate an automatic giveback and we're checking for long running operations which might veto our plans.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Checking for long running operations in preparation for an automatic giveback.

**Parameters**

(None).

**cf.fsm.cliTakeoverCancelled****Severity**

NOTICE

**Description**

This event is issued when the failover monitor cancels a pending takeover issued through a CLI.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover cannot be performed because of reason (%s)

**Parameters**

**reason** (STRING): Reason why takeover cannot occur

**cf.fsm.firmwareStatus****Severity**

INFORMATIONAL

**Description**

This event is issued when we detect an altered firmware status update from the partner.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner %s

**Parameters**

**reason** (STRING): Partner status

**cf.fsm.givebackHung****Severity**

ALERT

**Description**

This event occurs when the failover monitor detects that the giveback process is hung.

**Corrective Action**

Collect the resulting core file and provide it to Customer Support.

**Syslog Message**

Failover monitor: giveback process is hung ('%s')

**Parameters**

**moduleName** (STRING): The name of the module that the hang occurred in.

**cf.fsm.givebackMaxRetries****Severity**

ALERT

**Description**

This event is called when the giveback retry count has been exceeded. This situation exists when the system is unable either to takeover or giveback. It may be due to either a hardware bug (e.g., the disk

subsystem is hung) or a software bug.

#### **Corrective Action**

Examine the logs and determine why the giveback is failing. Correct that problem and retry the giveback.

#### **Syslog Message**

Failover monitor: giveback has exceeded max retry count

#### **Parameters**

**retries** (INT): Number of retries attempted.

### **cf.fsm.nfo.acceptTakeoverReq**

#### **Severity**

NOTICE

#### **Description**

This message occurs when the system starts a negotiated takeover of its partner, and requests a graceful shutdown of the partner.

#### **Corrective Action**

(None).

#### **Syslog Message**

Negotiated failover: starting takeover and shutdown of partner (%s), will take over in at most %d secs.  
Reason: %s.

#### **Parameters**

**partnerName** (STRING): Name of partner node.

**maxTakeoverTime** (INT): Maximum amount of time to wait for the partner to shut down before starting takeover, in seconds.

**partnerReason** (STRING): Reason for the initiation of the takeover.

### **cf.fsm.nfo.clearReqTakeover**

#### **Severity**

NOTICE

#### **Description**

This event is called when the system clears a request for takeover by its partner.

#### **Corrective Action**

(None).

#### **Syslog Message**

Negotiated failover: clearing partner takeover request

#### **Parameters**

(None).

## **cf.fsm.nfo.delayingGracefulShutdown**

### **Severity**

ERROR

### **Description**

This event is called when the system has been asked to shutdown by its partner as the result of the negotiated failover mechanism, but the system can not shut down due to a specific reason.

### **Corrective Action**

Using the information provided in the message, determine why shutdown cannot be invoked. Resolve that problem and retry the takeover request.

### **Syslog Message**

Negotiated failover: delaying shutdown due to %s

### **Parameters**

**why** (STRING): Indicates the cause of the delay.

## **cf.fsm.nfo.disable**

### **Severity**

ERROR

### **Description**

This event is called when negotiated failover is disabled for a particular module.

### **Corrective Action**

Examine previous messages for failures related to the type of NFO.

### **Syslog Message**

Negotiated failover: disabling negotiated failover for module %s

### **Parameters**

**mod** (STRING): Negotiated failover module or type.

## **cf.fsm.nfo.disable.shelfversion**

### **Severity**

ERROR

### **Description**

This event is called when negotiated failover is disabled due to Shelf Count message version mismatch.

### **Corrective Action**

Upgrade both nodes to the same release.

### **Syslog Message**

Negotiated failover: disabling negotiated failover due to version mis-match.

**Parameters**

(None).

**cf.fsm.nfo.enable****Severity**

NOTICE

**Description**

This event is called when negotiated failover is enabled for a particular module.

**Corrective Action**

(None).

**Syslog Message**

Negotiated failover: enabling negotiated failover for module %s

**Parameters**

**mod** (STRING): NFO module (or type)

**cf.fsm.nfo.gracefulShutdownTimerExpired****Severity**

NOTICE

**Description**

This event is called when the maximum time the system will wait for the partner to shutdown gracefully has passed. At this point the system takes over by force.

**Corrective Action**

(None).

**Syslog Message**

Negotiated failover: partner graceful shutdown appears hung, taking over

**Parameters**

(None).

**cf.fsm.nfo.moduleImpairmentChange****Severity**

ERROR

**Description**

This event is called when a module which is participating in negotiated failover changes from "unimpaired" to "impaired" or vice versa.

**Corrective Action**

Check the state of the module listed in the message.

## Syslog Message

Negotiated failover: module %s is now %s

## Parameters

**mod** (STRING): Type of negotiated failover

**impairment** (STRING): Either unimpaired or impaired

## cf.fsm.nfo.partnerShutdown

### Severity

NOTICE

### Description

This event is called when the system sees that the partner has finished shutting down gracefully during negotiated failover.

### Corrective Action

(None).

## Syslog Message

Negotiated failover: partner has shutdown

## Parameters

(None).

## cf.fsm.nfo.rejectTakeoverReqDueToImpairment

### Severity

ERROR

### Description

This message occurs when the system rejects a request by its partner to take it over because the system is itself impaired.

### Corrective Action

Use the "storage failover show" command to determine why takeover is not possible. Resolve that problem and retry the takeover request.

## Syslog Message

Negotiated failover: rejecting takeover request by partner due to own impairment.

## Parameters

(None).

## cf.fsm.nfo.rejectTakeoverReqDueToOwnReq

### Severity

ERROR

## Description

This event is called when the system rejects a request by its partner to take it over because the system has itself recently requested takeover by its partner. Rejecting this request prevents each system trying to takeover its partner simultaneously. If the partner persists and the system doesn't become impaired the request will soon be granted.

## Corrective Action

Resolve any impairment issues reported in previous messages that would cause takeover. If takeover is requested by the operator, it should only be requested on one node.

## Syslog Message

Negotiated failover: rejecting takeover request by partner due to own recent takeover request.

## Parameters

(None).

## cf.fsm.nfo.startingGracefulShutdown

### Severity

NOTICE

### Description

This event is called when the system has been asked to shutdown by its partner as the result of the negotiated failover mechanism. The system responds by shutting down gracefully, shutting down services in an orderly manner.

### Corrective Action

(None).

### Syslog Message

Negotiated failover: starting graceful shutdown.

### Parameters

(None).

## cf.fsm.nfo.takeoverPendingCancel

### Severity

ERROR

### Description

This message occurs when the system is waiting for the partner to shutdown gracefully and failover is disabled, canceling the pending takeover.

### Corrective Action

Use the "storage failover modify -enabled true" command to reenable failover.

### Syslog Message

Negotiated failover: pending takeover canceled.

**Parameters**

(None).

**cf.fsm.partnerNotResponding****Severity**

NOTICE

**Description**

This event is issued when we detect that the partner node is not responsive.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner not responding

**Parameters**

(None).

**cf.fsm.partnerOk****Severity**

NOTICE

**Description**

This event is issued when we detect that the partner node, which was previously not responsive, is now OK.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: partner ok

**Parameters**

(None).

**cf.fsm.releasingReservations****Severity**

INFORMATIONAL

**Description**

This event is generated when we release the disk reservations in preparation for a manual giveback.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Releasing disk reservations in preparation for giveback

## Parameters

(None).

## cf.fsm.shelfCount.fewerShelves

### Severity

ALERT

### Description

This event is emitted when we detect that the partner sees more of our disk shelves than we do. In other words, it sees more shelves on its FCAL B loop than we see on our A loop. This is probably due to a cabling problem or a broken FCAL host adaptor. If "disk\_shelf" negotiated failover is enabled, this condition should lead to a takeover by the partner if the partner is otherwise able to take us over.

### Corrective Action

Resolve cabling issues which are preventing both nodes from seeing the same disks.

### Syslog Message

Disk shelf count mismatch: partner sees more of our A shelves on its B loop (%d) than we do (%d).

### Parameters

**bShelves** (INT): Number of our shelves which the partner can see

**aShelves** (INT): Number of shelves which we can see

## cf.fsm.stateTransit

### Severity

INFORMATIONAL

### Description

This event is issued when a state transition is detected. Typically, this indication means that the failover monitor is about to either takeover its partner or giveback to its partner. This can happen as the result of timers going off, operator command, or an indication from the partner that a fault has been detected.

### Corrective Action

(None).

### Syslog Message

Failover monitor: %s → %s

### Parameters

**oldState** (STRING): The old failover monitor state.

**newState** (STRING): The new failover monitor state.

**elem** (STRING): The name of the FSM element that has caused the state transition to occur. This value is dependent upon the FSM implementation.

## cf.fsm.takeover.bootingExp

### Severity

ALERT

**Description**

This event is issued when an automatic takeover is initiated after detecting that the partner boot process is hung trying to load the kernel.

**Corrective Action**

Please capture console log of partner filer and contact Customer Support

**Syslog Message**

Failover monitor: automatic takeover attempted after detecting that partner is hung loading kernel while booting

**Parameters**

(None).

**cf.fsm.takeover.disaster****Severity**

INFORMATIONAL

**Description**

This message occurs when an operator-requested disaster recovery (DR) takeover is initiated.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover attempted after "cf forcetakeover -d" command.

**Parameters**

(None).

**cf.fsm.takeover.early****Severity**

INFORMATIONAL

**Description**

This event is issued when a filer takes over its partner while booting up in takeover mode.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover resumption attempted after reboot

**Parameters**

(None).

**cf.fsm.takeover.forced**

**Severity**

INFORMATIONAL

**Description**

This message occurs when an operator-requested forced takeover is initiated.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover attempted after "cf forcetakeover" or "storage failover takeover -option force" in advanced privilege.

**Parameters**

(None).

**cf.fsm.takeover.mdp****Severity**

ALERT

**Description**

This event is issued when an automatic takeover is initiated after detecting that the partner has panicked due to a multi-disk failure

**Corrective Action**

Please check the connectivity of the partner to it's disks and shelves and contact customer support.

**Syslog Message**

Failover monitor: takeover attempted after multi-disk failure on partner

**Parameters**

(None).

**cf.fsm.takeover.ndu****Severity**

INFORMATIONAL

**Description**

This message occurs when an operator-requested takeover is initiated with the "cf takeover -n" or "storage failover takeover -option allow-version-mismatch" command.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover attempted after "cf takeover -n" or "storage failover takeover -option allow-version-mismatch" command.

**Parameters**

(None).

**cf.fsm.takeover.nfo****Severity**

INFORMATIONAL

**Description**

This message occurs when an operator-requested takeover is initiated with the "storage failover takeover" command.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover attempted after "storage failover takeover" command.

**Parameters**

(None).

**cf.fsm.takeover.noHeartbeat****Severity**

ALERT

**Description**

This message occurs when a node detects no heartbeat from the partner, indicating that the partner is not functioning. The node will attempt an automatic takeover.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Failover monitor: Takeover initiated after no heartbeat was detected from the partner node.

**Parameters**

(None).

**cf.fsm.takeover.normal****Severity**

INFORMATIONAL

**Description**

This message occurs when an operator-requested takeover is initiated with the "storage failover takeover -option immediate" command, or when Kernel Cluster Services Connectivity, Liveness and Availability Monitor (CLAM) triggers a takeover after determining that the partner node is out of "CLAM quorum".

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: %s attempted

**Parameters**

**reason** (STRING): Reason a takeover of the partner was triggered. Possible values are "Operator initiated immediate takeover" and "CLAM initiated takeover".

**cf.fsm.takeover.on.halt****Severity**

INFORMATIONAL

**Description**

This message occurs when one node in a high-availability (HA) pair initiates an automatic takeover after detecting that its partner node has halted.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Node initiated automatic takeover after detecting that its partner node has halted.

**Parameters**

(None).

**cf.fsm.takeover.on.reboot****Severity**

INFORMATIONAL

**Description**

This message occurs when one node in a High Availability (HA) pair initiates an automatic takeover after detecting that its partner node is rebooting.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: One node initiated automatic takeover after detecting that its partner node is rebooting.

**Parameters**

(None).

**cf.fsm.takeover.operatorExp****Severity**

NOTICE

**Description**

This event is issued when an automatic takeover is initiated after detecting that the operator timer has expired. This may happen when the operator has failed to respond to a question or not entered a required command during boot.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover attempted after operator timeout expired on partner

**Parameters**

(None).

**cf.fsm.takeover.panic****Severity**

ALERT

**Description**

This message occurs when an automatic takeover is initiated after detecting that the partner has panicked.

**Corrective Action**

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: <http://mysupport.netapp.com/NOW/cgi-bin/pmsg/>. Contact NetApp technical support to confirm the analysis.

**Syslog Message**

Failover monitor: takeover attempted after partner panic.

**Parameters**

(None).

**cf.fsm.takeover.postFailed****Severity**

ALERT

**Description**

This event is issued when an automatic takeover is initiated after detecting that the partner's power-on self-test has failed.

**Corrective Action**

Please run hardware diagnostics on partner filer and contact Customer Support

**Syslog Message**

Failover monitor: takeover attempted after partner POST failed

**Parameters**

(None).

## **cf.fsm.takeover.rebootExp**

### **Severity**

ALERT

### **Description**

This message occurs when an automatic takeover is initiated after detecting that the partner boot process is hung.

### **Corrective Action**

Capture console log of partner node and contact NetApp technical support.

### **Syslog Message**

Failover monitor: automatic takeover attempted after detecting that partner is hung in boot.

### **Parameters**

(None).

## **cf.fsm.takeover.shortUptime**

### **Severity**

ALERT

### **Description**

This message occurs when an automatic takeover is initiated after detecting that the partner died very shortly after booting up.

### **Corrective Action**

Contact NetApp technical support.

### **Syslog Message**

Failover monitor: takeover attempted after partner went down shortly after booting up

### **Parameters**

(None).

## **cf.fsm.takeover.sparecoreExp**

### **Severity**

ALERT

### **Description**

This message occurs when an automatic takeover is initiated by the local node after it detects that the partner node has panicked, and that the partner has not initiated a main memory core dump to disk in a reasonable amount of time.

### **Corrective Action**

Capture the console log of the partner node, and then contact NetApp technical support.

### **Syslog Message**

A takeover was attempted by the local node after sparecore timeout expired on the partner node.

## Parameters

(None).

## cf.fsm.takeoverByPartnerDisabled

### Severity

ERROR

### Description

This message occurs when the failover monitor determines that takeover by the partner is disabled.

### Corrective Action

Find the reason for the error message (it is surrounded by parentheses). Based on that reason, the corrective action is one of the following:

- allowed: Takeover is allowed; you do not need to take any action.
- Controller failover (CFO) is not initialized: Make sure that the high-availability (HA) pair is set up correctly. Contact NetApp technical support if you need assistance.
- Controller is in non-HA mode: Set the HA mode to "ha" by using the "storage failover modify -mode ha" command to activate HA functionality.
- Takeover disabled: Use the "storage failover modify -enabled true" command to reenable HA functionality.
- partner mailbox disks not accessible or invalid: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. Failover monitor version mismatch: Make sure that both the local and partner node are running the same version of Data ONTAP®.
- Takeover disabled by partner: Use the "storage failover modify -enabled true" command to reenable HA functionality.
- Takeover disabled by operator: Use the "storage failover modify -enabled true" command to reenable HA functionality.
- NVRAM size mismatch: Make sure that the local NVRAM (nonvolatile random-access memory) size matches the partner node.
- version mismatch: Make sure that both the local and partner nodes are running the same version of Data ONTAP.
- interconnect error: Make sure that the interconnect link is connected and functioning.
- partner booting: Wait for the partner node to complete its booting process, and then try takeover.
- shelf too hot: Make sure that the disk shelf temperature is properly regulated.
- partner is performing revert: Wait for the partner node to complete the revert process, and then try takeover.
- revert is in progress: Wait for the local node to complete the revert process, and then try takeover.
- partner is attempting takeover: Cannot perform a takeover operation while the partner node is attempting a takeover.
- takeover is in progress: The local node is already taken over or is trying to take over the partner node.
- partner halted in notakeover mode: The partner node was most likely halted using the "halt -f" command; reboot the partner node, and then try again.
- unsynchronized log: Make sure that the interconnect link is connected and functioning.
- unknown notakeover reasons: Contact NetApp technical support.
- waiting for partner to recover: The partner has not booted completely after giveback; wait for the partner to come back up completely.
- low memory: Contact NetApp technical support to upgrade.
- local halt in progress: The local node is about to halt; try again after the reboot.
- status of backup mailbox is uncertain: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled.
- automatic takeover disabled: Use the "storage failover takeover" command manually.
- metrocluster disaster recovery operation is in progress: The local node is performing a MetroCluster(tm) disaster recovery operation; wait for it to finish, and then try again.
- This node or partner node is in switchover state and the MetroCluster configuration option "node-object-limit" is off in the disaster recovery(DR) group of this node: Retry takeover after doing a switchover.

### Syslog Message

Failover monitor: takeover of %s by %s disabled (%s).

### Parameters

**local** (STRING): Name of the local node.

**partner** (STRING): Name of the partner node.

**reason** (STRING): Reason takeover is disabled.

## **cf.fsm.takeoverByPartnerEnabled**

### **Severity**

NOTICE

### **Description**

This event is issued when the failover monitor determines that takeover by the partner has been enabled.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: takeover of %s by %s enabled

### **Parameters**

**local** (STRING): Name of local node

**partner** (STRING): Name of partner node

## **cf.fsm.takeoverCountdown**

### **Severity**

INFORMATIONAL

### **Description**

This event is issued as part of the takeover countdown processing in the FSM.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: takeover scheduled in %d seconds

### **Parameters**

**secsTillTakeover** (INT): Number of seconds until takeover occurs

## **cf.fsm.takeoverDelayed**

### **Severity**

NOTICE

### **Description**

This event is issued when we are delaying takeover due to status indications received from the partner.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: takeover delayed, partner %s

## Parameters

**reason** (STRING): Description of why takeover is being delayed  
**secsTillTakeover** (INT): Number of seconds until takeover will be started

## cf.fsm.takeoverHung

### Severity

EMERGENCY

### Description

This message occurs when the failover monitor detects that the takeover process is hung. Subsequent to this event, the takeover node will panic.

### Corrective Action

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: <http://mysupport.netapp.com/NOW/cgi-bin/pmsg/>. Contact NetApp technical support to confirm the analysis.

### Syslog Message

Failover monitor: takeover process is hung ('%s').

## Parameters

**moduleName** (STRING): Name of the module that the hang occurred in.

## cf.fsm.takeoverOfPartnerDisabled

### Severity

ERROR

### Description

This message occurs when the failover monitor determines that takeover of the partner is disabled.

### Corrective Action

Find the reason for the error message (it is surrounded by parentheses). Based on that reason, the corrective action is one of the following: -allowed: Takeover is allowed; you do not need to take any action. -Controller failover (CFO) is not initialized: Make sure that the high-availability (HA) pair is set up correctly. Contact NetApp technical support for assistance. -Controller is in non-HA mode: Set HA mode to "ha" by using the "storage failover modify -mode ha" command to activate HA functionality. -HA takeover disabled: Use the "storage failover modify -enabled true" command to reenab HA functionality. -partner mailbox disks not accessible or invalid: Check connectivity to all disks by running the "storage show" nodeshell command on each node and comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. -failover monitor version mismatch: Make sure that both the local and partner node are running the same version of Data ONTAP®. -Takeover disabled by partner: Use the "storage failover modify -enabled true" command to reenab HA functionality. -Takeover disabled by operator: Use the "storage failover modify -enabled true" command to reenab HA functionality. -NVRAM size mismatch: Make sure that the local NVRAM (nonvolatile random-access memory) size matches the partner node. -version mismatch: Make sure that both the local and partner nodes are running the same version of Data ONTAP. -interconnect error: Make sure that the interconnect link is connected and functioning. -partner booting: Wait for the partner node to complete its booting process, and then try takeover. -shelf too hot: Make sure that the disk shelf temperature is properly regulated. -partner is performing revert: Wait for the partner node to complete the revert process, and then try takeover. -revert is in progress: Wait for the local node to complete the revert process, and then try

takeover. -partner is attempting takeover: Cannot perform a takeover operation while the partner node is attempting a takeover. -takeover is in progress: The local node is already taken over or is trying to take over the partner node. -partner halted in notakeover mode: The partner node was most likely halted using the "halt -f" or "system node halt -inhibit-takeover" command; reboot the partner node, and then try again. -unsynchronized log: Make sure that the interconnect link is connected and functioning. -unknown notakeover reasons: Contact NetApp technical support. -waiting for partner to recover: The partner has not booted completely after giveback; wait for the partner to come back up completely. -low memory: Contact NetApp technical support to upgrade. -local halt in progress: The local node is about to halt; try again after the reboot. -status of backup mailbox is uncertain: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. -automatic takeover disabled: Use the "storage failover takeover" command manually. -metrocluster disaster recovery operation is in progress: The local node is performing a MetroCluster(tm) disaster recovery operation; wait for it to finish, and then try again. -This node or the partner node is in switchover state and the MetroCluster configuration option "node-object-limit" is off in the disaster recovery(DR) group of this node: Retry takeover after doing a switchback.

### Syslog Message

Failover monitor: takeover of %s disabled (%s).

### Parameters

**partner** (STRING): Name of the partner node.  
**reason** (STRING): Description of why takeover cannot occur.

## cf.fsm.takeoverOfPartnerEnabled

### Severity

NOTICE

### Description

This event is issued when the failover monitor determines that takeover of the partner has been enabled.

### Corrective Action

(None).

### Syslog Message

Failover monitor: takeover of %s enabled

### Parameters

**partner** (STRING): Name of partner node

## cf.giveback events

### cf.giveback.delayed.cleanup

### Severity

INFORMATIONAL

### Description

This message occurs when giveback of a partner node is delayed due to the cleanup of a previous giveback event.

## Corrective Action

(None).

## Syslog Message

Failover monitor: giveback process was delayed because of a previous giveback event.

## Parameters

(None).

## cf.giveback.disk.check.fail

### Severity

ALERT

### Description

This message occurs when the giveback failed due to a disk inventory check failure.

### Corrective Action

If the giveback failed or is disabled because the node did not receive the disk inventory information from the partner, then retry giveback after a few minutes. If the giveback failed or is disabled because the partner is missing its disks, make sure that the partner has connectivity to all of its disks. To check the list of disks that the partner can see, boot the partner in Maintenance mode and use the "disk show" command or "storage show disk" command to list its disks. To check for missing disks, use the "storage failover show -instance" command. If you want to override the disk inventory check, use the "cf disable diskInventory" command from the advanced privilege level of the nodeshell on the takeover node. However, disabling the disk inventory check can lead to client outage if the partner cannot see all of its disks.

### Syslog Message

cf giveback failed: %s.

### Parameters

**reason** (STRING): Reason for the disk inventory failure.

## cf.giveback.keepingPartnerAggr

### Severity

ERROR

### Description

This message occurs during the giveback process following a failed takeover attempt, when an aggregate belonging to the partner node is not given back to the partner node. The reason is that the aggregate was already under the control of the node performing the takeover before the takeover attempt. Only aggregates that are acquired during the failed takeover attempt are given back.

### Corrective Action

Give back the aggregate to the partner node by using the "storage failover giveback" command.

### Syslog Message

Not giving back aggregate '%s' because it was under the control of this node prior to the failed takeover attempt.

## Parameters

**aggr** (STRING): Name of the aggregate that was not given back.

# cf.headswap events

## cf.headswap.abort

### Severity

INFORMATIONAL

### Description

This message occurs when the headswap on the partner node is aborted.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**partner\_sysid** (LONGINT): Value of the partner system ID after aborting the headswap.

## cf.headswap.clear.partner

### Severity

INFORMATIONAL

### Description

This message occurs when the disks are manually reassigned to a new partner. The head swap information has been cleared.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

(None).

## cf.headswap.complete

### Severity

INFORMATIONAL

### Description

This message occurs when the headswap of a node is completed.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**old\_sysid** (LONGINT): Value of the partner system ID before completion of the headswap.

**new\_sysid** (LONGINT): Value of the partner system ID after completion of the headswap.

## cf.headswap.detected.local

### Severity

INFORMATIONAL

### Description

This message occurs when a headswap on the local node is detected.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**old\_local\_sysid** (LONGINT): System ID of the node that is being replaced.

**new\_local\_sysid** (LONGINT): System ID of the new node that is replacing the old node.

## cf.headswap.detected.partner

### Severity

INFORMATIONAL

### Description

This message occurs when a headswap on the partner node is detected.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**old\_partner\_sysid** (LONGINT): System ID of the partner that is being replaced.

**new\_partner\_sysid** (LONGINT): System ID of the new partner that is replacing the old partner.

## cf.headswap.state.change

### Severity

INFORMATIONAL

### Description

This message occurs when the headswap state changes. The headswap state is written to the primary mailbox. The possible values are HEADSWAP\_NONE, HEADSWAP\_START, HEADSWAP\_CFO\_START,

HEADSWAP\_CFO\_END, and HEADSWAP\_SFO\_START.

#### **Corrective Action**

(None).

#### **Syslog Message**

(None).

#### **Parameters**

**old\_state\_string** (STRING): Old value of the headswap state.

**new\_state\_string** (STRING): New value of the headswap state.

## **cf.hwassist events**

### **cf.hwassist.Default.NodemgmtAddr**

#### **Severity**

INFORMATIONAL

#### **Description**

This message occurs when the hardware-assist module automatically picked a local IP address for the hardware-assisted takeover feature.

#### **Corrective Action**

(None).

#### **Syslog Message**

The system automatically chose %s as the local hardware-assist IP address.

#### **Parameters**

**defaultip** (STRING): Default hardware-wassist IP address chosen to receive hardware assist alerts.

### **cf.hwassist.DefaultEnabled**

#### **Severity**

INFORMATIONAL

#### **Description**

This message occurs when the system automatically enables the hardware-assist takeover feature. With hardware-assisted takeover, certain failures, such as watchdog reset, POST error, and so on, trigger hardware-assisted takeover through hardware components such as Remote LAN Module (RLM) or Service Processor (SP).

#### **Corrective Action**

(None).

#### **Syslog Message**

Hardware-assisted takeover feature is enabled on this system. The partner can take over this node faster during certain failures.

## Parameters

(None).

## cf.hwassist.DefaultPrtnrAddr

### Severity

NOTICE

### Description

This message occurs when the hardware-assist partner address is not configured and the system automatically picked a partner IP address for the hardware-assisted takeover feature. If a partner node has multiple node management IP addresses, a different partner node management IP address can optionally be set by using the "storage failover modify -hwassist-partner-ip" command. Note: the automatically configured IP address cannot be modified on some platforms.

### Corrective Action

(None).

### Syslog Message

The system automatically chose %s as the hardware-assisted takeover partner address.

## Parameters

**defaultip** (STRING): Default hardware-assist partner IP address chosen to send hardware-assisted takeover alerts.

## cf.hwassist.DefaultPrtnrPort

### Severity

NOTICE

### Description

This message occurs when the partner's port for the hardware-assisted takeover feature is not configured and the system sets the hardware-assist partner port to a default port number. A different partner port number can optionally be set by using the "storage failover modify -hwassist-partner-port" command. Note: the default port number cannot be modified on some platforms.

### Corrective Action

(None).

### Syslog Message

The system set the default hardware-assist partner port number to %d.

## Parameters

**defaultport** (INT): Default hardware-assist partner port number.

## cf.hwassist.empty.MgmtAddr

### Severity

ERROR

**Description**

This message occurs when the local hardware-assist module cannot find at least one node management IP address that has the same capabilities as the partner's hardware components, such as Remote LAN Module (RLM) or Service Processor (SP).

**Corrective Action**

Complete or correct the setup of the Remote LAN Module (RLM) or Service Process (SP) for each node in your cluster.

**Syslog Message**

Cannot find hardware-assist node management IP address for partner node.

**Parameters**

(None).

**cf.hwassist.empty.NodemgmtAddr****Deprecated**

Deprecated as of version 9.1.

**Severity**

ERROR

**Description**

This message occurs when the local hardware-assist module cannot find at least one node management IP address that has the same capabilities as the partner's hardware components, such as Remote LAN Module (RLM) or Service Processor (SP).

**Corrective Action**

Complete or correct the setup of the Remote LAN Module (RLM) or Service Process (SP) for each node in your cluster.

**Syslog Message**

Cannot find hardware-assist node management IP address for partner node.

**Parameters**

(None).

**cf.hwassist.FwUpgrade****Severity**

ERROR

**Description**

This message occurs when hwassist thread detects that partner's hw\_assist hardware firmware does not support hw\_assist feature.

**Corrective Action**

Upgrade the partner hw\_assist hardware firmware to the latest version.

## Syslog Message

HA hw\_assist: Partner(%s) %s firmware does not support the hw\_assist feature.

## Parameters

**partnerName** (STRING): Partner's name.

**hwassist\_hrdwr** (STRING): Type of hw\_assist hardware, for example, Remote LAN module(RLM) or Service Processor(SP).

## cf.hwassist.hwasstActive

### Severity

INFORMATIONAL

### Description

This message occurs when hw\_assist successfully binds to a port to listen for alerts.

### Corrective Action

None.

## Syslog Message

hw\_assist: hw\_assist functionality is active on IP address: %s port: %d

## Parameters

**ipaddress** (STRING): IP address to which bind was attempted.

**port** (INT): Port on which bind was attempted.

## cf.hwassist.invalidConfig

### Severity

NOTICE

### Description

This message occurs when the system encounters invalid hardware-assist configurations.

### Corrective Action

(None).

## Syslog Message

Invalid hardware-assist configurations. IPv4: %s IPv6: %s port: %d keep\_alive\_interval: %d

## Parameters

**ipv4** (STRING): Partner node IPv4 address.

**ipv6** (STRING): Partner node IPv6 address.

**port** (INT): Partner node hardware-assist port number.

**keep\_alive\_interval** (INT): Hardware-assist keep-alive interval.

## cf.hwassist.IpNotConfigured

### Severity

ERROR

## Description

This message occurs when the hwassist thread detects that the partner's hw\_assist hardware is not configured with an IPv4 or IPv6 address.

## Corrective Action

Configure a valid IPv4 or IPv6 address for the partner's hw\_assist hardware by using the "storage failover modify -hwassist-partner-ip" command.

## Syslog Message

cf hw\_assist: Partner(%s)'s %s is not configured with the right IP address family. Use the "storage failover hwassist show" command for details.

## Parameters

**partnerName** (STRING): Partner's name.

**hwassist\_hrdwr** (STRING): Type of hw\_assist hardware, for example, RLM.

## cf.hwassist.keyMismatch

### Severity

NOTICE

### Description

This message occurs when hwassist receives a alert with wrong key. EMS displays both the expected and the received keys.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**expectedKey** (STRING): Expected key, generated by Failover Monitor(FM).

**receivedKey** (STRING): Received key from hwassist hardware.

**systemid** (STRING): Received systemid.

## cf.hwassist.localMonitor

### Severity

ERROR

### Description

This message occurs when hwassist thread is inactive because of problems on local node.

### Corrective Action

check console log for cf.hwassist\_socBindFailed message. If message exist, take corrective action for that message.

### Syslog Message

hw\_assist: hw\_assist functionality is inactive.

## Parameters

(None).

## cf.hwassist.missedKeepAlive

### Severity

ERROR

### Description

This message occurs when the HW-assisted takeover process on this node has not received keep-alive messages from its HA partner.

### Corrective Action

Use the "storage failover hwassist show" command to verify the status of the HW-assisted takeover feature. If the 'Keep Alive Status' field reports "healthy", it is functional. If the "storage failover hwassist show" command "Keep Alive Status" field reports "did not receive hwassist keep alive alerts from partner" and the "storage failover hwassist stats show" command shows the value of the "ID\_mismatch" is incrementing, disable the service-processor (SP or BMC) IPv4 or IPv6 network interfaces and then reenabling them, as stated below. Use the "system service-processor network show" command to display the current network configuration. Note whether the IPv4 or IPv6 address-family is enabled. You need this information in the next steps. Perform the following on each node that has an issue: Disable the interface for an address-family by using the "sp network modify -node {name} -address-family {IPv4|IPv6} -enable false" command. Then, reenabling the interface for an address-family by setting "-enable true" via the above command.

### Syslog Message

HW-assisted takeover missing keep-alive messages from HA partner (%s).

### Parameters

**partnerName** (STRING): HA partner name.

## cf.hwassist.noConfigRecv

### Severity

ERROR

### Description

This message occurs when hwassist thread has not received any config info from partner.

### Corrective Action

None.

### Syslog Message

hw\_assist: hw\_assist functionality inactive. No config received from partner(%s).

### Parameters

**partnerName** (STRING): Partner's name.

## cf.hwassist.notCapable

### Severity

ERROR

## Description

This message occurs when the currently installed firmware version of the hardware module doesn't support the hardware-assisted takeover feature.

## Corrective Action

Upgrade the hardware module firmware to the latest version.

## Syslog Message

Currently installed version of %s's firmware doesn't support the hardware-assist takeover feature. Install a latest firmware for the hardware-assist takeover feature to work.

## Parameters

**hwtype** (STRING): Hardware module type.

## cf.hwassist.notifyCfgFailed

### Severity

ALERT

### Description

This message occurs when a controller module fails to update the hardware-assist configuration with its partner node. This is most likely because the SP component is not ready. The controller module will retry the hardware-assist configuration update automatically.

### Corrective Action

Use the `""system node service-processor show""` command to check whether the SP is online. The SP must be online to update the hardware-assist configuration. If the SP is operational and online, use the `""system node service-processor reboot-sp""` command to reboot the SP. If the message persists, contact NetApp technical support.

### Syslog Message

Failed to update the hardware-assist configuration with hardware component (%s): %s(%d).

### Parameters

**hwtype** (STRING): Hardware component type.

**errorstr** (STRING): Error string returned by the hardware component.

**error** (INT): Error number returned by the hardware component.

## cf.hwassist.notifyEnableOff

### Severity

INFORMATIONAL

### Description

This message occurs when the hwassist thread detects that 'notify enable' is turned off on the partner node.

### Corrective Action

None.

### Syslog Message

HA hw\_assist: hw\_assist functionality on the partner node has been disabled by the user.

**Parameters**

(None).

**cf.hwassist.notifyEnableOn****Severity**

INFORMATIONAL

**Description**

This message occurs when the user enables hw\_assist functionality on the partner node. hw\_assist will try to bind to the specified IP address and port.

**Corrective Action**

None.

**Syslog Message**

HA hw\_assist: hw\_assist functionality on the partner node has been enabled by the user.

**Parameters**

(None).

**cf.hwassist.ptnStartThrottle****Severity**

INFORMATIONAL

**Description**

This message occurs when partner has started throttling hw\_assist alerts. UDP socket will be closed and no alerts will be received.

**Corrective Action**

(None).

**Syslog Message**

Failover Monitor hw\_assist: Partner(%s) node has started throttling hw\_assist alerts.

**Parameters**

**partnerName** (STRING): Partner's name

**cf.hwassist.ptnStopThrottle****Severity**

INFORMATIONAL

**Description**

This message occurs when partner has stopped throttling hw\_assist alerts. hw\_assist will bind to UDP socket and wait for alerts.

**Corrective Action**

(None).

## Syslog Message

hw\_assist: Partner(%s) has stopped throttling hw\_assist alerts.

## Parameters

**partnerName** (STRING): Partner's name

## cf.hwassist.recvKeepAlive

### Severity

INFORMATIONAL

### Description

This message occurs when hwassist thread receives hw\_assist KeepAlive alert after missing at least two consecutive KeepAlive alerts.

### Corrective Action

(None).

## Syslog Message

hw\_assist: Received hw\_assist KeepAlive alert from partner(%s).

## Parameters

**partnerName** (STRING): Partner's name

## cf.hwassist.socBindFailed

### Severity

ERROR

### Description

This message occurs when hwassist thread fails to bind to a socket on a particular ipaddress. The error indicates why bind failed.

### Corrective Action

Check if specified port and IP address is valid. You may want to try with a different recommended port number.

## Syslog Message

hw\_assist: bind failed to port %d on IP address %s. Error %d

## Parameters

**port** (INT): Port on which bind was attempted.

**ipaddress** (STRING): IP address to which bind was attempted.

**error** (INT): error returned by bind call

## cf.hwassist.socInitFailed

### Severity

NOTICE

## Description

This message occurs when hwassist thread fails to create socket.

## Corrective Action

None.

## Syslog Message

hw\_assist: Fail to create socket.

## Parameters

(None).

## cf.hwassist.startThrottle

### Severity

NOTICE

### Description

This message occurs when the hardware assist subsystem thread detects that it is receiving hardware assist alerts at a rate higher than the maximum configurable rate and has temporarily stopped listening for hardware assist alerts. This can be an indication that another client is configured to send SNMP traps to the hardware assist trap IP address and port. If the partner node fails while listening for hardware assist alerts is disabled, detection of the partner failure can take slightly longer as loss of heartbeat from the partner or other non-hardware-assisted mechanism is instead needed to detect the failure. Subsequent receipt of the cf.hwassist.stopThrottle message indicates the hardware assist thread is again listening for hardware assist alerts.

### Corrective Action

Check whether some other client is configured to send SNMP alerts to the IP address and port on which hardware assist is configured. You can obtain the IP address using the ""storage failover hwassist show"" command. If this is the case, direct those SNMP alerts to the correct IP address and port. If not, contact NetApp technical support to further diagnose the issue.

### Syslog Message

hw\_assist: Received %llu hw\_assist alerts in %llu secs. Throttling alerts for %llu secs.

### Parameters

**num\_of\_traps** (LONGINT): Number of traps received.

**time\_interval** (LONGINT): Time window in which the traps were received.

**throttle\_time** (LONGINT): Time for which throttle will happen.

## cf.hwassist.stopThrottle

### Severity

NOTICE

### Description

This message occurs when a node has stopped throttling hardware assist alerts from the partner. This indicates the hardware assist thread has restarted listening for hardware assist alerts subsequent to the receipt of the cf.hwassist.startThrottle event.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor hw\_assist: Shutting off throttle for hw\_assist alerts from partner(%s).

### **Parameters**

**partnerName** (STRING): Partner's name.

## **cf.hwassist.takeoverTrapRecv**

### **Severity**

NOTICE

### **Description**

This message occurs when hwassist thread receives a hw\_assist alert which will result in partner takeover. EMS displays trap type as well as reason for the trap.

### **Corrective Action**

(None).

### **Syslog Message**

hw\_assist: Received takeover hw\_assist alert from partner(%s), %s because %s.

### **Parameters**

**partnerName** (STRING): Partner's name  
**trap\_type** (STRING): Type of trap received  
**trap\_event** (STRING): Type of trap event

## **cf.hwassist.unknownSig**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when hwassist thread receives an unknown signal.

### **Corrective Action**

None.

### **Syslog Message**

hw\_assist: Received unknown signal 0x%x.

### **Parameters**

**sigmask** (INT): Signal received by hwassist thread.

## **cf.ic events**

## **cf.ic.cc.config.changed**

### **Severity**

NOTICE

### **Description**

This message occurs when the controller configuration is changed from a single enclosure HA configuration to a dual enclosure HA configuration.

### **Corrective Action**

If the controller is part of a dual enclosure HA configuration, make sure that the psm-cc-config? environment variable is unset and reboot.

### **Syslog Message**

HA interconnect: Controller configuration was changed from single enclosure HA configuration to dual enclosure HA configuration.

### **Parameters**

(None).

## **cf.ic.clientinitFailed**

### **Severity**

ERROR

### **Description**

This message occurs when the interconnect client fails to initialize due to remote VI setup failure.

### **Corrective Action**

Reboot the controller. Contact NetApp technical support if the problem persists.

### **Syslog Message**

HA interconnect: Initialization failure for %s client.

### **Parameters**

**client** (STRING): Name of the client that failed to initialize.

## **cf.ic.disabled**

### **Severity**

ERROR

### **Description**

This message occurs when the HA interconnect is disabled by the ic-type environment variable.

### **Corrective Action**

Either remove the HA interconnect from the controller or change the ic-type environment variable.

### **Syslog Message**

HA interconnect: Card in slot %d has been disabled because of the ic-type environment variable.

**Parameters**

**slot** (INT): Slot that the interconnect is in.

**cf.ic.driver.flush.idWarn****Severity**

NOTICE

**Description**

This message occurs when the HA interconnect cannot process a flush request for a particular driver I/O request.

**Corrective Action**

(None).

**Syslog Message**

HA interconnect: Flush %s failed for channel %d and ID %d.

**Parameters**

**s** (STRING): Name of the error.

**nvidx** (INT): Interconnect channel.

**wrid** (INT): Work request ID.

**cf.ic.failed.memReg****Severity**

INFORMATIONAL

**Description**

This message occurs when memory registration fails.

**Corrective Action**

(None).

**Syslog Message**

HA interconnect: Memory registration operation failed at %d.

**Parameters**

**source** (INT): Source for the memory operation.

**cf.ic.flush.ACKWarn****Severity**

NOTICE

**Description**

This message occurs when the HA interconnect cannot send acknowledgments through its completion channel.

**Corrective Action**

(None).

**Syslog Message**

HA interconnect: Flush completion %s error.

**Parameters**

s (STRING): Name of the error.

**cf.ic.flush.MemError****Severity**

ERROR

**Description**

This message occurs during boot time initialization, when the HA interconnect encounters an error with memory registration or allocation.

**Corrective Action**

Reboot the controller to restart the HA interconnect. Contact NetApp technical support if the problem persists.

**Syslog Message**

HA interconnect: Flush memory %s error.

**Parameters**

s (STRING): Name of the error.

**cf.ic.flush.oodlinitFailed****Severity**

ERROR

**Description**

This message occurs when there is a failure in the initialization of a NIC to enable out-of-order delivery on the HA interconnect.

**Corrective Action**

Reboot the controller to enable HA interconnect flushing. Contact NetApp technical support if the problem persists.

**Syslog Message**

HA interconnect: Flush out-of-order delivery initialization failed.

**Parameters**

(None).

**cf.ic.heartBeatFailed**

**Severity**

ERROR

**Description**

This message occurs when heartbeats cannot be sent or received over the HA interconnect.

**Corrective Action**

Verify that both controllers in the HA pair are operational. If this message persists, disable and reenab the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

**Syslog Message**

HA interconnect: Heartbeat failed.

**Parameters**

(None).

**cf.ic.initFailed****Severity**

ERROR

**Description**

This message occurs when the driver fails to find an HA interconnect adapter or the interconnect is nonfunctional.

**Corrective Action**

Verify that the High Availability interconnect card is present and operational on the system. Reboot the controller. Contact NetApp technical support if this problem persists.

**Syslog Message**

HA interconnect: Unable to initialize process.

**Parameters**

(None).

**cf.ic.non.cc.config.changed****Severity**

NOTICE

**Description**

This message occurs when the controller configuration is changed from a dual enclosure HA configuration to a single enclosure HA configuration.

**Corrective Action**

If the controller is part of single enclosure HA configuration, make sure that the other controller is physically present in the chassis and that the psm-cc-config? environment variable is set to true, and then reboot.

## Syslog Message

HA interconnect: Controller configuration was changed from dual enclosure HA configuration to single enclosure HA configuration.

## Parameters

(None).

## cf.ic.notifyTimeout

### Severity

NOTICE

### Description

This message occurs when data transfer over the HA interconnect times out.

### Corrective Action

(None).

## Syslog Message

HA interconnect: %s transfer timed out.

## Parameters

**qp\_name** (STRING): Queue-pair name.

## cf.ic.portsCrossConnected

### Severity

ALERT

### Description

This message occurs when the HA interconnect driver determines that the ports between this controller and its partner are cross-connected.

### Corrective Action

Connect port 1 on this controller to port 1 on the partner, and connect port 2 on this controller to port 2 on the partner. If the interconnect cables have serial number tags on both ends, use the serial numbers to verify that the ports are properly connected. If the interconnect cables do not have serial number tags, disconnect one of the HA interconnect ports from one of the controllers. The LEDs of this port and one of the ports on the partner turn off. If the two ports have different port numbers, the cables are cross-connected. Reversing the connection on one of the controllers rectifies the problem.

## Syslog Message

HA interconnect: Port %d of this controller seems to be connected to port %d on the partner.

## Parameters

**localPort** (INT): Local port number.

**remotePort** (INT): Remote port number.

## cf.ic.probe.error

**Severity**

ALERT

**Description**

This event is generated when we fail to detect an High Availability (HA) interconnect communication device during system initialization. If this error occurs, internode communication within the HA pair is down.

**Corrective Action**

Examine the logs for messages regarding the HA interconnect. Resolve the HA interconnect problems.

**Syslog Message**

Failover monitor: no interconnect found WARNING: Failover monitor operating in degraded mode

**Parameters**

**errorCode** (INT): The internal error code

**cf.ic.sbb****Severity**

NOTICE

**Description**

This message occurs when a system SBB (Storage Bridge Bay) Compatibility event occurs. SBB Compatibility events determine the presence or absence of the HA partner controller on some platforms.

**Corrective Action**

(None).

**Syslog Message**

HA interconnect: SBB Compatibility Event. %s

**Parameters**

**event\_description** (STRING): Presence or absence of the partner controller and what action has been taken on the interconnect device.

**cf.ic.xferTimedOut****Severity**

ERROR

**Description**

This message occurs when data transfer over the HA interconnect times out. This is usually seen when the interconnect link goes down. It can also be encountered when the interconnect hardware, firmware, or driver experiences a hang.

**Corrective Action**

Contact NetApp technical support if the problem persists.

**Syslog Message**

HA interconnect: %s transfer timed out.

## Parameters

**qp\_name** (STRING): Name of the connection queue-pair that timed out.

## cf.ic.xferTimedOutVSA

### Severity

NOTICE

### Description

This message occurs when data transfer over the high-availability (HA) interconnect times out on virtual platforms. This is usually seen when the underlying network is busy or the system is operating under heavy load.

### Corrective Action

Contact NetApp technical support if the problem persists.

### Syslog Message

HA interconnect: %s transfer timed out.

## Parameters

**qp\_name** (STRING): Name of the connection queue-pair that timed out.

## cf.mccip events

### cf.mccip.med.auso.stDisabled

### Severity

ERROR

### Description

This message occurs when automatic switchover in a MetroCluster(tm) IP configuration is disabled because the mediator mailbox disk is not healthy.

### Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that iSCSI connections to the mediator are up and healthy.

### Syslog Message

Automatic switchover disabled: Mediator mailbox disk not healthy.

## Parameters

(None).

### cf.mccip.med.auso.stEnabled

### Severity

NOTICE

**Description**

This message occurs when automatic switchover in a MetroCluster(tm) IP configuration is enabled because the mediator mailbox disk is online.

**Corrective Action**

(None).

**Syslog Message**

Automatic switchover enabled.

**Parameters**

(None).

## cf.misc events

### cf.misc.givebackPartnerNotReady

**Severity**

NOTICE

**Description**

The message occurs when a giveback is initiated before the partner has reached waiting-for-giveback state.

**Corrective Action**

(None).

**Syslog Message**

Giveback is being initiated before the partner is in the waiting-for-giveback state. The partner is in the %s state.

**Parameters**

**state** (STRING): Current state of the partner.

### cf.misc.operatorDisable

**Severity**

ERROR

**Description**

This message occurs when the operator disables the high-availability (HA) pair.

**Corrective Action**

Use the "storage failover modify -enabled true" command to reenable failover.

**Syslog Message**

Failover monitor: operator initiated disabling of takeover.

**Parameters**

(None).

## **cf.misc.operatorDisableOption**

### **Severity**

ERROR

### **Description**

This event is issued when the operator disables a High Availability (HA) option.

### **Corrective Action**

Re-enable the option

### **Syslog Message**

(None).

### **Parameters**

**option** (STRING): Name of the option

## **cf.misc.operatorEnable**

### **Severity**

NOTICE

### **Description**

This event is issued when the operator enables failover between the 2 nodes.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: operator initiated enabling of failover.

### **Parameters**

(None).

## **cf.misc.operatorEnableOption**

### **Severity**

NOTICE

### **Description**

This event is issued when the operator enables a controller failover option.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

**option** (STRING): Name of the option

## cf.misc.operatorForcedTakeover

### Severity

NOTICE

### Description

This event is issued when a forced takeover is initiated by the operator.

### Corrective Action

(None).

### Syslog Message

Failover monitor: forced takeover initiated by operator

### Parameters

(None).

## cf.misc.operatorGiveback

### Severity

INFORMATIONAL

### Description

This event is issued when a giveback is initiated by the operator.

### Corrective Action

(None).

### Syslog Message

Failover monitor: %s initiated by operator

### Parameters

**strengthString** (STRING): External string

**strengthCode** (INT): Internal code for strength

## cf.misc.operatorTakeover

### Severity

NOTICE

### Description

This event is issued when a takeover is initiated by the operator.

### Corrective Action

(None).

### Syslog Message

Failover monitor: takeover initiated by operator

**Parameters**

(None).

**cf.misc.ProgTakeover****Severity**

NOTICE

**Description**

This message is issued when a takeover is initiated programmatically by Data ONTAP®.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: takeover initiated.

**Parameters**

(None).

**cf.misc.ProgTakeoverFail****Severity**

NOTICE

**Description**

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails.

**Corrective Action**

Check the reason string and repair the problem reported.

**Syslog Message**

Failover monitor: Programmatic takeover failed (%s)

**Parameters**

**errorstr** (STRING): Error string returned by the failover monitor.

**cf.misc.ProgTakeoverFailInit****Severity**

NOTICE

**Description**

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails because the controller is set to "non\_ha" mode or is not initialized.

**Corrective Action**

Set the HA mode to "ha" by using the "storage failover modify -mode ha" command, and then reboot the node.

**Syslog Message**

Failover monitor: Programmatic takeover failed due to initialization issues.

**Parameters**

(None).

**cf.misc.ProgTakeoverFailInTO****Severity**

NOTICE

**Description**

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the node is already in takeover mode.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: Programmatic takeover failed due to previous takeover.

**Parameters**

(None).

**cf.misc.ProgTakeoverFailNotUp****Severity**

NOTICE

**Description**

This message occurs when a negotiated takeover is initiated programmatically by Data ONTAP® and the partner node is not up.

**Corrective Action**

Bring up the partner node.

**Syslog Message**

Failover monitor: Programmatic takeover failed because the partner node is not up.

**Parameters**

(None).

**cf.misc.ProgTakeoverFailPartnerDeny****Severity**

NOTICE

**Description**

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the partner node denies the takeover request.

**Corrective Action**

Check previous EMS messages to determine why takeover was denied.

**Syslog Message**

Failover monitor: Programmatic takeover failed because the partner node denied the takeover request.

**Parameters**

(None).

**cf.misc.ProgTakeoverFailShutdown****Severity**

NOTICE

**Description**

This message occurs when a takeover is initiated programmatically by Data ONTAP® and a shutdown is in progress.

**Corrective Action**

Verify that both nodes are booted.

**Syslog Message**

Failover monitor: Programmatic takeover failed because shutdown was in progress.

**Parameters**

(None).

**cf.mode events****cf.mode.auto.HA****Severity**

NOTICE

**Description**

This message occurs when the controller is automatically set to High Availability(HA) mode because of the configuration values in the Field Replaceable Unit(FRU) or the slot of the interconnect/NVRAM card (depending on the hardware type of the controller).

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

## **cf.mode.auto.non.HA**

### **Severity**

NOTICE

### **Description**

This message occurs when the controller is automatically set to non-High Availability (non-HA) mode because of the configuration values in the Field Replaceable Unit (FRU) or the slot of the interconnect/NVRAM card (depending on the hardware type of the controller).

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

(None).

## **cf.mode.HA**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the user sets the controller to High Availability(HA) mode through the command-line interface.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

(None).

## **cf.mode.HA.onboot**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the controller is set to High Availability (HA) mode according to options detected at boot.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

**Parameters**

(None).

**cf.mode.non.HA****Severity**

INFORMATIONAL

**Description**

This message occurs when the user sets the controller to non-High Availability (non-HA) mode through the command-line interface.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**cf.mode.non.HA.onboot****Severity**

INFORMATIONAL

**Description**

This message occurs when the controller is set to non-High Availability (non-HA) mode according to options detected at boot.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**cf.multidisk events****cf.multidisk.fatalProblem****Severity**

ERROR

**Description**

This message occurs when the node is waiting for the partner to take over, after the node encounters a multidisk error or some other fatal error.

**Corrective Action**

(None).

**Syslog Message**

Node encountered a multidisk error or other fatal error while waiting to be taken over. %s.

**Parameters**

**mdp\_msg** (STRING): Multi Disk Panic (MDP) string.

## cf.nducomplete events

**cf.nduComplete****Severity**

INFORMATIONAL

**Description**

This message occurs when a nondisruptive upgrade is completed successfully.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**token** (STRING): Unique token that identifies an instance of a nondisruptive upgrade.

**host** (STRING): Name of system that completed the nondisruptive upgrade.

## cf.nduincomplete events

**cf.nduIncomplete****Severity**

INFORMATIONAL

**Description**

This message occurs when a nondisruptive upgrade fails.

**Corrective Action**

Resolve the reason for the failure and retry the nondisruptive upgrade from the failed step.

**Syslog Message**

(None).

**Parameters**

**token** (STRING): Unique token that identifies an instance of a nondisruptive upgrade.

**host** (STRING): Name of the node that failed the nondisruptive upgrade.

**reason** (STRING): Reason for the upgrade failure.

# cf.ndustart events

## cf.nduStart

### Severity

INFORMATIONAL

### Description

This message occurs when a nondisruptive upgrade starts.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**token** (STRING): Unique token that identifies an instance of a nondisruptive upgrade.

**host** (STRING): Name of system that started the nondisruptive upgrade.

# cf.nm events

## cf.nm.nicReset

### Severity

NOTICE

### Description

This message occurs when the controller performs a soft reset of the HA interconnect card as part of automatic recovery from a timeout or link error.

### Corrective Action

(None).

### Syslog Message

HA interconnect: Initiating soft reset on card %d due to %s.

### Parameters

**nic\_num** (INT): Interconnect NIC number.

**reason** (STRING): Describes why the soft reset was initiated. Possible reasons: rendezvous jammed rendezvous fm timeout rendezvous peer-connect timeout

## cf.nm.nicViError

### Severity

INFORMATIONAL

### Description

This message occurs when any error is detected in any virtual interface while handling a link transition.

### Corrective Action

(None).

### Syslog Message

HA interconnect: NIC %d has an error on %s (virtual interface #%d): %s.

### Parameters

**nic\_num** (INT): Interconnect NIC number.  
**vi\_name** (STRING): Name of the virtual interface.  
**vinum** (INT): Virtual interface number.  
**origin** (STRING): Origin of the error.

## cf.noautogb events

### cf.noAutoGB.ptnrLowerVersion

#### Severity

NOTICE

#### Description

This message occurs when an automatic giveback operation is cancelled because the high-availability (HA) partner is using an earlier and incompatible Data ONTAP® version than the local node. Subsequent failover events might not be successful when HA partners are not using compatible Data ONTAP versions.

#### Corrective Action

Run the "system node image show" command to determine which image on the partner should be booted to be compatible with the local node. After rebooting the node, automatic giveback is performed.

#### Syslog Message

Auto-giveback cancelled because the HA partner is using a lower Data ONTAP version than the local node.

#### Parameters

(None).

## cf.nopartner\_takeover events

### cf.noPartner\_takeover

#### Severity

ERROR

#### Description

This message occurs when the partner node fails but requested not to be taken over to prevent multiple, simultaneous RAID reconstructs from starting.

#### Corrective Action

Check the partner node for multiple disk or disk shelf failures, and then correct that situation. If you want takeover to occur, use the "storage failover takeover" command. If you want takeover to occur when disk or shelf failures occur, change the setting of the "raid.panic.missing.disks" option to '0' from the nodeshell.

### **Syslog Message**

Failover monitor: Partner node is down, but requested not to be taken over.

### **Parameters**

(None).

## **cf.nullshelfcountmsg events**

### **cf.nullShelfCountMsg**

#### **Severity**

ERROR

#### **Description**

This event occurs if we are sent a NULL negotiated failover shelf count message. \* This is likely due to an InterConnect problem.

#### **Corrective Action**

Check for and resolve any interconnect errors.

### **Syslog Message**

Invalid disk shelf count message was received from partner.

### **Parameters**

(None).

## **cf.partner events**

### **cf.partner.login**

#### **Severity**

INFORMATIONAL

#### **Description**

This event is issued when a login to the console of the partner occurs as a result of the 'partner' command being issued with no arguments.

#### **Corrective Action**

(None).

### **Syslog Message**

Login to partner shell: %s

### **Parameters**

**hostname** (STRING): The name of this node

### **cf.partner.logoff**

**Severity**

INFORMATIONAL

**Description**

This event is issued when a logoff from the console of the partner occurs as a result of the 'partner' command being issued with no arguments.

**Corrective Action**

(None).

**Syslog Message**

Logoff from partner shell: %s

**Parameters**

**hostname** (STRING): The name of this node

**cf.partner.nvram.notSync****Severity**

INFORMATIONAL

**Description**

This message occurs during takeover, when the system finds the partner nonvolatile memory (NVRAM) unsynchronized. There might be data loss.

**Corrective Action**

(None).

**Syslog Message**

Partner NVRAM was not synchronized. Some data might be lost.

**Parameters**

(None).

**cf.partner.nvram.state****Severity**

INFORMATIONAL

**Description**

This message occurs during takeover, when the system determines that the partner mailbox is stale. This might mean that partner nonvolatile memory (NVRAM) is unsynchronized and might have some data loss.

**Corrective Action**

(None).

**Syslog Message**

Partner mailbox was stale. Partner NVRAM might not be synchronized and some data might be lost.

**Parameters**

(None).

## cf.partner.ready.giveback

### Severity

INFORMATIONAL

### Description

This message occurs when the partner is booted and ready for giveback.

### Corrective Action

Verify that network connectivity is restored, and then use the "storage failover giveback" command to initiate giveback to the partner.

### Syslog Message

Partner is booted and ready for giveback.

### Parameters

(None).

## cf.partner.shortUptime

### Severity

ERROR

### Description

This message occurs when a node in a controller failover pair determines that the partner node has stayed up for a very short time period. This might result in a takeover

### Corrective Action

Check the disk connectivity to the partner node. If the problem persists and the partner node restarts multiple times, perform hardware diagnostics in maintenance mode, and then consult the EMS logs to determine why this is happening.

### Syslog Message

Partner up for %llu seconds only.

### Parameters

**seconds** (LONGINT): Time duration for which the partner was up.

## cf.reservation events

### cf.reservation.disk.notFound

### Severity

NOTICE

### Description

This message occurs when the system does not halt on a disk reservation conflict and the reservation is not found on the disk.

**Corrective Action**

(None).

**Syslog Message**

Reservation found on disk %s; not halting due to sanown\_pr\_test\_mode.

**Parameters**

**diskName** (STRING): Disk name.

## cf.rsrc events

### cf.rsrc.givebackFail

**Severity**

ALERT

**Description**

This message occurs when a failure is detected during giveback. The giveback operation will be cancelled.

**Corrective Action**

Check the logs for other messages regarding the listed subsystem using the "event log show" CLI command. Resolve those problems and perform a planned giveback operation using "storage failover giveback" command.

**Syslog Message**

Failover monitor: giveback during %s failed; giveback cancelled.

**Parameters**

**op** (STRING): Name of the giveback subsystem that has suffered a fatal error.

### cf.rsrc.givebackForceFail

**Severity**

ERROR

**Description**

This event occurs if a failure is forced during giveback. This event should only occur in debugging kernels.

**Corrective Action**

Retry the takeover.

**Syslog Message**

Failover monitor: giveback during %s forced fail

**Parameters**

**op** (STRING): Name of the takeover operation

### cf.rsrc.givebackForceVeto

**Severity**

ERROR

**Description**

This event occurs if a veto is forced during giveback. This event should only occur in debugging kernels.

**Corrective Action**

Check the state of the subsystem listed in this message. Retry the giveback.

**Syslog Message**

Giveback during %s forced veto

**Parameters**

**op** (STRING): Name of the takeover operation

**cf.rsrc.givebackOpFail****Severity**

ERROR

**Description**

This event occurs if a failure is detected during giveback. This error is not fatal to the giveback process but indicates that the related service could not be shutdown cleanly.

**Corrective Action**

Check the state of the subsystem listed in the message and validate it is working correctly. Validate that there are no configuration errors for the listed subsystem.

**Syslog Message**

Failover monitor: giveback during %s failed; giveback continuing...

**Parameters**

**op** (STRING): Name of the giveback operation that has suffered a non-fatal error.

**cf.rsrc.givebackUnexpected****Severity**

ALERT

**Description**

This event occurs if we detect an unexpected failover monitor state during a giveback operation. This indicates a software bug.

**Corrective Action**

Retry the giveback.

**Syslog Message**

(None).

**Parameters**

**op** (STRING): Name of the giveback operation

**state** (INT): Value of the failover monitor state

## **cf.rsrc.givebackVeto**

### **Severity**

ALERT

### **Description**

This message occurs when a veto is indicated during giveback. A veto occurs when the active partner state is detected during the giveback process. A veto can be overridden by using the "cf giveback -f" or "storage failover takeover -override-vetoes true" command.

### **Corrective Action**

Check the preceding messages for reasons why the giveback was vetoed. Check the state of the subsystem listed in this message. Retry the giveback.

### **Syslog Message**

Failover monitor: %s: giveback canceled due to active state.

### **Parameters**

**op** (STRING): Name of the takeover operation.

## **cf.rsrc.raidReplayOnlyTODone**

### **Severity**

INFORMATIONAL

### **Description**

This event occurs when a node is booting after having panicked too soon after takeover or during takeover. In that event we want to replay the partner RAID logs, before we perform a giveback. This message indicates the point at which we have committed partner RAID logs to the disk and are now going to initiate a giveback.

### **Corrective Action**

(None).

### **Syslog Message**

Failover monitor: Raid replay-only takeover completed. Initiating giveback.

### **Parameters**

(None).

## **cf.rsrc.replayOnlyTakeoverDone**

### **Severity**

NOTICE

### **Description**

This event occurs when a node is booting after having panicked too soon after takeover or during takeover. In that event we want to replay the partner logs, before we perform a giveback. This message indicates the point at which we have committed partner logs to the disk and are now going to initiate a giveback.

**Corrective Action**

(None).

**Syslog Message**

Failover monitor: replay-only takeover completed. Initiating giveback.

**Parameters**

(None).

**cf.rsrc.takeoverFail****Severity**

ALERT

**Description**

This message occurs when a failure is detected during takeover. The takeover operation will be cancelled.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Failover monitor: takeover during %s failed; takeover cancelled.

**Parameters**

**op** (STRING): Name of the takeover operation that has suffered a fatal error.

**cf.rsrc.takeoverForceFail****Severity**

ERROR

**Description**

This event occurs if a failure is forced during takeover. This event should only occur in debugging kernels.

**Corrective Action**

Retry the takeover request.

**Syslog Message**

Failover monitor: takeover during %s forced fail

**Parameters**

**op** (STRING): Name of the takeover operation

**cf.rsrc.takeoverOpFail****Severity**

ERROR

**Description**

This event occurs if a failure is detected during takeover. This error is not fatal to the takeover process but indicates that the related service may be inaccessible during takeover of the partner.

### **Corrective Action**

After takeover completes, check the state of the subsystem listed in the message. Check that the configuration of the subsystem listed in the message is correct.

### **Syslog Message**

Failover monitor: takeover during %s failed; takeover continuing...

### **Parameters**

**op** (STRING): Name of the takeover operation that has suffered a non-fatal error.

## **cf.rsrc.takeoverUnexpected**

### **Severity**

ERROR

### **Description**

This event occurs if we detect an unexpected failover monitor state during a takeover operation. This indicates a software bug.

### **Corrective Action**

Check the state of the subsystem listed in 'op' parameter. Retry the giveback.

### **Syslog Message**

(None).

### **Parameters**

**op** (STRING): Name of the giveback operation

**state** (INT): Value of the failover monitor state

## **cf.rv events**

### **cf.rv.connected**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when an HA connection agent connects on an HA interconnect device.

### **Corrective Action**

(None).

### **Syslog Message**

HA interconnect: Connection for '%s' succeeded.

### **Parameters**

**rv\_name** (STRING): Logical name of the successful HA connection.

## cf.rv.flush.handleExchange

### Severity

INFORMATIONAL

### Description

This message occurs when HA interconnect exchanges flushing information with the partner.

### Corrective Action

If the flush handle exchange reports "inactive", the remote controller might be running a version of Data ONTAP® that does not support flushing. Make sure that the controller and its partner are running compatible versions of the software.

### Syslog Message

HA interconnect: Flushing is %s.

### Parameters

s (STRING): Flushing status.

## cf.rv.localNoConn

### Severity

INFORMATIONAL

### Description

This message occurs when the local controller votes not to connect to the HA partner. This can be caused by incompatibility between the software versions running on the two controllers.

### Corrective Action

Install compatible versions of software on both controllers.

### Syslog Message

HA interconnect: Local controller voted not to connect.

### Parameters

(None).

## cf.rv.nicReset

### Severity

ERROR

### Description

This message occurs when HA interconnects are reset due to NVRAM log being unsynchronized for longer time than 15seconds.

### Corrective Action

Contact NetApp technical support if the problem persists.

### Syslog Message

HA interconnect: Reset due to unsynchronized log.

## Parameters

(None).

## cf.rv.notConnected

### Severity

ALERT

### Description

This message occurs when an HA connection agent fails to connect on an HA interconnect device.

### Corrective Action

Verify that both controllers in the HA pair are operational. If this message persists, disable and reenable the link by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

### Syslog Message

HA interconnect: Connection for '%s' failed.

### Parameters

**rv\_name** (STRING): Logical name of the failing HA connection.

## cf.rv.partnerNoConn

### Severity

ERROR

### Description

This message occurs when the HA partner votes not to connect to this controller. This can happen if the HA partner detects an incompatibility between the software versions running on the two controllers.

### Corrective Action

Install compatible versions of software on both controllers.

### Syslog Message

HA interconnect: Partner voted not to connect.

### Parameters

(None).

## cf.shutdown events

### cf.shutdown.info

### Severity

NOTICE

### Description

This message occurs when the controller receives a message from its partner over the HA interconnect that indicates a condition related to the partner's attempted graceful shutdown.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**eventType** (STRING): Event type, such as "Long shutdown".

**eventSummary** (STRING): Last task executed and its duration.

**shutdownSummary** (STRING): Shutdown phase summary for the event.

## cf.sysid events

### cf.sysid.sent

#### Severity

INFORMATIONAL

#### Description

This message occurs when a node sends its system ID and its HA partner's system ID successfully across the HA interconnect.

#### Corrective Action

(None).

#### Syslog Message

(None).

#### Parameters

**sysid** (LONGINT): Value of the local system ID that was sent successfully .

**host** (STRING): This parameter is obsolete from Data ONTAP®8.3 and later because the partner's systemID is also sent in the message.

**partner\_sysid** (LONGINT): Value of the partner system ID that was sent successfully.

## cf.takeover events

### cf.takeover.aborted.bdfu

#### Severity

NOTICE

#### Description

This message occurs when negotiated takeover is aborted because the background disk firmware update took more than 120 seconds to finish.

#### Corrective Action

Rerun the takeover command.

**Syslog Message**

(None).

**Parameters**

(None).

**cf.takeover.delayed.bdfu****Severity**

INFORMATIONAL

**Description**

This message occurs when negotiated takeover is initiated on a node while the background disk firmware update (BDFU) is in progress. If update is not completed within 120 seconds, takeover is aborted.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**cf.takeover.delayed.cleanup****Severity**

INFORMATIONAL

**Description**

This message occurs when takeover of a node by the node's high-availability (HA) partner was delayed due to the cleanup being performed after the previous giveback event.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**delay** (LONGINT): Amount of time (in milliseconds) the takeover was delayed.

**cf.takeover.disabled****Severity**

ALERT

**Description**

This message occurs when takeover of a node by the node's high-availability (HA) partner is disabled.

## Corrective Action

Resolve the issue, as identified by the message, for takeover being disabled. Use the "storage failover show -instance" command to determine whether the disks are accessible by both nodes in the HA pair, also check the HA interconnect between both nodes is installed and functioning correctly. If not, fix the cabling, disk, or adapter issues to resolve the connectivity issues.

## Syslog Message

%s.

## Parameters

**reason** (STRING): Reason for takeover being disabled.

## cf.takeover.missing.ptnrDiskInventory

### Severity

EMERGENCY

### Description

This message occurs when a takeover request is denied because the node did not receive the partner disk inventory information.

## Corrective Action

Wait five minutes and then try takeover again. If you want to disable the disk inventory check instead, you can use the "cf disable diskInventory" command from the advanced privilege level of the nodeshell.

However, disabling the disk inventory check might lead to a client outage when the local node cannot see the partner disks during takeover.

## Syslog Message

(None).

## Parameters

(None).

## cf.takeover.missingPtnrDisks

### Severity

EMERGENCY

### Description

This message occurs when a takeover request is denied because the node cannot see some of the partner's drives.

## Corrective Action

Make sure that the local node has connectivity to all file system drives owned by the partner. Use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the drive and to determine latest ownership. Drives might not be visible if partner drives have failed or the node is having issues accessing the partner node's drives. Verify that the HA interconnect cabling is correct, replace any failed drives and then check whether the issue is resolved. If you want to disable the drive inventory check instead, use the "storage failover takeover -allow-disk-inventory-mismatch true" command. However, disabling the drive inventory check during takeover is not advisable, because it might lead to client outage.

## Syslog Message

Failover monitor: Takeover failed because the node cannot see some of the partner node's drives.

## Parameters

(None).

# cf.transition events

## cf.transition.info

### Severity

NOTICE

### Description

This message occurs when a failover event is completed successfully. It displays the protocol transition information for the event.

### Corrective Action

(None).

## Syslog Message

%s %s.

## Parameters

**eventType** (STRING): Takeover, aggregate relocation, SFO phase of takeover, or SFO giveback event type.

**eventSummary** (STRING): Transition duration for protocols during the event.

# cifs events

## cifs.does events

### cifs.does.not.exist

#### Severity

ERROR

#### Description

This message occurs when a Vserver or Cluster administrator tries to initialize Snapmirror on Async VserverDR ID Discard setup without creating a CIFS server at destination. Snapmirror initialize will not complete successfully and will remain uninitialized.

#### Corrective Action

Create CIFS server at destination(DP-destination) vservers. Reissue snapmirror initialize.

#### Syslog Message

CIFS server does not exist on Vserver '%s'.

#### Parameters

**vserverName** (STRING): Name of the DP-destination Vserver on which CIFS server does not exist.

## cifs.domainpwd events

### cifs.domainpwd.job.deletion

#### Severity

NOTICE

#### Description

This message occurs when disabling of CIFS domain password change schedule fails to delete the job for a Vserver.

#### Corrective Action

Delete the job on the owning node using 'job delete -id ' command.

#### Syslog Message

An attempt to delete the CIFS domain password change job with ID %d for Vserver %s failed. Reason %s.

#### Parameters

**jobid** (LONGINT): CIFS password change job ID that failed to delete.

**vserver** (STRING): Name of the Vserver for which the password change job failed to delete.

**reason** (STRING): Reason for the failure to delete the job.

### cifs.domainpwd.job.not.sched

#### Severity

ERROR

## Description

This message occurs when the scheduled job for a CIFS domain password change fails for a Vserver.

## Corrective Action

Disable and enable the feature for the Vserver by using the 'vserver cifs domain password schedule modify -is-schedule-enabled false' and 'vserver cifs domain password schedule modify -is-schedule-enabled true' commands. If the error persists, do the following: 1. Disable the scheduling feature for the password change on the Vserver by using the command specified above. 2. Change password manually by using the 'vserver cifs domain password change' command. 3. Contact NetApp technical support.

## Syslog Message

An attempt to schedule a job to update the domain account password for Vserver %s failed.

## Parameters

**vserver** (STRING): Name of the Vserver for which the password change job failed.

## cifs.domainpwd.not.updated

### Severity

ERROR

### Description

This message occurs when the CIFS domain password update for a Vserver fails.

### Corrective Action

Try updating the password manually by using the 'vserver cifs domain password change' command. Review recent event logs for additional information. If the error persists, contact NetApp technical support.

### Syslog Message

An attempt to update the domain account password for Vserver %s failed during %s with the following error:  
%s

### Parameters

**vserver** (STRING): Name of the Vserver for which the password update failed.  
**method** (STRING): Method used to update the password.  
**reason** (STRING): Reason for the failure.

## cifs.lug events

### cifs.lug.import.fail

#### Severity

ERROR

#### Description

This message occurs when the job to import CIFS local users and groups is completed successfully only at a primary site within a MetroCluster® configuration or Vserver DR setup. CIFS local users and groups have either not been applied or only partially applied at the secondary site.

### **Corrective Action**

Use the "metrocluster vserver resync -vserver <vserver name>" command to resynchronize the Vserver configuration.

### **Syslog Message**

CIFS local users and groups import job failed for Vserver %s. Reason: %s.

### **Parameters**

**vserver** (STRING): Name of the Vserver.

**reason** (STRING): Reason for the failure.

## **cifs.replay events**

### **cifs.replay.failure**

#### **Severity**

ALERT

#### **Description**

This message occurs when configuration is not synchronized. This might cause the node experiencing the problem to become unresponsive to data access.

#### **Corrective Action**

Contact NetApp technical support. Be prepared to provide log files to technical support, particularly the "mgwd.log" and "sktrace.log" files.

#### **Syslog Message**

Failed to replay configuration for %s module.

#### **Parameters**

**module** (STRING): Name of the module for which configuration is not synchronized.

## **cifs.server events**

### **cifs.server.auth.StyleMismatch**

#### **Severity**

ERROR

#### **Description**

This message occurs when the Vserver DR subsystem detects that the authentication style (domain or workgroup) of the source Vserver's CIFS server does not match the authentication style of the destination Vserver's CIFS server

#### **Corrective Action**

Use the 'vserver cifs modify' command to configure the source or destination Vserver's CIFS server into a domain or workgroup as necessary for the authentication styles to match.

## Syslog Message

Vserver DR check found that the CIFS server authentication style of the source Vserver, %s, did not match the authentication style of the destination Vserver, %s.

## Parameters

**source\_vserver** (STRING): Name of the source Vserver of the Vserver DR relationship.

**destination\_vserver** (STRING): Name of the destination Vserver of the Vserver DR relationship.

# cifs.shadowcopy events

## cifs.shadowcopy.abort

### Severity

NOTICE

### Description

This message occurs when a shadow copy set is automatically aborted when no activity has been detected for a certain period of time. This condition could be caused by improper operation of the backup application and/or the Volume Shadow Copy Service (VSS) client, or the loss of network connection to the host.

### Corrective Action

Check the backup application and VSS client. Verify the network connection between the file server and the client.

## Syslog Message

The shadow copy set ( Client Shadow Copy Set ID : %s , Filer Shadow Copy Set ID : %s ) has been automatically aborted. No activity has been seen for at least %d minutes.

## Parameters

**clientShadowCopySetId** (STRING): Client Shadow Copy Set ID.

**filerShadowCopySetId** (STRING): File Server Shadow Copy Set ID.

**timeout** (INT): No activity timeout in minutes.

## cifs.shadowcopy.failure

### Severity

ERROR

### Description

This message occurs when a shadow copy operation has failed.

### Corrective Action

Using the information provided in the event message, here are some things to check on your system: Shadow copy configuration; Is the feature enabled? Are the appropriate licenses installed? Share(s) on which the shadow copy operation is performed; Is the share name correct? Does the share path exist? State of the shadow copy set and its shadow copies.

## Syslog Message

A shadow copy operation has failed: %s. ( Operation : %s , Client Shadow Copy Set ID : %s , Filer Shadow Copy Set ID : %s , Client Shadow Copy ID : %s , Filer Shadow Copy ID : %s , Share Name : %s, Object type is: %s with UUID: %s )

## Parameters

**errMsg** (STRING): Reason the Shadow Copy operation failed.  
**operation** (STRING): Shadow Copy operation that failed.  
**clientShadowCopySetId** (STRING): Client Shadow Copy Set ID.  
**filerShadowCopySetId** (STRING): File Server Shadow Copy Set ID.  
**clientShadowCopyId** (STRING): Client Shadow Copy ID.  
**filerShadowCopyId** (STRING): File Server Shadow Copy ID.  
**shareName** (STRING): Share Name.  
**object\_type** (STRING): Type of resource object.  
**object\_uuid** (STRING): UUID of the resource object.

# cifs.static events

## cifs.static.homedir.create

### Severity

ERROR

### Description

This message occurs when a user creates a static home directory without a substitution value (%u or %w) to uniquely identify a home directory share. If multiple users from the same client access their home directories at the same time, unprotected access to each other's files can occur. This might cause unexpected \"access denied\" errors on those files, and data corruption within those files. Note: multiple users from a single client is most likely in a Citrix or Windows Terminal Services environment.

### Corrective Action

Ensure that a substitution value (%u or %w) is provided to the name of the home directory share.

### Syslog Message

A static home directory share \"%s\" without a substitution value (%%u or %%w) is created on Vserver: %s.

### Parameters

**shareName** (STRING): Name of the share that the user has created.  
**vserverName** (STRING): Name of the Vserver associated with this operation.

# clam events

## clam.disable events

### clam.disable

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is disabled by either turning off the KCS capability or by setting the 'clam sysctl/bootarg' variable.

#### Corrective Action

If you want CLAM functionality disabled, no action is needed. Otherwise, reenable CLAM and reboot the node to make CLAM operational again.

#### Syslog Message

CLAM functionality is disabled.

#### Parameters

(None).

### clam.disable.takeover

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is disabled from initiating storage failover requests. This capability is automatically disabled in a NAS-only configuration. To control the setting of CLAM takeover, additional interfaces, such as sysctl bootarg, are provided.

#### Corrective Action

No action is needed.

#### Syslog Message

CLAM is disabled from performing storage failover.

#### Parameters

(None).

## clam.enable events

### clam.enable

#### Severity

INFORMATIONAL

## Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is enabled to operate on this node. When all nodes in the cluster are upgraded to a KCS-available image, KCS capability gets turned on. This event is an indication that CLAM will be now begin to function.

## Corrective Action

No action is needed.

## Syslog Message

CLAM functionality is enabled.

## Parameters

(None).

## clam.enable.takeover

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is enabled to initiate storage failover requests when the CLAM OOQ (Out Of Quorum) condition is detected on the partner node. This capability is automatically enabled in a scalable SAN configuration. To control the setting of CLAM takeover, additional interfaces, such as `sysctl bootarg`, are provided.

### Corrective Action

No action is needed.

### Syslog Message

CLAM is enabled to perform storage failover when partner node is OOQ.

### Parameters

(None).

## clam.failover events

### clam.failover.event

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) receives a failover event from high-availability(HA) subsystem.

#### Corrective Action

(None).

#### Syslog Message

CLAM on node (id=%llu) received an HA failover event for partner (ID=%llu) indicating that %s.

## Parameters

**localnodeid** (LONGINT): Node ID of the local node.

**partnernodeid** (LONGINT): Node ID of the partner node.

**event\_description** (STRING): Description of the event that CLAM received from the HA subsystem.

# clam.heartbeat events

## clam.heartbeat.state.change

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) detects that the state of the heartbeats to a node changed(that is, either the heartbeats started succeeding or they started failing).

### Corrective Action

Take one or more of the following actions: - A repeated toggling of the heartbeat state indicates intermittent network issues. Check the connectivity of the node to the cluster interconnect and fix any problems. - In all the other cases, the heartbeat failure will eventually result in the node going out of quorum. If that happens, take the actions prescribed for "EMS\_clam\_node\_oq event".

### Syslog Message

Heartbeats to node (name=%s, ID=%llu) are %s.

## Parameters

**hostname** (STRING): Host name of the node.

**nodeid** (LONGINT): Node ID of the node.

**state** (STRING): New state of the heartbeats to this node.

# clam.invalid events

## clam.invalid.config

### Severity

ERROR

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that the local node is in an invalid configuration for providing CLAM functionality.

### Corrective Action

Take one or more of the following actions, as appropriate: - Enable failover on the node by running the 'storage failover modify -node node\_name -enabled true' command. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed.

### Syslog Message

Local node (name=%s, id=%llu) is in an invalid configuration for providing CLAM functionality. CLAM cannot determine the identity of the HA partner.

## Parameters

**localhostname** (STRING): Host name of the local node.

**localnodeid** (LONGINT): Node ID of the local node.

# clam.mailbox events

## clam.mailbox.initialized

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has written to the high availability (HA) mailboxes that it has initialized and is ready to participate in CLAM quorum.

### Corrective Action

(None).

### Syslog Message

CLAM on local node has initialized its mailboxes and is ready to participate in quorum.

## Parameters

(None).

# clam.node events

## clam.node.disabled

### Severity

INFORMATIONAL

### Description

This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) concludes that the local node is now disabled.

### Corrective Action

This EMS is logged when the local node has lost connectivity with the rest of the nodes in the cluster and the connectivity has not been restored in time for the local node to participate in cluster quorum. Take the actions prescribed for "EMS\_clam\_node\_ooq" event.

### Syslog Message

CLAM published an event indicating the local node is now disabled(reason: %s).

## Parameters

**disabled\_reason** (STRING): Reason for the node getting disabled.

## clam.node.inq

**Severity**

INFORMATIONAL

**Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that a node in the cluster has transitioned to "cluster quorum".

**Corrective Action**

(None).

**Syslog Message**

Cluster node (name=%s, ID=%llu) is in "CLAM quorum".

**Parameters**

**hostname** (STRING): Host name of the cluster node that transitioned to quorum.

**nodeid** (LONGINT): Node ID of the cluster node that transitioned to quorum.

**clam.node.oog****Severity**

EMERGENCY

**Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that a node in the cluster is out of "cluster quorum".

**Corrective Action**

Take one or more of the following actions: - Follow the KB article 2022109 to troubleshoot the resolve the issue. - Check the connectivity of the node to the cluster interconnect and fix any problems. - If the local node is administratively disabled, enable it by running the following command from the clustershell 'cluster modify -node node\_name -eligibility true'. - If the node is supposed to be in an HA pair but is not, enable the HA pair. You can check whether a node is in an HA pair by running 'storage failover show' command from the clustershell. You can enable storage failover by running the 'storage failover modify -enabled true' command from the clustershell. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed. You can see the software version of all the nodes from the clustershell using the 'version -node \*' command.

**Syslog Message**

Node (name=%s, ID=%llu) is out of "CLAM quorum" (reason=%s).

**Parameters**

**hostname** (STRING): Host name of the node that is out of quorum.

**nodeid** (LONGINT): Node ID of the node that is out of quorum.

**reason** (STRING): Reason for the out of quorum transition.

**clam.node.paused****Severity**

INFORMATIONAL

**Description**

This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) entered a paused state.

**Corrective Action**

(None).

**Syslog Message**

CLAM published an event indicating the local node has paused.

**Parameters**

(None).

**clam.node.resumed****Severity**

INFORMATIONAL

**Description**

This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) was previously in a paused state and has now resumed.

**Corrective Action**

(None).

**Syslog Message**

CLAM published an event indicating the local node has resumed.

**Parameters**

(None).

**clam.node.start.voting****Severity**

INFORMATIONAL

**Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) on a local node has started to vote for its high-availability (HA) partner node.

**Corrective Action**

(None).

**Syslog Message**

CLAM on local node (ID:%llu) has started to vote for its HA partner node (ID:%llu).

**Parameters**

**local\_id** (LONGINT): Node ID of the local node.

**partner\_id** (LONGINT): Node ID of the partner node.

## clam.node.stop.voting

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) on a local node has stopped voting for its high-availability (HA) partner node.

### Corrective Action

(None).

### Syslog Message

CLAM on local node (ID:%llu) has stopped to vote for its HA partner node (ID:%llu).

### Parameters

**local\_id** (LONGINT): Node ID of the local node.

**partner\_id** (LONGINT): Node ID of the partner node.

## clam.partner events

### clam.partner.halting

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, Availability Monitor (CLAM) is notified that its high-availability (HA) partner node is undergoing a planned shutdown.

#### Corrective Action

(None).

#### Syslog Message

CLAM is notified that its HA partner node is undergoing a planned shutdown (reason: %s).

#### Parameters

**reason** (STRING): Reason for the partner beginning the halt process.

## clam.peer events

### clam.peer.halting

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, and Availability Monitor (CLAM) is notified that its high-availability (HA) partner node is undergoing a planned shutdown.

### **Corrective Action**

(None).

### **Syslog Message**

CLAM is notified that node %s (ID=%llu) is undergoing a planned shutdown.

### **Parameters**

**hostnode** (STRING): Name of node beginning the halt process.

**nodeid** (LONGINT): ID of node beginning the halt process.

## **clam.reenable events**

### **clam.reenable**

#### **Severity**

INFORMATIONAL

#### **Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is reenabled to operate on this node after being intentionally disabled. The intentional disabling could have been through turning off KCS capability or setting the 'clam bootarg/sysctl' variable. Reenabling CLAM functionality warrants a reboot, upon which CLAM will be functional.

#### **Corrective Action**

Reboot the node to make CLAM operational.

#### **Syslog Message**

CLAM functionality is reenabled. Reboot the node to make CLAM operational.

#### **Parameters**

(None).

## **clam.start events**

### **clam.start.mailbox.polling**

#### **Severity**

INFORMATIONAL

#### **Description**

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has started a poll to read CLAM mailboxes.

#### **Corrective Action**

(None).

#### **Syslog Message**

CLAM on local node (ID=%llu) has started a poll to read HA partner (ID=%llu) mailbox.

## Parameters

**local\_id** (LONGINT): Node ID of the local node.  
**partner\_id** (LONGINT): Node ID of the partner node.

# clam.stop events

## clam.stop.mailbox.polling

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has stopped polling the CLAM mailboxes.

### Corrective Action

(None).

### Syslog Message

CLAM on local node (ID=%llu) has stopped the poll to read HA partner (ID=%llu) mailbox.

## Parameters

**local\_id** (LONGINT): Node ID of the local node.  
**partner\_id** (LONGINT): Node ID of the partner node.

# clam.takeover events

## clam.takeover

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) triggers takeover of a partner node after determining that the local node is in "CLAM quorum" and the partner node is out of "CLAM quorum".

### Corrective Action

Take one or more of the following actions: - If the node panicked or is hung, troubleshoot and resolve the problem. - Check the connectivity of the node to the cluster interconnect and fix any problems. - If the local node is administratively disabled, enable it by running the following command from the clustershell 'cluster modify -node node\_name -eligibility true'. - If the node is supposed to be in an HA pair but is not, enable the HA pair. You can check whether a node is in an HA pair by running the 'storage failover show' command from the clustershell. You can enable storage failover by running the 'storage failover modify -enabled true' command from the clustershell. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed. You can see the software version of all the nodes from the clustershell using the 'version -node \*' command.

### Syslog Message

Local node (name=%s, ID=%llu) initiated takeover of partner node (name=%s, ID=%llu, state=%llu)

result=%s, type=%s.

## Parameters

**localhostname** (STRING): Host name of the local node.  
**localnodeid** (LONGINT): Node ID of the local node.  
**partnerhostname** (STRING): Host name of the partner node.  
**partnernodeid** (LONGINT): Node ID of the partner node.  
**partnerstate** (LONGINTEX): The high-availability state of the partner node  
**result** (STRING): Result of the takeover initiation operation.  
**type** (STRING): Takeover Type.

## clam.takeover.disallowed

### Severity

INFORMATIONAL

### Description

This message occurs when Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) cannot initiate takeover operations. Takeover is disallowed by High Availability (HA) subsystem on the partner node.

### Corrective Action

(None).

### Syslog Message

CLAM on node %s (ID=%llu) cannot proceed with a takeover operation of partner node %s (ID=%llu) because HA disallowed takeover. Reason :%s

## Parameters

**local\_host\_name** (STRING): Host name of the local node.  
**localnodeid** (LONGINT): Node ID of the local node.  
**partner\_host\_name** (STRING): Host name of the partner node.  
**partnernodeid** (LONGINT): Node ID of the partner node.  
**reason** (STRING): Reason takeover was disabled.

## clam.update events

### clam.update.partner.state

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) updates the failover state of the partner.

#### Corrective Action

(None).

#### Syslog Message

CLAM on node (ID=%llu) updated failover state of partner (ID=%llu) to %s.

## Parameters

**localnodeid** (LONGINT): Node ID of the local node.  
**partnernodeid** (LONGINT): Node ID of the partner node.  
**partner\_state** (STRING): Description of the partner state.

# clam.valid events

## clam.valid.config

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that the local node is in a valid configuration for providing CLAM functionality.

### Corrective Action

No action is needed.

### Syslog Message

Local node (name=%s, id=%llu) is operating in a suitable configuration for providing CLAM functionality.

## Parameters

**localhostname** (STRING): Host name of the local node.  
**localnodeid** (LONGINT): Node ID of the local node.  
**partnerhostname** (STRING): Host name of the partner node.  
**partnernodeid** (LONGINT): Node ID of the partner node.

# clam.voting events

## clam.voting.state.change

### Severity

INFORMATIONAL

### Description

This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) detects that the voting state of the node changed.

### Corrective Action

(None).

### Syslog Message

CLAM on node (name=%s, ID=%llu) has %s voting for its HA partner node(name=%s, ID=%llu).

## Parameters

**local\_hostname** (STRING): Host name of the local node.  
**localId** (LONGINT): Node ID of the local node.  
**state** (STRING): New voting state of the node.  
**partner\_hostname** (STRING): Host name of the HA partner node.

**partnerId** (LONGINT): Node ID of the HA partner node.

# clone events

## clone.split events

### clone.split.objcopy.failed

#### Severity

ERROR

#### Description

This message occurs when the volume clone split object copy operation (which copies objects from source volume to a clone) fails because it is unable to read source objects due to unauthorized access to the object store container. The volume clone split object copy operation will be aborted and must be restarted manually after a valid access token is added to the object store configuration.

#### Corrective Action

Ensure that you have added the shared access signature token to the object store configuration. The access token can be added to the configuration using the "storage aggregate object-store config modify" command. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. The volume clone split object copy operation can be restarted using the "volume clone split start -match-parent-storage-tier true" command. If the condition persists, contact NetApp technical support.

#### Syslog Message

Clone split object copy operation to copy objects from source volume to clone failed on volume "%s" (aggregate %s) because of unauthorized access to the object store container. Aborting the volume clone object copy split operation.

#### Parameters

**volume\_name** (STRING): Clone volume.

**aggregate\_name** (STRING): FabricPool aggregate.

# cloud events

## cloud.aws events

### cloud.aws.iamCredsExpired

#### Severity

ERROR

#### Description

This message occurs when the IAM Role thread acquires Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials that have already expired. The credentials are acquired from the AWS metadata server using the IAM role, and are used in signing API requests to AWS S3.

#### Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

#### Syslog Message

ONTAP acquired AWS credentials associated with the AWS IAM role named '%s' on the AWS metadata server that have already expired. Node %s.

#### Parameters

**iamRole** (STRING): Name of the IAM role associated with this ONTAP Cloud® instance.  
**nodeUuid** (STRING): UUID of the node.

### cloud.aws.iamCredsInvalid

#### Severity

ERROR

#### Description

This message occurs when the system acquires Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials that are not valid.

#### Corrective Action

In the AWS EC2 Management Console, find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also, verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

#### Syslog Message

AWS credentials that were acquired by ONTAP are not valid. AWS IAM role: %s. Node: %s.

#### Parameters

**iamRole** (STRING): Name of the IAM role associated with this ONTAP Cloud instance.  
**nodeUuid** (STRING): UUID of the node.

## cloud.aws.iamCredsNotFound

### Severity

ERROR

### Description

This message occurs when the cloud credentials thread cannot acquire Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials from the AWS metadata server. The credentials are used in signing API requests to AWS S3.

### Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

### Syslog Message

ONTAP cannot acquire credentials associated with the AWS IAM role or GCP Service Account named '%s' on the metadata server. Node %s.

### Parameters

**iamRole** (STRING): Name of the AWS IAM role associated associated with this Cloud Volumes ONTAP® instance.

**nodeUuid** (STRING): UUID of the node.

## cloud.aws.iamNotInitialized

### Severity

NOTICE

### Description

This message occurs when a module attempts to access Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials from the cloud credentials thread before the cloud thread is finished initializing.

### Corrective Action

Wait for the cloud credential thread, and by extension the system, to complete initialization.

### Syslog Message

A module attempted to access credential information before the cloud credential thread initialized on node %s.

### Parameters

**nodeUuid** (STRING): UUID of the node.

## cloud.aws.iamRoleInvalid

### Severity

ERROR

### Description

This message occurs when the system acquires an Amazon Web Services (AWS) Identity and Access Management (IAM) role on the AWS metadata server that is not valid.

### Corrective Action

In the AWS EC2 Management Console, find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also, verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

### Syslog Message

IAM role "%s" on the AWS metadata server is not valid for this ONTAP instance (node %s).

### Parameters

**iamRole** (STRING): Name of the IAM role associated with this ONTAP Cloud instance.  
**nodeUuid** (STRING): UUID of the node.

## cloud.aws.iamRoleNotFound

### Severity

ERROR

### Description

This message occurs when the IAM Role thread cannot find an Amazon Web Services (AWS) Identity and Access Management (IAM) role on the AWS metadata server. The IAM role is needed to obtain role-based credentials used in signing API requests to AWS S3.

### Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this ONTAP Cloud® deployment. Also verify that the AWS IAM role associated with the instance exists.

### Syslog Message

ONTAP node %s cannot find an IAM role on the AWS metadata server.

### Parameters

**nodeUuid** (STRING): UUID of the node.

## cloud.aws.metadataConnFail

### Severity

ERROR

### Description

This message occurs when the IAM Role thread cannot establish a communication link with the Amazon Web Services (AWS) metadata server. Communication must be established to acquire the necessary AWS Identity and Access Management (IAM) role-based credentials used in signing API requests to AWS S3.

### Corrective Action

Log in to the AWS EC2 Engine Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment.

### Syslog Message

ONTAP cannot communicate with the AWS metadata server needed to acquire IAM role-based or Service Account based credentials for access to AWS S3 Storage. Error returned: %s Node: %s

## Parameters

**error** (STRING): Error code and string, if applicable.

**nodeUuid** (STRING): UUID of the node.

# cloud.azurecredsinvalid events

## cloud.azureCredsInvalid

### Severity

ERROR

### Description

This message occurs when the system acquires Azure Managed Service Identity (MSI) credentials that are not valid.

### Corrective Action

In the Azure Portal, find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also, verify that the MSI associated with the instance is enabled and grants proper privileges to the instance.

### Syslog Message

Azure MSI credentials that were acquired by ONTAP are not valid. Node UUID: %s.

## Parameters

**nodeUuid** (STRING): UUID of the node.

# cloud.bin events

## cloud.bin.objcopy.failed

### Severity

ERROR

### Description

This message occurs when the cloud bin object copy operation (which copies objects from a source object store to a destination object store) fails because it is unable to read source objects due to unauthorized access to the object store container.

### Corrective Action

Ensure that you have added the shared access signature token to the source object store configuration. The access token can be added to the configuration using the "storage aggregate object-store config modify" command. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. If the condition persists, contact NetApp technical support.

### Syslog Message

Cloud bin object copy operation to copy objects from a source object store to destination object store failed for "%s" operation because of unauthorized access to the source object store container ("%s").

## Parameters

**op\_name** (STRING): Operation context in which object copy is called. This can be either clone split or svm migrate.

**container\_name** (STRING): Source object store container name

# cloud.creds events

## cloud.creds.metadataConnFail

### Severity

ERROR

### Description

This message occurs when the system cannot establish a communication link with the cloud provider's metadata server, in order to acquire the necessary temporary credentials used in signing API requests to the cloud object store server.

### Corrective Action

Log in to the cloud provider's management console to examine the current set of running instances. Find the instance pertaining to this deployment of Cloud Volumes ONTAP® deployment, and then check its health from the console.

### Syslog Message

ONTAP cannot communicate with the cloud provider's metadata server needed to acquire the temporary credentials used to access an object store server. Command: %s Error returned: %s Node: %s

## Parameters

**command** (STRING): Command used to contact the metadata server.

**error** (STRING): Error text received as response to the metadata server command.

**nodeUuid** (STRING): UUID of the node.

## cloud.creds.notFound

### Severity

ERROR

### Description

This message occurs when the system cannot acquire the temporary credentials from the cloud provider's metadata server that are necessary for signing API requests to the object storage server.

### Corrective Action

Log in to the management console of the cloud provider to examine the current set of running instances. Find and check the health of the instance pertaining to this Cloud Volumes ONTAP deployment. Also verify that the role associated with the instance exists and grants the proper privileges.

### Syslog Message

ONTAP cannot acquire credentials associated with the instance named '%s' on the metadata server. Node %s.

## Parameters

**role** (STRING): Name of the AWS IAM role or GCP Service Account or Azure Managed Service Identity associated with this Cloud Volumes ONTAP® instance.  
**nodeUuid** (STRING): UUID of the node.

## cloud.creds.notInitialized

### Severity

NOTICE

### Description

This message occurs when the system attempts to access credentials before initialization is complete.

### Corrective Action

(None).

### Syslog Message

Module on node %s attempted to access credential information before initialization was complete

### Parameters

**nodeUuid** (STRING): UUID of the node.

## cloud.gcpcredsinvalid events

### cloud.gcpCredsInvalid

### Severity

ERROR

### Description

This message occurs when the system acquires Google Cloud Platform (GCP) Service Account based credentials that are not valid.

### Corrective Action

In the Google Cloud Console, find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also, verify that the Service Account associated with the instance exists and grants proper privileges to the instance.

### Syslog Message

GCP credentials that were acquired by ONTAP are not valid. Node: %s.

### Parameters

**nodeUuid** (STRING): UUID of the node.

# clus events

## clus.net events

### clus.net.noNeighbors

#### Severity

ALERT

#### Description

This message occurs when the cluster network ports with "link" reported as "up" are neither receiving CDP nor LLDP neighbor announcements. This is not a supported configuration and can negatively impact the performance of the cluster.

#### Corrective Action

Use the "network port show -ipospace Cluster -link up" command to list the ports expected to receive CDP and/or LLDP announcements. Verify that CDP and/or LLDP is enabled on the switch the cluster ports are wired to. Use the "network device-discovery show" command to view the announcements for each of the cluster ports.

#### Syslog Message

The cluster ports with "link" reported as "up" are neither receiving CDP nor LLDP neighbor announcements.

#### Parameters

(None).

### clus.net.switchlessInv

#### Severity

NOTICE

#### Description

This message occurs when the "switchless-cluster" option is disabled, but one or more cluster ports are directly wired to a cluster port on another node. This could result in packet loss across the cluster network, causing file operations to fail as well as loss of quorum.

#### Corrective Action

Use the "network options switchless-cluster modify" command to enable support for switchless clusters.

#### Syslog Message

One or more cluster ports are directly wired to a cluster port on another node, but the "switchless-cluster" option is not enabled.

#### Parameters

(None).

### clus.net.switchlessMismatch

**Severity**

NOTICE

**Description**

This message occurs when the "switchless-cluster" option is enabled, but all of the cluster ports are wired to a switch. This configuration will negatively impact the performance of the cluster network.

**Corrective Action**

Use the "network options switchless-cluster modify" command to disable support for switchless clusters.

**Syslog Message**

All of the cluster ports are wired to a switch, but the "switchless-cluster" option is enabled.

**Parameters**

(None).

## clus.reboot events

### clus.reboot.internalError

**Severity**

ALERT

**Description**

This message occurs when the cluster reboot detection feature detects an internal software error due to insufficient system resources.

**Corrective Action**

Reboot the node by using the "system node reboot -node <nodename>" command. Contact NetApp technical support if further assistance is needed.

**Syslog Message**

Cluster reboot detection feature detected an internal software error. Error: '%s'.

**Parameters**

**error** (STRING): Internal software error.

### clus.reboot.noBootSequence

**Severity**

ERROR

**Description**

This message occurs when the cluster reboot detection feature fails to obtain the node boot sequence from the /var/BOOT\_SEQ file.

**Corrective Action**

Contact NetApp technical support.

## Syslog Message

Cluster reboot detection feature failed to obtain the node boot sequence from /var/BOOT\_SEQ file.

## Parameters

(None).

## clus.reboot.persistencyError

### Severity

ERROR

### Description

This message occurs when the cluster reboot detection feature fails to save the node reboot information persistently.

### Corrective Action

Reboot the node by using the "system node reboot -node nodename" command. Contact NetApp technical support if further assistance is needed.

## Syslog Message

Cluster reboot detection feature failed to save the node reboot information persistently. Error: '%s'.

## Parameters

**error** (STRING): Error returned by the save operation.

## clus.reboot.rebootDetected

### Severity

NOTICE

### Description

This message occurs when a cluster reboot is detected.

### Corrective Action

(None).

## Syslog Message

Cluster reboot was detected at %s. Sequence number for the cluster reboot was %d. Estimated beginning time of the cluster reboot was %s.

## Parameters

**endtime** (STRING): End time of the cluster reboot.

**sequence** (LONGINT): Sequence number of the detected cluster reboot.

**begintime** (STRING): Estimated beginning time of the cluster reboot based on the last known time the cluster was operational.

# cluster events

## cluster.epsilon events

### cluster.epsilon.assign.fail

#### Severity

ERROR

#### Description

This message occurs when automatic assignment of epsilon to a node fails, alerting the customer that there is no epsilon on their system. Attempts to assign epsilon continue until automatic assignment succeeds or epsilon is assigned manually.

#### Corrective Action

Try to manually assign epsilon to a healthy node using the command 'cluster modify -node node-name -epsilon true'. Contact NetApp technical support if epsilon cannot be assigned.

#### Syslog Message

Epsilon could not be automatically assigned to node %s with error %s.

#### Parameters

**node** (STRING): Name of the node that epsilon was being assigned to.  
**error** (STRING): Error string detailing why epsilon assignment failed.

### cluster.epsilon.assigned

#### Severity

INFORMATIONAL

#### Description

This message occurs when epsilon is assigned to a node either manually by a user-initiated command or automatically by the system.

#### Corrective Action

(None).

#### Syslog Message

Epsilon was assigned to node %s by %s.

#### Parameters

**node** (STRING): Name of the node epsilon was assigned to.  
**actor** (STRING): Whether the change was made manually by a user command or automatically by the system.

### cluster.epsilon.removed

#### Severity

INFORMATIONAL

## Description

This message occurs when epsilon is removed from a node either manually by a user-initiated command or automatically by the system.

## Corrective Action

(None).

## Syslog Message

Epsilon was removed from node %s by %s.

## Parameters

**node** (STRING): Name of the node that epsilon was removed from.

**actor** (STRING): Whether the change was made manually by a user command or automatically by the system.

# cluster.ha events

## cluster.ha.not.configured

### Severity

ERROR

### Description

This message occurs when cluster HA has not been configured on a 2-node cluster with HA mode enabled.

### Corrective Action

Use the 'cluster ha modify -configured true' command to configure cluster HA.

### Syslog Message

Cluster HA has not been configured. Cluster HA must be configured on a 2-node cluster to ensure data access availability in the event of storage failover.

### Parameters

(None).

# cluster.image events

## cluster.image.update.aborted

### Severity

INFORMATIONAL

### Description

This message occurs when a non-disruptive data ONTAP upgrade of the cluster was aborted by the user.

### Corrective Action

(None).

### **Syslog Message**

A non-disruptive data ONTAP upgrade of the cluster was aborted by the user

### **Parameters**

(None).

## **cluster.network events**

### **cluster.network.config**

#### **Severity**

NOTICE

#### **Description**

This message occurs when a two node cluster transitions between a switched and switchless configuration.

#### **Corrective Action**

(None).

### **Syslog Message**

The cluster network configuration transitioned to %s.

### **Parameters**

**current\_configuration** (STRING): Displays if the current configuration is switched or switchless.

## **cluster.op events**

### **cluster.op.fail**

#### **Severity**

ERROR

#### **Description**

This message occurs when a "cluster create" or a "cluster join" or a "cluster unjoin" operation is attempted but does not succeed.

#### **Corrective Action**

Run the command specified to complete the cluster operation. Resolve the issue, and then try the command again.

### **Syslog Message**

(None).

### **Parameters**

**operation\_type** (STRING): Type of cluster operation.

**node** (STRING): Name of the node that attempted the cluster operation.

**serial** (STRING): System serial number of the node that attempted the cluster operation.

## cluster.op.not.complete

### Severity

ERROR

### Description

This message occurs when a cluster create or cluster join operation fails to complete. The node is not fully operational and many commands will not work properly until this is resolved.

### Corrective Action

Run the command specified to complete the cluster operation. Resolve the issue, and then try the command again.

### Syslog Message

Cluster operation (%s) failed to complete for node %s. The node is not fully operational.

### Parameters

**command** (STRING): Command for the cluster operation.

**node** (STRING): Name of the node.

## cluster.op.rerun.fail

### Severity

ERROR

### Description

This message occurs when a previously failed cluster create or cluster join operation that is automatically rerun in background fails. The operation is automatically retried a maximum of 'max\_retry\_count' times at an interval of 'retry\_interval' seconds.

### Corrective Action

To view the reason for failure, run the operation manually. Alternatively, allow the automatic reruns to execute in case the issue is temporary or fixed. To view the progress of these background attempts, use the command 'event log show -event cluster.op.rerun\*'. You may rerun the operation manually at any time, without waiting for these background runs to complete.

### Syslog Message

Attempt to %s cluster named '%s' in the background failed. This was retry attempt %d of %d.

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**cluster\_name** (STRING): Name of the cluster that is being created or joined.

**retry\_count** (INT): Number of attempts made to rerun the cluster create or join operations in the background.

**max\_retry\_count** (INT): Maximum number of retry attempts allowed to rerun the cluster create or join operation in the background.

**retry\_interval** (INT): Interval of time, in seconds, between each rerun attempt.

## cluster.op.rerun.start

## Severity

INFORMATIONAL

## Description

This message occurs when a previously failed cluster create or cluster join operation is rerun in the background in an attempt to successfully complete the operation. The operation is automatically retried a maximum of 'max\_retry\_count' times at an interval of 'retry\_interval' seconds.

## Corrective Action

To view the reason for failure, run the operation manually. Alternatively, allow the automatic reruns to execute in case the issue is temporary or fixed. To view the progress of these background attempts, use the command 'event log show -event cluster.op.rerun\*' You may rerun the operation manually at any time, without waiting for these background runs to complete.

## Syslog Message

Attempt to %s cluster named '%s' in the background. This is retry attempt %d of %d.

## Parameters

**operation\_type** (STRING): Type of cluster operation.

**cluster\_name** (STRING): Name of the cluster that is being created or joined.

**retry\_count** (INT): Number of attempts to retry the cluster create or join operation in the background.

**max\_retry\_count** (INT): Maximum number of rerun attempts allowed.

**retry\_interval** (INT): Interval of time, in seconds, between each rerun attempt.

## cluster.op.rerun.success

### Severity

INFORMATIONAL

### Description

This message occurs when a previously failed cluster create or cluster join operation automatically rerun in the background is successful.

### Corrective Action

(None).

### Syslog Message

Cluster %s operation run in the background completed successfully for cluster name '%s'.

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**cluster\_name** (STRING): Name of the cluster that is being created or joined.

## cluster.op.start

### Severity

INFORMATIONAL

### Description

This message occurs when a "cluster create" or a "cluster join" or a "cluster unjoin" operation is run.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**node** (STRING): Name of the node being operated on or empty if the name is not yet set.

**serial** (STRING): System serial number of the node being operated on or empty if the serial number is not set.

## cluster.op.success

### Severity

INFORMATIONAL

### Description

This message occurs when a cluster has been successfully created or a node has successfully joined or unjoined the cluster.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**node** (STRING): Name of the node that successfully performed the cluster operation.

**serial** (STRING): System serial number of the node that successfully performed the cluster operation.

## cluster.port events

### cluster.port.unsupport.speed

### Severity

ERROR

### Description

This message occurs when the cluster ports are operating at an unsupported speed.

### Corrective Action

Ensure that the cluster port has a supported network interface card installed, and that it is operating at the supported speed.

### Syslog Message

%s node %s cluster ports are not operating at a supported speed. Ensure that ports %s have supported network interface card installed, and are operating at a supported speed: %s.

## Parameters

- model\_name** (STRING): Model on which the misconfigured ports reside.
- node** (STRING): Node on which the misconfigured ports reside.
- portlist** (STRING): List of misconfigured ports.
- supported\_speed** (STRING): Speed at which the port is supported.

# cluster.repl events

## cluster.repl.localNW.unreachable

### Severity

NOTICE

### Description

This message occurs when the cluster replication heartbeat to a peer cluster cannot reach the local management gateway process for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

### Corrective Action

(None).

### Syslog Message

The cluster replication heartbeat could not reach the local management gateway process for at least %d seconds.

### Parameters

- durationSinceLastSuccess** (INT): Number of seconds since the problem first occurred.

## cluster.repl.peer.reachable

### Severity

NOTICE

### Description

This message occurs when the cluster replication heartbeat can now reach the peer cluster, after previous failures resulted in raising one of the following events: cluster.repl.localNW.unreachable, cluster.repl.peerNW.unreachable, or cluster.repl.remoteApp.unreachable.

### Corrective Action

(None).

### Syslog Message

The cluster replication heartbeat can now reach peer cluster %s.

### Parameters

- peerIPAddress** (STRING): Peer cluster IP address that can now be reached.

## cluster.repl.peerNW.unreachable

## Severity

ALERT

## Description

This message occurs when the cluster replication heartbeat to the peer cluster fails for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

## Corrective Action

Verify network connectivity between the local cluster and the peer cluster. Check the cluster peer EMS messages for more information.

## Syslog Message

The cluster replication heartbeat to peer cluster %s failed for at least %d seconds.

## Parameters

**peerIPAddress** (STRING): Cluster peer IP address that could not be reached.

**durationSinceLastSuccess** (INT): Number of seconds since the problem first occurred.

## cluster.repl.remoteApp.unreachable

### Severity

ALERT

### Description

This message occurs when the cluster replication heartbeat to the remote cluster replication application fails for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

### Corrective Action

Check the state of the replication application process running on the peer cluster by issuing the 'cluster ring show -unitname crs' command.

### Syslog Message

The cluster replication heartbeat to the remote application running on peer cluster %s failed for at least %d seconds.

### Parameters

**peerIPAddress** (STRING): Remote application cluster IP address that could not be reached.

**durationSinceLastSuccess** (INT): Number of seconds since the problem first occurred.

## cluster.switch events

### cluster.switch.count

### Severity

INFORMATIONAL

### Description

Redundant configuration is missing for cluster switches. If the remaining cluster switch fails, you can no longer access the cluster.

## Corrective Action

1) Ensure that a redundant pair of cluster switches exists in the network. 2) Ensure that cluster ports are connected to both switches. 3) Enable the Cisco Discovery Protocol (CDP)/Industry Standard Discovery Protocol (ISDP) on the switches, if you previously disabled it. CDP/ISDP is enabled by default. Refer to your switch documentation for instructions. 4) If Data ONTAP cannot automatically discover a switch, use the "system cluster-switch create" command to configure discovery and monitoring of the switch.

## Syslog Message

Cluster switch count: %d but requires %d.

## Parameters

**count** (INT): Number of cluster switches discovered.  
**required** (INT): Number of cluster switches required.

## cluster.switch.pwr.count

### Severity

INFORMATIONAL

### Description

The power supply on the switch is missing. The remaining power supply is a single point of failure. The switch might shut down with the next PSU failure.

## Corrective Action

1) Check whether the switch's power supply unit is properly inserted into the chassis of the switch.

## Syslog Message

Cluster switch: %s has: %d power supplies and requires %d.

## Parameters

**switch\_name** (STRING): Cluster switch name  
**count** (INT): The switch power supply count found.  
**required** (INT): The switch power supply count required.

## cluster.switch.pwr.fail

### Severity

INFORMATIONAL

### Description

The power supply on the switch is missing or is not operational.

## Corrective Action

1) Ensure that the power supply mains supplying power to the switch is turned on. 2) Ensure that the power cord is connected to the power supply of the switch. 3) Contact technical support if the alert persists.

## Syslog Message

Cluster switch: %s power supply: %s status: %s.

## Parameters

**switch\_name** (STRING): Cluster switch name

**pwr\_supply\_name** (STRING): The power supply name that is failing.  
**status** (STRING): The power supply status.

## cluster.switch.pwr.non.operational

### Severity

INFORMATIONAL

### Description

The power supply on the switch is not operational.

### Corrective Action

1) Ensure that the power supply unit is turned on through switch CLI. 2) Run diagnostics on the switch to check the operational status of the power supply unit (PSU). For instructions about how to run switch diagnostics, see the switch's configuration guide. 3) Contact technical support if the alert persists.

### Syslog Message

Cluster switch: %s power supply: %s status: %s.

### Parameters

**switch\_name** (STRING): Cluster switch name  
**pwr\_supply\_name** (STRING): The power supply name that is failing.  
**status** (STRING): The power supply status.

## cluster.switch.reboot

### Severity

INFORMATIONAL

### Description

The cluster switch has recently rebooted. Communication problems and cluster connectivity issues might occur.

### Corrective Action

1) If the cluster switch was not rebooted on purpose, then check the switch to ensure that it is operating normally. 2) If errors persist, contact technical support for further assistance.

### Syslog Message

Cluster switch: %s rebooted at: %ld

### Parameters

**switch\_name** (STRING): Cluster switch name  
**time** (INT): Last reported time before reboot.

## cluster.switch.unsupported

### Severity

INFORMATIONAL

### Description

Unsupported cluster switch is detected. Communication problems and cluster connectivity issues occur.

### Corrective Action

Unsupported cluster switch found. Connect a supported cluster switch to cluster network.

### Syslog Message

Cluster switch: %s model: %s not supported.

### Parameters

**switch\_name** (STRING): Cluster switch name

**model** (STRING): The switch model.

## cluster.vol events

### cluster.vol.create.success

#### Severity

NOTICE

#### Description

This message occurs when the volume required to store the system data needed for cluster-wide storage is created successfully after one or more attempts to create it failed. An event was previously raised for the failures.

#### Corrective Action

(None).

#### Syslog Message

Successfully created the volume for feature %s, after earlier attempts to create it failed.

#### Parameters

**Feature** (STRING): Feature using the cluster-wide storage.

### cluster.vol.delete.failed

#### Severity

ALERT

#### Description

This message occurs when the volume that was used for cluster-wide storage cannot be deleted.

#### Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume delete operation failed because the aggregate is offline, use the "aggr online -aggregate aggregate\_name" command to bring it back online. If the error message does not indicate an obvious problem, contact NetApp technical support.

#### Syslog Message

Could not delete volume %s %d times on aggregate %s for feature %s. Most recent delete before this EMS failed with error message: "%s".

## Parameters

**Volume** (STRING): Volume name.

**AttemptsMade** (INT): Count of failed attempts to delete the volume.

**Aggregate** (STRING): Aggregate name.

**Feature** (STRING): Feature using the cluster-wide storage.

**ErrorMessage** (STRING): Error message resulting from the delete failure at the time of EMS generation.

## cluster.vol.delete.success

### Severity

NOTICE

### Description

This message occurs when the volume that was used for cluster-wide storage is deleted successfully after one or more attempts to delete it failed. An event was previously raised for the failures.

### Corrective Action

(None).

### Syslog Message

Successfully deleted volume %s on aggregate %s for feature %s, after earlier attempts to delete it failed.

## Parameters

**Volume** (STRING): Volume name.

**Aggregate** (STRING): Aggregate name.

**Feature** (STRING): Feature using the cluster-wide storage.

## cluster.vol.feature.inoper

### Severity

ALERT

### Description

This message occurs when it is detected that a feature relying on cluster-wide storage has been unable to create its storage. This condition leaves the feature inoperative.

### Corrective Action

Look for any instances of the callhome.clus.vol.cre.fail event and follow any corrective action suggested there. For more information or assistance, contact NetApp technical support.

### Syslog Message

Feature %s is inoperative due to failures creating the cluster-wide storage that it requires.

## Parameters

**Feature** (STRING): Feature using the cluster-wide storage.

## cluster.vol.feature.ok

### Severity

INFORMATIONAL

## Description

This message occurs when it is detected that a feature relying on cluster-wide storage has been able to create its storage after previously not being able to.

## Corrective Action

(None).

## Syslog Message

Feature %s degraded state has been cleared.

## Parameters

**Feature** (STRING): Feature using the cluster-wide storage.

## cluster.vol.on.same.aggr

## Severity

ALERT

## Description

This message occurs when both active and standby volumes used for cluster-wide storage are hosted on the same aggregate. This is typically due to there not being a suitable second aggregate to host the standby volume. In this configuration, the loss of the single aggregate would remove all cluster-wide storage for the feature, which would severely affect its functionality.

## Corrective Action

Use the "volume show" command to identify the size of the specified volumes and on which aggregate they are hosted. Use the "storage aggregate show -fields mirror" command to identify if the aggregate that currently hosts the volumes is mirrored. Use the "storage aggregate show -fields mirror,size,usedsize,state" command to find an online aggregate with the same mirror attribute and with enough free space to host the standby volume. If a suitable aggregate cannot be found, then bring an offline aggregate back online using the "storage aggregate online" command or create a new aggregate using the "storage aggregate create" command. If creating a new aggregate, ensure that it is large enough to host the volume and that it has the same mirror attribute as the current aggregate. After a suitable aggregate has been identified or created, move the standby volume to this aggregate using the "volume move start" command. For more information or assistance, contact NetApp technical support.

## Syslog Message

Both active and standby cluster-wide storage volumes (%s, %s) for %s feature are on the same aggregate.

## Parameters

**ActiveVolume** (STRING): Active volume name.

**StandbyVolume** (STRING): Standby volume name.

**Feature** (STRING): Feature using the cluster-wide storage.

# cmd events

## cmd.result events

### cmd.result.reboot

**Severity**

NOTICE

**Description**

This message occurs when the system reboots as a consequence of executing the specified command.

**Corrective Action**

(None).

**Syslog Message**

System rebooted for ('%s').

**Parameters**

**cmd** (STRING): Command for which the system rebooted.

## cmd.sasadmin events

### cmd.sasadmin.fw\_update.fail

**Severity**

ERROR

**Description**

This message occurs when an adapter firmware update failure occurs.

**Corrective Action**

Verify that the firmware file is valid and try updating the firmware again. If the firmware update still fails, contact NetApp technical support.

**Syslog Message**

Adapter firmware update failed for adapter: %s.

**Parameters**

**adapterName** (STRING): Name of the associated SAS host bus adapter.

## cmd.shelfchk events

### cmd.shelfchk.config.OK

**Severity**

INFORMATIONAL

**Description**

This event is generated while verifying disk shelf cabling and configuration. The operator indicates that the correct disk LEDs have illuminated.

**Corrective Action**

(None).

**Syslog Message**

Disk Configuration - No Errors Identified.

**Parameters**

(None).

**cmd.shelfchk.config.warning****Severity**

ERROR

**Description**

This event is generated while verifying disk shelf cabling and configuration on a channel. The operator has indicated that the intended set of disk LEDs is not illuminated.

**Corrective Action**

Verify that the adapters and storage shelves are cabled correctly.

**Syslog Message**

Disk Configuration - Failure Identified by Operator.

**Parameters**

(None).

**cmd.start events****cmd.start.unsuccessful****Severity**

ERROR

**Description**

This message occurs when the Counter Manager daemon (cmd) fails to start. The failure impacts the continuous archiving of performance data, which is used by technical support to troubleshoot system issues.

**Corrective Action**

The startup failure might be due to improper permissions for the '/mroot/etc/log' directory, or a full disk. Verify that the permissions of the '/mroot/etc/log' directory are 'rwxr-xr-x' by executing the 'fsecurity show /vol/vol0/etc/log' command from the nodeshell. Verify that the '/mroot' file system is not full. After fixing the cause of the failure, restart the cmd by running the 'spmctl -e -h cmd' command from the freebsd shell.

**Syslog Message**

The cmd startup failed.

**Parameters**

(None).

# cmds events

## cmds.config events

### cmds.config.file.delete

**Severity**

NOTICE

**Description**

This message occurs when there is an error in deleting the specified file.

**Corrective Action**

(None).

**Syslog Message**

%s: Error in deleting %s: (%s).

**Parameters**

**funcname** (STRING): Function name.

**fname** (STRING): File name.

**errMessage** (STRING): Error message.

## cmds.software events

### cmds.software.dirErr

**Severity**

ERROR

**Description**

This message occurs because the system cannot create the directory at the designated path.

**Corrective Action**

(None).

**Syslog Message**

Could not create directory %s: %s

**Parameters**

**path** (STRING): Path where directory was supposed to be created.

**errorMsg** (STRING): Error message.

### cmds.software.installDone

**Severity**

INFORMATIONAL

**Description**

This message occurs during software update and installation to inform you that the installation is complete.

**Corrective Action**

(None).

**Syslog Message**

Software: Installation of %s was completed.

**Parameters**

**fileName** (STRING): Name of the file to be updated/installed.

**cmds.software.installNotDone****Severity**

INFORMATIONAL

**Description**

This message occurs during software update and installation to inform you that installation failed.

**Corrective Action**

(None).

**Syslog Message**

Software: Installation of %s failed.

**Parameters**

**fileName** (STRING): Name of the file to be updated/installed.

**cmds.sysconf events****cmds.sysconf.haltERR1****Severity**

ALERT

**Description**

This message occurs to log the reason for system halt, before actually system is halted.

**Corrective Action**

(None).

**Syslog Message**

Halting system due to %d configuration problems.

**Parameters**

**errCount** (INT): Number of error which caused the system halt.

## **cmds.sysconf.haltERR2**

### **Severity**

ALERT

### **Description**

This message occurs to log the reason for system halt, before actually system is halted.

### **Corrective Action**

(None).

### **Syslog Message**

Halting system due to a configuration problem.

### **Parameters**

(None).

## **cmds.sysconf.inconstRule**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs because the rule for the card is applicable to both non\_cluster\_only and cluster\_only systems, which is inconsistent.

### **Corrective Action**

(None).

### **Syslog Message**

Rule for model %s card %s is inconsistent: it applies both to cluster-only and non-cluster-only.

### **Parameters**

**model** (STRING): Model ID.

**card** (STRING): Card ID.

## **cmds.sysconf.logErr**

### **Severity**

NOTICE

### **Description**

This message occurs to log the error through syslog as an Error or Informational message depending upon the error count which is in this case greater than 0.

### **Corrective Action**

(None).

### **Syslog Message**

%s.

## Parameters

**errMsg** (STRING): Error message to be logged.

## cmds.sysconf.logInfo

### Severity

INFORMATIONAL

### Description

This message occurs to log the error through syslog as an Error or informational message depending upon the error count which is in this case less than or equal to 0.

### Corrective Action

(None).

### Syslog Message

%s.

## Parameters

**errMsg** (STRING): Error message to be logged.

## cmds.sysconf.perIntSmall

### Severity

INFORMATIONAL

### Description

This message occurs because the value for a periodic interval for internal testing is set too small, less than the minimum allowed.

### Corrective Action

(None).

### Syslog Message

options.sysconfig.periodic\_interval of %d minutes is too small; using %d.

## Parameters

**valueUsed** (INT): Value used for testing purpose.

**defaultMinValue** (INT): Minimum value allowed for a periodic interval.

## cmds.sysconf.syslogger

### Severity

NOTICE

### Description

This message occurs to send the output to syslog rather than command prompt because the option '-l' with sysconfig command is not documented and is included in DEBUG builds only.

**Corrective Action**

(None).

**Syslog Message**

%s.

**Parameters**

**message** (STRING): 'sysconfig -l' Command output message.

# cmpr events

## cmpr.algo events

### cmpr.algo.not.enabled

#### Severity

ALERT

#### Description

This message occurs when compression algorithm specified has not been enabled on the node.

#### Corrective Action

Contact technical support.

#### Syslog Message

Volume '%s' has '%s' compression enabled but the necessary bootarg(s) have not been set on the node.

#### Parameters

**vol** (STRING): Volume name.

**comp\_algo** (STRING): Compression Algorithm.

# cna events

## cna.dump events

### cna.dump

#### Severity

NOTICE

#### Description

This message occurs when an unexpected event or illegal condition is detected by the Converged Network Adapter (CNA) driver and the contents of the adapter's static RAM and memory must be dumped. After the dump, the adapter is reset and the contents of the dump are stored in a file in the `/etc/log/` directory.

#### Corrective Action

No corrective action is needed; the adapter was reset.

#### Syslog Message

CNA coredump generated for CNA adapter CNA\_%, %s

#### Parameters

**adapter** (STRING): Name of the Converged Network Adapter.

**reason** (STRING): Reason for the dump.

### cna.dump.saved

#### Severity

NOTICE

#### Description

This message occurs when an unexpected event or illegal condition is detected by the Converged Network Adapter (CNA) driver and the contents of the adapter's static RAM and memory are saved. The dump files are stored on the appliance's root volume in the `/etc/log/` directory, with the following file name format:  
`[date][time].bin`

#### Corrective Action

Send the dump file to technical support for analysis.

#### Syslog Message

A dump for CNA adapter CNA\_%, %s was stored in %s

#### Parameters

**adapter** (STRING): Name of the CNA.

**filename** (STRING): Name of the file containing the dump.

## cna.initfailed events

## **cna.initFailed**

### **Severity**

ALERT

### **Description**

This message occurs when the converged network adapter (CNA) fails to initialize.

### **Corrective Action**

Take corrective action based on the reason indicated for the failure.

### **Syslog Message**

Initialization of adapter %s failed, reason: %s.

### **Parameters**

**adapter** (STRING): Name of the Adapter.

**reason** (STRING): Reason for the failure.

## **cna.sfp events**

### **cna.sfp.notSupported**

### **Severity**

ERROR

### **Description**

This message occurs when the converged network adapter (CNA) detects an unsupported small form-factor Pluggable (SFP) in the adapter.

### **Corrective Action**

Replace the unsupported SFP with a supported SFP.

### **Syslog Message**

The SFP in adapter %s is not supported.

### **Parameters**

**adapter** (STRING): Name of the adapter.

# command events

## command.complex events

### command.complex.query

#### Severity

ERROR

#### Description

This message occurs when a custom role associated with a Storage Virtual Machine has a command directory with complex query.

#### Corrective Action

Remove the complex query. See [BUG 915877](#) for more information.

#### Syslog Message

The %s command directory in %s role under Storage Virtual Machine %s, will not be available in merged role.

#### Parameters

**vserver** (STRING): Name of the Storage Virtual Machine.

**rolename** (STRING): Name of the role associated with the Virtual Storage Machine, with a command directory with a complex query.

**cmddirname** (STRING): Name of the command directory with complex query.

# config events

## config.atanotsupported events

### config.ATANotSupported

**Severity**

ERROR

**Description**

This message occurs when an ATA disk is found, but the appliance does not support it.

**Corrective Action**

Remove the ATA disks or upgrade your appliance to a model that supports ATA disks. Check your support provider's web site or knowledgebase for more information about appliance models that support ATA disks.

**Syslog Message**

ATA disks are not supported on this appliance. Disk %s is an ATA disk and should be removed.

**Parameters**

**disk** (STRING): Name of the disk.

## config.badlocalswitch events

### config.BadLocalSwitch

**Severity**

ALERT

**Description**

This message occurs when a disk is found to be attached to a switch, but there are also disks attached via local connections. Mixed switch-attached and direct-attached disks are an illegal configuration.

**Corrective Action**

Correct the cabling so that all disks are attached either directly or through switches. Consult the hardware cabling guides at the NetApp technical support site.

**Syslog Message**

Disk %s is attached to a switch. However, there are also local attached disks. This is an illegal configuration.

**Parameters**

**disk** (STRING): Name of the disk.

## config.badpoolassign events

### config.BadPoolAssign

## Severity

ERROR

## Description

This message occurs when SyncMirror® is in use and disks are assigned to different pools on the same interface or loop. This affects the fault isolation of the plexes in mirrored aggregates such that if a single interface fails, both plexes in an aggregate might fail or become degraded. If both plexes of an aggregate fail, the system enters multidisk panic.

## Corrective Action

If the disk is a spare disk, use the "storage disk assign -pool [0|1]" command to change the pool assignment of the disks on the interface so that they are assigned to only one pool. If the disk is a file system disk, use the "storage disk replace" command to replace the disk from the incorrect pool with a spare disk from the correct pool.

## Syslog Message

Disk %s is in %s and other disks on this loop/domain are in %s. Disks/interfaces need to be in separate pools for SyncMirror.

## Parameters

**disk** (STRING): Name of the disk that fails.  
**disk\_pool** (STRING): Name of the pool that the disk is in.  
**other\_pool** (STRING): Name of the other pool.

# config.badslot events

## config.BadSlot

### Severity

ALERT

### Description

This message occurs when a disk is found to be attached to an invalid Host Adapter (HA) controller slot.

### Corrective Action

Consult the NetApp technical support guides for the supported slots for adapters in the hardware platform. If the adapter is in a supported slot, contact NetApp technical support for further assistance.

### Syslog Message

Disk %s is attached to an invalid HA slot. This is an illegal configuration.

### Parameters

**disk** (STRING): Name of the disk.

# config.badswitchlocal events

## config.BadSwitchLocal

### Severity

ALERT

## Description

This message occurs when a disk is found to be attached locally, but there are also disks attached via switches. Mixed switch-attached and direct-attached disks are an illegal configuration.

## Corrective Action

Correct the cabling so that all disks are attached either directly or through switches. Consult the hardware cabling guides at the NetApp technical support site.

## Syslog Message

Disk %s is attached locally. However, there are also switch attached disks. This is an illegal configuration.

## Parameters

**disk** (STRING): Name of the disk.

# config.bridge events

## config.bridge.adapter.invalid

### Severity

ERROR

### Description

This message occurs when an FC-to-SAS bridge is attached to an unsupported FC adapter port. Only QLogic® 4-Gb/s or 8-Gb/s adapters are supported.

### Corrective Action

Attach the FC-to-SAS bridge to a supported FC adapter port on the controller.

### Syslog Message

FC-to-SAS bridge %s S/N [%s] is attached to unsupported FC adapter port %s.

### Parameters

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**adapterName** (STRING): Name of the associated FC host bus adapter.

## config.bridge.extra.port

### Severity

ERROR

### Description

This message occurs when both FC ports of an FC-to-SAS bridge are attached to the same controller.

### Corrective Action

Follow the defined Fabric or Stretch MetroCluster wiring guide.

### Syslog Message

Both FC ports of FC-to-SAS bridge %s S/N [%s] are attached to this controller.

## Parameters

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

## config.bridge.fw.mismatch

### Severity

ERROR

### Description

This message occurs when two or more attached FC-to-SAS bridges are running different firmware revisions.

### Corrective Action

For more information about downloading and installing updated firmware, check your support provider's web site or knowledgebase.

### Syslog Message

Two or more %s FC-to-SAS bridges are running different firmware revisions.

## Parameters

**bridgeModel** (STRING): Name of the FC-to-SAS bridge model.

## config.bridge.SAS.miswired

### Severity

ERROR

### Description

This message occurs when the SAS disk shelves behind an FC-to-SAS bridge are not wired in the correct order.

### Corrective Action

Follow the defined Fabric or Stretch MetroCluster wiring guide.

### Syslog Message

The SAS disk shelves behind FC-to-SAS bridge %s S/N [%s] are not correctly wired.

## Parameters

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

## config.bridge.SAS2Domain

### Severity

ERROR

### Description

This message occurs when a disk is multipathed to one SAS domain; that is, both ports of the disk are visible from the same bridge FC port.

### Corrective Action

Recable the disk shelf containing the specified disk, so that the two disk ports are in different SAS domains.

### Syslog Message

Disk %s is multipathed to the same SAS domain. The two disk ports must be in different SAS domains.

### Parameters

**disk** (STRING): Name of the disk.

## config.bridge.unsupp.shelf

### Severity

ALERT

### Description

This message occurs when an FC-to-SAS bridge discovers a disk shelf that it does not support.

### Corrective Action

Verify the bridge firmware is up-to-date with minimum FW rev required for support of this shelf type. If the bridge firmware supports the disk shelf but the error condition persists, remove the disk shelf.

### Syslog Message

FC-to-SAS %s bridge with S/N: %s WWN: %s has unsupported %s shelf type attached.

### Parameters

**bridgeType** (STRING): Type of FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the bridge.

**bridgeWWN** (STRING): World Wide Name of the bridge.

**shelfType** (STRING): Type of shelf.

## config.cfobothabmodule events

### config.CFObothABmodule

### Severity

ALERT

### Description

This message occurs when a disk shelf in a node is cabled for multipathing and the configuration does not support it. Multipathing means that the disk shelf is connected to one node through both disk shelf module A and module B. In HA configurations, multipathing is only supported if software disk ownership is being used and the storage shelf supports it.

### Corrective Action

For a standard HA configuration, identify the miscabled disk shelf and attach either module A or module B to the partner node. For a shared storage or multipathed HA, assign disk ownership to the partner node by using the "disk assign" command in Maintenance mode.

### Syslog Message

The disk shelf where disk %s resides is connected to this node through both disk shelf module A and module B; one of the modules must be connected to the partner node instead.

## Parameters

**disk** (STRING): Name of the disk that is cabled for multipathing.

# config.cfomixedabmodule events

## config.CFOmixedABmodule

### Severity

ALERT

### Description

This message occurs when a disk shelf attached to a node is miscabled so that one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

### Corrective Action

Identify the miscabled disk shelf, and then recable it. For FC shelves, ensure that each disk shelf's module A is connected Output to Input to the next disk shelf's module A, and that the disk shelf's module B is connected Output to Input to the next disk shelf's module B. For SAS shelves, connect the port identified with a circle on disk shelf module A to the port identified with a square on the next disk shelf's module A, and the "circle" port on module B to the next disk shelf's "square" port.

### Syslog Message

Host adapter %s has miscabled disk shelves; one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

## Parameters

**adapter** (STRING): Adapter that the miscabled disk shelf is on.

# config.differentswitchport events

## config.DifferentSwitchPort

### Severity

ALERT

### Description

This message occurs when the two ports of the disk are connected to different switch ports.

### Corrective Action

(None).

### Syslog Message

Disks on port %s:%d are also connected to port %s:%d. They need to be connected via the same port on different switches. This is an illegal configuration.

## Parameters

**switch1** (STRING): (None).

**port1** (INT): (None).

**switch2** (STRING): (None).

**port2** (INT): (None).

# config.diffpool events

## config.DiffPool

### Severity

ALERT

### Description

This message occurs when a disk is found to be multipathed to two different mirroring pools. This configuration is illegal.

### Corrective Action

See the NetApp technical support site for guidelines about assigning disks or array LUNs to SyncMirror® pools.

### Syslog Message

Disk %s is dual-attached to two separate mirrored pools. This is an illegal configuration.

### Parameters

**disk** (STRING): Name of the disk.

# config.disknoswitch events

## config.DiskNoSwitch

### Severity

ALERT

### Description

This message occurs when a disk is found to be attached to a switch, but it's not supported for a switch configuration.

### Corrective Action

Ensure that the Disk Qualification Package (DQP) is up-to-date. Visit the NetApp technical support site for information on DQP files and installation. If the error persists for more than 10 minutes after installing an updated DQP file, remove the drive.

### Syslog Message

Disk %s is not supported in a switch configuration.

### Parameters

**disk** (STRING): Name of the disk.

# config.exceededha events

## config.ExceededHA

### Severity

ERROR

## Description

This message occurs when the number of local attached FC adapters exceeds the maximum allowed.

## Corrective Action

(None).

## Syslog Message

%d Fibre Channel disk adapters were detected and the maximum allowed is only %d.

## Parameters

numHA (INT): (None).

maxHA (INT): (None).

# config.fcsameloop events

## config.FCSameLoop

### Severity

ERROR

### Description

This message occurs when a disk is multipathed to the same Fibre Channel loop.

### Corrective Action

Recable the disk shelf containing the specified disk so that it is multipathed to different Fibre Channel loops.

### Syslog Message

Disk %s is attached to the same Fibre Channel loop. The disk should be multipathed to different loops.

### Parameters

disk (STRING): Name of the disk.

# config.habadbank1 events

## config.HABadBank1

### Severity

ALERT

### Description

This message occurs when a local host adapter is connected to a different switch bank (on ports 8-15) than other adapters on this controller, which are connected to ports 0-7. This is an illegal configuration.

### Corrective Action

Connect all of the adapters of this controller to the same bank of switch ports.

### Syslog Message

Other local host adapters are connected to Switch bank 1 (ports 0-7). Host adapter %s is connected to Switch bank 2 (ports 8-15). This is an illegal configuration.

## Parameters

**ha** (STRING): Name of the host adapter.

# config.habadbank2 events

## config.HABadBank2

### Severity

ALERT

### Description

This message occurs when a local host adapter is connected to a different switch bank (on ports 0-7) than other adapters on this controller, which are connected to ports 8-15. This is an illegal configuration.

### Corrective Action

Connect all of the adapters of this controller to the same bank of switch ports.

### Syslog Message

Other local host adapters are connected to Switch bank 2 (ports 8-15). Host adapter %s is connected to Switch bank 1 (ports 0-7). This is an illegal configuration.

## Parameters

**ha** (STRING): Name of the host adapter.

# config.habadremote events

## config.HABadRemote

### Severity

ALERT

### Description

This message occurs when a remote host adapter is connected to the wrong switch bank.

### Corrective Action

Examine the cabling to determine which switch bank the local controller host adapters are attached to (the lower-numbered ports or the higher-numbered ports.) Recable the HA of the remote controller to be in the other bank of switch ports.

### Syslog Message

A remote host adapter is connected to the same switch bank as the local host adapters. This is an illegal configuration.

## Parameters

(None).

# config.invalid events

## config.invalid.PortToPort

### Severity

ERROR

### Description

This message occurs when a SAS (Serial Attached SCSI) port is attached to another SAS port. This is not a valid connection.

### Corrective Action

Check and correct the cabling; connecting two SAS ports together in this configuration is not permitted.

### Syslog Message

SAS adapter "%s" is attached to another SAS adapter.

### Parameters

**adapterName** (STRING): Name of the associated SAS host bus adapter.

## config.localswitch events

### config.localswitch

### Severity

EMERGENCY

### Description

This message occurs when a disk is found attached via both local connection and a switch. This is permitted in debug. The system will be halted in non-debug.

### Corrective Action

(None).

### Syslog Message

Disk %s is attached via a local connection and a switch. This is an illegal configuration.

### Parameters

**disk** (STRING): Name of the disk.

## config.mirroring events

### config.mirroring.failure

### Severity

ERROR

### Description

This message occurs when the name-service configuration is not replicated in the node. The out-of-sync configuration file can impact access during data access attempts.

## Corrective Action

Use the "vserver services name-service unix-user load-from-uri" or "vserver services name-service unix-group load-from-uri" command to reload the configuration file. Use the (privilege: advanced) "vserver services name-service unix-user file status" or "vserver services name-service unix-group file status" command to verify that the configuration file was successfully loaded and corresponding database was successfully generated.

## Syslog Message

Failed getting the latest %s file for Vserver %s on node %s with error %s.

## Parameters

**configuration** (STRING): Name of the configuration.

**vserver\_name** (STRING): Name of the vserver, for which the configuration was not successfully replicated.

**node\_name** (STRING): Name of the node on which configuration failed to replicate.

**error\_string** (STRING): Error encountered while extracting package.

# config.mirrornotmultipath events

## config.MirrorNotMultiPath

### Severity

ERROR

### Description

This message occurs when a disk is not multipathed but synchronous mirroring is enabled.

### Corrective Action

Multipath the disk shelf stack by also attaching it to a different host adapter via the other shelf module in each disk shelf in the stack.

### Syslog Message

Disk %s and other disks on this loop/domain are not multipathed and should be for synchronous mirroring configuration.

### Parameters

**disk** (STRING): Name of the disk.

# config.mirrorscsidisk events

## config.MirrorSCSIdisk

### Severity

ALERT

### Description

This message occurs when a SCSI disk is found in a SyncMirror® configuration.

### Corrective Action

Unconfigure SyncMirror on the aggregate that contains the SCSI disk. Configure SyncMirror using aggregates that do not contain SCSI disks.

### **Syslog Message**

Disk %s is a SCSI disk, and is illegal in a SyncMirror configuration.

### **Parameters**

**disk** (STRING): Name of the SCSI disk that was found.

## **config.mixedabmodule events**

### **config.mixedABmodule**

#### **Severity**

ERROR

#### **Description**

This message occurs when the disk shelf stack is miscabled so that one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

#### **Corrective Action**

Identify the miscabled disk shelf, and then recable it. For fibre channel shelves, ensure that each disk shelf's module A is connected Output to Input to the next disk shelf's module A, and that the disk shelf's module B is connected Output to Input to the next disk shelf's module B. For SAS shelves, connect the port identified with a circle on disk shelf module A to the port identified with a square on the next disk shelf's module A, and the "circle" port on module B to the next disk shelf's "square" port on disk shelf module B.

### **Syslog Message**

Host adapter %s has miscabled disk shelves; one disk shelf's module A is connected to the next disk shelf's module B, or vice versa. This is not a recommended configuration.

### **Parameters**

**adapter** (STRING): Name of the adapter on the miscabled disk shelf stack.

## **config.more2path events**

### **config.More2Path**

#### **Severity**

ERROR

#### **Description**

This message occurs when a disk is found to have more than two connections to the storage controller.

#### **Corrective Action**

Remove connections to the disk so there are only two.

### **Syslog Message**

Disk %s and other disks on this loop/domain are attached with more than two connections. Only two connections are supported.

### **Parameters**

**disk** (STRING): Name of the disk.

## config.move events

### config.move.fail.lost.lif.address

#### Severity

ERROR

#### Description

This message occurs when a logical interface (LIF) migration fails in such a way that there might have been a resulting internal loss of the LIF IP address.

#### Corrective Action

Use the "network interface modify" command to toggle the LIF's "-status-admin" parameter down and then up. This reinstalls the LIF address in the network stack.

#### Syslog Message

LIF migration for IP address %s from port %s to port %s failed because of an internal error: %s.

#### Parameters

**address** (STRING): LIF IPv4 or IPv6 address being moved.

**migrateFromPort** (STRING): Name of the migrate-from port.

**migrateToPort** (STRING): Name of the migrate-to port.

**internalError** (STRING): Internal error message.

## config.multipath events

### config.MultiPath

#### Severity

INFORMATIONAL

#### Description

This message occurs when the filer configuration is configured for High Availability (HA) multipathing.

#### Corrective Action

(None).

#### Syslog Message

(None).

#### Parameters

(None).

## config.noadisk events

### config.noAdisk

#### Severity

ALERT

## Description

This message occurs when the local node in an HA configuration is connected to its disk shelves through the shelf B module instead of the shelf A module. In an HA configuration, the local node must be connected to its disk shelves through the shelf A module, and the partner node must be connected to those disk shelves through the shelf B module.

## Corrective Action

For a standard HA configuration, identify and connect the local node's disk shelves to the local node using the shelf's module A. Then connect those disk shelves to the partner node using the shelf module B. For a shared storage or multipathed HA, assign disk ownership to the local and partner nodes by using the "disk assign" command in Maintenance mode.

## Syslog Message

All disk shelves are attached to the local node through shelf module B. Some of these shelves should be attached via shelf module A.

## Parameters

(None).

# config.nobconnect events

## config.noBconnect

### Severity

EMERGENCY

### Description

This message occurs when the local node in an HA configuration has no access to its partner node's disk shelves because the partner node's shelves are not connected to the local node through the shelf's module B.

### Corrective Action

For an HA configuration that uses software disk ownership, verify that both the local and partner nodes can access the disks.

### Syslog Message

The local node cannot access the partner node's disk shelves because the partner node's shelves are not connected to the local node through their shelf module B.

### Parameters

(None).

# config.nocheck events

## config.NoCheck

### Severity

NOTICE

## Description

This message occurs when the system should be halting, but it cannot because the "no-config-check?" environment variable is set to true.

## Corrective Action

(None).

## Syslog Message

This is an illegal configuration. However the Filer is not halting due to no-config-check? being set to true.

## Parameters

(None).

# config.nomultipath events

## config.NoMultiPath

### Severity

ALERT

### Description

This message occurs when a disk is found with multiple paths and it does not support them.

### Corrective Action

Remove the second path from the disk shelf.

### Syslog Message

Disk %s cannot be multipathed.

### Parameters

**disk** (STRING): Name of the disk that was found.

# config.nopartnerdisks events

## config.noPartnerDisks

### Severity

ERROR

### Description

This message occurs in a High-Availability (HA) configuration when there are no partner disks.

### Corrective Action

Ensure that both nodes of the HA pair are cabled so they have access to all the disks. Check that the adapter interface to the disk shelves is up using the "storage adapter show" command. Ensure that any switches are correctly zoned for disk visibility by the nodes.

### Syslog Message

No disks were detected for the partner; this node cannot perform takeover correctly.

**Parameters**

(None).

## **config.nopartnerluns events**

### **config.noPartnerLUNs**

**Severity**

EMERGENCY

**Description**

This message occurs in a High-Availability (HA) configuration with array LUNS when there is no attachment to both local and partner LUNs.

**Corrective Action**

Ensure that both nodes of the HA pair are cabled so they have access to all of the LUNs. Check that the adapter interface to the array is up by using the "storage adapter show" command. Ensure that any switches are correctly zoned for LUN visibility by the nodes. Verify that the array or bridge is correctly exporting its LUNs on the proper interface.

**Syslog Message**

No LUNs were detected for the partner; this node cannot perform takeover correctly.

**Parameters**

(None).

## **config.noswitchcount events**

### **config.NoSwitchCount**

**Severity**

NOTICE

**Description**

This message occurs when an attempt to obtain the switch port count fails because it does not exist.

**Corrective Action**

(None).

**Syslog Message**

Unable to obtain switch port count information for attached switches.

**Parameters**

(None).

## **config.noswitchcountfordisk events**

## **config.NoSwitchCountForDisk**

### **Severity**

NOTICE

### **Description**

This message occurs when an attempt to obtain the switch port count fails because it does not exist.

### **Corrective Action**

(None).

### **Syslog Message**

Unable to obtain switch port count information for disk %s.

### **Parameters**

**disk** (STRING): Name of the disk.

## **config.notmultipath events**

### **config.NotMultiPath**

### **Severity**

ERROR

### **Description**

This message occurs when a disk is not multipathed.

### **Corrective Action**

Multipath the disk shelf stack by also attaching it to a different host adapter via the other shelf module in each disk shelf in the stack.

### **Syslog Message**

Disk %s and other disks on this loop/domain are not multipathed and should be for improved availability.

### **Parameters**

**disk** (STRING): Name of the disk.

## **config.oneswitch events**

### **config.OneSwitch**

### **Severity**

ALERT

### **Description**

This message occurs when the disk is only connected to one switch.

### **Corrective Action**

(None).

## Syslog Message

Disk %s and other disks on this loop are only connected to one switch. For availability reasons, it should be connected to two separate switches.

## Parameters

**disk** (STRING): name of the disk

# config.pvlan events

## config.pvlan.created

### Severity

NOTICE

### Description

This message occurs when a pseudo-VLAN port is created.

### Corrective Action

(None).

### Syslog Message

Pseudo-VLAN "%s" was created on the network interface "%s".

### Parameters

**pvlanName** (STRING): Pseudo-VLAN name.

**interface** (STRING): Interface name that the pseudo-VLAN will be on.

## config.pvlan.deleted

### Severity

NOTICE

### Description

This message occurs when a pseudo-VLAN port is deleted.

### Corrective Action

(None).

### Syslog Message

Pseudo-VLAN "%s" was deleted from the network interface "%s".

### Parameters

**pvlanName** (STRING): Pseudo-VLAN name.

**interface** (STRING): Interface name that the pseudo-VLAN is on.

# config.repl events

## **config.repl.bypass.disabled**

### **Severity**

NOTICE

### **Description**

This message occurs when the configuration replication bypass has been disabled. Configuration replication to any partner clusters will now resume.

### **Corrective Action**

(None).

### **Syslog Message**

The configuration replication bypass has been disabled.

### **Parameters**

(None).

## **config.repl.bypass.enabled**

### **Severity**

NOTICE

### **Description**

This message occurs when the configuration replication bypass has been enabled. Configuration replication to any partner clusters will cease until the bypass is disabled using the 'debug crs replication-bypass disable' command.

### **Corrective Action**

(None).

### **Syslog Message**

The configuration replication bypass has been enabled.

### **Parameters**

(None).

## **config.sameha events**

### **config.sameHA**

### **Severity**

ERROR

### **Description**

This message occurs when a disk is multipathed to the same host adapter. The second disk interface should be attached to a different host adapter.

### **Corrective Action**

Move one of the connections attaching the disk shelf to a different host adapter.

### **Syslog Message**

Disk %s and other disks attached to the same port are dual-attached to the same adapter. For improved availability you should dual-attach them to separate adapters.

### **Parameters**

**disk** (STRING): Name of the disk.

## **config.sameslot events**

### **config.sameSlot**

#### **Severity**

ERROR

#### **Description**

This message occurs when a SAS disk is multipathed to host adapters in the same controller slot. The second disk interface should be attached to a host adapter in a different slot.

#### **Corrective Action**

Move one of the connections attaching the disk shelf to a host adapter in a different slot.

### **Syslog Message**

Disk %s and other disks attached to the same port are dual-attached to adapters in the same slot . For improved availability you should dual-attach them to adapters in separate slots.

### **Parameters**

**disk** (STRING): Name of the disk.

## **config.sameswitch events**

### **config.SameSwitch**

#### **Severity**

ALERT

#### **Description**

This message occurs when both ports of a disk is found to be attached to the same switch.

#### **Corrective Action**

(None).

### **Syslog Message**

Disks on port %s:%d are also connected to the same switch at port %s:%d. This is an illegal configuration.

### **Parameters**

**switch1** (STRING): name of the switch

**port1** (INT): port number of 1st connection.

**switch2** (STRING): (None).

**port2** (INT): port number of 2nd connection.

## config.sameswitchwarn events

### config.SameSwitchWarn

#### Severity

ALERT

#### Description

This message occurs when both ports of a disk are found to be attached to the same switch. Higher availability is achieved by cabling disk ports to different switches.

#### Corrective Action

Recable one of the indicated ports to a different switch.

#### Syslog Message

Disks on port %s:%d are also connected to the same switch at port %s:%d. For availability reasons, they should be connected to two separate switches.

#### Parameters

**switch1** (STRING): Name of the switch.

**port1** (INT): Port number of first connection.

**switch2** (STRING): (None).

**port2** (INT): Port number of second connection.

## config.sas2domain events

### config.SAS2Domain

#### Severity

ERROR

#### Description

This message occurs when a disk is multipathed to one SAS domain; that is, both ports of the disk are visible from the same HBA port.

#### Corrective Action

Recable the disk shelf containing the specified disk, so that the two disk ports are in different SAS domains.

#### Syslog Message

Disk %s is multipathed to the same SAS domain. The two disk ports must be in different SAS domains.

#### Parameters

**disk** (STRING): Name of the disk.

## config.scsidisk events

### config.SCSIdisk

**Severity**

NOTICE

**Description**

This message occurs when a SCSI disk is found in a CFO configuration.

**Corrective Action**

(None).

**Syslog Message**

Disk %s is a SCSI disk, and is illegal in a Clustered Failover configuration.

**Parameters**

**disk** (STRING): Name of the SCSI disk which was found.

# configbr events

## configbr.backupcompleted events

### configbr.backupCompleted

#### Severity

NOTICE

#### Description

This message occurs when a scheduled configuration backup is successfully created.

#### Corrective Action

(None).

#### Syslog Message

Scheduled configuration backup %s was created successfully.

#### Parameters

**backup** (STRING): Backup file.

## configbr.backupfailed events

### configbr.backupFailed

#### Severity

ALERT

#### Description

This message occurs when when the configuration backup cannot be created.

#### Corrective Action

Verify the root volume file system is available and has enough space to create a backup with the "volume show" command or adjust the size of the memory-backed scratch space using the "configuration backup settings modify" command (privilege: diagnostic). If the scheduled backup could not be created, create a backup file manually with the (privilege: advanced) "system configuration backup create" command, find the remote URL for uploading with the (privilege: advanced) "system configuration backup settings show -fields destination" command, and upload the backup with the (privilege: advanced) "system configuration backup upload" command.

#### Syslog Message

The %s configuration backup %s cannot be created. Error: '%s'.

#### Parameters

**type** (STRING): Type of backup, either cluster or local.

**backup** (STRING): Backup file.

**reason** (STRING): Reason for the error.

## configbr.deletefailed events

### configbr.deleteFailed

#### Severity

ERROR

#### Description

This message occurs when an old configuration backup cannot be deleted.

#### Corrective Action

Ensure that the node is accessible and healthy. If necessary, delete the backup manually with the (privilege: advanced) "system configuration backup delete" command.

#### Syslog Message

The %s configuration backup %s on node %s cannot be deleted. Error: '%s'.

#### Parameters

**type** (STRING): Type of backup, either cluster or local.

**backup** (STRING): Backup file.

**node** (STRING): Node on which the backup file exists.

**reason** (STRING): Reason for the error.

## configbr.distributefailed events

### configbr.distributeFailed

#### Severity

ERROR

#### Description

This message occurs when a configuration backup cannot be distributed to another node in the cluster.

#### Corrective Action

Ensure that the destination node is accessible and healthy. If necessary, upload the backup file to the remote URL to increase the availability of the backup file with the (privilege: advanced) "system configuration backup upload" command.

#### Syslog Message

Configuration backup %s cannot be distributed to node %s. Error: '%s'.

#### Parameters

**backup** (STRING): Backup file.

**destination\_node** (STRING): Destination node to which the backup file failed to be distributed.

**reason** (STRING): Reason for the error.

## configbr.initfailed events

## configbr.initFailed

### Severity

ERROR

### Description

This message occurs when when the configuration backup and restore feature cannot initialize the necessary software components.

### Corrective Action

Verify the root volume file system is available and has enough space to create a backup with the "volume show" command. If replicated database entries could not be populated, wait 5 minutes and verify that the backup schedules are listed with the (privilege: advanced) "system configuration backup settings show -instance" command. If the backup jobs could not be created, wait 5 minutes and verify that backup jobs are displayed for each schedule with the "job show" command.

### Syslog Message

Configuration backup and restore feature could not be initialized. Error: '%s'.

### Parameters

**reason** (STRING): Reason for the initialization failure.

## configbr.interror events

### configbr.intError

### Severity

ERROR

### Description

This message occurs when an attempt to create a configuration backup file encountered an internal software error.

### Corrective Action

Create the configuration backup file manually by using the (privilege: advanced) "system configuration backup create" command.

### Syslog Message

Configuration backup and restore detected an internal software error. Error: '%s'.

### Parameters

**error** (STRING): Internal software error.

## configbr.nodesturl events

### configbr.noDestURL

### Severity

ERROR

## Description

This message occurs when the cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

## Corrective Action

Configure an offsite configuration backup destination URL as soon as possible, using the commands "system configuration backup settings modify -destination <destination-url> -username <username-on-destination-url>" and "system configuration backup settings set-password".

## Syslog Message

Cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

## Parameters

(None).

# configbr.snapshotdelfailed events

## configbr.snapshotDelFailed

### Severity

ERROR

### Description

This message occurs when a Snapshot(tm) copy on the root volume cannot be deleted. The Snapshot copy was created during a configuration backup.

### Corrective Action

Ensure that the root volume file system is available with the "volume show" command.

### Syslog Message

Snapshot copy %s on the root volume cannot be deleted on node %s. Error: '%s'.

### Parameters

**name** (STRING): Name of the Snapshot copy.

**node** (STRING): Node on which the Snapshot copy was created.

**reason** (STRING): Reason for the error.

# configbr.unpubfailed events

## configbr.unpubFailed

### Severity

ERROR

### Description

This message occurs when the configuration backup and restore feature fails to unpublish a package by using the file replication service. The configuration backup process creates file packages and registers them with the file replication service, which stores the package in the root file system. When the configuration backup process is complete, it cleans up these files by unpublishing the package by using the file

replication service. When unpublishing fails, these files are not be cleaned up and remain in the root file system. This message does not indicate a failure in the configuration backup process, which continues despite the event. You can monitor the status of an ongoing configuration backup process by using the "job show" command. The completed configuration backup files are visible when you run the "system configuration backup show" command.

### Corrective Action

Obtain diagnostic privilege and view the file replication packages by using the "system services replication show" command. Unpublish the file replication packages by issuing the "system services replication unpublish" command, for which you also need diagnostic privilege. Check the "cluster ring show" command to ensure that the node is in quorum; management quorum is required for the unpublish command to succeed. Do not take these actions while an active configuration backup process is running.

### Syslog Message

Configuration backup and restore failed to unpublish package %s; Error: '%s'.

### Parameters

**package\_name** (STRING): Name of the package.  
**reason** (STRING): Reason for the unpublishing failure.

## configbr.uploadfailed events

### configbr.uploadFailed

#### Severity

ERROR

#### Description

This message occurs when the configuration backup cannot be uploaded to the destination URL.

#### Corrective Action

Ensure that the destination URL is reachable, the protocol in the URL is supported, and the user credentials are valid.

#### Syslog Message

Configuration backup file %s cannot be uploaded to the destination URL %s. Error: '%s'.

#### Parameters

**backup** (STRING): Backup file.  
**destination** (STRING): Destination URL.  
**reason** (STRING): Reason for the upload failure.

# connectx events

## connectx.cmdinterface events

### connectx.cmdInterface.hung

**Severity**

NOTICE

**Description**

This message occurs when the command interface of ConnectX HA interconnect hardware is temporarily hung. If the command interface fails to recover, the HA interconnect goes down.

**Corrective Action**

Typically, the command interface recovers after a few seconds. If not, an AutoSupport message is generated when the HA interconnect goes down.

**Syslog Message**

HA interconnect ConnectX hardware command interface is temporarily hung.

**Parameters**

(None).

## connectx.fatalerror events

### connectx.fatalError

**Severity**

ERROR

**Description**

This message occurs when a fatal error is polled from the ConnectX(tm) InfiniBand® adapter. Controller failover will be disabled.

**Corrective Action**

Contact NetApp technical support. ConnectX registers have been dumped to the /etc/mlxlog/ConnectX\_regdump file.

**Syslog Message**

HA interconnect HBA failure, ConnectX fatal error was polled.

**Parameters**

(None).

## connectx.ibcabledetected events

### connectx.IbCableDetected

**Severity**

INFORMATIONAL

**Description**

This message occurs when an InfiniBand cable is detected on the InfiniBand port.

**Corrective Action**

(None).

**Syslog Message**

Detected %s of length %dM on InfiniBand port %s.

**Parameters**

**cable\_type** (STRING): InfiniBand cable type.

**cable\_length** (INT): Length of the InfiniBand cable in meters.

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

## connectx.iblinkretrainnotreqd events

### connectx.IBLinkRetrainNotReqd

**Severity**

INFORMATIONAL

**Description**

This message occurs when the software detects that the previous InfiniBand link training was successful.

**Corrective Action**

(None).

**Syslog Message**

InfiniBand Link training was successful for ConnectX in slot %d, port %d.

**Parameters**

**pcie\_slot** (INT): PCIe slot in which ConnectX is present.

**port\_num** (INT): Port number where the success was detected.

## connectx.iblinkretrainreqd events

### connectx.IBLinkRetrainReqd

**Severity**

NOTICE

**Description**

This message occurs when the software detects that the previous InfiniBand link training was unsuccessful.

**Corrective Action**

(None).

## Syslog Message

InfiniBand Link training failed for ConnectX in slot %d, port %d. Link Retraining Request status %d.

## Parameters

**pcie\_slot** (INT): PCIe slot in which ConnectX is present.  
**port\_num** (INT): Port number where the issue was detected.  
**status** (INT): Status of the link retraining request.

# connectx.ibqsfpdumpctrl events

## connectx.IbQsfpDumpCtrl

### Severity

ERROR

### Description

This message occurs when InfiniBand retimer programming fails due to a quad small form-factor pluggable (QSFP) transceiver register dump failure, causing the control registers of QSFP to be dumped.

### Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

## Syslog Message

InfiniBand retimer programming failed on port %s due to %s. Dumping registers: control 0x%0x, data 0x%0x, timeout 0x%0x, clock 0x%0x.

## Parameters

**port\_str** (STRING): InfiniBand port in which the cable is plugged.  
**reason** (STRING): Reason for the failure of InfiniBand retimer programming.  
**ctrlreg** (INTHEX): Contents of the QSFP control register in hexadecimal notation.  
**datareg** (INTHEX): Contents of the QSFP data register in hexadecimal notation.  
**timeoutreg** (INTHEX): Contents of the QSFP timeout register in hexadecimal notation.  
**clockreg** (INTHEX): Contents of the QSFP clock register in hexadecimal notation.

# connectx.ibqsfpdumpdata events

## connectx.IbQsfpDumpData

### Severity

ERROR

### Description

This message occurs when InfiniBand retimer programming fails due to a quad small form-factor pluggable (QSFP) transceiver parse error, and 128 bytes of QSFP data are dumped.

### Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

## Syslog Message

InfiniBand retimer programming failed on port %s due to %s. Dumping registers: %s.

## Parameters

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

**reason** (STRING): Reason for the failure of InfiniBand retimer programming.

**qsfp\_data** (STRING): Contents of QSFP data registers from offset 128 to 256 in hexadecimal notation.

# connectx.ibretimerfailcount events

## connectx.IbRetimerFailCount

### Severity

ERROR

### Description

This message occurs when InfiniBand retimer programming fails due to one of the following reasons: InfiniBand device not found, GPIO read failure or retimer chip failure.

### Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

## Syslog Message

InfiniBand retimer programming failed on port %s due to %s.

## Parameters

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

**reason** (STRING): Reason for the failure of InfiniBand retimer programming.

# connectx.ibretimerprogrmpass events

## connectx.IbRetimerProgrmPass

### Severity

INFORMATIONAL

### Description

This message occurs when InfiniBand retimer programming is successfully completed after the system detects that a cable is plugged in.

### Corrective Action

(None).

## Syslog Message

InfiniBand retimer programming was successful on port %s.

## Parameters

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

## connectx.ibretimerskipprogrm events

### connectx.IbRetimerSkipProgrm

#### Severity

INFORMATIONAL

#### Description

This message occurs when InfiniBand retimer programming is skipped after the system detects that a cable is plugged in, because there was no change in the cable's type and length.

#### Corrective Action

(None).

#### Syslog Message

InfiniBand retimer programming was skipped on port %s for %s cable.

#### Parameters

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

**cable\_type** (STRING): InfiniBand cable type.

## connectx.ibunsupportcable events

### connectx.IbUnsupportCable

#### Severity

ERROR

#### Description

This message occurs when an unsupported InfiniBand cable is detected on the InfiniBand port.

#### Corrective Action

Unplug the unsupported InfiniBand cable and plug in a supported cable. Search the support site "Hardware Universe" for information about supported InfiniBand cables.

#### Syslog Message

Detected unsupported %s on InfiniBand port %s.

#### Parameters

**cable\_type** (STRING): InfiniBand cable type.

**port\_str** (STRING): InfiniBand port in which the cable is plugged.

## connectx.portdisabled events

### connectx.portDisabled

#### Severity

ALERT

**Description**

This message occurs when the HA interconnect port experiences persistent node advertisement send timeouts. Port reinitialization does not correct the problem. The port is disabled.

**Corrective Action**

Reboot the controller. Contact NetApp technical support if the problem persists.

**Syslog Message**

Node advertisement send timed out for the ConnectX device in slot %d, port %d. The port is disabled.  
Device registers have been dumped to the /etc/mlxlog/ConnectX\_regdump file.

**Parameters**

**phys\_slot** (INT): Physical slot in which ConnectX is present.

**port\_num** (INT): Port number that is disabled.

# copy events

## copy.dst events

### copy.dst.raid.convert.fail

#### Severity

NOTICE

#### Description

This event is issued when a SnapMirror or aggregate copy operation attempts to update a flexible volume RAID block on the destination but is unable to do so.

#### Corrective Action

Verify the source and destination have flexible volumes with compatible versions.

#### Syslog Message

Unable to convert volume RAID block %llu during copy transfer.

#### Parameters

**block** (LONGINT): Block with the error

# coredump events

## coredump.all events

### coredump.all.disks.used

**Severity**

ERROR

**Description**

All disks available to coredump already contain unsaved cores.

**Corrective Action**

There are three choices. First, add more disks to the system. Second, delete any unsaved cores by running "savecore -k". Third, save any unsaved cores by running "savecore". It may be necessary to run "savecore -f" to save the cores, if previous attempts to save these cores have failed.

**Syslog Message**

No disks available for dumpcore

**Parameters**

(None).

## coredump.compress events

### coredump.compress.failed

**Severity**

ERROR

**Description**

An error was encountered while compressing data for the coredump. This core will be deleted.

**Corrective Action**

(None).

**Syslog Message**

Error compressing core data: %s

**Parameters**

msg (STRING): The error message

## coredump.compression events

### coredump.compression.details

**Severity**

INFORMATIONAL

## Description

This message occurs when a compressed kernel core is generated. Details about compression are reported.

## Corrective Action

(None).

## Syslog Message

%s, compression time %llu msec, compression count %llu, bytes before compression %llu, bytes after compression %llu, compression ratio %llu%%, compression bandwidth %llu MB/s, total compression time %llu msec, all-zero chunk count %llu.

## Parameters

**type** (STRING): Type of dump. Possible types are compressed core, compressed spraycore, spraycore and sparecore.

**compressTime** (LONGINT): Compression time, in milliseconds.

**compressCount** (LONGINT): Number of compressions.

**compressBytesIn** (LONGINT): Number of bytes before compression.

**compressBytesOut** (LONGINT): Number of bytes after compression.

**compressRatio** (LONGINT): Compression ratio expressed as a percentage.

**compressBandwidth** (LONGINT): Compression bandwidth, in MBps.

**totalCompressTime** (LONGINT): Total compression time, in milliseconds.

**allZeroChunks** (LONGINT): Number of all-zero chunks.

# coredump.coreid events

## coredump.coreid.not.found

### Severity

INFORMATIONAL

### Description

Could not find the specified core

### Corrective Action

Double-check the core id, and try again.

### Syslog Message

Core %d could not be found

### Parameters

**coreid** (INT): The core id that could not be found

# coredump.delete events

## coredump.delete.denied

### Severity

INFORMATIONAL

## Description

This message occurs when a requested coredump delete cannot occur because an aggregate relocation or a takeover is in progress. The system cannot delete a core while either an aggregate relocation or a takeover is in progress.

## Corrective Action

Retry the coredump delete after aggregate relocation or takeover completes.

## Syslog Message

Coredump delete disallowed because an aggregate relocation or a takeover in progress.

## Parameters

(None).

# coredump.disk events

## coredump.disk.write.details

### Severity

INFORMATIONAL

### Description

This message occurs when a kernel core is written to disk. Details about disk operations are reported.

### Corrective Action

(None).

### Syslog Message

%s, disk write time %llu msec, disk write count %llu, disk write bytes %llu, disk write bandwidth %llu MB/s.

### Parameters

**type** (STRING): Type of dump. Possible types are compressed core, compressed spraycore, spraycore and sparecore.

**writeTime** (LONGINT): Disk write time, in milliseconds.

**writeCount** (LONGINT): Number of disk writes.

**writeBytes** (LONGINT): Number of bytes written to disk.

**writeBandwidth** (LONGINT): Disk write bandwidth, in MBps.

# coredump.dr events

## coredump.dr.dump.not.started

### Severity

ERROR

### Description

This message occurs when coredump subsystem detects that disaster recovery (DR) partner sparecore dump did not start.

### Corrective Action

Log in to service processor and power cycle the DR partner that may not have started dumping core.

### Syslog Message

DR partner sparecore dump failed to start.

### Parameters

(None).

## coredump.dr.spare.abort

### Severity

INFORMATIONAL

### Description

This message occurs when coredump subsystem attempts to abort any sparecore dump that might be in progress on disaster recovery (DR) partner. This process can take up to 60 seconds. During this time, other coredump operations are not serviced.

### Corrective Action

(None).

### Syslog Message

Pausing to abort DR partner sparecore dump on %s because %s.

### Parameters

**diskuid** (STRING): UID of DR partner sparecore dump disk.

**reason** (STRING): Reason for aborting the DR partner sparecore dump.

## coredump.dr.spare.noAbort

### Severity

ERROR

### Description

This message occurs when coredump subsystem is unable to abort any sparecore dump that might be in progress on disaster recovery (DR) partner.

### Corrective Action

Log in to service processor and power cycle the DR partner that is still dumping core.

### Syslog Message

DR partner sparecore dump could not be aborted on disk %s because %s.

### Parameters

**diskuid** (STRING): UID of DR partner sparecore dump disk.

**reason** (STRING): Reason for abort failure.

# coredump.dump events

## coredump.dump.abort

### Severity

ERROR

### Description

This message occurs when there is an unsaved core on the dump device. The abort prevents a new crash from overwriting the original dump core, which is expected to contain more interesting information for analysis.

### Corrective Action

If the default behavior is not desired, then set the boot option 'save-latest-core?' to true.

### Syslog Message

Dump is aborted because a core in the dump device is not saved yet.

### Parameters

(None).

## coredump.dump.disk.failed

### Severity

NOTICE

### Description

This message occurs once for each core disk that has read or write errors while dumping the core. Each disk is marked as failed, so further writes to the disks are dropped. Dumpcore tries to recover from this error, and continue dumping the core.

### Corrective Action

(None).

### Syslog Message

Disk %s had %u read and %u write error(s) during dumpcore.

### Parameters

**disk** (STRING): Name of this core disk marked failed with read or write errors.

**readErrorCount** (INT): Number of read errors seen on this core disk.

**writeErrorCount** (INT): Number of write errors seen on this core disk.

## coredump.dump.disk\_failed.count

### Severity

ERROR

### Description

During the last dumpcore attempt, disk write errors are ignored, and dumpcore continues. In this case, too many disks failed during the last dump attempt for savecore to create a core file. The core will be deleted, and no core will be available from this panic.

## Corrective Action

(None).

## Syslog Message

%d of %d disks failed during dumpcore

## Parameters

**failed** (INT): Number of failed disks

**total** (INT): Number of disks used

## coredump.dump.disks.count

### Severity

ERROR

### Description

This message occurs when the system fails to write a coredump due to lack of disk space.

### Corrective Action

Disk space needed for a coredump can be reduced by enabling sparse cores, which is the default setting. Verify that sparse cores are enabled by using the "system node coredump config show" command. If not, enable them by using the "system node coredump modify -node local -sparse-enabled true" command. If there is still not enough disk space to write a coredump, add a spare disk that is at least 0.6 times the sum of primary memory size and NVRAM memory size. You can obtain sizes of primary memory and NVRAM memory by using the "run local sysconfig" command and reading entries for system board and NVRAM.

## Syslog Message

Not enough disks to write core dump.

## Parameters

(None).

## coredump.dump.dont

### Severity

INFORMATIONAL

### Description

This message occurs when a core dump is not performed because the system was configured to not dump cores or dump is disabled in the code path that caused the system to panic. Any of the following configuration methods can disable coredump: - Environment variable "dont-dump-core?" is "true" - Parameter "-coredump-attempts" in the command "system node coredump config" is "0".

### Corrective Action

If the reason is "dump disabled in the current code path", there is no corrective action that can be taken. If the reason is "coredump configured to not dump cores", 1. "-coredump-attempts" parameter might be set to "0". Check the "Max Dump Attempts" value in the output of the "system node coredump config show -node node\_name" command. If "0", use the "system node coredump config modify ←node node\_name> -coredump-attempts <number\_of\_attempts>" command to set a non-zero value. The default is 2 attempts. 2. "dont-dump-core?" environment variable might be set to "true". From the nodeshell, use the (priv: diag) "bootargs dump" command to check whether "dont-dump-core?" exists and is set to "true". To unset the variable, use the "bootargs unset dont-dump-core?" command.

**Syslog Message**

Coredump not performed because %s.

**Parameters**

**reason** (STRING): Reason that coredump was not performed.

**coredump.dump.failed****Severity**

EMERGENCY

**Description**

Coredump failed to complete.

**Corrective Action**

Previously logged coredump.dump.\* events should help explain the exact cause of the failure.

**Syslog Message**

Dumpcore failed

**Parameters**

(None).

**coredump.dump.find.all.used****Severity**

ERROR

**Description**

Unsaved cores occupy all the disks available to dumpcore.

**Corrective Action**

Save the unsaved cores using "savecore" or "savecore -f". If the cores aren't needed, run "savecore -k" to delete them.

**Syslog Message**

All available disks contain unsaved cores

**Parameters**

(None).

**coredump.dump.find.disks.failed****Severity**

ERROR

**Description**

Could not find any suitable disks for dumping a core.

**Corrective Action**

Make sure there are non-broken disks connected to (and owned by) the panicing host.

**Syslog Message**

No valid disks found

**Parameters**

(None).

**coredump.dump.find.spare.failed****Severity**

ERROR

**Description**

A sparecore dump is supposed to be done, but no suitable spare disk can be found. In these situations, it is more important to allow a fast takeover than it is to get the core, so the dump is terminated, and takeover begins.

**Corrective Action**

Add a spare disk to the system, or disable the "cf.takeover.on\_panic" option.

**Syslog Message**

No valid spare disk found

**Parameters**

(None).

**coredump.dump.nvram.copy.failed****Severity**

ERROR

**Description**

Error while copying NVRAM into main memory during dumpcore. The resulting coredump will have dummy data in the NVRAM segment.

**Corrective Action**

(None).

**Syslog Message**

Error while copying NVRAM contents into main memory

**Parameters**

(None).

**coredump.dump.raid.notready****Severity**

ERROR

**Description**

RAID has not yet processed the labels on the disks, so dumpcore cannot proceed. This is typically the case for panics very early during boot.

**Corrective Action**

(None).

**Syslog Message**

RAID not ready to dump cores

**Parameters**

(None).

**coredump.dump.recursive.late****Severity**

ERROR

**Description**

A recursive panic situation has been encountered. The location of the second panic makes it unsafe to attempt another dump.

**Corrective Action**

(None).

**Syslog Message**

Late recursive panic caused dumpcore to abort

**Parameters**

(None).

**coredump.dump.save.latest.core****Severity**

ERROR

**Description**

The boot option `save-latest-core?` is set to true. This will discard all unsaved cores during coredump.

**Corrective Action**

If the behavior is not desired then set the boot option `save-latest-core?` to false.

**Syslog Message**

Saving the latest core and discarding all unsaved cores.

**Parameters**

(None).

**coredump.dump.scrub.skipped**

**Severity**

NOTICE

**Description**

This message occurs when the coredump process was asked to scrub sensitive memory areas but could not do so. The dump must be aborted to avoid saving such memory areas to disk.

**Corrective Action**

(None).

**Syslog Message**

Could not scrub protected memory regions.

**Parameters**

(None).

**coredump.dump.segments.count****Severity**

ERROR

**Description**

Dumpcore ran out of space for the core segments in the header. This core cannot be dumped.

**Corrective Action**

Disable the "coredump.metadata\_only" option.

**Syslog Message**

Out of segment space in the core header

**Parameters**

(None).

**coredump.dump.spare.no.space****Severity**

ERROR

**Description**

The selected spare disk might not be big enough to hold the core. The dump attempt has been aborted.

**Corrective Action**

Make sure a spare disk is available that is at least as big as the sum of main memory and NVRAM. Set the option "coredump.metadata\_only" to "on". If the problem persists, turn off the option "cf.takeover.on\_panic". This will disable the sparecore feature, and delay takeovers until the panicing partner has finished dumping the core.

**Syslog Message**

Spare disk too small for coredump

## Parameters

(None).

## coredump.dump.started

### Severity

INFORMATIONAL

### Description

Basic info about start of dumpcore

### Corrective Action

(None).

### Syslog Message

%s starting with %d disks

### Parameters

**type** (STRING): Type of dump. Possible types are compressed, sprayed, and sparecore.

**disks** (INT): Number of disks being used

## coredump.dump.time

### Severity

INFORMATIONAL

### Description

Information about how long dumpcore took to complete.

### Corrective Action

(None).

### Syslog Message

%s completed in %d seconds

### Parameters

**type** (STRING): Type of dump. Possible types are compressed, sprayed, and sparecore.

**seconds** (INT): Number of seconds spent on the dump

## coredump.dump.write.blocks.failed

### Severity

ERROR

### Description

Failed to write dump data blocks to disk. If the write failed because of disk problems, dumpcore will restart, without the disk that failed. If the write failed for other reasons (eg. attempt to write to a bad position on the disk), dumpcore will be aborted.

### **Corrective Action**

(None).

### **Syslog Message**

Error dumping %llu blocks starting at block %llu to disk %s

### **Parameters**

**blocks** (LONGINT): Number of blocks trying to be dumped

**start** (LONGINT): Starting block number

**disk** (STRING): Name of disk on which the write failed

## **coredump.dump.write.error**

### **Severity**

ERROR

### **Description**

An i/o error occurred while attempting to write a coredump to disk.

### **Corrective Action**

(None).

### **Syslog Message**

An i/o error occurred while attempting to dump core.

### **Parameters**

(None).

## **coredump.dump.write.header.failed**

### **Severity**

ERROR

### **Description**

Failed to write the core header to disk during dumpcore.

### **Corrective Action**

(None).

### **Syslog Message**

Error writing core header to block %llu on disk %s

### **Parameters**

**header** (LONGINT): Block number of the core header block

**disk** (STRING): Name of disk on which the write failed

## **coredump.encryption events**

## **coredump.encryption.disabled**

### **Severity**

ERROR

### **Description**

This message occurs when encryption is configured on the controller, but the coredump subsystem cannot encrypt data. A system panic in this situation results in no core file being produced.

### **Corrective Action**

(Call support).

### **Syslog Message**

Coredump encryption cannot encrypt data. Core file will not be saved in this state.

### **Parameters**

(None).

## **coredump.encryption.restored**

### **Severity**

NOTICE

### **Description**

This message occurs when encryption is configured on the controller, the coredump subsystem experienced a transient problem encrypting data, but has since recovered and will be able to save encrypted core dump files in the event of a system panic.

### **Corrective Action**

(None).

### **Syslog Message**

Coredump encryption experienced a failure in the past but has recovered. Core files can now be saved.

### **Parameters**

(None).

## **coredump.findcore events**

### **coredump.findcore.error**

### **Severity**

ERROR

### **Description**

This message occurs when the core dump process detects an error while checking for an unsaved core in the dump device. The dump is not aborted.

### **Corrective Action**

(None).

## Syslog Message

Ignored the error (%d: %s) when trying to find an unsaved core in the dump device.

## Parameters

**errCode** (INT): Error code.

**errString** (STRING): Error code represented as a string.

## coredump.findcore.nospace

### Severity

ERROR

### Description

There are too many unsaved cores on the system to handle them all at one time. Some cores are being ignored.

### Corrective Action

Run "savecore" multiple times to save all the cores. Alternatively, run "savecore -k" to delete all of them.

## Syslog Message

Too many unsaved cores

## Parameters

(None).

## coredump.findcore.partial

### Severity

ERROR

### Description

This message occurs during a core dump, when only a partial core is found. Although enough of this core is present for the core to be partially saved, there might be errors while doing so. These occur when data essential to the core creation process is lost with the missing disks.

### Corrective Action

Run the "savecore" command to attempt to save the partial core, or run the "savecore -k" command to delete all unsaved cores.

## Syslog Message

Partial core %s is missing %d of %d disks.

## Parameters

**corefile** (STRING): Name of the kernel core file.

**missing** (INT): Number of disks that are missing.

**total** (INT): Total number of disks used in this dump.

## coredump.findcore.partial.nosave

**Severity**

ERROR

**Description**

This message occurs when a partial core is found with too much missing to be saved.

**Corrective Action**

Run the "savecore -k" command to delete all unsaved cores.

**Syslog Message**

Cannot save partial core %s, missing %d of %d disks.

**Parameters**

**corefile** (STRING): Name of the kernel core file.

**missing** (INT): Number of disks that are missing.

**total** (INT): Total number of disks used in this dump.

## coredump.host events

### coredump.host.spare.none

**Severity**

INFORMATIONAL

**Description**

This message occurs when no sparecore disk is found at boot/takeover time.

**Corrective Action**

(None).

**Syslog Message**

No sparecore disk was found for host %d.

**Parameters**

**host** (INT): Host for which no sparecore disk was found.

### coredump.host.spare.save

**Severity**

INFORMATIONAL

**Description**

This message occurs to tell you which disk was identified as the sparecore disk at boot/takeover time.

**Corrective Action**

(None).

**Syslog Message**

Disk %s was identified as the sparecore disk at boot/takeover time for host %d.

## Parameters

**diskname** (STRING): Name of the sparecore disk.  
**host** (INT): Host that the sparecore disk belongs to.

## coredump.host.spare.set

### Severity

INFORMATIONAL

### Description

This message occurs when a disk is identified as a sparecore disk and the host's sparecoreinfo is updated during assimilation.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**disk** (STRING): Name of the sparecore disk  
**host** (INT): Host whose sparecoreinfo was updated.

## coredump.job events

### coredump.job.notstarted

#### Severity

ERROR

#### Description

This message occurs when the system can not automatically save a core failed.

#### Corrective Action

Use the 'system node coredump save' command to save the core.

#### Syslog Message

(None).

#### Parameters

(None).

### coredump.job.notswitchedback

#### Severity

ERROR

#### Description

This message occurs when the system cannot automatically save cores because a MetroCluster(tm) switchback was not performed.

## Corrective Action

Return storage to the MetroCluster member by using the "metrocluster switchback" command, and then use the "coredump save-all" command to save any unsaved cores.

## Syslog Message

System cannot automatically save cores because a MetroCluster switchback was not performed.

## Parameters

(None).

# coredump.long events

## coredump.long.queued.msg

### Severity

NOTICE

### Description

This message occurs when the coredump manager thread detects that a message has been queued longer than expected, as defined by an internal threshold. System features and performance are not affected.

### Corrective Action

(None).

### Syslog Message

Coredump manager starts processing a long queued message: "%s" queued "%lu" ms.

### Parameters

**message\_type** (STRING): Coredump message type.  
**queue\_time** (LONGINT): Message queued duration, in milliseconds.  
**threshold** (LONGINT): Message queued threshold, in milliseconds.

## coredump.long.running.msg

### Severity

NOTICE

### Description

This message occurs when the coredump manager thread has finished processing a message that took longer than expected, as defined by an internal threshold.

### Corrective Action

(None).

### Syslog Message

Coredump manager finished processing a long running message: %s took %lu ms.

### Parameters

**message\_type** (STRING): Coredump message type.  
**duration** (LONGINT): Message processing duration, in milliseconds.  
**threshold** (LONGINT): Message processing threshold, in milliseconds.

# coredump.mcc events

## coredump.mcc.nso.veto

### Severity

INFORMATIONAL

### Description

This message occurs when the coredump subsystem vetoes MetroCluster(tm) negotiated switchover because a coredump save is in progress.

### Corrective Action

Use the "node coredump status" command to verify the completion of the active coredump save, or use the "-override-vetoes true" option when performing MetroCluster switchover. Using the "-override-vetoes true" option will abort the active coredump save.

### Syslog Message

MetroCluster switchover vetoed because a coredump save was in progress.

### Parameters

(None).

# coredump.micro events

## coredump.micro.completed

### Severity

INFORMATIONAL

### Description

Microcore generation has completed.

### Corrective Action

(None).

### Syslog Message

Microcore (%s) generation completed

### Parameters

**file** (STRING): Pathname of microcore that was created

## coredump.micro.failed

### Severity

ERROR

### Description

Microcore generation has failed.

**Corrective Action**

(Call support).

**Syslog Message**

Generation of microcore failed

**Parameters**

(None).

## coredump.nosavecore events

**coredump.nosavecore.noflush****Severity**

NOTICE

**Description**

This message occurs when the process that saves a coredump is not able to flush to the boot device at the end of coredump.

**Corrective Action**

(None).

**Syslog Message**

Coredump was not able to flush the remaining data to the boot device. Error: %llu.

**Parameters**

`dumpcore_error` (LONGINTEX): Coredump error code.

## coredump.nvlog events

**coredump.nvlog.replay.dump.dont****Severity**

NOTICE

**Description**

This message occurs when one or more unsuccessful attempts have been made to process information in the WAFL® NVlog after a previous failure. The number of allowed core dumps has been exceeded and this core dump will not be taken.

**Corrective Action**

The node will reboot. No further action is necessary.

**Syslog Message**

Core dump was not taken for the latest failure while processing the WAFL NVlog.

**Parameters**

(None).

# coredump.save events

## coredump.save.aborted

### Severity

NOTICE

### Description

This message occurs when the savecore operation is aborted while saving a kernel core. The core is preserved for a future iteration of savecore.

### Corrective Action

(None).

### Syslog Message

%s processing savecore aborted%s%s.

### Parameters

**file** (STRING): Name of the kernel core file being created.

**operation** (STRING): Type of operation that is being attempted when the abort occurs.

**action** (STRING): Type of action being taken when the abort occurs.

## coredump.save.attempts.count

### Severity

NOTICE

### Description

Previous attempts to save this core have failed, either due to reboots or panics. To prevent a panic loop, savecore is aborting this attempt.

### Corrective Action

Use either "savecore -f" to save the core, or "savecore -k" to erase the core.

### Syslog Message

Too many attempts to save this core

### Parameters

(None).

## coredump.save.completed

### Severity

NOTICE

### Description

This message occurs when all the core segments belonging to a coredump have been saved.

### Corrective Action

(None).

## Syslog Message

Saved core %s for node %s in %llu seconds. Core size is %llu bytes.

## Parameters

**file** (STRING): Primary core segment file that was created.

**node** (STRING): Name of the node whose core was saved.

**seconds** (LONGINT): Number of seconds spent on saving all the core segments.

**size** (LONGINT): Size of primary core segment in bytes.

**chksum** (STRING): Checksum of primary core segment file's data.

## coredump.save.denied

### Severity

INFORMATIONAL

### Description

This message occurs when the coredump subsystem cannot finish saving a core because an aggregate relocation or a takeover is in progress. The system cannot save a core while either an aggregate relocation or a takeover is in progress.

### Corrective Action

(None).

## Syslog Message

Coredump save disallowed because an aggregate relocation or a takeover in progress.

## Parameters

(None).

## coredump.save.disk.missing

### Severity

INFORMATIONAL

### Description

A disk being used by coredump is now missing. This could be due to the ownership of the disk changing, the disk being removed, etc. Most savecore operations will proceed, but if further errors are encountered, or an expected core cannot be found, corrective action will be necessary.

### Corrective Action

If this disk has failed, no action is possible. If this message was seen while running a "savecore -s", "savecore -i", or "savecore -l" operation, replace the missing disk. This might be done by undoing the ownership change, or reinserting the missing disk. If this message was seen while saving the core, and no further errors were seen, no action is necessary. If more errors were seen, replace the missing disk as above, and run "savecore" again.

## Syslog Message

Disk %s being used by coredump is missing

## Parameters

**disk** (STRING): Name of the missing disk

## **coredump.save.diskio.zone**

### **Severity**

ERROR

### **Description**

A disk IO operation was attempted outside of the allowed regions on the disk. This behavior indicates a corrupt core, and it will be deleted.

### **Corrective Action**

(None).

### **Syslog Message**

IO to %d block(s) starting at %llu on disk %s is not allowed

### **Parameters**

**count** (INT): Number of blocks in IO request

**start** (LONGINT): Starting block number on the disk

**disk** (STRING): Name of the disk causing trouble

## **coredump.save.error**

### **Severity**

NOTICE

### **Description**

A correctable error was encountered while saving the core. Savecore will continue saving other cores.

### **Corrective Action**

Once savecore finishes, address errors that may have appeared, and restart savecore.

### **Syslog Message**

%s processing encountered error

### **Parameters**

**file** (STRING): The core file that savecore was attempting to create

## **coredump.save.failed**

### **Severity**

NOTICE

### **Description**

An unrecoverable error was encountered while saving the core. This core will be deleted, and savecore will continue saving other cores.

### **Corrective Action**

(None).

### **Syslog Message**

%s processing failed

## Parameters

**file** (STRING): The core file that savecore was attempting to create

## coredump.save.internal.error

### Severity

ERROR

### Description

An internal coredump error was encountered. This indicates the dumped core is corrupt, and will be deleted.

### Corrective Action

(None).

### Syslog Message

Internal coredump error

### Parameters

(None).

## coredump.save.nospace

### Severity

ALERT

### Description

This message occurs when there is not enough space in the root volume to save the core. Savecore is making a worst-case estimate when determining how much space might be needed to save the core, and does not start unless that much space is available.

### Corrective Action

Try performing the following steps to make sufficient room in root volume: Delete old or unneeded core files by using the "coredump delete" command. Delete old or unneeded core file segments by using the "coredump segment delete" command. Delete any Snapshot@ copies that include the deleted files. Adjust minimum free space on the root file system by using "coredump config modify" command. Once there is sufficient room, take the following steps to save the cores: To save all core files using "coredump save-all" command, run the "coredump status -instance" command and ensure that "Space Available On Internal Filesystem" is greater than "Space Needed to Save All Unsaved Cores" plus "Minimum Free Bytes on Root Filesystem". To save a specific core file, run the "coredump save" command, when available space of "Space Needed To Save Core" (from the "coredump show" command) plus "Minimum Free Bytes on Root Filesystem" is sufficient.

### Syslog Message

Available space (%llu %dKB blocks) is not enough to save the core image (requires up to %llu blocks) and maintain the minimum free space of %llu blocks.

### Parameters

**avail** (LONGINT): Number of blocks available for saving the core image.

**blocksize** (INT): Block size in kilobytes.

**needed** (LONGINT): Number of blocks needed for saving the core image.

**minfree** (LONGINT): Number of blocks reserved for normal system operation.

## **coredump.save.partial.not.ok**

### **Severity**

INFORMATIONAL

### **Description**

Can not save partial core that was dumped using disks with different sizes. Savecore can not determine the size of the missing disks. Attempting a save in this condition will most likely end up in an error.

### **Corrective Action**

Run "savecore -k" to delete all unsaved cores.

### **Syslog Message**

Cannot save partial core (%s) that used disks with different sizes, missing %llu of %llu disks

### **Parameters**

**panic** (STRING): Panic string of the partial core.

**missing** (LONGINT): The number of disks that are missing

**total** (LONGINT): Total number of disks used in this dump

## **coredump.save.read.header.failed**

### **Severity**

NOTICE

### **Description**

An error was encountered while trying to read the core header block from disk.

### **Corrective Action**

(None).

### **Syslog Message**

Could not read core header block (%llu) from disk %s

### **Parameters**

**block** (LONGINT): Block number being searched for the core header

**disk** (STRING): Name of the disk that could not be read

## **coredump.save.started**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the savecore operation starts saving a kernel core.

### **Corrective Action**

(None).

### **Syslog Message**

Saving %llu MB to %s via %s ("%s") for node %s.

## Parameters

**size** (LONGINT): Number of MB being saved.  
**file** (STRING): Name of the kernel core file to be created.  
**dumpcoretype** (STRING): Kernel coredump type.  
**panic** (STRING): Panic string of the kernel core being saved.  
**node** (STRING): Name of the node whose core is being saved.

# coredump.segment.events

## coredump.segment.auto.fail

### Severity

NOTICE

### Description

This message occurs when the system encounters an error while trying to send a core segment request.

### Corrective Action

(None).

### Syslog Message

Failed to start automatic segmenting for core file, %s , for host %d.

## Parameters

**file** (STRING): Name of the core file that would have been segmented.  
**host** (INT): Host that owns the core file.

## coredump.segment.auto.pfail

### Severity

INFORMATIONAL

### Description

This message occurs when the system cannot start the segmenting of a core file because the node is no longer in takeover mode.

### Corrective Action

(None).

### Syslog Message

Cannot start segmenting a core file, %s. Node is no longer in takeover mode.

## Parameters

**file** (STRING): Name of core file that would have been segmented.

## coredump.segment.completed

### Severity

NOTICE

## Description

This message occurs when the segmenting of a full core file has been completed.

## Corrective Action

(None).

## Syslog Message

Saved core segment %s for node %s. Core size is %llu bytes and core data checksum is %s.

## Parameters

**file** (STRING): Name of the core file segmented.

**node** (STRING): Name of the node whose core segment was saved.

**size** (LONGINT): Size of core segment in bytes.

**chksum** (STRING): Checksum of the core segment file's data.

# coredump.shutdown events

## coredump.shutdown.trace

### Severity

NOTICE

### Description

This message occurs when a core is about to be generated. Durations of various activities at that time are reported.

### Corrective Action

(None).

### Syslog Message

coredump shutdown times: kmod dumper start %llu, panic\_info set %llu, sf\_dumpcore sent %llu, sparecore id sent %llu, fmot\_outage info sent %llu, disk\_dump\_start done %llu, coredump begin %llu (all in msec).

### Parameters

**kmodDumperStartTime** (LONGINT): Duration from panic start to dump processing start, in milliseconds.

**panicInfoTime** (LONGINT): Duration until panic information is collected, in milliseconds.

**sfDumpcoreSentTime** (LONGINT): Duration until SF\_DUMPCORE state is sent over the interconnect, in milliseconds.

**sparecoreSentTime** (LONGINT): Duration for sending the sparecore ID over the interconnect, in milliseconds.

**fmotOutageSentTime** (LONGINT): Duration for sending FMOT (Failover Monitor Outage Tracker) Outage information over the interconnect, in milliseconds.

**diskDumpStartTime** (LONGINT): Duration until disk dump start stage, in milliseconds.

**coredumpBeginTime** (LONGINT): Duration until the start of the actual core dump, in milliseconds.

# coredump.spare events

## coredump.spare.abort

**Severity**

INFORMATIONAL

**Description**

This message occurs when coredump attempts to terminate any sparecore dump that might be in progress on the partner. This process can take up to 60 seconds. During this time, other coredump operations are not serviced.

**Corrective Action**

(None).

**Syslog Message**

Pausing to abort partner sparecore dump because %s.

**Parameters**

**reason** (STRING): Reason for aborting the partner sparecore dump.

**coredump.spare.abort.failed****Severity**

ERROR

**Description**

Unable to reserve the sparecore disk. This disk cannot be used by RAID until it is successfully reserved.

**Corrective Action**

If the other partner can be booted, do a giveback. Otherwise, periodic attempts will automatically be made to reserve the disk in question.

**Syslog Message**

Sparecore disk could not be reserved

**Parameters**

(None).

**coredump.spare.abort.release****Severity**

NOTICE

**Description**

This message occurs when the system encounters an error while trying to release the disk reservation from a disk.

**Corrective Action**

(None).

**Syslog Message**

Could not release disk reservation from disk %s (0x%x)

## Parameters

**diskname** (STRING): Name of the disk whose disk reservation could not be released.

**diskid** (INHEX): ID of the disk whose disk reservation could not be released.

## coredump.spare.dump

### Severity

INFORMATIONAL

### Description

This message occurs to tell you which disk was used as the sparecore disk at dumpcore time.

### Corrective Action

(None).

### Syslog Message

Disk %s was used as the sparecore disk at dumpcore time.

### Parameters

**diskname** (STRING): Name of the sparecore disk.

## coredump.spare.invalid.size

### Severity

ERROR

### Description

This message occurs when coredump subsystem encounters a spare disk with an invalid size. If an unsaved core file exists on this disk, it will be deleted because it can no longer be saved.

### Corrective Action

Run the "storage disk show -disk disk\_name" command to make sure that the disk is still connected as a spare disk. If so, replace the disk. If not, the disk is part of an aggregate or is in the process of being assigned to one, and no action is required.

### Syslog Message

sparecore disk: %s has invalid size: %llu, skipping it from all coredump subsystem operations

### Parameters

**disk** (STRING): Name of the disk.

**size** (LONGINT): Size available on the disk, reported by RAID.

## coredump.sparecore events

### coredump.sparecore.killed

### Severity

INFORMATIONAL

**Description**

Sparecore was aborted by partner.

**Corrective Action**

(None).

**Syslog Message**

Sparecore was aborted by partner.

**Parameters**

(None).

## **coredump.sparecoreinit events**

### **coredump.sparecoreinit.times**

**Severity**

NOTICE

**Description**

This message occurs when sparecore initialization is completed. Durations of constituent activities within sparecore initialization are reported.

**Corrective Action**

(None).

**Syslog Message**

sparecore\_init: update firmware %llu msec, write partial headers %llu msec, clear abort area %llu msec, write node status %lld msec.

**Parameters**

**fwUpdateTime** (LONGINT): Time taken to update firmware, in milliseconds.

**partialHeaderTime** (LONGINT): Time taken to write partial headers, in milliseconds.

**clearAbortAreaTime** (LONGINT): Time taken to clear sparecore abort area, in milliseconds.

**writeNodeStatusTime** (LONGINT): Time taken to write the node status information to the sparecore disk, in milliseconds, if any.

# cpeer events

## cpeer.access events

### cpeer.access.restricted

#### Severity

ERROR

#### Description

This message occurs when an access request from a peer cluster is rejected, either because the request is made to a restricted Vserver or to a restricted table.

#### Corrective Action

Check the Vserver peering relationships with the peer cluster. If additional Vserver access is required, use the "vserver peer create" command to initiate the peering relationship with the peer cluster.

#### Syslog Message

An access request from peer cluster %s (IP: %s) was denied. Reason: %s.

#### Parameters

**peer** (STRING): Name of the peer cluster making the request to the local cluster.

**address** (STRING): Source IP address of the incoming request.

**reason** (STRING): Reason for the access restriction.

## cpeer.addr events

### cpeer.addr.bad.dns

#### Severity

ERROR

#### Description

This message occurs when a stable address for the peer cluster cannot be resolved because of a bad name-server. This will make the peer cluster unreachable and cross-cluster operations will fail. Stable addresses are normally provided by the administrator during cluster peer creation.

#### Corrective Action

Delete the incorrect DNS server entry for the local cluster using the 'vserver services dns delete' command. Create a new DNS entry with the correct name-server using the 'vserver services dns create' command. If you need further assistance, contact NetApp technical support.

#### Syslog Message

Failed to resolve address %s of peer cluster %s, Reason:bad name-server.

#### Parameters

**addr** (STRING): Peer cluster stable IP addresses that cannot be contacted.

**peer** (STRING): Name of the peer cluster whose stable address cannot be contacted.

## **cpeer.addr.bad.host**

### **Severity**

ERROR

### **Description**

This message occurs when a stable IP address for the peer cluster is no longer valid. This will make the peer cluster unreachable and cross-cluster operations will fail. Stable addresses are normally provided by the administrator during cluster peer creation.

### **Corrective Action**

Correct the stable IP address using the 'cluster peer modify' command. If you need further assistance, contact NetApp technical support.

### **Syslog Message**

Failed to resolve address %s of peer cluster %s, Reason:invalid address.

### **Parameters**

**addr** (STRING): Peer cluster stable addresses that is not valid.  
**peer** (STRING): Name of the peer cluster whose stable address is not valid.

## **cpeer.addr.stable.down**

### **Severity**

ERROR

### **Description**

This message occurs when a stable address cannot be contacted. Stable addresses are provided by the administrator during peer creation.

### **Corrective Action**

Verify network connectivity between the local cluster and the peer cluster. Check the logs, trace buffers, and UI output for more information about the nature of the failure.

### **Syslog Message**

Stable address %s of cluster %s, in IPspace %s, cannot be contacted.

### **Parameters**

**addr** (STRING): Stable address that cannot be contacted.  
**peer** (STRING): Name of the peer cluster whose address cannot be contacted.  
**ipspace** (STRING): IPspace in which the contact attempt was made.

## **cpeer.addr.warn.host**

### **Severity**

ALERT

### **Description**

This message occurs when a stable IP address for the peer cluster is no longer valid, making the peer cluster unreachable and causing cross-cluster operations to fail.

### Corrective Action

Correct the stable IP address using the "cluster peer modify" command. Valid addresses for the remote ("peer") cluster are given under "Active IP Addresses" when you use the "cluster peer show -instance" command. Verify connectivity by using the "cluster peer ping" command. If you need further assistance, contact NetApp technical support.

### Syslog Message

Address %s is not any of the addresses that peer cluster %s considers valid for the cluster peer relationship; Details: %s

### Parameters

**addr** (STRING): Peer cluster stable address that is not valid.  
**peer** (STRING): Name of the peer cluster whose stable address is not valid.  
**complaint** (STRING): Details, if any, of the issue with the stable address.

## cpeer.authentication events

### cpeer.authentication.create

#### Severity

NOTICE

#### Description

This message occurs when authentication is successfully established with a peer cluster.

#### Corrective Action

(None).

#### Syslog Message

The peering relationship with cluster %s is now authenticated.

#### Parameters

**peer** (STRING): Peer cluster with which this cluster is now mutually authenticated.

### cpeer.authentication.disable

#### Severity

NOTICE

#### Description

This message occurs when authentication is disabled for a cluster peer relationship.

#### Corrective Action

(None).

#### Syslog Message

The peering relationship with cluster %s is now unauthenticated.

#### Parameters

**peer** (STRING): Peer cluster that is now peered to this cluster without authentication.

## cpeer.authentication.revoke

### Severity

ERROR

### Description

This message occurs when authentication is revoked for a cluster peer relationship.

### Corrective Action

Modify the relationship to match on both of the peered clusters. To have them agree on an unauthenticated relationship, use the 'cluster peer modify -authentication no-auth' command. To have them agree on an authenticated relationship, use the same passphrase with the 'cluster peer modify -authentication use-auth' command.

### Syslog Message

The peering relationship with cluster %s is now revoked and is no longer functional.

### Parameters

**peer** (STRING): Peer cluster for which the peering relationship has had its peering authentication revoked.

## cpeer.authentication.viol

### Severity

NOTICE

### Description

This message occurs when a cross-cluster access should be authenticated, but is not. The access has been denied successfully.

### Corrective Action

(None).

### Syslog Message

Access as peer cluster %s was claimed from network address %s, but has not been granted because %s.

### Parameters

**peer** (STRING): Peer cluster on behalf of which this access was made.

**remoteAddress** (STRING): Remote network address of the violating connection.

**reason** (STRING): Justification for the violation claim.

## cpeer.create events

### cpeer.create.reciprocal.fail

### Severity

ERROR

### Description

This message occurs when a peer cluster reciprocal join fails.

### **Corrective Action**

Verify network connectivity between the local cluster and the peer cluster. Check the logs, trace buffers, and UI output for more information about the nature of the failure.

### **Syslog Message**

Cluster %s attempted to create a reciprocal peer relationship with this cluster but failed.

### **Parameters**

**peer** (STRING): Peer cluster which executed the reciprocal join.

## **cpeer.create.reciprocal.ok**

### **Severity**

NOTICE

### **Description**

This message occurs when a peer cluster reciprocal join succeeds.

### **Corrective Action**

(None).

### **Syslog Message**

Cluster %s is now peered with this cluster.

### **Parameters**

**peer** (STRING): Peer cluster that executed the reciprocal join.

## **cpeer.dns events**

### **cpeer.dns.family.mismatch**

### **Severity**

ERROR

### **Description**

This message occurs when an attempt is made to resolve and insert a stable address that is a Domain Name System (DNS) style host name. If it resolves to an address family that does not match the family style specified for the cluster peer relationship, it is indicative of incorrect addresses being provided by the administrator or DNS configuration issues. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship.

### **Corrective Action**

Correct the stable IP address by using the 'cluster peer modify' command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Confirm that the DNS services are appropriately specified by using the 'vserver services dns show' command. Also, the DNS server in question should be configured correctly to be able to resolve the DNS style host name to an IP address belonging to the appropriate address family. If you need further assistance, contact NetApp technical support.

## Syslog Message

Host name %s of peer cluster %s resolved to %s, which does not match the peer relationship's selected address type.

## Parameters

**addr** (STRING): Peer cluster host name that is being inserted.

**peer** (STRING): Name of the peer cluster for which an address family mismatch was seen.

**resolved\_address** (STRING): Address resolved to, which belongs to the incorrect address family.

# cpeer.duplicate events

## cpeer.duplicate.remote.addr

### Severity

ERROR

### Description

This message occurs when an IP address from a peer cluster is also in use by the local cluster in the same IPspace. This may prevent the cluster peering relationship from reaching an available state.

### Corrective Action

Replace the duplicate address on the local cluster with a different address.

## Syslog Message

Cannot use address %s from peer cluster %s because it is already in use on the local cluster.";

## Parameters

**address** (STRING): Duplicate address from the peer cluster.

**peer** (STRING): Name of the peer cluster.

# cpeer.ip events

## cpeer.ip.family.mismatch

### Severity

ERROR

### Description

This message occurs when an attempt is made to insert an IP address whose address family does not match the family style specified for the cluster peer relationship. This is indicative of incorrect addresses being provided by the administrator. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship.

### Corrective Action

Correct the stable IP address by using the 'cluster peer modify' command. Ensure that the LIFs of the appropriate address family exist on both the local cluster and the remote peer. If you need further assistance, contact NetApp technical support.

## Syslog Message

Failed to insert address %s of peer cluster %s, reason: %s

## Parameters

**addr** (STRING): Peer cluster address that is being inserted.

**peer** (STRING): Name of the peer cluster for which an address family mismatch was seen.

**reason** (STRING): Reason that the EMS message was sent.

# cpeer.localid events

## cpeer.localid.bad

### Severity

ERROR

### Description

This message occurs when there is an issue reading the local cluster ID. This indicates a serious problem with the cluster which may affect processes outside of cluster peering.

### Corrective Action

(Call support).

### Syslog Message

Unexpected local cluster ID: %s.

## Parameters

**id** (STRING): The string representation of the bad cluster ID.

# cpeer.long events

## cpeer.long.remote.update

### Severity

ERROR

### Description

This message occurs when a cross-cluster update takes longer than 15 minutes. This indicates a communication failure between the clusters.

### Corrective Action

Ensure cross-cluster network connectivity by performing network diagnostics using the "cluster peer ping" command and either the "network ping" or "network ping6" command. Correct IP address issues by using the "cluster peer modify" command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Confirm that the DNS services are appropriately configured by using the "vserver services dns show" command. You can use "cluster peer show" to list the state of all peer clusters. This is a point-in-time command and the health of remote clusters might not have been updated yet. If you need further assistance, contact NetApp technical support.

### Syslog Message

Cross-cluster update job took longer than 15 minutes. Potential network connectivity issues.

## Parameters

(None).

# cpeer.modify events

## cpeer.modify.address.family

### Severity

NOTICE

### Description

This message occurs when the address family for a peering relationship is modified. The same configuration change should be made at the peered cluster in a timely manner. Peering services are maintained while intercluster LIFs of both address families are configured on each cluster.

### Corrective Action

This is a notification of a configuration change. No corrective action applies.

### Syslog Message

Address family change for peer cluster %s to address family %s.

### Parameters

**peer** (STRING): Name of the peer cluster affected by the address family change.

**family** (STRING): The new address family of the peering relationship.

# cpeer.out events

## cpeer.out.pp.mismatch

### Severity

ERROR

### Description

This message occurs when an outgoing cluster peer request authentication fails due to a passphrase mismatch.

### Corrective Action

For multiple occurrences of this event, verify the peering request with the admin of this local cluster. If the admin is not responsible for the attempts, the local cluster might be under attack.

### Syslog Message

This cluster did not accept a cluster peering authentication offer from cluster %s//%s due to a passphrase mismatch. Acceptance was attempted on session %s, command %s, application %s, location %s, port %s, user name %s, auth\_method %s, and PSK method %s.

### Parameters

**remotename** (STRING): Name of the cluster to which the contact was made.

**remoteuuid** (STRING): UUID of the cluster to which the contact was made.

**session** (STRING): Session ID over which the contact was made.

**command** (STRING): Command ID for which the contact was made.

**application** (STRING): Application used for the contact.

**location** (STRING): Location from which the contact was made.

**port** (STRING): Port over which the contact was made.

**username** (STRING): User name for the contact.

**authMethod** (STRING): Authentication method for the user.  
**offerStyle** (STRING): Style of authentication offer.

## cpeer.passphrase events

### cpeer.passphrase.expired

#### Severity

NOTICE

#### Description

This message occurs when the cluster peer offer for anonymous cluster with system-generated passphrase expired and deleted.

#### Corrective Action

If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

#### Syslog Message

The cluster peer offer with system-generated passphrase (%s) expired and deleted.

#### Parameters

**passphrase\_details** (STRING): Cluster peer passphrase details.

## cpeer.ping events

### cpeer.ping.family.mismatch

#### Severity

ERROR

#### Description

This message occurs when an attempt is made to check the cluster peering relationship and no intercluster LIFs of the same address family and the correct IPspace are found on this node. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship. The IPspace for a cluster peer relationship may be supplied when creating or modifying the relationship.

#### Corrective Action

Correct the stable IP address by using the "cluster peer modify" command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Ensure that LIFs of the local cluster exist in the given IPspace.

#### Syslog Message

Failed to find LIFs of type %s on node %s for destination address %s in IPspace %s belonging to destination cluster %s.

#### Parameters

**peering\_family** (STRING): IP address family.  
**node** (STRING): Originating node.  
**dest\_address** (STRING): Destination IP address.

**ipspace** (STRING): IPspace for the relationship.  
**dest\_cluster** (STRING): Destination cluster.

## **cpeer.ping.no.lifs**

### **Severity**

ERROR

### **Description**

This message occurs when an attempt is made to check the cluster peering relationship and no intercluster LIFs in the correct IPspace are found on this node.

### **Corrective Action**

Create intercluster LIFs with the same address family and IPspace as the peering relationship. If the peering relationship is obsolete, remove it by using the "cluster peer delete" command.

### **Syslog Message**

Failed to find intercluster LIFs in IPspace %s on node %s.

### **Parameters**

**ipspace** (STRING): IPspace for the relationship.  
**node** (STRING): Originating node.

## **cpeer.pm events**

### **cpeer.pm.update.warn**

#### **Severity**

ERROR

#### **Description**

This message occurs when the peer manager job experiences a transient failure. The peer manager job periodically contacts one peer cluster and performs updates of cluster-wide state necessary to support cross-cluster enabled features.

#### **Corrective Action**

Verify network connectivity between the local cluster and its peer clusters. It might be necessary to manually correct the peer clusters' configurations using the 'cluster peer modify' command if peer addresses have changed recently. Verify that each cluster is up.

#### **Syslog Message**

Periodic update of peer information from %s failed. The following operations are incomplete: %s

#### **Parameters**

**peer** (STRING): Peer whose updates failed.  
**failures** (STRING): Failed peer updates.

## **cpeer.pp events**

## cpeer.pp.mismatch

### Severity

ERROR

### Description

This message occurs when an incoming cluster peer authentication request fails due to a passphrase mismatch.

### Corrective Action

For multiple occurrences of this event, verify the peering request with the admin of the remote cluster. If the admin is not responsible for the attempts, the local or remote cluster might be under attack.

### Syslog Message

Remote cluster %s//%s did not accept a cluster peering authentication offer (from address %s in IPspace %s) due to a passphrase mismatch. Local offer made on %s, valid for %s, with the %s PSK method.

### Parameters

**remotename** (STRING): Name of the cluster for which the contact was made.  
**remoteuuid** (STRING): UUID of the cluster for which the contact was made.  
**address** (STRING): Network address from which the authentication attempt was made.  
**ipspace** (STRING): IPspace from which the contact attempt was made.  
**offerTime** (STRING): Time at which the offer from the local cluster was generated.  
**offerDuration** (STRING): Duration of the offer from the local cluster.  
**offerStyle** (STRING): Style of authentication offer.

## cpeer.psk events

### cpeer.psk.cluster.revoked

### Severity

ERROR

### Description

This message occurs when the system receives an authentication request for a remote cluster whose peer authentication has been revoked by the local cluster administrator. It might indicate that this system is under attack.

### Corrective Action

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

### Syslog Message

ONTAP received a TLS request to authenticate with the pre-shared key of remote cluster %s, but the relationship with the remote cluster has been revoked by the administrator of this cluster. The request was sent from address %s in IPspace %s.

### Parameters

**clustername** (STRING): Name of the remote cluster being probed.  
**sourceIP** (STRING): IP address that is the source of the probe.

**sourceIPspace** (STRING): IPspace in which the probe arrived.

## **cpeer.psk.cluster.unauth**

### **Severity**

ERROR

### **Description**

This message occurs when the system receives an authentication request for a remote cluster whose peer relationship is unauthenticated. It might indicate that this system is under attack. The request was sent from address %s in IPspace %s.

### **Corrective Action**

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

### **Syslog Message**

ONTAP received a TLS request to authenticate with a cluster's pre-shared key, but there is no authenticated relationship with this remote cluster. Instead, the relationship is unauthenticated and has no keying information associated with it.

### **Parameters**

**clustername** (STRING): Name of the remote cluster being probed.

**sourceIP** (STRING): IP address that is the source of the probe.

**sourceIPspace** (STRING): IPspace in which the probe arrived.

## **cpeer.psk.disabled**

### **Severity**

NOTICE

### **Description**

This message occurs when the system is unable to find a suitable pre-shared key (PSK) cipher suite required for cluster peering. This is likely because the PSK cipher suites are disabled in the ONTAP security configuration. Cluster peering connections and associated applications may fail as a result.

### **Corrective Action**

View the enabled cipher suites with the "security config show" command. Enable the PSK cipher suites with the "security config modify" command.

### **Syslog Message**

The system was unable to find a suitable pre-shared key (PSK) cipher suite required for cluster peering. This is likely because the PSK cipher suites are disabled in the ONTAP security configuration. Cluster peering connections and associated applications may fail as a result.

### **Parameters**

(None).

## **cpeer.psk.unknown.cluster**

## Severity

ERROR

## Description

This message occurs when the system receives an authentication request from an unknown cluster. It might indicate that this system is under attack.

## Corrective Action

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

## Syslog Message

ONTAP received a TLS request to authenticate with a remote cluster's pre-shared key, but the remote cluster UUID (%s) is unrecognized. The probe arrived from address %s in IPspace %s.

## Parameters

**clusterUUID** (STRING): Cluster UUID being probed.

**sourceIP** (STRING): IP address that is the source of the probe.

**sourceIPspace** (STRING): IPspace in which the probe arrived.

# cpeer.receiver events

## cpeer.receiver.noindex

### Severity

NOTICE

### Description

This message occurs when an incoming cluster peer request using the system-generated passphrase. However, the cluster peer request failed because there is no matching outstanding cluster peer offers for the request in the system.

### Corrective Action

Verify the peer request with peer cluster admin. If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

### Syslog Message

The cluster peer request from the remote cluster (%s) using the system-generated passphrase (Index: %d) has failed because cluster peer offer with system-generated passphrase is not available for this index.

### Parameters

**remote\_cluster\_details** (STRING): Remote cluster name.

**ppindex** (INT): Cluster peer passphrase index.

# cpeer.recv events

## cpeer.recv.pp.mismatch

**Severity**

NOTICE

**Description**

This message occurs when there is an incoming cluster peer request using the system-generated passphrase. However, the cluster peer request authentication failed due to passphrase mismatch and so the cluster peer offer is deleted.

**Corrective Action**

Verify the peer request with peer cluster admin. If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

**Syslog Message**

The cluster peer offer with system-generated passphrase was attempted for cluster peering by the remote cluster (%s:%s) with address %s but cluster peer request failed due to passphrase mismatch. So, the offer is deleted.

**Parameters**

**remotename** (STRING): Remote cluster name.  
**remoteuuid** (STRING): Remote cluster UUID.  
**address** (STRING): Remote cluster IP address.

## cpeer.unavailable events

### cpeer.unavailable

**Severity**

ALERT

**Description**

This message occurs when a peer cluster becomes unavailable.

**Corrective Action**

Verify network connectivity between the local cluster and the peer cluster. It might be necessary to manually correct the peer configuration using the 'cluster peer modify' command if peer addresses have changed recently. Verify that the peer cluster is up.

**Syslog Message**

Peer cluster %s is no longer available.

**Parameters**

**peer** (STRING): Peer cluster that became unavailable.

## cpeer.xcm events

### cpeer.xcm.addr.disc.warn

**Severity**

ERROR

## Description

This message occurs when address discovery fails for a peer cluster.

## Corrective Action

Verify network connectivity between the local cluster and the peer cluster. It might be necessary to manually correct the peer configuration using the 'cluster peer modify' command if peer addresses have changed recently. Verify that the peer cluster is up.

## Syslog Message

Address discovery failed for peer cluster %s. Reason: %s.

## Parameters

**peer** (STRING): Peer cluster whose address discovery failed.

**reason** (STRING): Reason for address discovery failure.

## cpeer.xcm.update.warn

### Severity

ERROR

### Description

This message occurs when the cross-cluster manager job experiences a transient failure. The cross-cluster manager job periodically contacts each peer cluster, requests configuration information, and maintains the node-local network configuration for the remote peer cluster.

### Corrective Action

Verify network connectivity between the local cluster and its peer clusters. It might be necessary to manually correct the peer clusters' configurations using the 'cluster peer modify' command if peer addresses have changed recently. Verify that each cluster is up.

### Syslog Message

Periodic update of peer network information failed. The following operations are incomplete: %s.

### Parameters

**failures** (STRING): Failed peer updates.

# cr events

## cr.data events

### CR.Data.File.Inaccessible

#### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

#### Severity

NOTICE

#### Description

This message occurs when the namespace scanner skips an inode for which it cannot access the data file. This might be due to the data volume being offline.

#### Corrective Action

Bring the data volume back online using the "volume online" command. If the problem persists, retry the scan operation.

#### Syslog Message

The redirector file [%s] on namespace volume [%s] will be skipped by "Volume Check" because the corresponding data file on data volume [%s] in Vserver [%s] is not accessible.

#### Parameters

**redirPath** (STRING): Path of the redirector file that will be skipped.

**nsVol** (STRING): Name of the constituent namespace volume that hosts the redirector file.

**dataVol** (STRING): Name of the constituent data volume that hosts the data file.

**vserver** (STRING): Vserver hosting the constituent volumes.

## cr.del events

### CR.Del.CrptStreamData.Fail

#### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

#### Severity

NOTICE

#### Description

This message occurs when an attempt to delete corrupt stream data fails.

#### Corrective Action

(None).

#### Syslog Message

Deletion failed for corrupt stream data [%s] on volume [%s] in Vserver [%s].

## Parameters

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the stream resides.

**vserver** (STRING): Vserver hosting the volume.

## CR.Del.CrptStreamRedir.Fail

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

NOTICE

### Description

This message occurs when an attempt to delete corrupt stream redirector failed.

### Corrective Action

(None).

### Syslog Message

Deletion failed for corrupt stream redirector [%s] on volume [%s] in Vserver [%s].

## Parameters

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the stream resides.

**vserver** (STRING): Vserver hosting the volume.

## CR.Del.DangStreamData.Fail

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

NOTICE

### Description

This message occurs when an attempt to delete dangling stream data fails. This stream was created when there was a failure in cleaning up stream data on the data constituent, which left dangling data that is unnecessarily consuming resources.

### Corrective Action

(None).

### Syslog Message

Deletion failed for dangling stream data [%s] on volume [%s] in Vserver [%s].

## Parameters

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the stream data resides.

**vserver** (STRING): Vserver hosting the volume.

## CR.Del.DangStreamRedir.Fail

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

NOTICE

### Description

This message occurs when an attempt to delete dangling stream redirector failed.

### Corrective Action

(None).

### Syslog Message

Deletion failed for dangling stream redirector [%s] on volume [%s] in Vserver [%s].

### Parameters

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the redirector resides.

**vserver** (STRING): Vserver hosting the volume.

## cr.fix events

### CR.Fix.Corrupt.Redir.Failed

#### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

#### Severity

NOTICE

#### Description

This message occurs when corrective action for corrupt redirector file failed.

#### Corrective Action

(None).

#### Syslog Message

Corrective action failed for corrupt redirector of data file [%s] on volume [%s] in Vserver [%s].

#### Parameters

**path** (STRING): File path.

**volume** (STRING): Name of the constituent volume where the data file resides.

**vserver** (STRING): Vserver hosting the volume.

### CR.Fix.Crpt.Data.Dir.Failed

#### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

INFORMATIONAL

**Description**

This message occurs when the corrective action for a corrupt data directory fails. These entries were created when they were moved to the [lost+found] folder by wafllron, on the data constituents.

**Corrective Action**

(None).

**Syslog Message**

Corrective action failed for corrupt data directory [%s] on volume [%s].

**Parameters**

**path** (STRING): Directory path.

**volume** (STRING): Name of the constituent volume where the directory resides.

**vserver** (STRING): Vserver hosting the volume.

**CR.Fix.Crpt.Data.File.Failed****Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when the corrective action for a corrupt data file fails.

**Corrective Action**

(None).

**Syslog Message**

Corrective action failed for corrupt data file [%s] on volume [%s] in Vserver [%s].

**Parameters**

**path** (STRING): File path.

**volume** (STRING): Name of the constituent volume where the file resides.

**vserver** (STRING): Vserver hosting the volume.

**CR.Fix.CrptStreamRedir.Fail****Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when the fix for corrupt stream redirector fails.

**Corrective Action**

(None).

**Syslog Message**

Corrective action failed for corrupt stream redirector of stream data [%s] on volume [%s] in Vserver [%s].

**Parameters**

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the stream redirector resides.

**vserver** (STRING): Vserver hosting the volume.

**CR.Fix.Dang.Data.File.Failed****Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when the corrective action for a dangling data file fails. This file was created when there was a failure in cleaning up a file on the data constituent, which left a dangling file that is unnecessarily consuming resources.

**Corrective Action**

(None).

**Syslog Message**

Corrective action failed for dangling data file [%s] on volume [%s] in Vserver [%s].

**Parameters**

**path** (STRING): File path.

**volume** (STRING): Name of the constituent volume where the file resides.

**vserver** (STRING): Vserver hosting the volume.

**CR.Fix.Nlinks.Failed****Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when the corrective action for an Nlinks (number of hardlinks on the file) mismatch fails.

**Corrective Action**

(None).

## Syslog Message

Corrective action failed for Nlinks mismatch on file [%s] on volume [%s] in Vserver [%s].

## Parameters

**path** (STRING): File path.

**volume** (STRING): Name of the constituent volume where the file resides.

**vserver** (STRING): Vserver hosting the volume.

# cr.rdb events

## CR.RDB.Counters.Not.Updated

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

INFORMATIONAL

### Description

This message occurs when the RDB (replicated database) cannot be updated with the inode counters for a particular scan.

### Corrective Action

(None).

## Syslog Message

The inode counters [percentage scan complete: %d], [estimated time remaining: %s], [number of issues detected: %d] and [number of issues fixed: %d] could not be updated in the RDB due to [error: %s] for [volume: %s] in [Vserver: %s].

## Parameters

**percentComplete** (INT): Percentage of the inodes scanned.

**estimatedTime** (STRING): Estimated time remaining for the scan to finish.

**issuesDetected** (INT): Number of issues detected by the scan so far.

**issuesFixed** (INT): Number of issues fixed by the scan so far.

**reason** (STRING): Reason for the failed update.

**volume** (STRING): Name of the constituent volume for which the RDB could not be updated.

**vserver** (STRING): Vserver hosting the volume.

## CR.RDB.State.Not.Updated

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

NOTICE

### Description

This message occurs when the RDB (replicated database) cannot be updated with the final state of the scan, that is, success/failure.

## Corrective Action

Run the 'volume check stop' command on the respective volume.

## Syslog Message

The final state [%s] of the 'volume check' scan could not be updated in the RDB due to [error: %s] for volume [%s] in Vserver [%s].

## Parameters

**state** (STRING): Final state of the scan that has to be updated.

**reason** (STRING): Reason for the failed update.

**volume** (STRING): Name of the constituent volume for which the RDB could not be updated.

**vserver** (STRING): Vserver hosting the volume.

# cr.redir events

## CR.Redir.File.Inaccessible

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

NOTICE

### Description

This message occurs when the data scanner skips an inode for which it cannot access the redirector file. This might be due to the namespace volume being offline.

### Corrective Action

Bring the namespace volume back online using the "volume online" command. If the problem persists, retry the scan operation.

### Syslog Message

The data file [%s] on data volume [%s] will be skipped by "Volume Check" because the corresponding redirector file on namespace volume [%s] on Vserver [%s] is not accessible.

### Parameters

**dataFilePath** (STRING): Path of the data file that will get skipped.

**dataVol** (STRING): Name of the constituent data volume that hosts the data file.

**nsVol** (STRING): Name of the constituent namespace volume that hosts the redirector file.

**vserver** (STRING): Vserver hosting the constituent volumes.

# cr.snapshot events

## CR.Snapshot.Not.Deleted

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when a temporary Snapshot(tm) copy created by the 'volume check' command could not be deleted.

**Corrective Action**

Delete the Snapshot copy by using the following command from "diag" mode: volume snapshot delete -vserver <vserver> -volume <volume> -snapshot <snapshot-name> -ignore-owners

**Syslog Message**

The temporary Snapshot copy [%s] created by the 'volume check' command for volume [%s] in Vserver [%s] could not be deleted [error: %s].

**Parameters**

**snapshot** (STRING): Name of the Snapshot copy.

**volume** (STRING): Name of the constituent volume for which the Snapshot copy could not be deleted.

**vserver** (STRING): Vserver hosting the volume.

**reason** (STRING): Reason for the failure.

## cr.sync events

### CR.Sync.ACL.Fail

**Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

NOTICE

**Description**

This message occurs when an attempt to synchronize the ACL from data to redirector fails.

**Corrective Action**

(None).

**Syslog Message**

ACL synchronizing failed for file [%s] on volume [%s] in Vserver [%s].

**Parameters**

**path** (STRING): Stream path.

**volume** (STRING): Name of the constituent volume where the file resides.

**vserver** (STRING): Vserver hosting the volume.

# crypto events

## crypto.debug events

### crypto.debug

**Severity**

INFORMATIONAL

**Description**

The Crypto module debug event.

**Corrective Action**

(None).

**Syslog Message**

%s.

**Parameters**

**debug\_string** (STRING): Description of the event being logged.

## crypto.export events

### crypto.export.failed

**Severity**

ALERT

**Description**

This message occurs when the export of a cryptographic key fails.

**Corrective Action**

This message might be seen when attempting to create an encrypted volume. Contact NetApp technical support if further attempts to create the encrypted volume fail.

**Syslog Message**

ERROR: Export of key with key ID %s failed. Additional information: %s.

**Parameters**

**key\_id** (STRING): Key ID for the cryptographic key.

**msg** (STRING): Associated failure message.

## crypto.import events

### crypto.import.failed

**Severity**

ALERT

## Description

This message occurs when the import of a cryptographic key fails.

## Corrective Action

This message might be seen when attempting to bring an encrypted volume online. Contact NetApp technical support if manual attempts to bring the encrypted volume online fail.

## Syslog Message

ERROR: Import of key with key ID %s failed. Additional information: %s.

## Parameters

**key\_id** (STRING): Key ID for the cryptographic key.

**msg** (STRING): Associated failure message.

# crypto.key events

## crypto.key.deleted

### Severity

NOTICE

### Description

This message occurs when a cryptographic key is deleted.

### Corrective Action

(None).

### Syslog Message

Deleted key with key ID %s. Reason %s.

### Parameters

**key\_id** (STRING): Key ID for the cryptographic key.

**reason** (STRING): Reason for deletion.

## crypto.key.stored

### Severity

NOTICE

### Description

This message occurs when a cryptographic key is stored.

### Corrective Action

(None).

### Syslog Message

Stored key with key ID %s. Key digest: %s.

### Parameters

**key\_id** (STRING): Key ID for the cryptographic key.

**key\_digest** (STRING): Key digest for the cryptographic key.

## crypto.okmrecovery events

### crypto.okmrecovery.failed

#### Severity

ALERT

#### Description

This message occurs when the Onboard Key Manager (OKM) recovery command in the boot menu fails to recover the OKM hierarchy. Without the the OKM hierarchy, volumes encrypted using OKM will not come online, and you will not be able to use OKM to encrypt volumes.

#### Corrective Action

This message is usually seen when an incorrect cluster passphrase was entered during a previous boot menu recovery command. Often, using the "security key-manager onboard sync" command will resolve the situation. If that does not fix the problem, the OKM hierarchy can be recovered during the boot process. To recover the OKM hierarchy during the boot process, enter option 10 ("Set Onboard Key Manager recovery secrets.") at the boot menu prompt. You will need to have the cluster passphrase and a copy of the output from the "security key-manager backup show" command. If the boot menu recovery process fails again, contact NetApp technical support.

#### Syslog Message

Import of the Onboard Key Manager (OKM) hierarchy has failed: %s. Additional information: %s.

#### Parameters

**failure\_msg** (STRING): Message describing which operation failed.

**additional\_msg** (STRING): Additional information regarding the failure.

## crypto.ssal events

### crypto.ssal.failed

#### Severity

ALERT

#### Description

This message occurs when a Secure Storage Access Layer(SSAL) operation fails. This might cause import of the onboard key hierarchy to fail and might result in a temporary loss of access to any data secured using the SSAL.

#### Corrective Action

(Call support).

#### Syslog Message

SSAL operation failed: %s. %s

#### Parameters

**failure\_msg** (STRING): Message describing which operation failed.

**additional\_msg** (STRING): Additional information regarding the failure.

## **crypto.ssal.tpm.clear**

### **Severity**

NOTICE

### **Description**

This message occurs when a Trusted Platform Module(TPM) clear operation is performed successfully. A TPM clear operation can happen while reverting to a previous release or when the "security tpm clear" command was executed. A TPM clear operation clears out the TPM and resets it with a new seed for the TPM's storage hierarchy.

### **Corrective Action**

(None).

### **Syslog Message**

A TPM clear operation has been completed successfully.

### **Parameters**

(None).

## **crypto.ssal.tpm.reset**

### **Severity**

NOTICE

### **Description**

This message occurs when a Trusted Platform Module(TPM) reset operation is performed successfully. A TPM reset operation can happen when the node boots up for the first time or when the "security tpm reset" command was executed. A TPM reset operation clears out the TPM and resets it with a new seed for the TPM's storage hierarchy. The TPM then generates a new primary key under the same hierarchy and makes it persistent.

### **Corrective Action**

(None).

### **Syslog Message**

A TPM reset operation has been completed successfully.

### **Parameters**

(None).

# cs events

## cs.create events

### cs.create.inprogress

#### Severity

ALERT

#### Description

This message occurs when there is an attempt to release SnapMirror resources for a volume as a result of volume delete while a Cloud Snapshot create operation is in progress.

#### Corrective Action

Ensure no Cloud Snapshot create operation is in-progress when the volume is deleted. Either abort the create operation or wait for the creation to complete before deleting the volume.

#### Syslog Message

Failed to delete the volume "%s" as one or more Cloud Snapshot operations are in progress. Number of Cloud Snapshot operations in progress: "%d".

#### Parameters

**volumeUUID** (STRING): UUID of the volume.

**in\_transfer\_snap\_count** (INT): Number of Cloud Snapshot create in-progress.

## cs.endpoint events

### cs.endpoint.has.no.snapshots

#### Severity

ALERT

#### Description

This message occurs when volume delete operations attempts to clean-up snapmirror resources and finds that there are no cloud snapshots associated with the volume. The cloud endpoint is automatically deleted on deletion of last cloud snapshot. So it's unusual to find a cloud snapshot endpoint with no snapshots.

#### Corrective Action

(None).

#### Syslog Message

The volume "%s" has no cloud snapshots associated with it.

#### Parameters

**volumeUUID** (STRING): UUID of the volume.

# csm events

## csm.badauthaccess events

### csm.badAuthAccess

#### Severity

NOTICE

#### Description

This message occurs when a blade fails an attempt to authenticate as a given peer cluster, and Cluster Session Manager (CSM), which establishes and manages SpinNP sessions between blades in the cluster, denies access of the unauthenticated blade. This could indicate that an interloper is attempting to gain access to the cluster.

#### Corrective Action

(None).

#### Syslog Message

Access as peer cluster %s was claimed from network address %s, but has not been granted because %s.

#### Parameters

**clusterUuid** (STRING): UUID of the cluster to which the blade claimed to belong.

**addrstr** (STRING): Remote network address of the blade.

**msg** (STRING): Reason that access could not be authenticated.

## csm.badconnection events

### csm.badConnection

#### Severity

ALERT

#### Description

This message occurs when ONTAP® software receives a Cluster Session Manager (CSM) connection with unrecognizable content. This might indicate that the system is under attack. As a precaution, the connection used to receive that data has been closed.

#### Corrective Action

Carefully inspect the networking configuration, event messages, and logs of both the local and remote nodes. If any evidence exists of an intrusion attempt, configure site networking equipment to avoid forwarding data to the local address and port, and if necessary, from forwarding data from the remote address and port. Check external site security tools for unauthorized access attempts. Audit site security logs.

#### Syslog Message

ONTAP received a CSM connection with unrecognizable content at local address %s local port %d, from remote address %s remote port %d, via IPspace %d.

## Parameters

**localAddr** (STRING): Full internet address of the local end of the connection.  
**localPort** (INT): Local port number.  
**remoteAddr** (STRING): Full internet address of the remote end of the connection.  
**remotePort** (INT): Remote port number.  
**IPspace** (INT): Identifier of the IPspace within which the remote address was reached.

# csm.badplainaccess events

## csm.badPlainAccess

### Severity

NOTICE

### Description

This message occurs when a blade attempts to access the local cluster without encrypting its communication channel, and Cluster Session Manager (CSM), which establishes and manages SpinNP sessions between blades in the cluster, denies access of the unencrypted communication channel. This could indicate that an interloper is attempting to gain access to the cluster.

### Corrective Action

(None).

### Syslog Message

Access as peer cluster %s was claimed from network address %s, but has not been granted because it was not using TLS.

### Parameters

**clusterUuid** (STRING): UUID of the cluster to which the blade claimed to belong.  
**addrstr** (STRING): Remote network address of the blade.

# csm.ctfallbackactiveopen events

## csm.ctFallbackActiveOpen

### Severity

NOTICE

### Description

This message occurs when the Cluster Session Manager (CSM) uses CT (TCP transport) as the default when creating LIF pairs because connections running CSM over remote direct memory access (RDMA) repeatedly fail during successive retry attempts.

### Corrective Action

(None).

### Syslog Message

Cluster Session Manager (CSM) could not successfully create the RDMA connections for session "%s" even after several retry attempts. CSM will use TCP connections as defaults.

## Parameters

**uniquifier** (STRING): Unique identifier for this session.

# csm.ctfallbackswitchless events

## csm.ctFallbackSwitchless

### Severity

NOTICE

### Description

This message occurs when the Cluster Session Manager (CSM) defaults to use CT (TCP transport) when creating LIF pairs because remote device ID information is not available on switchless clusters running CSM over remote direct memory access (RDMA).

### Corrective Action

(None).

### Syslog Message

Cluster Session Manager (CSM) could not determine the cluster ports that are directly connected between the switchless cluster nodes to create the RDMA connections for session "%s". CSM will use TCP connections as defaults.

## Parameters

**uniquifier** (STRING): Unique identifier for this session.

# csm.homeportinfounexpected events

## csm.homePortInfoUnexpected

### Severity

NOTICE

### Description

This message occurs when the Cluster Session Manager (CSM) establishes a connection between nodes over the cluster network interface of a switchless cluster and detects that the logical interface's (LIF's) home port and the corresponding remote device information are not the expected values.

### Corrective Action

This message can occasionally happen during normal operations on a system startup or a LIF migration event. If the message repeats every few minutes, it might indicate a problem in the cluster interface configuration or the physical cabling of the switchless cluster.

### Syslog Message

CSM reports unexpected information for cluster LIF ID "%d" (home port: "%s", remote device ID: "%s").

## Parameters

**vifId** (INT): ID of the local cluster LIF over which the connection gets established.

**homePort** (STRING): Home port hosting the LIF.

**remoteDeviceId** (STRING): Remote device associated with the home port.

# csm.mismatchremotedevice events

## csm.mismatchRemoteDevice

### Severity

ERROR

### Description

The message occurs when the Cluster Session Manager (CSM) establishes a connection between nodes over the cluster network interface, but the node's remote device IDs do not match.

### Corrective Action

Ensure that the Cisco Discover Protocol (CDP) is running on the nodes and switches. In addition, ensure that the cluster ports are up and the cluster LIFs are configured and hosted according to the suggested cluster configuration.

### Syslog Message

CSM connection between source LIF %d and destination address %s might not be optimal for session %s. The source is currently connected to %s remote device and the destination is currently connected to %s remote device.

### Parameters

**sourceLIF** (INT): Source logical interface.

**destAddr** (STRING): Destination IP address.

**uniquifier** (STRING): Unique identifier for this session.

**sourceRemoteDevice** (STRING): Remote device associated with the source logical interface.

**destRemoteDevice** (STRING): Remote device associated with the destination IP address.

# csm.nomemory events

## csm.noMemory

### Severity

ERROR

### Description

This message occurs when the memory allocator temporarily runs out of memory that can be allocated or when the entire node has an insufficient amount of free system memory. If the issue persists, the cluster session manager (CSM) might not be able to create connections to remote cluster nodes to serve data traffic.

### Corrective Action

If the condition persists, contact NetApp technical support.

### Syslog Message

CSM was unable to process events due to insufficient free memory.

### Parameters

**filename** (STRING): Name of the file where the event occurred.

**lineno** (INT): Line number where the event occurred.

## **csm.rdmarecoveractiveopen events**

### **csm.rdmaRecoverActiveOpen**

#### **Severity**

NOTICE

#### **Description**

This message occurs when the Cluster Session Manager (CSM) attempts to restore the use of the preferred remote direct memory access (RDMA) transport for the eligible sessions because the condition which triggered the CSM to use CT (TCP transport) as default might have resolved.

#### **Corrective Action**

(None).

#### **Syslog Message**

Cluster Session Manager (CSM) is attempting to restore the use of the preferred RDMA connections for eligible sessions, which had previously defaulted to use TCP connections due to repeated active open failures.

#### **Parameters**

(None).

## **csm.rdmarecoverswitchless events**

### **csm.rdmaRecoverSwitchless**

#### **Severity**

NOTICE

#### **Description**

This message occurs when the Cluster Session Manager (CSM) attempts to restore the use of the preferred remote direct memory access (RDMA) transport for the eligible sessions because the condition which triggered the CSM to use CT (TCP transport) as default might have been resolved in the switchless cluster.

#### **Corrective Action**

(None).

#### **Syslog Message**

Cluster Session Manager (CSM) is attempting to restore the use of the preferred RDMA connections for eligible sessions, which had previously defaulted to use TCP connections in the switchless cluster.

#### **Parameters**

(None).

## **csm.unmarshallerror events**

## **csm.unmarshallError**

### **Severity**

ERROR

### **Description**

The message occurs when the Cluster Session Manager (CSM) fails to unmarshal a packet.

### **Corrective Action**

Unmarshal errors reported in CSM indicate corrupted packet(s) were delivered to CSM. Often this can be attributed to network layer problems. TCP checksum errors should be checked for if unmarshal errors continue to increment.

### **Syslog Message**

Cluster Session Manager (CSM) failed to unmarshall packet for session %s.

### **Parameters**

**sessionId** (STRING): Full session ID of this session.

# ctl events

## ctl.ctlbe events

### ctl.ctlbe.IOInternalError

**Severity**

ERROR

**Description**

IO failure due to internal error

**Corrective Action**

The command failure associated with the device specified in this event is caused by some internal error.

**Syslog Message**

Device Serial Number %s - Internal error reason: %s - SCSI error : %s

**Parameters**

**devSerial** (STRING): Device Serial Number

**reason** (STRING): Internal error

**scsiError** (STRING): SCSI error code

### ctl.ctlbe.lunCreationFailed

**Severity**

ERROR

**Description**

LUN creation failed in the CAM target layer.

**Corrective Action**

The creation of a CAM target end point for the LUN failed. This will cause the disk or partition to not be exported to the DR cluster, and therefore cannot be used for storage mirroring.

**Syslog Message**

LUN %d - endpoint creation failed, reason: %s

**Parameters**

**lunId** (INT): The LUN ID

**errorString** (STRING): Description of the error

### ctl.ctlbe.lunError

**Severity**

ERROR

**Description**

The LUN has been deleted or is not configured properly

## Corrective Action

The command failure associated with the device specified in this event is caused by the device being not configured or in error state. The device may be in the process of being deleted or the path to this device may not be accessible. Check the state of the device.

## Syslog Message

Device Serial Number %s - Device is not configured or in error state - SCSI error : %s - LUN flags : 0x%x

## Parameters

**devSerial** (STRING): Device Serial Number  
**scsiError** (STRING): SCSI error code  
**lunFlags** (INT): Internal CTL Backend LUN flags

## ctl.ctlbe.lunNotConfigured

### Severity

ERROR

### Description

The LUN is not configured

### Corrective Action

The command failure associated with the device specified in this event is caused by the device not being configured. Check the state of the device.

## Syslog Message

Device Serial Number %s - Device is not configured - SCSI error : %s

## Parameters

**devSerial** (STRING): Device Serial Number  
**scsiError** (STRING): SCSI error code

## ctl.session events

### ctl.session.stateChanged

### Severity

NOTICE

### Description

This message occurs when iSCSI CAM target layer session status is changed.

### Corrective Action

If the identified iSCSI CAM target layer session is experiencing unexpected events (disconnecting, reconnecting, or connected), examine the link for excessive errors or latency.

## Syslog Message

iSCSI CAM target layer's session state is changed to %s for the initiator %s (address: %s). %s

## Parameters

**ctl\_session\_state** (STRING): New iSCSI CAM target layer session state.

**ctl\_initiator** (STRING): iSCSI CAM target layer initiator's name.

**ctl\_initiator\_address** (STRING): iSCSI CAM target layer initiator's address.

**ctl\_session\_state\_change\_reason** (STRING): Reason for the iSCSI CAM target layer session state change.

**ctl\_timeout\_value** (INT): iSCSI CAM target layer timeout value.

# ctran events

## ctran.disabled events

### ctran.disabled

#### Severity

INFORMATIONAL

#### Description

This message occurs when Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) subsystem is disabled.

#### Corrective Action

This happens only when the local node went out of CLAM quorum. Take the corrective action specified in EMS\_clam\_node\_ooq event.

#### Syslog Message

CTRAN subsystem is now disabled.

#### Parameters

(None).

## ctran.enabled events

### ctran.enabled

#### Severity

INFORMATIONAL

#### Description

This message occurs when Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) subsystem is enabled.

#### Corrective Action

No action is needed.

#### Syslog Message

CTRAN subsystem is now enabled.

#### Parameters

(None).

## ctran.gbuf events

### ctran.gbuf.alloc.unsuccessful

## Severity

NOTICE

## Description

This message occurs when one or more attempts to allocate a message buffer to convey messages between nodes for the Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) has been unsuccessful.

## Corrective Action

If this message occurs more than 10 times in a hour KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node \* -message "ctran.gbuf.alloc.unsuccessful" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.gbuf.alloc.unsuccessful" -subsystem kcs" and contact NetApp technical support support.

## Syslog Message

Attempt to allocate a message buffer for CTRAN has been unsuccessful. Total number of unsuccessful attempts is %u.

## Parameters

**attempts\_failed** (LONGINT): Total number of message buffer allocation attempts that have been unsuccessful.

# ctran.gc events

## ctran.gc.proposal.stuck

## Severity

EMERGENCY

## Description

This message occurs when the Cluster Transaction Manager (CTRAN) Group Coordinator (GC) of a group runs a prop-done probe for a proposal longer than anticipated.

## Corrective Action

KCS CTRAN logs need to be collected for further analysis. Trigger an ALL AutoSupport® message by using the "autosupport invoke -node \* -message "ctran.gc.proposal.stuck" -type all" command. Also trigger a diagnostic AutoSupport by using the "autosupport invoke-diagnostic -node \* -message "ctran.gc.proposal.stuck" -subsystem kcs" command. Then contact NetApp technical support support.

## Syslog Message

CTRAN group %s has attempted a prop\_done probe %d times against gm\_id %ld on node %s with UUID %s for txn %ld with opcode %d.

## Parameters

**group\_name** (STRING): Name of the group being polled.  
**attempts** (LONGINT): Number of attempts.  
**gm\_id** (LONGINT): Group member (GM) ID.  
**node\_name** (STRING): Name of the node the GM resides on.  
**node\_uuid** (STRING): UUID of the node the GM resides on.  
**trans\_id** (LONGINT): ID of the stuck transaction.  
**opcode** (INT): Operation type of the stuck transaction.

## ctran.gc.reselection.failed

### Severity

ALERT

### Description

This message occurs when some Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) groups lose their Group co-ordinator (GC) and a subsequent GC reselection process fails to complete.

### Corrective Action

Reboot the node, and if the node is waiting for giveback then perform a giveback.

### Syslog Message

CTRAN GC Reselection failed on local node (name=%s, id=%llu).

### Parameters

**localhostname** (STRING): The host name of the local node.

**localnodeid** (LONGINT): The node ID of the local node.

## ctran.group events

### ctran.group.reset.failed

### Severity

EMERGENCY

### Description

This message occurs when an attempt to reset a group by Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) fails.

### Corrective Action

KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using "autosupport invoke -node \* -message "ctran.group.reset.failed" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.group.reset.failed" -subsystem kcs" and contact NetApp technical support support.

### Syslog Message

Group reset for %s has failed on node %s.

### Parameters

**localhostname** (STRING): The host name of the local node.

**group\_name** (STRING): The group on which the group reset operation is attempted.

## ctran.jpc events

### ctran.jpc.assigned

### Severity

INFORMATIONAL

## Description

This message occurs when a Join Proposal Coordinator (JPC) node is assigned by Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN).

## Corrective Action

(None).

## Syslog Message

Cluster node (name=%s, ID=%llu) is the Join Proposal Coordinator (JPC) node.

## Parameters

**nodename** (STRING): Host name of the JPC node.

**node\_id** (LONGINT): Node id of the JPC node.

## ctran.jpc.multiple.nodes

### Severity

EMERGENCY

### Description

This message occurs when multiple Join Proposal Coordinator (JPC) nodes for the Cluster Transaction Manager (CTRAN) are detected.

### Corrective Action

KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node \* -message "ctran.jpc.multiple.nodes" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.jpc.multiple.nodes" -subsystem kcs" and contact NetApp technical support support.

### Syslog Message

Cluster node %u detected multiple JPC nodes (node %u reports JPC %u, node %u reports JPC %u)

### Parameters

**local\_node\_id** (LONGINT): ID of the local node.

**src\_node\_id\_1** (LONGINT): ID of the first node reporting a JPC.

**jpc\_node\_id\_1** (LONGINT): ID of the JPC node reported by src\_node\_id\_1.

**src\_node\_id\_2** (LONGINT): ID of the second node reporting a JPC.

**jpc\_node\_id\_2** (LONGINT): ID of the JPC node reported by src\_node\_id\_2.

## ctran.jpc.not.found

### Severity

EMERGENCY

### Description

This message occurs when this node cannot find a a Join Proposal Coordinator (JPC) within the cluster for Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN). Until this error is resolved the reporting node will not be able to participate in distributed operations.

### Corrective Action

Perform a planned takeover/giveback sequence to reset the reporting node non-disruptively by using the "takeover -ofnode (reporting node)" and "giveback -ofnode (reporting node)" commands. If the error

message is still seen KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node \* -message "ctran.jpc.not.found" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.jpc.not.found" -subsystem kcs" and contact NetApp technical support support.

### Syslog Message

This node was unable to locate a Join Proposal Coordinator (JPC) node.

### Parameters

(None).

## ctran.jpc.valid.failed

### Severity

EMERGENCY

### Description

This message occurs when the Join Proposal Coordinator (JPC) validation fails due to an inconsistent state of some of the Cluster Transaction Manager (CTRAN) group members following a JPC reselection event. In some cases, this can result in loss of SAN data access, CLI command failures and/or giveback failures.

### Corrective Action

Reset the CTRAN subsystem during a maintenance window by placing the node specified ineligible by using "cluster modify -node (node reporting error) -eligibility false". Once complete return the node to service by entering "cluster modify -node (node reporting error) -eligibility true". Note, making a node ineligible impacts all protocols on that node. During the time that a node is ineligible, it will not serve any data. If a non-disruptive resolution is desired, takeover the reporting node by using "takeover -of-node (reporting-node)", and then returning it to service by "giveback -of-node (reporting-node)" when it is ready. If the error is still seen KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using "autosupport invoke -node \* -message "ctran.jpc.valid.failed" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.jpc.valid.failed" -subsystem kcs" and contact NetApp technical support support.

### Syslog Message

CTRAN JPC validation failed on local node (name=%s, id=%llu, num\_groups=%llu).

### Parameters

**localhostname** (STRING): Host name of the local node.

**localnodeid** (LONGINT): Node ID of the local node.

**numgroups** (LONGINT): Number of inconsistent groups.

## ctran.net events

### ctran.net.unreachable

### Severity

ALERT

### Description

This message occurs when the Cluster Transaction Manager (CTRAN) on the local node is unable to reach a peer node that it believes is in CLAM quorum.

## Corrective Action

Check all cluster interfaces on the node initiating this error message and the peer node specified in the message. \* Ensure all interfaces are in up state with "network interface show -role cluster". \* Ensure that each node initiating this message can reach their peer node with "cluster ping". \* Check the cluster interconnect switches and correct any issues found with the health or configuration found. If the error still persists KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node \* -message "ctran.net.unreachable" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node \* -message "ctran.net.unreachable" -subsystem kcs" and contact NetApp technical support support.

## Syslog Message

Node %s (id=%llu) is unable to reach peer node %s (id=%llu) on connection %s (ACN=0x%08llx).

## Parameters

**local\_node\_name** (STRING): Node name of the local node.

**local\_node\_id** (LONGINT): Node ID of the local node.

**peer\_node\_name** (STRING): Node name of the unreachable peer node.

**peer\_node\_id** (LONGINT): Node ID of the unreachable peer node.

**connection** (STRING): Name of connection that is unreachable.

**acn** (LONGINTEX): The ACN value.

# ctrl events

## ctrl.link events

### ctrl.link.degraded

#### Severity

ERROR

#### Description

This message occurs when the software detects either symbol errors or out-of-sequence errors on HA interconnect links.

#### Corrective Action

If possible, replace the degraded interconnect cables and reenale automatic switchover by using the "options -option-name rdma.link\_monitor -option-value on" command. If the problem persists after replacing both interconnect cables, replace the interconnect hardware on both nodes.

#### Syslog Message

Link errors detected on card in slot %d. Number of symbol errors (Port1:Port2): %d:%d; Number of OOS errors(RQ:SQ): %d:%d.

#### Parameters

**slot** (INT): Slot number of the HA Interconnect device.  
**sym\_err1** (INT): Symbol errors on the first port.  
**sym\_err2** (INT): Symbol errors on the second port.  
**rq\_oos** (INT): Out-of-sequence errors on the receive queue.  
**sq\_oos** (INT): Out-of-sequence errors on the send queue.

### ctrl.link.switchover

#### Severity

INFORMATIONAL

#### Description

This message occurs when the software initiates a switchover of the active interconnect link, which has been declared degraded.

#### Corrective Action

If possible, replace the degraded interconnect cable and reenale the automatic switchover by using the "options -option-name rdma.link\_monitor -option-value on" command. If the problem persists after replacing both the interconnect cables, replace the interconnect hardware on both nodes.

#### Syslog Message

Link switchover initiated to switch active interconnect link %s.

#### Parameters

**degraded\_port\_name** (STRING): Port name of the degraded link that is being switched from.

# ctrl.rdma.events

## ctrl.rdma.badSystemId

### Severity

NOTICE

### Description

This message occurs when an invalid system ID is found.

### Corrective Action

(None).

### Syslog Message

Invalid system ID %d. High-availability interconnect might not work properly.

### Parameters

**name** (INT): Invalid system ID value.

## ctrl.rdma.heartBeat

### Severity

INFORMATIONAL

### Description

This message logs heartbeat messages.

### Corrective Action

(None).

### Syslog Message

HA interconnect: %s.

### Parameters

**hb** (STRING): Heartbeat string.

## ctrl.rdma.partnerOK

### Severity

INFORMATIONAL

### Description

This message occurs when the partner resumes from pause state.

### Corrective Action

(None).

### Syslog Message

Partner node (system ID: %lld IP address: %s) has resumed from pause state.

## Parameters

**sysid** (LONGINT): Partner system ID.

**ipaddr** (STRING): Partner IP address.

## ctrl.rdma.partnerPause

### Severity

INFORMATIONAL

### Description

This message occurs when the partner enters pause state.

### Corrective Action

(None).

### Syslog Message

Partner node (system ID: %lld IP address: %s) has entered pause state.

## Parameters

**sysid** (LONGINT): Partner system ID.

**ipaddr** (STRING): Partner IP address.

## ctrl.rdma.portStateChange

### Severity

INFORMATIONAL

### Description

This message occurs when the state of the HA interconnect link changed frequently in the last hour.

### Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabte the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

### Syslog Message

HA interconnect: Link to %s changed state %d times in the last hour.

## Parameters

**ip** (STRING): IP address of the peer.

**num\_times** (INT): Number of times the state changed.

# daasync events

## daasync.capacity events

### daasync.capacity.changed

**Severity**

NOTICE

**Description**

This message occurs when the capacity data of a target device changes.

**Corrective Action**

(None).

**Syslog Message**

Capacity data has changed for device path %s with target address %s.

**Parameters**

**path** (STRING): Device path.

**targ\_addr** (STRING): Target address.

## daasync.inquiry events

### daasync.inquiry.changed

**Severity**

NOTICE

**Description**

This message occurs when the inquiry data of a target device changes.

**Corrective Action**

(None).

**Syslog Message**

Inquiry data has changed in path %s with target address %s.

**Parameters**

**path** (STRING): Device path.

**targ\_addr** (STRING): Target address.

## daasync.periph events

### daasync.periph.alloc.fail

**Severity**

ERROR

**Description**

This message occurs when the system cannot attach a drive.

**Corrective Action**

Use the "disk show -fields vmdisk-target-address" command to get the list of drives that are visible to the system and to verify that the missing drive is connected properly.

**Syslog Message**

Unable to attach new device %s due to status 0x%x.

**Parameters**

**device\_name** (STRING): Drive name.

**status** (INTEX): Status of the system.

# daregister events

## daregister.periph events

### daregister.periph.lost

#### Severity

ERROR

#### Description

This message occurs when a peripheral device is lost during registration.

#### Corrective Action

Check whether the device is connected correctly.

#### Syslog Message

Lost peripheral device during registration in path %s with respect to target address %s.

#### Parameters

**path** (STRING): Device path.

**targ\_addr** (STRING): Target address.

# dbfs events

## dbfs.api events

### dbfs.api

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) event related to an API operation occurs, such as an authentication failure.

#### Corrective Action

(None).

#### Syslog Message

A DBS API event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

#### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the API event. It displays as a string, in JSON format, or is empty.

## dbfs.assignments events

### dbfs.assignments

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) assignments event is reported, which occurs when the distribution of block data within the cluster changes. The DBS is responsible for managing the data that backs the FlexVols®.

#### Corrective Action

(None).

## Syslog Message

A DBS assignments event %s of type %s occurred for ServiceID %u on node %u/%s. DriveID = %u/%s. EventID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# db.block events

## db.block.repair.success

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) successfully completes a block service repair operation involving block rewrites to all BServices that are replicas for the block . See the previous data related events for further information. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

Contact NetApp technical support for data related events to assess the severity and for any required corrective actions.

## Syslog Message

A DBS block repair success event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbb.bulk events

## dbb.bulk.op

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to bulk volume operations such as backups, restores, making of Snapshot copies, or cloning occurs. If the original distributed block store event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is "0" if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbb.capacity events

## dbb.capacity.stranded

### Severity

NOTICE

### Description

This message occurs when the Distributed Block Store (DBS) detects that more than half of the cluster capacity is available on only one node. To achieve high availability (HA), the DBS effectively reduces the capacity of the largest node so that some of its capacity is stranded (unusable).

### Corrective Action

Adjust node disk capacities so that no node exceeds the capacity of the remaining nodes in the cluster.

### Syslog Message

Distributed Block Store has detected stranded capacity. Cluster fault type %s, fault ID %u, status %u. %s

## Parameters

**cfType** (STRING): Distributed Block Store cluster fault type of the associated object.

**cfID** (INT): Distributed Block Store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault: 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed Block Store cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

# db.clone events

## db.clone

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to volume cloning occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is "0" if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# db.cluster events

## db.cluster

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to cluster operations occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

## Corrective Action

(None).

## Syslog Message

A DBS event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is "0" if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbs.cluster.iops.overprov

### Severity

ERROR

### Description

This message occurs when the distributed block store detects that the sum of all minimum quality of service (QoS) IOPS of flexible volumes is greater than the expected IOPS of the cluster. Minimum QoS cannot be maintained for all flexible volumes simultaneously. The distributed block store is responsible for managing the data that backs the flexible volumes.

### Corrective Action

Adjust QoS settings on one or more flexible volumes, or add more nodes to increase cluster IOPS capabilities.

### Syslog Message

The distributed block store detects that the sum of all minimum QoS IOPS is greater than the expected IOPS of the cluster. The cluster fault type is %s and fault id is %u.

### Parameters

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## dbs.cluster.master

## Severity

NOTICE

## Description

This message occurs when a Distributed Block Store (DBS) event related to cluster master operation occurs, such as cluster master being selected or cluster capacity limits being reached.

## Corrective Action

(None).

## Syslog Message

A DBS cluster master event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbS.db events

## dbS.db

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to its internal shared database occurs.

### Corrective Action

(None).

### Syslog Message

A DBS database event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.  
**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.  
**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.  
**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.  
**evtID** (INT): DBS event ID number.  
**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## **dbb.director events**

### **dbb.director.addrs.stable**

#### **Severity**

NOTICE

#### **Description**

This message occurs when data address assignments are stable. This means that all data address movement, graceful or ungraceful, is complete and remains stable until another event on the cluster requires subsequent data address movement.

#### **Corrective Action**

(None).

#### **Syslog Message**

Data address movement is complete and data address assignments are stable.

#### **Parameters**

(None).

### **dbb.director.aggrs.stable**

#### **Severity**

NOTICE

#### **Description**

This message occurs when aggregate assignments are stable. This means that all aggregate movement, graceful or ungraceful, is complete and remains stable until another event on the cluster requires subsequent aggregate movement.

#### **Corrective Action**

(None).

#### **Syslog Message**

Aggregate movement is complete and aggregate assignments are stable.

#### **Parameters**

(None).

# db.discon events

## db.discon.snapmirror.end

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) is unable to access snapmirror endpoint on the network. The DBS is responsible for managing the data that backs the FlexVols®.

### Corrective Action

Check network connectivity between the cluster and the remote snapmirror endpoint. Check the 1G management network.

### Syslog Message

The Distributed Block Store is unable to access the snapmirror endpoint from cluster. The cluster fault type is %s and fault id is %u.

### Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.disconn events

## db.disconn.cluster.pair

### Severity

ERROR

### Description

This message occurs when the distributed block store detects that a cluster pair is disconnected or configured incorrectly. The distributed block store is responsible for managing the data that backs the flexible volumes.

### Corrective Action

Check network connectivity between clusters. One of the clusters in the pair might have become misconfigured or disconnected. Remove the local pairing and retry pairing the clusters.

### Syslog Message

The distributed block store detects that the cluster pair is disconnected or configured incorrectly. The cluster fault type is %s and fault id is %u.

### Parameters

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## dbb.disconn.remote.node

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) detects that a remote node is not connected to cluster network. The DBS is responsible for managing the data that backs the FlexVols®.

### Corrective Action

Ping the remote nodes using jumbo frames to test network connectivity.

### Syslog Message

The Distributed Block Store has detected that a remote node is not connected to cluster network. The cluster fault type is %s and fault id is %u.

### Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## dbb.drive events

### dbb.drive

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to drive operations occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is "0" if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## **db.drives.capacity.mismatch**

### **Severity**

ALERT

### **Description**

This message occurs when Distributed Block Store (DBS) detects a drive capacity mismatch.

### **Corrective Action**

Check capacity of drive against other DBS drives on the node. All drives are expected to be the same size.

### **Syslog Message**

DBS has detected a drive capacity mismatch. Cluster fault node %u, node UUID %s, drives %s, drive UUIDs %s, type %s, fault ID %u, status %u. %s

### **Parameters**

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfDriveIDs** (STRING): IDs of the affected drives.

**cfDriveUuids** (STRING): UUIDs of the affected drives.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the hardware mismatch.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## **db.drives.events**

### **db.drives.failed**

#### **Severity**

ERROR

#### **Description**

This message occurs when Distributed Block Store (DBS) has one or more failed drives. This can be happen due to: no access, too many failures, a missing drive, inaccessible master service for the node, or the drive is locked and cannot be unlocked or the authentication key cannot be accessed.

## Corrective Action

Check network connectivity for the node. Replace the drives. Make sure that the authentication key is available.

## Syslog Message

DBS has detected a failed drive(s). Cluster fault node %u, node UUID %s, drives %s, drive UUIDs %s, type %s, cluster fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfDriveIDs** (STRING): IDs of the failed drives

**cfDriveUuids** (STRING): UUIDs of the failed drives

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# dbm.ekm events

## dbm.ekm.cert.alert

### Severity

ALERT

### Description

This message occurs when Distributed Block Store (DBS) detects that an External Key Management (EKM) key server configuration contains a certificate that will expire in less than 7 days.

### Corrective Action

Renew each listed certificate and update the associated EKM key server configuration.

### Syslog Message

DBS has detected that an EKM key server certificate is nearing expiration. Cluster fault type %s, fault ID %u, status %u. %s

### Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the certificates that are nearing expiration.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## dbm.ekm.cert.error

## Severity

ERROR

## Description

This message occurs when Distributed Block Store (DBS) detects that an External Key Management (EKM) key server configuration contains a certificate that will expire in less than 30 days.

## Corrective Action

Renew each listed certificate and update the associated EKM key server configuration.

## Syslog Message

DBS has detected that an EKM key server certificate is nearing expiration. Cluster fault type %s, fault ID %u, status %u. %s

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the certificates that are nearing expiration.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

# dbt.encl events

## dbt.encl.at.rest

### Severity

NOTICE

### Description

This message occurs when Distributed Block Store (DBS) enables or disables encryption at rest on a self-encrypting drive. Encrypting drives automatically encrypt and decrypt the data as it is written or read from the drive media. Enabling encryption at rest protects the data from unauthorized access if the drive is power-cycled. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS encryption at rest event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays

zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## db.ensemble events

### db.ensemble

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) event related to the database ensemble occurs, such as the inability to reach the database in a node.

#### Corrective Action

(None).

#### Syslog Message

A DBS ensemble event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

#### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

### db.ensemble.alert

#### Severity

ALERT

#### Description

This message occurs when the Distributed Block Store (DBS) detects the database connection to less than half of the ensemble nodes (of 3 or 5 total) is not available. The database still has quorum and is operational.

#### Corrective Action

Verify power for all nodes and their network connectivity. Wait 10 minutes and check that the fault status has changed to Resolved. If the condition persists, contact NetApp technical support.

## Syslog Message

DBS has lost network connectivity or power an ensemble node. Cluster fault type %s, fault ID %u, status %u. %s

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the degraded ensemble.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.exception events

## db.exception

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) is unable to process a cluster fault.

### Corrective Action

Wait 60 minutes and check that the fault status has changed to Resolved. If the condition persists, contact NetApp technical support.

## Syslog Message

DBS has detected a software exception. Cluster fault type %s, fault ID %u, status %u. %s

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the exception.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.fault events

## db.fault.checker

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to the fault checker occurs, such as excessive time for the periodic fault checker to execute.

## Corrective Action

(None).

## Syslog Message

A DBS fault checker event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbfs.file events

## dbfs.file.system.capacity.low

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) detects the mounted container file system ("/", "/persist", "/var/log") has capacity below 5 percent.

### Corrective Action

Add additional filesystem capacity to the node or remove any unneeded files until the fault is cleared.

### Syslog Message

DBS has detected low filesystem free space on node %u/%s. Cluster fault type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Universal unique identifier (UUID) of the associated node. If there is no associated node, zeroes display.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## dbfs.file.system.read.only

### Severity

ALERT

### Description

This message occurs when Distributed Block Store (DBS) detects a mounted container file system ("/, "/persist", "/var/log") that should be writeable is marked as read-only.

### Corrective Action

Verify required node file systems ("/, "/persist", "/var/log") are writeable. If not, resolve this issue. Contact NetApp technical support if cause cannot be found.

### Syslog Message

DBS has detected a file system is read-only. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the file system set to read-only.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## dbfs.generic.events

### dbfs.generic.cluster.fault

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) cluster fault is reported as a generic fault. The DBS is responsible for managing the data that backs the FlexVols®. Multiple faults are mapped to this one event.

### Corrective Action

None.

### Syslog Message

A DBS generic cluster fault occurred, fault %s (%u), sev %u, service %u, node %u/%s, drives %s.

### Parameters

**cfCodeName** (STRING): Name of the original DBS cluster fault code.

**cfCode** (INT): DBS cluster fault code number.

**cfSeverity** (INT): Severity of the original DBS cluster fault. This is different than the EMS severity.

**serviceID** (INT): Service ID that identifies the associated cluster service. It will be "0" if there is no

associated service.

**nodeID** (INT): Node ID number of the associated node. It will be "0" if there is no associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.

**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## db.generic.event

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event is reported as a generic event. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events are mapped to this one event. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

DBS generic event %s occurred, type %s, service %u, node %u/%s. drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## db.ie events

### db.ie

#### Severity

NOTICE

## Description

This message occurs when a Distributed Block Store (DBS) internal interface exception condition occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

## Corrective Action

(None).

## Syslog Message

A DBS IE event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# db.s.ikm events

## db.s.ikm

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event relating to Internal Key Management (IKM) occurs, such as purging a key.

### Corrective Action

(None).

### Syslog Message

DBS IKM event %s occurred, type %s, service %u, node %u/%s. drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It will be 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier UUID of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated

drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It may be a string, in JSON format, or empty.

## dbinstall events

### dbinstall

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) install event occurs, such as inability to install the system software on a pending node.

#### Corrective Action

(None).

#### Syslog Message

A DBS install event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

#### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbslimit events

### dbslimit

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) limit event occurs, such as reaching the recommended or maximum number of volumes or virtual volumes. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

#### Corrective Action

(None).

## Syslog Message

A DBS limit event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbm.maintenance events

## dbm.maintenance.mode

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) maintenance mode event occurs, such as that a node no longer exists. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

## Syslog Message

A DBS maintenance mode event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbms.master events

## dbms.master.didnt.start.cm

### Severity

NOTICE

### Description

This message occurs when the node fails to execute cluster master startup. The system attempts to start the cluster master again automatically.

### Corrective Action

(None).

### Syslog Message

Cluster master startup on service ID %u on node ID %u (UUID: %s) failed. Reason: %s.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**reason** (STRING): Reason cluster master startup failed.

## dbms.master.started.cm

### Severity

NOTICE

### Description

This message occurs when the node completes cluster master startup successfully.

### Corrective Action

(None).

### Syslog Message

Cluster master startup on service ID %u on node ID %u (UUID: %s) completed successfully.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node universal unique identifier (UUID) of the associated node.

# dbms.mem events

## dbms.mem.threshold.alert

### Severity

ALERT

## Description

This message occurs when Distributed Block Store (DBS) detects a node's container has very low memory.

## Corrective Action

Purge unused volumes and allow up to an hour for garbage collection between the Block and Slice services to run. Alternatively, add more nodes.

## Syslog Message

DBS has detected free memory is low on a node. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the memory usage threshold.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## db.mem.threshold.error

### Severity

ERROR

### Description

This message occurs when Distributed Block Store (DBS) detects a node's container has low memory.

### Corrective Action

Purge unused volumes and allow up to an hour for garbage collection between the Block and Slice services to run. Alternatively, add more nodes.

### Syslog Message

DBS has detected free memory is low on a node. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the memory usage threshold.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# dbns.network events

## dbns.network.error.fault

### Severity

ERROR

### Description

This message occurs when a distributed block store detects network configuration or connectivity errors on nodes in the cluster. Multiple error conditions are mapped to this one event. The distributed block store is responsible for managing the data that backs the flexible volumes.

### Corrective Action

Check and rectify network configuration parameters for configuration faults. For network connectivity faults, check physical components such as network interface card (NIC) port, switch port and ethernet cable. Replace the faulty component.

### Syslog Message

The distributed block store detects a network configuration cluster fault on node %u/%s. The cluster fault type is %s and fault ID is %u.

### Parameters

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Universal unique identifier (UUID) of the associated node. If there is no associated node, zeroes display.

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## dbns.network.event

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event related to storage cluster networking occurs.

### Corrective Action

Contact NetApp technical support for events related to network errors to assess the severity and for any required corrective actions.

### Syslog Message

A DBS software networking event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is "0" if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is "0" if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## db.network.mtu.check

### Severity

ERROR

### Description

This message occurs when a distributed block store fails to send messages between the storage cluster nodes using configured maximum transmission unit (MTU size). The distributed block store is responsible for managing the data that backs the flexible volumes.

### Corrective Action

Check and rectify network MTU size on cluster nodes and switches connected to it. Contact NetApp technical support.

### Syslog Message

The distributed block store detects a network MTU check cluster fault on node %u/%s. The cluster fault type is %s and fault ID is %u.

## Parameters

**nodeID** (INT): Node ID number of the associated node. It is "0" if there is no associated node.

**nodeUuid** (STRING): Universal unique identifier (UUID) of the associated node. If there is no associated node, zeroes display.

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## db.node events

### db.node.maint.mode.alert

### Severity

ALERT

## Description

This message occurs when Distributed Block Store (DBS) detects a node with a maintenance mode failure.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

DBS has detected a node with a maintenance mode failure. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the node in maintenance mode.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## **dbs.node.maint.mode.error**

### Severity

ERROR

### Description

This message occurs when Distributed Block Store (DBS) detects a node is in maintenance mode.

### Corrective Action

Disable maintenance mode when maintenance is complete.

### Syslog Message

DBS has detected a node is in maintenance mode. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the node in maintenance mode.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## **dbs.node.offline**

### Severity

ALERT

## Description

This message occurs when Distributed Block Store (DBS) detects the Cluster Master cannot communicate with the master service on a node.

## Corrective Action

Check for network connectivity issues and hardware errors.

## Syslog Message

DBS has detected the Cluster Master cannot communicate with the master service on a node. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the node offline.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.platform\_hardware events

## db.platform\_hardware

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) platform hardware event occurs, such as a drive hardware fault. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS platform hardware event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbms.prestartup events

### dbms.prestartup

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) prestartup event occurs. Several events might be posted during startup.

#### Corrective Action

(None).

#### Syslog Message

A DBS prestartup event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

#### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbms.provisioned events

### dbms.provisioned.space.full

#### Severity

ERROR

#### Description

This message occurs when the distributed block store detects that the overall provisioned capacity of the cluster has exceeded the slice reserve space threshold. The slice reserve space is only used when slices get reassigned due to slice drive failure. Therefore, the slice files can no longer be migrated during drive failure until this fault is resolved. The distributed block store is responsible for managing the data that backs the flexible volumes.

## Corrective Action

Add more provisioned space, or delete and purge volumes to resolve this fault.

## Syslog Message

The distributed block store detected that the overall provisioned capacity of the cluster is full. The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

# db.raid events

## db.raid.group.degraded

### Severity

ERROR

### Description

This message occurs when distributed block store detects that a RAID group in the cluster is degraded. The RAID group can continue to serve data, but performance might be adversely affected.

### Corrective Action

Look for disk error EMS messages, or use REST, Kubernetes, or kubectl calls to check for disk errors. If the errors cannot be resolved, contact NetApp technical support.

### Syslog Message

Distributed block store has detected a degraded RAID group. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node universal unique identifier (UUID) string of the associated node.

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the degraded RAID group.

**cfExtSrc** (STRING): Distributed block store cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## db.raid.group.not.oper

### Severity

ALERT

## Description

This message occurs when distributed block store detects that a RAID group is not operational and is unable to serve data.

## Corrective Action

Look for disk error EMS messages, or use REST, Kubernetes, or kubectl calls to check for disk errors. If the errors cannot be resolved, contact NetApp technical support.

## Syslog Message

Distributed block store has detected a nonoperational RAID group. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node universal unique identifier (UUID) string of the associated node.

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the RAID group that is not operational.

**cfExtSrc** (STRING): Distributed block store cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

# db.remote events

## db.remote.cluster

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event such as a change in cluster pair connectivity status occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS remote cluster event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated

drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## **db.remote.rep.cluster.full**

### **Severity**

ALERT

### **Description**

This message occurs when the distributed block store detects that the volumes have paused remote replication because the target storage cluster is full. The distributed block store is responsible for managing the data that backs the flexible volumes.

### **Corrective Action**

Free target space.

### **Syslog Message**

The distributed block store detects that the volumes have paused remote replication because the target storage cluster is full. The cluster fault type is %s and fault id is %u.

### **Parameters**

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## **db.remrep events**

### **db.remrep.async.dly.exceed**

#### **Severity**

ERROR

#### **Description**

This message occurs when the Distributed Block Store (DBS) is executing remote replication for a pair of volumes, but that it has not reached active state for 6 hours. The DBS is responsible for managing the data that backs the FlexVols®.

#### **Corrective Action**

Check network connectivity between clusters. Inspect slice service logs to see if some issue is preventing replication from continuing.

#### **Syslog Message**

The Distributed Block Store is attempting to perform remote replication that has not reached active state for 6 hours. The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## dbfs.remrep.snap.cluster.full

### Severity

ALERT

### Description

This message occurs when the Distributed Block Store (DBS) detects that Remote Replication of Snapshots is paused for associated volumes because target cluster is full. The DBS is responsible for managing the data that backs the FlexVols®.

### Corrective Action

Free space on the target volume.

### Syslog Message

The Distributed Block Store detected that Remote Replication of Snapshots is paused for associated volumes because target cluster is full. The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## dbfs.remrep.snapshots.exceed

### Severity

ALERT

### Description

This message occurs when the Distributed Block Store (DBS) detects that Remote Replication of Snapshots is paused for associated volumes because target volume has exceeded its snapshot limit. The DBS is responsible for managing the data that backs the FlexVols®.

### Corrective Action

Delete snapshots on the target volume.

### Syslog Message

The Distributed Block Store detected that Remote Replication of Snapshots is paused for associated volumes because target volume has exceeded its snapshot limit. The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.schedul.events

## db.schedul.e.action.error

### Severity

ERROR

### Description

This message occurs when the Distributed Block Store (DBS) is running one or more of the scheduled activities but the activity failed, for example running a scheduled create snapshot fails to complete. The fault clears if the scheduled activity runs again and succeeds, if the scheduled activity is deleted, or if the activity is paused and resumed. The DBS is responsible for managing the data that backs the FlexVols®.

### Corrective Action

Check the scheduler entry for issues.

### Syslog Message

The Distributed Block Store is attempting one or more scheduled activities which fails to complete. The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.s.secondary.events

## db.s.secondary.cache.thresh

### Severity

ALERT

### Description

This message occurs when the Distributed Block Store (DBS) detects that Slice volume secondary write cache has reached the first fullness warning threshold. Secondary cache starts to fill when Slice service write requests to the Block service (and by extension the FireStorm service) are not receiving replies. Client write performance may be reduced if this condition persists. The DBS is responsible for managing the data that backs the FlexVols®.

## Corrective Action

Verify that all nodes are online. Verify that all Block and FireStorm services, and associated aggregates, are online. Attempt repairs needed to bring nodes and aggregates online. If the reason for this condition cannot be found, contact NetApp technical support.

## Syslog Message

Slice secondary cache fullness threshold reached for service ID %u on node %u.

## Parameters

**serviceID** (INT): Service ID that identifies the associated cluster service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**cfDriveIDs** (STRING): List of the drive IDs associated with the fault. The list might be empty.

**cfDriveUuids** (STRING): List of the drive UUIDs associated with the fault. The list might be empty.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db.service events

## db.service

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) service event occurs, such as inability to start the FireStorm service.

### Corrective Action

(None).

### Syslog Message

A DBS service event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## db.service.not.running

### Severity

ALERT

### Description

This message occurs when Distributed Block Store (DBS) detects a service is not running.

### Corrective Action

Verify that the service is started within 10 minutes.

### Syslog Message

DBS has detected a service is not running. Cluster fault service ID %u, node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**serviceID** (INT): Service ID that identifies the associated cluster service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## db.slice events

### db.slice.operation

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) event relating to a slice service operation such as removing a metadata drive, slice reassignment i.e. balancing volumes, moving primaries, snapshot success, failure, expiration, group snapshot success, failure occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS slice event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## **dbs.slice.service.unhealthy**

### **Severity**

ALERT

### **Description**

This message occurs when the Distributed Block Store (DBS) is trying to migrate data away from an unresponsive Slice Service. The DBS is responsible for managing the data that backs the FlexVols®.

### **Corrective Action**

Expect DBS to automatically resolve this failure. The cluster is automatically decommissioning data and re-replicating its data onto other healthy drives.

### **Syslog Message**

DBS is migrating data away from unresponsive Slice service %u, node %u.

### **Parameters**

**serviceID** (INT): Service ID that identifies the associated DBS service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

## **dbs.snapshot events**

### **dbs.snapshot.scheduler**

#### **Severity**

NOTICE

#### **Description**

This message occurs when a Distributed Block Store (DBS) event related to scheduling snapshots occurs. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

## Corrective Action

(None).

## Syslog Message

A DBS scheduler event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbnsnmp events

## dbnsnmp.trap

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) reports an SNMP trap. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

A DBS SNMP trap event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbsoftware events

## dbsoftware.version.mismatch

### Severity

ALERT

### Description

This message occurs when Distributed Block Store (DBS) detects a software version mismatch in the cluster.

### Corrective Action

Bring the node out of maintenance mode. Check for cluster faults and upgrade again if the faults are cleared.

### Syslog Message

DBS has detected a software upgrade that has failed. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

### Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the software version that did not upgrade properly.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# dbssl events

## dbssl.node.cert.expire

### Severity

NOTICE

### Description

This message occurs when Distributed Block Store (DBS) detects that a Secure Socket Layer (SSL) certificate on a node is nearing expiration. No action is needed. The system resolves this issue by automatically updating the certificate.

### Corrective Action

(None).

### Syslog Message

DBS has detected that an SSL certificate is nearing expiration. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node universal unique identifier (UUID) string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the certificates that are nearing expiration.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

## dbstat events

### dbstat

#### Severity

NOTICE

#### Description

This message occurs when a Distributed Block Store (DBS) statistics event occurs, such as inconsistent statistics. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

#### Corrective Action

(None).

#### Syslog Message

A DBS statistics event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbsw events

### dbsw.encr.at.rest

#### Severity

NOTICE

## Description

This message occurs when a Distributed Block Store (DBS) event relating to Software Encryption At Rest occurs, such as master key rekey completes or fails, rewrapping drive keys with new SEAR master key takes too long occur. Software Encryption At Rest when enabled, encrypts all data written, and decrypts all data read automatically in the software. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

## Corrective Action

(None).

## Syslog Message

A DBS SW Encryption at Rest event occurred, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# db.unexpected events

## db.unexpected.exception

### Severity

NOTICE

### Description

This message occurs when a Distributed Block Store (DBS) exception occurs unexpectedly, such as the inability to analyze existing error information. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

### Corrective Action

(None).

### Syslog Message

An unexpected DBS exception %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

### Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.  
**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.  
**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.  
**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.  
**evtID** (INT): DBS event ID number.  
**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

## dbns.unresponsive events

### dbns.unresponsive.service.alrt

#### Severity

ALERT

#### Description

This message occurs when Distributed Block Store (DBS) Master Service detects an unresponsive service.

#### Corrective Action

Wait 10 minutes and check that the fault status has changed to Resolved. If the condition persists, contact NetApp technical support.

#### Syslog Message

DBS has detected an unresponsive service. Cluster fault service ID %u, node %u, node UUID %s, type %s, fault ID %u, status %u. %s

#### Parameters

**serviceID** (INT): Service ID that identifies the associated cluster service.  
**nodeID** (INT): Node ID number of the associated node.  
**nodeUuid** (STRING): Node UUID string of the associated node.  
**cfType** (STRING): DBS cluster fault type of the associated object.  
**cfID** (INT): DBS cluster fault ID number associated with the fault.  
**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).  
**cfDetails** (STRING): Name of the affected service.  
**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

### dbns.unresponsive.service.err

#### Severity

ERROR

#### Description

This message occurs when Distributed Block Store (DBS) detects an unresponsive service.

#### Corrective Action

Verify that the service is restarted within 10 minutes.

## Syslog Message

DBS has detected an unresponsive service. Cluster fault service ID %u, node %u, node UUID %s, type %s, fault ID %u, status %u. %s

## Parameters

**serviceID** (INT): Service ID that identifies the associated cluster service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID string of the associated node.

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Name of the affected service.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db upgrade events

## db upgrade

### Severity

ERROR

### Description

This message occurs when Distributed Block Store (DBS) detects a software upgrade is in progress longer than 24 hours.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

DBS has detected a software upgrade is in progress. Cluster fault type %s, fault ID %u, status %u. %s

## Parameters

**cfType** (STRING): DBS cluster fault type of the associated object.

**cfID** (INT): DBS cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Details of the upgrade.

**cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

# db valence events

## db valence.test.bad

### Severity

NOTICE

## Description

This message occurs when a Distributed Block Store (DBS) valence test failure event occurs. Valence test are internal periodic tests. If the original DBS event specifies multiple drives, then an EMS event is generated for each drive.

## Corrective Action

(None).

## Syslog Message

A DBS valence test failure event %s of type %s occurred for Service ID %u on node %u/%s. Drive ID = %u/%s. Event ID = %u.

## Parameters

**evtMessage** (STRING): Description of the DBS event, including context details.

**evtType** (STRING): Type of the original DBS event.

**serviceID** (INT): Service ID that identifies the associated DBS service. It is 0 if there is no associated service.

**nodeID** (INT): Node ID number of the associated node. It is 0 if there is no associated node.

**nodeUuid** (STRING): Generated Universal Unique Identifier (UUID) of the associated node. It displays zeroes if there is no associated node.

**driveID** (INT): Drive ID number of the associated drive. It is 0 if there is no associated drive.

**driveUuid** (STRING): Generated UUID of the associated drive. It displays zeroes if there is no associated drive.

**evtID** (INT): DBS event ID number.

**evtDetails** (STRING): Specific details of the DBS event. It displays as a string, in JSON format, or is empty.

# dbb.volumes events

## dbb.volumes.degraded

### Severity

ALERT

### Description

This message occurs when the distributed block store detects that the listed volumes currently have only one copy of some of their data (they do not have a live secondary). This normally happens when a primary or live secondary slice service experiences remote procedure call (RPC) message timeouts to a peer slice service and changes it to a dead secondary. It can also happen briefly when a volume is created. The volume is current, syncing to a live secondary. The distributed block store is responsible for managing the data that backs the flexible volumes.

### Corrective Action

Check for network connectivity issues and hardware errors. There should be other faults if specific hardware components have failed. This fault clears when syncing completes and there is a live secondary slice service.

### Syslog Message

The distributed block store detects that the listed volumes currently have only one copy of some of their data (they do not have a live secondary). The cluster fault type is %s and fault id is %u.

## Parameters

**cfType** (STRING): Distributed block store cluster fault type of the associated object.

**cfID** (INT): Distributed block store cluster fault ID number associated with the fault.

**cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

**cfDetails** (STRING): Description of the cluster fault, including context details.

**cfExtSrc** (STRING): Distributed block store cluster fault external source label created by the "CreateClusterFault" API command and attached to the fault for testing purposes.

# dcx events

## dcx.framework events

### dcx.framework.disabled

**Severity**

NOTICE

**Description**

This message occurs when the DCS framework has been disabled on this node. This node will not allow any updates to any counters stored in the DCS framework on this node. However, the values for existing counters may be retrieved for display purposes.

**Corrective Action**

(None).

**Syslog Message**

The DCS framework is disabled on this node.

**Parameters**

(None).

### dcx.framework.enabled

**Severity**

INFORMATIONAL

**Description**

This message occurs when the DCS framework has been enabled on this node.

**Corrective Action**

(None).

**Syslog Message**

The DCS framework is enabled on this node.

**Parameters**

(None).

# dev events

## dev.driver events

### dev.driver.throttling

#### Severity

NOTICE

#### Description

This message occurs when an I/O driver is throttling I/O requests because the underlying controller is overloaded with I/O requests.

#### Corrective Action

(None).

#### Syslog Message

%s driver unit %d throttling I/O requests due to %s.

#### Parameters

**devname** (STRING): Name of the device.

**unit** (INT): Unit number of the controller.

**reason** (STRING): Reason for throttling.

**current\_throttle\_sendq** (INT): Current throttle value for send requests

**lowest\_throttle\_sendq** (INT): Lowest throttle value for send requests

## dev.path events

### dev.path.inquiry.failed

#### Severity

ERROR

#### Description

This message occurs when the system fails to discover the drive.

#### Corrective Action

Use the "disk show -fields vmdisk-target-address" command to get the list of drives that are visible to the system and to verify that the missing drive is connected properly.

#### Syslog Message

Failed to discover drive (device name:%s%d).

#### Parameters

**periph\_name** (STRING): Drive name.

**unit\_no** (INT): Drive unit number.

# device events

## device.install events

### device.install.successful

#### Severity

INFORMATIONAL

#### Description

This message occurs when Data ONTAP® successfully installs one or more devices after a prior installation failure.

#### Corrective Action

(None).

#### Syslog Message

Device type %s installation successful for one or more devices that reported installation failure previously.

#### Parameters

**devtype** (STRING): SCSI device type.

## device.latency events

### device.latency.threshold

#### Severity

NOTICE

#### Description

This message occurs when a device exceeds the latency threshold for the 30- second monitoring period. The event provides the name of the device, the target device (if applicable), the current threshold value, the average execution latency, and total latency for this period. The event also displays the number of I/O operations for the period, which is used to calculate latency.

#### Corrective Action

Contact your hypervisor provider if this issue persists. This usually indicates undersized storage in terms of allowed operations per second.

#### Syslog Message

The device latency in microseconds exceeded the threshold value for device "%s%d" and the associated target device "%s". The threshold is "%d", execution latency is "%d", total latency is "%d", and the number of operations for this period is "%d".

#### Parameters

**devname** (STRING): Name of the device. The device name can be "isl" (local to this node), "isp" (local to the partner node) or "ism" (the mediator with no associated target device), which represents the iSCSI name. Any other device name will be the name of the actual target device. If the device name is not "isl", or "isp", or the target device name, the name will always be "n/a".

**unit** (INT): Unit number of the device.

**target\_dev** (STRING): Name of the target device. The name will be the target (end point) device name if the device name is either "isl" or "isp". Otherwise it is the actual underlying device on this node.

**threshold** (INT): Monitoring threshold in microseconds.

**exec\_lat** (INT): Execution latency in microseconds for this period.

**total\_lat** (INT): Total latency in microseconds for this period.

**num\_operations** (INT): Number of I/O operations for this period.

## device.max events

### device.max.count.exceeded

#### Severity

ERROR

#### Description

This message occurs when Data ONTAP® cannot install one or more discovered devices since the device type count is at full capacity.

#### Corrective Action

If possible, remove an existing device of the same type so that device installation can proceed. If the failure persists, contact NetApp technical support.

#### Syslog Message

Unable to install one or more %s devices discovered on initiator port %s, target port WWNN: %s, WWPN: %s. The device limit (%d) has been reached.

#### Parameters

**devtype** (STRING): SCSI device type.

**adapter** (STRING): Name of the initiator port discovering the device(s).

**wwnn** (STRING): World Wide Node Name of the target port exporting the device(s).

**wwpn** (STRING): World Wide Port Name of the target port exporting the device(s).

**limit** (INT): Device maximum count.

# dfu events

## dfu.badbridgeshelfconfig events

### dfu.badBridgeShelfConfig

#### Severity

ERROR

#### Description

This message occurs when the disk firmware update aborts because it cannot contact the two peer FC-to-SAS bridges.

#### Corrective Action

Make sure that the storage controller is correctly cabled to the two peer FC-to-SAS bridges and that the bridges are correctly cabled to the SAS disk shelves. Then retry the 'disk\_fw\_update' command.

#### Syslog Message

Error contacting two peer FC-to-SAS bridges. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.clusterdisknotready events

### dfu.clusterDiskNotReady

#### Severity

ERROR

#### Description

This message occurs when the controller failover partner reports that a disk selected for download is in the NOT READY state.

#### Corrective Action

Only disks in the READY state can be downloaded to. If a disk is in the NOT READY state, it indicates that the disk has probably failed for some reason and should be returned for RMA.

#### Syslog Message

Controller failover partner reports disk as NOT READY. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.

**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.clustericdown events

### dfu.clustericDown

#### Severity

ERROR

#### Description

This message occurs when the high-availability (HA) interconnect is not available.

#### Corrective Action

The HA interconnect was not functional. Make sure that controller failover is enabled. Check that the HA interconnect cables are connected properly, and if applicable (based on the HA interconnect type), that the SFPs (Small Form-Factor Pluggables) are seated properly on both controllers.

#### Syslog Message

HA interconnect not available (cf disabled?). Unable to download firmware to disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.clustericerror events

### dfu.clustericError

#### Severity

ERROR

#### Description

This message occurs when communication with the controller failover partner cannot be established.

#### Corrective Action

Typically, these errors are related to cable or transmission errors from the HA interconnect. Check that the HA interconnect cables are connected properly, and if applicable (based on the HA interconnect type), that the SFPs (Small Form-Factor Pluggables) are seated properly on both controllers.

#### Syslog Message

HA interconnect error %d encountered. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

#### Parameters

**clusterError** (INT): High-availability (HA) interconnect error number.  
**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.

**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.clusterpartner events

### dfu.clusterPartner

#### Severity

ERROR

#### Description

This message occurs when automatic firmware download is performed as part of system boot and partner disks are downrev.

#### Corrective Action

Firmware download is not allowed to update partner disks automatically. Manual invocation of the "storage disk firmware update" command is required. See the "storage disk firmware update" man page for details.

#### Syslog Message

Operator must issue disk\_fw\_update command to download firmware to partner Disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.clustertakeover events

### dfu.clusterTakeover

#### Severity

ERROR

#### Description

This message occurs when firmware download is attempted while in takeover mode.

#### Corrective Action

Firmware download is not allowed while in takeover mode. Exit takeover mode and attempt the "storage disk firmware update" command again. See the "storage disk firmware update" man page for details.

#### Syslog Message

Unable to download firmware while in takeover mode to Disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product id of the disk.

**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.disksizechanged events

### dfu.diskSizeChanged

#### Severity

NOTICE

#### Description

This message occurs when a size change is detected after a firmware update. This can be either an increase or decrease in physical size of the disk.

#### Corrective Action

The disk might not be usable any longer by the RAID subsystem because of the size change that occurred. If RAID cannot access the disk any longer, it will be failed and should be returned for RMA. If the disk is still accessible, leaving it in the system is perfectly fine.

#### Syslog Message

Disk %s [%s %s %s] S/N [%s] size changed (%x:%x %llx:%llx %llx:%llx %llx:%llx %llx:%llx)

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.  
**oldSectorSize** (INTHEX): Old sector size of the disk.  
**newSectorSize** (INTHEX): New sector size of the disk.  
**oldLastSector** (LONGINTEX): Old right-size of the disk.  
**newLastSector** (LONGINTEX): New right-size of the disk.  
**oldDiskBlocks** (LONGINTEX): Old right-sized blocks on the disk.  
**newDiskBlocks** (LONGINTEX): New right-sized blocks on the disk.  
**oldRealLastSector** (LONGINTEX): Old raw size of the disk.  
**newRealLastSector** (LONGINTEX): New raw size of the disk.  
**oldRealDiskBlocks** (LONGINTEX): Old raw blocks on the disk.  
**newRealDiskBlocks** (LONGINTEX): New raw blocks on the disk.

## dfu.firmwaredownloading events

### dfu.firmwareDownloading

#### Severity

INFORMATIONAL

#### Description

This message occurs when firmware is being downloaded for a specific product ID of disks on the system.

### Corrective Action

(None).

### Syslog Message

Now downloading firmware file %s on %d disk(s) of plex [%s]...

### Parameters

**file** (STRING): Firmware file which is being downloaded.

**diskcount** (INT): Number of disks being downloaded to.

**plex** (STRING): Plex name being downloaded to.

## dfu.firmwaredownrev events

### dfu.firmwareDownrev

#### Severity

ERROR

#### Description

This message occurs when the system finds disks with a downrev version of firmware, as defined by the installed version of Data ONTAP®.

#### Corrective Action

Use the "storage disk firmware update" command to update the downrev firmware on the disks. Check your support provider for more information about obtaining the latest disk firmware. If the problem persists, contact NetApp technical support.

#### Syslog Message

Downrev firmware on %d disks.

#### Parameters

**downrev** (INT): Number of disks with downrev firmware.

## dfu.firmwareuptodate events

### dfu.firmwareUpToDate

#### Severity

NOTICE

#### Description

This message occurs when all eligible disks are determined to be updated to the latest version of firmware available on the system.

#### Corrective Action

(None).

#### Syslog Message

Firmware is up-to-date on all eligible disks.

## Parameters

(None).

# dfu.fwdownloadfailedmultfiles events

## dfu.fwDownloadFailedMultFiles

### Severity

ERROR

### Description

This message occurs when more than one file is found for downloading to an ATA drive. Because there is no version string control, only one file at a time is allowed on the system.

### Corrective Action

Two or more firmware files were found for download. Delete all except the one that should be downloaded to the drive. Background firmware update should download on the next check cycle.

### Syslog Message

Download failed due to multiple firmware files found for Disk type [%s %s].

### Parameters

**vendorName** (STRING): Vendor name of the disk.

**productId** (STRING): Product ID of the disk.

# dfu.fwdownloadfailedstatus events

## dfu.fwDownloadFailedStatus

### Severity

ERROR

### Description

This message occurs when a firmware download failure occurs.

### Corrective Action

Decode sense codes based on drive supplier to determine the reason for the failure. Most situations can be recovered by attempting to download firmware again using the "disk\_fw\_update" command. See the disk\_fw\_update man page for complete details.

### Syslog Message

Status: (0x%x/0x%x/0x%x) (SCSI sense 0x%x/0x%x/0x%x/0x%x)

### Parameters

**OpStatus** (INTEX): Status of the passthru I/O.

**HostStatus** (INTEX): Host Status of the passthru I/O.

**TargetStatus** (INTEX): Target Status of the passthru I/O.

**sense\_key** (INTEX): SCSI Sense key.

**sense\_code** (INTEX): SCSI Sense Code.

**sense\_code\_qualifier** (INTEX): SCSI Sense Code Qualifier.

**fru** (INTHEX): SCSI Sense Code FRU identifier.

## dfu.fwdownloadfailedwbuf events

### dfu.fwDownloadFailedWbuf

#### Severity

ERROR

#### Description

This message occurs when retries are exhausted on the write buffer command that is used to download firmware to a disk.

#### Corrective Action

Disk firmware might still need to be updated. See the `disk_fw_update` man page for complete details on performing this.

#### Syslog Message

Write buffer command failed to Disk %s [%s %s %s] S/N [%s].

#### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.init events

### dfu.init.noMemory

#### Severity

ERROR

#### Description

This message occurs when the disk firmware update initialization routine cannot allocate memory.

#### Corrective Action

Memory allocation relies on the availability of memory resources in the system. If possible, reduce the workload so that fewer resources are needed. If the failure persists after reducing the workload, contact NetApp technical support.

#### Syslog Message

Could not allocate memory for disk firmware update. Requested size=%d bytes.

#### Parameters

**size** (INT): Size (in bytes) of the memory allocation request.

# dfu.mallocfailed events

## dfu.mallocFailed

### Severity

ALERT

### Description

This message occurs when Data ONTAP® cannot allocate memory to read the disk firmware file and aborts the disk firmware update.

### Corrective Action

Inability to allocate memory for this action indicates a failure within Data ONTAP. Take a core for reference, and then open a support case to address the underlying issue. The reboot process when you take the core resolves the immediate problem.

### Syslog Message

Cannot allocate memory to read disk firmware file %s; disk firmware update aborted.

### Parameters

**filename** (STRING): Name of the disk firmware file.

# dfu.nomemory events

## dfu.noMemory

### Severity

ERROR

### Description

This message occurs when the disk firmware update routine cannot allocate memory to update the disk firmware.

### Corrective Action

Memory allocation relies on the availability of memory resources in the system. If possible, reduce the workload so that fewer resources are needed. Rebooting the system can recover memory resources that might have been lost. If the failure persists after reducing the workload and rebooting, contact NetApp technical support for assistance in determining whether additional system memory is indicated.

### Syslog Message

Could not allocate memory for disk firmware update. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

### Parameters

**diskName** (STRING): Name of the disk.

**vendorName** (STRING): Name of the vendor of the disk.

**productId** (STRING): Product ID of the disk.

**fwVersion** (STRING): Firmware version of the disk.

**serialno** (STRING): Serial number of the disk.

# dfu.readtestfailed events

## dfu.readTestFailed

### Severity

ERROR

### Description

This message occurs when a read of the disk fails after downloading firmware to a disk.

### Corrective Action

Disk was unable to be read from after a firmware update occurred. I/O will be retried. If the retries are not successful, you should fail the disk and return it for RMA.

### Syslog Message

Media Access test failed on Disk %s [%s %s %s] S/N [%s].

### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

## dfu.readTestFailed.fatal

### Severity

ERROR

### Description

This message occurs when a read of the disk fails after downloading firmware to a disk and all retries have been exhausted.

### Corrective Action

Disk was unable to be read from after a firmware update occurred. I/O will be retried. If the retries are not successful, you should fail the disk and return it for RMA.

### Syslog Message

Unable to access media after firmware update on Disk %s [%s %s %s] S/N [%s].

### Parameters

**diskName** (STRING): Name of the disk.  
**vendorName** (STRING): Vendor name of the disk.  
**productId** (STRING): Product ID of the disk.  
**fwVersion** (STRING): Firmware version of the disk.  
**serialno** (STRING): Serial number of the disk.

# dfu.readtestfailedstatus events

## dfu.readTestFailedStatus

### Severity

ERROR

### Description

This message occurs when a read test failure occurs after a firmware download.

### Corrective Action

Decode sense codes based on drive supplier to determine the reason for the failure. Most situations can be recovered by the system automatically retrying the I/O operation.

### Syslog Message

Status: (0x%x/0x%x/0x%x) (SCSI sense 0x%x/0x%x/0x%x/0x%x)

### Parameters

**OpStatus** (INTEHEX): Status of the read I/O.

**HostStatus** (INTEHEX): Host Status of the read I/O.

**TargetStatus** (INTEHEX): Target Status of the read I/O.

**sense\_key** (INTEHEX): SCSI Sense key.

**sense\_code** (INTEHEX): SCSI Sense Code.

**sense\_code\_qualifier** (INTEHEX): SCSI Sense Code Qualifier.

**fru** (INTEHEX): SCSI Sense Code FRU identifier.

## dfu.refreshinquiryfailed events

### dfu.refreshInquiryFailed

### Severity

ERROR

### Description

This message occurs after a successful disk firmware update, when the 'SCSI inquiry' command, which is issued to all disks as part of the disk firmware download process, fails to finish. It is also possible to get messages indicating that disks have downrev firmware.

### Corrective Action

When this error happens, check the connection to the partner node and manually retry the firmware download process. If the problem still persists, open a support case to investigate the underlying cause.

### Syslog Message

(None).

### Parameters

**retryCount** (INT): Number of times the command was retried and failed.

## dfu.suspended\_disasterrecovery events

## **dfu.suspended\_DisasterRecovery**

### **Severity**

ERROR

### **Description**

This message occurs in a MetroCluster™ environment when firmware download to remote disks is suspended during disaster recovery. This event is signaled at most once during disaster recovery, the first time firmware download to a remote disk is suspended.

### **Corrective Action**

Firmware download to remote disks is suspended during MetroCluster disaster recovery. Wait until switchback has completed, and either allow the firmware to be downloaded automatically, or run the "storage disk firmware update" command. See the "storage disk firmware update" man page for details.

### **Syslog Message**

Suspend firmware download to remote disks while in MetroCluster Disaster Recovery state %s

### **Parameters**

**dr\_state** (STRING): Current MetroCluster disaster recovery state.

# diff events

## diff.svcs events

### diff.svcs.setting.topartner

#### Severity

ERROR

#### Description

This message occurs when the system cannot automatically apply the Differentiated Services (diff-svcs) setting to the High Availability (HA) partner. In the event there is a setting mismatch between HA pairs the node with the incorrect setting may produce an incorrect At-Risk-System (ARS) report.

#### Corrective Action

Manually apply the diff-svcs setting to the HA partner to ensure the setting is consistent across both nodes in the HA pair. In the event of a failure, issue the following command on the HA partner: "system node modify -node nodename -diff-svcs true|false" .

#### Syslog Message

Differentiated services setting was not automatically applied to the HA partner of node %s: %s.

#### Parameters

**node** (STRING): Name of the node where the setting was successfully applied. A failure occurred while trying to apply the same setting to its HA partner.

**error** (STRING): Error reported when attempting to apply the setting to the HA partner.

# dipmon events

## dipmon.dataip events

### dipmon.dataip.responsive

#### Severity

NOTICE

#### Description

This message occurs when a data IP address becomes responsive on the node on which it is hosted and has been committed to the Zookeeper database.

#### Corrective Action

(None).

#### Syslog Message

Data IP address %s (ID: %u) hosted on node %s (ID: %u, Uuid: %s) is responsive and has been committed to the database.

#### Parameters

**dataip** (STRING): IP address of the data IP.

**dataipID** (INT): Unique identifier of the data IP.

**nodeName** (STRING): Name of the node that is hosting the data IP.

**nodeID** (INT): Unique identifier of the node that is hosting the data IP.

**nodeUuid** (STRING): Universal unique identifier of the node that is hosting the data IP.

### dipmon.dataip.unresponsive

#### Severity

NOTICE

#### Description

This message occurs when a data IP address becomes unresponsive on the node on which it is hosted and has been committed to the Zookeeper database.

#### Corrective Action

(None).

#### Syslog Message

Data IP address %s (ID: %u) hosted on node %s (ID: %u, Uuid: %s) is unresponsive and has been committed to the database.

#### Parameters

**dataip** (STRING): IP address of the data IP.

**dataipID** (INT): Unique identifier of the data IP.

**nodeName** (STRING): Name of the node that is hosting the data IP.

**nodeID** (INT): Unique identifier of the node that is hosting the data IP.

**nodeUuid** (STRING): Universal unique identifier of the node that is hosting the data IP.

# director events

## director.aggr events

### director.aggr.reassigned

#### Severity

NOTICE

#### Description

This message occurs when an aggregate is being reassigned from one node to another node. The output contains the Firefly ID and node ID of both nodes as well as whether or not the operation was done forcefully. The value of isForceful is "true" if an aggregate is moved in response to a error condition on the cluster rather than a user requested operation.

#### Corrective Action

(None).

#### Syslog Message

Aggregate (ID: %u) is being reassigned (forcefully:%u) from node %s (ID: %u, Uuid: %s Firefly ID: %u) to node %s (ID: %u, Uuid: %s Firefly ID: %u).

#### Parameters

**aggrID** (INT): Unique identifier of the aggregate being reassigned.

**isForceful** (INT): Boolean value to denote whether or not the reassignment was done forcefully.

**fromNode** (STRING): Name of the node that the aggregate is being reassigned from.

**fromNodeID** (INT): Unique identifier of the node that the aggregate is being reassigned from.

**fromNodeUuid** (STRING): Universal unique identifier of the node that the aggregate is being reassigned from.

**fromFireflyID** (INT): Unique identifier of the Firefly Service that the aggregate is reassigned to.

**toNode** (STRING): Name of the node that the aggregate is being reassigned to.

**toNodeID** (INT): Unique identifier of the node that the aggregate is being reassigned to.

**toNodeUuid** (STRING): Universal unique identifier of the node that the aggregate is being reassigned to.

**toFireflyID** (INT): Unique identifier of the Firefly Service that the aggregate is reassigned to.

## director.dataip events

### director.dataip.reassigned

#### Severity

NOTICE

#### Description

This message occurs when a data IP address is being reassigned from one node to another node. The output contains the node ID of both nodes as well as whether or not the operation was done forcefully. The value of isForceful is "true" if the data IP is moved in response to a error condition on the cluster rather than a user requested operation.

## Corrective Action

(None).

## Syslog Message

Data IP address %s (ID: %u) is being reassigned (forcefully:%u) from node %s (ID: %u, Uuid: %s) to node %s (ID: %u, Uuid: %s).

## Parameters

**dataip** (STRING): IP address of the data IP.

**dataipID** (INT): Unique identifier of the data IP.

**isForceful** (INT): Boolean value to denote whether or not the reassignment was done forcefully.

**fromNode** (STRING): Name of the node from which the data IP is being reassigned.

**fromNodeID** (INT): Unique identifier of the node from which the data IP is being reassigned.

**fromNodeUuid** (STRING): Universal unique identifier of the node from which the data IP is being reassigned.

**toNode** (STRING): Name of the node to which the data IP is being reassigned.

**toNodeID** (INT): Unique identifier of the node to which the data IP is being reassigned.

**toNodeUuid** (STRING): Universal unique identifier of the node to which the data IP is being reassigned.

# discover events

## discover.6500 events

### discover.6500.supported

**Severity**

NOTICE

**Description**

This message occurs when discovery of a 6500N FC-to-SAS bridge is enabled.

**Corrective Action**

(None).

**Syslog Message**

FC-to-SAS bridge ATTO 6500N discovery is enabled.

**Parameters**

(None).

### discover.6500.unsupported

**Severity**

NOTICE

**Description**

This message occurs when discovery of a 6500N FC-to-SAS bridge is disabled.

**Corrective Action**

(None).

**Syslog Message**

FC-to-SAS bridge ATTO 6500N discovery is disabled.

**Parameters**

(None).

# discoveryd events

## discoveryd.search events

### discoveryd.search.request

**Severity**

NOTICE

**Description**

This message occurs when the discoveryd service is contacted during the initial cluster setup phase with an M-SEARCH multicast and a follow up HTTP GET to get the device description document.

**Corrective Action**

(None).

**Syslog Message**

The discoveryd service was contacted by a device (IP address: %s) to discover information about this node.

**Parameters**

**client\_ip** (STRING): IP address of the client machine requesting the discoveryd information.

# disk events

## disk.adaptererror events

### disk.adapterError

**Severity**

ALERT

**Description**

This message occurs when an adapter error is detected.

**Corrective Action**

(None).

**Syslog Message**

Disk %s: unexpected adapter error 0x%x

**Parameters**

**diskName** (STRING): Name of the device.

**error** (INHEX): Adapter status.

## disk.bdfu events

### disk.bdfu.suspended

**Severity**

ERROR

**Description**

This message occurs when the background drive firmware update process fails to unlock SAS NetApp® Storage Encryption (NSE) drives in FIPS-compliance mode. The FIPS-certified SAS NSE drives must be unlocked with a valid authentication key before firmware can be downloaded to them. If the number of failed unlock attempts reaches a certain threshold, the drives will be locked out, leading to permanent loss of data in certain conditions. The system will automatically suspend the background drive firmware update for 12 hours, after which it is reenabled.

**Corrective Action**

Contact NetApp technical support for assistance with restoring valid authentication keys on the drive.

**Syslog Message**

Background drive firmware update is suspended because FIPS NSE drives cannot be unlocked. Reason: %s.

**Parameters**

**suspend\_reason** (STRING): Reason for the drive unlock failure.

# disk.capacity events

## disk.capacity.changed

### Severity

NOTICE

### Description

This message occurs when a media size change is reported for the underlying storage device. The new size and previous size are measured in 4096-byte blocks.

### Corrective Action

(None).

### Syslog Message

A storage device reported a size change for device "%s". New size: %llu, previous size: %llu (4096-byte blocks).

### Parameters

**diskName** (STRING): Name of the disk.

**new\_size** (LONGINT): The new size measured in 4096-byte blocks.

**previous\_size** (LONGINT): The previous size measured in 4096-byte blocks.

# disk.checksum events

## disk.checksum.offlineAdapter

### Severity

ALERT

### Description

This message occurs when multiple errors are detected during checksum verification. The adapter is taken offline.

### Corrective Action

Replace the adapter. Contact Contact NetApp technical support. for assistance with a Return Material Authorization.

### Syslog Message

Adapter %s taken offline due to checksum verification failure on multiple disks. Keep the adapter offline and contact Contact NetApp technical support. for assistance.

### Parameters

**adapterName** (STRING): Name of the adapter.

## disk.checksum.verifyFailed

### Severity

ALERT

## Description

This message occurs when disk checksum verify fails.

## Corrective Action

(None).

## Syslog Message

Disk level checksum verification failed on WRITE VERIFY: Disk %s, Block #%llu: Volume %s, FileId %d, Block #%llu

## Parameters

**diskName** (STRING): Name of the device.

**bno** (LONGINT): block id

**vol** (STRING): Volume name.

**fileid** (INT): File ID.

**block** (LONGINT): File block ID.

# disk.cksum events

## disk.cksum.bno.verifyFailed

### Severity

ALERT

### Description

This message occurs when the system detects a block number mismatch during disk checksum verification. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location.

### Corrective Action

(None).

### Syslog Message

Block number mismatch on WRITE VERIFY: Disk %s, expected\_dbn = %u, stored\_dbn = %u, expected\_vbn = %llu, stored\_vbn = %llu, Volume %s, FileId %d, Block #%llu.

### Parameters

**diskName** (STRING): Name of the device.

**expected\_dbn** (INT): Expected physical disk block number.

**stored\_dbn** (INT): Physical disk block number stored in the checksum entry.

**expected\_vbn** (LONGINT): Expected volume block number.

**stored\_vbn** (LONGINT): Volume block number stored in the checksum entry.

**vol** (STRING): Volume name.

**fileid** (INT): File ID.

**block** (LONGINT): File block ID.

# disk.ddr events

## **disk.ldr.dqp.out.of.date**

### **Severity**

NOTICE

### **Description**

This message occurs when the Dynamic Drive Recognition (DDR) Scanner detects a disk that is not part of its qualification table.

### **Corrective Action**

Check your support provider's web site or knowledgebase for more information about downloading and installing an updated Disk Qualification Package (DQP) file.

### **Syslog Message**

The DDR Scanner has detected that the latest DQP is not present on this system.

### **Parameters**

(None).

## **disk.ldr.invalid.azcs.capacity**

### **Severity**

ERROR

### **Description**

This event is generated when the DDR Scanner detects a capacity value that does not match with the alias string associated with it.

### **Corrective Action**

(None).

### **Syslog Message**

The DDR Scanner has detected an invalid AZCS alias capacity on disk %s

### **Parameters**

**diskname** (STRING): Name of the disk.

**capacity\_value** (LONGINT): The value of the invalid capacity

## **disk.ldr.invalid.bcs.capacity**

### **Severity**

ERROR

### **Description**

This event is generated when the DDR Scanner detects a capacity value that does not match with the alias string associated with it.

### **Corrective Action**

(None).

## Syslog Message

The DDR Scanner has detected an invalid BCS alias capacity on disk %s

## Parameters

**diskname** (STRING): Name of the disk.

**capacity\_value** (LONGINT): The value of the invalid capacity

## disk.ddr.scanner.ddr.failure

### Severity

NOTICE

### Description

This event is issued when a the ddr scanner has failed to read the new DDR label it just placed on the disk.

### Corrective Action

(None).

## Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] [%s]: DDR label verify Failure - DDR Error

## Parameters

**disk\_name** (STRING): The name of the disk

**shelf** (STRING): Shelf identifier where the disk is located

**bay** (STRING): Disk bay within the shelf where disk is located

**vendor** (STRING): Name of the vendor of the disk

**model** (STRING): Model string of the disk drive

**firmware\_revision** (STRING): Firmware revision of the disk

**serialno** (STRING): Serial number of the disk

**ddr\_error** (STRING): DDR Error string which has been parsed

## disk.ddr.scanner.label.done

### Severity

NOTICE

### Description

This event is issued when a the ddr scanner has completed has completed scanning a disk successfully

### Corrective Action

(None).

## Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label write complete

## Parameters

**disk\_name** (STRING): The name of the disk

**shelf** (STRING): Shelf identifier where the disk is located

**bay** (STRING): Disk bay within the shelf where disk is located

**vendor** (STRING): Name of the vendor of the disk

**model** (STRING): Model string of the disk drive

**firmware\_revision** (STRING): Firmware revision of the disk  
**serialno** (STRING): Serial number of the disk

## disk.ddr.scanner.verify.failure

### Severity

NOTICE

### Description

This event is issued when a the ddr scanner has failed to read the new DDR label it just placed on the disk.

### Corrective Action

(None).

### Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label verify Failure

### Parameters

**disk\_name** (STRING): The name of the disk  
**shelf** (STRING): Shelf identifier where the disk is located  
**bay** (STRING): Disk bay within the shelf where disk is located  
**vendor** (STRING): Name of the vendor of the disk  
**model** (STRING): Model string of the disk drive  
**firmware\_revision** (STRING): Firmware revision of the disk  
**serialno** (STRING): Serial number of the disk

## disk.ddr.scanner.write.failure

### Severity

NOTICE

### Description

This event is issued when a the ddr scanner has failed to write a new DDR label to the disk

### Corrective Action

(None).

### Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label write Failure

### Parameters

**disk\_name** (STRING): The name of the disk  
**shelf** (STRING): Shelf identifier where the disk is located  
**bay** (STRING): Disk bay within the shelf where disk is located  
**vendor** (STRING): Name of the vendor of the disk  
**model** (STRING): Model string of the disk drive  
**firmware\_revision** (STRING): Firmware revision of the disk  
**serialno** (STRING): Serial number of the disk

## disk.ldr.unable.add.disk

### Severity

ALERT

### Description

This event is generated when the DDR Scanner is unable to re-add a disk to the filer after trying for 2 minutes. This means there are no more spare disk\_Cbs in the filer.

### Corrective Action

(None).

### Syslog Message

The filer has not freed a disk\_Cb for over 2 minutes for %s.

### Parameters

**diskuid** (STRING): The unique identifier of the disk

## disk.diagnostic events

### disk.diagnostic.logs.saved

### Severity

NOTICE

### Description

This message occurs when ONTAP retrieves the diagnostic logs from the disk. The logs are saved at `/etc/logs/drive_failure_logs/`.

### Corrective Action

(None).

### Syslog Message

Diagnostic logs retrieved for disk "%s".

### Parameters

**diskName** (STRING): Name of the disk.

## disk.duplicate events

### disk.duplicate.name

### Severity

ERROR

### Description

This message occurs when duplicate disk names are detected. This can be caused by corruption of the disk's shelf id or bay number or failure to determine the stack id. There is no known impact to functional systems, but failure to correct this error may result in operations taken on the wrong disk and ambiguity where the disks are referenced.

## Corrective Action

If any disk reports a shelf id or bay number not corresponding to its physical location, choose one of the following options: 1. Perform a takeover and giveback of the affected systems. 2. Remove the disk for at least 20 seconds, and then reinsert it. Note: If the disk is part of an aggregate, this option will result in a degraded RAID group and disk reconstruction will be initiated. Otherwise: 1. Verify cabling. 2. Contact NetApp technical support.

## Syslog Message

Multiple disks detected with the same name %s. Disks: %s (%s).

## Parameters

**disk\_name** (STRING): Name of the disks.

**disk\_uid\_list** (STRING): UIDs of disks with the same name.

**disk\_serialno\_list** (STRING): Serial numbers of disks with the same name.

# disk.dynamicqual events

## disk.dynamicqual.fail.parse

### Severity

ERROR

### Description

This message occurs when dynamic device qualification fails due to an invalid `/etc/qual_devices` file. The system is unable to properly recognize disk drives or fully enable all resiliency and performance features.

### Corrective Action

For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "[disk.dynamicqual.fail.parse]" keyword. Request an updated `qual_devices` file from NetApp.

### Syslog Message

Device qualification information file (`/etc/qual_devices`) is invalid. The following error, "%s" has been detected. For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "[disk.dynamicqual.fail.parse]" keyword.

### Parameters

**errorstring** (STRING): Error string for parsing error in `/etc/qual_devices` file.

## disk.dynamicqual.failure.cleared

### Severity

NOTICE

### Description

This message occurs when a previous dynamic device qualification error has been corrected.

### Corrective Action

(None).

## Syslog Message

Device qualification failure condition has been corrected. All devices have been qualified.

## Parameters

(None).

## disk.dynamicqual.failure.invalidFile

### Severity

ALERT

### Description

This message occurs when dynamic device qualification fails due to an invalid /etc/qual\_devices file.

### Corrective Action

See the qual\_devices man page for information about updating device qualification data. Request an updated qual\_devices file from NetApp.

## Syslog Message

Device qualification information file (/etc/qual\_devices) is invalid. See the qual\_devices man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

## Parameters

**time** (INT): Time until forced shutdown.  
**disklist** (STRING): List of disks that are still not qualified.

## disk.dynamicqual.failure.missingFile

### Severity

ALERT

### Description

This message occurs when dynamic device qualification fails with a missing qualification file.

### Corrective Action

See the qual\_devices man page for information about updating device qualification data. Request a qual\_devices file from NetApp.

## Syslog Message

Device Qualification information file (/etc/qual\_devices) is missing. See the qual\_devices man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

## Parameters

**time** (INT): Time until forced shutdown.  
**disklist** (STRING): List of disks that are still not qualified.

## disk.dynamicqual.failure.occurred

**Severity**

ALERT

**Description**

This message occurs when dynamic device qualification fails with an unknown error.

**Corrective Action**

See the `qual_devices` man page for information about updating device qualification data.

**Syslog Message**

Device qualification failure occurred. See the `qual_devices` man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

**Parameters**

**time** (INT): Time until forced shutdown.

**disklist** (STRING): List of disks that are still not qualified.

## **disk.dynamicqual.failure.shutdown**

**Severity**

EMERGENCY

**Description**

This message occurs when one or more disks are not recognized by Data ONTAP®. This can result in a forced system shutdown if the offending disks are not removed or recognized properly within the allowed window of time.

**Corrective Action**

Download the latest Drive Qualification Package (DQP) from NetApp technical support, and then install it on your system.

**Syslog Message**

Device qualification failure has not been corrected for the past %d hour(s). The following disk(s) remain unqualified: %s. System is SHUTTING DOWN.

**Parameters**

**time** (INT): Time until forced shutdown.

**disklist** (STRING): List of disks that are still not qualified.

## **disk.encrypt events**

### **disk.encrypt.destroy.complete**

**Severity**

INFORMATIONAL

**Description**

This message occurs when the disk encrypt destroy operation is completed.

## Corrective Action

(None).

## Syslog Message

Disk %s [S/N %s] has completed encrypt destroy.

## Parameters

**diskName** (STRING): Name of the device.

**serialno** (STRING): Serial number of the device.

## disk.encrypt.revert.complete

### Severity

NOTICE

### Description

This message occurs when the disk encrypt revert operation is completed.

### Corrective Action

(None).

## Syslog Message

Disk %s [S/N %s] has completed encrypt revert.

## Parameters

**diskName** (STRING): Name of the device.

**serialno** (STRING): Serial number of the device.

## disk.encryptaccesserr events

### disk.encryptAccessErr

### Severity

ERROR

### Description

This message occurs when a disk reports a data protection error, and ONTAP® cannot restore permission to access the data through storage encryption methods.

### Corrective Action

If the disk is known to be an encrypting disk, then ONTAP might not have the correct storage encryption passphrase for this device. If possible, import the proper passphrase. If the passphrase cannot be recovered, or if the disk is not an encrypting disk, then all data on the disk is permanently inaccessible. You can return an encrypting disk to service as a spare through the use of the 'disk encrypt sanitize' command. If the device cannot be recovered, then it must be removed from the system.

## Syslog Message

Unable to restore data access on encrypting disk %s; status %s (0x%x).

## Parameters

**diskName** (STRING): Name of the disk.  
**status\_string** (STRING): Status code description.  
**status** (INT): Status code from the SCSI driver.

# disk.encryptaccessfwerr events

## disk.encryptAccessFWErr

### Severity

ERROR

### Description

This message occurs when a disk reports a SCSI data protection error on an attempt to download firmware and ONTAP® cannot restore permission to access the firmware through storage encryption methods.

### Corrective Action

If the disk is known to be an encrypting disk, then ONTAP might not have the correct storage encryption passphrase for this device. If possible, import the proper passphrase. If the passphrase cannot be recovered, or if the disk is not an encrypting disk, then the firmware cannot be downloaded. If the device cannot be recovered, then it must be removed from the system.

### Syslog Message

Unable to restore firmware download access on encrypting disk %s; status %s (0x%x).

## Parameters

**diskName** (STRING): Name of the disk.  
**status\_string** (STRING): Status code description from the SCSI driver.  
**status** (INT): Status code from the SCSI driver.

# disk.encryptcmdfailed events

## disk.encryptCmdFailed

### Severity

ERROR

### Description

This message occurs when the indicated "storage encryption disk" command fails on an encrypting disk that supports storage encryption methods.

### Corrective Action

Verify that storage encryption key servers, if required, are available and functioning, or that expected on-board keys are present.

### Syslog Message

Encrypting disk %s failed disk encrypt %s command with error status %s (0x%x).

## Parameters

**disk** (STRING): Name of the disk.  
**command** (STRING): Storage encryption disk command.  
**error\_string** (STRING): Error status code description.  
**error** (INT): Error status code.

# disk.encryptfipspassphnosync events

## disk.encryptFIPSPassphNoSync

### Severity

NOTICE

### Description

This message occurs when a system with NetApp® Storage Encryption (NSE) enabled detects that the authentication keys (AKs, or passphrases) for the internal FIPS-compliance authorities in a FIPS-certified drive are inconsistent. This can occur when a previous attempt to modify the FIPS-compliance passphrases failed.

### Corrective Action

Use the "security key-manager" commands to display the available AKs from external KMIP key-management servers or onboard key management (OKM). Use the "storage encryption disk modify -fips -key-id" command to assign the desired AK to the FIPS-compliance authorities in the drive. If the condition persists, either replace the drive, or use the "storage encryption disk revert-to-original-state" command to reset the drive to its original condition. Warning: This command also removes all user data from the drive.

### Syslog Message

The FIPS-compliance authorities for NSE drive %s have inconsistent authentication keys (AKs).

### Parameters

**diskName** (STRING): Name of the drive.

# disk.encryptgetmsidfailed events

## disk.encryptGetMSIDFailed

### Severity

NOTICE

### Description

This message occurs when an encrypting disk reports a SCSI data protection error, but Data ONTAP® cannot obtain the Manufacturer's Secure ID (MSID) that is mandatory on disks that support storage encryption methods. Some conditions can cause this error temporarily.

### Corrective Action

If the error persists, replace the disk or remove it from the system.

### Syslog Message

Unable to obtain MSID from disk %s; status "%s" (0x%x).

## Parameters

**diskName** (STRING): Name of the disk.

**status\_string** (STRING): Status code description from the SCSI driver.

**status** (INT): Status code from the SCSI driver.

# disk.encryptnosupport events

## disk.encryptNoSupport

### Severity

ALERT

### Description

This message occurs when ONTAP® software detects one or more FIPS-certified self-encrypting drives, but the environment variable 'bootarg.storageencryption.support' is not present or is set to "false" to indicate that FIPS-certified drives are not supported.

### Corrective Action

Remove all FIPS-certified drives.

### Syslog Message

Detected FIPS-certified encrypting drive %s, but FIPS drives are not supported on this node. %d of %d disks checked are FIPS-certified.

## Parameters

**disk** (STRING): Name of a FIPS-certified drive.

**FIPS\_disks** (INT): Number of FIPS-certified drives detected.

**disk\_count** (INT): Total number of drives checked. For a high-availability pair, this might be fewer than the total number of drives.

# disk.encryptprotdiff events

## disk.encryptProtDiff

### Severity

NOTICE

### Description

This message occurs when self-encrypting drives have different settings of data-at-rest protections; that is, some are protected, having a nondefault Data Key ID, and some are not, having one of the default Data Key IDs. Best protection is provided when all encrypting drives are protected, including spares that might be assigned automatically to an aggregate.

### Corrective Action

Use the "storage encryption disk show -protection-mode !data" command to display the drives that are not protected; use the "storage encryption disk show -protection-mode data" command to show the drives that are protected. Use the "storage encryption disk modify -data-key-id" command to set the Data Key ID to a nondefault value.

## Syslog Message

Self-encrypting drives on the system have dissimilar data protection settings.

## Parameters

(None).

# disk.encryptsupportreqd events

## disk.encryptSupportReqd

### Severity

ALERT

### Description

This message occurs when ONTAP® software detects one or more nonencrypting drives or non-FIPS-certified self-encrypting drives (SEDs), but the environment variable 'bootarg.storageencryption.support' is set to "true" to indicate that all drives must be FIPS-certified.

### Corrective Action

Remove all non-FIPS-certified SEDs and standard drives.

## Syslog Message

Detected nonencrypting drive or non-FIPS-certified drive %s, but only FIPS-certified drives are supported on this node. %d of %d drives checked are FIPS-certified.

## Parameters

**disk** (STRING): Name of a drive that is not FIPS-certified.

**encrypting\_disks** (INT): Number of FIPS-certified drives detected.

**disk\_count** (INT): Total number of drives checked. For a high-availability pair, this might be fewer than the total number of drives.

# disk.eos events

## disk.EOS.OS.error

### Severity

ALERT

### Description

This message occurs when a disk is detected that is not supported in this version of Data ONTAP® or later

### Corrective Action

Remove the disk and replace it with a disk that is supported.

## Syslog Message

%s support ended in version of %s. Current version is %s.

## Parameters

**disk\_information** (STRING): Disk information.

**EOS\_OS\_version** (STRING): Latest version of Data ONTAP supported by the disk.

**cur\_OS\_version** (STRING): Current version of Data ONTAP.

## disk.exceed events

### disk.exceed.cmd.completeTime

#### Severity

INFORMATIONAL

#### Description

This event is generated during disk qualification testing when READ/WRITE I/O requests exceed their expected maximum completion time.

#### Corrective Action

(None).

#### Syslog Message

Disk %s has exceeded %d ms limit — required %llu ms to complete command %s.

#### Parameters

**diskName** (STRING): Name of the disk.

**timeLimit** (INT): Time limit to complete command.

**timeTaken** (LONGINT): Time taken to complete command.

**commandSTR** (STRING): Disk qualification command in string.

## disk.fail events

### disk.fail.ssdstats

#### Severity

INFORMATIONAL

#### Description

This message occurs when a disk is marked failed, is being sanitized, or has entered Maintenance Center.

#### Corrective Action

(None).

#### Syslog Message

Disk %s (%s) failed with rated life used %, percent spare blocks %, spare blocks %s.

#### Parameters

**diskName** (STRING): Name of the disk.

**serialno** (STRING): Serial number.

**ratedLife** (STRING): Rated life used.

**percentSpare** (STRING): Percent spare blocks consumed.

**spareBlks** (STRING): Spare blocks consumed limit.

# disk.failmsg events

## disk.failmsg

### Deprecated

Deprecated as of ONTAP 9.5 - replaced by disk.outOfService.

### Severity

NOTICE

### Description

This message occurs when a drive is marked failed, is being sanitized, or has entered Maintenance Center.

### Corrective Action

(None).

### Syslog Message

Disk %s (%s)%s. %d %s

### Parameters

**diskName** (STRING): Name of the drive.

**serialno** (STRING): Serial number.

**reason** (STRING): Reason for the failure.

**powerOnTime** (INTEX): Time, in minutes, that the drive was powered on when the failure occurred.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

# disk.fakereassignsuccess events

## disk.fakereassignSuccess

### Severity

NOTICE

### Description

This message occurs when a fake reassign is detected on a disk and the sector verify succeeds.

### Corrective Action

(None).

### Syslog Message

disk %s: A fake reassign was issued on sector %llu for disk %s. Disable with boot arg disable-disk-fake-reassign? true.

### Parameters

**diskName** (STRING): Name of the disk.

**sector** (LONGINT): Sector where the error was detected.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

# disk.fli events

## disk.fli.abort.ioSent

### Severity

NOTICE

### Description

This message occurs when an I/O operation below the SCSI layer is aborted because a Foreign LUN Import (FLI) abort message was issued.

### Corrective Action

(None).

### Syslog Message

An I/O with the opcode %s has been aborted on disk %s.

### Parameters

**opcode** (STRING): Opcode that specifies the operation that was aborted.

**diskName** (STRING): Name of the disk.

## disk.fli.abort.ioUnSent

### Severity

NOTICE

### Description

This message occurs when an I/O operation in the disk class layer is aborted because a Foreign LUN Import (FLI) abort message was issued.

### Corrective Action

(None).

### Syslog Message

An I/O with the block count %llu starting at offset %llu has been aborted on disk %s.

### Parameters

**blockCount** (LONGINT): Number of blocks that this I/O operation spans.

**offset** (LONGINT): Start of the I/O operation.

**diskName** (STRING): Name of the disk.

## disk.fli.tmf.complete

### Severity

NOTICE

### Description

This message occurs when a Foreign LUN Import (FLI) message (abort or LUN reset) is completed.

### Corrective Action

(None).

### Syslog Message

Foreign LUN Import (FLI) message: %s completed on disk %s with status %d.

### Parameters

**msgType** (STRING): Specifies which type of FLI message: either abort or LUN reset.

**diskName** (STRING): Name of the disk to which this FLI message was sent.

**returnStatus** (INT): Completion status of the FLI message.

## disk.fw events

### disk.fw.autodownrev

#### Severity

INFORMATIONAL

#### Description

This message occurs when the system detects disks with firmware that is not up-to-date. The background firmware update program will update the firmware automatically if the correct firmware files are in place.

#### Corrective Action

Download the correct firmware file onto the system. Check your support provider's web site or knowledgebase for more information about obtaining the latest disk firmware.

#### Syslog Message

%d disks have downrev firmware. They will be updated automatically using background disk firmware update if the correct firmware files are in place.

#### Parameters

**driveCount** (INT): Number of disks that need to have updated firmware.

### disk.fw.downrevWarning

#### Severity

ERROR

#### Description

This message occurs when the system detects disks with firmware that is not up-to-date.

#### Corrective Action

Download and install the latest disk firmware file. Check your support provider's web site or knowledgebase for more information about obtaining the latest disk firmware.

#### Syslog Message

%d disks have downrev firmware that you need to update.

#### Parameters

**driveCount** (INT): Number of disks that need to have updated firmware.

# disk.healthtrigger events

## disk.healthTrigger

### Severity

NOTICE

### Description

This message occurs when the disk returns a health trigger event.

### Corrective Action

No action is required because this message is informational only. If the disk is having problems processing I/O, an error will be returned.

### Syslog Message

Disk %s received NHT health trigger (0x%x 0x%x 0x%x 0x%x)

### Parameters

**diskName** (STRING): Name of the device.  
**sense\_key** (INTHEX): SCSI sense key.  
**sense\_code** (INTHEX): SCSI sense code.  
**qualifier** (INTHEX): SCSI sense code qualifier.  
**fru\_failed** (INTHEX): SCSI FRU code.

# disk.init events

## disk.init.badSectorSize

### Severity

ERROR

### Description

This message occurs when a disk reports a sector size that does not match the drive qualification table.

### Corrective Action

Replace the disk.

### Syslog Message

Disk %s has an unexpected sector size (%d bytes) and cannot be used.

### Parameters

**diskName** (STRING): Name of the disk.  
**sector\_size** (INT): Invalid sector size.

## disk.init.err.capacityFlash

### Severity

ERROR

## Description

This message occurs when a capacity-optimized flash solid-state drive (SSD) is detected by a node that does not support this type of SSD.

## Corrective Action

Remove the disk from the system.

## Syslog Message

Disk %s cannot be used on a node that does not support capacity-optimized flash.

## Parameters

**diskName** (STRING): Name of the disk.

## disk.init.err.flashOptimized

### Severity

ERROR

### Description

This message occurs when a hard disk drive (HDD) is detected by a node configured with the All-Flash Optimized personality. With this personality, only solid-state drives (SSD) can be used.

### Corrective Action

Remove the disk from the system.

### Syslog Message

Disk %s cannot be used on a node configured as All-Flash Optimized.

### Parameters

**diskName** (STRING): Name of the disk.

## disk.init.err.unsupp.shelf

### Severity

ERROR

### Description

This message occurs when an unsupported NVMe solid-state drive (SSD) is discovered in an external NVMe shelf. This NVMe SSD is only supported as an internal drive on the A800 system.

### Corrective Action

Remove the drive from the external NVMe shelf.

### Syslog Message

Drive %s cannot be used in an external NVMe shelf.

### Parameters

**disk\_name** (STRING): Name of the SSD.

**disk\_information** (STRING): Formatted information about the SSD. This includes the drive's vendor, model, firmware revision, and serial number.

## **disk.init.err.unsupported**

### **Severity**

ERROR

### **Description**

This message occurs when an unsupported disk is detected on a node.

### **Corrective Action**

Remove the disk from the system.

### **Syslog Message**

Disk %s is not recognized as a supported disk and cannot be used on this node.

### **Parameters**

**diskName** (STRING): Name of the disk.

## **disk.init.err.zns**

### **Severity**

ERROR

### **Description**

This message occurs when a zoned namespace solid-state drive (SSD-ZNS) is detected by a node that does not support this type of SSD.

### **Corrective Action**

Remove the disk from the system.

### **Syslog Message**

Disk "%s" cannot be used on a node that does not support SSD-ZNS disks.

### **Parameters**

**diskName** (STRING): Name of the disk.

## **disk.init.error.capacity**

### **Severity**

ERROR

### **Description**

This message occurs when a disk reports an unexpected capacity.

### **Corrective Action**

Replace the disk.

### **Syslog Message**

Disk %s has an unexpected capacity (%llu sectors) and cannot be used. Replace it.

### **Parameters**

**diskName** (STRING): Name of the disk.

**lastSector** (LONGINT): Last sector of the disk.  
**productID** (STRING): Product name of the disk.

## **disk.init.error.serialno**

### **Severity**

ERROR

### **Description**

This message occurs when the inquiry command does not return a valid serial number or device ID for the device. The device is failed during initialization.

### **Corrective Action**

Replace the disk.

### **Syslog Message**

Serial number or device ID not available for %s.

### **Parameters**

**disk\_name** (STRING): Disk name.  
**page\_code** (INT): Page code that was sent.  
**error\_pcode** (INT): Page code received in error.

## **disk.init.failure.error**

### **Severity**

ERROR

### **Description**

This message occurs when a drive fails initialization. For NVMe drives, the returned error information is translated into the SCSI equivalent.

### **Corrective Action**

Replace the drive.

### **Syslog Message**

Drive %s failed initialization due to error %d, sense code(%x %x %x %x).

### **Parameters**

**diskName** (STRING): Name of the drive.  
**errorCode** (INT): Internal E\_SCSI return code.  
**sense\_key** (INTHEX): Sense key.  
**sense\_code** (INTHEX): Additional sense code.  
**qualifier** (INTHEX): Additional sense code qualifier.  
**fru\_failed** (INTHEX): FRU code.

## **disk.init.failure.spinup**

### **Severity**

ERROR

**Description**

This message occurs when a disk cannot spin up during initialization. The disk is marked as failed and is not used.

**Corrective Action**

Removed the disk from the system.

**Syslog Message**

Disk %s has failed to spin up and cannot be used. Replace it with a new drive.

**Parameters**

**diskName** (STRING): Name of the disk.

**disk.init.failureBytes****Severity**

ERROR

**Description**

This message occurs when the system discovers a previously failed disk. The system will not use the disk and it should be replaced.

**Corrective Action**

Replace the failed disk.

**Syslog Message**

Failed disk %s detected during disk initialization.

**Parameters**

**diskName** (STRING): Name of the disk.

**disk.init.invalidDDR****Severity**

INFORMATIONAL

**Description**

This message occurs when a disk contains a Dynamic Drive Recognition (DDR) label entry that is not for this disk. The system rewrites the DDR label with proper values.

**Corrective Action**

(None).

**Syslog Message**

Disk %s has an invalid DDR entry. DDR label will be corrected and rewritten automatically.

**Parameters**

**diskName** (STRING): Name of the disk.

**vendorID** (STRING): Vendor name of the disk.

**productID** (STRING): Product name of the disk.

## disk.init.protype.incompat

### Severity

ERROR

### Description

This message occurs when a hard disk drive (HDD) has a protection type enabled that is not supported. Protection type is a disk option that determines how information is physically saved on the disk.

### Corrective Action

Remove the disk from the system.

### Syslog Message

Disk %s has protection type %x enabled and cannot be used. %s

### Parameters

**diskName** (STRING): Name of the disk.

**protType** (INHEX): Value indicating the version of the enabled protection type.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.init.recognizedDDR

### Severity

INFORMATIONAL

### Description

This message occurs when a Dynamic Drive Recognition (DDR) label on a drive with dynamically qualified data is properly updated with aliased data.

### Corrective Action

(None).

### Syslog Message

Disk %s has been updated with the proper drive name alias. The DDR label will be rewritten automatically.

### Parameters

**diskName** (STRING): Name of the disk.

**vendorID** (STRING): Vendor name of the disk.

**productID** (STRING): Product name of the disk.

## disk.init.unknownDisk

### Severity

ERROR

### Description

This message occurs when a unique identifier cannot be created for a disk due to internal disk problems.

### Corrective Action

The disk needs to be replaced, remove it from the system.

## Syslog Message

Unable to identify disk %s.

## Parameters

**diskName** (STRING): Name of the disk.

# disk.iomediumerror events

## disk.ioMediumError

### Severity

NOTICE

### Description

This message occurs when the drive reports a medium error.

### Corrective Action

(None).

## Syslog Message

Medium error on disk %s: op %s sector %llu %s - %s %s (%x %x %x %x) (%d) %s

## Parameters

**diskName** (STRING): Name of the disk.

**op** (STRING): I/O operation being performed.

**sector** (LONGINT): Sector where the error was detected.

**senseInfo** (STRING): Sense data.

**sCode** (STRING): Sector code.

**disk\_info** (STRING): Static description of events on the disk.

**sense\_key** (INTHEX): Actual sense key.

**sense\_code** (INTHEX): Actual sense code.

**qualifier** (INTHEX): Actual sense code qualifier.

**fru\_failed** (INTHEX): Actual FRU code.

**CTime** (INT): Time, in milliseconds, from when the command was first issued until this I/O operation completed.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

# disk.ioReassignfailed events

## disk.ioReassignFailed

### Severity

ALERT

### Description

This message occurs when a disk reports a medium error and the sector reassignment fails. The system will fail the disk after possible recovery of retrievable disk data.

### Corrective Action

Replace the disk when the system indicates that you should remove it in subsequent logged events.

### Syslog Message

disk %s: sector %llu failed to be reassigned (%d). %s

### Parameters

**diskName** (STRING): Name of the disk.

**sector** (LONGINT): Sector where the error was detected.

**ETime** (INT): Time, in milliseconds, from when the command was first issued until this I/O operation failed.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.ioReassignsuccess events

### disk.ioReassignSuccess

#### Severity

NOTICE

#### Description

This message occurs when a medium error is detected on a disk and the sector reassignment succeeds.

#### Corrective Action

(None).

#### Syslog Message

disk %s: sector %llu was reassigned (%d). %s

#### Parameters

**diskName** (STRING): Name of the disk.

**sector** (LONGINT): Sector where the error was detected.

**CTime** (INT): Time, in milliseconds, from when the command was first issued until this I/O operation completed.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.ioRecoverederror events

### disk.ioRecoveredError.pfa

#### Severity

ERROR

#### Description

This message occurs when a disk determines that it will fail shortly. This occurs when a threshold internal to the disk indicates that a failure is imminent.

## Corrective Action

To avoid an uncontrolled failure, replace the disk as soon as possible. If the disk is a member of a RAID volume, the disk will be failed by RAID when this error occurs on a RAID I/O and the RAID group is not in degraded mode.

## Syslog Message

Recovered error predictive failure alert on disk %s: op %s sector %llu %s - %s (%x %x %x %x)

## Parameters

**diskName** (STRING): Name of the disk.

**op** (STRING): I/O operation being performed.

**sector** (LONGINT): Sector where the error was detected.

**senseInfo** (STRING): Sense data.

**disk\_info** (STRING): Static description of events on the disk.

**sense\_key** (INTHEX): Actual sense key.

**sense\_code** (INTHEX): Actual sense code.

**qualifier** (INTHEX): Actual sense code qualifier.

**fru\_failed** (INTHEX): Actual FRU code.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.ioRecoveredError.reassign

### Severity

NOTICE

### Description

This message occurs when a disk automatically reassigns a sector on a disk.

### Corrective Action

(None).

### Syslog Message

Recovered error on disk %s: op %s sector %llu %s - %s (%x %x %x %x) %s

### Parameters

**diskName** (STRING): Name of the disk.

**op** (STRING): I/O operation being performed.

**sector** (LONGINT): Sector where the error was detected.

**senseInfo** (STRING): Sense data.

**disk\_info** (STRING): Static description of events on the disk.

**sense\_key** (INTHEX): Actual sense key.

**sense\_code** (INTHEX): Actual sense code.

**qualifier** (INTHEX): Actual sense code qualifier.

**fru\_failed** (INTHEX): Actual FRU code.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.ioRecoveredError.retry

**Severity**

INFORMATIONAL

**Description**

This message occurs when a recovered error is detected on a disk.

**Corrective Action**

(None).

**Syslog Message**

Recovered error on disk %s: op %s sector %llu %s - %s (%x %x %x %x) (%d) %s

**Parameters**

**diskName** (STRING): Name of the disk.

**op** (STRING): I/O operation being performed.

**sector** (LONGINT): Sector where the error was detected.

**senseInfo** (STRING): Sense data.

**disk\_info** (STRING): Static description of events on the disk.

**sense\_key** (INTHEX): Actual sense key.

**sense\_code** (INTHEX): Actual sense code.

**qualifier** (INTHEX): Actual sense code qualifier.

**fru\_failed** (INTHEX): Actual FRU code.

**ETime** (INT): Time, in milliseconds, from when the command was first issued until this I/O operation failed.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

## disk.lipstormdetect events

### disk.lipStormDetect

**Severity**

NOTICE

**Description**

This message occurs when a Fibre Channel disk detects a large number of Loop Initialization Procedure requests (a LIP storm) and has reset itself.

**Corrective Action**

None required. If this happens a second time, the disk will be failed.

**Syslog Message**

shm: disk %s reports a LIP storm reset. %s. Error %x/%x/%x/%x.

**Parameters**

**diskName** (STRING): Name of the disk (host adapter, loop ID).

**disk\_info** (STRING): Static description of events on the disk.

**sense\_key** (INT): Actual sense key.

**sense\_code** (INT): Actual sense code.

**qualifier** (INT): Actual sense code qualifier.

**fru\_failed** (INT): Actual FRU code.

# disk.lostwritedetected events

## disk.lostwriteDetected

### Severity

ERROR

### Description

This message occurs when the system detects a lost write.

### Corrective Action

(None).

### Syslog Message

Disk level lost write detected on WRITE VERIFY: Disk %s, Block #%%llu: Volume %s, Fileid %d, Block #%%llu: Expected 0x%x, Recomputed as 0x%x.

### Parameters

**diskName** (STRING): Name of the device.

**bno** (LONGINT): Block ID.

**vol** (STRING): Volume name.

**fileid** (INT): File ID.

**block** (LONGINT): File block ID.

**cksum** (INTHEX): Expected checksum.

**cksum2** (INTHEX): Computed checksum.

# disk.lun events

## disk.lun.allMemoryAvailable

### Severity

NOTICE

### Description

This message occurs to confirm that enough memory is present to successfully allocate command blocks for all of the disks in the system and for additional LUNS.

### Corrective Action

(None).

### Syslog Message

disk\_init :Allocated all memory required for array LUNs.

### Parameters

(None).

## disk.lun.outOfMemory

### Severity

NOTICE

## Description

This message occurs when the system cannot allocate the additional memory for LUNs.

## Corrective Action

(None).

## Syslog Message

disk\_init: Unable to allocate memory for array LUN commands on %s.

## Parameters

**diskName** (STRING): Name of the device that could not allocate memory.

## disk.lun.sizeTooLarge

### Severity

ALERT

## Description

This message occurs when an array LUN on an external RAID storage subsystem or a virtual disk is too large to be used as storage by the controller.

## Corrective Action

Reduce this array LUN size, or re-create the virtual disk within the parameter limit.

## Syslog Message

Array LUN or virtual disk %s is too large (%s bytes) and cannot be used. The maximum permissible array LUN or virtual disk size is %s. Reduce this array LUN size by %lld bytes, or re-create the virtual disk within the parameter limit (%lld %d byte blocks).

## Parameters

**diskName** (STRING): Name of the array LUN or virtual disk that is too large.

**lunSize** (STRING): Size, expressed in bytes, of the array LUN or virtual disk that is too large.

**maxSize** (STRING): Maximum permissible array LUN or virtual disk size, expressed in bytes.

**byteDiff** (LONGINT): Difference, expressed in bytes, between the array LUN or virtual disk size and the maximum size Data ONTAP® supports.

**blockDiff** (LONGINT): Difference, expressed in blocks, between the array LUN or virtual disk size and the maximum size Data ONTAP supports.

**blockSize** (INT): Block size of the array LUN or virtual disk.

## disk.lun.sizeTooSmall

### Severity

ALERT

## Description

This message occurs when an array LUN on an external RAID storage subsystem or a virtual disk is too small to be used as storage by the controller.

## Corrective Action

Delete the array LUN or virtual disk and re-create it within the parameter limit.

## Syslog Message

LUN or virtual disk %s is too small (%s bytes) and cannot be used. The minimum permissible LUN or virtual disk size is %s. Increase this LUN or virtual disk size by %lld bytes (%lld %d byte blocks).

## Parameters

**diskName** (STRING): Name of the LUN or virtual disk that is too small.

**lunSize** (STRING): Size, in bytes, of the LUN or virtual disk that is too small.

**minSize** (STRING): Minimum permissible LUN or virtual disk size, expressed in bytes.

**byteDiff** (LONGINT): Difference, in bytes, between the LUN or virtual disk size and the minimum size Data ONTAP® supports.

**blockDiff** (LONGINT): Difference, in blocks, between the LUN or virtual disk size and the minimum size Data ONTAP supports.

**blockSize** (INT): Block size of the LUN or virtual disk.

## disk.lun.unsupportedBlkSize

### Severity

ALERT

### Description

This message occurs when an array logical unit (LUN) on the external RAID storage subsystem reports an unsupported block size.

### Corrective Action

Reformat the array LUN with a supported block size.

## Syslog Message

disk\_init: Array LUN %s reports a block size of %u bytes and it cannot be used. Reformat the array LUN with a supported block size.

## Parameters

**diskName** (STRING): Name of the array LUN with the unsupported block size.

**sector\_size** (INT): Unsupported block size.

## disk.maint events

### disk.maint.test.end

### Severity

NOTICE

### Description

This message occurs when maintenance testing has completed.

### Corrective Action

(None).

## Syslog Message

Disk %s Model [%s] S/N [%s] has completed maintenance testing with status %d (0x%x,0x%x,0x%x,0x%x).

## Parameters

**disk\_name** (STRING): Name of the disk.

**productID** (STRING): Product name of the disk.

**serialno** (STRING): Serial number of the disk.

**status** (INT): Maintenance test completion status where 0 represents successful completion of the test.

**fa0** (INTHEX): Failure byte 0.

**fa1** (INTHEX): Failure byte 1.

**fa2** (INTHEX): Failure byte 2.

**fa3** (INTHEX): Failure byte 3.

## disk.maint.test.start

### Severity

NOTICE

### Description

This message occurs when maintenance testing begins on a disk.

### Corrective Action

(None).

### Syslog Message

Disk %s Model [%s] S/N [%s] has started maintenance testing.

## Parameters

**disk\_name** (STRING): Name of the disk.

**productID** (STRING): Product name of the disk.

**serialno** (STRING): Serial number of the disk.

## disk.max events

## disk.max.partitions

### Severity

ERROR

### Description

This message occurs when ONTAP® software cannot partition a disk because the system already has the maximum number of partitioned disks.

### Corrective Action

Contact Contact NetApp technical support. for assistance.

### Syslog Message

Disk %s cannot be partitioned as the system already has %d partitioned disks.

## Parameters

**diskName** (STRING): Name of the disk.

**maxPartitionLimit** (INT): Maximum number of disks which can be partitioned.

# disk.min events

## disk.min.OS.error

### Severity

ERROR

### Description

This message occurs when a disk is detected that is not supported in this version of Data ONTAP®.

### Corrective Action

Remove the disk and replace it with a disk that is supported, or upgrade the kernel to the required version.

### Syslog Message

%s is not supported because it requires a minimum kernel version of %s. Current version is %s.

### Parameters

**disk\_information** (STRING): Disk information.

**min\_OS\_version** (STRING): Disk's minimum supported Data ONTAP version.

**cur\_OS\_version** (STRING): Current version of the Data ONTAP.

# disk.outofservice events

## disk.outOfService

### Severity

NOTICE

### Description

This message occurs when a drive is removed from service because it has been marked failed, is being sanitized, or has entered Maintenance Center.

### Corrective Action

(None).

### Syslog Message

Drive %s (%s)%s. Power-On Hours: %s, GList Count: %d, Drive Info: %s.

### Parameters

**diskName** (STRING): Name of the drive.

**serialno** (STRING): Serial number of the drive.

**reason** (STRING): Reason for removal from service.

**powerOnHours** (STRING): Time, in hours, that the drive was powered on when the failure occurred.

**glistEntries** (INT): Number of grown defect list entries.

**disk\_information** (STRING): Formatted information about the drive. This includes the drive's vendor, model, firmware revision, and serial number.

# disk.partdisknotsuppmcc events

## disk.partDiskNotSuppMCC

### Severity

NOTICE

### Description

This message occurs when a partitioned disk is found in a MetroCluster™ configuration.

### Corrective Action

Remove the partitioned disk, because it is not supported in a MetroCluster configuration.

### Syslog Message

Ignoring disk %s because partitioned disks are not supported in a MetroCluster™ configuration.

### Parameters

**diskName** (STRING): Name of the disk.

## disk.partition events

### disk.partition.exceeded

### Severity

ERROR

### Description

This message occurs when the disk partition layout contains more partitions than are supported by the system.

### Corrective Action

Fix the unsupported disk partition layout by using the 'disk unpartition' command to make the disk a spare disk.

### Syslog Message

Disk %s has %d partitions, which exceeds the maximum of %d partitions.

### Parameters

**disk\_name** (STRING): Name of the disk.

**partition\_count** (INT): Number of partitions on the disk.

**max\_partition\_count** (INT): Maximum number of partitions supported per disk.

## disk.partner events

### disk.partner.encrRevertDone

### Severity

NOTICE

### Description

This message occurs when a node receives notice that a partner node has completed a disk encrypt revert operation.

**Corrective Action**

(None).

**Syslog Message**

The partner has completed reverting drive %s to its original state.

**Parameters**

**diskName** (STRING): Name of the device.

**disk.partner.encrRevertStart****Severity**

NOTICE

**Description**

This message occurs when a node receives notice that a partner node has started a disk encrypt revert operation.

**Corrective Action**

(None).

**Syslog Message**

The partner has started reverting drive %s to its original state.

**Parameters**

**diskName** (STRING): Name of the device.

**disk.partner.sanitizeStart****Severity**

INFORMATIONAL

**Description**

This message occurs when a message is received from the partner for a disk sanitize start.

**Corrective Action**

(None).

**Syslog Message**

The partner has started a disk sanitize on %s.

**Parameters**

**diskName** (STRING): Name of the disk.

**disk.readreservationfailed events****disk.readReservationFailed****Severity**

ERROR

## Description

This message occurs when a SCSI (Small Computer System Interface) read reservation fails.

## Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, open a support case to investigate the underlying cause.

## Syslog Message

Disk read reservation failed on %s CDB %s - %s (%x %x %x)

## Parameters

**diskName** (STRING): Name of the device.

**cdb** (STRING): CDB (Command Descriptor Block) containnig the I/O operation being performed.

**sSenseKey** (STRING): Sense key value.

**iSenseKey** (INTHEX): Actual sense key.

**iASC** (INTHEX): SCSI Additional Sense Code.

**iASCQ** (INTHEX): SCSI Additional Sense Code Qualifier.

**sm** (STRING): SCSI Persistent Reservation state machine.

**state** (INT): SCSI Persistent Reservation state machine step.

**out\_status\_flags** (INTHEX): Status flag contains bits describing which of the following status values are valid.

**ha\_status** (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.

**target\_status** (INTHEX): Value returned by the target describing completion status of I/O request.

**target\_rsp\_code** (INTHEX): Target response code.

# disk.releasefailed events

## disk.releaseFailed

### Severity

ERROR

### Description

This message occurs when a SCSI release reservation fails.

### Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, open a support case to investigate the underlying cause.

### Syslog Message

Disk release failed on %s CDB %s - %s (%x %x %x)

### Parameters

**diskName** (STRING): Name of the device.

**cdb** (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.

**sSenseKey** (STRING): Sense key value.

**iSenseKey** (INTHEX): Actual sense key.

**iASC** (INTHEX): SCSI Additional Sense Code.

**iASCQ** (INTHEX): SCSI Additional Sense Code Qualifier.

**sm** (STRING): SCSI Persistent Reservation state machine.

**state** (INT): SCSI Persistent Reservation state machine step.

**out\_status\_flags** (INTEX): Status flag contains bits describing which of the following status values are valid.

**ha\_status** (INTEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.

**target\_status** (INTEX): Value returned by the target describing completion status of I/O request.

**target\_rsp\_code** (INTEX): Target response code.

## disk.reservedelay events

### disk.reserveDelay

#### Severity

NOTICE

#### Description

This message occurs when a SCSI reservation command has a longer latency than expected during takeover. This delay could cause a system outage in which case the disk should be removed to prevent further problems. .

#### Corrective Action

If you see this message before an outage on takeover, remove the specified disk.

#### Syslog Message

The disk reservation command sent to %s has taken longer than expected: %d msec during takeover.

#### Parameters

**diskName** (STRING): Name of the device.

**elapsed\_time** (INT): Number of milliseconds for the command to complete.

## disk.reserveerror events

### disk.reserveError

#### Severity

NOTICE

#### Description

This message occurs when a SCSI reservation is requested for a disk or LUN that is no longer seen.

#### Corrective Action

A disk or LUN might have been removed from the storage subsystem or the path to a disk or LUN has been lost. Verify that all paths to the disk or LUN are visible to the appliance using the storage show disk -p command.

#### Syslog Message

disk\_reserve: %s was not found: CDB %s - %s (%x %x %x)

#### Parameters

**diskName** (STRING): Name of the device.

**cdb** (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.

**sSenseKey** (STRING): Sense key string.

**iSenseKey** (INTHEX): Sense key value.

**iASC** (INTHEX): SCSI Additional Sense Code.

**iASCQ** (INTHEX): SCSI Additional Sense Code Qualifier.

**sm** (STRING): SCSI Persistent Reservation state machine.

**state** (INT): SCSI Persistent Reservation state machine step.

**out\_status\_flags** (INTHEX): Status flag containing bits describing which of the following status values are valid.

**ha\_status** (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.

**target\_status** (INTHEX): Value returned by the target describing completion status of I/O request.

**target\_rsp\_code** (INTHEX): Target response code.

## disk.reservefailed events

### disk.reserveFailed

#### Severity

ERROR

#### Description

This message occurs when a SCSI reservation fails.

#### Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, contact NetApp technical support to open a support case to investigate the underlying cause.

#### Syslog Message

Disk reservation failed on %s CDB %s - %s (%x %x %x)

#### Parameters

**diskName** (STRING): Name of the device.

**cdb** (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.

**sSenseKey** (STRING): Sense key string.

**iSenseKey** (INTHEX): Actual sense key.

**iASC** (INTHEX): SCSI Additional Sense Code.

**iASCQ** (INTHEX): SCSI Additional Sense Code Qualifier.

**sm** (STRING): SCSI Persistent Reservation state machine.

**state** (INT): SCSI Persistent Reservation state machine step.

**out\_status\_flags** (INTHEX): Status flag containing bits describing which of the following status values are valid.

**ha\_status** (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.

**target\_status** (INTHEX): Value returned by the target describing completion status of I/O request.

**target\_rsp\_code** (INTHEX): This is the target response code

## disk.rewritedatafailed events

### disk.rewriteDataFailed

**Severity**

ALERT

**Description**

This message occurs when the system encounters an error and cannot rewrite data that was difficult to read on ATA drives.

**Corrective Action**

(None).

**Syslog Message**

Unable to rewrite %s on disk %s.

**Parameters**

**command** (STRING): SCSI command that reported a problem.

**diskName** (STRING): Name of the device.

## disk.sanit events

### disk.sanit.complete

**Severity**

INFORMATIONAL

**Description**

This message occurs when disk sanitization has been completed.

**Corrective Action**

(None).

**Syslog Message**

Disk %s [S/N %s] has completed sanitization.

**Parameters**

**diskName** (STRING): Name of the device.

**serialno** (STRING): Serial number of the device.

### disk.sanit.error

**Severity**

ERROR

**Description**

This message occurs when a disk returns an error during sanitization.

**Corrective Action**

Verify that the drive is capable of sanitization. See the ONTAP® Physical Storage Management Guide <https://library.netapp.com/ecmdocs/ECMP12458210/html/GUID-1DC1DEC2-AAB3-483E-805D-82E722023AA6.html> for more information.

## Syslog Message

Disk %s has received an error %d (0%hx/0%hx/0%hx/0%hx) during sanitization.

### Parameters

**diskName** (STRING): Name of the disk.  
**scsi\_error** (INT): SCSI error code.  
**sense\_key** (INT): Actual sense key.  
**sense\_code** (INT): Actual sense code.  
**qualifier** (INT): Actual sense code qualifier.  
**fru\_failed** (INT): Actual FRU code.

## disk.sanit.formatComplete

### Severity

INFORMATIONAL

### Description

This message occurs when the disk sanitization format phase is complete.

### Corrective Action

(None).

## Syslog Message

Disk sanitization format complete for disk %s [S/N %s], begin pattern writes.

### Parameters

**diskName** (STRING): Name of the device.  
**serialno** (STRING): Serial number of the device.

## disk.sanit.formatError

### Severity

ERROR

### Description

This message occurs when disk sanitization formatting fails.

### Corrective Action

(None).

## Syslog Message

Disk %s has received an error %d (0%hx/0%hx/0%hx) during the formatting of the drive. Format will be retried within fifteen minutes.

### Parameters

**diskName** (STRING): Name of the device.  
**status** (INT): Error code.  
**sense\_key** (INTHEX): Actual sense key.  
**sense\_code** (INTHEX): Actual sense code.  
**qualifier** (INTHEX): Actual sense code qualifier.

## disk.sanit.formatFailed

### Severity

ERROR

### Description

This message occurs when disk sanitization reformatting has been retried unsuccessfully the maximum number of times.

### Corrective Action

Disk sanitization reformatting attempts have been unsuccessful. To make the disk usable, it must be reformatted. You can do this in maintenance mode with the SCSI "format" command.

### Syslog Message

Disk sanitization reformat has failed for disk %s.

### Parameters

**diskName** (STRING): Name of the device.

## disk.sanit.patternDone

### Severity

INFORMATIONAL

### Description

This message occurs when disk sanitization has completed a cycle of a pattern write.

### Corrective Action

(None).

### Syslog Message

Disk %s [S/N %s] cycle %d pattern write of 0x%02x completed in %02d:%02d:%02d.

### Parameters

**diskName** (STRING): Name of the device.

**serialno** (STRING): Serial number of the device.

**cycle** (INT): Sanitization cycle.

**pattern** (INT): Pattern byte.

**hours** (INT): Time in hours.

**minutes** (INT): Time in minutes.

**seconds** (INT): Time in seconds.

## disk.sanit.randomPatternDone

### Severity

INFORMATIONAL

### Description

This message occurs when disk sanitization has completed a cycle of random data write.

## Corrective Action

(None).

## Syslog Message

Disk %s [S/N %s] cycle %d pattern write of random data completed in %02d:%02d:%02d.

## Parameters

**diskName** (STRING): Name of the device.  
**serialno** (STRING): Serial number of the device.  
**cycle** (INT): Sanitization cycle.  
**hours** (INT): Time in hours.  
**minutes** (INT): Time in minutes.  
**seconds** (INT): Time in seconds.

## disk.sanit.reformatComplete

### Severity

INFORMATIONAL

### Description

This message occurs when disk sanitization reformatting is complete.

### Corrective Action

(None).

### Syslog Message

Disk %s has been successfully reformatted. To sanitize disk, restart the disk sanitize command. To bypass format, use -s option.

### Parameters

**diskName** (STRING): Name of the device.

## disk.sanit.sanitComplete

### Severity

INFORMATIONAL

### Description

This message occurs when the SCSI sanitize command phase of a 'disk sanitize' command is complete, and the data pattern write phase begins.

### Corrective Action

(None).

### Syslog Message

Sanitization phase of the 'disk sanitize' command was completed for disk %s [S/N %s]. Pattern writes have begun.

### Parameters

**diskName** (STRING): Name of the device.  
**serialno** (STRING): Serial number of the device.

# disk.selectiontimeout events

## disk.selectionTimeout

### Severity

ERROR

### Description

This message occurs when a selection timeout is received.

### Corrective Action

(None).

### Syslog Message

Disk %s: selection timeout

### Parameters

**diskName** (STRING): Name of the device.

# disk.senseerror events

## disk.senseError

### Severity

ERROR

### Description

This message occurs when the drive reports an error.

### Corrective Action

Check the event log for related error messages and corrective actions.

### Syslog Message

Disk %s: op %s sector %llu %s - %s (%X %X %X %X)

### Parameters

**diskName** (STRING): Name of the disk.

**op** (STRING): I/O operation being performed.

**sector** (LONGINT): Sector where the error was detected.

**senseInfo** (STRING): Sense data.

**sCode** (STRING): Sector code.

**sense\_key** (INTHEX): SCSI sense key.

**sense\_code** (INTHEX): SCSI sense code.

**qualifier** (INTHEX): SCSI sense code qualifier.

**fru\_failed** (INTHEX): SCSI FRU code.

**disk\_information** (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

# disk.senseinfoinvalid events

## disk.senseInfoNotValid

### Severity

ERROR

### Description

This message occurs when invalid sense information is returned.

### Corrective Action

(None).

### Syslog Message

Disk %s: sense data information field is not valid.

### Parameters

**diskName** (STRING): Name of the device.

# disk.setarraylqd events

## disk.setArrayLQD

### Severity

INFORMATIONAL

### Description

This message occurs when you set the LUN queue depth for all the LUNs of an array.

### Corrective Action

(None).

### Syslog Message

All the LUNs on array '%s' have a LUN queue depth value set to %d.

### Parameters

**arrayName** (STRING): Name of the array.

**lqd** (INT): LUN queue depth value.

# disk.sizegrew events

## disk.sizeGrew

### Severity

NOTICE

### Description

This message occurs when the controller detects an increase in the capacity of a virtual disk.

## Corrective Action

(None).

## Syslog Message

Size of virtual disk %s has been changed from %s to %s, an increase of %lld bytes (%lld %d-byte blocks).

## Parameters

**diskName** (STRING): Name of the virtual disk that has an increased capacity.

**Size** (STRING): Original size of the virtual disk in bytes.

**NewSize** (STRING): Current size of the virtual disk in bytes.

**byteDiff** (LONGINT): Difference in bytes between the original size and the current size of the virtual disk.

**blockDiff** (LONGINT): Difference in blocks between the original size and the current size of the virtual disk.

**blockSize** (INT): Block size in bytes of the virtual disk.

# disk.sizeshrank events

## disk.sizeShrank

### Severity

NOTICE

### Description

This message occurs when the controller detects a decrease in the capacity of a virtual disk.

### Corrective Action

(None).

### Syslog Message

Size of virtual disk %s has changed from %s to %s, a decrease of %lld bytes (%lld %d-byte blocks).

### Parameters

**diskName** (STRING): Name of the virtual disk that has a decreased capacity.

**Size** (STRING): Original size of the virtual disk in bytes.

**NewSize** (STRING): Current size of the virtual disk in bytes.

**byteDiff** (LONGINT): Difference in bytes between the original size and the current size of the virtual disk.

**blockDiff** (LONGINT): Difference in blocks between the original size and the current size of the virtual disk.

**blockSize** (INT): Block size in bytes of the virtual disk.

# disk.spindleerror events

## disk.spindleError.detect

### Severity

ERROR

### Description

This message occurs when a disk returns a spindle detect error. The disk will be recommended for failure.

## Corrective Action

Disk firmware has detected spindle motor problems. The disk will be recommended for failure. If the disk is a member of a RAID volume, it will be failed by RAID when this error occurs on a RAID I/O and the raid group is not in degraded mode.

## Syslog Message

Disk %s has reported a spindle detect error: (%x %x %x %x)

## Parameters

**diskName** (STRING): Name of the disk.  
**sense\_key** (INTHEX): Actual sense key  
**sense\_code** (INTHEX): Actual sense code.  
**qualifier** (INTHEX): Actual sense code qualifier.  
**fru\_failed** (INTHEX): Actual FRU code.

## disk.spindleError.notice

### Severity

INFORMATIONAL

### Description

This message occurs when a disk returns a spindle detect error.

### Corrective Action

Disk firmware has detected spindle motor problems. The option to recommend the drive for failure is not set, so the disk will not be automatically recommended for failure.

### Syslog Message

(None).

### Parameters

**diskName** (STRING): Name of the disk.  
**sense\_key** (INT): Actual sense key.  
**sense\_code** (INT): Actual sense code.  
**qualifier** (INT): Actual sense code qualifier.  
**fru\_failed** (INT): Actual FRU code.

## disk.stalledtoolong events

### disk.stalledTooLong

#### Severity

ERROR

#### Description

This message occurs when a disk has been stalled too long.

#### Corrective Action

(None).

## Syslog Message

I/O for disk %s has been suspended %d times for %d seconds.

## Parameters

**diskName** (STRING): Name of the device.

**count** (INT): Count of times suspended.

**error** (INT): Time suspended.

# disk.timeout.events

## disk.timeout.flush.end

### Severity

NOTICE

### Description

This message occurs when the disk driver stops flushing aggressive timeout I/Os.

### Corrective Action

(None).

## Syslog Message

Aggressive timeout flush ended on disk %s S/N %s.

## Parameters

**disk\_name** (STRING): Name of the disk.

**serial\_num** (STRING): Serial number of the disk.

## disk.timeout.flush.start

### Severity

NOTICE

### Description

This message occurs when an I/O operation is taking longer than expected and aggressive timeout I/Os are flushed from the disk driver.

### Corrective Action

(None).

## Syslog Message

Aggressive timeout flush started on disk %s S/N %s. Details: %s.

## Parameters

**disk\_name** (STRING): Name of the disk.

**serial\_num** (STRING): Serial number of the disk.

**details** (STRING): Additional information.

# disk.toomanynvmespindles events

## disk.tooManyNvmeSpindles

### Severity

ALERT

### Description

This message occurs when Data ONTAP® finds more NVMe disks present on a platform than the platform actually supports. Additional disks above the support number are ignored. Correct this issue before rebooting the system.

### Corrective Action

Too many NVMe disks have been installed. Reconfigure the system to the maximum number of NVMe disks supported.

### Syslog Message

Reached the maximum number of NVMe disks that are supported on this system of %d NVMe disks. All additional NVMe disks will be ignored. This problem must be resolved before the system is rebooted.

### Parameters

**maxSpindle** (INT): Maximum number of NVMe disks supported on this platform.

# disk.toomanypartitioneddisk events

## disk.tooManyPartitionedDisks

### Severity

ALERT

### Description

This message occurs when Data ONTAP® finds more partitioned disks present on a platform than the platform supports. The system ignores any partitioned disks above the limit, and they will be unusable.

### Corrective Action

Too many partitioned disks have been installed. Reconfigure the system to the maximum number of partitioned disks supported.

### Syslog Message

Ignoring partitioned disk %s because the maximum limit of %d partitioned disks supported on this system has been reached.

### Parameters

**diskName** (STRING): Name of the disk.

**maxPartitionedDisks** (INT): Maximum number of partitioned disks supported on this platform.

# disk.toomanyreassignments events

## disk.tooManyReassignments

### Severity

NOTICE

### Description

This message occurs when a reassignment fails due to table overflow.

### Corrective Action

(None).

### Syslog Message

Disk %s: sector %llu was NOT reassigned, too many reassignments.

### Parameters

**diskName** (STRING): Name of the device.

**error** (LONGINT): Bad sector.

## disk.toomanyspindles events

### disk.tooManySpindles

### Severity

ALERT

### Description

This message occurs when Data ONTAP® finds more disks present on a platform than the platform actually supports. Additional disks above the support number are ignored. Correct this issue before rebooting the system.

### Corrective Action

Too many disks have been installed. Reconfigure the system to the maximum number of disks supported.

### Syslog Message

Found %d disks, but maximum of %d disks are supported on this system. All additional disks will be ignored. This problem must be resolved before the system is rebooted.

### Parameters

**actualSpindle** (INT): Actual number of disks configured.

**maxSpindle** (INT): Maximum number of disks supported on this platform.

## disk.uid events

### disk.uid.changed

### Severity

NOTICE

## Description

This message occurs when a SCSI (Small Computer System Interface) INQUIRY command done during a disk drive initialization sequence finds different data in the INQUIRY response for page 0x83. The unique id (UID) derived from this information has changed unexpectedly.

## Corrective Action

Locate the failed disk drive by looking for a disk drive whose amber LED fault light is lit. Replace the disk drive.

## Syslog Message

Disk %s has unexpectedly changed its unique ID. vendor:%s product:%s serial\_number:%s

## Parameters

**diskName** (STRING): Name of the disk that had the UID change.  
**disk\_vendor\_id** (STRING): Vendor name of the disk that had the UID change.  
**disk\_product\_id** (STRING): Product name of the disk that had the UID change.  
**disk\_serialno** (STRING): Serial number of the disk that had the UID change.

# disk.unabletorewritedata events

## disk.unableToRewriteData

### Severity

INFORMATIONAL

### Description

This message occurs when Data ONTAP® receives too many errors reading from a particular location on an ATA disk drive, but its attempt to rewrite the data to the disk drive fails.

### Corrective Action

(None).

### Syslog Message

Difficulty reading disk drive %s with the command %s; could not rewrite the data.

### Parameters

**diskName** (STRING): Name of the disk drive with the problem.  
**command** (STRING): SCSI command that reported a problem.

# disk.vendorspecificcode events

## disk.vendorSpecificCode

### Severity

ERROR

### Description

This message occurs when a disk returns a vendor-specific error.

## Corrective Action

Replace the disk.

## Syslog Message

Drive %s has failed with a vendor specific error: class 0x%x segment 0x%x sense\_key 0x%x info 0x%x 0x%x 0x%x 0x%x length 0x%x resv\_1 0x%x sense\_code %d sense\_code\_qualifier %d fru\_failed 0x%x flags 0x%x field\_pointer 0x%x.

## Parameters

**diskName** (STRING): Name of the disk.  
**class** (INHEX): Sense class.  
**segment** (INHEX): Segment.  
**sense\_key** (INHEX): Actual sense key.  
**info0** (INHEX): Vendor-specific information[0].  
**info1** (INHEX): Vendor-specific information[1].  
**info2** (INHEX): Vendor-specific information[2].  
**info3** (INHEX): Vendor-specific information[3].  
**len** (INHEX): Length.  
**resv** (INHEX): Resv field.  
**sense\_code** (INT): Actual sense code.  
**qualifier** (INT): Actual sense code qualifier.  
**fru\_failed** (INHEX): Actual FRU code.  
**flags** (INHEX): Flags of the error.  
**field\_ptr** (INHEX): Sense field pointer.

# disk.writeverifyerror events

## disk.writeVerifyError

### Severity

ERROR

### Description

This message occurs when a write verify error occurs.

### Corrective Action

(None).

### Syslog Message

WRITE VERIFY on disk %s received an unexpected status %d.

### Parameters

**diskName** (STRING): Name of the device.  
**error** (INT): Returned error code

# diskown events

## diskown.aashelf events

### diskown.AAShelf.InterPools

#### Severity

ERROR

#### Description

This message occurs when the controller cannot automatically assign a disk because disks on the shelf and disks on the loop have the same owner but belong to different pools.

#### Corrective Action

1) Find all of the disks belonging to the same shelf, loop and owners as disk %s (S/N %s) by using the "storage disk show" command with the "-fields shelf, owner, dr-home, pool" option. 2) Assign all of the disks with the same owners on this shelf and other shelves to the same pool. Alternatively, manually assign all unowned disks belonging to this shelf.

#### Syslog Message

The controller could not automatically assign disk %s (S/N %s) and any other unassigned disks in the same shelf because the disks are shared across multiple pools within the same loop.

#### Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

### diskown.AAShelf.MoreShelf

#### Severity

ERROR

#### Description

This message occurs when more than the supported number of shelves are connected to a storage stack.

#### Corrective Action

1) Check which adapter has more than the supported number of shelves attached by using the "run local storage show shelf" command. 2) Reconfigure the shelves so that the adapter is not connected to more than the supported number of shelves.

#### Syslog Message

(None).

#### Parameters

(None).

### diskown.AAShelf.MultiOwners

**Severity**

ERROR

**Description**

This message occurs when the controller cannot automatically assign disks because the disks on the shelf are owned by multiple systems.

**Corrective Action**

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Either assign all of the disks on this shelf to a single system, or assign all unowned disks belonging to this shelf.

**Syslog Message**

The controller could not automatically assign disk %s (S/N %s) because disks on the shelf are owned by multiple systems. Because of this problem, the controller also could not assign any unowned disks on this shelf.

**Parameters**

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

**diskown.AAShelf.MultiPools****Severity**

ERROR

**Description**

This message occurs when the controller cannot automatically assign a disk because the disks on the shelf are shared across multiple pools.

**Corrective Action**

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of pools by using the "run local disk show -v" command. 3) Either assign all of the disks on this shelf to a single pool, or assign all unowned disks belonging to this shelf.

**Syslog Message**

The controller could not automatically assign disk %s (S/N %s) and any other unassigned disks in the same shelf because the disks are shared across multiple pools.

**Parameters**

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

**diskown.AAShelf.NoMemory****Severity**

ALERT

**Description**

This message occurs when the node cannot allocate memory for shelf-level automatic assignment.

### Corrective Action

Initiate the automatic disk assign by running the "storage disk assign -auto true -node node-name" CLI command. If the out-of-memory condition persists, perform a manual disk assign.

### Syslog Message

Memory not allocated for shelf-level automatic assignment.

### Parameters

(None).

## diskown.AAShelf.NoOwner

### Severity

ERROR

### Description

This message occurs when the controller cannot automatically assign a disk because none of the disks on the shelf are owned by any system.

### Corrective Action

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Either assign all of unowned disks in this shelf or assign one of the disks on this shelf by using the "storage disk assign" command.

### Syslog Message

The controller could not automatically assign disk %s (S/N %s) (and other unassigned disks in the same shelf, if any) because no disks on the shelf are owned by any system.

### Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

## diskown.assign events

### diskown.assign.splitOwner

### Severity

INFORMATIONAL

### Description

This message occurs when the "storage disk assign" command fail to assign a disk to a different owner from the other disks within the carrier. This is because the "storage disk assign" command with the -f option must be used in such cases.

### Corrective Action

Use the "storage disk assign" command with the -f option to assign the disk to a different owner from the other disks within the carrier.

## Syslog Message

Assigning ownership failed for disk %s. Use the "storage disk assign" command with the -f option to assign the disk to a different owner from the other disks within the carrier.

## Parameters

**diskname** (STRING): Name of the disk.

# diskown.assignexceeded events

## diskown.AssignExceeded

### Severity

ERROR

### Description

This message occurs when an attempt is made to assign more disks than are supported by this node.

### Corrective Action

Review the system capacity limits and the assigned disks on this system.

## Syslog Message

The maximum number of disks that can be assigned to this node has been exceeded. Attempted to assign %d, maximum supported: %d.

## Parameters

**attempted** (INT): Number of disks attempted to assign.

**supported** (INT): Number of disks supported.

# diskown.autoassign events

## diskown.AutoAssign.MultipleOwners

### Severity

ERROR

### Description

This message occurs when automatic assigning of a disk fails because the disks on the loop are owned by multiple systems.

### Corrective Action

Use the "storage disk show" command to view the list of systems, and then assign all of the disks on this loop to a single system. Or use the "storage disk assign" command to manually assign this disk.

## Syslog Message

Automatic assigning failed for disk %s (S/N %s) because the disks on the loop are owned by multiple systems. Automatic assigning failed for all unowned disks on this loop.

## Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

## diskown.AutoAssign.MultiplePools

### Severity

ERROR

### Description

This message occurs when automatic assigning of a disk fails because the disks on the loop are shared across multiple pools.

### Corrective Action

Use the "storage disk assign -pool" command to assign all of the disks on this loop to a single pool. Or use the "storage disk assign" command to manually assign this disk.

### Syslog Message

Automatic assigning failed for disk %s (S/N %s) because the disks on the loop are shared across multiple pools. Automatic assigning failed for all unowned disks on this loop.

### Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

## diskown.AutoAssign.NoOwner

### Severity

ERROR

### Description

This message occurs when automatic assigning of a disk fails because none of the disks on the loop are owned by any system.

### Corrective Action

Use the "run local disk show -v" command to get the list of systems and unowned disks. Manually assign one of the disks on this loop by using the "storage disk assign" command.

### Syslog Message

Automatic assigning failed for disk %s (S/N %s) because none of the disks on the loop are owned by any system. Automatic assigning failed for all unowned disks on this loop.

### Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

## diskown.autoassignproblem events

### diskown.AutoAssignProblem

### Severity

ERROR

## Description

This message occurs when Data ONTAP® attempts to assign a disk automatically, but the request fails. The failure could be due to a disk error or a user simultaneously assigning the disk to a storage system.

## Corrective Action

Use the "disk show -v" nodeshell command to determine the status of the disk. Use the "storage disk assign" command to assign the disk.

## Syslog Message

Automatic assigning failed for disk %s (S/N %s). Reason: %s

## Parameters

**diskname** (STRING): Name of the disk.  
**serialno** (STRING): Serial number of the disk.  
**reason** (STRING): Reason for the failure.

# diskown.bayctrlr events

## diskown.bayctrlr

### Severity

NOTICE

### Description

This message occurs if the controller address is determined when the bay policy override option has been set. The controller address "A/B" is used to automatically assign the disks in odd/even bays.

### Corrective Action

(None).

### Syslog Message

Determined controller address %s based on shelf ID %d and slot number %d.

### Parameters

**ctrlr** (STRING): Controller address.  
**shelfid** (INT): ID of the shelf chosen to determine the controller address.  
**slot** (INT): Slot number of the shelf chosen to determine the controller address.

## diskown.bayctrlr.unknown

### Severity

NOTICE

### Description

This message occurs when disks in a shelf are not assigned to the current node.

### Corrective Action

(None).

## Syslog Message

Cannot make determination of controller address.

## Parameters

(None).

# diskown.changingowner events

## diskown.changingOwner

### Severity

NOTICE

### Description

This message occurs when the ownership of a disk is being changed.

### Corrective Action

(None).

## Syslog Message

The ownership of disk %s (S/N %s) is being changed from node "%s" (ID: %u, home ID: %u, DR home ID: %u) to node "%s" (ID: %u, home ID: %u, DR home ID: %u).

## Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

**oldownername** (STRING): Name of the former owner node.

**oldownerid** (LONGINT): System ID of the former owner node.

**oldhomeownerid** (LONGINT): System ID of the former home node.

**olddrhomeownerid** (LONGINT): System ID of the former disaster recovery home node.

**newownername** (STRING): Name of the new owner node.

**newownerid** (LONGINT): System ID of the new owner node.

**newhomeownerid** (LONGINT): System ID of the new home node.

**newdrhomeownerid** (LONGINT): System ID of the new disaster recovery home node.

**thread** (STRING): Name of the thread that issued the ownership change request.

**APIname** (STRING): Name of the API that issued the ownership change request.

# diskown.cleaningownership events

## diskown.cleaningOwnership

### Severity

INFORMATIONAL

### Description

This message occurs when a "storage disk assign -f" command is run for an SES drive and the system discovers that the newly assigned owner already owns an SES drive on the same loop and shelf as the supplied drive. The assign is completed because it is a forced assign, but the error message is generated as an alert.

### Corrective Action

(None).

### Syslog Message

Disk %s (S/N %s) contains software-based disk ownership information that indicates it was previously in use by system ID %u. The ownership information is being cleared.

### Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

**ownerid** (INT): System ID of the system that owned the disk.

## diskown.completion events

### diskown.completion.timer.reEnabled

#### Severity

INFORMATIONAL

#### Description

This message occurs when the COMPLETION events from sanown layer remain after an aggregate is migrated from a source to a destination. Typically the events are enabled automatically, and if that doesn't happen within a certain amount of time, the system reenables the COMPLETION events and logs this message.

#### Corrective Action

(None).

#### Syslog Message

Sanown completion event timer reenabled after a giveback.

#### Parameters

(None).

## diskown.delayed events

### diskown.delayed.completionEvent

#### Severity

INFORMATIONAL

#### Description

This message occurs when the software disk ownership module completes the process of updating its view of the disks attached to the system but delays notifying other layers of the completion of this process. Typically, this happens when an SFO aggregate giveback is in progress on the HA partner.

#### Corrective Action

(None).

### **Syslog Message**

Software disk ownership module temporarily delayed notification that it has completed updating its view of the disks.

### **Parameters**

(None).

## **diskown.disk events**

### **diskown.disk.already.deleted**

#### **Severity**

ERROR

#### **Description**

This message occurs during an attempt to assign a disk that is being deleted. This can happen if the disk is deleted at the storage layer while disk assignment is in progress.

#### **Corrective Action**

Run the "run local disk show -v" command to see the list of available disks, and then retry the operation using one of the listed disks.

### **Syslog Message**

Assign request failed for disk %s because it is being deleted.

### **Parameters**

**disk\_name** (STRING): Name of the disk that is being deleted.

## **diskown.diskhaswronginfo events**

### **diskown.diskHasWrongInfo**

#### **Severity**

ERROR

#### **Description**

This message occurs when the disk ownership information on a disk does not belong to the disk that it was read from. This could be a result of a read going to the wrong disk or a prior write intended for some other disk getting written to the disk.

#### **Corrective Action**

On the controller that owns the disk, use the "storage disk assign" command to rewrite the ownership information to the disk.

### **Syslog Message**

Disk %s (S/N %s) has ownership information for disk %s (S/N %s) on it.

### **Parameters**

**diskname** (STRING): Name of the disk from which the ownership information was read.

**serialno** (STRING): Serial number of the disk from which the ownership information was read.

**infoForDiskname** (STRING): Name of the disk that the ownership information is for.

**infoForSerialNo** (STRING): Serial number of the disk that the ownership information is for.

## diskown.disknotsup events

### diskown.diskNotSup

#### Severity

INFORMATIONAL

#### Description

This message occurs when newly inserted disks are only supported with software disk ownership enabled, but it is not enabled.

#### Corrective Action

Halt the system by using the "halt" command, and then turn on software disk ownership by using the "storage disk assign" command. After you assign the disks, the system can recognize them.

#### Syslog Message

Newly added disk %s (and others) is only supported with software disk ownership enabled.

#### Parameters

**disk** (STRING): Name of the disk.

## diskown.diskwasstolen events

### diskown.diskWasStolen

#### Severity

NOTICE

#### Description

This event is issued when the ownership of a disk owned by the system is changed such that the disk is no longer owned by the system.

#### Corrective Action

(None).

#### Syslog Message

Disk %s (S/N %s) has had its ownership changed so that it is no longer owned by this system. This can lead to a system panic if the disk is a filesystem disk.

#### Parameters

**diskname** (STRING): The name of the disk

**serialno** (STRING): The serial number of the disk

## diskown.drawer events

## **diskown.drawer.assignStatus**

### **Severity**

NOTICE

### **Description**

This message occurs when drawer-based drive assignment for shelves with drawers is enabled or disabled.

### **Corrective Action**

(None).

### **Syslog Message**

Drawer-based automatic drive assignment for shelf "%d" is "%s".

### **Parameters**

**shelf\_id** (INT): Shelf identifier.

**state** (STRING): Drawer-based automatic drive assignment state..

## **diskown.drawer.invalidShlf**

### **Severity**

ERROR

### **Description**

This message occurs when the controller cannot automatically assign disks because the shelf is either offline, or temporarily unavailable, and therefore cannot be queried for the information that is required to properly assign the disks to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic disk assignment fails for the disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

### **Corrective Action**

Use the "storage shelf show" command to verify that the specified shelf is online and to verify connectivity from the controller to all of the paths to the shelf. If multiple shelves in a cluster have the same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

### **Syslog Message**

The system cannot automatically assign disks for shelf "%d" because the shelf is in an invalid state.

### **Parameters**

**shelf\_id** (INT): Shelf identifier.

## **diskown.drawer.MultiOwners**

### **Severity**

ERROR

### **Description**

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple systems in a conflicting manner.

### Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show" command. 2) View the list of systems by using the "disk show -v" command. 3) Ensure that disks assigned on lower half bays of each drawer are owned by a single owner, and ensure that disks assigned on higher half bays of each drawer are owned by a different single owner. Disks assigned on lower half bays of each drawer must have a different owner than disks assigned on higher half bays.

### Syslog Message

The system cannot automatically assign disks because the disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

### Parameters

**shelf\_id** (INT): Shelf identifier.

## diskown.duplicatessoftentries events

### diskown.duplicateSoftEntries

#### Severity

NOTICE

#### Description

This event is issued when we find duplicate entries in the sanown filer table.

#### Corrective Action

(None).

#### Syslog Message

%s

#### Parameters

**ems\_txt** (STRING): The warning message

## diskown.errorduringio events

### diskown.errorDuringIO

#### Severity

ERROR

#### Description

This event is issued when an I/O error occurs during a sanown disk operation.

#### Corrective Action

(None).

#### Syslog Message

error %d (%s) on disk %s (S/N %s) while %s

## Parameters

**errno** (INT): The error number that occurred  
**errortext** (STRING): The error description as text  
**diskname** (STRING): The name of the disk  
**serialno** (STRING): The serial number of the disk  
**details** (STRING): The operation that was going on

# diskown.errorreadingownership events

## diskown.errorReadingOwnership

### Severity

NOTICE

### Description

This event is issued when we get an error while reading all the DOWNS at once. The recovery is to read them individually.

### Corrective Action

(None).

### Syslog Message

error %d (%s) while reading ownership on disk %s (S/N %s)

## Parameters

**errno** (INT): The error that occurred  
**errortext** (STRING): The error description as text  
**diskname** (STRING): The name of the disk  
**serialno** (STRING): The serial number of the disk

# diskown.generated events

## diskown.generated.completionEvent

### Severity

INFORMATIONAL

### Description

This message occurs when the software disk ownership module notifies other layers that it has completed the process of updating its view of the disks attached to the system. These notifications were previously disabled for a short time.

### Corrective Action

(None).

### Syslog Message

Software disk ownership module notified other layers that it has completed updating its view of the disks.

## Parameters

(None).

# diskown.hlfshlf events

## diskown.hlfShlf.assignStatus

### Severity

NOTICE

### Description

This message occurs when half-shelf based drive assignment is enabled or disabled.

### Corrective Action

(None).

### Syslog Message

Half-shelf based automatic drive assignment for shelf "%d" is "%s".

### Parameters

**shelf\_id** (INT): Shelf identifier.

**state** (STRING): Half-shelf based automatic drive assignment state.

## diskown.hlfShlf.invalidShlf

### Severity

NOTICE

### Description

This message occurs when the controller cannot automatically assign disks to a shelf using half shelf-based disk assignment, either because the shelf is offline, or is temporarily unavailable and therefore cannot be queried for the information required to properly divide the disks for assignment to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic half shelf-based disk assignment is bypassed for disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

### Corrective Action

Use the "storage shelf show" command to ensure that the specified shelf is online and to ensure connectivity from the controller to all paths to the shelf. If there are multiple shelves in a cluster with the same same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

### Syslog Message

Half shelf based disk assignment will be skipped for shelf "%d" because the shelf is in invalid state.

### Parameters

**shelf\_id** (INT): Shelf identifier.

## diskown.hlfShlf.MultiOwners

## Severity

NOTICE

## Description

This message occurs when the controller cannot automatically assign disks using half shelf based disk assignment because disks in a shelf are assigned to multiple systems in a conflicting manner.

## Corrective Action

1) Find all of the disks belonging to the shelf specified by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Ensure that disks assigned on lower half bays of the shelf are owned by a single owner. Similarly, ensure that disks assigned on higher half bays of that shelf are owned by a single owner. Ensure that disks assigned on lower half bays have a different owner than disks assigned on higher half bays.

## Syslog Message

The controller cannot automatically assign disks using half shelf based disk assignment because disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

## Parameters

**shelf\_id** (INT): Shelf identifier.

# diskown.ilv events

## diskown.ilv.hShlf.invShlf

## Severity

ERROR

## Description

This message occurs when the controller cannot automatically assign drives to a shelf using interleaved-half-shelf-based drive assignment, either because the shelf is offline, or is temporarily unavailable and therefore cannot be queried for the information required to properly divide the drives for assignment to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic interleaved-half-shelf-based drive assignment is bypassed for drives in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

## Corrective Action

Use the "storage shelf show" command to ensure that the specified shelf is online and to ensure connectivity from the controller to all paths to the shelf. Ensure that each shelf within the cluster has a unique shelfID.

## Syslog Message

Interleaved-half-shelf-based drive assignment will be skipped for shelf "%d" because the shelf is in invalid state.

## Parameters

**shelf\_id** (INT): Shelf identifier.

## diskown.ilv.hShlf.mOwners

**Severity**

ERROR

**Description**

This message occurs when the controller cannot automatically assign drives using interleaved-half-shelf based drive assignment because drives in a shelf are assigned to multiple systems in a conflicting manner.

**Corrective Action**

1) Find all of the drives belonging to the shelf specified by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Ensure that drives assigned on first and third quarter bays of the shelf are owned by a single owner. Similarly, ensure that drives assigned on second and fourth quarter bays of that shelf are owned by a single owner. Ensure that drives assigned on first and third quarter bays have a different owner than drives assigned on second and fourth quarter bays.

**Syslog Message**

The controller cannot automatically assign drives using interleaved-half-shelf based drive assignment because drives in shelf "%d" are assigned to multiple systems in a conflicting manner.

**Parameters**

**shelf\_id** (INT): Shelf identifier.

**diskown.ilv.hShlf.status****Severity**

NOTICE

**Description**

This message occurs when interleaved-half-shelf based drive assignment is either enabled or disabled.

**Corrective Action**

(None).

**Syslog Message**

Interleaved-half-shelf based automatic drive assignment for shelf %d is "%s".

**Parameters**

**shelf\_id** (INT): Shelf identifier.

**state** (STRING): Interleaved-half-shelf based automatic drive assignment state.

**diskown.incorrectownername events****diskown.IncorrectOwnerName****Severity**

INFORMATIONAL

**Description**

This event is issued when we find a system finds a disk that it owns, but which has a different owner name than the system name.

### Corrective Action

(None).

### Syslog Message

Disk %s has incorrect owner name information (%s). It will be changed to match the system name (%s).

### Parameters

**diskname** (STRING): The name of the disk for which this was observed

**wrong\_ownership** (STRING): The owner name, which is incorrect, that the disk currently has

**system\_name** (STRING): The system name that should be the owner name for the disk

## diskown.isbeingenabled events

### diskown.isBeingEnabled

#### Severity

INFORMATIONAL

#### Description

This event is issued when the system is being converted from non-software based disk ownership to software based disk ownership

#### Corrective Action

(None).

#### Syslog Message

System is being changed to use software based disk ownership

#### Parameters

(None).

## diskown.isenabled events

### diskown.isEnabled

#### Severity

INFORMATIONAL

#### Description

This event is issued when enable sanown.

#### Corrective Action

(None).

#### Syslog Message

software ownership has been enabled for this system

#### Parameters

(None).

# diskown.mcc events

## diskown.mcc.AssignExceeded

### Severity

ERROR

### Description

This message occurs when the number of drives assigned in the MetroCluster(tm) configuration exceeds the supported limit.

### Corrective Action

Review the system capacity limits and the assigned drives on this system. If possible, unassign the unused array LUNs. If you need further assistance, contact NetApp technical support.

### Syslog Message

The maximum number of drives that can be assigned in the configuration has exceeded. Total physical drive count: %d, maximum supported: %d.

### Parameters

**total\_disk\_count** (INT): Total number of drives assigned in the configuration.

**supported** (INT): Number of drives supported.

# diskown.mccip events

## diskown.mccip.assignStatus

### Severity

NOTICE

### Description

This message occurs when MetroCluster(tm) quarter-shelf based drive assignment is enabled or disabled. It is enabled when the system is a member of an AFF HA pair in a 4-node MetroCluster IP configuration.

### Corrective Action

(None).

### Syslog Message

MetroCluster quarter-shelf based automatic drive assignment for shelf "%d" is "%s".

### Parameters

**shelf\_id** (INT): Shelf identifier.

**state** (STRING): MetroCluster quarter-shelf based automatic drive assignment state.

## diskown.mccip.invalidShlf

### Severity

ERROR

## Description

This message occurs when the controller cannot automatically assign disks because the shelf is either offline, or temporarily unavailable and therefore cannot be queried for the information that is required to properly assign the disks to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic disk assignment fails for the disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

## Corrective Action

Use the "storage shelf show" command to verify that the specified shelf is online and to verify connectivity from the controller to all of the paths to the shelf. If multiple shelves in a cluster have the same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

## Syslog Message

The system cannot automatically assign disks for shelf "%d" because the shelf is in an invalid state.

## Parameters

**shelf\_id** (INT): Shelf identifier.

## diskown.mccip.MultiOwners

### Severity

ERROR

## Description

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple systems in a conflicting manner.

## Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show" command. 2) View the list of systems by using the "disk show -v" command. 3) Ensure that the disks on each shelf are assigned such that lower half bays are assigned to the local high-availability (HA) pair and the higher half bays are assigned to the remote HA pair. Additionally within each half shelf, ensure that the disks are assigned equally to the HA pair such that the lower quarter bays are assigned to one node and the higher quarter bays are assigned to the node's HA partner.

## Syslog Message

The system cannot automatically assign disks because the disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

## Parameters

**shelf\_id** (INT): Shelf identifier.

## diskown.ownerchangefailed events

### diskown.ownerChangeFailed

### Severity

ERROR

## Description

This message occurs when a disk ownership change request fails.

## Corrective Action

Verify that there are no disk connectivity issues, that disks are not in a failed state, and that the procedures for executing the "storage disk assign" command are being followed.

## Syslog Message

Disk ownership change request failed on disk %s (S/N %s). Reason: %s.

## Parameters

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

**status** (STRING): Description of the error in the ownership change request.

**thread** (STRING): Name of the thread that issued the ownership change request.

**APIname** (STRING): Name of the API that issued the ownership change request.

# diskown.ownernameupdatefailed events

## diskown.OwnerNameUpdateFailed

### Severity

NOTICE

### Description

This event is issued when we have to rewrite a DOWN because it is out of date wrt the other DOWNS.

### Corrective Action

(None).

### Syslog Message

owner name update failed for disk %s (S/N %s)

### Parameters

**diskname** (STRING): The name of the disk

**serialno** (STRING): The serial number of the disk

# diskown.ownerreservationmismatch events

## diskown.ownerReservationMismatch

### Severity

ERROR

### Description

This message occurs when the system discovers a disk that is supposed to be owned by one node, but the persistent reservation is owned by another node.

## Corrective Action

1) Find the disk causing the conflict from EMS messages. 2) If the disk is in the spare pool, go to step 5. 3) Run the "storage aggr status -r" command to find the aggregate containing the disk. 4) If the aggregate is online, bring it offline by using the "storage aggr modify -aggr aggr\_name -state offline" command. 5) Run the "storage disk show -fields owner-id,reserver-id" command to identify the reservation owner of the disk. 6) Run the "storage disk assign disk\_name -s partner\_sys\_id -f" command to perform the disk assignment change from the node that owns the reservation for the disk.

## Syslog Message

disk %s (S/N %s) is supposed to be owned by this node but has a persistent reservation placed by node %s (ID %u).

## Parameters

**diskname** (STRING): Name of the disk.  
**serialno** (STRING): Serial number of the disk.  
**resvownername** (STRING): Name of the system owning the reservation.  
**resvowner** (INT): System ID of the node owning the reservation.

# diskown.raid events

## diskown.RAID.Ownershipchange

### Severity

ERROR

### Description

This message occurs when a disk assign or disk remove ownership request is rejected at the RAID layer.

### Corrective Action

Review the error message and verify that the request was not for a file system disk.

### Syslog Message

%s

### Parameters

**err\_msg** (STRING): Reason the request failed.

# diskown.reassignfailed events

## diskown.ReassignFailed

### Severity

ERROR

### Description

This message occurs when a disk reassign request fails.

### Corrective Action

Verify that there are no disk connectivity issues and that the procedures for executing the 'storage disk reassign' command are being followed.

### Syslog Message

Disk reassign request failed. Reason: %s.

### Parameters

**reason** (STRING): Reason for failure.

## diskown.releasingmismatchedreservation events

### diskown.releasingMismatchedReservation

#### Severity

NOTICE

#### Description

This event is issued when we release the reservation because the DOWN says the disk is owned by someone else.

#### Corrective Action

(None).

#### Syslog Message

%s is releasing reservation on disk %s (S/N %s) as it is owned by %s (ID %u)

#### Parameters

**originator** (STRING): The internal component of diskown issuing the event

**diskname** (STRING): The name of the disk

**serialno** (STRING): The serial number of the disk

**filername** (STRING): The name of the filer that owns the disk

**systemid** (INT): The system id of the filer that owns the disk

## diskown.replayingownership events

### diskown.replayingOwnership

#### Severity

INFORMATIONAL

#### Description

This event occurs during a boot or takeover when a disk ownership request is replayed from NVRAM.

#### Corrective Action

(None).

#### Syslog Message

Replaying ownership request for %d disks

#### Parameters

**diskcount** (INT): The number of disks in the ownership request

## diskown.replayingOwnership.Nv

### Severity

ERROR

### Description

This message occurs during takeover, when a disk ownership request is replayed from NVRAM but NVRAM corruption is detected.

### Corrective Action

1) If you changed the ownership of disks on the partner in the last five minutes prior to takeover, verify their ownerships were stored by using the "storage disk show" command. 2) If you see this message often or in other modules, the partner's NVRAM card might be faulty and might need to be replaced.

### Syslog Message

Failed to replay disk ownership because NVRAM corruption was detected.

### Parameters

(None).

## diskown.rescan events

### diskown.rescan.notConnected

### Severity

ERROR

### Description

This message occurs when the high-availability (HA) messaging layer fails to connect to the specified node for disk ownership updates.

### Corrective Action

Run the command "run local disk show -v" from the node specified in the node parameter to correct disk ownership.

### Syslog Message

HA messaging layer on the local node failed to connect to node %s for disk ownership updates.

### Parameters

**node** (STRING): Name of the node where disk ownership might be outdated.

**status** (INT): Error number returned by the HA messaging layer from the HA message error space.

**scope** (INT): Internal scope identifier for the module that returned the error.

**scope\_err** (INT): Internal error number returned by the module.

### diskown.rescan.notSent

### Severity

ERROR

## Description

This message occurs when the high-availability (HA) messaging layer fails to send a disk ownership update message.

## Corrective Action

Run the command "run local disk show -v" from the node specified in the node parameter to correct disk ownership.

## Syslog Message

HA messaging layer on the local node failed to send a disk ownership update message to node %s.

## Parameters

**node** (STRING): Name of the node where disk ownership might be outdated.

**status** (INT): Error number returned by the HA messaging layer from the HA message error space.

**scope** (INT): Internal scope identifier for the module that returned the error.

**scope\_err** (INT): Internal error number returned by the module.

# diskown.rescanmessagefailed events

## diskown.RescanMessageFailed

### Severity

ERROR

### Description

This message occurs while transferring the ownership of a disk to another node, when a rescan message is sent but does not go through.

### Corrective Action

Use the "disk show" command on the nodeshell of %s for the node to rescan the disks which changed ownership.

### Syslog Message

Could not send rescan message to %s.

### Parameters

**hostname** (STRING): Name of the host that the message was sent to.

# diskown.rescanwait events

## diskown.rescanWait

### Severity

INFORMATIONAL

### Description

This message occurs when the disk ownership rescan code waits.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**status** (STRING): Description on the type of wait.

## diskown.rewriteowner events

**diskown.rewriteOwner****Severity**

NOTICE

**Description**

This event is issued when we have to rewrite a DOWN because it is out of date wrt the other DOWNS.

**Corrective Action**

(None).

**Syslog Message**

rewriting ownership information for disk %s (S/N %s)

**Parameters**

**diskname** (STRING): The name of the disk

**serialno** (STRING): The serial number of the disk

## diskown.shareddisk events

**diskown.sharedDsk.nonHACfg****Severity**

ERROR

**Description**

This message occurs when a disk is shared by multiple nodes in a non-HA or stand-alone configuration. If the procedure to convert an HA configuration to a non-HA configuration is not followed properly, the system may end up either having disks whose partitions are owned by another node, or owning partitions on non-local disks.

**Corrective Action**

Refer to the High-Availability Configuration Guide.

**Syslog Message**

Either some local disks have partitions that are not owned by the local node, or the local node owns partitions on non-local disks.

## Parameters

(None).

# diskown.shlf events

## diskown.Shlf.assignStatus

### Severity

NOTICE

### Description

This message occurs when shelf granular-based drive assignment is enabled or disabled. This is currently applicable for an MetroCluster(tm) IP configurations.

### Corrective Action

(None).

### Syslog Message

Shelf-based automatic drive assignment for shelf "%d" is "%s".

### Parameters

**shelf\_id** (INT): Shelf identifier.

**state** (STRING): Shelf-based automatic drive assignment state.

## diskown.Shlf.MultiOwners

### Severity

ERROR

### Description

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple nodes in a conflicting manner. Until the disk assignments are corrected, the specified shelf will be excluded during auto assignment, and unowned disks on the shelf will be skipped.

### Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show -fields owner,shelf" command. 2) Ensure that the disks on the shelf are assigned to a single system by manually assigning disks in the shelf to a single owner.

### Syslog Message

The system cannot automatically assign disks because the disks in shelf %d are assigned to multiple nodes in a conflicting manner.

### Parameters

**shelf\_id** (INT): Shelf identifier.

# diskown.split events

## diskown.split.shelf.assignStatus

### Severity

NOTICE

### Description

This message occurs when any type of split-shelf automatic drive assignment is disabled.

### Corrective Action

(None).

### Syslog Message

Split-shelf based automatic drive assignment is "%s".

### Parameters

**state** (STRING): All split-shelf based drive assignment states.

## diskown.statusreadownership events

### diskown.statusReadOwnership

### Severity

INFORMATIONAL

### Description

This message occurs when an event is logged to track that an error was encountered while reading all data ownership blocks at once. Data ONTAP® will attempt to recover by reading each disk ownership block individually.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**errorno** (INT): Error that occurred.

**errortext** (STRING): Error description as text.

**diskname** (STRING): Name of the disk.

**serialno** (STRING): Serial number of the disk.

## diskown.stealingdisk events

### diskown.StealingDisk

### Severity

NOTICE

### Description

This event is issued when a user reassigns a disk that is owned and has a reservation from another system.

## Corrective Action

(None).

## Syslog Message

Ownership for disk %s (S/N %s) is being stolen from node "%s" (System ID: %u).

## Parameters

**diskname** (STRING): Name of the disk whose ownership is being reassigned.

**serialno** (STRING): Serial number of the disk.

**hostname** (STRING): Name of the host that currently owns the disk.

**systemid** (INT): System ID of the host that currently owns the disk.

**thread** (STRING): Name of the thread that issued the ownership change request.

**APIname** (STRING): Name of the API that issued the ownership change request.

# diskown.stealingdiskprevented events

## diskown.StealingDiskPrevented

### Severity

NOTICE

### Description

This message occurs when a "storage disk assign" operation is performed on a disk that is owned and has a reservation from another system. The reservation prevents the disk ownership change from being completed.

### Corrective Action

Perform the "storage disk assign" operation on the system that currently owns the disk.

### Syslog Message

Ownership for disk %s (S/N %s) cannot be changed because node "%s" (System ID: %u) currently owns the persistent reservation.

### Parameters

**diskname** (STRING): Name of the disk whose ownership is being assigned.

**serialno** (STRING): Serial number of the disk.

**hostname** (STRING): Name of the host that currently owns the disk.

**systemid** (INT): System ID of the host that currently owns the disk.

**thread** (STRING): Name of the thread that issued the ownership change request.

**APIname** (STRING): Name of the API that issued the ownership change request.

# diskown.uprevversion events

## diskown.UpRevVersion

### Severity

NOTICE

### Description

This message occurs when disk ownership information has been read and found to be from a version that is

higher (newer) than what the current version of Data ONTAP understands. New fields in the ownership information will be ignored.

#### **Corrective Action**

(None).

#### **Syslog Message**

(None).

#### **Parameters**

**diskname** (STRING): The name of the disk with the newer version.

**serialno** (STRING): The serial number of the disk.

**foundversion** (INT): The version of the disk ownership information found on the disk.

**curversion** (INT): The version of the disk ownership information that the current Data ONTAP uses.

## **diskown.waitingforreassign events**

### **diskown.WaitingForReassign**

#### **Severity**

NOTICE

#### **Description**

This message occurs when a giveback is occurring and the "storage disk reassign" is in progress. The giveback must wait until the reassign operation is complete.

#### **Corrective Action**

(None).

#### **Syslog Message**

Waiting for ownership of the partner disks to be updated as a result of a "storage disk reassign" command.

#### **Parameters**

(None).

# diskshelf events

## diskshelf.psu events

### diskShelf.psu.added

#### Severity

NOTICE

#### Description

This message occurs when a power supply unit is added to the disk shelf.

#### Corrective Action

(None).

#### Syslog Message

%s power supply was added to %s.shelf%d

#### Parameters

**location** (STRING): Which power supply was added.  
**channelName** (STRING): Channel connected to disk shelf.  
**shelfIdent** (INT): ID number displayed on the disk shelf OPS panel.  
**serialNumber** (STRING): Serial number of disk shelf.

### diskShelf.psu.removed

#### Severity

ERROR

#### Description

This message occurs when a power supply unit is removed from the disk shelf.

#### Corrective Action

Insert a functional power supply unit into the disk shelf.

#### Syslog Message

%s power supply was removed from %s.shelf%d

#### Parameters

**location** (STRING): Which power supply was removed.  
**channelName** (STRING): Channel connected to disk shelf.  
**shelfIdent** (INT): ID number displayed on the disk shelf OPS panel.  
**serialNumber** (STRING): Serial number of disk shelf.

NOTICE

**Description**

This message occurs when a new disk shelf support file is detected. Current support level of existing shelves will be checked.

**Corrective Action**

(None).

**Syslog Message**

New disk shelf support file (DQP) detected.

**Parameters**

(None).

## diskshelf.supported events

### diskShelf.supported

**Severity**

NOTICE

**Description**

This message occurs when a newly supported disk shelf is detected.

**Corrective Action**

(None).

**Syslog Message**

Disk shelf %s (%s) is now supported.

**Parameters**

**device** (STRING): Device address of the disk shelf.

**product\_id** (STRING): Product ID of the disk shelf.

## diskshelf.unsupported events

### diskShelf.unsupported

**Severity**

ALERT

**Description**

This message occurs when ONTAP® software detects an unsupported disk shelf.

**Corrective Action**

Verify that the disk shelf attached is supported by the version of ONTAP running on the storage controller. If the disk shelf is supported, replace the disk shelf module.

### **Syslog Message**

Disk shelf %s (%s) is unsupported.

### **Parameters**

**device** (STRING): Device address of the disk shelf.

**product\_id** (STRING): Product ID of the disk shelf.

# dlock events

## dlock.release events

### dlock.release.error

#### Severity

ERROR

#### Description

This message occurs when ONTAP® software reports an error while attempting to release an internal lock. This might impact services like Application-aware data management.

#### Corrective Action

Run the node local "dlock show" diag-level command to confirm whether the lock still exists. If the lock exists, run the node local "dlock release" diag-level command to clear the lock. If the lock does not exist, then the error was likely transient and can be ignored. Contact NetApp technical support for more information or assistance.

#### Syslog Message

Failed to release internal lock. Lock ID: "%s". Owner ID: "%s". Reason: %s.

#### Parameters

**lockid** (STRING): Lock ID.

**ownerid** (STRING): Owner ID.

**error** (STRING): Error that was encountered.

# dm events

## dm.cluster events

### dm.cluster.rebaselinefailed

**Severity**

ERROR

**Description**

This message occurs when resynchronization of the cluster configuration failed in a MetroCluster(tm) configuration.

**Corrective Action**

Use the "metrocluster check config-cluster resync" command to resynchronize the cluster configuration.

**Syslog Message**

Cluster configuration resynchronization failed for cluster %s.

**Parameters**

**cluster** (STRING): Name of the cluster whose configuration is being replicated.

## dm.vserver events

### dm.vserver.mcc.rebaselinefailed

**Severity**

ERROR

**Description**

This message occurs when resynchronization of the Vserver configuration failed in a MetroCluster(tm) configuration.

**Corrective Action**

Use the "metrocluster vserver resync" command to resynchronize the Vserver configuration.

**Syslog Message**

Vserver configuration resynchronization failed for Vserver %s.

**Parameters**

**vserver** (STRING): Name of the Vserver whose configuration is being replicated.

### dm.vserver.sm.rebaselinefailed

**Severity**

ERROR

**Description**

This message occurs when resynchronization of the Vserver configuration failed in a Vserver DR

relationship.

**Corrective Action**

Use the "snapmirror resync" command to resynchronize the Vserver configuration.

**Syslog Message**

Vserver configuration resynchronization failed for Vserver %s.

**Parameters**

**vserver** (STRING): Name of the Vserver whose configuration is being replicated.

**dm.vserver.unlockfailed****Severity**

ERROR

**Description**

This message occurs when unlocking the Vserver failed after resynchronization of the Vserver configuration in a MetroCluster(tm) configuration or Vserver DR setup. Management operations on this Vserver will fail, until an unlock operation is done by the admin manually.

**Corrective Action**

Use the "vserver unlock -force true" command at diagnostic privilege to manually unlock the Vserver.

**Syslog Message**

Vserver unlock failed for Vserver %s.

**Parameters**

**vserver** (STRING): Name of the Vserver whose unlock operation failed.

# dml events

## dml.drive events

### dml.drive.offline.status

**Severity**

NOTICE

**Description**

This message occurs when drive offline completes.

**Corrective Action**

(None).

**Syslog Message**

Drive offline request for drive %s %s, (%d).

**Parameters**

**drive\_name** (STRING): Drive name.  
**status\_str** (STRING): Drive offline status string.  
**status\_code** (INT): Drive offline status code.

### dml.drive.online.status

**Severity**

NOTICE

**Description**

This message occurs when drive online completes.

**Corrective Action**

(None).

**Syslog Message**

Drive online request %s %s, (%d).

**Parameters**

**drive\_name** (STRING): Drive name.  
**status\_str** (STRING): Drive online status string.  
**status\_code** (INT): Drive online status code.

## dml.fae events

### dml.fae.key.import.failed

**Severity**

ERROR

## Description

This message occurs when the Device Management Layer fails to import key material.

## Corrective Action

Verify whether aggregate keys are required. Retry the key transport operation.

## Syslog Message

Key import failed. Reason: %s.

## Parameters

**reaon** (STRING): Failure reason.

# dml.init events

## dml.init.fail

### Severity

ERROR

### Description

This message occurs when the Device Management Layer (DML) fails initialization.

### Corrective Action

Retry the startup.

### Syslog Message

Firestorm initialization failed with error code (%d).

### Parameters

**error\_code** (INT): Failure code.

# dml.initialized events

## dml.initialized

### Severity

NOTICE

### Description

This message occurs when the Device Management Layer (DML) is started.

### Corrective Action

(None).

### Syslog Message

DML initialized.

### Parameters

(None).

# dms events

## dms.restserver events

### dms.restserver.ssl.disabled

**Severity**

ERROR

**Description**

This message occurs when the system hits an error in enabling SSL authentication in the rest server.

**Corrective Action**

Check that the SSL certificates and keys given to the rest server are accessible and valid.

**Syslog Message**

Failed to set SSL authentication in DMAP rest server due to %s

**Parameters**

**error** (STRING): Text describing the error.

# dns events

## dns.disabled events

### dns.disabled.configs.removed

**Severity**

NOTICE

**Description**

This message occurs when the last system to be upgraded in a cluster removes DNS configurations that were marked as disabled.

**Corrective Action**

(None).

**Syslog Message**

All DNS configurations with the "-state" parameter set to "disabled" were removed.

**Parameters**

(None).

## dns.server events

### dns.server.timed.out

**Severity**

ERROR

**Description**

This message occurs when the DNS server fails to respond to a query and timeout occurs.

**Corrective Action**

Make sure that the DNS server is up and running and that there are no networking issues preventing the Vserver from communicating with the DNS server.

**Syslog Message**

DNS server %s did not respond to vserver = %s within timeout interval.

**Parameters**

**ipaddr** (STRING): Ip address of the DNS server.

**vsName** (STRING): Name of the Vserver for which DNS response timed out.

# download events

## download.request events

### download.request

**Severity**

NOTICE

**Description**

This event is generated when a user-initiated download is initiated.

**Corrective Action**

(None).

**Syslog Message**

Operator requested download initiated

**Parameters**

(None).

## download.requestdone events

### download.requestDone

**Severity**

NOTICE

**Description**

This event is generated when a user-initiated download has completed.

**Corrective Action**

(None).

**Syslog Message**

Operator requested download completed

**Parameters**

(None).

## download.requestdoneerror events

### download.requestDoneError

**Severity**

ERROR

**Description**

This event is generated when a user-initiated download did not complete successfully because of a problem. See console log for problem and corrective action.

**Corrective Action**

(None).

**Syslog Message**

Operator requested download failed.

**Parameters**

(None).

# ds events

## ds.sas events

### ds.sas.config.warning

#### Severity

ERROR

#### Description

This message occurs when the system detects a configuration problem on the shelf I/O module.

#### Corrective Action

Reseat the disk shelf I/O module. If that does not fix the problem, replace the disk shelf I/O module.

#### Syslog Message

Configuration error on Serial Attached SCSI (SAS) I/O module %s channel %s shelf ID %lld - %s of %d expected %d

#### Parameters

**module\_id** (STRING): Module (A or B) that is experiencing the problem.  
**channel** (STRING): Channel of the shelf that is experiencing the problem.  
**shelfId** (LONGINT): Shelf ID of the shelf that is experiencing the problem.  
**desc** (STRING): Description of the parameter that is misconfigured.  
**actual** (INT): Actual value for this configuration parameter on the shelf I/O module.  
**expected** (INT): Expected value for this configuration parameter on the disk shelf I/O module.

### ds.sas.drivephy.disableErr

#### Severity

ERROR

#### Description

This message occurs when a drive physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to one of the following reasons: manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold Transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; exceeded broadcast change threshold; or mirroring disabled on the other I/O module.

#### Corrective Action

Replace the disabled disk drive.

#### Syslog Message

Disk %s%s on channels %s shelf ID %lld %s bay %s %s.

#### Parameters

**phy** (STRING): Physical layer device (phy) that is being disabled.  
**disk\_data** (STRING): Disk data includes vendor name, model, firmware revision and the serial number of the disabled disk. If unable to access the disk then, this field is blank.  
**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED

if unconnected.

**shelfID** (LONGINT): Shelf ID of the disk shelf reporting the error.

**element** (STRING): IOM (I/O module) designator (A or B).

**bay** (STRING): Bay in which the disk is installed.

**reason** (STRING): Reason the disk phy was disabled.

## **ds.sas.element.fault**

### **Severity**

ERROR

### **Description**

This message occurs when a Serial Attached SCSI (SAS) module in a disk shelf reports an error.

### **Corrective Action**

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

### **Syslog Message**

State of shelf module %s is %s on channels %s shelf ID %d

### **Parameters**

**element** (STRING): Shelf module designator (A or B).

**state** (STRING): Current state of IOM.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

## **ds.sas.element.xport.error**

### **Severity**

ERROR

### **Description**

This message occurs when a Serial Attached SCSI (SAS) disk shelf module reports a transport error.

### **Corrective Action**

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

### **Syslog Message**

Shelf module %s XPORT ERROR on channels %s shelf ID %d

### **Parameters**

**element** (STRING): Shelf module designator (A or B).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

## ds.sas.hostphy.disableErr

### Severity

ALERT

### Description

This message occurs when a host physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to one of the following reasons: Invalid SAS2-SAS3 Transition; manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold; transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; exceeded broadcast change threshold; or mirroring disabled on the other I/O module.

### Corrective Action

If the Host phys were disabled because of an invalid transition, remove the SAS cable on the disabled phys completely from both IOMs and then recable correctly. Removing the cable completely allows both IOMs to reset. For other disabled host phy conditions, replace the shelf module to which the affected host phy belongs.

### Syslog Message

Port %s on channels %s shelf ID %lld %s %s.

### Parameters

**phy** (STRING): Host port that is being disabled.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (LONGINT): Shelf ID of the shelf reporting the error.

**element** (STRING): I/O module designator (A or B).

**reason** (STRING): Reason the host phy was disabled.

## ds.sas.id.conflict.cleared

### Severity

NOTICE

### Description

This message occurs when a shelf ID conflict on a channel reported earlier is resolved.

### Corrective Action

(None).

### Syslog Message

Shelf ID conflict on channel %s (shelf ID: %lld, S/N: %s) was cleared.

### Parameters

**channel** (STRING): Channel that the shelf is attached to.

**shelfid** (LONGINT): Shelf ID.

**SerialNumber** (STRING): Shelf serial number.

## ds.sas.id.conflict.detected

**Severity**

ERROR

**Description**

This message occurs when a SAS shelf ID conflict is detected on a channel.

**Corrective Action**

Ensure that all of the disk shelves in a high-availability pair have a unique shelf ID. For instructions, see "Changing the disk shelf ID" in the Disk Shelf Installation and Service Guide for the shelf model.

**Syslog Message**

SAS shelf on channel %s (shelf ID: %lld, S/N: %s) reported a shelf ID conflict.

**Parameters**

**channel** (STRING): Channel that the shelf is attached to.

**shelfId** (LONGINT): Shelf ID.

**SerialNumber** (STRING): Shelf serial number.

**ds.sas.multPhys.disableErr****Severity**

ALERT

**Description**

This message occurs when the system detects that multiple Physical Layer Devices (PHYs) are disabled on a SAS disk shelf.

**Corrective Action**

Check whether the problems on the PHYs are valid by looking for PHY errors in nearby events. If multiple PHYs are disabled at the same time in a particular disk shelf module, replace the disk shelf module.

**Syslog Message**

Multiple phys have been disabled on the disk shelf %d on Channels %s, %s.

**Parameters**

**shelfID** (INT): ID of the disk shelf reporting the error.

**channels** (STRING): Channels that have the error. "Channel" can be an adapter port, (for example, 0c), or PARTNER for high-availability partner, or UNUSED if unconnected.

**element** (STRING): Disk shelf module designator (A or B).

**ds.sas.ses.disableErr****Severity**

ALERT

**Description**

This message occurs when a virtual (SES) physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to one of the following reasons: manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold Transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; or exceeded broadcast change threshold.

### Corrective Action

Replace the shelf module.

### Syslog Message

SES phy on channel %s shelf ID %lld module %s is disabled.

### Parameters

**channel** (STRING): Channel that has the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (LONGINT): Shelf ID of the shelf reporting the error.

**element** (STRING): I/O module designator (A or B).

## ds.sas.xfer.element.fault

### Severity

ERROR

### Description

This message occurs when an element had a fault during an I/O request. It might be due to a transient condition in link connectivity.

### Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

### Syslog Message

I/O failure on shelf module %s on channels %s shelf id %d, status is %s.

### Parameters

**element** (STRING): Shelf module designator (A or B).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

**state** (STRING): Current state of IOM.

## ds.sas.xfer.not.sent

### Severity

ERROR

### Description

This message occurs when an I/O transfer could not be sent. It might be due to a transient condition in link connectivity.

### Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

### Syslog Message

Shelf module %s I/O failure NOT\_SENT channels %s shelf ID %d

## Parameters

**element** (STRING): Shelf module designator (A or B).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

## ds.sas.xfer.unknown.error

### Severity

EMERGENCY

### Description

This message occurs when an unknown error occurs during an I/O request.

### Corrective Action

Ensure that the shelf module firmware and ONTAP® software are compatible versions. Find firmware versions at the NetApp technical support web site.

### Syslog Message

Shelf module %s I/O failure UNKNOWN: %d channels %s shelf id %d

## Parameters

**element** (STRING): Shelf module designator (A or B).

**status** (INT): Error status code.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

## ds.sas.xfer.xport.error

### Severity

ERROR

### Description

This message occurs when a transport error occurs during an I/O request. It might be due to a transient condition in link connectivity.

### Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

### Syslog Message

Shelf module %s I/O failure TRANSPORT\_ERROR channels %s shelf ID %d.

## Parameters

**element** (STRING): Shelf module designator (A or B).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Shelf ID (0-99) of the shelf reporting the error.

# dump events

## dump.bitmap events

### dump.bitmap.fail

**Severity**

ERROR

**Description**

This event is generated during dump restarting and looking for the bitmap file and it is unable to locate

**Corrective Action**

(None).

**Syslog Message**

Missing bitmap files.

**Parameters**

(None).

## dump.fail events

### dump.fail.snapreserve

**Severity**

ERROR

**Description**

This event is generated while dump is trying to restart and there is no space left in the snap reserve

**Corrective Action**

Please increase the snap reserve space to avoid this error.

**Syslog Message**

Snapshots overflow reserved space.

**Parameters**

(None).

## dump.file events

### dump.file.has.security.label

**Severity**

NOTICE

## Description

This message occurs when the dump engine encounters an NFS security label during any type of dump operation. The dump engine does not back up any NFS security labels but skips them and continues.

## Corrective Action

(None).

## Syslog Message

The dump engine encountered one or more inodes with NFS security labels. The dump engine will back up the inodes but will not back up the associated security labels.

## Parameters

**src\_path** (STRING): Path being backed up.

# dump.inconsistent events

## dump.inconsistent.acl\_data

### Severity

ERROR

### Description

This message occurs when the dump engine encounters a disk error in an ACL file in a Snapshot(tm) copy. Backup will abort.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Dump of source path (%s), Snapshot copy ID (%d): WAFL ACL data inconsistent due to disk errors. Aborting the backup.

### Parameters

**src\_path** (STRING): Source path being backed up.

**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.

## dump.inconsistent.file\_data

### Severity

ERROR

### Description

This message occurs when the dump engine encounters a disk error in a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), inum (%u): WAFL data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort\_on\_disk\_error option.

## Parameters

**src\_path** (STRING): Source path being backed up.  
**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.  
**inum** (INT): Inode number of the file that encountered the disk error.

## dump.inconsistent.ind\_buf

### Severity

ERROR

### Description

This message occurs when the dump engine encounters a disk error in indirect buffers of a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), inum (%u): WAFL metadata and data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort\_on\_disk\_error option.

## Parameters

**src\_path** (STRING): Source path being backed up.  
**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.  
**inum** (INT): Inode number of the file that encountered the disk error.

## dump.inconsistent.stream\_data

### Severity

ERROR

### Description

This message occurs when the dump engine encounters a disk error in a stream associated with a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), stream inum (%u), base inum(%u): WAFL data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort\_on\_disk\_error option.

## Parameters

**src\_path** (STRING): Source path being backed up.  
**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.  
**sinum** (INT): Inode number of the stream that encountered the disk error.  
**inum** (INT): Inode number of the basefile whose associated stream encountered the disk error.

## dump.inconsistent.wafl\_metadata

**Severity**

ERROR

**Description**

This message occurs when the dump engine encounters a disk error in either the inode file, a directory or a stream directory in a Snapshot(tm) copy. As a result of this error, the backup is aborted.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Dump of source path (%s), Snapshot copy ID (%d): WAFL metadata inconsistent due to disk errors.  
Aborting the backup.

**Parameters**

**src\_path** (STRING): Source path being backed up.

**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.

## dump.inconsistent\_streamdir\_lunclone events

### dump.inconsistent\_streamdir\_lunclone

**Severity**

ERROR

**Description**

This message occurs when the dump engine encounters a disk error in a stream directory of an inconsistent LUN clone in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Dump of source path (%s), Snapshot copy ID (%d): WAFL metadata inconsistent due to disk errors.  
Aborting the backup.

**Parameters**

**src\_path** (STRING): Source path being backed up.

**snap\_id** (INT): ID of the Snapshot copy where the disk error was encountered.

## dump.max events

### dump.max.limit

**Severity**

ERROR

## Description

This message occurs when new dump or restore sessions cannot be started because the limit for this platform has been reached.

## Corrective Action

Dump/restore operation limit has been reached for this platform.

## Syslog Message

Maximum limit of dump/restore sessions (%d) has been reached.

## Parameters

**max\_limit** (INT): Maximum dump and restore session limits.

# dump.notify events

## dump.notify.backward.ctime

### Severity

ALERT

### Description

This message occurs when the dump incremental backup might be incomplete. When setting ctime to past values is allowed, files copied to volumes through SMB/CIFS might have timestamps that are in the past compared to the time of copy. If an inode number is reused for the files with timestamps in the past that were copied into the volume after the last backup, the files will be missed in the incremental backup.

### Corrective Action

Disable updates to ctime with past values by setting "bootarg.wafl.allow\_ctime\_backward" to "false", reboot the nodes, and then start a new backup chain from the baseline. For more information on the workaround, contact Technical Support.

### Syslog Message

The incremental backup (Dump name = "%s", Snapshot copy ID = "%d") might be incomplete because setting ctime to past values is allowed on this node.

### Parameters

**dump\_name** (STRING): Dump name.

**snap\_id** (INT): ID of the Snapshot copy being backed up.

# dump.register events

## dump.register.commit

### Severity

ERROR

### Description

This event is generated when a registry transaction failed to commit

**Corrective Action**

(None).

**Syslog Message**

Failed to flush backup table entry upgrade to registry: %s

**Parameters**

**subject** (STRING): Error description

**dump.register.create****Severity**

ERROR

**Description**

This event is generated when a registry creation is failed. Memory allocation failure

**Corrective Action**

(None).

**Syslog Message**

Failed to create a registry transaction for dump(%d).

**Parameters**

**dump\_id** (INT): Dump ID

**dump.register.set****Severity**

ERROR

**Description**

This event is generated when a registry is tried to set and failed because a freed transaction is being tried to set

**Corrective Action**

(None).

**Syslog Message**

Failed to write context update information to registry.

**Parameters**

(None).

**dump.snapshot events****dump.snapshot.fail****Severity**

ERROR

## Description

This event is generated during dump restarting and looking for the snapshot that was created by the dump while it was terminating last time and we are unable to locate the snapshot

## Corrective Action

(None).

## Syslog Message

Unable to locate snapshot needed by dump context ID (%d).

## Parameters

**dump\_id** (INT): Dump ID

# dump.terminate events

## dump.terminate

### Severity

NOTICE

### Description

This event is generated during dump termination, we see if we can retrieve the name of the dump. If we are unable to retrieve the name of the dump then dump id that is terminated is notified or else both dump id and name of the dump are notified

### Corrective Action

(None).

### Syslog Message

Terminating dump(%d)%s

### Parameters

**dump\_id** (INT): Dump ID

**dump\_name** (STRING): Dump Name

## dump.terminate.reserved

### Severity

NOTICE

### Description

This event is generated when we tried to terminate dump and have checked if dump is in the reserved state. This is just a notification message for dump termination and it is also restartable.

### Corrective Action

(None).

### Syslog Message

Terminating restartable dump(%d)

## Parameters

`dump_id` (INT): Dump ID

# dump.transit events

## dump.transit.fail

### Severity

ERROR

### Description

This event is generated when the failover is still in transit while waiting for the dump to be initialized

### Corrective Action

(None).

### Syslog Message

Failover is still in transit.

## Parameters

(None).

# dump.volume events

## dump.volume.memory

### Severity

NOTICE

### Description

This event is generated when we are trying to dump a volume which is full and we cannot write the offsetmap on to the disk and we are using memory instead of disk to do this.

### Corrective Action

Please free up some of the disk space for this volume in order to avoid this memory consumption.

### Syslog Message

DUMP using memory due to lack of disk space on /vol/%s.

## Parameters

`vol_name` (STRING): Name of the volume that is full which needs to be freed

# dump.xfercomplete events

## dump.xfercomplete.inconsistent\_data

### Severity

ERROR

**Description**

This message occurs when the dump engine completes data backup with disk errors in user files.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Dump of source path (%s): One or more files in the backup encountered disk errors. Refer to /etc/log/backup for a list of files that encountered disk errors.

**Parameters**

**src\_path** (STRING): Source path being backed up.

# ekmip events

## ekmip.akv events

### ekmip.akv.available

#### Severity

NOTICE

#### Description

This message occurs when a configured Azure Key Vault (AKV) that was previously reported unavailable for key operations is now available.

#### Corrective Action

(None).

#### Syslog Message

The AKV Key Management Service is now available. AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

#### Parameters

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**configName** (STRING): Name of the AKV configuration.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

### ekmip.akv.keyExpired

#### Severity

ERROR

#### Description

This message occurs when the current key version associated with the key identifier of the configured Azure Key Vault (AKV) has expired. The key version might be out of compliance. It is recommended that you update the key version to an active, non-expired key. ONTAP is still able to unwrap the top-level internal key protection key with the expired key version and there is no interruption to data availability.

#### Corrective Action

Update the key-ID to an active, non-expired key at the AKV portal.

#### Syslog Message

The AKV key version has expired. Key ID: "%s". AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

#### Parameters

**keyId** (STRING): Key ID.

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**configName** (STRING): Name of the AKV configuration.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

## ekmip.akv.keyVersionChanged

### Severity

NOTICE

### Description

This message occurs when the current key version associated with the key identifier of the configured Azure Key Vault (AKV), the AKV key-ID, changes. The key version might have been auto-rotated or manually changed at the AKV. Additionally, the top-level internal key protection key has been successfully re-wrapped with the current key version of the AKV key-ID.

### Corrective Action

(None).

### Syslog Message

The AKV key version has been changed. AKV configuration details, SVM "%s", configuration name "%s", AKV: "%s", previous key version: "%s", current key version: "%s".

### Parameters

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**configName** (STRING): Name of the AKV configuration.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

**oldKeyVersion** (STRING): Previous key version.

**newKeyVersion** (STRING): Current key version.

## ekmip.akv.notAvailable

### Severity

ALERT

### Description

This message occurs when a check for the availability of the configured Azure Key Vault (AKV) for key operations fails. The AKV might be down or there might be a network-related problem preventing communication. Without access to the AKV, the node might not be able to restore authentication keys needed to unlock NetApp Storage Encryption (NSE) or SED drives, or encryption keys needed to mount encrypted volumes. If the AKV is unavailable the next time this node boots, then the failure to restore the keys might prevent the node from booting successfully or prevent the encrypted volumes hosted on this node from coming online.

### Corrective Action

Ensure that the AKV configuration is correct by using the "security key-manager external azure show -vserver <vserver>" command and verifying that the cluster state is available. If it is not available, run the "security key-manager external azure restore" command to bring the cluster state to available. If the issue still persists, contact technical support.

### Syslog Message

The AKV Key Management Service is not available. AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

### Parameters

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**configName** (STRING): Name of the AKV configuration.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

## ekmip.akv.volOffline

### Severity

ALERT

### Description

This message occurs when the SVM has been blocked and any encrypted volumes belonging to the SVM have been taken offline due to errors received when attempting to access the key owned by the Azure Key Vault (AKV). Reasons for AKV key access errors include a disabled key, a key not being found and a key missing encryption and decryption privileges. ONTAP polls the AKV every 15 minutes to verify key accessibility. If, for 60 minutes, ONTAP does not receive a successful response to a poll, all encrypted volumes are taken offline and remain offline until the key access issues are resolved at the AKV. When ONTAP does receive a successful response, the volumes are brought back online automatically.

### Corrective Action

Resolve the key access issues at the AKV portal. Ensure that the key is active and has the required encryption and decryption privileges.

### Syslog Message

The SVM has been blocked and any encrypted volumes belonging to the SVM have been taken offline due to key access errors. AKV configuration details, SVM: "%s", configuration name "%s", key ID: "%s", AKV name: "%s".

### Parameters

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**keyId** (STRING): Key ID.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

**configName** (STRING): Name of the AKV configuration.

## ekmip.akv.volOnline

### Severity

NOTICE

### Description

This message occurs when the volumes configured on the Azure Key Vault (AKV) that were unavailable due to key access issues are now back online.

### Corrective Action

(None).

### Syslog Message

Encrypted volumes belonging to the SVM are now back online. AKV configuration details, SVM: "%s", configuration name: "%s", key ID "%s", AKV name: "%s".

### Parameters

**svm** (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.

**name** (STRING): Uniform resource identifier (URI) of the AKV.

**configName** (STRING): Name of the AKV configuration.

**keyId** (STRING): Key ID.

**keyringName** (STRING): Name of the key ring.

## ekmip.ikpkms events

### ekmip.ikpkms.200.missingField

### Severity

ALERT

### Description

This message occurs when trying to access the key owned by the IBM Key Protect (IKP) Key Management Service (KMS) and an "OK" response (code 200) is received but one field of the response is not populated. Reasons for IKP KMS key access errors include a disabled key, a destroyed key, key not found, or a user not having sufficient privileges to access the key. ONTAP polls the IKP KMS to verify key accessibility. The missing field is integral in determining the status of the key.

### Corrective Action

The IKP KMS provided a response with a status of 200 (OK) that did not contain all of the expected fields. Contact technical support to resolve this issue.

### Syslog Message

A 200 OK response was received from IKP KMS but the field "%s" was missing for Vserver "%s" with Keymanager Name "%s" associated with key "%s" owned by IKP KMS region "%s" with instance ID "%s".

## Parameters

**missingField** (STRING): Name of the field that is not populated.  
**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): The name of the IKP KMS.  
**keyId** (STRING): The Key ID associated with this IKP KMS instance.  
**region** (STRING): The region associated with this IKP KMS instance.  
**instanceId** (STRING): IKP KMS Instance ID.

## ekmip.ikpkms.available

### Severity

This message occurs when a configured IBM Key Protect (IKP) Key Management Service (KMS) that was unavailable for key operations is now available.

### Corrective Action

(None).

### Syslog Message

The IKP KMS with region: "%s", instance ID: "%s", and key ID: "%s" configured for Vserver "%s" with Keymanager Name "%s" is now available.

## Parameters

**region** (STRING): The region associated with this IKP KMS instance.  
**instanceId** (STRING): IKP KMS Instance ID.  
**keyId** (STRING): The Key ID associated with this IKP KMS instance.  
**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): The name of the IKP KMS.

## ekmip.ikpkms.keyVersionChg

### Severity

NOTICE

### Description

This message occurs when the key version associated with the key ID of the configured IBM Key Protect (IKP) Key Management Service (KMS) changes. The key version might have been auto-rotated or manually changed at the IKP KMS. Additionally, as a result of updated key version, the top-level internal key-protection key has been successfully rewrapped with the current key version of the IKP KMS key ID.

### Corrective Action

(None).

### Syslog Message

The version of the key "%s" owned by IKP KMS region "%s" and instance ID "%s", configured for Vserver "%s" with Keymanager Name "%s", has been changed from "%s" to "%s".

## Parameters

**keyId** (STRING): The Key ID associated with this IKP KMS instance.  
**region** (STRING): The region associated with this IKP KMS instance.

**instanceId** (STRING): IKP KMS Instance ID.  
**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): The name of the IKP KMS.  
**oldKeyVersion** (STRING): Prior key version.  
**newKeyVersion** (STRING): New key version.

## ekmip.ikpkms.notAvailable

### Severity

ALERT

### Description

This message occurs when a check for the availability of the configured IBM Key Protect (IKP) Key Management Service (KMS) fails. The IKP KMS might be down or there might be a network-related problem preventing communication. Without access to the IKP KMS, the node might be unable to restore authentication keys needed to unlock NetApp Storage Encryption (NSE) drives or encryption keys needed to mount encrypted volumes. If the IKP KMS is unavailable, then the next time this node boots, the failure to restore the keys might prevent the node from booting successfully or the encrypted volumes hosted on this node from coming online.

### Corrective Action

Verify that the IKP KMS configuration is correct by using the "security key-manager external ikp show -vserver <vserver\_name>" command, and verify that the IKP KMS cluster state is available. If the cluster state is unavailable, run the "security key-manager external ikp restore" command to bring the cluster state to available. If the issue still persists, contact NetApp technical support.

### Syslog Message

The IKP KMS with region: "%s", instance ID: "%s", and key ID: "%s" configured for Vserver "%s" with Keymanager Name "%s" is not available.

### Parameters

**region** (STRING): The region associated with this IKP KMS instance.  
**instanceId** (STRING): IKP KMS Instance ID.  
**keyId** (STRING): The Key ID associated with this IKP KMS instance.  
**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): The name of the IKP KMS.

## ekmip.ikpkms.volOffline

### Severity

ALERT

### Description

This message occurs when the volumes belonging to the Vserver are taken offline due to errors received when trying to access the key owned by the IBM Key Protect (IKP) Key Management Service (KMS). Reasons for IKP KMS key access errors include a disabled key, a destroyed key, key not found, or a user not having sufficient privileges to access the key. ONTAP polls the IKP KMS to verify key accessibility. If, after 60 minutes, ONTAP has not received a successful response to a poll, volumes are taken offline and remain offline until the key access issues are resolved at the IKP KMS. Subsequently, if ONTAP does receive a successful response, the volumes will be brought back online automatically.

### Corrective Action

Resolve the key access issues at the IKP KMS portal. Ensure that the key is active and the user has the required privileges to access the key.

### Syslog Message

Encrypted volumes belonging to Vserver "%s" with Keymanager Name "%s" were taken offline due to key access errors associated with key "%s" owned by IKP KMS region "%s" and instance ID "%s".

### Parameters

**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): The name of the IKP KMS.  
**keyId** (STRING): The Key ID associated with this IKP KMS instance.  
**region** (STRING): The region associated with this IKP KMS instance.  
**instanceId** (STRING): IKP KMS Instance ID.

## ekmip.ikpkms.volOnline

### Severity

This message occurs when the volumes configured on the IBM Key Protect (IKP) Key Management Service (KMS) that were unavailable due to key access issues are now back online.

### Corrective Action

(None).

### Syslog Message

Encrypted volumes belonging to Vserver "%s" with keymanager name "%s" associated with key-id "%s" owned by IBM Key Protect (IKP) KMS region "%s" and instance ID "%s" are now back online.

### Parameters

**vserver** (STRING): Name of the Vserver where the IKP KMS is configured.  
**kmName** (STRING): Name of the IKP KMS.  
**keyId** (STRING): Key ID associated with this IKP KMS instance.  
**region** (STRING): Region associated with this IKP KMS instance.  
**instanceId** (STRING): IKP KMS Instance ID.

# ems events

## ems.asup events

### ems.asup.noteto.transition

#### Severity

NOTICE

#### Description

This message occurs when the e-mail addresses for deprecated AutoSupport "noteto" messages are copied to EMS event notification destinations during an upgrade to Data ONTAP® 9.0 or later. This results in duplicate event notifications: one EMS notification and one AutoSupport short note message. Use the "event notification destination {show|modify}" command to view or modify deprecated "noteto" e-mail addresses to use new e-mail destinations. This copy action also creates an event notification that maps the "important-events" filter to all of the newly created destinations. Use the "event notification {show|modify}" command to view or modify the new event notification, as necessary. All events that match the "important-events" filter send notifications to the new destinations, including the AutoSupport triggers with "noteto" enabled.

#### Corrective Action

To remove event message duplication, remove the AutoSupport "noteto" addresses by entering the "system node autosupport modify -node \* -noteto -" command.

#### Syslog Message

AutoSupport -noteto e-mail addresses have been copied and transitioned to EMS event notification destinations.

#### Parameters

(None).

## ems.engine events

### ems.engine.event.dnsLkupFail

#### Severity

ERROR

#### Description

This message occurs when the Event Management System (EMS) fails to send an event to a mail destination due to name resolution lookup failures for the mail server specified in EMS configuration options. Possible reasons for failure: DNS servers are not reachable, name services might not be configured correctly or, the configured mail server host name is no longer valid.

#### Corrective Action

Use the "vserver services name-service dns show" command to check the DNS configuration. If DNS is not configured correctly, use the "vserver services name-service dns modify" command to correct DNS server information, or the "vserver services name-service dns host modify" to correct static host name-to-IP address mapping information. Use the "event config {show|modify}" command to verify or change the configured mail server.

## Syslog Message

Failed to send EMS event %s to mail server "%s" because the host name could not be resolved.

## Parameters

**emsId** (STRING): EMS identifier of the event that was not sent to the mail destination.

**mailserver** (STRING): Mail server specified in EMS configuration options that could not be resolved.

## ems.engine.event.undefinedEvent

### Severity

NOTICE

### Description

This message occurs when the Event Management System (EMS) receives an event that it does not recognize. The event cannot be processed.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**requestedEventName** (STRING): EMS identifier of the event that was undefined.

**requestedEventParams** (STRING): List of parameters provided with the requested event.

## ems.engine.event.unrecognizedEventVersion

### Severity

NOTICE

### Description

This message occurs when the Event Management System (EMS) receives an event name that it recognizes, but the event has unexpected parameters. This might occur naturally when the EMS tries to replay an event that occurred before an upgrade (or revert) and the event definition changed between versions.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**originalEventXml** (STRING): Event name and parameters that were not recognized.

## ems.engine.flush

### Severity

INFORMATIONAL

## Description

This message occurs when the event queues are flushed. Event queues are flushed on system shutdown and before some types of AutoSupport™ data collection.

## Corrective Action

(None).

## Syslog Message

(None).

## Parameters

(None).

# ems.snmp events

## ems.snmp.parse.error

### Severity

ERROR

### Description

This message occurs when SNMP parsing of an input packet fails. It could fail for various reasons. The most common failures are due to invalid values for the integer and string fields in the Protocol Data Unit (PDU) and message overflows.

### Corrective Action

An agent is incorrectly communicating with the system using SNMP. Find and disable or correct this agent. An Ethernet "sniffer" might be required to identify the client source that is sending the unsupported or incorrect SNMP request.

### Syslog Message

%s

### Parameters

**errorMsg** (STRING): Returned error message from the parsing of the input packet.

# ems.test events

## ems.test.notice

### Severity

NOTICE

### Description

This message occurs when the system generates a test EMS message of notice severity in response to a user test request.

### Corrective Action

(None).

**Syslog Message**

(None).

**Parameters**

(None).

# enc events

## enc.operation events

### enc.operation.aborted

#### Severity

ERROR

#### Description

This message occurs when either the rekeying of an encrypted flexible volume, or the conversion of the volume from unencrypted to encrypted, has been aborted.

#### Corrective Action

Determine the cause of the error by using either the "volume encryption rekey show -vserver <vserver-name> -volume <volume-name>" command or the "volume encryption conversion show -vserver <vserver-name> -volume <volume-name>" command. Correct the error. If the error was related to rekeying, continue the operation by using the "volume encryption rekey resume -vserver <vserver-name> -volume <volume-name>" command. If the error was related to conversion to encryption, continue the operation by using the "volume encryption conversion resume -vserver <vserver-name> -volume <volume-name>" command.

#### Syslog Message

%s scan is aborted in the volume '%s' (aggr '%s'). Reason: %s.

#### Parameters

**op** (STRING): Rekey or conversion operation.  
**volume** (STRING): Volume name.  
**aggr** (STRING): Name of the containing aggregate.  
**status** (STRING): Status of the scan.

### enc.operation.completed

#### Severity

NOTICE

#### Description

This message occurs when rekey or conversion to encryption operation is completed in a flexible volume.

#### Corrective Action

(None).

#### Syslog Message

%s operation is completed in the volume '%s' (aggr '%s').

#### Parameters

**op** (STRING): Rekey or conversion operation.  
**volume** (STRING): Volume name.  
**aggr** (STRING): Name of the containing aggregate.

## enc.operation.disableAid

### Severity

NOTICE

### Description

This message occurs when the system automatically disables the Aggregate Inline Deduplication (AID) feature for a volume as it is converted from a non-encrypted volume to an encrypted volume because AID is not supported for an encrypted volume.

### Corrective Action

(None).

### Syslog Message

AID is disabled for volume %s within aggregate %s during conversion to encryption operation.

### Parameters

**volume** (STRING): Volume name.

**aggr** (STRING): Name of the containing aggregate.

## enc.operation.failure

### Severity

ERROR

### Description

This message occurs when there is a failure in encryption operation. The operation description explains the nature of operation and reason for failure.

### Corrective Action

Ensure that there is enough space in the aggregate, cluster is healthy, volume location database is online, and then retry the volume encryption operation.

### Syslog Message

Failure in %s operation on volume '%s' (aggr '%s'). Reason '%s'.

### Parameters

**op** (STRING): Rekey or conversion operation.

**volume** (STRING): Volume name.

**aggr** (STRING): Name of the containing aggregate.

**desc** (STRING): Describes the reason for the failure of operation with arguments.

## enc.operation.started

### Severity

NOTICE

### Description

This message occurs when rekey or conversion to encryption operation is started in a flexible volume.

**Corrective Action**

(None).

**Syslog Message**

%s operation is started in the volume '%s' (aggr '%s').

**Parameters**

**op** (STRING): Rekey or conversion operation.

**volume** (STRING): Volume name.

**aggr** (STRING): Name of the containing aggregate.

NOTICE

#### Description

This message occurs when a rekey or conversion to encryption operation is completed on a volume.

#### Corrective Action

(None).

#### Syslog Message

%s operation is completed on the volume '%s' in Vserver '%s'.

#### Parameters

**op** (STRING): Rekey or conversion operation.  
**volumename** (STRING): Name of the volume.  
**vservername** (STRING): Name of the Vserver.

### encryption.op.paused.by.user

#### Severity

NOTICE

#### Description

This message occurs when a rekey or conversion to encryption operation is paused as a result of an operator request.

#### Corrective Action

(None).

#### Syslog Message

%s operation is paused by user on the volume '%s' in Vserver '%s'.

#### Parameters

**op** (STRING): Rekey or conversion operation.  
**volumename** (STRING): Name of the volume.  
**vservername** (STRING): Name of the Vserver.

### encryption.op.paused.on.err

#### Severity

ERROR

## Description

This message occurs when a rekey or conversion to encryption operation is paused as a result of an error. If it is a rekey operation, volume will use two encryption keys until the rekey operation is completed. New writes and rekeyed blocks will use the new key, while the data written before the rekey start will still use the old key in the read path. If it is a conversion to encryption operation, new writes and converted blocks will use the key, while data written before conversion will not use any key in the read path. Data access continues to be possible, although performance might be degraded.

## Corrective Action

Determine the cause of the error by using either the "volume encryption rekey show -vserver <vserver-name> -volume <volume-name>" command or the "volume encryption conversion show -vserver <vserver-name> -volume <volume-name>" command. Correct the error. If the error was related to rekeying, continue the operation by using the "volume encryption rekey resume -vserver <vserver-name> -volume <volume-name>" command. If the error was related to conversion to encryption, continue by using the "volume encryption conversion resume -vserver <vserver-name> -volume <volume-name>" command.

## Syslog Message

%s operation on volume '%s' in Vserver '%s' is paused due to an error. Reason '%s'.

## Parameters

**op** (STRING): Rekey or conversion operation.  
**volumename** (STRING): Name of the volume.  
**vservername** (STRING): Name of the Vserver.  
**reason** (STRING): Reason for the failure.

## encryption.op.queued

### Severity

NOTICE

### Description

This message occurs when a plaintext volume is queued for encryption.

### Corrective Action

(None).

### Syslog Message

Volume %s in Vserver %s is queued for %s.

### Parameters

**volumename** (STRING): Name of the volume.  
**vservername** (STRING): Name of the Vserver.  
**op** (STRING): Conversion operation.

## encryption.op.started

### Severity

NOTICE

### Description

This message occurs when a rekey or conversion to encryption operation is started on a volume.

**Corrective Action**

(None).

**Syslog Message**

%s operation is started on the volume '%s' in Vserver '%s'.

**Parameters**

**op** (STRING): Rekey or conversion operation.

**volumename** (STRING): Name of the volume.

**vservername** (STRING): Name of the Vserver.

## encryption.queue events

**encryption.queue.op.failed****Severity**

ERROR

**Description**

This message occurs when an operation on the volume in the encryption queue failed.

**Corrective Action**

Check the reason for the failure included in the message. Correct the issue and try the operation again.

**Syslog Message**

%s operation failed on the queued volume '%s' in Vserver '%s'. Reason: %s.

**Parameters**

**op** (STRING): Conversion operation.

**volumename** (STRING): Name of the volume.

**vservername** (STRING): Name of the Vserver.

**reason** (STRING): Reason for the failure.

# esh events

## esh.async events

### esh.async.error

#### Severity

ERROR

#### Description

This message occurs when there is an error allocating memory for an asynchronous message during disk shelf discovery processing.

#### Corrective Action

If the error occurs upon addition of a disk shelf to a running system, disconnect the shelf and reattach it. If the error occurs during boot, reboot the controller.

#### Syslog Message

Could not allocate memory for an asynchronous message.

#### Parameters

(None).

## esh.auto events

### esh.auto.term.error

#### Severity

ERROR

#### Description

This message occurs when there is an error in autotermination. Major causes of this include: 1) Last disk shelf in the loop has the termination switch set improperly. 2) Communication is lost to some number of disk shelves in the loop due to an incorrect speed setting for DS14mk2 disk shelves, a bad cable connection, or unavailable power.

#### Corrective Action

Use the 'fcstat device\_map' command to verify that all disk shelves in the loop are still accessible. If the disk shelf reporting the autotermination event is not the last disk shelf in the loop, a problem exists with some number of disk shelves in the loop. Check the speed, power, and cabling of all disk shelves in the loop after the disk shelf reporting the autotermination.

#### Syslog Message

AUTO TERMINATION ERROR: TERM switch set improperly on ESH %s on channels %s disk shelf ID %d.

#### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

# esh.bypass events

## esh.bypass.err.disk

### Severity

ERROR

### Description

This message occurs when there is a disk bypass event. It indicates that a disk is bypassed by the embedded switched hub (ESH) due to one of the following reasons: Manually bypassed; Transmitter fault; LIP F8; Data timeout; Receiver loss of signal; Comma loss of signal; Loop test before insert failure; Redundant port configuration; Exceeded stall threshold; Exceeded word error threshold; Exceeded CRC error threshold; or Exceeded clock delta error threshold.

### Corrective Action

Replace the bypassed disk.

### Syslog Message

Disk %s%son channels %s disk shelf ID %d %s%s%s.

### Parameters

**diskID** (STRING): Disk that is being bypassed.

**disk\_data** (STRING): disk data includes vendor name, model, firmware revision and the serial number of the disabled disk. If won't be able to access the disk then this field will be blank.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**bay** (STRING): Bay in which the disk is installed.

**reason** (STRING): Reason the disk was bypassed.

## esh.bypass.host.port

### Severity

ALERT

### Description

This message occurs when there is a host port bypass event. It indicates that a host port is bypassed by the embedded switched hub (ESH) due to one of the following reasons: Manually bypassed; Transmitter fault; LIP F8; Data timeout; Receiver loss of signal; Comma loss of signal; Loop test before insert failure; Redundant port configuration; Exceeded stall threshold; Exceeded word error threshold; Exceeded CRC error threshold; or Exceeded clock delta error threshold.

### Corrective Action

Replace the disk shelf module to which the concerned host port belongs.

### Syslog Message

%s on channels %s disk shelf ID %d %s%s.

### Parameters

**portID** (STRING): Host port that is being bypassed.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**reason** (STRING): Reason the host port was bypassed.

## esh.element events

### esh.element.fault

#### Severity

ERROR

#### Description

This message occurs when the filer cannot communicate with the ESH module.

#### Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

#### Syslog Message

State of ESH module %s is %s on channels %s disk shelf id %d

#### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**state** (STRING): Current state of ESH Module.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

### esh.element.xport.error

#### Severity

ERROR

#### Description

This message occurs when there is a transport error.

#### Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

#### Syslog Message

ESH %s XPORT ERROR on channels %s disk shelf ID %d.

#### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

## esh.init events

### esh.init.error

#### Severity

ERROR

#### Description

This message occurs when the system cannot allocate memory for a required service. The controller might not have sufficient memory to run the operating system, or installed memory is not functioning properly.

#### Corrective Action

Contact NetApp technical support.

#### Syslog Message

Could not allocate memory for ESH globals.

#### Parameters

(None).

## esh.module events

### esh.module.multiprob

#### Severity

ERROR

#### Description

This message occurs when the ESH might have failed because it is reporting multiple problems.

#### Corrective Action

Replace the ESH module if the reported multiple problems are not valid.

#### Syslog Message

channels %s disk shelf ID %d %s%s.

#### Parameters

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**reason** (STRING): Reason the message is being sent.

## esh.pctl events

## esh.pctl.bpCPLDFailed

### Severity

ERROR

### Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the backplane CPLD (Complex Programmable Logic Device) is not operational.

### Corrective Action

Power-cycle the disk shelf. If the problem persists, replace the disk shelf.

### Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. Backplane CPLD (Complex Programmable Logic Device) in the disk shelf is not operational.

### Parameters

**loopID** (INT): Loop ID of the disk for which the 'power control' command failed.

**vendor** (STRING): Vendor name of the disk.

**model** (STRING): Model name of the disk.

**fwrev** (STRING): Firmware revision of the disk.

**serno** (STRING): Serial number of the disk.

**shelfID** (INT): Disk shelf ID of the disk shelf that reported an error.

**channelName** (STRING): Name of the Fibre Channel adapter port.

## esh.pctl.connFailed

### Severity

ERROR

### Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the CPLD (Complex Programmable Logic Device) serial link on the specified module has a problem.

### Corrective Action

Replace the specified I/O module.

### Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. The CPLD (Complex Programmable Logic Device) serial link on I/O module %s has a problem.

### Parameters

**loopID** (INT): Loop ID of the disk for which the 'power control' command failed.

**vendor** (STRING): Vendor name of the disk.

**model** (STRING): Model name of the disk.

**fwrev** (STRING): Firmware revision of the disk.

**serno** (STRING): Serial number of the disk.

**shelfID** (INT): Disk shelf ID of the disk shelf that reported an error.

**channelName** (STRING): Name of the Fibre Channel adapter port.

**module** (STRING): Name of the module with a bad CPLD serial link.

## esh.pctl.modCPLDFailed

### Severity

ERROR

### Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the CPLD (Complex Programmable Logic Device) on an I/O module is not operational.

### Corrective Action

Replace the specified I/O module.

### Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. The CPLD (Complex Programmable Logic Device) on I/O module %s is not operational.

### Parameters

**loopID** (INT): Loop ID of the disk for which the 'power control' command failed.

**vendor** (STRING): Vendor name of the disk.

**model** (STRING): Model name of the disk.

**fwrev** (STRING): Firmware revision of the disk.

**serno** (STRING): Serial number of the disk.

**shelfID** (INT): Disk shelf ID of the disk shelf that reported an error.

**channelName** (STRING): Name of the Fibre Channel adapter port.

**module** (STRING): I/O module with the failed CPLD.

## esh.speed events

### esh.speed.error

#### Severity

ERROR

#### Description

This message occurs when there is an error in the link speed of the disk shelves that are attached to the node. Major causes of this include: 1) Last disk shelf in the loop has the termination switch set improperly. 2) Communication is lost to some number of disk shelves in the loop due to an incorrect speed setting for DS14mk2 disk shelves, a bad cable connection, or unavailable power.

#### Corrective Action

Use the 'fcstat device\_map' command to verify that all disk shelves in the loop are still accessible. Check the speed, power, and cabling of all disk shelves in the loop after the disk shelf reporting the autotermination.

#### Syslog Message

Disk shelf previously connected to the OUT port of ESH %s on channels %s disk shelf ID %d is now inaccessible. (Check cables, speed selection.)

#### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED

if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

## esh.term events

### esh.term.error

#### Severity

ERROR

#### Description

This message occurs when there is an error related to loop termination.

#### Corrective Action

Set the termination switch to the OFF position on the ESH module that is reporting the error.

#### Syslog Message

FORCED TERMINATION ERROR: TERM switch set improperly on ESH %s on channels %s disk shelf ID %d. The disk shelf connected to the OUT port of this ESH module is inaccessible.

#### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

## esh.unable events

### esh.unable.add.shelf

#### Severity

ERROR

#### Description

This message occurs when a disk shelf cannot be added due to a memory allocation failure during disk shelf discovery processing.

#### Corrective Action

If the error occurs upon addition of a disk shelf to a running system, disconnect the shelf and reattach it. If the error occurs during boot, reboot the controller.

#### Syslog Message

Could not perform disk shelf add because of memory allocation failure (%s).

#### Parameters

**name** (STRING): Where in the disk shelf add path the error occurred.

## esh.unexpected events

## esh.unexpected.status

### Severity

ALERT

### Description

This message occurs when a disk shelf reports an unknown status.

### Corrective Action

Ensure that the shelf module firmware and ONTAP® software are compatible versions. Find firmware versions at the NetApp technical support web site.

### Syslog Message

Unexpected ESH status of: %d.

### Parameters

**status** (INT): Unexpected/unknown status code that was received.

## esh.xfer.events

### esh.xfer.element.fault

### Severity

ERROR

### Description

This message occurs when an element is unreachable during an I/O request. It might be due to a transient condition in loop connectivity.

### Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

### Syslog Message

I/O failure on ESH module %s on channels %s disk shelf id %d, status is %s.

### Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

**state** (STRING): State of ESH module.

### esh.xfer.not.sent

### Severity

ERROR

## Description

This message occurs when an I/O transfer cannot be sent. It might be due to a transient condition in loop connectivity.

## Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

## Syslog Message

ESH %s I/O failure NOT\_SENT channels %s disk shelf ID %d.

## Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

## esh.xfer.pctl.error

### Severity

ERROR

### Description

This message occurs when an error is encountered while sending a disk 'power control' command to SCSI Enclosure Services (SES).

### Corrective Action

Check the cabling to the disk shelf. Verify that the SES disk drives in slots 0 and 1 are properly seated. Check the status LEDs on the disk shelf and make sure that the fault LEDs are not lit. Clear any fault condition, if possible. See the quick reference cards beneath the fault disk shelf for information about interpreting the LEDs.

### Syslog Message

Error sending disk 'power control' command to SCSI Enclosure Services (SES) in disk shelf %d on channel %s.

### Parameters

**shelfID** (INT): Disk shelf ID of the disk shelf that reported an error.

**channelName** (STRING): Name of the Fibre Channel adapter port.

## esh.xfer.unknown.error

### Severity

ERROR

### Description

This message occurs when there is an unknown error during an I/O request.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

ESH %s I/O failure UNKNOWN: %d channels %s disk shelf ID %d.

## Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**status** (INT): Error status code.

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

## esh.xfer.xport.error

### Severity

ERROR

### Description

This message occurs when there is a transport error during an I/O request. It might be due to a transient condition in loop connectivity.

### Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

## Syslog Message

ESH %s I/O failure TRANSPORT\_ERROR channels %s disk shelf ID %d.

## Parameters

**element** (STRING): ESH module designator (A is the upper module, B is the lower module).

**channels** (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.

**shelfID** (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

# exports events

## exports.anon events

### exports.anon.noCredForId

#### Severity

ERROR

#### Description

This message occurs when we cannot get UNIX credentials for a user id when evaluating the "-anon" portion of an export-policy rule.

#### Corrective Action

If "-anon" is a UID, ensure that a valid UID exists on the configured name servers. If "-anon" is a username, ensure that a mapping exists between the username and the UID on the configured name servers and the resulting UID is also present.

#### Syslog Message

Cannot retrieve credentials for UID "%u" present in the "-anon" entry for the export-policy rule for Vserver "%d".

#### Parameters

**anonId** (INT): UNIX UID for which we cannot acquire credentials.  
**vserver** (INT): Identifier of the Vserver owning the export-policy.

## exports.dns events

### exports.dns.config

#### Severity

ERROR

#### Description

This message occurs when a name services lookup request finds that DNS is configured as an ns-switch source for hosts, but DNS is not configured for the Vserver. Name services lookups using DNS do not function.

#### Corrective Action

Check the ns-switch sources for hosts database configured for the Vserver using "vserver services name-service ns-switch show -database hosts" and the DNS configuration for the Vserver using "vserver services name-service dns show". Either remove DNS as an ns-switch source, or configure DNS using the "vserver services name-service dns create" command.

#### Syslog Message

DNS is configured as a ns-switch source for hosts, but the DNS configuration is not found for Vserver "%s".

#### Parameters

**vserver** (STRING): Name of the Vserver on which the problem is occurring.

# exports.dom events

## exports.dom.notFound

### Severity

ERROR

### Description

This message occurs when the reverse lookup record mapping an IP address to its hostname cannot be found in the configured name servers. This record must be present to evaluate the export-policy rule that has a domain name in its clientmatch entry.

### Corrective Action

The reverse mapping record might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

### Syslog Message

IP address "%s" does not have a reverse mapping for its corresponding hostname in the configured name servers when evaluating the export-policy rule at index "%u" in policy-id "%llu" for Vserver "%s".

### Parameters

**ipaddr** (STRING): IP address of the client that does not have the reverse lookup record.

**ruleindex** (INT): Index of the export-policy rule for which the problem is occurring.

**policyid** (LONGINT): Identifier for the export-policy owning the export-policy rule.

**vserver** (STRING): Name of the data Vserver for which the problem is occurring.

## exports.dom.transient

### Severity

ERROR

### Description

This message occurs when reverse lookup of the IP address of a client using the configured name servers in a data Vserver is unsuccessful for an export-policy rule that uses the domain name in clientmatch.

### Corrective Action

The name service might not be functioning correctly. Check the configuration with the appropriate tools for each name service.

### Syslog Message

IP address "%s" could not be resolved to a hostname (error %d) when evaluating export-policy rule at index "%u" in policy-id "%llu" in Vserver "%s".

### Parameters

**ipaddr** (STRING): IP address of the client encountering the reverse lookup error.

**retcode** (INT): Error code returned by the name service reverse lookup.

**ruleindex** (INT): Index of the export-policy rule for which the problem is occurring.

**policyid** (LONGINT): Identifier for the export-policy owning the export-policy rule.

**vserver** (STRING): Name of the data Vserver for which the problem is occurring.

# exports.hostname events

## exports.hostname.notFound

### Severity

INFORMATIONAL

### Description

This message occurs when the forward lookup record mapping a host name to its IP address is not found in the configured name servers in a Vserver. This record must be present to evaluate the export-policy rule that has a host name in its clientmatch entry.

### Corrective Action

Ensure that the host has an interface configured for this address family, that the host name is correctly entered, that the host was not inadvertently removed from the name service, or that the host name was never entered at all. If the host should have an address for this address family, then check the configuration by using the appropriate tools for each name service.

### Syslog Message

Hostname "%s" does not have a forward mapping for its corresponding %s address in the configured name servers when evaluating the export-policy rule at index "%u" in policy-id "%llu" for Vserver "%s".

### Parameters

**hostname** (STRING): Name of the host that is not found.

**addrfamily** (STRING): Name of the address family for which the problem occurs.

**ruleindex** (INT): Index of the export-policy rule for which the problem occurs.

**policyid** (LONGINT): Identifier for the export-policy that owns the export-policy rule.

**vserver** (STRING): Name of the Vserver for which the problem occurs.

## exports.hostname.transient

### Severity

ERROR

### Description

This message occurs when a host named in a clientmatch entry of an export-policy rule is not resolved to an IP address using the configured name servers in a data Vserver.

### Corrective Action

Ensure that the name service is functioning correctly by checking the configuration by using the appropriate tools for each name service.

### Syslog Message

Hostname "%s" could not be resolved to an %s address (error %d) when evaluating export-policy rule at index "%u" in policy-id "%llu" on Vserver "%s".

### Parameters

**hostname** (STRING): Name of the host that is not resolved.

**addrfamily** (STRING): Name of the address family for which the problem occurs.

**retcode** (INT): Error code returned by the name service lookup.

**ruleindex** (INT): Index of the export-policy rule for which the problem occurs.

**policyid** (LONGINT): Identifier for the export-policy that owns the export-policy rule.  
**vserver** (STRING): Name of the data Vserver for which the problem occurs.

## exports.netgroup events

### exports.netgroup.dnsNoPtrRec

#### Severity

ERROR

#### Description

This message occurs when the reverse lookup record mapping an IP address to its hostname cannot be found in the configured name servers. This record must be present to evaluate the membership of a hostname in the netgroup named in the clientmatch of an export-policy rule.

#### Corrective Action

The reverse mapping record might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

#### Syslog Message

IP address "%s" does not have a reverse mapping for its corresponding hostname in the configured name servers when evaluating the export-policy rules for netgroup "%s" on Vserver "%s".

#### Parameters

**ipaddr** (STRING): IP address of the client that does not have the reverse lookup record.  
**netgroup** (STRING): Name of the netgroup that is being evaluated.  
**vserver** (STRING): Name of the Vserver for which the problem is occurring.

### exports.netgroup.notFound

#### Severity

ERROR

#### Description

This message occurs when a netgroup named in a clientmatch of an export-policy rule is not found in the configured name servers.

#### Corrective Action

The netgroup name might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

#### Syslog Message

Netgroup "%s" cannot be found when evaluating export-policy rules on Vserver "%s".

#### Parameters

**netgroup** (STRING): Name of the netgroup that is not being found.  
**vserver** (STRING): Name of the Vserver for which the problem is occurring.

### exports.netgroup.partial

## Severity

ERROR

## Description

This message occurs when partial netgroup results are returned by the name services because of errors in the netgroup mapping.

## Corrective Action

If the netgroup mapping is greater than 1024 characters for netgroups on Network Information Service (NIS) or 4096 for netgroups in a local file, consider creating a sub netgroup to divide it. If the nesting of the netgroup is too deep, consider reducing the depth by adding the entries directly to the netgroup instead of adding to sub netgroups. If the netgroup has a sub netgroup that is not available as a top level netgroup in the mapping, add an empty entry for the sub netgroup to resolve the error. Ensure the line length and nesting limits are not exceeded.

## Syslog Message

Netgroup %s expansion failed with %s (error: %d) when evaluating export-policy rules on Vserver "%s".

## Parameters

**netgroup** (STRING): Name of the netgroup that could not be expanded.  
**reason** (STRING): Specific reason for the netgroup expansion failure.  
**error** (INT): Error code returned during netgroup expansion.  
**vserver** (STRING): Name of the Vserver in which the problem is occurring.

# exports.ngbh events

## exports.ngbh.allFailed

### Severity

ERROR

### Description

This message occurs when a netgroup by host request fails because all ns-switch sources for the netgroup database have returned connection errors and files are unusable as a source.

### Corrective Action

There might be temporary connectivity issues with the Vserver's configured ns-switch sources for the netgroup database. Check connectivity to the name servers configured for netgroups.

### Syslog Message

Connectivity issues encountered in all ns-switch sources when matching Client IP "%s" in Netgroup "%s" for Vserver "%s".

### Parameters

**client** (STRING): IP address of the client for which the lookup failed.  
**netgroup** (STRING): Name of the netgroup being evaluated.  
**vserver** (STRING): Name of the Vserver where the problem is occurring.

# exports.nsd events

## exports.nsd.anonNameTold

### Severity

ERROR

### Description

This message occurs when a user string cannot be mapped to a user id when evaluating the "-anon" portion of an export-policy rule.

### Corrective Action

If the "-anon" value is a name, ensure that a mapping from that name to a UID exists in the configured name services. For both a name and a UID entry in "-anon", ensure that the resulting UID exists in the configured name services.

### Syslog Message

Cannot retrieve UID for UNIX username "%s" present in the "-anon" entry for the export-policy rule for Vserver "%d".

### Parameters

**anon** (STRING): Anonymous string that cannot be mapped to a user id.  
**vserver** (INT): Name of the Vserver owning the export-policy.

# exports.policy events

## exports.policy.empty

### Severity

NOTICE

### Description

This message occurs when an export policy with no rules is assigned to a volume or a qtree. Such an empty policy makes the volume or qtree inaccessible to NFS and CIFS protocol clients.

### Corrective Action

If access is needed for the volume or qtree, then create an export policy rule using the "export-policy rule create" command.

### Syslog Message

An export policy "%s" with no rules was assigned to a %s "%s" on the Vserver %s.

### Parameters

**policyName** (STRING): Name of the export policy with no rules.  
**type** (STRING): Type of object (volume or qtree).  
**typeName** (STRING): Name of the volume or qtree.  
**vserver** (STRING): Name of the Vserver with this issue.

## **exports.policy.last.rule**

### **Severity**

ERROR

### **Description**

This message occurs when the last rule from the export policy assigned to a volume or qtree is deleted. An empty policy will make the volume or qtree inaccessible to clients using NFS or CIFS protocol.

### **Corrective Action**

If access is needed for the volume or qtree, then create an export policy rule using the "export-policy rule create" command.

### **Syslog Message**

The last rule from export policy "%s" was deleted on Vserver %s.

### **Parameters**

**policyName** (STRING): Name of the export policy from which the rule is being deleted.

**vserver** (STRING): Name of the Vserver where the issue occurs.

# extcache events

## extcache.aggregate events

### extCache.aggregate.invalidate

#### Severity

INFORMATIONAL

#### Description

This message provides diagnostic information about background work taking place in the WAFL® external cache subsystem.

#### Corrective Action

(None).

#### Syslog Message

WAFL external cache: %s

#### Parameters

**detail** (STRING): Specific diagnostic information related to the aggregate invalidation event.

## extcache.configunsupported events

### extCache.configUnsupported

#### Severity

ERROR

#### Description

This message occurs when the controller contains an external cache hardware configuration that cannot be supported on the controller.

#### Corrective Action

Consult the release documentation, check the Interoperability Matrix Tool (IMT) for a supported configuration, or contact Contact NetApp technical support. to understand and correct the hardware configuration.

#### Syslog Message

WAFL external cache hardware configuration is not supported: %s.

#### Parameters

**description** (STRING): String providing information about why the configuration is unsupported.

## extcache.control events

### extCache.control

**Severity**

NOTICE

**Description**

This message occurs when the external cache software cannot signal its administrative thread.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache: %s

**Parameters**

**detail** (STRING): Specific details of the event.

## extcache.disabled events

**extCache.disabled****Severity**

NOTICE

**Description**

This message occurs when the external cache is administratively disabled.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache administratively disabled

**Parameters**

(None).

## extcache.enabled events

**extCache.enabled****Severity**

NOTICE

**Description**

This message occurs when the external cache is administratively enabled.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache administratively enabled

## Parameters

(None).

# extcache.io events

## extCache.io.BlockChecksumError

### Severity

ERROR

### Description

This message occurs when the external cache detects a block checksum verification error while performing a read operation. Checksum errors are infrequent. Some combinations of external cache hardware and software handle these errors automatically without the need for administrator action. If further action is required, other messages will be generated. The operation will be retried from persistent storage (RAID).

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**block\_num** (INT): Block number that failed checksum verification.

## extCache.io.extInfo

### Severity

NOTICE

### Description

This message accompanies read or write errors and prints out any relevant information about the failure.

### Corrective Action

(None).

### Syslog Message

%s: fbn: %lld, pvbn: %lld, vvbn: %lld, inum: %d, ecbn: %lld, vol: %s, aggr: %s.

### Parameters

**description** (STRING): String providing information about the message.

**fileBlockNum** (LONGINT): fbn of the block that errored.

**physBlockNum** (LONGINT): pvbn of the block that errored.

**volBlockNum** (LONGINT): vvbn of the block that errored.

**fileId** (INT): Inode number of the file that owns the block.

**ECblockNum** (INT): The ecbn of the block.

**volName** (STRING): Name of the volume.

**aggrName** (STRING): Name of the aggregate.

## extCache.io.readError

### Severity

NOTICE

### Description

This message occurs when the external cache detects an error on a read. Read errors are infrequent and are usually handled automatically by the external cache without the need for administrator action. The operation will be retried from persistent storage (RAID).

### Corrective Action

(None).

### Syslog Message

WAFL external cache I/O read error: %s, code %d.

### Parameters

**description** (STRING): String providing information about why the operation failed.

**detail** (INT): Detailed error code about why the operation failed.

## extCache.io.writeError

### Severity

NOTICE

### Description

This message occurs when the external cache detects an error on a write. Write errors are infrequent and are usually handled automatically by the external cache without the need for administrator action.

### Corrective Action

(None).

### Syslog Message

WAFL external cache I/O write error: %s, code %d.

### Parameters

**description** (STRING): String providing information about why the operation failed.

**detail** (INT): Detailed error code about why the operation failed.

## extcache.offline events

### extCache.offline

### Severity

ERROR

### Description

This message occurs when the external cache is automatically taken offline. This can happen after an I/O error on the external cache and may result in degraded performance until the problem is corrected.

**Corrective Action**

(Call support).

**Syslog Message**

External cache has been taken offline on error (rc=%d). Check the EMS log for earlier errors.

**Parameters**

**code** (INT): A unique error code for this event.

## extcache.qos events

**extCache.QoS****Severity**

INFORMATIONAL

**Description**

This message occurs when External Cache Quality of Service (QoS) monitoring is enabled/disabled.

**Corrective Action**

(None).

**Syslog Message**

External Cache QoS is: %s.

**Parameters**

**description** (STRING): State of External Cache QoS

## extcache.restart events

**extCache.restart****Severity**

NOTICE

**Description**

This message occurs when the external cache encounters an internal consistency issue and triggers an automatic reset.

**Corrective Action**

(None).

**Syslog Message**

WAF external cache reset: %s

**Parameters**

**detail** (STRING): String providing additional information about what triggered the reset.

# extcache.rw events

## extCache.rw.alloc

### Severity

NOTICE

### Description

This message occurs when an external cache cannot obtain sufficient system resources. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache could not allocate resources: %s.

### Parameters

**description** (STRING): String identifying the specific resources that were not obtained.

## extCache.rw.canceled

### Severity

NOTICE

### Description

This message occurs when the external cache cannot complete cache rearming. This causes the external cache component to start with no data cached, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache reconstruct was canceled.

### Parameters

(None).

## extCache.rw.configChange

### Severity

INFORMATIONAL

### Description

This message occurs when the external cache warming logic detects a change in cache hardware configuration. This causes the external cache component to start with no data cached for any aggregates, which can cause a temporary performance impact. The problem should resolve itself at the next reboot.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache warming aborted due to hardware configuration change.

**Parameters**

(None).

**extCache.rw.emptyCache****Severity**

INFORMATIONAL

**Description**

This message occurs when the external cache warming process terminates due to a lack of active cache entries.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache warming canceled: cache is not in use.

**Parameters**

(None).

**extCache.rw.entry****Severity**

NOTICE

**Description**

This message occurs when the external cache cannot rebuild cache entries from stored data. This event is caused by an internal error and results in a small portion of the cache remaining empty during rewarming.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache experienced an internal error during reconstruct.

**Parameters**

(None).

**extCache.rw.headerInvalid****Severity**

NOTICE

## Description

This message occurs when the external cache warming process encounters an invalid file header. This causes the external cache component to start with no data cached for one or all aggregates, which might cause a temporary performance impact.

## Corrective Action

(None).

## Syslog Message

WAFL external cache warming encountered an invalid file header: %s.

## Parameters

**section** (STRING): String identifying the header section in question.

## extCache.rw.io.readLimit

### Severity

NOTICE

### Description

This message occurs when the external cache exceeds the allowable threshold for I/O errors on reads. This causes the external cache component to start with no data cached for any aggregates and might result in temporarily degraded performance.

### Corrective Action

(None).

### Syslog Message

WAFL external cache warming encountered too many read errors: %s (%d).

### Parameters

**description** (STRING): String providing information about the operation.

**number** (INT): Number of unsuccessful reads detected.

## extCache.rw.io.write

### Severity

INFORMATIONAL

### Description

This message occurs when the external cache detects an I/O error on a write. This causes the external cache component to be unable to reconstruct portions of the cache and might result in slightly degraded performance.

### Corrective Action

(None).

### Syslog Message

WAFL external cache I/O write: %s, code %d.

## Parameters

**description** (STRING): String providing information about the operation.

**detail** (INT): Detailed error code about the operation.

## extCache.rw.io.writeLimit

### Severity

NOTICE

### Description

This message occurs when the external cache exceeds the allowable threshold for I/O errors on writes.

This causes the external cache component to start with no cached data for any aggregates and might result in temporarily degraded performance.

### Corrective Action

(None).

### Syslog Message

WAFL external cache warning encountered too many write errors: %s (%d).

## Parameters

**description** (STRING): String providing information about the operation.

**number** (INT): Number of unsuccessful writes detected.

## extCache.rw.log.bufLoad

### Severity

NOTICE

### Description

This message occurs when the external cache invalidation log cannot load a WAFL® buffer. This causes the external cache component to be unable to rewarm the aggregate in question after a reboot, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache invalidation log buf could not be loaded: aggregate %s.

## Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

## extCache.rw.log.disabled

### Severity

NOTICE

### Description

This message occurs when external cache invalidation logging is disabled for an aggregate. This causes the external cache component to be unable to rewarm that aggregate after a reboot, which might cause a

temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache invalidation log disabled: aggregate %s: %s.

### Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**reason** (STRING): String indicating the cause of the problem.

## extCache.rw.log.freeSpace

### Severity

NOTICE

### Description

This message occurs when an external cache log file cannot be written due to lack of free space. This causes the external cache component to be unable to rewarm a specific aggregate or the entire cache after a reboot, which might cause a temporary performance impact.

### Corrective Action

Make sufficient space available on the aggregate.

### Syslog Message

WAFL external cache log out of space on aggregate %s (needs %d bytes).

### Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the failure.

**bytes** (INT): Number of free bytes needed to successfully open the log file.

## extCache.rw.log.maxSize

### Severity

NOTICE

### Description

This message occurs when an external cache log file reaches its maximum size. This causes the external cache component to be unable to rewarm a specific aggregate or the entire cache after a reboot, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache log reached maximum size: aggregate %s, log %s.

### Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**logtype** (STRING): String identifying the log file that reached the maximum size.

## extCache.rw.log.open

### Severity

NOTICE

### Description

This message occurs when the external cache cannot open a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates after a reboot, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache log could not be opened: aggregate %s, log %s.

### Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**logtype** (STRING): String identifying the type of log file that could not be opened.

## extCache.rw.log.range

### Severity

NOTICE

### Description

This message occurs when the external cache invalidation log has a block address that is not within an aggregate's address range. This causes the external cache component to be unable to rewarm the aggregate in question after a reboot, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache invalidation log block out of range: aggregate %s block %lld.

### Parameters

**aggregate** (STRING): String identifying the aggregate that experienced the failure.

**block** (LONGINT): Block encountered in the invalidation log.

## extCache.rw.log.read

### Severity

NOTICE

### Description

This message occurs when the external cache cannot read from a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates during a reboot, which might cause a temporary performance impact.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache log could not be read: aggregate %s, log %s.

**Parameters**

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**logtype** (STRING): String identifying the log file that could not be read.

**extCache.rw.log.seek****Severity**

NOTICE

**Description**

This message occurs when the external cache cannot manipulate a log file. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache log could not be read: aggregate %s, log %s.

**Parameters**

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**logtype** (STRING): String identifying the log file that could not be read.

**extCache.rw.log.write****Severity**

NOTICE

**Description**

This message occurs when the external cache cannot write to a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates after a reboot, which might cause a temporary performance impact.

**Corrective Action**

(None).

**Syslog Message**

WAFL external cache log could not be written: aggregate %s, log %s.

**Parameters**

**aggregate** (STRING): String identifying the aggregate that experienced the problem.

**logtype** (STRING): String identifying the log file that could not be written.

## **extCache.rw.replay.canceled**

### **Severity**

NOTICE

### **Description**

This message occurs when the external cache cannot successfully process the invalidation logs for an individual aggregate. This causes the external cache component to start with no data cached for the aggregate, which might cause a temporary performance impact.

### **Corrective Action**

(None).

### **Syslog Message**

WAFL external cache replay canceled for aggregate %s: %s.

### **Parameters**

**aggregate** (STRING): String identifying the aggregate in question.

**description** (STRING): String providing information about the operation.

## **extCache.rw.replay.complete**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the external cache finishes processing the invalidation logs for an individual aggregate.

### **Corrective Action**

(None).

### **Syslog Message**

WAFL external cache warming replay complete for aggregate %s with invalidation log %d%% full.

### **Parameters**

**aggregate** (STRING): String identifying the aggregate in question.

**percent** (INT): Percentage of ilog that is full.

## **extCache.rw.replay.start**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the external cache begins processing the invalidation logs for an individual aggregate.

### **Corrective Action**

(None).

### **Syslog Message**

WAFL external cache warming replay has begun for aggregate %s.

### **Parameters**

**aggregate** (STRING): String identifying the aggregate in question.

## **extCache.rw.replay.timeout**

### **Severity**

NOTICE

### **Description**

This message occurs when the external cache timed out waiting for an aggregate to come online and purged old cache entries for it. This causes the external cache component to start with no data cached for the aggregate, which might cause a temporary performance impact.

### **Corrective Action**

(None).

### **Syslog Message**

WAFL external cache replay timed out for aggregate %s.

### **Parameters**

**aggregate** (STRING): String identifying the aggregate in question.

## **extCache.rw.snap.canceled**

### **Severity**

NOTICE

### **Description**

This message occurs when the external cache cannot save a warming snapshot copy. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

### **Corrective Action**

(None).

### **Syslog Message**

WAFL external cache snapshot copy canceled: %s.

### **Parameters**

**description** (STRING): String providing information about why the operation was canceled.

## **extCache.rw.terminated**

### **Severity**

NOTICE

## Description

This message occurs when the external cache warming process is terminated. This causes the external cache component to start with no data cached for any aggregates, which might cause a temporary performance impact.

## Corrective Action

(None).

## Syslog Message

WAFL external cache warming process terminated.

## Parameters

(None).

## extCache.rw.timeout

### Severity

NOTICE

### Description

This message occurs when the external cache warming process terminates after exceeding its allowed time. This causes the external cache component to start with a subset of cached data, which might cause a temporary performance impact.

### Corrective Action

(None).

### Syslog Message

WAFL external cache warming process exceeded its maximum allowable time and was aborted.

### Parameters

(None).

## extcache.unallowed events

### extCache.unallowed.option

#### Severity

NOTICE

#### Description

This message occurs when an external cache bootarg or setflag is set without the required privilege. The default value is used instead.

#### Corrective Action

(None).

#### Syslog Message

WAFL external cache %s %s is set without the required privilege; using the default value.

## Parameters

**type** (STRING): Whether the option set is a bootarg or a setflag.

**option** (STRING): Option name.

# fabric events

## fabric.mgmt events

### fabric.mgmt.interface

**Severity**

NOTICE

**Description**

This message occurs when the system fails to establish a management interface on the fabric.

**Corrective Action**

(None).

**Syslog Message**

Cannot establish a management (Status/Control/Maintenance) interface on fabric %s.

**Parameters**

**fabName** (STRING): Fabric name.

## fabric.sdm events

### fabric.sdm.mem.alloc

**Severity**

NOTICE

**Description**

This message occurs when the system fails to allocate a message for storage device monitor (SDM) notification.

**Corrective Action**

(None).

**Syslog Message**

Failed to allocate a message for SDM notification to fabric\_man.

**Parameters**

(None).

# fabriclink events

## fabriclink.retry events

### fabriclink.retry.delay

#### Severity

NOTICE

#### Description

This message occurs when object replication encounters an error when attempting to contact a remote object store. The attempt will be retried after a short delay.

#### Corrective Action

(None).

#### Syslog Message

Link L%u (%s) encountered OSC error %s; will retry in %u seconds.

#### Parameters

**linkid** (INT): Link ID that encountered an error.

**objstore** (STRING): Object store UUID that encountered an error.

**error** (STRING): Error that was encountered.

**delay** (INT): Delay (seconds) before the attempt will be retried.

# fabricpool events

## fabricpool.cloud events

### fabricpool.cloud.subscription.added

**Severity**

NOTICE

**Description**

This message occurs when a cloud subscription license for FabricPools has been added.

**Corrective Action**

(None).

**Syslog Message**

A cloud subscription license for FabricPools has been added for license type %s. Cluster id: %s.

**Parameters**

**license\_type** (STRING): The type of license that the subscription is added for.

**cluster\_uuid** (STRING): UUID of the cluster.

### fabricpool.cloud.subscription.removed

**Severity**

NOTICE

**Description**

This message occurs when a cloud subscription license for FabricPools has been removed.

**Corrective Action**

(None).

**Syslog Message**

A cloud subscription license for FabricPools has been removed for license type %s. Cluster id: %s.

**Parameters**

**license\_type** (STRING): The type of license that the subscription was removed for.

**cluster\_uuid** (STRING): UUID of the cluster.

## fabricpool.full events

### fabricpool.full

**Severity**

ERROR

## Description

This message occurs when the total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has reached the license limit.

## Corrective Action

To find the percentage of the licensed capacity used by each FabricPool, use the "storage aggregate object-store show-space" command. To create more space, delete Snapshot(tm) copies from volumes with the tiering policy "snapshot" or "backup" by using the "volume snapshot delete" command. To increase the licensed capacity, install a new license on the cluster.

## Syslog Message

Total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has reached the licensed limit. Cluster ID: %s. Current usage: %s, licensed capacity: %s.

## Parameters

**cluster\_uuid** (STRING): UUID of the cluster.

**used\_capacity** (STRING): Total usage of capacity-licensed object stores.

**licensed\_capacity** (STRING): FabricPool licensed capacity.

# fabricpool.lost events

## fabricpool.lost.contact.scu

### Severity

ALERT

### Description

This message occurs when ONTAP has lost contact with the Service Control Unit used with cloud subscription licenses.

### Corrective Action

Ensure that the Service Control Unit is running and Ontap should have connectivity to it.

### Syslog Message

ONTAP has lost contact with the service control unit for the license of type %s. Cluster ID: %s.

### Parameters

**license\_type** (STRING): The type of license which has lost contact with the Service Control Unit.

**cluster\_uuid** (STRING): UUID of the cluster.

# fabricpool.nearly events

## fabricpool.nearly.full

### Severity

ERROR

### Description

This message occurs when the total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has nearly reached the license limit.

## Corrective Action

To find the percentage of the licensed capacity used by each FabricPool, use the "storage aggregate object-store show-space" command. To create more space, delete Snapshot® copies from volumes with the tiering policy "snapshot" or "backup" by using the "volume snapshot delete" command. To increase the licensed capacity, install a new license on the cluster.

## Syslog Message

Total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has nearly reached the licensed limit. Cluster id: %s. Current usage: %s, licensed capacity: %s.

## Parameters

**cluster\_uuid** (STRING): UUID of the cluster.

**used\_capacity** (STRING): Total usage of capacity-licensed object stores.

**licensed\_capacity** (STRING): FabricPool licensed capacity.

# fabricpool.scu events

## fabricpool.scu.contacted

### Severity

NOTICE

### Description

This message occurs when contact has resumed between ONTAP and the Service Control Unit that is used with cloud subscription licenses.

### Corrective Action

(None).

### Syslog Message

Contact has resumed between ONTAP and the service control unit for the license of type %s. Cluster ID: %s.

### Parameters

**license\_type** (STRING): The type of license which has resumed contact with the Service Control Unit.

**cluster\_uuid** (STRING): UUID of the cluster.

# fabricpool.tiering events

## fabricpool.tiering.stopped.no.scu

### Severity

ALERT

### Description

This message occurs when ONTAP has stopped tiering data to the cloud tier because it has lost contact with the Service Control Unit used for one or more cloud subscription licenses.

### Corrective Action

Ensure that the Service Control Unit is running and ONTAP should have connectivity to it.

## **Syslog Message**

Ontap has stopped tiering data to the cloud tier because it lost contact with the Service Control Unit for the license of type %s. Cluster ID: %s.

## **Parameters**

**license\_type** (STRING): The type of license which has lost contact with the Service Control Unit.

**cluster\_uuid** (STRING): UUID of the cluster.

# **fal\_nvme events**

## **fal\_nvme.init events**

### **fal\_nvme.init.failed**

**Severity**

ERROR

**Description**

This message occurs when the Flash Adaptation Layer (FAL) NVMe subsystem fails to initialize.

**Corrective Action**

Reboot the node. If the problem persists, contact technical support for assistance.

**Syslog Message**

FAL NVMe subsystem initialization failed. Reason: %s.

**Parameters**

**reason** (STRING): Reason for failure.

## **fal\_nvme.online events**

### **fal\_nvme.online.succ**

**Severity**

INFORMATIONAL

**Description**

This message occurs when the Flash Adaptation Layer (FAL) NVMe subsystem successfully brings online all resources in a caching module.

**Corrective Action**

(None).

**Syslog Message**

Successfully brought online %lu GB of the caching module.

**Parameters**

**capacity** (LONGINT): Total capacity.

## **fal\_nvme.partition events**

### **fal\_nvme.partition.status**

**Severity**

NOTICE

**Description**

This message occurs when a partition status in the Flash Adaptation Layer (FAL) changes.

**Corrective Action**

(None).

**Syslog Message**

Partition %lx-%lu with capacity %lu GiB status: %s.

**Parameters**

**id** (LONGINTEX): Unique identifier for the partition.

**ns** (LONGINTEX): Index of the namespace.

**capacity** (LONGINT): Partition capacity.

**state** (STRING): Partition state.

# fc events

## fc.bridge events

### fc.bridge.fc.port.alert

#### Severity

ALERT

#### Description

This message occurs when an FC port goes offline.

#### Corrective Action

Check cables, SFPs, and connected devices. If the port is intentionally unused, use the Fibre Channel bridge CLI to disable it.

#### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s FC Port FC\_PORT%d offline. %s

#### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePort** (INT): Port reported by the FC-to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

### fc.bridge.fc.port.notice

#### Severity

NOTICE

#### Description

This message occurs when an FC port on the identified bridge comes online.

#### Corrective Action

(None).

#### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s FC Port FC\_PORT%d connected. %s

#### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePort** (INT): Port reported by the FC-to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.power.alert

### Severity

ALERT

### Description

This message occurs when an FC-to-SAS bridge power supply fails.

### Corrective Action

Check input power and cable. If the problem persists, replace the power supply.

### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s Power Supply %s has failed. %s

### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePowerSupply** (STRING): Power supply reported by the FC-to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.power.notice

### Severity

NOTICE

### Description

This message occurs when an FC-to-SAS bridge power supply returns to normal operation.

### Corrective Action

(None).

### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s Power supply %s operating normally. %s

### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePowerSupply** (STRING): Port reported by the FC-to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.sas.phy.alert

### Severity

ALERT

### Description

This message occurs when a SAS port PHY goes offline.

## Corrective Action

Check Mini-SAS HD connector, cables, and connected equipment.

## Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port %d Phy %d offline. %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePort** (INT): Port reported by the FC-to-SAS bridge.

**bridgePhy** (INT): SAS port Phy reported by the FC-to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.sas.phy.notice

### Severity

NOTICE

### Description

This message occurs when a SAS port PHY on a bridge comes online.

### Corrective Action

(None).

### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS port %d Phy %d online. %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.

**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.

**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.

**bridgePort** (INT): Port reported by the FC-to-SAS bridge.

**bridgePhy** (INT): Phy reported by the FC—to-SAS bridge.

**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.sas.port.alert

### Severity

ALERT

### Description

This message occurs when an SAS port goes offline.

### Corrective Action

Check cables, SFPs, and connected devices. If the port is intentionally unused, use the Fibre Channel bridge CLI to disable it.

## Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port SAS\_PORT%d offline. %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**bridgePort** (INT): Port reported by the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.sas.port.notice

### Severity

NOTICE

### Description

This message occurs when an SAS port on the identified bridge comes online.

### Corrective Action

(None).

## Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port SAS\_PORT%d connected. %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**bridgePort** (INT): Port reported by the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.temp.alert

### Severity

ALERT

### Description

This message occurs when an FC-to-SAS bridge reaches an elevated temperature threshold. The bridge will continue to operate, but action should be taken to reduce the temperature.

### Corrective Action

The bridge is experiencing an elevated temperature, which indicates a loss of cooling airflow. Check cooling airflow, fan operation, and ambient temperature, and take action to reduce the FC-to-SAS bridge operating temperature. If this is not done and the temperature continues to rise, the FC-to-SAS bridge will shut down when the critical temperature threshold is reached.

## Syslog Message

FC-to-SAS %s bridge with name: %s S/N: %s WWN: %s is operating at elevated temperature (%d C). %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**bridgeTemp** (INT): Temperature reported by the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.temp.emergency

### Severity

EMERGENCY

### Description

This message occurs when an FC-to-SAS bridge reaches a critical temperature threshold. The bridge will shut down to protect the hardware.

### Corrective Action

Take immediate action to reduce the operating temperature of the FC-to-SAS bridge to avoid hardware damage. Check cooling airflow, fan operation, and ambient temperature. The FC-to-SAS bridge will shut down when this condition is reached, and will not operate until the temperature is reduced.

### Syslog Message

FC-to-SAS %s bridge with name: %s S/N: %s WWN:%s has reached critical temperature (%d C) and will soon shut down. %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**bridgeTemp** (INT): Temperature reported by the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.temp.notice

### Severity

NOTICE

### Description

This message occurs when an FC-to-SAS bridge returns to a normal operating temperature. No action needs to be taken, because the FC-to-SAS bridge temperature has returned to normal levels.

### Corrective Action

(None).

### Syslog Message

FC-to-SAS %s bridge %s S/N: %s WWN: %s temperature has returned to normal (%d C). %s

## Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.

**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**bridgeTemp** (INT): Temperature reported by the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.throughput.alert

### Severity

ALERT

### Description

This message occurs when an FC-to-SAS bridge experiences degraded throughput.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s is experiencing degraded throughput. %s

### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

## fc.bridge.throughput.notice

### Severity

NOTICE

### Description

This message occurs when an FC-to-SAS bridge recovers from degraded throughput.

### Corrective Action

(None).

### Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s throughput is normal. %s

### Parameters

**bridgeType** (STRING): Type of the FC-to-SAS bridge.  
**bridgeName** (STRING): Name of the FC-to-SAS bridge.  
**bridgeSerialNum** (STRING): Serial number of the FC-to-SAS bridge.  
**bridgeWWN** (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.  
**addlInfo** (STRING): Additional information about the alert being generated, if available.

# fcadmin events

## fcadmin.bridge events

### fcadmin.bridge.prog.disk

#### Severity

INFORMATIONAL

#### Description

This event reports the WWN written to a device.

#### Corrective Action

(None).

#### Syslog Message

Programming Disk %s LUN=%d on Path=0x%0x with WWN  
%02x:%02x:%02x:%02x:%02x:%02x:%02x:%02x.

#### Parameters

**diskName** (STRING): Name of the disk.  
**LUNid** (INT): Logical Unit Number identifier.  
**pathAddress** (INTHEX): Device address.  
**WWNbyte0** (INTHEX): 0th byte of World Wide Name.  
**WWNbyte1** (INTHEX): 1st byte of World Wide Name.  
**WWNbyte2** (INTHEX): 2nd byte of World Wide Name.  
**WWNbyte3** (INTHEX): 3rd byte of World Wide Name.  
**WWNbyte4** (INTHEX): 4th byte of World Wide Name.  
**WWNbyte5** (INTHEX): 5th byte of World Wide Name.  
**WWNbyte6** (INTHEX): 6th byte of World Wide Name.  
**WWNbyte7** (INTHEX): 7th byte of World Wide Name.

### fcadmin.bridge.prog.done

#### Severity

INFORMATIONAL

#### Description

This message indicates that WWN programming has been successfully completed on a disk.

#### Corrective Action

(None).

#### Syslog Message

Disk %s LUN=%d on path=0x%0x successfully programmed. Reboot the drive to see the updated WWN.

#### Parameters

**diskName** (STRING): Name of the disk.  
**LUNid** (INT): Logical Unit Number identifier.  
**pathAddress** (INTHEX): Device address.

## fcadmin.bridge.prog.fault

### Severity

ERROR

### Description

This message indicates that the attempt to write the WWN to the disk has failed.

### Corrective Action

Retry the command after sometime, error might be transient.

### Syslog Message

Error programming disk %s LUN=%d on path=0x%0x. Error status=0x%0x.

### Parameters

**diskName** (STRING): Name of the disk.  
**LUNid** (INT): Logical Unit Number identifier.  
**pathAddress** (INTHEX): Device address.  
**commandStatus** (INTHEX): Returned SCSI error code.

## fcadmin.bridge.progWWN

### Severity

INFORMATIONAL

### Description

This message reports the statistics of the operation to write the World Wide Name (WWN) to the drives.

### Corrective Action

(None).

### Syslog Message

Total LUNs/drives reported = %d. Total LUNs/drives programmed = %d.

### Parameters

**reportedLUNs** (INT): Total number of LUN instances reported for entire session.  
**programmedLUNs** (INT): Total number of LUN instances programmed for entire session.

## fcadmin.bridge.retrieve.fail

### Severity

ERROR

### Description

This event is generated when the drive is not qualified for DDB (Disk Drive Behavior) update while programming the WWNs.

### Corrective Action

(None).

### **Syslog Message**

Error retrieving DDB data for disk=%s on path=0x%0x. Drives on the current path could not be programmed with WWN.

### **Parameters**

**diskName** (STRING): Name of the disk.  
**pathAddress** (INTHEX): Device address.

## **fcadmin.bridge.rprt.fault**

### **Severity**

ERROR

### **Description**

This message is generated when the Report LUNs response completed with some error.

### **Corrective Action**

Retry the command after sometime, error might be transient.

### **Syslog Message**

Error reported for Report LUN command on disk %s on path 0x%0x, error=0x%0x.

### **Parameters**

**diskName** (STRING): Name of the disk.  
**pathAddress** (INTHEX): Device address.  
**commandStatus** (INTHEX): Returned SCSI error code.

## **fcadmin.bridge.rprtcmd.fail**

### **Severity**

ERROR

### **Description**

This event is generated when insufficient SCSI command blocks are available for Report LUN command.

### **Corrective Action**

Retry the command after sometime. As command blocks may have become available.

### **Syslog Message**

Memory allocation failed for Report LUN command. No LUN instances are programmed.

### **Parameters**

(None).

## **fcadmin.bridge.rprtdata.fail**

### **Severity**

ERROR

**Description**

This event is generated when insufficient SCSI command blocks are available for Report LUN command.

**Corrective Action**

Retry the command after sometime. As command blocks may have become available.

**Syslog Message**

Memory allocation failed for Report LUN data command, bytes Requested=%d Disk %s on Path=0x%0x.

**Parameters**

**requestedMemory** (INT): Requested memory for Report LUN data command.

**diskName** (STRING): Name of the disk

**deviceAddress** (INTHEX): Device address.

**fcadmin.bridge.WWN.prog.stat****Severity**

INFORMATIONAL

**Description**

This event is generated when the programming of the WWNs into the reported LUNs is complete. An error in programming is indicated when the number of reported LUNs is different from the number programmed.

**Corrective Action**

(None).

**Syslog Message**

WWN update completed on disk %s path 0x%0x, total %d LUNS reported, total %d LUNS programmed.

**Parameters**

**diskName** (STRING): Name of the disk.

**pathAddress** (INTHEX): Device address.

**LUNsReported** (INT): Number of LUNs reported.

**LUNsProgrammed** (INT): Number of LUNs programmed.

# fci events

## fci.adapter events

### fci.adapter.bootarg.option

#### Severity

INFORMATIONAL

#### Description

This message occurs when the the Fibre Channel adapter driver is setting an option based on the setting of a bootarg variable.

#### Corrective Action

(None).

#### Syslog Message

Bootarg option "%s" configured for Fibre Channel adapter %s.

#### Parameters

**option** (STRING): Option being modified.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter (HBA).

### fci.adapter.dump.saved

#### Severity

NOTICE

#### Description

This message occurs when an unexpected event or invalid condition is detected by the Fibre Channel(FC) initiator driver and the contents of the FC initiator memory is saved. Dump files are stored in a directory on the system's root volume at /etc/log, with the following directory name format:  
slifc\_[adapterName][YYYYMMDD][HHMMSS]

#### Corrective Action

Send the dump file to technical support for analysis.

#### Syslog Message

A dump for adapter %s was stored in %s.

#### Parameters

**adapterName** (STRING): Name of the associated FC host bus adapter.

**filename** (STRING): Name of the file containing the dump.

### fci.adapter.error

#### Severity

NOTICE

## Description

This message occurs when the Fibre Channel adapter driver encounters an error with the adapter. The adapter will be reset to recover.

## Corrective Action

(None).

## Syslog Message

Fibre Channel adapter driver encountered error "%s" on adapter %s.

## Parameters

**error** (STRING): Type of error that occurred.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.fabric.login.failed

### Severity

ERROR

### Description

This message occurs when the Fibre Channel adapter cannot log in with the fabric management server.

### Corrective Action

The driver will attempt to recover from this error, but if this error keeps occurring, make sure that the switch is configured correctly and then try disconnecting and then reconnecting the adapter to the switch.

### Syslog Message

Fibre Channel adapter %s cannot log in with the fabric management server for reason 0x%x.

### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**status** (INHEX): Status returned from the adapter.

## fci.adapter.fabric.ns.login.failed

### Severity

ERROR

### Description

This message occurs when the Fibre Channel adapter cannot log in with the fabric name server.

### Corrective Action

The driver will attempt to recover from this error but if this error keeps occurring make sure that the switch is configured correctly, and then try disconnecting and then reconnecting the adapter to the switch.

### Syslog Message

Fibre Channel adapter %s was unable to log in with the fabric name server for reason 0x%x.

### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**status** (INHEX): Status returned from the adapter.

## **fci.adapter.fabric.request.failed**

### **Severity**

ERROR

### **Description**

This message occurs when the Fibre Channel adapter returns an unexpected status for a fabric query.

### **Corrective Action**

The driver will attempt to recover from this error but if this error keeps occurring make sure that the switch is configured correctly, and then try disconnecting and then reconnecting the adapter to the switch.

### **Syslog Message**

Fibre Channel adapter %s returned unexpected status 0x%x for a fabric query.

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**status** (INHEX): Status returned from the adapter.

## **fci.adapter.failed**

### **Severity**

ALERT

### **Description**

This message occurs when the Fibre Channel adapter driver cannot recover the adapter after resetting it multiple times. The adapter will be put offline.

### **Corrective Action**

If the adapter is in use check the cabling, and if it is connected to disk shelves check the seating of the LRC/ESH cards and disks. If the problem keeps occurring try replacing the adapter. If the issue is still not resolved, contact NetApp technical support for assistance in diagnosing a Fibre Channel issue.

### **Syslog Message**

Failed to recover Fibre Channel HBA %s after multiple resets. Taking the adapter offline.

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**reason** (STRING): Diagnostic information.

## **fci.adapter.firmware.fault**

### **Severity**

NOTICE

### **Description**

This message occurs when a firmware fault is detected on the Fibre Channel adapter and it is being reset to recover.

### **Corrective Action**

(None).

## Syslog Message

Detected firmware fault 0x%x on Fibre Channel adapter %s.

## Parameters

**faultCode** (INHEX): Firmware fault code.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.firmware.pause

### Severity

NOTICE

### Description

This message occurs when a firmware fault is detected on the Fibre Channel adapter and it is being reset to recover.

### Corrective Action

(None).

## Syslog Message

Detected firmware fault 0x%x on Fibre Channel adapter %s.

## Parameters

**faultCode** (INHEX): Firmware fault code.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.link.online

### Severity

INFORMATIONAL

### Description

This message occurs when a Fibre Channel adapter reports online link status, usually after the adapter is reset successfully.

### Corrective Action

(None).

## Syslog Message

Fibre Channel adapter %s link online.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.notification

### Severity

NOTICE

**Description**

This message occurs following a management request from the Fibre Channel(FC) driver to the host bus adapter.

**Corrective Action**

(None).

**Syslog Message**

Fibre Channel adapter driver notification: "%s" on adapter %s.

**Parameters**

**info** (STRING): Description of the outcome.

**adapterName** (STRING): Name of the associated FC host bus adapter.

**fci.adapter.nvram.invalid****Severity**

ALERT

**Description**

This message occurs when ONTAP® software cannot read the NVRAM content of a Fibre Channel adapter. This might cause ONTAP to load an incorrect driver, which could cause the adapter not to work as intended. In addition, the World Wide Node Name (WWNN) and the World Wide Port Name (WWPN) will be incorrect and temporary ones will be assigned. This might cause fabric zoning not to work correctly and might cause problems with anything that depends on consistent WWNNs and WWPNs.

**Corrective Action**

Reboot the appliance. If the problem still exists, replace the adapter.

**Syslog Message**

Cannot read NVRAM content of Fibre Channel adapter %s.

**Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**fci.adapter.offline****Severity**

INFORMATIONAL

**Description**

This message occurs when the system takes a Fibre Channel adapter offline.

**Corrective Action**

(None).

**Syslog Message**

Fibre Channel adapter %s is now offline.

**Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## **fci.adapter.offlining**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the system takes a Fibre Channel adapter offline after all outstanding I/O requests have finished.

### **Corrective Action**

(None).

### **Syslog Message**

Taking Fibre Channel adapter %s offline.

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## **fci.adapter.online**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the system brings a Fibre Channel adapter online.

### **Corrective Action**

(None).

### **Syslog Message**

Fibre Channel adapter %s is now online.

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## **fci.adapter.online.failed**

### **Severity**

ERROR

### **Description**

This message occurs when a Fibre Channel adapter fails to come online.

### **Corrective Action**

If the adapter is in use check the cabling, and if it connected to disk shelves check the seating of the LRC/ESH cards.

### **Syslog Message**

Fibre Channel adapter %s failed to come online.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.onlining

### Severity

INFORMATIONAL

### Description

This message occurs when the Fibre Channel adapter begins the process of going online.

### Corrective Action

(None).

### Syslog Message

Onlining Fibre Channel adapter %s.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.adapter.speed

### Severity

INFORMATIONAL

### Description

This message occurs when speed auto- negotiation for the Fibre Channel port is disabled because the administrator used either the 'ispfc-force-XG-only?' or the 'mptfc-force-XG-only?' boot argument in conjunction with the 'fc-force-XG-ports' boot argument to force a particular speed. For example, setting 'ispfc-force-2G-only?' to 'true' and setting 'fc-force-2G-ports' to '0a,0c' would force ports 0a and 0c to operate at a rate of 2 Gigabits per second.

### Corrective Action

(None).

### Syslog Message

The speed of Fibre Channel adapter port %s was forced to %u Gbps by link speed related boot arguments.

## Parameters

**port** (STRING): Name of the adapter port.

**speed** (INT): Speed the adapter port was assigned.

## fci.adapter.topology

### Severity

INFORMATIONAL

### Description

This message occurs when topology auto- negotiation for the Fibre Channel port is disabled because the administrator used either the 'fc-force-ptp-ports' or the 'fc-force-loop-ports' boot argument to force a particular topology.

## Corrective Action

(None).

## Syslog Message

Fibre Channel adapter port %s was forced to negotiate its topology as %s by topology-related boot arguments.

## Parameters

**port** (STRING): Name of the adapter port.

**topo** (STRING): Topology the adapter port was assigned.

# fci.config events

## fci.config.autoReboot

### Severity

NOTICE

### Description

This message occurs when the system reboots automatically to enable correct adapter operation after changing the state of a reconfigurable adapter.

### Corrective Action

No user action is required. The system is rebooting to enable the new adapter configuration.

### Syslog Message

Rebooting for Fibre Channel adapter %s to become available.

### Parameters

**adapters** (STRING): Affected adapters.

## fci.config.error

### Severity

ERROR

### Description

This message occurs when there is an error during the Fibre Channel adapter auto-reconfiguration process. The specified adapters will be unavailable until the problem is fixed.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Auto-reconfiguration for Fibre channel %s adapter(s) %s has failed.

### Parameters

**type** (STRING): Adapter type.

**adapters** (STRING): Affected adapter(s).

## **fci.config.missing**

### **Severity**

ERROR

### **Description**

This message occurs when the system cannot find Fibre Channel adapter configuration stored on disk, but the adapter is configured in the boot environment. The boot environment information will be used, but you should update the on-disk configuration to be consistent and to prevent the adapter from getting into an unexpected state if the boot environment settings are lost.

### **Corrective Action**

Use the 'fcadmin config' command to reapply the on-disk configuration to match the setting in the boot environment. If the on-disk configuration is not saved and the boot environment is lost, recovery of this adapter's port personality is not possible. No action is taken automatically to correct the problem.

### **Syslog Message**

Fibre Channel adapter %s is configured in the boot environment but the on-disk configuration information is missing.

### **Parameters**

**adapter** (STRING): Name of the affected Fibre Channel adapter.

## **fci.config.needsReboot**

### **Severity**

ERROR

### **Description**

This message occurs when the state of a reconfigurable adapter is changed, but the system must be rebooted to place the adapter into service.

### **Corrective Action**

Reboot the system to enable the new adapter configuration.

### **Syslog Message**

Reboot the system for Fibre channel %s adapter %s to become available.

### **Parameters**

**type** (STRING): Adapter type.

**adapters** (STRING): Affected adapter(s).

## **fci.config.offline**

### **Severity**

NOTICE

### **Description**

This message occurs when a configurable Fibre Channel adapter cannot be brought online because the configured adapter type needs to be changed.

## Corrective Action

Use the 'fcadmin config' utility to change the adapter configuration state and/or reboot the system to allow the PENDING adapter state change to take effect before bringing the adapter online.

## Syslog Message

Fibre Channel adapter %s is offline because it is in the %s state.

## Parameters

**adapter** (STRING): Name of the associated Fibre Channel adapter.

**state** (STRING): Configured adapter state.

## fci.config.state

### Severity

NOTICE

### Description

This message occurs when the state of a configurable Fibre Channel adapter changes.

### Corrective Action

(None).

## Syslog Message

Fibre Channel %s adapter %s is in the %s state.

## Parameters

**type** (STRING): Current adapter type.

**adapter** (STRING): Name of the associated Fibre Channel adapter.

**state** (STRING): Configured adapter state.

## fci.device events

### fci.device.general.reject

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Fibre Channel port transmits a frame that is rejected. The reject frame contains a reason code that can help diagnose the problem. In some cases, this might lead to a solution.

#### Corrective Action

(None).

#### Syslog Message

The frame transmitted by port %s was rejected by port\_id 0x%x with reason code 0x%x '%s', explanation code 0x%x '%s'.

#### Parameters

**port** (STRING): Name of the adapter port that transmitted the rejected frame.

**identifier** (INTEX): Destination port identifier of the rejected frame.

**reasonCode** (INTEX): Reason code byte provided for the exchange failure.  
**reasonString** (STRING): Reason code string provided for the exchange failure.  
**explanationCode** (INTEX): Explanation code byte provided for the exchange failure.  
**explanationString** (STRING): Explanation code string provided for the exchange failure.

## **fci.device.invalidate.soft.address**

### **Severity**

ERROR

### **Description**

This message occurs when a Fibre Channel disk drive takes a soft-assigned address and is being invalidated because soft-assigned addresses are not allowed.

### **Corrective Action**

Disk drives can take a soft-assigned address if the shelf IDs conflict. Make sure that all of the shelves in the loop have unique shelf IDs, and if different shelf types are being mixed, be sure to follow the documentation guidelines for mixing shelves on the same loop. After setting the shelves correctly, power-cycle the shelves so that the drives acquire the correct hard-assigned address.

### **Syslog Message**

Fibre Channel adapter %s is invalidating disk drive %s, which appears to have taken a soft address. Expected hard address %d (0x%x), assigned soft address %d (0x%x).

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.  
**deviceName** (STRING): Name of the associated Fibre Channel device.  
**hardLoopId** (INT): Hard loop ID that the device attempted to acquire.  
**hardALPA** (INTEX): Hard AL\_PA that the device attempted to acquire.  
**softLoopId** (INT): Soft loop ID that the device acquired.  
**softALPA** (INTEX): Soft AL\_PA that the device acquired.

## **fci.device.login.failure**

### **Severity**

ERROR

### **Description**

This message occurs when the Fibre Channel port login fails during the PLOGI or PRLI frame exchange. This can happen due to the reception of a Reject or Logout frame coming from the target, or due to a timeout.

### **Corrective Action**

Power-cycling the device might allow it to recover from this problem.

### **Syslog Message**

A login failure has occurred between Fibre Channel adapter %s and %s device %s, with error subcode %s.

### **Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.  
**deviceType** (STRING): Type of device.  
**deviceName** (STRING): Name of the device.

**code** (STRING): Error subcode provided by the firmware for the login failure, "N/A" if not provided.

## fci.device.login.reject

### Severity

INFORMATIONAL

### Description

This message occurs when the Fibre Channel port transmits a PLOGI frame that is rejected. The reject frame contains a reason code that can help diagnose the problem. In some cases, this might lead to a solution.

### Corrective Action

None.

### Syslog Message

The PLOGI transmitted by port %s was rejected by port\_id 0x%x with reason code 0x%x '%s', explanation code 0x%x '%s'.

### Parameters

**port** (STRING): Name of the adapter port that transmitted the PLOGI frame.

**identifier** (INHEX): Destination port identifier of the PLOGI frame.

**reasonCode** (INHEX): Reason code byte provided for the login failure.

**reasonString** (STRING): Reason code string provided for the login failure.

**explanationCode** (INHEX): Explanation code byte provided for the login failure.

**explanationString** (STRING): Explanation code string provided for the login failure.

## fci.device.loop.recovery

### Severity

ERROR

### Description

This message occurs when a device reports a break in the Fibre Channel loop, which could be due to a bad or unstable connection.

### Corrective Action

Check the cabling and verify that the disk drives and the shelf Fibre Channel modules on the loop are fully inserted. The problem is being caused by a connection in the loop upstream from the device.

### Syslog Message

Loop recovery event caused by the device upstream from %s device %s.

### Parameters

**deviceType** (STRING): Type of device.

**deviceName** (STRING): Name of the device.

## fci.discovery events

## **fci.discovery.timeout**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the Fibre Channel adapter driver cannot complete device discovery within the specified time. The driver allows ONTAP® software to continue booting and continues the discovery process in the background.

### **Corrective Action**

(None).

### **Syslog Message**

Device discovery timeout after %d seconds on adapter %s.

### **Parameters**

**time** (INT): Amount of time, in seconds, spent waiting for device discovery to be completed.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## **fci.fabric.events**

### **fci.fabric.max.ports**

#### **Severity**

ERROR

#### **Description**

This message occurs when a switch in the fabric attached to the Fibre Channel adapter exceeds the maximum number of ports allowed on a switch. Any devices on this switch will not be seen by the Fibre Channel adapter.

#### **Corrective Action**

Any devices on this switch will not be seen by the Fibre Channel adapter. If that is okay then this error can be ignored. If the devices need to be seen by the Fibre Channel adapter then they need to be connected to a switch that does not exceed the maximum number of ports supported per switch.

#### **Syslog Message**

Switch with WWN %s on Fibre Channel adapter %s exceeded the maximum number of ports supported: Maximum ports supported is %d and this switch has %d ports.

#### **Parameters**

**switchWWN** (STRING): World-Wide Name (WWN) of the switch that has exceeded the maximum number of supported ports.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**numMaxSwitches** (INT): Maximum number of ports supported per switch.

**numFabricSwitches** (INT): Number of ports on this switch.

### **fci.fabric.max.switches**

**Severity**

ERROR

**Description**

This message occurs when the fabric attached to the Fibre Channel adapter exceeds the maximum number of allowed switches. This configuration is not supported and will not work.

**Corrective Action**

Reduce the number of switches in the fabric.

**Syslog Message**

Invalid Fabric configuration detected on Fibre Channel adapter %s: Maximum switches supported is %d and this fabric contains %d switches.

**Parameters**

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**numMaxSwitches** (INT): Maximum number of switches supported in a fabric.

**numFabricSwitches** (INT): Number of switches in the fabric.

## fci.flash events

### fci.flash.preload.failed

**Severity**

ERROR

**Description**

This message occurs when there is a failure updating the Fibre Channel adapter flash preload table. If the preload table cannot be updated, the adapter might not have the best configuration settings for the PCI Express link.

**Corrective Action**

In most cases the adapter will still function normally. However, if you see PCI Express correctable errors on this adapter, you should replace the adapter.

**Syslog Message**

Failed to update flash preload table on Fibre Channel adapter %s with error %d.

**Parameters**

**port** (STRING): Name of the adapter port.

**errorCode** (INT): Update error code.

### fci.flash.preload.reboot

**Severity**

INFORMATIONAL

**Description**

This message occurs when the Fibre Channel adapter flash preload table has been updated and the controller is rebooting for the new settings to take effect.

**Corrective Action**

(None).

**Syslog Message**

Rebooting for updated Fibre Channel flash preload table to take effect.

**Parameters**

(None).

**fci.flash.preload.updated****Severity**

INFORMATIONAL

**Description**

This message occurs when the Fibre Channel adapter flash preload table is updated. The preload table contains configuration settings for the adapter.

**Corrective Action**

(None).

**Syslog Message**

Updated flash preload table on Fibre Channel adapter %s to version %s.

**Parameters**

**port** (STRING): Name of the adapter port.  
**version** (STRING): Preload table version.

**fci.fwupdate events****fci.fwupdate.AutoBoot****Severity**

NOTICE

**Description**

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver successfully updates the firmware of the host bus adapter (HBA).

**Corrective Action**

None; the controller is rebooted automatically to enable the new HBA firmware.

**Syslog Message**

FC Initiator HBA %s firmware updated from version %s to %s. The adapter will be reset automatically to enable the new HBA firmware.

**Parameters**

**hba** (STRING): HBA where the firmware version update occurred.  
**currentversion** (STRING): Firmware version the HBA is running.  
**bundleversion** (STRING): Firmware version bundled with ONTAP® software.

## **fci.fwupdate.NeedBoot**

### **Severity**

NOTICE

### **Description**

This message occurs when the Service Level Interface Fibre Channel (SLIFC) Initiator driver successfully updates the firmware version of the host bus adapter (HBA), and requires a reboot of the controller to complete the process.

### **Corrective Action**

(None).

### **Syslog Message**

FC Initiator HBA %s firmware updated from version %s to %s. Reboot the controller to enable the new HBA firmware.

### **Parameters**

**hba** (STRING): HBA where the firmware update occurred.  
**currentversion** (STRING): Firmware version the HBA is running.  
**bundleversion** (STRING): Firmware version bundled with ONTAP® software.

## **fci.fwupdate.UpdDone**

### **Severity**

NOTICE

### **Description**

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver successfully updates the firmware of the host bus adapter (HBA).

### **Corrective Action**

(None).

### **Syslog Message**

FC Initiator HBA %s firmware updated successfully from version %s to %s.

### **Parameters**

**hba** (STRING): HBA where the firmware update occurred.  
**currentversion** (STRING): Firmware version the HBA was running.  
**bundleversion** (STRING): Firmware version bundled with ONTAP® software.

## **fci.fwupdate.UpdErr**

### **Severity**

ERROR

### **Description**

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver encounters an error while updating the firmware of the host bus adapter (HBA).

### Corrective Action

Contact NetApp technical support for further analysis.

### Syslog Message

FC Initiator HBA %s failed to update the firmware from version %s to %s with the status of %d.

### Parameters

**hba** (STRING): HBA where the firmware update failure occurred.  
**currentversion** (STRING): Firmware version the HBA is running.  
**bundleversion** (STRING): Firmware version bundled with ONTAP® software.  
**status** (INT): Status code of the firmware update process.

## fci.link events

### fci.link.break

#### Severity

ERROR

#### Description

This message occurs when the Fibre Channel adapter detects a break in the link.

#### Corrective Action

If the adapter is in use, check the cabling.

#### Syslog Message

Link break detected on Fibre Channel adapter %s.

#### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

### fci.link.break.shelf.fw.update

#### Severity

INFORMATIONAL

#### Description

This message occurs when the Fibre Channel adapter detects a break in the link due to a shelf firmware update being performed.

#### Corrective Action

No corrective action is required. This is expected behavior when firmware is being downloaded to a shelf.

#### Syslog Message

Link break detected on Fibre Channel adapter %s while downloading shelf firmware.

#### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.link.error

### Severity

NOTICE

### Description

This message occurs when the Fibre Channel adapter cannot recover the link and the link is going offline.

### Corrective Action

(None).

### Syslog Message

Could not recover link on Fibre Channel adapter %s after %d seconds. Taking the adapter offline.

### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**downTime** (INT): Amount of time that the link is down.

## fci.loop.events

### fci.loop.stability

### Severity

ERROR

### Description

This message occurs when the Fibre Channel loop generates too many loop initialization events. This can be a sign of unstable hardware.

### Corrective Action

If the adapter is in use check cabling, and if it is connected to disk shelves check the seating of the LRC/ESH cards and disks. If this does not resolve the issue, contact NetApp technical support for assistance in diagnosing a Fibre Channel issue.

### Syslog Message

Fibre Channel adapter %s has a loop stability problem. %d loop-initialization events seen in %d seconds.

### Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**numLips** (INT): Number of loop-initialization events that occurred.

**numSeconds** (INT): Time interval that these loop-initialization events were seen.

## fci.mserr.events

### fci.mserr.general

### Severity

ERROR

## Description

This message occurs when the Fibre Channel fabric cannot successfully complete a request to the Management Server to retrieve configuration information. This query request is issued when the specified adapter is connected to a Fibre Channel fabric. Included in the event is the specific Management Server query along with text describing the reason and explanation codes returned by the fabric.

## Corrective Action

If the system happens to issue a Management Server query while the fabric is processing one or more configuration changes, the fabric might not successfully complete the request. After the fabric stabilizes, the Management Server can resume processing requests and the system automatically recovers from the error. This error is expected on McData switches that do not have the OSMS license installed, and devices on those switches cannot be seen by the Fibre Channel adapter. This error might also take place if the configuration has not been cabled properly, particularly if the explanation code translates into something like 'Invalid name for interconnect element or port'. If this error continues to occur after the fabric has stabilized and it is not happening on a McData switch without the OSMS license installed, check cabling, and contact NetApp technical support.

## Syslog Message

The Fibre Channel fabric Management Server request (%s) sent from adapter %s for WWN (%s) failed with reason code 0x%x (%s), explanation code 0x%x (%s), and response code 0x%x.

## Parameters

**msRequest** (STRING): Name of the failing Fibre Channel Management Server request.  
**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter (HBA).  
**queryWWN** (STRING): World Wide Name that was used for the query.  
**reasonCode** (INHEX): Reason code provided by the fabric for failure of the Management Server request.  
**reason** (STRING): Reason text provided by the fabric for failure of the Management Server request.  
**explanationCode** (INHEX): Explanation code provided by the fabric qualifying the stated reason.  
**explanation** (STRING): Explanation text provided by the fabric qualifying the stated reason.  
**responseCode** (INHEX): Response code provided by the fabric for failure of the specified Management Server request.

# fci.nserr events

## fci.nserr.general

### Severity

ERROR

### Description

This message occurs when the Fibre Channel fabric cannot successfully complete a Name Server query issued to obtain configuration and device information when an adapter is connected to the Fibre Channel fabric. Included in the event are the specific Name Server query and text describing the reason and explanation codes returned by the fabric.

### Corrective Action

If the system happens to issue a Name Server query while the fabric is processing one or more configuration changes, the fabric might not successfully complete the request. After the fabric stabilizes, the Name Server can resume processing requests and the system automatically recovers from the error. If this error continues to occur after the fabric has stabilized, contact NetApp technical support.

## Syslog Message

The Fibre Channel fabric Name Server request (%s) sent from adapter %s failed with reason code 0x%x (%s), explanation code 0x%x (%s) and response code 0x%x.

## Parameters

**nsRequest** (STRING): Name of the failing Fibre Channel Name Server request.

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**reasonCode** (INHEX): Reason code provided by the fabric for failure of the Name Server request.

**reason** (STRING): Reason text provided by the fabric for failure of the Name Server request.

**explanationCode** (INHEX): Explanation code provided by the fabric qualifying the stated reason.

**explanation** (STRING): Explanation text provided by the fabric qualifying the stated reason.

**responseCode** (INHEX): Response code provided by the fabric for failure of the specified Name Server request.

## fci.nserr.noDevices

### Severity

ERROR

### Description

This message occurs when the fabric to which the specified adapter is attached reports that no Fibre Channel devices are present.

### Corrective Action

Check the fabric to ensure that all expected devices appear in the Name Server. If they appear in the Name Server but have not been reported to the specified adapter, review fabric zoning (if zoning is in use) to ensure that devices are present in the zone containing the adapter. If all expected devices are not present in the Name Server, verify the devices are powered-on, in an operational state, and switch connections/ports are operational.

## Syslog Message

The Fibre Channel fabric attached to adapter %s reports the presence of no Fibre Channel devices.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

## fci.nserr.peerWWN

### Severity

ERROR

### Description

This message occurs when the fabric connected to the specified adapter is zoned such that the adapter (or switch port if port zoning is in use) is not included in a fabric zone.

### Corrective Action

Check the fabric to ensure that the specified adapter is included in a fabric zone. If port zoning is in use, make sure that the switch port to which the adapter is attached is included in the active zone configuration. If WWN zoning is in use, ensure that the WWN of the specified adapter is included in the active zone configuration. Also make sure that the associated switch port is in an operational state.

## Syslog Message

Adapter %s is not in a fabric zone.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

# fci.set events

## fci.set.wwn

### Severity

INFORMATIONAL

### Description

This message occurs when the World-Wide Name (WWN) for this adapter is set to the value in the fci-wwn-"adapter\_name" bootarg.

### Corrective Action

(None).

## Syslog Message

Setting WWN for adapter %s to %s.

## Parameters

**adapterName** (STRING): Name of the associated Fibre Channel host bus adapter.

**wwn** (STRING): WWN that will be used by the adapter.

# fci.sfp events

## fci.sfp.invalid

### Severity

ERROR

### Description

This message occurs when an invalid Small Form-factor Pluggable (SFP) is inserted into the adapter. For example, a 10-GB SFP was inserted into an 8-GB FC adapter.

### Corrective Action

Replace the SFP with one that supports the proper speed.

## Syslog Message

The SFP in FC adapter %s is not valid. (%s)

## Parameters

**port** (STRING): Name of the adapter port.

**reason** (STRING): Reason for Invalid SFP.

# fci.wrong events

## fci.wrong.speed

### Severity

NOTICE

### Description

This message occurs when the fixed speed level requested by the fc-force-XG-ports bootarg is out of range for the corresponding FC port.

### Corrective Action

If another fixed speed is desired, adjust accordingly. Otherwise, the port will autonegotiate.

### Syslog Message

Fibre Channel adapter port %s does not support a speed setting of %u Gbps, which does not fall within port range %x.

### Parameters

**port** (STRING): Name of the adapter port.

**speed** (INT): Speed the adapter port was assigned.

**range** (INTHEX): Range of speeds the adapter port is capable of using.

# fcmon events

## fcmon.status events

### fcmon.status

#### Deprecated

Deprecated as of Data ONTAP 9.2 because FCMON process has been removed.

#### Severity

INFORMATIONAL

#### Description

This message occurs when FCMON starts up, halts or is requested to print it's current state.

#### Corrective Action

None.

#### Syslog Message

FCMON is %s

#### Parameters

**status** (STRING): The status of FCMON (initializing|running|sleeping|halted)

# fcp events

## fcp.service events

### fcp.service.shutdown

**Severity**

INFORMATIONAL

**Description**

The Fibre Channel Protocol (FCP) service has been shutdown.

**Corrective Action**

(None).

**Syslog Message**

FCP service shutdown

**Parameters**

(None).

### fcp.service.startup

**Severity**

INFORMATIONAL

**Description**

The Fibre Channel Protocol (FCP) service has been started.

**Corrective Action**

(None).

**Syslog Message**

FCP service startup

**Parameters**

(None).

# fcvi events

## fcvi.attr events

### fcvi.attr.changed

#### Severity

NOTICE

#### Description

This message occurs when any of the FCVI attributes changes.

#### Corrective Action

(None).

#### Syslog Message

FC-VI adapter: %s changed on port %s. %s

#### Parameters

**attr\_type** (STRING): Attribute type.

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

## fcvi.cm events

### fcvi.cm.timedout

#### Severity

NOTICE

#### Description

This message occurs when connection requests times out.

#### Corrective Action

(None).

#### Syslog Message

FC-VI adapter: Connection request timedout on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

#### Parameters

**port** (STRING): FCVI Interconnect NIC.

**qpname** (STRING): QP name.

**qpnum** (INT): QP index.

**system\_id** (LONGINT): Remote node's system id.

**info** (STRING): Additional info.

# fcvi.cross events

## fcvi.cross.connect.detected

### Severity

ERROR

### Description

This message occurs when the fcvi driver detects a cross connection

### Corrective Action

Check the FCVI interconnect cabling at the local and remote nodes. FCVI adapter ports fcvi\_device\_0s and fcvi\_device\_1s should not be connected to the same fabric. Contact NetApp technical support if the problem persists.

### Syslog Message

FC-VI adapter: Cross Connection detected between local port %s and remote port %s. Local System ID = %llu, Remote System ID = %llu.

### Parameters

**lname** (STRING): Local node's port name.  
**rname** (STRING): Remote node's port name.  
**lsid** (LONGINT): Local node's system id.  
**rsid** (LONGINT): Remote node's system id.

# fcvi.disabled events

## fcvi.disabled

### Severity

ALERT

### Description

This message occurs when the HA interconnect card is disabled by the ic-type environment variable.

### Corrective Action

Either remove the HA interconnect card from the controller or change the ic-type environment variable.

### Syslog Message

FC-VI adapter: Port %s has been disabled because of the ic-type environment variable.

### Parameters

**port** (STRING): FCVI Interconnect NIC.

# fcvi.fcrenabled events

## fcvi.fcrEnabled

**Severity**

NOTICE

**Description**

This message occurs if Fiber Channel Routing (FCR) functionality is enabled on the system.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Fiber Channel Routing (FCR) is enabled.

**Parameters**

(None).

## fcvi.initfailed events

### fcvi.initFailed

**Severity**

ERROR

**Description**

This message occurs when the driver fails to initialize a FC-VI port.

**Corrective Action**

Reboot the controller. Contact NetApp technical support if the problem persists.

**Syslog Message**

FC-VI adapter: %s failed for port %s.

**Parameters**

**operation** (STRING): Type of operation  
**port** (STRING): FCVI Interconnect NIC.

## fcvi.invalid events

### fcvi.invalid.advertisement

**Severity**

ERROR

**Description**

This message occurs when FCVI driver receives invalid advertisement.

**Corrective Action**

(None).

## Syslog Message

FC-VI adapter: Port %s received invalid advertisement. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

## fcvi.invalid.sfp

### Severity

ERROR

### Description

This message occurs when the SFP (Small Form-Factor Pluggable) module of the Fibre Channel Virtual Interface (FC-VI) is invalid or incompatible.

### Corrective Action

Replace the SFP with a compatible one.

## Syslog Message

FC-VI adapter: Invalid SFP - Reason: %s on port %s.

## Parameters

**reason** (STRING): Reason for the incompatibility.

**port** (STRING): Interconnect NIC.

## fcvi.link events

### fcvi.link.down

### Severity

NOTICE

### Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter goes down.

### Corrective Action

1. Ensure that the FC-VI link has not been tampered with.
2. Verify that the physical status of the FC-VI adapter is "Up" by using the command "metrocluster interconnect adapter show".
3. If the configuration includes fabric switches, ensure that they are properly cabled and configured.

## Syslog Message

(None).

## Parameters

**alertId** (STRING): Alert ID.

**alertingResource** (STRING): Alerting resource unique name.

**alertingResourceName** (STRING): Alerting resource name.

**possibleEffect** (STRING): Possible effect for link transition.

**probableCause** (STRING): Probable cause of the event.

**probableCauseDescription** (STRING): Probable cause description of the event.  
**additionalInfo** (STRING): Any additional information for the event.

## fcvi.link.up

### Severity

NOTICE

### Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter comes up.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**alertId** (STRING): Alert ID.  
**alertingResource** (STRING): Alerting resource unique name.

## fcvi.qlgc events

### fcvi.qlgc.async.event.overflow

### Severity

ERROR

### Description

This message occurs when total number of async events are overflowed.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Port %s async event overflowed. Resetting the adapter.

### Parameters

**port** (STRING): FCVI Interconnect NIC.

### fcvi.qlgc.connErr

### Severity

ERROR

### Description

This message occurs when the FC-VI adapter detects a connection error. The FC-VI driver will attempt to retry the connection.

## Corrective Action

If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

## Syslog Message

FC-VI adapter: Port %s detects connection error. FC-VI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): Interconnect NIC.  
**opcode\_str** (STRING): FCVI opcode.  
**opcode** (INHEX): FCVI opcode.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP number.  
**systemID** (LONGINT): Remote node's system ID.  
**info** (STRING): Additional info.

## fcvi.qlgc.cpr.reset.cancelled

### Severity

ERROR

### Description

This message occurs when the CPR reset initiated by the FC-VI port got cancelled.

### Corrective Action

Reboot the filer. If issue still persists then replace the FCVI adapter.

### Syslog Message

FC-VI adapter: CPR reset initiated by port %s got cancelled. Offlining the port.

### Parameters

**port** (STRING): FCVI Interconnect adapter.

## fcvi.qlgc.cpr.reset.failed

### Severity

ERROR

### Description

This message occurs when the CPR reset initiated by the FC-VI port fails.

### Corrective Action

Reboot the filer. If issue still persists then replace the FCVI adapter.

### Syslog Message

FC-VI adapter: CPR reset initiated by port %s failed.

### Parameters

**port** (STRING): FCVI Interconnect adapter.

## **fcvi.qlgc.cpr.reset.unsupported**

### **Severity**

ERROR

### **Description**

This message occurs when the CPR reset is not supported by the adapter.

### **Corrective Action**

Reboot the filer. If issue still persists then replace the FCVI adapter.

### **Syslog Message**

FC-VI adapter: CPR reset is not supported by port %s.

### **Parameters**

**port** (STRING): FCVI Interconnect adapter.

## **fcvi.qlgc.FrameDiscardErr**

### **Severity**

ERROR

### **Description**

This message occurs when the FC-VI adapter firmware discards a received frame because of a receive frame error.

### **Corrective Action**

(None).

### **Syslog Message**

FC-VI adapter: Discarded a received frame because of a receive frame error. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.

**qp\_name** (STRING): QP name.

**qp\_index** (INT): QP number.

**exchange\_id** (INTHEX): Exchange ID.

**address** (INTHEX): Address offset of the last good frame.

**system\_id** (LONGINT): Remote node's system id.

**info** (STRING): Additional info.

## **fcvi.qlgc.hard.reset.failed**

### **Severity**

ERROR

### **Description**

This message occurs when an FC-VI port's soft reset fails.

### Corrective Action

If CPR reset is not supported in the platform, then reboot the filer to recover from this issue. If issue persists then replace the FCVI adapter.

### Syslog Message

FC-VI adapter: Hard reset failed at port %s.

### Parameters

**port** (STRING): FCVI Interconnect adapter.

## fcvi.qlgc.invalid.data

### Severity

ERROR

### Description

This message occurs when FCVI driver receives invalid data from firmware.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Port %s received invalid data. QP index = %d, completion status = %s(status code = %d), opcode = %s(%d), remote node's system id = %llu. %s

### Parameters

**port** (STRING): FCVI Interconnect NIC.

**qpnum** (INT): QP index.

**status** (STRING): Completion status.

**status\_code** (INT): Completion status code.

**opcode\_str** (STRING): FCVI opcode in string.

**opcode** (INT): FCVI opcode.

**systemID** (LONGINT): Remote node's system Id.

**info** (STRING): Additional info.

## fcvi.qlgc.invalid.exch.address

### Severity

ERROR

### Description

This message occurs when FCVI driver receives a response with invalid exchange address.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Port %s received invalid exchange address for %s. QP name = %s, QP index = %d, expected exchange address = 0x%x, received exchange address = 0x%x. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**resp\_type** (STRING): Response type.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP number.  
**exp\_oxid** (INTHEX): Expected exchange address.  
**rcvd\_oxid** (INTHEX): Received exchange address.  
**info** (STRING): Additional info.

## fcvi.qlgc.invalid.qp

### Severity

ERROR

### Description

This message occurs when FCVI driver receives invalid QP index from firmware.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Port %s received invalid QP. Received QP index = %d, completion status = %s(status code = %d), entry type = %s(entry code = %d). %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qpnum** (INT): QP index.  
**status** (STRING): Completion status.  
**status\_code** (INT): Completion status code.  
**entry\_type** (STRING): Request/Response entry type.  
**entry\_code** (INT): Request/Response entry code.  
**info** (STRING): Additional info.

## fcvi.qlgc.invalid.response

### Severity

ERROR

### Description

This message occurs when FCVI driver receives invalid response from firmware.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Port %s received invalid response. %s. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**error\_type** (STRING): Type of error.  
**info** (STRING): Additional info.

## fcvi.qlgc.ioErr

### Severity

ERROR

### Description

This message occurs when the FC-VI driver receives some IO error.

### Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

### Syslog Message

FC-VI adapter: FCVI driver on port %s received IO error. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

### Parameters

**port** (STRING): Interconnect NIC.  
**status\_str** (STRING): Completion status in string.  
**status** (INHEX): Completion status code.  
**opcode\_str** (STRING): FCVI opcode in string.  
**opcode** (INHEX): FCVI opcode.  
**qpName** (STRING): QP name.  
**qpIndex** (INT): QP number.  
**systemID** (LONGINT): Remote node's system ID.

## fcvi.qlgc.login.timedout

### Severity

NOTICE

### Description

This message occurs when port login request times out.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Remote port login timedout on port %s. Remote port id = 0x%x, Remote port handle = %d.  
%s

### Parameters

**port** (STRING): FCVI Interconnect NIC.  
**portid** (INHEX): Remote port identifier.  
**porthandle** (INT): Remote port handle.  
**info** (STRING): Additional info.

## fcvi.qlgc.ls.reject

**Severity**

ERROR

**Description**

This message occurs when the FCVI firmware rejects a link service.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Link service = %s(code = %d), rejected on port %s. %s

**Parameters**

**ls** (STRING): Link service name.

**ls\_code** (INT): Link service code.

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

**fcvi.qlgc.mbox.cmd.pending****Severity**

ERROR

**Description**

This message occurs when a mailbox command is pending for a long time.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Mailbox command '%s(code = 0x%x)' pending on port %s. %s

**Parameters**

**cmd** (STRING): Mailbox command.

**cmd\_code** (INTHEX): Mailbox command code.

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

**fcvi.qlgc.mbox.cmd.timedout****Severity**

ERROR

**Description**

This message occurs when a mailbox command times out.

**Corrective Action**

(None).

## Syslog Message

FC-VI adapter: Mailbox command '%s(code = 0x%x)' timedout on port %s. %s

## Parameters

**cmd** (STRING): Mailbox command.  
**cmd\_code** (INTHEX): Mailbox command code.  
**port** (STRING): FCVI Interconnect NIC.  
**info** (STRING): Additional info.

## fcvi.qlgc.no.iu.buffer

### Severity

ERROR

### Description

This message occurs when the FCVI firmware identifies no more incoming IU buffers in the free pool.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: Port %s doesn't have free IU buffer. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**info** (STRING): Additional info.

## fcvi.qlgc.no.recv.buffer

### Severity

ERROR

### Description

This message occurs when the FCVI firmware identifies no more receive buffers available for the incoming receive frames.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: Port %s doesn't have free receive buffer. QP name = %s, QP index = %d, Message ID = 0x%x. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP index.  
**msg\_id** (INTHEX): Message id of the incoming message.  
**info** (STRING): Additional info.

## fcvi.qlgc.oodErr

### Severity

ERROR

### Description

This message occurs when the FC-VI driver receives out of order completions.

### Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

### Syslog Message

FC-VI adapter: FCVI driver on port %s receives out of order completions. FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

### Parameters

**port** (STRING): Interconnect NIC.  
**opcode\_str** (STRING): FCVI opcode in string.  
**opcode** (INTHEX): FCVI opcode.  
**qpName** (STRING): QP name.  
**qpIndex** (INT): QP number.  
**systemID** (LONGINT): Remote node's system ID.

## fcvi.qlgc.PCIErr

### Severity

ERROR

### Description

This message occurs when the FC-VI adapter firmware encounters a PCI error because it cannot write a frame to host memory.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: PCI error while writing a frame to host memory. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

### Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qp\_name** (STRING): QP name.  
**qp\_index** (INT): QP number.  
**exchange\_id** (INTHEX): Exchange ID.  
**address** (INTHEX): Address offset of the last good frame.  
**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## **fcvi.qlgc.port.reset**

### **Severity**

ERROR

### **Description**

This message occurs when a FCVI port resets.

### **Corrective Action**

(None).

### **Syslog Message**

FC-VI adapter: Resetting the port %s. %s

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.

**reason** (STRING): Reason for port reset.

## **fcvi.qlgc.qp.create.err**

### **Severity**

ERROR

### **Description**

This message occurs when QP creation fails.

### **Corrective Action**

(None).

### **Syslog Message**

FC-VI adapter: Failed to create QP on port %s. Requested QP index = %d, completion status = %s(status code = %d). %s

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.

**qpnum** (INT): QP index.

**status** (STRING): Completion status.

**status\_code** (INT): Completion status code.

**info** (STRING): Additional info.

## **fcvi.qlgc.qp.destroy.failed**

### **Severity**

ERROR

### **Description**

This message occurs when the QP destroy request failed.

### **Corrective Action**

(None).

## Syslog Message

FC-VI adapter: QP destroy failed on port %s. QP index = %d. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.

**qpnum** (INT): QP index.

**info** (STRING): Additional info.

## fcvi.qlgc.qpErr

### Severity

ERROR

### Description

This message occurs when the FC-VI driver receives a QP error from the Firmware. The FC-VI driver will attempt to retry the connection.

### Corrective Action

If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

## Syslog Message

FC-VI adapter: FCVI driver on port %s received QP Error. QP name = %s, QP index = 0x%x, VI state = %s(state code = 0x%x), sub-error = %s(error code = 0x%x). Remote node's system id = %llu. This error has occurred %d times. %s

## Parameters

**port** (STRING): Interconnect Adapter.

**qpname** (STRING): QP name.

**qpnum** (INTHEX): QP number.

**state\_str** (STRING): QP state.

**state** (INTHEX): QP state code.

**suberror** (STRING): Sub-error.

**code** (INTHEX): Sub-error code.

**system\_id** (LONGINT): Remote node's system ID.

**errcnt** (INT): Number of times QP async error was encountered.

**info** (STRING): Additional info.

## fcvi.qlgc.rcvd.invalid.iu.buffer

### Severity

ERROR

### Description

This message occurs when the FC-VI adapter receives invalid information unit buffer.

### Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

## Syslog Message

FC-VI adapter: Port %s received invalid IU buffer. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): Interconnect NIC.  
**status\_str** (STRING): Completion status in string.  
**status** (INTEX): Completion status code.  
**opcode\_str** (STRING): FCVI opcode in string.  
**opcode** (INTEX): FCVI opcode.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP number.  
**bufhdl** (INT): Buffer handle.  
**systemID** (LONGINT): Remote node's system ID.  
**info** (STRING): Additional info.

## fcvi.qlgc.receive.error

### Severity

ERROR

### Description

This message occurs when the FCVI firmware detects an error in the received frame.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: Received bad frame on port %s. Mailbox-1 = %d, Mailbox-2 = %d. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**mbox1** (INT): Content of mailbox-1.  
**mbox2** (INT): Content of mailbox-2.  
**info** (STRING): Additional info.

## fcvi.qlgc.received.disconnect

### Severity

NOTICE

### Description

This message occurs when FCVI driver receives disconnect request from partner.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: Disconnect request received on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP index.  
**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## fcvi.qlgc.received.reject

### Severity

NOTICE

### Description

This message occurs when FCVI driver receives connection reject from partner.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Connect request rejected on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP index.  
**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## fcvi.qlgc.recvIUErr

### Severity

ERROR

### Description

This message occurs when the FC-VI adapter receives some error in received information unit.

### Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

### Syslog Message

FC-VI adapter: Port %s received IU error. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu.

## Parameters

**port** (STRING): Interconnect NIC.  
**status\_str** (STRING): Completion status in string.  
**status** (INHEX): Completion status code.  
**opcode\_str** (STRING): FCVI opcode in string.  
**opcode** (INHEX): FCVI opcode.

**qpname** (STRING): QP name.  
**qpnum** (INT): QP number.  
**bufhdl** (INT): Buffer handle.  
**systemID** (LONGINT): Remote node's system ID.

## **fcvi.qlgc.regDumped**

### **Severity**

NOTICE

### **Description**

This message occurs when the FCVI driver saves a diagnostic dump in a file.

### **Corrective Action**

(None).

### **Syslog Message**

FC-VI adapter: Diagnostic dump for port %s saved to file %s.

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.  
**filename** (STRING): File to which the diagnostic dump was saved.

## **fcvi.qlgc.RespFrameErr**

### **Severity**

ERROR

### **Description**

This message occurs when the adapter firmware sends a response frame with the error bit set.

### **Corrective Action**

(None).

### **Syslog Message**

FC-VI adapter: Firmware sent a response with the error bit set. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.  
**qpname** (STRING): QP name.  
**qp\_index** (INT): QP number.  
**exchange\_id** (INTHEX): Exchange ID.  
**address** (INTHEX): Address offset of the last good frame.  
**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## **fcvi.qlgc.risc.paused**

### **Severity**

ERROR

**Description**

This message occurs when FCVI RISC is paused.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Port %s detected a RISC pause error. %s

**Parameters**

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

**fcvi.qlgc.rmt.link.down****Severity**

NOTICE

**Description**

This message occurs when FCVI driver lost link to partner port.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Link to partner node over port %s is down. Partner port id = 0x%x, partner node's system id = %llu. %s

**Parameters**

**port** (STRING): FCVI Interconnect NIC.

**port\_id** (INHEX): Partner port id.

**system\_id** (LONGINT): Partner node's system id.

**info** (STRING): Additional info.

**fcvi.qlgc.rmt.link.up****Severity**

NOTICE

**Description**

This message occurs when FCVI driver gets link to partner port.

**Corrective Action**

(None).

**Syslog Message**

FC-VI adapter: Link to partner node over port %s is up. Partner port id = 0x%x, partner node's system id = %llu. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**port\_id** (INTHEX): Partner port id.  
**system\_id** (LONGINT): Partner node's system id.  
**info** (STRING): Additional info.

## fcvi.qlgc.sendIUError

### Severity

ERROR

### Description

This message occurs when the FC-VI adapter fails to send an information unit.

### Corrective Action

No corrective action is required. The driver internally retries. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

### Syslog Message

FC-VI adapter: Port %s sendIU status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): Interconnect NIC.  
**status\_str** (STRING): Completion status in string.  
**status** (INTHEX): Completion status code in hex.  
**opcode\_str** (STRING): FCVI opcode in string.  
**opcode** (INTHEX): FCVI opcode in hex.  
**qpName** (STRING): QP name.  
**qpIndex** (INT): QP number.  
**systemID** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## fcvi.qlgc.sent.disconnect

### Severity

NOTICE

### Description

This message occurs when FCVI driver sends disconnect request to remote partner.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Disconnect request sent on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qpname** (STRING): QP name.  
**qpnum** (INT): QP index.

**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## **fcvi.qlgc.soft.reset.failed**

### **Severity**

ERROR

### **Description**

This message occurs when an FC-VI port's soft reset fails.

### **Corrective Action**

None.

### **Syslog Message**

FC-VI adapter: Soft reset failed at port %s.

### **Parameters**

**port** (STRING): FCVI Interconnect adapter.

## **fcvi.qlgc.system.error**

### **Severity**

ERROR

### **Description**

This message occurs when FCVI driver receives system error from FCVI firmware.

### **Corrective Action**

No corrective action is required. The driver internally resets the adapter. However, if you see this message frequently, there might be an issue with the adapter/firmware. Contact NetApp technical support.

### **Syslog Message**

FC-VI adapter: System Error on port %s. %s

### **Parameters**

**port** (STRING): FCVI Interconnect NIC.

**info** (STRING): Additional info.

## **fcvi.qlgc.TimeOutErr**

### **Severity**

ERROR

### **Description**

This message occurs when the adapter firmware cannot send a request.

### **Corrective Action**

(None).

## Syslog Message

FC-VI adapter: Firmware could not send a request. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**qp\_name** (STRING): QP name.  
**qp\_index** (INT): QP number.  
**exchange\_id** (INTHEX): Exchange ID.  
**address** (INTHEX): Address offset of the last good frame.  
**system\_id** (LONGINT): Remote node's system id.  
**info** (STRING): Additional info.

## fcvi.qlgc.transfer.error

### Severity

ERROR

### Description

This message occurs when the FCVI firmware detects a transfer error.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: %s transfer error on port %s. Affected queue number = %d. %s

## Parameters

**trans\_type** (STRING): Transfer type.  
**port** (STRING): FCVI Interconnect NIC.  
**queue\_num** (INT): Queue number.  
**info** (STRING): Additional info.

## fcvi.qlgc\_regdumpfailed events

### fcvi.qlgc\_regDumpFailed

### Severity

NOTICE

### Description

This message occurs when the HA interconnect driver could not save a diagnostic dump.

### Corrective Action

(None).

## Syslog Message

FC-VI adapter: Failed to save diagnostic dump for port %s. %s.

## Parameters

**port** (STRING): FCVI Interconnect NIC.  
**reason** (STRING): Reason for the failure.

# fcvi.unsupported events

## fcvi.unsupported.config

### Severity

ERROR

### Description

This message occurs when a network adapter port behavior type is set to use FC-VI on a platform that has not been validated for its use and is therefore unsupported.

### Corrective Action

Change the port behavior type to a value other than "FC-VI". Use the "system hardware unified-connect show" command to view network adaptor port information, including the current behavior type. Use the "system hardware unified-connect modify" command to change the network adapter port behavior type.

### Syslog Message

FC-VI port behavior type not supported on network adapter port %s.

## Parameters

**port** (STRING): The network adapter port whose behavior type is set to use FC-VI.

# fcvi.update events

## fcvi.update.link.state

### Severity

NOTICE

### Description

This message occurs when there is a change in physical link state of the Fibre Channel Virtual Interface (FC-VI) adapter.

### Corrective Action

(None).

### Syslog Message

FC-VI adapter: Physical link is %s on port %s.

## Parameters

**link\_state** (STRING): New link state.  
**port** (STRING): Interconnect NIC.

# ffm events

## ffm.aggr events

### ffm.aggr.attach.done

#### Severity

NOTICE

#### Description

This message occurs when an aggregate attach operation is complete. The event displays the service ID of the attached Firefly Service and the generation number, which is the number of times this aggr has been unattached.

#### Corrective Action

(None).

#### Syslog Message

Aggregate ID: %u has been attached to a Firefly service ID: %u, the current attach generation of the aggregate is %u.

#### Parameters

**aggrID** (INT): Unique identifier of the aggregate.

**fireflyID** (INT): Unique identifier of the Firefly Service the aggregate is attached to.

**attachGeneration** (INT): Current attach generation of the aggregate.

### ffm.aggr.attach.started

#### Severity

NOTICE

#### Description

This message occurs when an aggregate attach operation is started. The event displays the service ID of the attached Firefly Service and the generation number, which is the number of times this aggr has been unattached.

#### Corrective Action

(None).

#### Syslog Message

Attachment of an aggregate ID: %u to a Firefly service ID: %u has been started, the current attach generation of the aggregate is %u.

#### Parameters

**aggrID** (INT): Unique identifier of the aggregate.

**fireflyID** (INT): Unique identifier of the Firefly Service the aggregate is being attached to.

**attachGeneration** (INT): Current attach generation of the aggregate.

## ffm.aggr.detach.done

### Severity

NOTICE

### Description

This message occurs when an aggregate detach operation is completed. The event displays the service ID of the attached Firefly Service and the generation number, which is the number of times this aggr has been unattached.

### Corrective Action

(None).

### Syslog Message

Aggregate ID: %u has been detached from a Firefly service ID: %u, the current attach generation of the aggregate is %u.

### Parameters

**aggrID** (INT): Unique identifier of the aggregate.

**fireflyID** (INT): Unique identifier of the Firefly Service the aggregate is detached from.

**attachGeneration** (INT): Current attach generation count of the aggregate.

## ffm.aggr.detach.started

### Severity

NOTICE

### Description

This message occurs when an aggregate detach operation is started. The event displays the service ID of the attached Firefly Service and the generation number, which is the number of times this aggr has been unattached.

### Corrective Action

(None).

### Syslog Message

Detachment of an aggregate ID: %u from a Firefly service ID: %u has been started, the current attach generation of the aggregate is %u.

### Parameters

**aggrID** (INT): Unique identifier of the aggregate.

**fireflyID** (INT): Unique identifier of the Firefly Service the aggregate is being detached from.

**attachGeneration** (INT): Current attach generation of the aggregate.

## ffm.attach events

### ffm.attach.outage.end

### Severity

NOTICE

## Description

This message occurs when volumes on an aggregate become available to the protocol clients near the end of the attach phase of volume relocation.

## Corrective Action

(None).

## Syslog Message

Protocol outage for volumes on aggregate "%s" has ended at %llu, %llu ms after the attach callback (including %llu ms for replay).

## Parameters

**aggr\_name** (STRING): Name of the aggregate.

**sk\_msecs** (LONGINT): Timestamp of this event.

**attach\_protocol\_outage\_duration** (LONGINT): Duration in milliseconds from the moment of the attach callback to this event.

**attach\_replay\_duration** (LONGINT): Duration of the nvlog replay before the protocol outage ends.

## ffm.attach.outage.summary

### Severity

NOTICE

### Description

This message occurs when the attach phase of graceful or ungraceful volume relocation finishes.

### Corrective Action

(None).

### Syslog Message

Attach of volumes on aggregate "%s" has started at %llu and ended at %llu. Total attach time: %llu ms.

### Parameters

**aggr\_name** (STRING): Name of the aggregate.

**attach\_start\_sk\_msecs** (LONGINT): Timestamp when the attach starts.

**attach\_end\_sk\_msecs** (LONGINT): Timestamp of this event.

**attach\_op\_total** (LONGINT): Duration in milliseconds from the moment of the attach callback to this event.

## ffm.dataip events

### ffm.dataip.failedToHost

#### Severity

NOTICE

#### Description

This message occurs when a data IP address was failed to host on the node. Data access through this IP address is not available.

### Corrective Action

(None).

### Syslog Message

Data IP address %s was failed to host by the NFS protocol service on the node %s (ID: %u).

### Parameters

**dataip** (STRING): The IP address that was failed to host.

**nodename** (STRING): Name of the node on which the data IP was failed to host.

**nodeid** (INT): Unique identifier of the node on which the data IP was failed to host.

## ffm.dataip.notUnhosted

### Severity

NOTICE

### Description

This message occurs when a data IP address is not unhosted on the node.

### Corrective Action

(None).

### Syslog Message

The NFS protocol service could not unhost data IP address "%s" on node "%s" (ID: %u).

### Parameters

**dataip** (STRING): IP address that could not be unhosted.

**nodename** (STRING): Name of the node on which the data IP could not be unhosted.

**nodeid** (INT): Unique identifier of the node on which the data IP could not be unhosted.

## ffm.dataip.successfullyHosted

### Severity

NOTICE

### Description

This message occurs when a data IP address was successfully hosted on the node. Data access through this IP address is now available.

### Corrective Action

(None).

### Syslog Message

Data IP address %s was hosted by the NFS protocol service on the node %s (ID: %u).

### Parameters

**dataip** (STRING): The IP address that was hosted.

**nodename** (STRING): Name of the node on which the data IP was hosted.

**nodeid** (INT): Unique identifier of the node on which the data IP was hosted.

## ffm.dataip.unhostSuccess

### Severity

NOTICE

### Description

This message occurs when a data IP address is successfully unhosted from the node. Data access through this IP address is not available.

### Corrective Action

(None).

### Syslog Message

The NFS protocol service unhosted data IP address "%s" on node "%s" (ID: %u).

### Parameters

**dataip** (STRING): IP address that was unhosted.

**nodename** (STRING): Name of the node on which the data IP was unhosted.

**nodeid** (INT): Unique identifier of the node on which the data IP was unhosted.

## ffm.detach events

### ffm.detach.outage.start

#### Severity

NOTICE

#### Description

This message occurs when a volume becomes unavailable to protocol traffic during a graceful volume relocation.

#### Corrective Action

(None).

#### Syslog Message

Protocol outage of volume "%s" on aggregate "%s" has started. Timestamp: %llu, %llu ms after the detach callback.

#### Parameters

**volume\_name** (STRING): Name of the volume.

**aggr\_name** (STRING): Name of the aggregate.

**sk\_msecs** (LONGINT): Timestamp of this event.

**detach\_lead\_time** (LONGINT): Duration in milliseconds from the moment of the detach callback to this event.

### ffm.detach.outage.summary

#### Severity

NOTICE

## Description

This message occurs when the detach phase of graceful volume relocation finishes.

## Corrective Action

(None).

## Syslog Message

Detach protocol outage has completed for volumes on aggregate %s. Timestamp: %llu, estimated protocol outage duration: %llu ms, total detach duration: %llu ms.

## Parameters

**aggr\_name** (STRING): Name of the aggregate.

**detach\_end\_sk\_msecs** (LONGINT): Timestamp of this event.

**est\_detach\_protocol\_outage\_duration** (LONGINT): Estimated duration in milliseconds from the start to the end of the protocol outage for the detach operation.

**detach\_op\_total** (LONGINT): Duration in milliseconds from the moment of the detach callback to this event.

# ffm.init events

## ffm.init.firefly

### Severity

NOTICE

### Description

This message occurs when the Firefly manager is initiated during Firefly boot.

### Corrective Action

(None).

### Syslog Message

Firefly manager initiated.

### Parameters

(None).

# ffm.restart events

## ffm.restart.firefly

### Severity

NOTICE

### Description

This message occurs when the Firefly manager restarts Firefly after detecting abnormal behavior. This restart avoids a core dump, which would not help address the abnormal behavior. When Firefly comes back up, aggregates will be re-attached.

**Corrective Action**

(None).

**Syslog Message**

Firefly manager restart: %s

**Parameters**

**reason** (STRING): Reason to restart.

# ffrespmon events

## ffrespmon.aggr events

### ffRespMon.aggr.offline

#### Severity

NOTICE

#### Description

This message occurs when an aggregate is detected to be offline due to an unresponsive Firefly Service on a node.

#### Corrective Action

(None).

#### Syslog Message

Aggregate (ID: %u) attached (attaching: %u) to a Firefly Service (ID: %u), running on node %s (ID: %u, Uuid: %s), is offline.

#### Parameters

**aggrID** (INT): Unique identifier of the aggregate.

**attaching** (INT): Boolean value to denote whether the Firefly Service was in the process of attaching the aggregate.

**fireflyID** (INT): Unique identifier of the Firefly Service to which the aggregate is attached.

**nodeName** (STRING): Name of the node hosting the Firefly Service.

**nodeID** (INT): Unique identifier of the node the hosting the Firefly Service.

**nodeUuid** (STRING): Universal unique identifier of the node the hosting the Firefly Service.

## ffrespmon.nfs events

### ffRespMon.nfs.unresponsive

#### Severity

NOTICE

#### Description

This message occurs when a data interface's IP address is unreachable. The NFS service might be affected and unresponsive.

#### Corrective Action

(None).

#### Syslog Message

Data IP address %s (ID: %u), hosted on node %s (ID: %u, Uuid: %s), is currently not reachable.

#### Parameters

**dataip** (STRING): IP address of the data interface.

**dataipID** (INT): Unique identifier of the data IP.

**nodeName** (STRING): Name of the node hosting given data IP.

**nodeID** (INT): Unique identifier of the node hosting given data IP.

**nodeUuid** (STRING): Universal unique identifier of the node hosting given data IP.

# fg events

## fg.admin events

### fg.admin.wait.long

#### Severity

NOTICE

#### Description

This message occurs when the data component takes longer than 15 seconds to update its view of the FlexGroup volume after an admin operation.

#### Corrective Action

(None).

#### Syslog Message

FlexGroup volume "%s" (MSID "%lu") in Vserver "%s" took %lu seconds to update the "%s" property during the "%s" operation.

#### Parameters

**volumeName** (STRING): Name of the FlexGroup volume.

**volumeMsid** (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup volume resides.

**numSeconds** (LONGINT): Number of seconds that the data component took to update.

**property** (STRING): Volume property being updated.

**operation** (STRING): Admin operation performed before the data component update.

## fg.aggr events

### fg.aggr.mixed.types.error

#### Severity

ERROR

#### Description

This message occurs when the constituents of a FlexGroup volume are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates) for more than one week. It is reported once per week if a FlexGroup volume remains in this state. Leaving a FlexGroup volume in a mixed-aggregate state might lead to unbalanced data placement and unexpected performance issues.

#### Corrective Action

Move all the constituents of the FlexGroup volume to the same aggregate type, i.e., either FabricPool-enabled aggregates or non-FabricPool-enabled aggregates, using the 'volume move start' command with the 'allow-mixed-aggr-types' option set to true.

#### Syslog Message

The constituents of FlexGroup volume '%s' with UUID '%s' have been located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates) for more than one

week.

## Parameters

**vol** (STRING): Name of the FlexGroup volume.  
**uuid** (STRING): UUID of the FlexGroup volume.

## fg.aggr.mixed.types.notice

### Severity

NOTICE

### Description

This message occurs when the constituents of a FlexGroup volume are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates). It is reported once per hour. Leaving a FlexGroup volume in a mixed-aggregate state might lead to unbalanced data placement and unexpected performance issues.

### Corrective Action

Move all the constituents of the FlexGroup volume to the same aggregate type, i.e., either FabricPool-enabled aggregates or non-FabricPool-enabled aggregates, using the 'volume move start' command with the 'allow-mixed-aggr-types' option set to true.

### Syslog Message

The constituents of FlexGroup volume '%s' with UUID '%s' are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates).

## Parameters

**vol** (STRING): Name of the FlexGroup volume.  
**uuid** (STRING): UUID of the FlexGroup volume.

## fg.convert events

### fg.convert.critical.fail

### Severity

ALERT

### Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup fails. The FlexVol volume is inoperable, and can no longer serve data.

### Corrective Action

(Call support).

### Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s. The FlexVol can no longer serve data. Reason: %s.

## Parameters

**volumeName** (STRING): Name of the volume being converted to a FlexGroup.  
**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

**reason** (STRING): Reason the conversion failed.

**rollbackFailedReason** (STRING): Reason the conversion could not roll back after failing to convert.

## fg.convert.fail

### Severity

ERROR

### Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup fails. The FlexVol volume is still operable.

### Corrective Action

Ensure that the FlexVol volume is a valid candidate for the convert operation, and then retry the command. If the error persists, contact NetApp technical support.

### Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s

### Parameters

**volumeName** (STRING): Name of volume being converted to a FlexGroup.

**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

**reason** (STRING): Reason why the conversion failed.

## fg.convert.ksmf.timeout

### Severity

NOTICE

### Description

This message occurs when the operation to convert a FlexVol® volume into a FlexGroup times out when updating the volume's RAID label. The system retries the conversion automatically.

### Corrective Action

(None).

### Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu has timed out while updating the volume's RAID label.

### Parameters

**volumeName** (STRING): Name of the volume being converted to a FlexGroup.

**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

## fg.convert.start

### Severity

NOTICE

### Description

This message occurs when the conversion of a FlexVol® volume to a FlexGroup begins.

## Corrective Action

(None).

## Syslog Message

Starting conversion of FlexVol volume %s to new FlexGroup with MSID %llu, UUID %s.

## Parameters

**volumeName** (STRING): Name of volume being converted to a FlexGroup.

**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

**flexgroupUuid** (STRING): UUID of the new FlexGroup.

## fg.convert.success

### Severity

NOTICE

### Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup succeeds.

## Corrective Action

(None).

## Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu successful.

## Parameters

**volumeName** (STRING): Name of volume being converted to a FlexGroup.

**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

## fg.create events

### fg.create.workflow.non.auto

### Severity

NOTICE

### Description

This message occurs when a user creates a FlexGroup volume that has a workflow with a type that is not "auto".

## Corrective Action

(None).

## Syslog Message

FlexGroup volume "%s" in Vserver "%s" was created with workflow type "%s"

## Parameters

**volumeName** (STRING): Name of the FlexGroup volume.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup volume resides.

**workflow** (STRING): The type of workflow for the FlexGroup volume.

# fg.inactive events

## fg.inactive.dc.only.delete

### Severity

NOTICE

### Description

This message occurs when the system automatically deletes an inactive FlexGroup constituent that existed only in the data component.

### Corrective Action

(None).

### Syslog Message

Constituent with DISD "%lu" of FlexGroup volume "%s" (MSID "%lu") in Vserver "%s", which exists only in the data component and is inactive, has been automatically deleted.

### Parameters

**constituentDsid** (LONGINT): Data Set ID (DSID) of the deleted constituent.

**volumeName** (STRING): Name of the FlexGroup volume owning the deleted constituent.

**volumeMsid** (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume owning the deleted constituent.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup volume resides.

## fg.inactive.delete

### Severity

NOTICE

### Description

This message occurs when the system automatically deletes an inactive FlexGroup constituent.

### Corrective Action

(None).

### Syslog Message

Constituent "%lu" (DISD "%lu") of FlexGroup volume "%s" (MSID "%lu") in Vserver "%s" is inactive and has been automatically deleted.

### Parameters

**flexgroupIndex** (LONGINT): FlexGroup index of the deleted constituent.

**constituentDsid** (LONGINT): Data Set ID (DSID) of the deleted constituent.

**volumeName** (STRING): Name of the FlexGroup volume owning the deleted constituent.

**volumeMsid** (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume owning the deleted constituent.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup volume resides.

# fg.inodes events

## fg.inodes.member.allOK

### Severity

NOTICE

### Description

This message occurs when conditions that led to previous "fg.inodes.member.nearlyFull" and "fg.inodes.member.full" events no longer apply for any constituent in this FlexGroup. All constituents within this FlexGroup have sufficient inodes for normal operation.

### Corrective Action

(None).

### Syslog Message

All constituents in FlexGroup %s (fg-uuid %s) have sufficient inodes for normal operation.

### Parameters

**object\_name** (STRING): Human-readable name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

## fg.inodes.member.full

### Severity

ALERT

### Description

This message occurs when a constituent with a FlexGroup has run out of inodes. New files cannot be created on this constituent. This might lead to an overall imbalanced distribution of content across the FlexGroup.

### Corrective Action

Adding capacity to the FlexGroup by using the "volume modify -files +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup may work, but it is difficult to determine which files have landed on which constituent.

### Syslog Message

Constituent %llu in FlexGroup %s (fg-uuid %s) is out of inodes.

### Parameters

**constituent\_dsid** (LONGINT): DSID of the constituent that is out of inodes.

**object\_name** (STRING): Human-readable name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

## fg.inodes.member.nearlyFull

### Severity

ALERT

## Description

This message occurs when a constituent within a FlexGroup is almost out of inodes. This constituent will receive far fewer new create requests than average, which might impact the FlexGroup's overall performance, because those requests are routed to constituents with more inodes.

## Corrective Action

Adding capacity to the FlexGroup by using the "volume modify -files +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup might work, although it can be difficult to determine which files have landed on which constituent.

## Syslog Message

Constituent %llu in FlexGroup %s (fg-uuid %s) is nearly out of inodes.

## Parameters

**constituent\_dsid** (LONGINT): DSID of the constituent that is almost out of inodes.

**object\_name** (STRING): Human-readable name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

# fg.member events

## fg.member.below.threshold

### Severity

ALERT

### Description

This message occurs when a members available space is below the threshold. ONTAP will be reporting zero space for the entire flexgroup.

### Corrective Action

Correct the problem based on the reason specified. If the error persists, contact NetApp technical support for further assistance.

### Syslog Message

FlexGroup volume "%s" (Size: "%lu", Usage: "%lu"%%) has member volume "%s" (Size: "%lu", Usage: "%lu"%%) that is at or below the free space threshold of "%lu" blocks.

### Parameters

**flexgroupName** (STRING): Name of the FlexGroup volume.

**flexgroupSize** (LONGINT): Size in blocks of the FlexGroup volume.

**flexgroupUsage** (LONGINT): Usage percentage of the FlexGroup volume.

**memberName** (STRING): Name of the FlexGroup member volume.

**memberSize** (LONGINT): Size in blocks of the FlexGroup member volume.

**memberUsage** (LONGINT): Usage percentage of the FlexGroup member volume.

**thresholdSize** (LONGINT): Size of threshold that has been reached.

## fg.member.elastic.sizing

### Severity

NOTICE

## Description

This message occurs when a constituent volume in a FlexGroup volume undergoes elastic sizing either to restore balance among constituent volumes or to resize them to accommodate space needs.

## Corrective Action

(None).

## Syslog Message

Constituent volume "%u" in FlexGroup volume "%s" was resized from %lu bytes to %lu bytes. This constituent volume (%s) %s by resizing the constituent volume "%s" (dsid "%u"). This constituent volume is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

## Parameters

**constituent\_dsid** (INT): DSID of the constituent volume undergoing elastic sizing.  
**object\_name** (STRING): Name of the FlexGroup volume.  
**current\_size** (LONGINT): Original block size of the constituent volume.  
**new\_size** (LONGINT): New block size of the constituent volume.  
**constituent\_name** (STRING): Name of the constituent volume.  
**operation** (STRING): Indicates whether the constituent volume is being grown or shrunk.  
**partner\_name** (STRING): Name of the constituent volume's partner.  
**partner\_dsid** (INT): DSID of the constituent volume's partner.  
**size** (LONGINT): Size in bytes of the constituent volume.  
**used** (LONGINT): Size in bytes of the used space of the constituent volume.  
**percent\_full** (INT): Percentage of filled space in the constituent volume.  
**flexgroup\_size** (LONGINT): Size in bytes of the FlexGroup volume.  
**flexgroup\_used** (LONGINT): Size in bytes of the used space in the FlexGroup volume.  
**flexgroup\_percent\_full** (INT): Percentage of filled space in the FlexGroup volume.  
**event\_time** (LONGINT): When the event occurred, shown in system time.

# fg.modify events

## fg.modify.workflow

### Severity

NOTICE

### Description

This message occurs when a user modifies the workflow type of a FlexGroup volume.

### Corrective Action

(None).

### Syslog Message

The workflow type for FlexGroup volume "%s" in Vserver "%s" was modified from "%s" to "%s".

### Parameters

**volumeName** (STRING): Name of the FlexGroup volume.  
**vserverName** (STRING): Name of the Vserver on which the FlexGroup volume resides.  
**oldWorkflow** (STRING): The old workflow type of the FlexGroup volume.  
**newWorkflow** (STRING): The new workflow type for the FlexGroup volume.

# fg.move events

## fg.move.unmirrored.aggr

### Severity

NOTICE

### Description

This message occurs when a user moves a FlexGroup constituent to an unmirrored aggregate on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

### Corrective Action

(None).

### Syslog Message

FlexGroup constituent %s was moved to unmirrored aggregate %s on Vserver %s.

### Parameters

**volumeName** (STRING): Name of the FlexGroup constituent moved to the unmirrored aggregate.

**aggregateName** (STRING): Name of the unmirrored aggregate.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup constituent resides.

# fg.multidelete events

## fg.multidelete.inval.snapid

### Severity

NOTICE

### Description

This message occurs when a Snapshot copy in an invalid state is deleted from a FlexGroup volume. For example, if a Snapshot copy creation fails on some constituent volumes of a FlexGroup volume, but succeeds on others, it is deemed invalid and deleted by ONTAP.

### Corrective Action

(None).

### Syslog Message

Invalid Snapshot copy ID "%u" on FlexGroup volume "%s" is being deleted (UUID: %s, MSID: %llx).

### Parameters

**snapid** (INT): ID of the invalid Snapshot copy to be deleted.

**flexgroup\_name** (STRING): Name of the FlexGroup volume.

**flexgroup\_uuid** (STRING): UUID of the FlexGroup volume.

**flexgroup\_msid** (LONGINHEX): Master Data Set ID (MSID) of the FlexGroup volume.

# fg.plex events

## fg.plex.del.unmirror.aggr

### Severity

NOTICE

### Description

This message occurs when a user unmirrors an aggregate (plex delete) that contains a FlexGroup constituent on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

### Corrective Action

(None).

### Syslog Message

Aggregate %s, which contains a FlexGroup constituent, was unmirrored.

### Parameters

**aggregateName** (STRING): Name of the aggregate that is unmirrored.

## fg.provision events

### fg.provision.unmirrored.aggr

### Severity

NOTICE

### Description

This message occurs when a user provisions a FlexGroup on unmirrored aggregates on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

### Corrective Action

(None).

### Syslog Message

FlexGroup %s was provisioned on unmirrored aggregates on Vserver %s.

### Parameters

**volumeName** (STRING): Name of the FlexGroup created on the unmirrored aggregates.

**vserverName** (STRING): Name of the Vserver on which the FlexGroup resides.

## fg.quota events

### fg.quota.cannot.enforce

### Severity

NOTICE

### Description

This message occurs when a FlexGroup cannot enforce its quota as expected.

## Corrective Action

(None).

## Syslog Message

FlexGroup %s (fg-uuid %s) cannot enforce quota due to %s.

## Parameters

**object\_name** (STRING): Name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

**reason** (STRING): Reason for lack of quota enforcement.

## fg.quota.enforcement.on

### Severity

NOTICE

### Description

This message occurs when a file operation discovers that the quota enforcement state of a FlexGroup has changed to "on".

### Corrective Action

(None).

### Syslog Message

FlexGroup %s (fg-uuid %s) quota enforcement state is on.

### Parameters

**object\_name** (STRING): Name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

## fg.quota.on.failed

### Severity

ERROR

### Description

This message occurs when enabling quotas (quota on an operation) on a FlexGroup constituent fails.

### Corrective Action

Correct the problem based on the reason specified. If the error persists, contact technical support.

### Syslog Message

Failed to execute the quota on operation on FlexGroup constituent %s in Vserver %s. Reason: %s.

### Parameters

**volumeName** (STRING): Name of the constituent.

**vserverName** (STRING): Name of the Vserver.

**reason** (STRING): Reason for the failure.

## fg.quota.usermapping.result

### Severity

NOTICE

### Description

This message occurs when the quota mapper decides whether to map the Windows quota record and the UNIX quota record of a user into a single multiuser record.

### Corrective Action

(None).

### Syslog Message

%s (uuid %s) tid %d: %s.

### Parameters

**constituent\_name** (STRING): Name of the FlexGroup constituent.

**object\_uuid** (STRING): UUID of the FlexGroup constituent.

**qtree** (LONGINT): Qtree identifier (tid).

**result** (STRING): User mapping result.

## fg.recover events

### fg.recover.fail

#### Severity

ERROR

#### Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® fails. The FlexGroup volume is still operable.

#### Corrective Action

Ensure that the FlexGroup volume is a valid candidate for the recovery operation, and then retry the command. If the error persists, contact NetApp technical support.

#### Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s

#### Parameters

**volumeName** (STRING): Name of volume being recovered back into a FlexVol.

**flexgroupMsid** (LONGINTEX): MSID of the recovered FlexVol.

**reason** (STRING): Reason why the recovery failed.

### fg.recover.start

#### Severity

NOTICE

## Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® begins.

## Corrective Action

(None).

## Syslog Message

Starting recovery of FlexGroup volume %s back into a FlexVol® with MSID %llu.

## Parameters

**volumeName** (STRING): Name of volume being recovered back into a FlexVol.

**volMsid** (LONGINTEX): MSID of the recovered FlexVol.

## fg.recover.success

### Severity

NOTICE

### Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® succeeds.

### Corrective Action

(None).

### Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu successful.

### Parameters

**volumeName** (STRING): Name of volume being recovered back into a FlexVol.

**volMsid** (LONGINTEX): MSID of the recovered FlexVol.

## fg.space events

### fg.space.member.allOK

#### Severity

NOTICE

#### Description

This message occurs when conditions that led to previous "fg.space.member.nearlyFull" and "fg.space.member.full" events no longer apply. All constituents within this FlexGroup have sufficient space for normal operation.

#### Corrective Action

(None).

#### Syslog Message

The FlexGroup %s (fg-uuid %s) no longer has any full constituents.

## Parameters

**object\_name** (STRING): Human-readable name of the FlexGroup.

**object\_uuid** (STRING): UUID of the FlexGroup.

## fg.space.member.full

### Severity

ALERT

### Description

This message occurs when a constituent volume within a FlexGroup volume is now full. Although new files can still be created within the FlexGroup volume and some files can still be expanded, none of the files that are stored on this constituent volume can be modified. The user might see random out-of-space errors as a consequence when trying to perform write operations on this FlexGroup volume.

### Corrective Action

Adding capacity to the FlexGroup volume by using the "volume modify -size +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup volume might work, but it is difficult to determine which files have landed on which constituent volume.

### Syslog Message

Constituent volume "%llu" in FlexGroup volume "%s" (fg-uuid "%s") is out of space. This constituent volume ("%s") is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

## Parameters

**constituent\_dsid** (LONGINT): DSID of the constituent volume that is out of space.

**object\_name** (STRING): Human-readable name of the FlexGroup volume.

**object\_uuid** (STRING): UUID of the FlexGroup volume.

**constituent\_name** (STRING): Name of the constituent volume.

**size** (LONGINT): Size in bytes of the constituent volume.

**used** (LONGINT): Size in bytes of the used space of the constituent volume.

**percent\_full** (INT): Percentage of filled space in the constituent volume.

**flexgroup\_size** (LONGINT): Size in bytes of the FlexGroup volume.

**flexgroup\_used** (LONGINT): Size used in bytes of the FlexGroup volume.

**flexgroup\_percent\_full** (INT): Percentage of filled space in the FlexGroup volume.

**event\_time** (LONGINT): When the event occurred, shown in system time.

## fg.space.member.nearlyFull

### Severity

ALERT

### Description

This message occurs when a constituent volume within a FlexGroup volume is nearly out of space. Although files can be created and expanded, if the constituent volume runs out of space, the user's ability to append to and modify those files that reside on this constituent volume will be impeded.

### Corrective Action

Adding capacity to the FlexGroup volume by using the "volume modify -size +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup volume might work, but it is difficult to determine which files have landed on which constituent volume.

## Syslog Message

Constituent volume "%llu" in FlexGroup volume "%s" (fg-uuid "%s") is nearly out of space. This constituent volume ("%s") is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

## Parameters

**constituent\_dsid** (LONGINT): DSID of the constituent volume that is nearly out of space.  
**object\_name** (STRING): Human-readable name of the FlexGroup volume.  
**object\_uuid** (STRING): UUID of the FlexGroup volume.  
**constituent\_name** (STRING): Name of the constituent volume.  
**size** (LONGINT): Size in bytes of the constituent volume.  
**used** (LONGINT): Size in bytes of the used space of the constituent volume.  
**percent\_full** (INT): Percentage of filled space in the constituent volume.  
**flexgroup\_size** (LONGINT): Size in bytes of the FlexGroup volume.  
**flexgroup\_used** (LONGINT): Size used in bytes of the FlexGroup volume.  
**flexgroup\_percent\_full** (INT): Percentage of filled space in the FlexGroup volume.  
**event\_time** (LONGINT): When the event occurred, shown in system time.

# fg.statechange events

## fg.stateChange

### Severity

NOTICE

### Description

This message occurs when the FlexGroup has transitioned from one state to another. This message might not occur immediately after the state transition occurred.

### Corrective Action

(None).

### Syslog Message

FlexGroup %s (fg-uuid %s) has changed state from %s to %s.

### Parameters

**object\_name** (STRING): Human-readable name of the FlexGroup.  
**object\_uuid** (STRING): UUID of the FlexGroup.  
**old\_state** (STRING): State that the FlexGroup was in before the EMS event.  
**new\_state** (STRING): State that the FlexGroup was in at the time of the EMS event.

# fg.svmdr events

## fg.svmdr.qos.wklds.insuff

### Severity

NOTICE

### Description

This message occurs during FlexGroup volume replication in an SVM DR setup when the available QoS workloads are insufficient on the secondary cluster.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Available QoS workloads are insufficient to support replicated FlexGroup "%s" in Vserver "%s".

### Parameters

**volume** (STRING): FlexGroup name.

**vserver** (STRING): Vserver name.

## fg.unconfig events

### fg.unconfig.consts.exist

#### Severity

ERROR

#### Description

This message occurs when a FlexGroup detects constituents that are not properly configured and have not been removed after a sufficient timeout. This usually means that a failed attempt to expand the volume also failed to delete constituents.

#### Corrective Action

Contact NetApp technical support for assistance.

#### Syslog Message

FlexGroup %s has had constituents that are not properly configured for longer than %d seconds.

#### Parameters

**object\_name** (STRING): Name of the FlexGroup.

**seconds** (INT): Timeout period in seconds.

## fg.unconvert events

### fg.unconvert.critical.fail

#### Severity

ALERT

#### Description

This message occurs when a member of a FlexGroup fails to be converted into an independent FlexVol® volume. The original state of this member could not be restored, so the FlexGroup itself is inoperable, and requires repair.

#### Corrective Action

Contact NetApp technical support.

#### Syslog Message

FlexGroup member #%u of %u in FlexGroup %s failed to be converted into an independent FlexVol volume. The FlexGroup is inoperable. Reason: %s

## Parameters

**fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.

**fgmembers** (INT): Total number of members in this FlexGroup.

**fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

**reason** (STRING): Reason why the conversion failed.

## fg.unconvert.fail

### Severity

ERROR

### Description

This message occurs when a member of a FlexGroup has fails to be converted into an independent FlexVol® volume. The FlexGroup is still functional.

### Corrective Action

Ensure that the FlexGroup is a valid candidate for the unconvert operation, and then retry the command. If the error persists, contact NetApp technical support.

### Syslog Message

FlexGroup member #%u of %u in FlexGroup %s failed to be converted into an independent FlexVol volume.  
Reason: %s

## Parameters

**fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.

**fgmembers** (INT): Total number of members in this FlexGroup.

**fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

**reason** (STRING): Reason why the conversion failed.

## fg.unconvert.start

### Severity

NOTICE

### Description

This message occurs when a member of a FlexGroup, usually the root constituent, is being converted to an independent FlexVol® volume.

### Corrective Action

(None).

### Syslog Message

Starting conversion of FlexGroup member #%u of %u in FlexGroup %s into an independent FlexVol volume.

## Parameters

**fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.

**fgmembers** (INT): Total number of members in this FlexGroup.

**fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

## fg.unconvert.success

### Severity

NOTICE

### Description

This message occurs when a member of a FlexGroup is successfully converted to an independent FlexVol® volume.

### Corrective Action

(None).

### Syslog Message

FlexGroup member #%u of %u in FlexGroup %s was successfully converted into an independent FlexVol volume.

### Parameters

**fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.

**fgmembers** (INT): Total number of members in this FlexGroup.

**fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

## fg.writeback events

### fg.writeback.delta.checker

### Severity

NOTICE

### Description

This message occurs when an inconsistency is discovered during a writeback. The writeback is ignored, so that the inconsistency does not get transferred to the cache origin.

### Corrective Action

(None).

### Syslog Message

Writeback operation failed for %s at line %d (%s).

### Parameters

**fh** (STRING): File handle of the affected inode.

**source** (INT): Location of the failing writeback validation test.

**state** (STRING): Description of the inconsistency.

# fgr events

## fgr.metadata events

### fgr.metadata.repaired

#### Severity

NOTICE

#### Description

This message occurs when the system detects an inconsistency in the volume capacity rebalancing metadata. As a consequence, the inconsistent metadata is deleted and new metadata will be repopulated according to latest volume capacity rebalancing state.

#### Corrective Action

None.

#### Syslog Message

The system detected an inconsistency in the volume capacity rebalancing metadata associated with volume %s:%s.

#### Parameters

**vserveruuid** (STRING): Universal unique identifier (UUID) of the volume's Vserver.

**volname** (STRING): Volume name.

# fips events

## fips.post events

### fips.post.failure

#### Severity

ERROR

#### Description

This message occurs when an unrecoverable error prevents initialization of the cryptographic subsystem into FIPS mode. No SSL communication will be possible with the storage system in this state. Other ONTAP features may also be affected by the lack of cryptographic operations.

#### Corrective Action

To operate in non FIPS cryptographic mode, turn off FIPS mode for the SSL interface using command "security config modify -interface SSL -is-fips-enabled false" and restart the system. For more information or assistance, contact NetApp technical support.

#### Syslog Message

SSL interface disabled due to failure of FIPS mode cryptographic services.

#### Parameters

(None).

# firmware events

## firmware.file events

### firmware.file.invalid

#### Severity

ERROR

#### Description

This message occurs when the system detects an invalid disk or shelf firmware file. This file cannot be used to update firmware on any disk or shelf device. This message repeats every 24 hours as long as the invalid file is present. There might be other invalid files on the system, and messages for those files are suppressed if they are detected within 24 hours of this event.

#### Corrective Action

Check your support provider for more information about obtaining the latest disk and shelf firmware. If the problem persists, contact NetApp technical support.

#### Syslog Message

%s %s failed verification due to: %s.

#### Parameters

**fwFileType** (STRING): Type of the firmware file, for example disk or shelf firmware file.

**fwFileName** (STRING): Name of the firmware file.

**reason** (STRING): Reason for mismatch.

# flexcache events

## flexcache.attrib events

### flexcache.attrib.sync.failed

#### Severity

ALERT

#### Description

This message occurs when when syncing properties between an origin of a FlexCache volume and its FlexCache volume fails, and due to which FlexCache volume may not be able to proceed with accurate data.

#### Corrective Action

Use the "volume flexcache sync-properties" command on the cluster hosting the FlexCache volume to sync the origin volume properties with the FlexCache volume.

#### Syslog Message

Failed to sync the FlexCache configuration for cluster %s in Vserver %s hosting FlexCache volume %s.

#### Parameters

**cacheCluster** (STRING): Name of the cluster hosting the FlexCache volume.  
**cacheVserver** (STRING): Name of the Vserver hosting the FlexCache volume.  
**cacheVolName** (STRING): Name of FlexCache volume for which sync failed.

### flexcache.attrib.sync.passed

#### Severity

NOTICE

#### Description

This message occurs when origin of a FlexCache volume properties sync succeeds for all connected FlexCache volumes.

#### Corrective Action

(None).

#### Syslog Message

Sync of origin of a FlexCache volume %s in Vserver %s succeeded for all connected FlexCache volumes.

#### Parameters

**originVolName** (STRING): Origin of a FlexCache volume.  
**originVserver** (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

### flexcache.attrib.sync.warn

#### Severity

NOTICE

## Description

This message occurs when syncing properties between an origin of a FlexCache volume and its FlexCache volume fails, and the sync operation will be retried.

## Corrective Action

Use the "volume flexcache sync-properties" command on the cluster hosting the FlexCache volume to sync the origin volume properties with the FlexCache volume.

## Syslog Message

Failed to sync the FlexCache configuration for cluster %s in Vserver %s hosting FlexCache volume %s. Operation will be retried.

## Parameters

**cacheCluster** (STRING): Name of the cluster hosting the FlexCache volume.

**cacheVserver** (STRING): Name of the Vserver hosting the FlexCache volume.

**cacheVolName** (STRING): Name of FlexCache volume for which sync failed.

# flexcache.autogrow events

## flexcache.autogrow.fail

### Severity

ERROR

### Description

This message occurs when automatically growing a FlexCache volume fails because the total cluster-wide FlexCache provisioned space has exceeded the licensed limit.

### Corrective Action

To increase the licensed capacity, install a new license in the cluster.

### Syslog Message

Autosize of FlexCache volume '%s%s%s' failed because the total cluster-wide FlexCache provisioned space has exceeded the licensed limit in the cluster %s.

### Parameters

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

**cluster\_uuid** (STRING): UUID of the Cluster.

# flexcache.cacheconnected events

## flexcache.cacheConnected

### Severity

INFORMATIONAL

## Description

This message occurs when a FlexCache® origin volume establishes communication with its cache volume.

## Corrective Action

No action required.

## Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s is connected with FlexCache volume with Vserver UUID %s and MSID %lu.

## Parameters

**originVolumeName** (STRING): Origin Volume name.  
**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.  
**originVserverName** (STRING): Vserver name of the origin volume.  
**originVserverUuid** (STRING): Vserver UUID of the origin volume.  
**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.  
**cacheMsid** (LONGINT): MSID of the FlexCache volume.

# flexcache.cachedisconnected events

## flexcache.cacheDisconnected

### Severity

EMERGENCY

### Description

This message occurs when a FlexCache® origin volume cannot communicate with its cache volume. The cache volume might therefore present stale data to its clients until the connection is reestablished.

### Corrective Action

Verify that the origin volume can connect with the FlexCache volume. If both volumes are within the same cluster, check the health of the owning nodes by using the "system node show" command. If the volumes are on different clusters, ensure that the intercluster LIFs on each cluster can connect by using the "network ping" command.

### Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s is disconnected from FlexCache volume with Vserver UUID %s and MSID %lu.

### Parameters

**originVolumeName** (STRING): Origin Volume name.  
**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.  
**originVserverName** (STRING): Vserver name of the origin volume.  
**originVserverUuid** (STRING): Vserver UUID of the origin volume.  
**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.  
**cacheMsid** (LONGINT): MSID of the FlexCache volume.

# flexcache.capacity events

## flexcache.capacity.exceeded

### Severity

ERROR

### Description

This message occurs when the total cluster-wide FlexCache provisioned space has exceeded the licensed limit.

### Corrective Action

To increase the licensed capacity, install a new license in the cluster.

### Syslog Message

The total cluster-wide FlexCache provisioned space has exceeded the licensed limit. Cluster id: %s, Current usage: %s, Licensed capacity: %s.

### Parameters

**cluster\_uuid** (STRING): UUID of the Cluster.

**used\_capacity** (STRING): Total FlexCache provisioned space in the cluster.

**licensed\_capacity** (STRING): FlexCache licensed capacity.

## flexcache.conf events

### flexcache.conf.refreshFailed

### Severity

ALERT

### Description

This message occurs when FlexCache configuration refresh fails. If this event happens, FlexCache will not be able to reach to its origin which will cause FlexCache to serve only cached data. This message occurs at most once every 30 minutes.

### Corrective Action

Use the "volume flexcache config-refresh" command on the cluster hosting the FlexCache volume to refresh the origin volume configuration on FlexCache volume.

### Syslog Message

Failed to refresh FlexCache configuration for peer vserver UUID %s and peer volume MSID %lu.  
isPeerOrigin : %u.

### Parameters

**peerVserverUuid** (STRING): Peer vserver UUID in string format for which refresh failed.

**peerVolMsid** (LONGINT): Peer volume MSID for which refresh failed.

**isPeerOrigin** (INT): Origin peer volume or cache peer volume for which refresh failed.

## flexcache.config events

## flexcache.config.sync.failed

### Severity

ERROR

### Description

This message occurs when the FlexCache volume expand operation fails to synchronize the FlexCache configuration information between the newly created constituent volume and the origin cluster.

### Corrective Action

Use the "volume flexcache config-refresh" command on the origin cluster to update the FlexCache configuration.

### Syslog Message

Volume expand failed to create the cache configuration for FlexCache volume "%s" in Vserver "%s" on the origin of the FlexCache cluster. Error: %s.

### Parameters

**cacheVolName** (STRING): Name of the FlexCache volume.

**cacheVserver** (STRING): Name of the Vserver hosting the FlexCache volume.

**errorString** (STRING): Error string.

## flexcache.encryption events

### flexcache.encryption.mismatch.with.origin

### Severity

ALERT

### Description

This message occurs when a plaintext FlexCache volume has been created for an encrypted origin volume.

### Corrective Action

(None).

### Syslog Message

A plaintext FlexCache volume "%s" in Vserver "%s" has been created for origin volume "%s" in Vserver "%s".

### Parameters

**originVolumeName** (STRING): Origin Volume Name.

**cacheVolumeName** (STRING): Cache Volume Name.

**cacheVserverName** (STRING): Cache Vserver Name.

**originVserverName** (STRING): Origin Vserver Name.

## flexcache.featuredisabled events

### flexcache.featureDisabled

**Severity**

ERROR

**Description**

This message occurs when an attempt is made to mount a FlexCache volume. FlexCache is no longer supported, please remove any remaining FlexCache volumes left over from upgrading the cluster.

**Corrective Action**

Delete all FlexCache volumes in the cluster. They can be displayed by using the "volume flexcache show" command.

**Syslog Message**

(None).

**Parameters**

**volume** (STRING): FlexCache volume involved.

## flexcache.mcc events

### flexcache.mcc.refresh.failed

**Severity**

ERROR

**Description**

This message occurs when a FlexCache® configuration refresh operation fails during MetroCluster(tm) switchover and switchback. Data access through FlexCache volumes might be impacted as a result.

**Corrective Action**

First, verify that the two Vservers in question are peered by using the "vserver peer show" command. Next, enter the "flexcache config-refresh -peer-server <peer-vserver> -peer-volume <peer-volume> -peer -endpoint-type <peer-endpoint-type>" command on a node within the cluster that directly manages the peer endpoint.

**Syslog Message**

FlexCache configuration refresh failed on peer Vserver %s for peer volume %s and peer endpoint %s on cluster %s.

**Parameters**

**peeredVserverUuid** (STRING): UUID of the peered Vserver.

**peerVolumeName** (STRING): Name of the peer volume.

**peerEndPointType** (STRING): Peer endpoint type.

**clusterUuid** (STRING): UUID of the cluster with the peer endpoint.

**localVserverUuid** (STRING): UUID of the local Vserver.

## flexcache.name events

### flexcache.name.sync.failed

## Severity

ERROR

## Description

This message occurs when the FlexCache® volume rename operation fails to synchronize the FlexCache name information to the origin cluster. Because of this failure, the "volume flexcache origin show-caches" command shows the old FlexCache volume name for the origin relationship.

## Corrective Action

Use the "volume flexcache sync-properties" command on the FlexCache cluster to update the FlexCache name on the origin cluster. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

## Syslog Message

Volume rename failed to update the new FlexCache volume "%s" on Vserver "%s" to the origin of the FlexCache cluster. Error: %s.

## Parameters

**cacheVolName** (STRING): Name of the FlexCache volume.

**cacheVserver** (STRING): Name of the Vserver hosting the FlexCache volume.

**errorString** (STRING): Error string.

# flexcache.nearly events

## flexcache.nearly.full

### Severity

ERROR

### Description

This message occurs when the total cluster-wide FlexCache provisioned space has nearly reached the licensed limit.

### Corrective Action

To increase the licensed capacity, install a new license in the cluster.

### Syslog Message

The total cluster-wide FlexCache provisioned space has nearly reached the licensed limit. Cluster id: %s, Current usage: %s, Licensed capacity: %s.

### Parameters

**cluster\_uuid** (STRING): UUID of the Cluster.

**used\_capacity** (STRING): Total FlexCache provisioned space in the cluster.

**licensed\_capacity** (STRING): FlexCache licensed capacity.

# flexcache.origin events

## flexcache.origin.config.sync.failed

**Severity**

ERROR

**Description**

This message occurs when the origin of the FlexCache volume expand operation fails to synchronize the configuration information between the newly created constituent volume and the cache cluster.

**Corrective Action**

Use the "volume flexcache config-refresh" command on the cache cluster to update the origin of the FlexCache configuration.

**Syslog Message**

Volume expand failed to create the origin configuration for the origin of the FlexCache volume "%s" in Vserver "%s" on the FlexCache cluster. Error: %s.

**Parameters**

**originVolName** (STRING): Name of the origin of the FlexCache volume.

**cacheVserver** (STRING): Name of the Vserver hosting the origin of the FlexCache volume.

**errorString** (STRING): Error string.

**flexcache.origin.size.sync.failed.disconnected.mode****Severity**

ERROR

**Description**

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails because the cluster containing the FlexCache volume is not reachable.

**Corrective Action**

Make sure that the cluster containing the FlexCache volume is reachable. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

**Syslog Message**

Failed to sync origin size property for FlexCache Cluster "%s". Error: %s

**Parameters**

**originClusterUuid** (STRING): Cache Cluster UUID.

**errorString** (STRING): Error string.

**flexcache.origin.size.sync.failed.for.cache.cluster****Severity**

ERROR

**Description**

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails because we encountered some error on the cluster containing the FlexCache volume.

### Corrective Action

Look for an EMS on the cache cluster and take the corrective action needed. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

### Syslog Message

Failed to sync origin size property for Cache Cluster "%s".

### Parameters

**cacheClusterUuid** (STRING): Cache Cluster UUID.

## flexcache.origin.size.sync.failed.for.cache.volume

### Severity

ERROR

### Description

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails, and the sync operation will be retried.

### Corrective Action

Take the appropriate action depending on the error message. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

### Syslog Message

Failed to sync origin size property for FlexCache volume "%s" in Vserver "%s". Error: %s.

### Parameters

**volumeName** (STRING): Cache Volume Name.

**vserverName** (STRING): Cache Vserver Name.

**errorString** (STRING): Error string.

## flexcache.origincleanup events

### flexcache.origincleanup.fail

### Severity

ERROR

### Description

This message occurs when the origin of a FlexCache® volume cleanup job fails to clean up the origin volume. All future FlexCache operations on the origin volume will fail.

### Corrective Action

Use the "volume flexcache origin cleanup-cache-relationship -force-retry true" command on the origin cluster to cleanup origin of a FlexCache volume. If the problem persists then contact technical support for assistance.

### Syslog Message

Origin volume cleanup job failed to clean up the origin volume of the FlexCache volume %s in Vserver %s.

## Parameters

**originVolName** (STRING): Name of the origin volume of the FlexCache volume.  
**originVserver** (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

## flexcache.origincleanup.retry

### Severity

ERROR

### Description

This message occurs when the RAL cleanup at the origin volume of a FlexCache® volume fails due to timeout. All future FlexCache operations on the origin volume will fail.

### Corrective Action

Use the "volume flexcache origin cleanup-cache-relationship -force-retry true" command on the origin cluster to cleanup origin of a FlexCache volume. If the problem persists then contact technical support for assistance.

### Syslog Message

RAL cleanup incomplete for the origin volume of the FlexCache volume %s in Vserver %s.

## Parameters

**originVolName** (STRING): Name of the origin volume of the FlexCache volume.  
**originVserver** (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

## flexcache.originconnected events

### flexcache.originConnected

### Severity

INFORMATIONAL

### Description

This message occurs when a FlexCache® volume establishes communication with its origin volume.

### Corrective Action

No action required.

### Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s is connected with its origin volume with Vserver UUID %s and MSID %lu.

## Parameters

**cacheVolumeName** (STRING): Volume Name of the FlexCache volume.  
**cacheMsid** (LONGINT): MSID of the FlexCache volume.  
**cacheVserverName** (STRING): Vserver Name of the FlexCache volume.  
**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.  
**originVserverUuid** (STRING): Vserver UUID of the origin volume.  
**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.

# flexcache.originDisconnected events

## flexcache.originDisconnected

### Severity

EMERGENCY

### Description

This message occurs when a FlexCache® volume cannot communicate with its origin volume. The cache volume might therefore present stale data to its clients. Client I/O to the cache volume might also not appear to respond if the client is requesting data that has not been cached.

### Corrective Action

Verify that the FlexCache volume can connect with its origin volume. If both volumes are within the same cluster, check the health of the owning nodes by using the "system node show" command. If the volumes are on different clusters, ensure that the intercluster LIFs on each cluster can connect by using the "network ping" command.

### Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s is disconnected from its origin volume with Vserver UUID %s and MSID %lu.

### Parameters

**cacheVolumeName** (STRING): Volume Name of the FlexCache volume.

**cacheMsid** (LONGINT): MSID of the FlexCache volume.

**cacheVserverName** (STRING): Vserver Name of the FlexCache volume.

**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.

**originVserverUuid** (STRING): Vserver UUID of the origin volume.

**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.

# flexcache.originfull events

## flexcache.originFull

### Severity

ALERT

### Description

This message occurs when a FlexCache® origin volume cannot serve data to cache volume because origin volume is full. The cache volume might therefore not be able to serve data to its clients until the origin has free space.

### Corrective Action

Ensure that the origin volume has free space.

### Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s may not be able to serve data to FlexCache volume with Vserver UUID %s and MSID %lu because origin volume is full.

## Parameters

**originVolumeName** (STRING): Origin Volume name.  
**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.  
**originVserverName** (STRING): Vserver name of the origin volume.  
**originVserverUuid** (STRING): Vserver UUID of the origin volume.  
**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.  
**cacheMsid** (LONGINT): MSID of the FlexCache volume.

# flexcache.originfull\_1 events

## flexcache.originFull\_1

### Severity

ALERT

### Description

This message occurs when a FlexCache® volume cannot retrieve data from its origin volume because origin volume is full. Client I/O to the cache volume might not appear to respond if the client is requesting data that has not been cached.

### Corrective Action

Ensure that the origin volume has free space.

### Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s may not be able to retrieve data from its origin volume with Vserver UUID %s and MSID %lu because origin volume is full.

## Parameters

**cacheVolumeName** (STRING): Volume Name of the FlexCache volume.  
**cacheMsid** (LONGINT): MSID of the FlexCache volume.  
**cacheVserverName** (STRING): Vserver Name of the FlexCache volume.  
**cacheVserverUuid** (STRING): Vserver UUID of the FlexCache volume.  
**originVserverUuid** (STRING): Vserver UUID of the origin volume.  
**originMsid** (LONGINT): Master data set identifier (MSID) of the origin volume.

# flexcache.softevict events

## flexcache.softEvict.failed

### Severity

ERROR

### Description

This message occurs when soft evicting a cache volume fails. The cache volume might therefore present stale data to its clients.

### Corrective Action

(None).

**Syslog Message**

Soft eviction of constituent DSID %lu failed.

**Parameters**

**constituentDsid** (LONGINT): Constituent's DSID.

**flexcache.softEvict.success****Severity**

INFORMATIONAL

**Description**

This message occurs on successfully soft evicting the cache volume.

**Corrective Action**

No Action Required.

**Syslog Message**

Constituent DSID %lu is successfully soft evicted.

**Parameters**

**constituentDsid** (LONGINT): Constituent's DSID.

# fli events

## fli.lun events

### fli.lun.import.checkpoint

#### Severity

ERROR

#### Description

This message occurs when a checkpoint record delete fails. Checkpoint is metadata information stored with the NetApp LUN attribute stream for tracking import progress. An attempt is made to delete this metadata during import stop or delete operations.

#### Corrective Action

This record can remain in the LUN attribute stream without any harm. It could occupy ~100-200 bytes of space in the LUN attribute stream. If that is an issue, a support personnel could be contacted to delete this record.

#### Syslog Message

Import checkpoint record could not be deleted for LUN %s - Reason:%s

#### Parameters

**LUNSerialNumber** (STRING): Serial number of the LUN.

**FailureReason** (STRING): Internal error reason.

### fli.lun.import.complete

#### Severity

INFORMATIONAL

#### Description

This message occurs when a foreign LUN import is complete.

#### Corrective Action

(None).

#### Syslog Message

Import of foreign LUN %s of size %lld bytes from array model %s belonging to vendor %s is successfully completed. Destination NetApp LUN is %s.

#### Parameters

**DiskSerialNumber** (STRING): Foreign disk serial number.

**Size** (LONGINT): Size of the foreign LUN.

**ForeignArrayModelID** (STRING): Foreign array model ID.

**ForeignArrayVendor** (STRING): Foreign array vendor name.

**LUNSerialNumber** (STRING): Serial number of the LUN.

## fli.lun.import.failed

### Severity

ERROR

### Description

This message occurs when a foreign LUN import goes into failed state. 1. Data could not be read from the source(foreign LUN). 2. Data could not be written to the destination(NetApp LUN). 3. This is an Internal/metadata related error.

### Corrective Action

1. Verify the connectivity to the foreign disk.
2. Verify that the destination volume is online and has enough space by using "volume show" command.
3. Run the "lun import pause" command followed by a "lun import resume" command. In certain cases, the import might need to be restarted ( Use "lun import stop" command followed by "lun import start" command). The ultimate recovery is to delete this relationship (with -force option) and create it again.

### Syslog Message

Import of foreign LUN %s to LUN %s failed - Reason:%s

### Parameters

**DiskSerialNumber** (STRING): Foreign disk serial number.

**LUNSerialNumber** (STRING): Serial number of the LUN.

**FailureReason** (STRING): Internal error reason.

## fli.lun.import.inconsistent

### Severity

ERROR

### Description

This message occurs when the import inconsistent flag cannot be unset. The import inconsistent flag is a system attribute for the NetApp LUN that is set during import progress, to indicate inconsistent data in the destination LUN. This is to discourage restore operations on LUN Snapshot(tm) copies created during import. A best effort is done to unset this flag after the import is complete, and also during import stop and delete operations. It is safe to perform restore operations if data in the destination LUN is known to be successfully verified.

### Corrective Action

(None).

### Syslog Message

Import inconsistent flag could not be unset for LUN %s - Reason:%s

### Parameters

**LUNSerialNumber** (STRING): Serial number of the LUN.

**FailureReason** (STRING): Internal error reason.

## fli.lun.verify.complete

**Severity**

INFORMATIONAL

**Description**

This message occurs when a foreign LUN import verify is complete.

**Corrective Action**

(None).

**Syslog Message**

Import verify of foreign LUN %s of size %lld bytes from array model %s belonging to vendor %s with NetApp LUN %s is successfully completed.

**Parameters**

**DiskSerialNumber** (STRING): Foreign disk serial number.

**Size** (LONGINT): Size of the foreign LUN.

**ForeignArrayModelID** (STRING): Foreign array model ID.

**ForeignArrayVendor** (STRING): Foreign array name.

**LUNSerialNumber** (STRING): Serial number of the LUN.

**fli.lun.verify.failed****Severity**

ERROR

**Description**

This message occurs when a foreign LUN import verify fails. 1. Data could not be read from the source(foreign LUN). 2. Data could not be written to the destination(NetApp LUN). 3. There was a data mismatch during the verify operation. 4. There was an internal error.

**Corrective Action**

1. For a data mismatch, start the import operation again.
2. Verify the connectivity to the foreign disk.
3. Verify that destination volume is in a healthy state. In certain cases, the verify operation might need to be restarted (Use "lun import verify stop" command followed by "lun import verify start" command). The ultimate recovery is to delete this relationship (with -force option) and create it again.

**Syslog Message**

Import verify of foreign LUN %s and NetApp LUN %s failed - Reason:%s

**Parameters**

**DiskSerialNumber** (STRING): Foreign disk serial number.

**LUNSerialNumber** (STRING): Serial number of the LUN.

**FailureReason** (STRING): Internal error reason.

# fm events

## fm.cpuutilduringarl events

### fm.cpuUtilDuringARL

#### Deprecated

Deprecated as of version 9.0.

#### Severity

NOTICE

#### Description

This message occurs at the start of an aggregate relocation (ARL) and at the completion of an ARL. It records the maximum, minimum, and average CPU and disk utilization on the node executing the ARL.

#### Corrective Action

(None).

#### Syslog Message

CPU and disk utilization during the %d seconds %s: cpu\_util\_high: %lld; cpu\_util\_low: %lld; cpu\_util\_avg: %lld; disk\_util\_high: %lld; disk\_util\_low: %lld; disk\_util\_avg: %lld

#### Parameters

**window\_sz** (INT): Duration, in seconds, over which CPU and disk utilization are tracked.

**when** (STRING): Event during which CPU and disk utilization are tracked.

**cpu\_util\_high** (LONGINT): Maximum CPU utilization.

**cpu\_util\_low** (LONGINT): Minimum CPU utilization.

**cpu\_util\_avg** (LONGINT): Average CPU utilization.

**disk\_util\_high** (LONGINT): Maximum disk utilization.

**disk\_util\_low** (LONGINT): Minimum disk utilization.

**disk\_util\_avg** (LONGINT): Average disk utilization.

## fm.cpuutilduringtransition events

### fm.cpuUtilDuringTransition

#### Severity

NOTICE

#### Description

This message occurs during various failover and aggregate mobility events, including start of a takeover, end of a successful takeover, start of a CFO giveback, after completion of SFO giveback and completion of an aggregate relocation. This message records the maximum, minimum, and average CPU and disk utilization on the node executing the failover or aggregate mobility operation.

#### Corrective Action

(None).

## Syslog Message

CPU and disk utilization during the %d seconds %s: cpu\_util\_high: %lld; cpu\_util\_low: %lld; cpu\_util\_avg: %lld; disk\_util\_high: %lld; disk\_util\_low: %lld; disk\_util\_avg: %lld

## Parameters

**window\_sz** (INT): Duration, in seconds, over which CPU and disk utilization are tracked.

**when** (STRING): Event during which CPU and disk utilization are tracked.

**cpu\_util\_high** (LONGINT): Maximum CPU utilization.

**cpu\_util\_low** (LONGINT): Minimum CPU utilization.

**cpu\_util\_avg** (LONGINT): Average CPU utilization.

**disk\_util\_high** (LONGINT): Maximum disk utilization.

**disk\_util\_low** (LONGINT): Minimum disk utilization.

**disk\_util\_avg** (LONGINT): Average disk utilization.

# fm.overrideMbxUncertain events

## fm.overrideMbxUncertain

### Severity

NOTICE

### Description

This message occurs when the user has chosen to override a mailbox uncertain state using the CTRL\_O option. The node could have gotten into the mailbox uncertain state if, while booting up, it finds that one or more disks are missing and it does not have the requisite number of mailbox disks to boot up. If the override was successful, at least half of the online disks were also present in the mailbox hints bootarg and the node will boot up. If the override was unsuccessful, the node continues to remain in an uncertain mailbox state and will not boot up completely.

### Corrective Action

(None).

### Syslog Message

HA mailbox uncertain state overridden.

### Parameters

(None).

# fmmb events

## fmmb.add events

### fmmb.add.problem

#### Severity

ERROR

#### Description

This event is issued when the HA mailbox is attempting to add a mailbox disk and a problem occurred.

#### Corrective Action

(None).

#### Syslog Message

Error attempting to add disk %s as a %s HA mailbox disk.

#### Parameters

**disk** (STRING): The name of the disk. If the disk name is not available, a ?? will be used.

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

## fmmb.blobnotfound events

### fmmb.BlobNotFound

#### Severity

ALERT

#### Description

This message occurs when a mailbox 'blob' is not read from the on-disk mailbox data structure. A 'blob' is a piece of data which has been stored for a non-High Availability (HA) Data ONTAP® subsystem in the mailbox.

#### Corrective Action

If the blob id is "3" and this is a 2-node cluster, use the 'cluster ha modify -configure' command to unconfigure ha and then reconfigure it.

#### Syslog Message

(None).

#### Parameters

**blob\_id** (INT): 'blob' ID.

**owner** (STRING): Owner of the blob, either PARTNER or LOCAL.

**reason** (STRING): Reason for the problem.

## fmmb.blobnotwritten events

## fmmb.BlobNotWritten

### Deprecated

Deprecated as of version 9.2.

### Severity

ALERT

### Description

This message occurs when a mailbox 'blob' write operation to the on-disk mailbox data structure fails. A 'blob' is a piece of data that has been stored for a non-high availability (HA) Data ONTAP® subsystem in the HA mailbox.

### Corrective Action

If the blob ID is "3" and this is a two-node cluster, use the 'cluster ha modify -configure' command to unconfigure HA and then reconfigure it.

### Syslog Message

(None).

### Parameters

**blob\_id** (INT): 'blob' ID.

**owner** (STRING): Owner of the blob, either PARTNER or LOCAL.

**reason** (STRING): Reason for the problem.

## fmmb.blobwritten events

### fmmb.BlobWritten

### Severity

INFORMATIONAL

### Description

This message occurs when a mailbox 'blob' write to the on-disk mailbox data structure succeeds. A 'blob' is a piece of data that has been stored for a non-high availability (HA) Data ONTAP® subsystem in the HA mailbox.

### Corrective Action

(None).

### Syslog Message

Blob %d: bytes written %d: data: %llx.

### Parameters

**blob\_id** (INT): 'blob' ID.

**blob\_data\_len** (INT): Total number of bytes of data written.

**data** (LONGINTEX): First eight bytes of the data written.

# fmmb.current events

## fmmb.current.lock.disk

### Severity

INFORMATIONAL

### Description

This event is issued when HA mailbox disks are discovered or allocated.

### Corrective Action

(None).

### Syslog Message

Disk %s is a %s HA mailbox disk.

### Parameters

**disk** (STRING): The name of the disk. If the disk name is not available, the name ?? will be used.

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

# fmmb.destroy events

## fmmb.destroy.mbx

### Severity

INFORMATIONAL

### Description

This event is issued when the high-availability (HA) Mailbox contents are cleared, typically by the 'mailbox destroy' command.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**disk\_name** (STRING): Disk name on which the mailbox was cleared.

## fmmb.destroy.mbx.fail

### Severity

NOTICE

### Description

This event is issued when an attempt is made to destroy the mailbox contents on the disk and this fails. Data ONTAP to a 7.0 or later version.

**Corrective Action**

(None).

**Syslog Message**

Failed to clear mailbox on disk:%s, error:%s.

**Parameters**

**disk\_name** (STRING): disk name on which we are trying to clear the mailbox.

**error** (STRING): The reason why mailbox clear failed.

## fmmb.disk events

### fmmb.disk.IDchange

**Severity**

INFORMATIONAL

**Description**

This event is issued when the unique identifier of one of the disks used by the HA mailbox has changed.

**Corrective Action**

(None).

**Syslog Message**

Disk %s has changed its unique identifier.

**Parameters**

**disk** (STRING): The name of the disk whose identifier has changed.

### fmmb.disk.notAccsble

**Severity**

NOTICE

**Description**

This message occurs when mailbox disks of the specified host are not accessible.

**Corrective Action**

(None).

**Syslog Message**

All %s mailbox disks are inaccessible.

**Parameters**

**host** (STRING): Host string, which is either local or partner.

## fmmb.exthdr events

## fmmb.exthdr.null

### Severity

ERROR

### Description

This event is issued when the HA Mailbox extension header is invalid. The extension header is an on-disk structure which describes the opaque client blocks and major reset structures.

### Corrective Action

(None).

### Syslog Message

HA Mailbox extension header is null.

### Parameters

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

## fmmb.inststat events

### fmmb.instStat.change

### Severity

INFORMATIONAL

### Description

This message occurs whenever the mailbox instance state changes.

### Corrective Action

(None).

### Syslog Message

%s on %s side.

### Parameters

**buff** (STRING): Instance state string.

**host** (STRING): Host string, which is either local or partner.

## fmmb.lock events

### fmmb.lock.disk.remove

### Severity

INFORMATIONAL

### Description

This event is issued when a disk is removed from the HA mailbox disk lock set.

**Corrective Action**

(None).

**Syslog Message**

Disk %s removed from %s mailbox set.

**Parameters**

**disk** (STRING): The name of the disk. If the disk name is not available, a ?.? will be used.

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

## fmmb.major events

### fmmb.major.reset.invalid

**Severity**

ALERT

**Description**

This event is issued when the HA Mailbox major reset data should exist and it doesn't. The major reset data in the mailbox is created and used when there is a major change of information kept in the HA mailbox records.

**Corrective Action**

(None).

**Syslog Message**

HA %s Mailbox major reset header information is invalid.

**Parameters**

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

## fmmb.mediator events

### fmmb.mediator.lckdiskSuggest

**Severity**

INFORMATIONAL

**Description**

This message occurs when a mailbox disk from the mediator site is selected to be included in the mailbox disk list.

**Corrective Action**

(None).

**Syslog Message**

(None).

## Parameters

**side** (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

**uuid** (STRING): Disk unique ID of the mailbox disk on mediator site.

## fmmb.mediator.noLckdisk

### Severity

INFORMATIONAL

### Description

This message occurs when there is no mediator mailbox detected.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**side** (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

## fmmb.mediator.nullLckdiskSuggest

### Severity

INFORMATIONAL

### Description

This message occurs when there is null mediator mailbox detected.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**side** (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

## fmmb.mmr events

### fmmb.MMR.payload.bad

### Severity

ALERT

### Description

This event is issued when the outbound FM payload area is found to be corrupted and the master mailbox record is missing.

**Corrective Action**

(None).

**Syslog Message**

%s outbound FM payload area is invalid and the master mailbox record is missing.

**Parameters**

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

## fmmb.newdisksuggestion events

**fmmb.NewDiskSuggestion****Severity**

INFORMATIONAL

**Description**

This message occurs when RAID sends to the high-availability (HA) mailbox code a list of disks to use for HA mailbox disks.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**count** (INT): Number of suggested disks.

**new** (STRING): List of suggested disks.

**old** (STRING): Current list of HA mailbox disks.

## fmmb.oldformatcleared events

**fmmb.oldFormatCleared****Severity**

INFORMATIONAL

**Description**

This event is issued when the older format HA mailboxes (special area of disk used for bookkeeping) are cleared on an upgrade from a pre 7.0 version of Data ONTAP to a 7.0 or later version.

**Corrective Action**

(None).

**Syslog Message**

Clearing content of %s old format HA mailboxes (special area of disk used for bookkeeping).

## Parameters

**whichone** (STRING): Either local or partner to indicate which set of HA mailboxes are being cleared.

# fmmb.opaque events

## fmmb.opaque.hdr.invalid

### Severity

ALERT

### Description

This event is issued when the HA Mailbox opaque header is invalid. The opaque area in the HA Mailbox is used by HA mailbox clients, like RAID, to store persistent information.

### Corrective Action

(None).

### Syslog Message

HA %s Mailbox opaque header is invalid.

## Parameters

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

# fmmb.payload events

## fmmb.payload.outbound.bad

### Severity

ALERT

### Description

This event is issued when the outbound FM payload area is found to be corrupted. The invalid fm state information is logged. As a result of this condition the payload is zeroed and HA mailbox re-initialization is done.

### Corrective Action

(None).

### Syslog Message

%s outbound FM payload area is invalid with fmState of %d.

## Parameters

**host** (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

**fmState** (INT): The invalid FM state information.

# fmmb.revert events

## **fmmb.revert.opaque**

### **Severity**

ERROR

### **Description**

This event is issued when the HA Mailbox opaque receives a write request for the opaque area and a revert\_to command is in progress. The write request is rejected. The opaque area in the HA Mailbox is used by non HA mailbox clients, like RAID, to store persistent information.

### **Corrective Action**

(None).

### **Syslog Message**

HA Mailbox RAID write request rejected during revert.

### **Parameters**

(None).

# fp events

## fp.est events

### fp.est.scan.catalog.failed

#### Severity

ERROR

#### Description

This message occurs when the volume footprint estimator scan fails to update the catalog file. This can cause footprint data reduction to be unreported post volume remount until the next scan updates the file.

#### Corrective Action

Check if there is atleast 4K worth of space available for the catalog metafile in the volume. Use "df <vol-name>" command to see available space details.

#### Syslog Message

Volume footprint estimator scan catalog update fails on "%s" - %s.

#### Parameters

**vol** (STRING): Volume name.

**fail\_message** (STRING): Update failure reason.

### fp.est.scan.catalog.updated

#### Severity

NOTICE

#### Description

This message occurs when related information of the volume footprint estimator scan is updated on the catalog file.

#### Corrective Action

(None).

#### Syslog Message

Volume footprint estimator scan catalog updated on '%s' (SE ratio local: %s, SE ratio migrate: %s, Incompressible: %d%%, Hot data: %llu%%, Mode: %d, SE ratio cold migrate: %s).

#### Parameters

**vol** (STRING): Volume name.

**se\_ratio\_local** (STRING): Storage efficiency ratio for local reporting.

**se\_ratio\_migrate** (STRING): Storage efficiency ratio for migrate reporting.

**incomp\_data\_pct** (INT): Incompressible data percentage.

**hot\_data\_pct** (LONGINT): Hot data percentage.

**scan\_mode** (INT): Scan mode.

**se\_ratio\_cold\_migrate** (STRING): Storage efficiency ratio for cold migrate reporting.

## **fp.est.scan.start.failed**

### **Severity**

ERROR

### **Description**

This message occurs when the volume footprint estimator scan fails to start. This might cause footprint data reduction reporting to be inaccurate. But the scan is expected to be triggered again in the next cycle which is likely to be the next day.

### **Corrective Action**

Scan will be triggered again in the next cycle which is likely to be the next day.

### **Syslog Message**

Volume footprint estimator scan fails to start on "%s" - %s.

### **Parameters**

**vol** (STRING): Volume name.

**fail\_message** (STRING): Scan failure reason.

# fpolicy events

## fpolicy.eagain events

### fpolicy.eagain.disconnect

#### Severity

ALERT

#### Description

This message occurs when the TCP connection to the FPolicy server is broken four times in a two minute interval due to EAGAIN error. ONTAP will not establish a new connection and FPolicy notifications will not be sent to the server.

#### Corrective Action

Persistent EAGAIN errors indicate slow network or slow/unresponsive FPolicy server. Check the connection between the FPolicy server and the node or contact the FPolicy application's vendor support to address the slow/unresponsive server.

#### Syslog Message

Connection to the FPolicy server "%s" of policy "%s" is broken for Vserver %s ( reason: "%s" ).

#### Parameters

**fpserver** (STRING): IP address of the FPolicy server.

**policy** (STRING): Name of the policy.

**vserver** (STRING): Vserver Name.

**reason** (STRING): Reason for disconnection.

### fpolicy.eagain.on.write

#### Severity

NOTICE

#### Description

This message occurs when there is no space in the send buffer for sending a message to the FPolicy server. The FPolicy server is apparently slow in reading notifications.

#### Corrective Action

Occasional EAGAIN (resource temporarily unavailable) errors can occur for transient network issues. If this message occurs frequently, check the connection between the FPolicy server and the node. If the errors persist, contact the FPolicy application's vendor support.

#### Syslog Message

Write returned EAGAIN while sending notification to the FPolicy server "%s" for Vserver %s with UUID %s.

#### Parameters

**fpserver** (STRING): IP address of the FPolicy server.

**vserver** (STRING): Vserver Name.

**Vserver\_UUID** (STRING): Vserver UUID.

# fpolicy.fgconversion events

## fpolicy.fgconversion.warning

### Severity

NOTICE

### Description

This message occurs when a FlexVol® unmount notification is not sent to the FPolicy(tm) server during a FlexGroup conversion.

### Corrective Action

(None).

### Syslog Message

Failed to send FPolicy unmount notification for FlexVol %s of Vserver %s. FlexGroup MSID: %llu.

### Parameters

**vserverName** (STRING): Name of the Vserver.

**volumeName** (STRING): Name of the volume being converted to a FlexGroup.

**flexgroupMsid** (LONGINTEX): MSID of the new FlexGroup.

# fpolicy.memory events

## fpolicy.memory.pressure

### Severity

ALERT

### Description

This message occurs when either the FPolicy Service Manager (FSM) receives too many requests to process immediately, or when the number of requests is accumulating due to server connectivity issues. FSM processing time might degrade as a result.

### Corrective Action

Check the connection between the node and the FPolicy server by using the "vserver fpolicy show-engine" command. Verify that FPolicy is only monitoring file operations that are recommended by the FPolicy server vendor. Verify that FPolicy is using filters recommended by the server vendor for common file operations, for example, close, read, write and open.

### Syslog Message

FSM is experiencing memory pressure.

### Parameters

(None).

# fpolicy.outage events

## **fpolicy.outage.file.invalid**

### **Severity**

ERROR

### **Description**

This message occurs when file creation fails under the configured resiliency directory path.

### **Corrective Action**

Check the configured resiliency directory path. To find the configured resiliency directory path by using the "vserver fpolicy policy external-engine show" command.

### **Syslog Message**

Failed to create file under configured resiliency directory path of FPolicy external engine "%s" for policy "%s". Reason: %s.

### **Parameters**

**engine** (STRING): FPolicy external engine.

**policy** (STRING): FPolicy policy.

**reason** (STRING): Reason for the failure.

## **fpolicy.outage.msg.lost**

### **Severity**

ERROR

### **Description**

This message occurs when the send operation fails for the network outage notification.

### **Corrective Action**

Find the file in the configured resiliency directory path.

### **Syslog Message**

Failed to send outage notification message to any FPolicy server for policy "%s" and path "%s".

### **Parameters**

**policy** (STRING): FPolicy policy.

**path** (STRING): File path.

## **fpolicy.outage.msg.success**

### **Severity**

NOTICE

### **Description**

This message occurs when a network outage notification is successfully sent.

### **Corrective Action**

(None).

## Syslog Message

Outage notification message sent to at least one FPolicy server for policy "%s" and file path "%s".

## Parameters

**policy** (STRING): FPolicy policy.

**path** (STRING): File path.

## fpolicy.outage.over

### Severity

NOTICE

### Description

This message occurs when the FPolicy external engine, acting asynchronously and with resiliency support enabled, is reconnected after a network outage.

### Corrective Action

(None).

## Syslog Message

The network outage (duration: "%llu" sec) is over. At least one FPolicy server is now connected successfully for FPolicy external engine "%s" of policy "%s".

## Parameters

**Duration** (LONGINT): Network outage duration in seconds.

**engine** (STRING): Asynchronous FPolicy external engine.

**policy** (STRING): FPolicy policy.

## fpolicy.outage.start

### Severity

NOTICE

### Description

This message occurs when the FPolicy external engine, acting asynchronously and with resiliency support enabled, is disconnected due to a network outage.

### Corrective Action

(None).

## Syslog Message

Network outage for FPolicy external engine "%s" of policy "%s".

## Parameters

**engine** (STRING): Asynchronous FPolicy external engine.

**policy** (STRING): FPolicy policy.

## fpolicy.outage.timeout

**Severity**

NOTICE

**Description**

This message occurs when the maximum notification retention duration for the FPolicy external engine expires, and the engine is configured to operate asynchronously with resiliency support enabled. The storage controller stores no more notifications.

**Corrective Action**

(None).

**Syslog Message**

Maximum notification retention time has expired for FPolicy external engine "%s" of policy "%s".

**Parameters**

**engine** (STRING): Asynchronous FPolicy external engine.

**policy** (STRING): FPolicy policy.

**fpolicy.outage.write****Severity**

NOTICE

**Description**

This message occurs when FPolicy cannot store file notifications using the configured resiliency directory path.

**Corrective Action**

(None).

**Syslog Message**

Failed to store notifications in configured resiliency directory path of FPolicy external engine "%s" for policy "%s". Reason: %s.

**Parameters**

**engine** (STRING): FPolicy external engine.

**policy** (STRING): FPolicy policy.

**reason** (STRING): Reason for the failure.

**fpolicy.outage.writes.lost****Severity**

ERROR

**Description**

This message occurs when FPolicy fails multiple consecutive times to store file notifications using the configured resiliency directory path.

**Corrective Action**

Check the configured resiliency directory path. To find the configured resiliency directory path by using the "vserver fpolicy policy external-engine show" command.

## Syslog Message

Unable to store notifications in configured resiliency directory path of FPolicy external engine "%s" for policy "%s".

## Parameters

**engine** (STRING): FPolicy external engine.  
**policy** (STRING): FPolicy policy.

# fpolicy.pspath events

## fpolicy.pspath.failed

### Severity

ERROR

### Description

This message occurs when the creation of the FPolicy persistent store active or backlog directories fails. This disrupts the persistent store workflow in FPolicy.

### Corrective Action

Check the space availability and permission on volume and recreate the PS config.

## Syslog Message

Failed to create FPolicy persistent store path "%s" in SVM "%s".

## Parameters

**path** (STRING): The directory path name that failed while it's creation.  
**vserverName** (STRING): Name of the Vserver.

# fpolicy.server events

## fpolicy.server.bkPressApply

### Severity

INFORMATIONAL

### Description

This message occurs when the FPolicy server has applied backpressure which means that the server is busy and does not want to receive requests until it removes backpressure.

### Corrective Action

(None).

## Syslog Message

FPolicy server "%s" has applied backpressure.

## Parameters

**fpserver** (STRING): IP Address of the FPolicy server.

## **fpolicy.server.bkPressRemove**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the FPolicy server removes backpressure, which it has previously applied. The FPolicy server removes backpressure when it is ready to receive requests.

### **Corrective Action**

(None).

### **Syslog Message**

FPolicy server "%s" has removed backpressure.

### **Parameters**

**fpserver** (STRING): IP Address of the FPolicy server.

## **fpolicy.server.connect**

### **Severity**

NOTICE

### **Description**

This message occurs when a control channel is established between the node and the FPolicy server.

### **Corrective Action**

(None).

### **Syslog Message**

Control channel with the FPolicy server "%s" of policy "%s" is established for Vserver %s.

### **Parameters**

**fpserver** (STRING): IP Address of the FPolicy server.

**policy** (STRING): Name of the policy.

**vserver** (STRING): Vserver Name.

## **fpolicy.server.connectError**

### **Severity**

ERROR

### **Description**

This message occurs when the node fails to establish a control channel with the FPolicy server. The control channel is used for communication between the node and the FPolicy server. The error could be because of a failure in establishing TCP connection, SSL failure, FPolicy handshake failure, or some internal error.

### **Corrective Action**

Depending on the failure reason, check the following: On the node, check whether the correct IP and port entries are specified in the policy configuration. Also, the FPolicy server should be running and listening on the port specified in the policy configuration. Run the command "network interface show" to determine that at least one data logical interface (LIF) is configured to the Vserver on the node. Run the command

"routing-groups route show" to verify that the network route exists to the FPolicy server. Run the command "network ping" to verify that the FPolicy server is reachable from the node. For any other reason, see the Cluster-Mode documentation.

### Syslog Message

Node failed to establish a connection with the FPolicy server "%s" of policy "%s" for Vserver %s (reason: "%s").

### Parameters

**fpserver** (STRING): IP address of the FPolicy server.  
**policy** (STRING): Name of the policy.  
**vserver** (STRING): Vserver Name.  
**reason** (STRING): Reason for failure.

## fpolicy.server.disconnect

### Severity

ERROR

### Description

This message occurs when the TCP connection to the FPolicy(tm) server is broken.

### Corrective Action

Reestablish the connection by using "vserver fpolicy engine-connect" command.

### Syslog Message

Connection to the FPolicy server "%s" of policy "%s" is broken for Vserver %s ( reason: "%s" ).

### Parameters

**fpserver** (STRING): IP address of the FPolicy server.  
**policy** (STRING): Name of the policy.  
**vserver** (STRING): Vserver Name.  
**reason** (STRING): Reason for disconnection.

## fpolicy.server.maxPendingReq

### Severity

INFORMATIONAL

### Description

This message occurs when the maximum outstanding requests for a FPolicy server from a node has reached. The value is configurable through CLI.

### Corrective Action

If you want to increase the maximum pending request modify the "-max-server-reqs" option using command "fpolicy policy external-engine modify" from CLI.

### Syslog Message

Maximum outstanding requests for the FPolicy server "%s" has reached.

## Parameters

**fpserver** (STRING): IP Address of the FPolicy server.

# fsm events

## fsm.low events

### fsm.low.memory

#### Severity

ERROR

#### Description

This message occurs when Fpolicy Service Manager (FSM) fails to send outage, alert, handshake, cancel or volume operation notification to the FPolicy server due to memory allocation error.

#### Corrective Action

Check the connection between ONTAP and FPolicy server. Slow connection may result in accumulation of notifications in FSM. Make sure that the FPolicy is monitoring file operation which are recommended by FPolicy server vendor. Also use vendor recommended filter for operation like close, read, write and open.

#### Syslog Message

Failed to allocate memory for %s notification.

#### Parameters

**reqType** (STRING): Type of the message.

# gb events

## gb.cfo events

### gb.cfo.abort.raid.fm

#### Severity

ERROR

#### Description

This message occurs when a high-availability (HA) controller failover (CFO) giveback is canceled due to RAID activity on a partner aggregate.

#### Corrective Action

Reissue the "storage failover giveback" command to initiate giveback to the partner after the pending or in-progress operation on the partner volume or aggregate is complete. Use the "storage aggregate status -r" command to view the state of the aggregate. If a plex is offline, use the "storage aggregate plex online" command to bring the plex online. If unmirrored aggregates are not supported on this configuration, use the "storage aggregate mirror" command to mirror this aggregate.

#### Syslog Message

%s %s%s is %s; canceling giveback.

#### Parameters

**vol\_type** (STRING): Volume type.  
**owner** (STRING): Current owner of the aggregate.  
**vol** (STRING): Name of the aggregate.  
**reason** (STRING): Activity that is preventing CFO giveback.

### gb.cfo.veto.asup.generalNopart

#### Severity

NOTICE

#### Description

This message occurs when AutoSupport vetoes a controller failover (CFO) giveback request because an AutoSupport message for the down partner node was not collected prior to the giveback request.

#### Corrective Action

Typically, an AutoSupport message for the partner node is collected shortly after takeover is complete. If the CFO giveback was attempted and vetoed within 20 minutes of the takeover, retry the operation later. If time does not permit waiting, use the 'cf giveback -f' command to force a giveback.

#### Syslog Message

AutoSupport vetoed giveback because an AutoSupport message for the down partner node was not yet collected.

#### Parameters

(None).

## **gb.cfo.veto.coredump.pardump**

### **Severity**

NOTICE

### **Description**

This message occurs when the partner node is still dumping core, and cannot yet resume serving data. The giveback attempt has been canceled.

### **Corrective Action**

Either let the dumpcore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

### **Syslog Message**

Giveback canceled because partner is still dumping core

### **Parameters**

(None).

## **gb.cfo.veto.coredump.parsave**

### **Severity**

NOTICE

### **Description**

This message occurs when savecore is currently saving the partner coredump. This work will be lost if a giveback is done at this time, so the giveback has been canceled.

### **Corrective Action**

Either let the savecore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

### **Syslog Message**

Giveback canceled because savecore is running. %d%% - %d of %d blocks saved

### **Parameters**

**percent** (INT): Percentage of core that has been saved  
**completed** (INT): Number of blocks that have been saved  
**total** (INT): Total number of blocks in the core

## **gb.cfo.veto.coredump.savinit**

### **Severity**

NOTICE

### **Description**

This message occurs when savecore is getting ready to start saving the partner coredump. The giveback attempt has been canceled.

### **Corrective Action**

Either let the savecore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

## Syslog Message

Giveback canceled because savecore is initializing

## Parameters

(None).

## gb.cfo.veto.lmgr.nonCA.broke

### Severity

NOTICE

### Description

This message occurs when a giveback is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in controller failover (CFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

### Corrective Action

(None).

## Syslog Message

Dropped non-CA locks on volume %s%s%s%s on CFO aggregate %s due to forced giveback.

## Parameters

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.

**aggrname** (STRING): Aggregate name.

## gb.cfo.veto.lmgr.nonCA.locks

### Severity

ERROR

### Description

This message occurs when a giveback has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in controller failover (CFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

### Corrective Action

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate list" -continuously-available No' command. "aggregate list" is a list of aggregates that are sent home as a result of the giveback operation. If lock state disruption for all existing non-CA locks is acceptable, retry the giveback operation by using the '-override-vetoes true' option.

## Syslog Message

Could not complete giveback because of non-CA locks on volume %s%s%s%s CFO aggregate %s.

## Parameters

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.

**aggrname** (STRING): Aggregate name.

## gb.cfo.veto.nvsave.fail

### Severity

ERROR

### Description

This message occurs when the system cannot perform a giveback due to WAFL® NVSave file replay activity, and must abort the giveback.

### Corrective Action

Retry the giveback operation after completion of NVSave files replay. Replay completion is indicated by the EMS message 'wafl.nvsave.replaying.pass' or 'wafl.nvsave.replaying.fail'.

## Syslog Message

%s %s%s%s%s has WAFL NVSave file replay activity underway; canceling giveback.

## Parameters

**type** (STRING): Object type (volume or aggregate).

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

## gb.cfo.veto.repl

### Severity

NOTICE

### Description

This message occurs when a cluster failover(CFO) giveback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

### Corrective Action

Either abort the replication transfer that is preventing the giveback from being completed, retry the 'storage failover giveback' command with the '-override-vetoes true' option, or wait for the transfer to finish.

## Syslog Message

Could not complete giveback because a replication transfer with UUID %s is in progress.

## Parameters

**transferId** (STRING): UUID of the SnapMirror® replication transfer that vetoed the giveback.

## gb.cfo.veto.sanown.ReassignInProgress

### Severity

ERROR

### Description

This message occurs when a controller disallows a giveback attempt because the partner's disk ownership is being reassigned. Typically, ownership reassignment is done after a controller replacement.

### Corrective Action

Reissue the giveback request after disk ownership assignment is completed.

### Syslog Message

Giveback was vetoed because the disk ownership reassignment in progress on the partner cannot be interrupted.

### Parameters

(None).

## gb.cfo.veto.snap.fail

### Severity

NOTICE

### Description

This message occurs when the system cannot perform a giveback due to Snapshot(tm) copy activity, and must abort the giveback.

### Corrective Action

(None).

### Syslog Message

%s %s%s%s%s has Snapshot copy activity underway; canceling giveback.

### Parameters

**type** (STRING): Object type (volume or aggregate).

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): To uniquely identify the volume in cases where the the volume name itself is insufficient.

## gb.cfo.veto.snap.warning

### Severity

NOTICE

### Description

This message occurs when the system detects Snapshot(tm) copy activity during giveback.

## Corrective Action

(None).

## Syslog Message

%s %s%s%s%s has Snapshot copy activity underway.

## Parameters

**type** (STRING): Object type (volume or aggregate).

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): To uniquely identify the volume in cases where the the volume name itself is insufficient.

## gb.cfo.veto.storageDiskBrkn

### Severity

ERROR

### Description

This message occurs when a giveback is aborted because a failed disk is present.

### Corrective Action

Remove all failed disks and retry the giveback.

### Syslog Message

Failed disk %s should be removed before the giveback command is invoked.

### Parameters

**diskName** (STRING): Name of the device.

## gb.cfo.veto.storageDiskByp

### Severity

ERROR

### Description

This message occurs when a giveback is aborted because one or more bypassed disks are present.

### Corrective Action

Remove all bypassed disks and retry the giveback.

### Syslog Message

All bypassed disks should be removed before a giveback command is entered.

### Parameters

(None).

## gb.cfo.veto.storageDiskSanit

**Severity**

ERROR

**Description**

This message occurs when a giveback is aborted because disk sanitization is in progress.

**Corrective Action**

Retry the giveback after sanitization is completed.

**Syslog Message**

Disk sanitization is in the process of formatting a disk. This operation should not be interrupted by a giveback.

**Parameters**

(None).

**gb.cfo.veto.vservermigrate****Severity**

ERROR

**Description**

This message occurs when the vserver migrate cutover operation vetoes cfo aggregate giveback because vserver migration cannot be aborted during that time.

**Corrective Action**

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the vserver migrate cutover operation is completed.

**Syslog Message**

Vserver migration in progress prevents giveback.

**Parameters**

(None).

**gb.netra events****gb.netra.ca.check.failed****Severity**

ERROR

**Description**

This message occurs during the migration of an aggregate as a part of storage failover (SFO) giveback, when the destination node cannot reach the object stores.

**Corrective Action**

Verify that your intercluster LIF is online and functional by using the 'network interface show' command. Also, check network connectivity to the object store server by using the 'ping' command over the destination node intercluster LIF. Additionally, verify that the configuration of your object store has not changed and that login and connectivity information is still accurate by using the 'aggregate object-store config show'

command. It is possible to override this error by specifying false for the "require-partner-waiting" parameter of the giveback command. For more information or assistance, contact NetApp technical support.

### Syslog Message

Giveback of aggregate '%s' (uuid: %s) failed due to %s preventing object store access on the destination node.

### Parameters

**vol** (STRING): Name of the aggregate.

**aggr\_uuid** (STRING): UUID of the aggregate.

**reason** (STRING): Activity that is preventing the aggregate giveback operation.

## gb.sfo events

### gb.sfo.abort.raid.fm

#### Severity

ERROR

#### Description

This message occurs when a high-availability (HA) storage failover (SFO) giveback is canceled due to RAID activity on a partner aggregate.

#### Corrective Action

Reissue the "storage failover giveback" command to initiate giveback to the partner after the pending or in-progress operation on the partner volume or aggregate is complete. Use the "storage aggregate status -r" command to view the state of the aggregate. If a plex is offline, use the "storage aggregate plex online" command to bring the plex online. If unmirrored aggregates are not supported on this configuration, use the "storage aggregate mirror" command to mirror this aggregate.

#### Syslog Message

%s %s%s is %s; canceling giveback.

#### Parameters

**vol\_type** (STRING): Volume type.

**owner** (STRING): Current owner of the aggregate.

**vol** (STRING): Name of the aggregate.

**reason** (STRING): Activity that is preventing SFO giveback.

### gb.sfo.netra.ha.dskChkFailed

#### Severity

ERROR

#### Description

This message occurs when giveback of the partner's storage failover (SFO) aggregate fails because the high-availability (HA) partner cannot see all disks belonging to the aggregate.

#### Corrective Action

Use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the disks and to determine the latest ownership. If the disk inventory mismatch is not resolved, check the

cabling for loose connections or a bad cable on the partner node.

### **Syslog Message**

Giveback of aggregate %s failed because the partner cannot see all disks belonging to the aggregate.

### **Parameters**

**aggr** (STRING): Name of the aggregate that was not given back.

## **gb.sfo.netra.raid.failed**

### **Severity**

ERROR

### **Description**

This message occurs during migration of an aggregate as part of storage failover (SFO) giveback, when one of the aggregate checks on the destination node fails, including duplicate aggregate name or duplicate Universally Unique Identifier (UUID).

### **Corrective Action**

1. If checks fail due to duplicate aggregate name or UUID, delete the duplicate aggregate created from previous "storage failover giveback" or "storage aggregate relocation" operations. Contact NetApp technical support for assistance with deletion of the unwanted duplicate aggregate.

### **Syslog Message**

Aggregate '%s' (UUID = %s, type = %s, home\_owner\_id = %llu, dr\_home\_owner\_id = %llu): RAID aggregate migration checks failed on destination node %s.

### **Parameters**

**vol** (STRING): Name of the aggregate.

**aggregate\_uuid** (STRING): UUID of the aggregate.

**raid\_type** (STRING): RAID type of the volume.

**home\_owner\_id** (LONGINT): NVRAM system ID of the aggregate's home owner.

**dr\_home\_owner\_id** (LONGINT): NVRAM system ID of the aggregate's disaster recovery (DR) home owner.

**reason** (STRING): Activity that is preventing the aggregate relocation or giveback operation.

## **gb.sfo.netra.wafl.mcc.veto**

### **Severity**

ERROR

### **Description**

This message occurs during migration of an aggregate as part of storage failover (SFO) giveback, when one or more online left-behind disaster recovery(DR) aggregates are found on the destination node and the "node-object-limit" option is set to off.

### **Corrective Action**

Check whether there exists any online left-behind DR aggregates on the destination node from a previous switchover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner, and then retry the operation. If you cannot perform the corrective action, then use the "override-vetoes" option in the "giveback" command to force the giveback.

### **Syslog Message**

Aggregate '%s': One or more online left-behind DR aggregates were found on the destination node and the "node-object-limit" option is set to off.

### **Parameters**

**vol** (STRING): Name of the aggregate.

## **gb.sfo.precmt.lmgr.resynabrt**

### **Severity**

NOTICE

### **Description**

This message occurs during giveback, when automatic lock resynchronization with the node's high-availability (HA) partner for files on this aggregate was aborted.

### **Corrective Action**

(None).

### **Syslog Message**

Automatic lock resynchronization was aborted for aggregate %s on forced giveback.

### **Parameters**

**aggr** (STRING): Name of the aggregate for which resynchronization was aborted.

## **gb.sfo.precmt.lmgr.resyncing**

### **Severity**

ERROR

### **Description**

This message occurs during giveback, when automatic lock resynchronization with the node's high-availability (HA) partner is in progress for files on this aggregate.

### **Corrective Action**

Retry the giveback after verifying that lock synchronization is complete using the 'debug locks auto-resync-status -aggregate <aggregate>' diagnostic privilege command. If lock state disruption for all CA locks on the aggregate is acceptable, retry the giveback with the '-override-vetoes true' option.

### **Syslog Message**

Could not give back aggregate %s because automatic lock resynchronization was in progress.

### **Parameters**

**aggr** (STRING): Name of the aggregate with locks not yet in sync.

## **gb.sfo.precmt.repl**

### **Severity**

NOTICE

**Description**

This message occurs when all replication transfers are aborted because of storage failover (SFO) giveback.

**Corrective Action**

(None).

**Syslog Message**

Replication transfers aborted due to SFO giveback.

**Parameters**

(None).

**gb.sfo.precmt.vdom.lowMem****Severity**

ERROR

**Description**

This message occurs when giveback of the partner's storage failover (SFO) aggregate fails due to the unavailability of Data ONTAP® memory on the source node.

**Corrective Action**

Free some memory and retry the giveback.

**Syslog Message**

Giveback of aggregate %s failed due to unavailability of Data ONTAP® memory on the source node.

**Parameters**

**aggr** (STRING): Name of the aggregate that was not given back.

**gb.sfo.precmt.wafl.volconversion****Severity**

ERROR

**Description**

This message occurs when an active volume conversion is running on one or more volumes on the source aggregate. Pre-commit is aborted.

**Corrective Action**

When volume conversion is complete, re-run the 'storage failover giveback' command.

**Syslog Message**

SFO giveback is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

**Parameters**

**aggregate\_name** (STRING): The name of the aggregate containing the volume on which conversion is in progress.

## **gb.sfo.veto.asup.generalNopart**

### **Severity**

NOTICE

### **Description**

This message occurs when AutoSupport vetoes a storage failover (SFO) giveback (sendhome) request because an AutoSupport message for the down partner node was not collected prior to the giveback request.

### **Corrective Action**

Typically, an AutoSupport message for the partner node is collected shortly after takeover is complete. If an SFO giveback was attempted and vetoed within 20 minutes of the takeover, retry the operation later. If time does not permit waiting, use the 'storage failover giveback -override-vetoes true' command to force a giveback.

### **Syslog Message**

AutoSupport vetoed giveback because an AutoSupport message for the down partner node was not yet collected.

### **Parameters**

(None).

## **gb.sfo.veto.dump**

### **Severity**

ERROR

### **Description**

This message occurs when dump/restore is aborted during storage failover/ aggregate relocation.

### **Corrective Action**

(None).

### **Syslog Message**

Dump/restore operations were aborted because %s is in progress.

### **Parameters**

**arl\_or\_sendhome** (STRING): Describes whether ARL or SFO

## **gb.sfo.veto.kmgr.keysmismissing**

### **Severity**

ERROR

### **Description**

This message occurs when a giveback of the partner's storage failover (SFO) aggregate fails due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the partner node.

### **Corrective Action**

Wait a few minutes, and then try the giveback of the partner's SFO aggregate again. If the problem persists, run the "security key-manager external restore" command for an external key manager, the "security key-

manager external azure restore" command for an AKV configuration, the "security key-manager external aws restore" command for an AWSKMS configuration, the "security key-manager external gcp restore" command for a GCPKMS configuration, the "security key-manager external ikp restore" command for an IKPKMS configuration, or the "security key-manager onboard sync" command for the Onboard Key Manager. These commands retrieve the encryption keys for the encrypted volumes of the aggregate from the key manager. After running the appropriate command, then try the giveback of the partner's SFO aggregate again.

### Syslog Message

Giveback of aggregate "%s" failed due to the unavailability of the volume encryption keys for the encrypted volumes of the aggregate on partner node "%s".

### Parameters

**aggr** (STRING): Name of the aggregate that was not given back.  
**node** (STRING): Name of the node that is missing encryption keys.

## gb.sfo.veto.lmgr.nonCA.broke

### Severity

NOTICE

### Description

This message occurs when a giveback is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

### Corrective Action

(None).

### Syslog Message

Dropped non-CA locks on volume %s%s%s%s on SFO aggregate %s due to forced giveback.

### Parameters

**owner** (STRING): Volume owner.  
**vol** (STRING): Volume name.  
**app** (STRING): Application UUID.  
**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.  
**aggrname** (STRING): Aggregate name.

## gb.sfo.veto.lmgr.nonCA.locks

### Severity

ERROR

### Description

This message occurs when a giveback has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

## Corrective Action

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate list" -continuously-available No' command. "aggregate list" is a list of aggregates that are sent home as a result of the giveback operation. If lock state disruption for all existing non-CA locks is acceptable, retry the giveback operation by using the '-override-vetoes true' option.

## Syslog Message

Could not complete giveback because of non-CA locks on volume %s%s%s%s SFO aggregate %s.

## Parameters

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.

**aggrname** (STRING): Aggregate name.

## gb.sfo.veto.lmgr.recons.left

### Severity

ERROR

### Description

This message occurs when a storage failover giveback has started, but cannot proceed because reconstruction of client file locks from mirrored lock information is not yet complete.

## Corrective Action

Retry the giveback after checking the status of reconstruction using the 'debug locks reconstruction show' diagnostic privilege command. If the locks reconstruction operation is not completed, restart the giveback and override the veto using the '-override-vetoes true' option.

## Syslog Message

Could not perform giveback because lock reconstruction on node %s is in progress.

## Parameters

**node** (STRING): Name of the node reconstructing locks.

## gb.sfo.veto.lmgr.syncing

### Severity

ERROR

### Description

This message occurs when a storage failover giveback has started but cannot proceed because synchronization of client file locks ("locks sync") with the partner is not yet complete.

## Corrective Action

Retry the giveback after verifying that lock synchronization is completed, by using the 'debug locks lock-sync show' diagnostic privilege command.

## Syslog Message

Could not perform giveback because locks sync from node %s to its partner node %s is in progress.

## Parameters

**node** (STRING): Name of the node performing locks sync with its partner.

**partner** (STRING): Name of the partner node with which locks sync is being performed.

## gb.sfo.veto.repl

### Severity

NOTICE

### Description

This message occurs when a storage failover(SFO) giveback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

### Corrective Action

Either abort the replication transfer that is preventing the giveback from being completed, retry the 'storage failover giveback' command with the '-override-vetoes true' option, or wait for the transfer to finish.

## Syslog Message

Could not complete giveback because a replication transfer with UUID %s involving the aggregate %s is in progress.

## Parameters

**transferId** (STRING): UUID of the SnapMirror® replication transfer that vetoed the giveback.

**aggr** (STRING): Name of the aggregate.

## gb.sfo.veto.snaprestore

### Severity

ERROR

### Description

This message occurs when the system cannot perform a giveback because a volume snaprestore operation is active. The giveback is aborted.

### Corrective Action

Retry giveback after the snaprestore operation is finished.

## Syslog Message

%s %s%s%s%s is running snaprestore. Canceling giveback.

## Parameters

**type** (STRING): Type of object (volume or aggregate).

**owner** (STRING): Volume owner.

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Unique volume identity when the volume name itself is insufficient.

## **gb.sfo.veto.volmove**

### **Severity**

ERROR

### **Description**

This message occurs when the volume move operation vetoes a giveback because volume move can not be aborted during that time.

### **Corrective Action**

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the volume move is completed. Or use the '-override-vetoes true' option to abort the volume move.

### **Syslog Message**

Volume move in progress for volume %s with DSID %llu prevents giveback.

### **Parameters**

**vol\_name** (STRING): Name of the source or destination volume.

**volume\_dsid** (LONGINT): Source or destination volume data set identifier (DSID).

## **gb.sfo.veto.vservermigrate**

### **Severity**

ERROR

### **Description**

This message occurs when the vserver migrate cutover operation vetoes data aggregate giveback because vserver migration cannot be aborted during that time.

### **Corrective Action**

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the vserver migrate cutover operation is completed.

### **Syslog Message**

Vserver migration in progress prevents giveback.

### **Parameters**

(None).

## **gb.sfo.veto.wafl.volconversion**

### **Severity**

ERROR

### **Description**

This message occurs when an active volume conversion against one or more of the volumes on the source aggregate vetoed giveback.

### **Corrective Action**

When volume conversion is complete, re-run the 'storage failover giveback' command.

### **Syslog Message**

SFO giveback is vetoed as Volume Conversion is in progress on one of the volumes on aggregate %s.

### **Parameters**

**aggregate\_name** (STRING): The name of the aggregate containing the volume on which conversion is in progress.

# geom events

## geom.ontap events

### geom.ontap.orphan.removing

#### Severity

NOTICE

#### Description

This message occurs when the geometry layer (geom) detects a device to be detached from the system.

#### Corrective Action

(None).

#### Syslog Message

Removing unit %d type %d.

#### Parameters

**unit** (INT): Unit number.

**disk\_type** (INT): Disk type.

# gpo events

## gpo.cap events

### gpo.CAP.applied

**Severity**

INFORMATIONAL

**Description**

This message occurs when applying group policy object (GPO) central access policy (CAP) settings succeeds.

**Corrective Action**

(None).

**Syslog Message**

Successfully applied CAP settings to Vserver %s.

**Parameters**

**vserver** (STRING): Vserver name.

### gpo.CAP.notApplied

**Severity**

ERROR

**Description**

This message occurs when applying group policy object (GPO) central access policy (CAP) settings fails.

**Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

**Syslog Message**

Failed to apply CAP settings to Vserver %s failed, reason: %s.

**Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.frmwork events

### gpo.frmwork.RSoPApplied

**Severity**

NOTICE

**Description**

This event occurs after the resultant set of Group Policy (GPO) is calculated and applied to the Replicated Database (RDB) successfully.

**Corrective Action**

(None).

**Syslog Message**

GPO policy applied into RDB successfully.

**Parameters**

**vserver** (STRING): Vserver name.

**gpo.frmwork.secJobFailed****Severity**

ERROR

**Description**

This message occurs when starting or restarting the GPO Security Apply job fails.

**Corrective Action**

Address the specific reason for the issue, and then start the job by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

**Syslog Message**

Failed to start a GPO Security Apply job run for Vserver %s, reason: %s.

**Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

**gpo.frmwork.updateFailed****Severity**

ERROR

**Description**

This message occurs when updating group policy object (GPO) tables fails.

**Corrective Action**

Address the specific reason for the issue, and then update the tables by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

**Syslog Message**

GPO tables update failed for Vserver %s, reason: %s.

**Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.frmwork.updateRSOPFailed

### Severity

ERROR

### Description

This message occurs when updating group policy object (GPO) RSoP (Resultant Set of Policy) settings fails.

### Corrective Action

Address the specific reason for the issue, and then update the settings by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### Syslog Message

GPO RSoP update failed for Vserver %s, reason: %s.

### Parameters

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.job events

### gpo.job.mainUpdateFailed

#### Severity

ERROR

#### Description

This message occurs when the GPO Main Update job run fails.

#### Corrective Action

Address the specific reason for the issue, and then run the job again by running the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

#### Syslog Message

GPO Main Update job (%s) run failed for Vserver %s, reason: %s.

#### Parameters

**jobid** (STRING): GPO job ID.

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

### gpo.job.mainUpdateSuccess

#### Severity

INFORMATIONAL

#### Description

This message occurs when the GPO Main Update job run succeeds.

**Corrective Action**

(None).

**Syslog Message**

Successfully completed a GPO Main Update job (%s) run for Vserver %s.

**Parameters**

**jobid** (STRING): GPO job ID.

**vserver** (STRING): Vserver name.

**gpo.job.outOfMemory****Severity**

ERROR

**Description**

This event occurs when the system has not enough memory to perform the GPO (Group Policy Object) job.

**Corrective Action**

Ensure there is enough memory available to perform the GPO job.

**Syslog Message**

GPO job %s failure: Out of memory.

**Parameters**

**jobid** (STRING): The GPO job ID.

**gpo.job.securityApplyFailed****Severity**

ERROR

**Description**

This message occurs when the GPO Security Apply job run fails.

**Corrective Action**

Address the specific reason for the issue, and then run the job again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

**Syslog Message**

GPO Security Apply job (%s) run failed for Vserver %s, reason: %s.

**Parameters**

**jobid** (STRING): GPO job ID.

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

**gpo.job.securityApplySuccess**

**Severity**

INFORMATIONAL

**Description**

This message occurs when the GPO Security Apply job run succeeds.

**Corrective Action**

(None).

**Syslog Message**

Successfully completed a GPO Security Apply job (%s) run for Vserver %s.

**Parameters**

**jobid** (STRING): GPO job ID.

**vserver** (STRING): Vserver name.

## gpo.reg events

### gpo.reg.applied

**Severity**

INFORMATIONAL

**Description**

This message occurs when the group policy object (GPO) registry policy settings are applied.

**Corrective Action**

(None).

**Syslog Message**

Successfully applied GPO registry settings to Vserver %s.

**Parameters**

**vserver** (STRING): Vserver name.

### gpo.reg.bCache.applied

**Severity**

INFORMATIONAL

**Description**

This message occurs when the group policy object (GPO) BranchCache settings are applied.

**Corrective Action**

(None).

**Syslog Message**

Successfully applied BranchCache settings to Vserver %s.

## Parameters

**vserver** (STRING): Vserver name.

## **gpo.reg.bCache.notApplied**

### Severity

ERROR

### Description

This message occurs when applying group policy object (GPO) registry BranchCache policy settings fails.

### Corrective Action

**Corrective Action**

(None).

**Syslog Message**

Successfully applied event audit and log settings to Vserver %s.

**Parameters**

**vserver** (STRING): Vserver name.

**gpo.sec.EvtAdt.notApplied****Severity**

ERROR

**Description**

This message occurs when applying group policy object (GPO) event audit policy settings fails.

**Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

**Syslog Message**

Failed to apply event audit and log settings to Vserver %s, reason: %s.

**Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

**gpo.sec.fsec.applied****Severity**

INFORMATIONAL

**Description**

This message occurs when the group policy object (GPO) file security settings are applied.

**Corrective Action**

(None).

**Syslog Message**

Successfully applied file security settings to Vserver %s.

**Parameters**

**vserver** (STRING): Vserver name.

**gpo.sec.fsec.notApplied****Severity**

ERROR

## Description

This message occurs when applying group policy object (GPO) file security settings fails.

## Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

## Syslog Message

Failed to apply file security settings to Vserver %s, reason: %s.

## Parameters

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.sec.fsec.notAppliedFor

### Severity

NOTICE

### Description

This message occurs when applying a group policy object (GPO) security descriptor to a given file fails.

### Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### Syslog Message

Failed to apply file security settings to path %s in Vserver %s, reason: %s.

### Parameters

**path** (STRING): File and directory path to which a security descriptor is to be applied.

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.sec.kerb.applied

### Severity

INFORMATIONAL

### Description

This message occurs when applying group policy object (GPO) Kerberos settings succeeds.

### Corrective Action

(None).

### Syslog Message

Successfully applied Kerberos settings to Vserver %s.

### Parameters

**vserver** (STRING): Vserver name.

## **gpo.sec.kerb.notApplied**

### **Severity**

ERROR

### **Description**

This message occurs when applying group policy object (GPO) Kerberos settings fails.

### **Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### **Syslog Message**

Failed to apply Kerberos settings to Vserver %s, reason: %s.

### **Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## **gpo.sec.privR.applied**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when applying group policy object (GPO) privilege-rights settings succeeds.

### **Corrective Action**

(None).

### **Syslog Message**

Successfully applied privilege rights settings to Vserver %s.

### **Parameters**

**vserver** (STRING): Vserver name.

## **gpo.sec.privR.notApplied**

### **Severity**

ERROR

### **Description**

This message occurs when applying group policy object (GPO) privilege-rights settings fails.

### **Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### **Syslog Message**

Failed to apply privilege-rights settings to Vserver %s, reason: %s.

## Parameters

**vserver** (STRING): Vserver name.  
**reason** (STRING): Reason for the failure.

## **gpo.sec.privR.notAppliedFor**

### Severity

NOTICE

### Description

This message occurs when applying group policy object (GPO) privilege-rights fails for a supported setting.

### Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### Syslog Message

Failed to apply privilege-rights %s setting to Vserver %s, reason: %s.

## Parameters

**setting** (STRING): Name of the setting: Take ownership, Security privilege, or Bypass traverse.  
**vserver** (STRING): Vserver name.  
**reason** (STRING): Reason for the failure.

## **gpo.sec.reg.applied**

### Severity

INFORMATIONAL

### Description

This message occurs when applying group policy object (GPO) security registry settings succeeds.

### Corrective Action

(None).

### Syslog Message

Successfully applied security registry settings to Vserver %s.

## Parameters

**vserver** (STRING): Vserver name.

## **gpo.sec.reg.notAppliedFor**

### Severity

ERROR

### Description

This message occurs when applying a group policy object (GPO) security registry setting fails.

## Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

## Syslog Message

Failed to apply security registry %s setting to Vserver %s, reason: %s.

## Parameters

**setting** (STRING): Name of the setting: SMB signing.

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## gpo.sec.resAno.applied

### Severity

INFORMATIONAL

### Description

This message occurs when applying group policy object (GPO) security restrict anonymous settings succeeds.

### Corrective Action

(None).

### Syslog Message

Successfully applied restrict anonymous settings to Vserver %s.

### Parameters

**vserver** (STRING): Vserver name.

## gpo.sec.resAno.notApplied

### Severity

ERROR

### Description

This message occurs when applying group policy object (GPO) security restrict anonymous settings fails.

### Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### Syslog Message

Failed to apply restrict anonymous settings to Vserver %s, reason: %s.

### Parameters

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

## **gpo.sec.resGrp.applied**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when applying group policy object (GPO) restricted-groups settings succeeds.

### **Corrective Action**

(None).

### **Syslog Message**

Successfully applied restricted group settings to Vserver %s.

### **Parameters**

**vserver** (STRING): Vserver name.

## **gpo.sec.resGrp.notApplied**

### **Severity**

ERROR

### **Description**

This message occurs when applying group policy object (GPO) restricted-groups settings fails.

### **Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### **Syslog Message**

Failed to apply restricted-groups settings to Vserver %s, reason: %s.

### **Parameters**

**vserver** (STRING): Vserver name.

**reason** (STRING): Reason for the failure.

This message occurs when applying group policy object (GPO) restricted-groups settings fails for a given group.

### **Corrective Action**

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

### **Syslog Message**

Failed to apply restricted-groups settings for group %s in Vserver %s, reason: %s.

## Parameters

**group** (STRING): Group name.  
**vserver** (STRING): Vserver name.  
**reason** (STRING): Reason for the failure.

# gpo.security events

## gpo.security.unrecogFileForm

### Severity

ERROR

### Description

This event occurs when the GptTmpl.inf file is not in UNICODE (16 bit)format.

### Corrective Action

Ensure the security file GptTmpl.inf is in UNICODE 16bit format.

### Syslog Message

Security file is not unicoded.

### Parameters

**filename** (STRING): The security filename.

## gpo.security.unrecogTemplate

### Severity

ERROR

### Description

This event occurs when the system fails to recognize the security template.

### Corrective Action

Ensure the security file GptTmpl.inf has the correct header.

### Syslog Message

Unable to recognize the security template.

### Parameters

(None).

# ha events

## ha.aggrmigrduration events

### ha.aggrMigrDuration

#### Severity

NOTICE

#### Description

This message occurs every 60 seconds during an aggregate migration operation. It indicates the current phase of the aggregate migration, the high-availability (HA) operation that triggered the aggregate migration, and the elapsed time since the start of the current phase of the aggregate migration.

#### Corrective Action

(None).

#### Syslog Message

As part of the current %s operation, the aggregate migration phase %s has been ongoing for %lld msec.  
Aggregate undergoing migration: %s.

#### Parameters

**aggr\_migr\_op\_name** (STRING): Name of the HA operation that triggered the aggregate migration.

**aggr\_migr\_phase** (STRING): Current phase of the aggregate migration.

**elapsed\_time** (LONGINT): Elapsed time since the start of the current phase of the aggregate migration.

**aggr\_name** (STRING): Name of the aggregate undergoing migration.

## ha.bdfu events

### ha.bdfu.notEnabledOnDest

#### Severity

INFORMATIONAL

#### Description

This message occurs during storage failover (SFO) giveback or aggregate relocation when the source node cannot reenables background disk firmware update (BDFU) on the destination node. BDFU will be reenables automatically on the destination node after all the aggregates have been given back.

#### Corrective Action

(None).

#### Syslog Message

(None).

#### Parameters

**nodename** (STRING): Destination node.

# ha.disasterbootinitiated events

## ha.disasterBootInitiated

### Severity

NOTICE

### Description

This message occurs when an HA disaster recovery boot is initiated. Such a boot occurs when the HA partner of a failing node also experiences a failure, and one from which it cannot recover.

### Corrective Action

(None).

### Syslog Message

HA disaster recovery boot initiated.

### Parameters

(None).

# ha.fm events

## ha.fm.platformTypeChanged

### Severity

NOTICE

### Description

This message occurs when the Failover Monitor (FM) platform type changes in response to changes in the cluster configuration.

### Corrective Action

(None).

### Syslog Message

FM platform type changed from %s to %s.

### Parameters

**from** (STRING): Previous FM platform type.

**to** (STRING): New FM platform type.

# ha.gb events

## ha.gb.mbxAccessErr

### Severity

ALERT

## Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback.

## Corrective Action

Verify the mailbox disk physical locations and mailbox disk counts by using the "storage failover mailbox-disk show -node node-id" advanced command. If all mailbox disks are present for the indicated physical location, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If none of the mailbox disks for the indicated physical location are shown, wait a few minutes, and then retry the show command to see whether all mailbox disks are present. If all mailbox disks are present, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If some but not all mailbox disks are present for the indicated physical location, then set the "-override-vetoes" field to "true" for either the "storage failover giveback" command or sf-send-home-initiate ZAPI, and then retry the giveback.

## Syslog Message

Problem accessing %s mailbox disks prior to giveback. Found %d disks, expected %d disks. Override vetoes option: %s; Internal error code: %d status: %d.

## Parameters

**physical\_location** (STRING): Identifies the physical location of the mailbox disks. Values are Local Node, Partner Node, Mediator, or a node name.

**mailbox\_disk\_count** (INT): Current count of mailbox disks having the physical location specified by the physical\_location parameter.

**expected\_count** (INT): Expected count of mailbox disks having the physical location specified by the physical\_location parameter.

**override\_vetoes** (STRING): Value of the "-override-vetoes" field in the "storage failover giveback" command or sf-send-home-initiate ZAPI.

**error\_code** (INT): Disk I/O or other error code.

**error\_status** (INT): Additional internal status related to the error code.

## ha.gb.mbxCountMismatch

### Severity

NOTICE

### Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback, but giveback is allowed to proceed because the "override-vetoes" field is set to "true" for the "storage failover giveback" command or the sf-send-home-initiate ZAPI.

### Corrective Action

(None).

### Syslog Message

Problem accessing %s mailbox disks during giveback. Found %d disks, expected %d disks. Override vetoes option: %s; Internal result code: %d status: %d"

### Parameters

**physical\_location** (STRING): Identifies the physical location of the mailbox disks. Values are Local Node, Partner Node, Mediator, or a node name.

**mailbox\_disk\_count** (INT): Current count of mailbox disks having the physical location specified by the physical\_location parameter.

**expected\_count** (INT): Expected count of mailbox disks having the physical location specified by the physical\_location parameter.

**override\_vetoes** (STRING): Value of the "-override-vetoes" field in the "storage failover giveback" command or sf-send-home-initiate ZAPI.

**result\_code** (INT): Disk I/O or other result code.

**result\_status** (INT): Additional internal status related to the result code.

## ha.gb.mbxNotFound

### Severity

ALERT

### Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback.

### Corrective Action

Verify the mailbox disk physical locations and mailbox disk counts by using the "storage failover mailbox-disk show -node node-id" advanced command. If all mailbox disks are present, retry the "storage failover giveback" command or the sf-send-home-initiate ZAPI. If none of the mailbox disks for the indicated mailbox owner are shown, wait a few minutes, and then retry the show command to see whether all mailbox disks are present. If all mailbox disks are present, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If some but not all mailbox disks are present for the indicated mailbox owner, verify whether all nodes in the cluster are healthy and accessible by using the "cluster show" command, and check whether disks are healthy by using the "disk show" command.

### Syslog Message

Problem accessing %s mailbox disks prior to giveback. Found %d disks. Override vetoes option: %s; Internal error code: %d status: %d.

### Parameters

**mailbox\_owner** (STRING): Identifies the node in the high-availability (HA) pair that owns the missing mailbox disk.

**mailbox\_disk\_count** (INT): Number of mailbox disks found. These disks are owned by the node specified by the mailbox\_owner parameter.

**override\_vetoes** (STRING): Value of the "-override-vetoes" parameter passed to the "storage failover giveback" command or the sf-send-home-initiate ZAPI.

**error\_code** (INT): Disk I/O or other error code.

**error\_status** (INT): Additional internal status related to the error code.

## ha.get takeoverlockstatus events

### ha.getT takeoverLockStatus

### Severity

NOTICE

### Description

This message occurs when the HA subsystem attempts to acquire takeover lock as part of the takeover operation.

### Corrective Action

(None).

## Syslog Message

Attempting to acquire takeover lock. Status: %s.

## Parameters

**status** (STRING): Status of the attempt to acquire the lock.

# ha.giveback events

## ha.giveback.aggrOnlineFailed

### Severity

INFORMATIONAL

### Description

This message occurs when the RAID or WAFL® subsystem fails to bring online the aggregate or its containing volumes after giveback.

### Corrective Action

Check the EMS logs for messages from the RAID and WAFL subsystems to determine the exact cause of the failure and corrective action.

## Syslog Message

Bringing online of aggregate %s or its volumes failed after giveback with error %d.

## Parameters

**aggrName** (STRING): Name of the aggregate that was given back.

**error** (INT): Error that occurred while bringing online the aggregate or its volumes after giveback.

## ha.giveback.aggrOnlineTimeout

### Severity

ERROR

### Description

This message occurs when a node fails to bring online the aggregate and its containing volumes within the specified time after giveback.

### Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online.

## Syslog Message

Node did not bring online the aggregate %s and its volumes after the giveback for %llu milliseconds.

## Parameters

**aggrUUID** (STRING): UUID of the aggregate that was given back.

**time** (LONGINT): Timeout, in milliseconds, to bring online the aggregate and its volumes after the giveback.

## ha.giveback.aggrPartnerTimeout

**Severity**

INFORMATIONAL

**Description**

This message occurs during a giveback operation, when a node does not receive notification from its high-availability (HA) partner within the specified time that the aggregate is online.

**Corrective Action**

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online on the partner node.

**Syslog Message**

Node did not receive notification from its partner in %llu milliseconds that aggregate %s is online after the giveback.

**Parameters**

**time** (LONGINT): Timeout, in milliseconds, for notification from the partner node that an aggregate is online after giveback.

**aggrName** (STRING): Name of the aggregate that was given back.

**ha.giveback.commWithPartnerFailed****Severity**

ERROR

**Description**

This message occurs when the local node cannot communicate over the cluster network with the d-blade of its high-availability (HA) partner while giving back an aggregate.

**Corrective Action**

1. Verify that the partner node is up.
2. Use the "network interface show" command to verify that the cluster network interfaces on the local and the partner node are up.
3. If the preceding checks pass, then run the "storage failover giveback" command to initiate giveback. To force giveback, use the "storage failover giveback -require-partner-waiting false" command.

**Syslog Message**

Failed to communicate with the partner %s over the cluster network while giving back aggregate %s.

**Parameters**

**partnerName** (STRING): Name of the partner node.

**aggrName** (STRING): Name of the aggregate being given back.

**ha.giveback.connectToPartnerFailed****Severity**

ERROR

**Description**

This message occurs when the local node cannot connect over the cluster network to the d-blade of its high-availability (HA) partner while giving back an aggregate.

## Corrective Action

1. Verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local node and the partner node are up. 3. If the preceding checks pass, then run the "storage failover giveback" command to initiate giveback. To force giveback, use the "storage failover giveback -require-partner-waiting false" command.

## Syslog Message

Failed to connect with the partner node %s (d-blade ID: %s) over the cluster network while giving back aggregate %s.

## Parameters

- partnerName** (STRING): Name of the partner node.
- partnerDbladeid** (STRING): D-blade ID of the partner node.
- aggrName** (STRING): Name of the aggregate being given back.

## ha.giveback.emptyAggr

### Severity

ERROR

### Description

This message occurs when the local node does not find any disks in the aggregate being given back.

### Corrective Action

1. Use the "storage disk show -aggregate aggrName" command to verify that the aggregate has disks. 2. If the preceding check passes, then run the "storage failover giveback" command to initiate giveback.

### Syslog Message

Aggregate %s does not have any disks.

### Parameters

- aggrName** (STRING): Name of the aggregate being given back.

## ha.giveback.sysCommit

### Severity

INFORMATIONAL

### Description

This message occurs during the commit phase of the giveback of an aggregate to indicate the time taken by the specified subsystem to commit.

### Corrective Action

(None).

### Syslog Message

Subsystem %s took %llu msecs to commit giveback of aggregate '%s'.

### Parameters

- subsys** (STRING): Name of the subsystem performing the commit.
- time** (LONGINT): Time taken by the subsystem to commit the giveback.

**aggr** (STRING): Name of the aggregate being given back.

## ha.giveback.sysVetoChk

### Severity

INFORMATIONAL

### Description

This message occurs during the veto phase of the giveback of an aggregate to indicate the time taken by the specified subsystem to check whether giveback should be aborted.

### Corrective Action

(None).

### Syslog Message

Subsystem %s took %llu msec to check whether to veto giveback of aggregate '%s'.

### Parameters

**subsys** (STRING): Name of the subsystem performing the veto check.

**time** (LONGINT): Time taken by the subsystem to check whether giveback should be aborted.

**aggr** (STRING): Name of the aggregate being given back.

## ha.giveback.totalCommit

### Severity

INFORMATIONAL

### Description

This message occurs during the giveback of an aggregate to indicate the total time taken by the commit phase.

### Corrective Action

(None).

### Syslog Message

Total time taken to commit the giveback of aggregate '%s' was %llu msec.

### Parameters

**aggr** (STRING): Name of the aggregate being given back.

**time** (LONGINT): Total time taken to commit the giveback.

## ha.giveback.usingHAInterconnect

### Severity

INFORMATIONAL

### Description

This message occurs when the local node uses the high-availability (HA) interconnect instead of the preferred cluster network to communicate with its HA partner during giveback.

**Corrective Action**

(None).

**Syslog Message**

Local node used the HA interconnect to communicate with the partner during giveback of aggregate %s.

**Parameters**

**aggrName** (STRING): Name of the aggregate being given back.

## ha.localnodeshutdown events

**ha.localNodeShutDown****Severity**

NOTICE

**Description**

This message occurs when shutdown of the local node is initiated.

**Corrective Action**

(None).

**Syslog Message**

Shutdown of the local node has been initiated with inhibit\_takeover set to %s.

**Parameters**

**inhibit\_takeover** (STRING): Specifies whether takeover by the partner node is inhibited on shutdown of the local node.

## ha.mbxresvreleasedelay events

**ha.mbxResvReleaseDelay****Severity**

NOTICE

**Description**

This message occurs when the takeover node cannot release a disk reservation for a mailbox disk in preparation for a giveback event. The mailbox reservation release will be automatically retried after a few minutes.

**Corrective Action**

The mailbox reservation release will be automatically retried after a few minutes. If this problem persists and "storage failover giveback" is not run automatically or cannot be run manually, release the mailbox disks reservations manually using maintenance mode.

**Syslog Message**

Problem releasing reservation for mailbox disk attached to node with System ID %d. Disk name %s, disk owner %s, disk UUID: %s, status: %d.

## Parameters

**physical\_location** (LONGINT): System ID of the node directly attached to the mailbox disk on which the reservation release failure occurred.

**disk\_name** (STRING): Name of the disk for which the reservation release failed.

**mbx\_disk\_owner** (STRING): Owner of the mailbox disk where the reservation release failed. Values are Local Node or Partner Node.

**disk\_uid** (STRING): Unique identifier of the disk where the reservation release failed.

**status** (INT): Reservation release status code.

# ha.netpartition events

## ha.netPartition

### Severity

NOTICE

### Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, but cannot take over the partner node or allow the partner to take over because both takeover-of-partner and takeover-by-partner are both disabled. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

### Corrective Action

(None).

### Syslog Message

Network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

## Parameters

**error\_code** (INT): Internal error code.

**error\_status** (INTEX): Additional internal status bits related to error\_code.

**req\_id** (INT): Internal request ID.

**duration** (LONGINT): Elapsed time in msec spent resolving the reported error.

## ha.netPartition.reboot

### Severity

NOTICE

### Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, and reboots the local node due to the network partition. The reboot occurs only if ` takeover-by-partner is enabled on the local node. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

### Corrective Action

(None).

## Syslog Message

Rebooting the local node due to a network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

## Parameters

**error\_code** (INT): Internal error code.

**error\_status** (INHEX): Additional internal status bits related to error\_code.

**req\_id** (INT): Internal request ID.

**duration** (LONGINT): Elapsed time in msec spent resolving the reported error.

## ha.netPartition.takeover

### Severity

NOTICE

### Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, and initiates a takeover of the partner node due to the partition. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

### Corrective Action

(None).

## Syslog Message

Taking over the partner node due to a network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

## Parameters

**error\_code** (INT): Internal error code.

**error\_status** (INHEX): Additional internal status bits related to error\_code.

**req\_id** (INT): Internal request ID.

**duration** (LONGINT): Elapsed time in msec spent resolving the reported error.

## ha.netparttodisabled events

### ha.netPartToDisabled

### Severity

NOTICE

### Description

This message occurs when takeovers due to network partitioning are disabled because of the number of previous, consecutive, network-partition takeovers that occurred within a preceding detection period. Subsequent takeovers due to network partitioning are automatically reenabled after the disable time limit is reached or after a takeover is initiated for a different reason.

### Corrective Action

(None).

## Syslog Message

Network partitioning takeovers are disabled due to %d network-related takeovers in the preceding %d minutes. Takeovers by local node %d; partner node %d. Takeovers will be re-enabled in %d minutes or when another type of takeover occurs.

## Parameters

**takeovers\_initiated** (INT): Consecutive takeovers initiated from either node within the detection period that were due to network partitioning.

**detection\_period** (INT): Number of minutes over which the network partition takeover attempts were monitored and counted.

**local\_node\_initiated** (INT): Number of takeovers due to network partitioning occurring within the detection period that were initiated by the local node. This number is included in the takeover\_initiated number.

**partner\_node\_initiated** (INT): Number of takeovers due to network partitioning occurring within the detection period that were initiated by the partner node. This number is included in the takeover\_initiated number.

**minutes\_until\_reenable** (INT): Minutes until takeover due to network partitioning is reenabled.

# ha.netra events

## ha.netra.dskChkNoContDsk

### Severity

ERROR

### Description

This message occurs during an aggregate migration, when the destination node either cannot determine whether at least one disk in the aggregate is a disk partition, or the associated container disk is not visible to the destination node. The aggregate migration operation is aborted.

### Corrective Action

Use the (privilege: advanced) "storage disk refresh-ownership" command to rescan the disks and update ownership information. After refreshing the disk ownership info, use the "storage show disk" command to view the ownership of all disks, and the "storage show disk -container-type shared" command to view container-disk ownership. If any disks are incorrectly owned, update the disk ownership information. If the problem persists, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to check whether there are any disks that are not visible to a subset of the nodes. Use the "storage failover show" command to check whether the high-availability (HA) partner's information is known. If HA partner information is missing, verify the HA Interconnect between both nodes is installed and functioning correctly. If not, fix the HA Interconnect cabling issues to resolve the connectivity problems. Use the "storage disk show" command to check whether there are any failed disks. If failed disks are present, remove or replace them. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disk is not visible. If the problem persists, contact NetApp technical support.

## Syslog Message

Disk with UUID %s is not visible to node %s, which is the destination of an aggregate migration operation. As a result, the aggregate migration was aborted. Check the event log of the destination node to determine the name of the aggregate whose migration was aborted.

## Parameters

**disk\_uuid** (STRING): Universal unique identifier (UUID) of the disk that is not visible to the destination node.

**node\_name** (STRING): Name of the destination node.

## ha.nomediatormbx events

### ha.noMediatorMbx

#### Severity

ERROR

#### Description

This message occurs when the non-local mailbox disks of a node are not accessible. The system will not be able to perform a takeover and can potentially prevent a takeover by the partner as well.

#### Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that all iSCSI connections are up and healthy. If not healthy, use the "storage iscsi-initiator add-target" and "storage iscsi-initiator connect" commands to add and connect any missing or misconnected iSCSI targets.

#### Syslog Message

Takeover not possible because non-local mailbox disks owned by node "%s" cannot be accessed.

#### Parameters

`mailbox_owner` (STRING): Node that owns the non-local mailbox disks that could not be accessed.

## ha.noprogrammaticto events

### ha.noProgrammaticTO

#### Severity

NOTICE

#### Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails because giveback or aggregate relocation cleanup is still in progress.

#### Corrective Action

(None).

#### Syslog Message

Failover monitor: Programmatic takeover failed due to giveback or aggregate relocation post-processing cleanup not yet complete.

#### Parameters

(None).

## ha.panicinfonotsent events

### ha.panicInfoNotSent

## Severity

NOTICE

## Description

This message occurs when a node cannot send panic information to its high-availability (HA) partner over the HA interconnect. The HA partner might still initiate takeover if it detects that the partner is down by other means, and takeover of the panicking node is allowed.

## Corrective Action

(None).

## Syslog Message

Local node cannot send a panic information message to the HA partner over the HA interconnect due to error: %s. Partner name: %s. Partner system ID: %llu.

## Parameters

**error** (STRING): Reason the node cannot send panic information to its HA partner.

**partner\_name** (STRING): Name of the HA partner.

**partner\_systemid** (LONGINT): System ID of the HA partner.

# ha.panicinfonotsentic events

## ha.panicInfoNotSentIC

## Severity

NOTICE

## Description

This message occurs when a node cannot send panic information to its high-availability (HA) partner over the HA interconnect due to an HA interconnect error. The HA partner might still initiate takeover if it detects that the partner is down by other means, and takeover of the panicking node is allowed.

## Corrective Action

(None).

## Syslog Message

Local node cannot send a panic information message to its HA partner due to an HA interconnect error: %s (error code: %d). Partner name: %s. Partner system ID: %llu.

## Parameters

**error** (STRING): Reason the node cannot send panic information to its HA partner.

**error\_code** (INT): Specific error generated by the HA Interconnect. Example error codes: 1

(ERR\_ICDOWN): Interconnect is down 4 (ERR\_SYSERROR): System error 5 (ERR\_ICERROR):

Interconnect error 6 (ERR\_OUTOFMEMORY): Out of memory 11 (ERR\_SENDSIZE): Send size is too large

19 (ERR\_CKSUM): Checksum error

**partner\_name** (STRING): Name of the HA partner.

**partner\_systemid** (LONGINT): System ID of the HA partner.

# ha.panicinforcvbadvrsn events

## ha.panicInfoRcvBadVrsn

### Severity

NOTICE

### Description

This message occurs when the version of the panic information received from the high-availability (HA) partner is not equal to the expected version. The receiving node will discard this panic information message. A takeover might still occur if the local node detects that its HA partner is down by other means, and takeover of the panicking node is allowed.

### Corrective Action

(None).

### Syslog Message

Panic information message received from the HA partner is the wrong version. Expected version: %u. Received version: %u. Partner name: %s. Partner system ID: %llu.

### Parameters

**expected\_version** (LONGINT): Expected version of the panic information.

**received\_version** (LONGINT): Received version of the panic information.

**partner\_name** (STRING): Name of the HA partner.

**partner\_systemid** (LONGINT): System ID of the HA partner.

# ha.panicinfosent events

## ha.panicInfoSent

### Severity

NOTICE

### Description

This message occurs when a node successfully sends panic information to its high-availability (HA) partner over the HA interconnect.

### Corrective Action

(None).

### Syslog Message

Node successfully sent a panic information message to its HA partner. Partner name: %s. Partner system ID: %llu.

### Parameters

**local\_hostname** (STRING): Name of the node that panicked and sent panic information over the HA interconnect.

**local\_systemid** (LONGINT): System ID of the node that panicked and sent panic information over the HA interconnect.

# ha.panicinfosznotok events

## ha.panicInfoSzNotOk

### Severity

NOTICE

### Description

This message occurs when the size of the panic information received from the high-availability (HA) partner is not equal to the expected panic information size. The receiving node will discard this panic information message. A takeover might still occur if the local node detects that its HA partner is down by other means, and takeover of the panicking node is allowed.

### Corrective Action

(None).

### Syslog Message

Panic information message received from the HA partner is the wrong size. Expected size: %u. Received size: %u. Partner name: %s. Partner system ID: %llu.

### Parameters

**expected\_size** (LONGINT): Expected size of the panic information.

**received\_size** (LONGINT): Received size of the panic information.

**partner\_name** (STRING): Name of the HA partner.

**partner\_systemid** (LONGINT): System ID of the HA partner.

# ha.resvconflicthalt events

## ha.resvConflictHalt

### Severity

NOTICE

### Description

This message occurs when the node halts itself after it finds disks with reservation conflicts. Reservations are placed on disks as part of a node taking over its partner. This disk reservation conflict is due to this node being taken over by its partner.

### Corrective Action

(None).

### Syslog Message

A disk reservation conflict was detected on disk %s at %-20s. Typically, this only occurs when the node was taken over by its partner.

### Parameters

**disk\_name** (STRING): Name of the disk.

**time** (STRING): Time when the disk reservation was detected.

**last\_update** (INT): Time passed since last rescan, in milliseconds.

# ha.resvmediatormbxstatus events

## ha.ResvMediatorMbxStatus

### Severity

NOTICE

### Description

This message occurs when the local node attempts to reserve a mailbox disk while trying to acquire the takeover lock as part of the takeover operation.

### Corrective Action

(None).

### Syslog Message

Attempting to reserve mailbox disk %s (UUID: %s) on node "%s" as part of takeover lock. Status: %d.

### Parameters

**mailbox\_disk\_name** (STRING): Name of the disk being reserved.

**mailbox\_disk\_uid** (STRING): UUID of the mailbox disk on which a reservation was attempted.

**mailbox\_host** (STRING): Name of the node that owns the mailbox disk.

**mailbox\_op\_status** (INT): Result of the disk reservation attempt on the mailbox disk.

# ha.takeover events

## ha.takeover.bypOptimChange

### Severity

INFORMATIONAL

### Description

This message occurs when the value of the 'bypass-takeover-optimization' parameter of the "storage failover" command is changed on a node.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**node\_name** (STRING): Name of the node.

**new\_value** (STRING): New value of the 'bypass-takeover-optimization' parameter.

## ha.takeover.checkEnd

### Severity

ALERT

**Description**

This message occurs when a node is simulating a takeover. This marks the end of a simulated takeover on the local node.

**Corrective Action**

(None).

**Syslog Message**

This node is testing the takeover workflow. This test is a simulation only. The simulation has ended on the local node.

**Parameters**

(None).

**ha.takeover.checkError****Severity**

ALERT

**Description**

This message occurs when a takeover with the check-only flag detects an error that would prevent takeover.

**Corrective Action**

Use the "storage failover check-takeover" command to identify the failures that occurred along the takeover path. Perform corrective action based on error information shown by the command.

**Syslog Message**

This node is testing the takeover workflow. This test is a simulation only. The simulation has encountered an error that would disrupt takeover.

**Parameters**

(None).

**ha.takeover.checkStart****Severity**

ALERT

**Description**

This message occurs when a node is simulating a takeover. This marks the start of a simulated takeover on the local node.

**Corrective Action**

(None).

**Syslog Message**

This node is testing the takeover workflow. This test is a simulation only. The simulation has started on the local node.

## Parameters

(None).

# ha.takeoverimpdegraded events

## ha.takeoverImpDegraded

### Severity

ALERT

### Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover because the partner mailbox disks are not available.

### Corrective Action

Check connectivity to the partner disks. Identify the mailbox disks on the partner node by using the "storage failover show -instance" command. Verify that this node has connectivity to the partner mailbox disks by using the "storage disk show -instance" command. Resolve any connectivity issues by fixing cabling or shelf issues.

### Syslog Message

Takeover of the partner node is impossible due to lack of connectivity to the partner mailbox disks.

## Parameters

(None).

# ha.takeoverimphotshelf events

## ha.takeoverImpHotShelf

### Severity

EMERGENCY

### Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover due to disk shelves that are overheating.

### Corrective Action

Check cooling for the disk shelves.

### Syslog Message

Takeover of the partner node is impossible due to disk shelves that are overheating.

## Parameters

(None).

# ha.takeoverimpic events

## ha.takeoverImpIC

### Severity

ALERT

### Description

This message occurs when the partner node is down and the local node cannot perform a takeover because of interconnect errors.

### Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

### Syslog Message

Takeover of the partner node is not possible due to interconnect errors.

### Parameters

(None).

## ha.takeoverimplowmem events

### ha.takeoverImpLowMem

### Severity

ERROR

### Description

This message occurs when the partner node is down; however, due to this node being low on memory, it is currently impossible to perform a takeover.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Takeover of the partner node is impossible due to a low memory situation.

### Parameters

(None).

## ha.takeoverimpnotdef events

### ha.takeoverImpNotDef

### Severity

ERROR

## Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover.

## Corrective Action

Check the reason string and repair the problem reported.

## Syslog Message

Takeover of the partner node is impossible due to reason %s.

## Parameters

**reason** (STRING): Reason the takeover is currently impossible.

# ha.takeoverimpunsync events

## ha.takeoverImpUnsync

### Severity

ALERT

### Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover because the takeover node does not have partner NVRAM data.

### Corrective Action

Verify that the interconnect cables are correctly connected between the nodes. Boot the partner node to reestablish the interconnect if it was shut down. If necessary, force a takeover with the '[run node] cf forcetakeover' command. This action might cause data loss if there is NVRAM data on the partner node not written to disk.

### Syslog Message

Takeover of the partner node is impossible due to lack of partner NVRAM data.

### Parameters

(None).

# ha.takeoverimpversion events

## ha.takeoverImpVersion

### Severity

ALERT

### Description

This message occurs when the partner node is down; however, due to a version mismatch, it is currently impossible to perform a takeover.

### Corrective Action

Upgrade the downrev node, so that both nodes are on the same release of Data ONTAP®. If a revert is being performed, downgrade the uprev node to the same release as the partner node.

## Syslog Message

Takeover of the partner node is impossible due to version mismatch.

## Parameters

(None).

# ha.tkover events

## ha.tkover.waitARLabort

### Severity

INFORMATIONAL

### Description

This message occurs when a pending takeover is waiting for an in-progress aggregate relocation (ARL) operation to complete or abort before proceeding with the takeover.

### Corrective Action

(None).

## Syslog Message

Node %s has been waiting for an ongoing ARL for %d seconds. It will proceed with takeover when the ARL operation has been completed or aborted.

## Parameters

**node\_name** (STRING): Name of the node doing the takeover.

**wait\_time** (LONGINT): Amount of time spent waiting for the ongoing ARL operation to be completed or aborted.

## ha.tkover.waitGBabort

### Severity

INFORMATIONAL

### Description

This message occurs when a pending takeover is waiting for an in-progress SFO giveback operation to complete or abort before proceeding with the takeover.

### Corrective Action

(None).

## Syslog Message

Node %s has been waiting for an ongoing SFO giveback for %d seconds. It will proceed with takeover when the SFO giveback operation has been completed or aborted.

## Parameters

**node\_name** (STRING): Name of the node doing the takeover.

**wait\_time** (LONGINT): Amount of time spent waiting for the ongoing SFO giveback operation to be completed or aborted.

# ha.tkoverabortednomediatormbx events

## ha.tkoverAbortedNoMediatorMbx

### Severity

NOTICE

### Description

This message occurs when a planned failover is aborted because the mediator mailbox disks were not detected.

### Corrective Action

Run the "storage failover show -fields local-mailbox-disks partner-mailbox-disks" and "storage failover show -instance" commands to check whether the mediator mailbox disks are missing. If the mediator mailbox disks are not present, rescan the disks on both nodes in the HA pair to determine the latest ownership by using the "storage disk refresh-ownership" command. If the rescan does not work, contact NetApp technical support.

### Syslog Message

(None).

### Parameters

(None).

# ha.toafterrcvpanicinfo events

## ha.toAfterRcvPanicInfo

### Severity

NOTICE

### Description

This message occurs when the local node initiates a takeover of its high-availability (HA) partner after detecting a panic of the HA partner node.

### Corrective Action

(None).

### Syslog Message

Local node initiated takeover after receiving a panic information message from its HA partner. Partner name: %s. Partner system ID: %llu.

### Parameters

**hostname** (STRING): Host name of the node being taken over.  
**systemid** (LONGINT): System ID of the node being taken over.

# ha.tp events

## ha.tp.testPointHit

### Severity

NOTICE

### Description

This message occurs when the testpoint is encountered or hit.

### Corrective Action

(None).

### Syslog Message

Testpoint hit: '%s' [%s, %s], [%s:%d], count %d ⇒ '%s'.

### Parameters

**message** (STRING): Test message.

**tpModuleName** (STRING): Testpoint module name.

**tpId** (STRING): ID of the testpoint within the module.

**fileName** (STRING): File name.

**lineNo** (INT): Line number.

**tpCount** (INT): Number of times the testpoint triggers before being disabled.

**tpType** (STRING): Type of testpoint.

# hamsg events

## hamsg.diskcheckresp events

### hamsg.diskCheckResp

#### Severity

NOTICE

#### Description

This message occurs when a node receives a disk inventory check response from its high-availability (HA) partner.

#### Corrective Action

(None).

#### Syslog Message

The local node has received a disk inventory check response (%d) from its HA partner.

#### Parameters

**response** (INT): The disk inventory check response received from the HA partner.

## hamsg.dskchkpopulateerr events

### hamsg.dskChkPopulateErr

#### Severity

ERROR

#### Description

This message occurs when a disk inventory check cannot be sent to the local node's high-availability (HA) partner because the disk check request could not be correctly constructed.

#### Corrective Action

Retry the operation. If the problem persists, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the disks and to determine the latest ownership. If the disk inventory mismatch is not resolved, check the cabling for either loose connections or for a bad cable on the partner node.

#### Syslog Message

A disk inventory check cannot be sent to the local node's HA partner. Failure reason: %s.

#### Parameters

**failure\_reason** (STRING): The reason that the disk inventory check request could not be properly constructed.

# haosc events

## haosc.config events

### haosc.config.unknown.cf

#### Severity

ALERT

#### Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memories (FRU PROMs) have inconsistent data.

#### Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Exercise extreme caution. Setting the wrong configuration might lead to data loss.

#### Syslog Message

Cannot determine whether configuration should be stand-alone or HA. Chassis is in %s configuration, and controller is in %s configuration.

#### Parameters

**cha\_config** (STRING): Chassis FRU PROM HA configuration string.  
**cont\_config** (STRING): Controller FRU PROM HA configuration string.

### haosc.config.unknown.ls

#### Severity

ALERT

#### Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memory (FRU PROM) configurations conflict with the HA mode.

#### Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. If you need assistance, contact NetApp technical support.

#### Syslog Message

Cannot determine whether the configuration should be stand-alone or HA. Chassis is in %s configuration, controller is in %s configuration, and the HA mode is %s.

#### Parameters

**cha\_config** (STRING): Chassis FRU PROM HA configuration string.  
**cont\_config** (STRING): Controller FRU PROM HA configuration string.  
**mode** (STRING): HA mode string.

## haosc.config.unknown.nv

### Severity

ALERT

### Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memories (FRU PROMs) have factory default configurations and the nonvolatile memory is dirty.

### Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. If you need assistance, contact NetApp technical support.

### Syslog Message

Cannot determine whether configuration should be stand-alone or HA. Chassis is in %s configuration, controller is in %s configuration, and the nonvolatile memory is dirty.

### Parameters

**cha\_config** (STRING): Chassis FRU PROM HA configuration string.  
**cont\_config** (STRING): Controller FRU PROM HA configuration string.

## haosc.fru events

### haosc.fru.op.failed

### Severity

ALERT

### Description

This message occurs when the chassis or controller field-replaceable unit programmable read-only memory (FRU PROM) read/write fails.

### Corrective Action

Replace the system chassis or controller, and contact NetApp technical support for assistance.

### Syslog Message

%s FRU PROM %s operation failed.

### Parameters

**fru** (STRING): Chassis/controller string.  
**op** (STRING): Read/write operation string.

## haosc.invalid events

### haosc.invalid.config

### Severity

EMERGENCY

## Description

This message occurs when the chassis or controller field-replaceable unit programmable read-only memory (FRU PROM) returns an invalid configuration.

## Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. If you need assistance, contact NetApp technical support.

## Syslog Message

%s FRU PROM returns an invalid configuration.

## Parameters

fru (STRING): Chassis/controller string.

# haosc.sa events

## haosc.sa.config

### Severity

ERROR

### Description

This message occurs when nonvolatile memory on a stand-alone system is configured for a high-availability system. Only half of the available nonvolatile memory will be used and system performance will be affected.

### Corrective Action

Reboot the system to use all of the nonvolatile memory.

### Syslog Message

Only half of the available nonvolatile memory is in use. This will affect system performance.

### Parameters

(None).

# hashd events

## hashd.maxstore events

### hashd.maxstore.oversize

#### Severity

NOTICE

#### Description

This message occurs when the size of hashes in the hash store is greater than the maximum size configured.

#### Corrective Action

If the hash files are not being retained for a long enough duration, consider resizing the maximum size of the hash store by issuing the 'vserver cifs branchcache modify -hash-store-max-size' command.

#### Syslog Message

Size of the hashes in the hash store exceeded maximum size configured for Vserver %s.%s

#### Parameters

**vserver\_name** (STRING): Name of the Vserver where the problem is occurring.

**oldestKept\_timestamp** (STRING): Timestamp of the oldest kept hash file.

# hm events

## hm.alert events

### hm.alert.cleared

#### Severity

NOTICE

#### Description

This message occurs when a system health monitor alert is successfully cleared. Because health monitors evaluate the conditions dynamically, they might determine that the alerting condition is no longer valid. The alert is then removed from the system and this message is generated.

#### Corrective Action

(None).

#### Syslog Message

%s cleared by monitor %s

#### Parameters

**detailed\_info** (STRING): Specific information for the deleted alert.

**monitor** (STRING): Health monitor hm\_type value for this alert.

**alert\_id** (STRING): Alert ID for the alert.

**alerting\_resource** (STRING): Alert resource related to this alert.

### hm.alert.raised

#### Severity

ALERT

#### Description

This message occurs when a system health monitor alert is detected. Based on predefined policies, alerts are created dynamically as and when conditions are evaluated. The alert is then populated with the actual names of the resources causing it.

#### Corrective Action

Run the "system health alert show" command to see the alert that was created with this event. Follow the suggested actions listed in the "Corrective Actions" field of the alert.

#### Syslog Message

%s raised by monitor %s

#### Parameters

**detailed\_info** (STRING): Specific information for the created alert.

**monitor** (STRING): Health monitor hm\_type value for this alert.

**alert\_id** (STRING): Alert ID for the alert.

**alerting\_resource** (STRING): Alert resource related to this alert.

**probable\_cause\_description** (STRING): Description of what could have caused the alert.

**alert\_corrective\_action** (STRING): Instructions to correct the alerting condition.

**possible\_effect** (STRING): Possible effect on the system if the alert is not addressed.  
**additional\_info** (STRING): Additional information related to the alert.  
**tags** (STRING): Tags to categorize the alert.  
**acknowledge** (INT): True indicates the alert has been acknowledged.  
**acknowledger** (STRING): Text describing the user that acknowledged the alert.  
**suppress** (INT): True indicated the alert has been suppressed.  
**suppressor** (STRING): Text describing the user that suppressed the alert.  
**asup\_enable** (INT): True indicates that this alert will trigger an AutoSupport® message.

# host events

## host.app events

### host.app.component.error

#### Severity

ERROR

#### Description

This message occurs when a host encounters an error specific to an application component.

#### Corrective Action

For more information or assistance, contact NetApp technical support.

#### Syslog Message

Application component %s (UUID: %s) belonging to application %s (UUID: %s) on host %s running %s reported error %d: %s.

#### Parameters

**app\_name** (STRING): Name of the application.

**app\_uuid** (STRING): UUID of the application.

**component\_name** (STRING): Name of the application component.

**app\_component\_uuid** (STRING): UUID of the application component.

**host\_name** (STRING): Fully qualified domain name (FQDN) of the host.

**software\_product** (STRING): Name of the software product running on the host.

**host\_error\_num** (INT): Number of the error on the host.

**host\_error\_string** (STRING): Description of the error on the host.

### host.app.error

#### Severity

ERROR

#### Description

This message occurs when a host encounters an error specific to an application.

#### Corrective Action

For more information or assistance, contact NetApp technical support.

#### Syslog Message

Application %s (UUID: %s) on host %s running %s reported error %d: %s.

#### Parameters

**app\_name** (STRING): Name of the application.

**app\_uuid** (STRING): UUID of the application.

**host\_name** (STRING): Fully qualified domain name (FQDN) of the host.

**software\_product** (STRING): Name of the software product running on the host.

**host\_error\_num** (INT): Number of the error on the host.

**host\_error\_string** (STRING): Description of the error on the host.

# host.error events

## host.error

### Severity

ERROR

### Description

This message occurs when the host software encounters an error.

### Corrective Action

For more information or assistance, contact NetApp technical support.

### Syslog Message

Host %s running %s reported error %d: %s.

### Parameters

**host\_name** (STRING): Fully qualified domain name (FQDN) of the host.

**software\_product** (STRING): Name of the software product running on the host.

**host\_error\_num** (INT): Number of the error on the host.

**host\_error\_string** (STRING): Description of the error on the host.

# hotplug events

## hotplug.generic events

### hotplug.generic.busy\_not\_ready

#### Severity

ERROR

#### Description

This message occurs when a module replacement or removal command fails because the driver or system is busy. Hot plug functionality is not available at this time.

#### Corrective Action

Try the command again after a few minutes. If the system remains busy, it is an internal error. Contact NetApp technical support for assistance.

#### Syslog Message

%s command failed for module %s in slot %s of node %s because the driver or system is busy.

#### Parameters

**command** (STRING): Name of the command.

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert events

### hotplug.insert.badCard.type

#### Severity

ERROR

#### Description

This message occurs when the module type does not match the system's record for this slot.

#### Corrective Action

Use a replacement module of the same type.

#### Syslog Message

%s module insertion failed in slot %s of node %s because the module type does not match the system's record for this slot.

#### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert.badCard.ver

### Severity

ERROR

### Description

This message occurs when the module revision does not match the system's record for this slot.

### Corrective Action

Use a replacement module of the same board revision.

### Syslog Message

%s module insertion failed in slot %s of node %s because the module revision does not match the system's record for this slot.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert.illegal\_card

### Severity

NOTICE

### Description

This message occurs when the module inserted is not supported.

### Corrective Action

Use vendor-approved modules.

### Syslog Message

%s module insertion failed in slot %s of node %s because the module is not supported.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert.link\_not\_up

### Severity

ALERT

### Description

This message occurs when link on module fails to initialize after module is powered on.

### Corrective Action

Reinsert the module and try command again. If problem persists, contact NetApp technical support for assistance.

## Syslog Message

%s module insertion failed in slot %s of node %s because the link on module failed to initialize.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert.no\_power\_up

### Severity

ALERT

### Description

This message occurs when a module does not initialize after it is powered on.

### Corrective Action

Reinsert the module and try the command again. If the problem persists, contact NetApp technical support for assistance.

## Syslog Message

%s module insertion failed in slot %s of node %s because module failed to initialize.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.insert.success

### Severity

NOTICE

### Description

This message occurs when module insertion is successful.

### Corrective Action

(None).

## Syslog Message

%s module insertion is successful in slot %s of node %s.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.remove events

## hotplug.remove.success

### Severity

NOTICE

### Description

This message occurs when module removal is successful.

### Corrective Action

(None).

### Syslog Message

%s module removal is successful in slot %s of node %s.

### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

## hotplug.replace.events

### hotplug.replace.success

#### Severity

NOTICE

#### Description

This message occurs when module replacement is successful.

#### Corrective Action

(None).

#### Syslog Message

%s module replacement is successful in slot %s of node %s.

#### Parameters

**card** (STRING): Name of the module.

**slot** (STRING): Number of the slot.

**node** (STRING): Name of the node.

# http events

## http.cfg events

### http.cfg.csrf.max.tokens

#### Severity

NOTICE

#### Description

This message occurs when the maximum number of Cross-Site Request Forgery (CSRF) tokens has been reached. Web applications served from ONTAP®, such as ONTAP System Manager, use CSRF tokens to prevent unauthorized modifications to the cluster. When the token limit has been reached, new connections to these applications will not be able to make changes to the cluster configuration.

#### Corrective Action

You can fix the issue in a few different ways. You can disable CSRF protection by using the "system services web modify -csrf-protection-enabled false" command. You can increase the maximum number of tokens by using the "system services web modify -csrf-token-concurrent-limit <number>" command. You can wait until existing CSRF tokens expire. You can view and modify CSRF token settings by using the "system services web show" command.

#### Syslog Message

Maximum number of CSRF tokens (%d) has been reached.

#### Parameters

**limit** (INT): Maximum number of CSRF tokens that can exist at any given time.

# httpd events

## httpd.api events

### httpd.api.expired.session.limit

#### Severity

ERROR

#### Description

This message occurs when a Manage ONTAP® API request to an internal server expires due to configured session limits.

#### Corrective Action

Inspect the last error contained in the message to determine why the API request exceeded the configured session limits. The "security session show -interface ontapi" command may be used to display all active and pending API requests across the cluster. Run "security session limit show -interface ontapi" to verify the currently configured session limits.

#### Syslog Message

A Manage ONTAP® API request (%s) has expired after %lu seconds. Last error: %s

#### Parameters

**api\_name** (STRING): The name of the API.

**elapsed\_time** (LONGINT): The age of the API request (in seconds).

**last\_error** (STRING): Reason for the warning, indicating the limit category that was exceeded.

**purge\_time** (LONGINT): The purge time (in seconds) for outstanding API requests.

**trace\_tag** (LONGINTEX): The generated trace tag associated with the API request.

# hya events

## hya.dup\_vbn\_lookup events

### hya.dup\_vbn\_lookup

**Severity**

ERROR

**Description**

This event is generated if we detect redundant lookups of a PVBN without an intervening suspend.

**Corrective Action**

(None).

**Syslog Message**

%s %s %s %s %s %s %s %s %s %s %s %s

**Parameters**

- f2** (STRING): Third frame of backtrace.
- f3** (STRING): Fourth frame of backtrace.
- f4** (STRING): Fifth frame of backtrace.
- f5** (STRING): Sixth frame of backtrace.
- f6** (STRING): Seventh frame of backtrace.
- f7** (STRING): Eighth frame of backtrace.
- f8** (STRING): Ninth frame of backtrace.
- f9** (STRING): Tenth frame of backtrace.
- f10** (STRING): Eleventh frame of backtrace.
- f11** (STRING): Twelfth frame of backtrace.
- f12** (STRING): Thirteenth frame of backtrace.

### hya.dup\_vbn\_lookup.detail

**Severity**

ERROR

**Description**

This event is generated if we detect redundant lookups of a PVBN without an intervening suspend.

**Corrective Action**

(None).

**Syslog Message**

%s %s

**Parameters**

- description** (STRING): Description of failure.
- buffers** (STRING): Details of buffers that were predirtied.

# hybaggrcopy events

## hybaggrcopy.dstgeomismatch events

### hybAggrCopy.dstGeomMismatch

#### Severity

ERROR

#### Description

This message occurs when there is a mismatch between the disk geometries of source and destination hybrid aggregates.

#### Corrective Action

Satisfy the following conditions: Both aggregates are hybrid. The destination aggregate has at least the same number of HDD and SSD disks as the source aggregate. The disk size and type of each disk of the source aggregate matches those of the destination aggregate.

#### Syslog Message

Aggregate %s cannot be copied. Source and destination hybrid aggregate geometries do not match.

#### Parameters

**srcaggr** (STRING): Aggr copy source aggregate.

## hybaggrcopy.srcgeomismatch events

### hybAggrCopy.srcGeomMismatch

#### Severity

ERROR

#### Description

This message occurs when an aggregate cannot be copied. The issue is either that the source is a hybrid aggregate and the destination is not, or there is a mismatch between the disk geometries of the source and destination hybrid aggregates.

#### Corrective Action

Verify that the source and destination are both hybrid aggregates. Verify that the destination aggregate has at least the same number each of hard disk drives (HDDs) and solid state drives (SSDs) as the source aggregate. Verify that the disk size and type of each disk of the source aggregate matches those of the destination aggregate.

#### Syslog Message

Aggregate %s cannot be copied. Either the source is a hybrid aggregate but the destination is not, or the source and destination hybrid aggregate geometries do not match.

#### Parameters

**srcaggr** (STRING): Name of the source aggregate.

# ic events

## ic.hainterconnectdown events

### ic.HAInterconnectDown

#### Severity

ERROR

#### Description

This message occurs every hour when the high-availability (HA) interconnect is down.

#### Corrective Action

Base the corrective action on the number and type of HA interconnect links supported by the platform and the reason for which the interconnect is down. If links are down: Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabte the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If links are disabled: Enable the links by using the "system ha interconnect link on" command. If a peer is not connected: Disable and reenabte the links one at a time by using the "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

#### Syslog Message

HA interconnect: Interconnect down for %d minutes: %s

#### Parameters

**ic\_downtime** (INT): Amount of time (in minutes) the connection has been down.

**reason** (STRING): Reason that the HA interconnect is down, which might be due to links being down, links being disabled, or an unconnected peer.

## ic.hainterconnectlinkdown events

### ic.HAInterconnectLinkDown

#### Severity

ERROR

#### Description

This message occurs every hour when one of the high-availability (HA) interconnect links is down.

#### Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabte the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

## Syslog Message

HA interconnect: %s link #%d has been down for %d minutes.

## Parameters

**link\_type** (STRING): Type of link that is down. Possible values are external and backplane.

**link\_num** (INT): Number that identifies which link is down.

**link\_downtime** (INT): Amount of time (in minutes) the link has been down.

# ic.linkspeeddegraded events

## ic.linkSpeedDegraded

### Severity

ERROR

### Description

This message occurs when the high-availability (HA) interconnect detects a degraded link speed.

### Corrective Action

For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabling the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

## Syslog Message

HA interconnect: Link speed of link #%d degraded. Current: %s, expected: %s.

## Parameters

**link\_num** (INT): Number that identifies the link.

**link\_speed** (STRING): Current link speed.

**expected\_speed** (STRING): Link speed expected for the HA interconnect device.

# ic.linkstatuschange events

## ic.linkStatusChange

### Severity

INFORMATIONAL

### Description

This message occurs when the link status changes for a high-availability (HA) interconnect port.

### Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabling the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

## Syslog Message

HA interconnect: Port %s link is %s.

## Parameters

**port\_name** (STRING): Name of the port for which link status changed.

**link\_status** (STRING): Link status string: "up" or "down".

# ic.linkwidthdegraded events

## ic.linkWidthDegraded

### Severity

ERROR

### Description

This message occurs when the high-availability (HA) interconnect detects a degraded link width. This can affect the write performance of the system.

### Corrective Action

For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenabling the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

## Syslog Message

HA interconnect: Link width of link #%d degraded. Current: %dX, expected: %dX.

## Parameters

**link\_num** (INT): Number that identifies the link.

**link\_width** (INT): Current link width.

**expected\_width** (INT): Link width expected for the HA interconnect type.

# ic.unsupportcable events

## ic.unsupportCable

### Severity

ERROR

### Description

This message occurs when an unsupported cable is detected on the high-availability interconnect port. An unsupported cable might cause the interconnect to be unstable, resulting in unsynchronized logs.

### Corrective Action

Unplug the unsupported cable, and then plug in a supported cable. Search the support site "Hardware Universe" for information about supported high-availability cables for this platform.

## Syslog Message

Detected unsupported %s cable with part number %s.

## Parameters

**cable\_type** (STRING): Cable type.

**cable\_part** (STRING): Cable part number.

# ic.viif events

## ic.viif.initFailed

### Severity

ERROR

### Description

This message occurs when the driver fails to create a virtual interface.

### Corrective Action

Reboot the controller. Contact NetApp technical support if the problem persists.

### Syslog Message

HA interconnect: Virtual interface initialization failure.

### Parameters

(None).

# iclink events

## iclink.init events

### iclink.init.error

**Severity**

ALERT

**Description**

This message occurs when the HA interconnect fails to initialize.

**Corrective Action**

Reboot the system. If the problem persists, run diagnostics on the memory in the node.

**Syslog Message**

(None).

**Parameters**

**errorCode** (INT): The internal error code.

## iclink.probe events

### iclink.probe.error

**Severity**

ALERT

**Description**

This message occurs when the system cannot detect a High Availability (HA) interconnect card, making HA communication inoperable.

**Corrective Action**

Verify that the High Availability interconnect card is present and operational on the system. If this message persists, disable and reenable the link by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

**Syslog Message**

(None).

**Parameters**

**errorCode** (INT): Internal error code.

# icmp events

## icmp.ping events

### icmp.ping.throttle

#### Severity

NOTICE

#### Description

This message occurs when the system receives a burst of ICMP ping packet within a one-second interval. The packets are dropped by the system because these packets could be due to an ICMP attack.

#### Corrective Action

If the condition persists, determine the network source of the ICMP ping traffic and then block it by using a firewall rule. For assistance in determining the source, contact your network administrator.

#### Syslog Message

icmp\_input: The system dropped %d ping packets after limiting the packets to %d per second.

#### Parameters

**pingDropped** (INT): ICMP\_ECHO packets dropped due to throttling since the last time this message was generated.

**icmpLimit** (INT): Maximum number of ICMP packets per second.

# image events

## image.install events

### image.install.fail.aggregate

**Severity**

ERROR

**Description**

This message occurs when a software image installation fails, because one or more aggregates or volumes are not online.

**Corrective Action**

Ensure that aggregates and volumes are all online by using the "storage aggregate show -state !online" command and the "volume show -state !online -state !restricted" command.

**Syslog Message**

"Image installation fail: One or more aggregates are not online"

**Parameters**

(None).

### image.install.fail.mcluster

**Severity**

ERROR

**Description**

This message occurs when a software image installation fails because a MetroCluster(tm) switchover operation is in progress or already switched over.

**Corrective Action**

Use the "metrocluster show" command to verify that both the local and remote clusters are neither performing switchover nor in switchover mode.

**Syslog Message**

"MetroCluster switchover operation is in progress or already switched over."

**Parameters**

(None).

### image.install.fail.sfostate

**Severity**

ERROR

**Description**

This message occurs when a software image installation fails because the node is in takeover state.

**Corrective Action**

Ensure that all storage failover operations have been completed and that no nodes remain taken over by using the "storage failover show-giveback" command, and then try the installation again.

**Syslog Message**

"The node is taken over, cannot set to new image."

**Parameters**

(None).

**image.install.fail.sign****Severity**

ALERT

**Description**

This message occurs when the software installation process cannot verify the digital signature of the intended image.

**Corrective Action**

Replace the image, and then try the command again.

**Syslog Message**

"Image installation fail: Image digital signature check failed."

**Parameters**

(None).

# ipfw events

## ipfw.reachedmaxstates events

### ipfw.ReachedMaxStates

#### Severity

NOTICE

#### Description

This message occurs when the ipfw firewall fails to create a new dynamic state entry for a "keep-state" rule because the number of dynamic state entries has reached the maximum allowed value of 32768. The "keep-state" rule is used by the firewall to keep track of whether a connection is established. States are maintained by firewall for TCP, UDP, BGP, and ESP packets. This message occurs at most once every 60 seconds; it lists the most recent connections to reach the limit.

#### Corrective Action

(None).

#### Syslog Message

The ipfw firewall failed to create dynamic "keep-state" entry. Reason: %s, current # of entries: %d. Recent connections reaching this limit: %s

#### Parameters

**message** (STRING): Information about the failed ipfw dynamic state creation.

**current\_states\_held** (INT): Current total number of ipfw dynamic "keep state" entries held.

**cnn\_message** (STRING): Information about recent connections that reached the limit.

# ipmultipath events

## ipmultipath.init events

### ipmultipath.init.badChecksumType

**Severity**

ERROR

**Description**

This message occurs during IP Multipath session initialization, when an INIT packet with an unknown checksum type is received.

**Corrective Action**

The two end points are possibly running incompatible versions of Data ONTAP®. Run identical/compatible versions of Data ONTAP on the two end points and try again.

**Syslog Message**

Unknown checksum type (%d) in IP Multipath INIT packet.

**Parameters**

**chksum\_type** (INT): Checksum type received.

### ipmultipath.init.badVersion

**Severity**

ERROR

**Description**

This message occurs during IP Multipath session initialization, when an INIT packet with an unknown version number is received.

**Corrective Action**

The two end points are possibly running incompatible versions of Data ONTAP®. Run identical/compatible versions of Data ONTAP on the two end points and try again.

**Syslog Message**

Unknown version (%d) in IP Multipath INIT packet.

**Parameters**

**version** (INT): Version number received.

## ipmultipath.session events

### ipmultipath.session.noMemory

**Severity**

ERROR

## Description

This message occurs when an IP Multipath session is dropped due to failure to allocate memory.

## Corrective Action

The system is out of memory. Try to reduce load on the system. When memory becomes available, IP Multipath automatically reestablishes the session.

## Syslog Message

IP Multipath aborting session due to failure to allocate memory.

## Parameters

(None).

# ipmultipath.setup events

## ipmultipath.setup.bindFailed

### Severity

ERROR

### Description

This message occurs during IP Multipath connection setup, when the IP Multipath listener process cannot bind to any IP address of the source.

### Corrective Action

The source host information provided to IP Multipath is probably incorrect. Correct the configuration information and retry.

### Syslog Message

IP Multipath failed to bind to %s.

### Parameters

**src** (STRING): Host name on which the failure occurred.

## ipmultipath.setup.connFailed

### Severity

ERROR

### Description

This message occurs during IP Multipath connection setup, when it cannot connect to the remote end point.

### Corrective Action

The destination host information provided to IP Multipath is incorrect or the remote host is unreachable. Correct configuration information and retry. If the remote host is unreachable, IP Multipath automatically establishes the connection after the problem is corrected.

### Syslog Message

IP Multipath failed to connect to %s.

## Parameters

**dst** (STRING): Host name of the remote host.

# ipsec events

## ipsec.ib events

### ipsec.ib.bad.encrypt

#### Severity

ALERT

#### Description

This message occurs when an inbound IPsec packet cannot be successfully decrypted. Corrupt data is received.

#### Corrective Action

The IPsec SA database could be out of sync to cause this decryption failure. Use the "security ipsec policy modify -is-enabled" command to disable and then reenale the affected policy matching the source and destination IP address.

#### Syslog Message

IPsec: %s packet cannot be successfully decrypted.

#### Parameters

**sa2str** (STRING): IPsec Security Association (SA) in string format SA (Security Parameter Index, source IP address, destination IP address).

### ipsec.ib.no.lookup

#### Severity

ALERT

#### Description

This message occurs when an inbound IPsec packet cannot able to locate the IPsec Security Association (SA) from the SA database. The remote side is using an SA which does not exist in the local SA database.

#### Corrective Action

The IPsec SA database is out of sync. Use the "security ipsec policy modify -is-enabled" command to disable and then reenale the affected policy matching the source and destination IP address.

#### Syslog Message

IPsec: SA not found. SPI: %s Src IP: %s Dst IP: %s.

#### Parameters

**spi** (STRING): IPsec SA Security Parameter Index (SPI).

**srcAddr** (STRING): Source IP address.

**dstAddr** (STRING): Destination IP address.

### ipsec.ib.no.replay

**Severity**

NOTICE

**Description**

This message occurs when an inbound IPsec Security Association (SA) encounters a replay check failure. Number of out-of-order and retransmitted IPsec packet received. Possible causes include a denial-of-service (DoS) attack or traffic congestion.

**Corrective Action**

Possible traffic congestion or DoS attack.

**Syslog Message**

IPsec: %s replay packets detected. Possible DoS attack or traffic congestion.

**Parameters**

**sa2str** (STRING): IPsec SA in string format SA (Security Parameter Index, source IP address, destination IP address).

## ipsec.ib.policy.violation

**Severity**

ALERT

**Description**

This message occurs when an inbound IPsec packet is found to violate the security policy. It is either not IPsec protected or it is protected in a different way than the policy specifies.

**Corrective Action**

check the IPsec policy configuration on both ends to make sure that they match each other.

**Syslog Message**

IPsec: Inbound %s packet %s => %s security policy violation.

**Parameters**

**protocol** (STRING): Packet protocol.  
**srcAddr** (STRING): Source IP address.  
**dstAddr** (STRING): Destination IP address.

## ipsec.ob events

### ipsec.ob.no.acquire

**Severity**

NOTICE

**Description**

This message occurs when the kernel cannot acquire an IPsec Security Association (SA) to protect an outbound packet.

**Corrective Action**

Double check the IPsec policy configuration on both ends to make sure that they match each other.

**Syslog Message**

IPsec: Could not acquire SA for packet %s => %s.

**Parameters**

**srcAddr** (STRING): Source IP address.

**dstAddr** (STRING): Destination IP address.

# iscsi events

## iscsi.loginfailure events

### iscsi.loginFailure

#### Severity

NOTICE

#### Description

This event is issued when an initiator fails an iSCSI login attempt.

#### Corrective Action

Attempt to configure the iSCSI text keys on the initiator such that the iSCSI login succeeds. If the event occurs occasionally but does not affect stability or performance, no corrective action is needed but the event should be monitored. If the event persists and/or iSCSI application performance degrades, starting and stopping the iSCSI service and restarting any iSCSI applications may help clear the condition. Contact NetApp technical support.

#### Syslog Message

ISCSI: iSCSI login failure, '%s'

#### Parameters

**m** (STRING): A more detailed message describing the iSCSI login failure.

## iscsi.loginipnotauthorized events

### iscsi.loginIpNotAuthorized

#### Severity

NOTICE

#### Description

This message occurs when the system rejects an iSCSI login attempt because it originates from an unauthorized IP address.

#### Corrective Action

Run 'iscsi security show -address-ranges' to see if the initiator IP address has been added to the list of permitted IP addresses from where iSCSI logins are allowed.

#### Syslog Message

iSCSI login authorization failure. Initiator %s attempted to log in on Vserver %s, LIF %s from IP address %s

#### Parameters

**initiator\_name** (STRING): Name of the initiator that attempted to login.

**vserver** (STRING): Name of the vserver to which the unauthorized login attempt is made.

**lif** (STRING): Name of the LIF where the login was attempted.

**initiator\_ip\_address** (STRING): Source IP address of the initiator that attempted to login.

# iscsi.notice events

## iscsi.notice

### Severity

NOTICE

### Description

This event is issued when a loggable, non-error event occurs within the iSCSI subsystem.

### Corrective Action

(None).

### Syslog Message

ISCSI: %s

### Parameters

m (STRING): A more specific message describing the event.

# iscsi.session events

## iscsi.session.stateChanged

### Severity

NOTICE

### Description

This message occurs when iSCSI session status is changed.

### Corrective Action

If the identified iSCSI session is experiencing unexpected events (disconnecting, reconnecting, or connected), examine the link for excessive errors or latency.

### Syslog Message

iSCSI session state is changed to %s for the target %s (type: %s, address: %s). %s

### Parameters

**iscsi\_session\_state** (STRING): New iSCSI session state.

**iscsi\_target** (STRING): iSCSI target name.

**iscsi\_target\_type** (STRING): iSCSI target type.

**iscsi\_target\_address** (STRING): iSCSI target address.

**iscsi\_session\_state\_change\_reason** (STRING): Reason for the iSCSI session state change.

**iscsi\_timeout\_value** (INT): iSCSI timeout value.

# iscsi.warning events

## iscsi.warning

**Severity**

NOTICE

**Description**

This event is issued if the iSCSI subsystem detects an abnormal state.

**Corrective Action**

(None).

**Syslog Message**

ISCSI: %s

**Parameters**

**m** (STRING): A more specific message describing the state.

# isns events

## isns.enqueue events

### isns.enqueue.failed

#### Severity

ERROR

#### Description

This message occurs when the Internet Storage Name Service (iSNS) is not able to enqueue a new operation to the iSNS subsystem.

#### Corrective Action

The iSNS failed to enqueue an action into the work queue. This may be due to an overloaded system. Please consider moving the Vserver's Management LIF to another node for that Vserver in the cluster with a lighter work-load.

#### Syslog Message

The iSNS cannot enqueue an operation %s for Vserver %s.

#### Parameters

**event** (STRING): Event/Operation that was no enqueued.

**vserver** (STRING): Name of the Vserver

## isns.portal events

### isns.portal.info.unavailable

#### Severity

ERROR

#### Description

This message occurs when the Internet Storage Name Service (iSNS) is not able to retrieve the portal information required for iSNS registration.

#### Corrective Action

Ensure that at least one node hosting a IP data LIF for SAN is successfully loaded and operating correctly.

#### Syslog Message

The iSNS cannot retrieve the portal information for %s: %s.

#### Parameters

**vserver** (STRING): Name of the Vserver

**err\_msg** (STRING): Reported error.

## isns.reg events

## isns.reg.info.unavailable

### Severity

ERROR

### Description

This message occurs when the Internet Storage Name Service (iSNS) registration information is not valid or not available.

### Corrective Action

Check the Data ONTAP® iSNS configuration to ensure that all configuration information is present. Also check the cluster health for the impacted node to ensure that it is online.

### Syslog Message

The iSNS registration information for %s was not valid or not available: %s.

### Parameters

**vserver** (STRING): Name of the Vserver

**err\_msg** (STRING): Reported error.

## isns.reg.pdu.oversized

### Severity

ALERT

### Description

This message occurs when the the Internet Storage Name Service (iSNS) registration query packet data unit (PDU) length is larger than the supported maximum value. iSNS will not function properly until the problem is resolved.

### Corrective Action

Reconfigure the networking interfaces to reduce the portals until the iSNS registration query PDU is within its maximum value.

### Syslog Message

The iSNS registration query for %s failed due to the oversized iSNS query PDU length. Reduce the networking interface portals.

### Parameters

**vserver** (STRING): Name of the Vserver

## isns.reg.period.too\_small

### Severity

INFORMATIONAL

### Description

This message occurs when the Internet Storage Name Service (iSNS) requests a registration period that is too small. When this happens, the iSNS client service will be automatically disabled.

### **Corrective Action**

Reconfigure the server to increase the registration period.

### **Syslog Message**

The iSNS registration period for %s was too small (%d); increase the registration period.

### **Parameters**

**vserver** (STRING): Name of the Vserver

**period** (INT): Registration period received from the iSNS server

## **isns.socket.events**

### **isns.socket.conn.failed**

#### **Severity**

ERROR

#### **Description**

This message occurs when the TCP socket connection in the Internet Storage Name Service (iSNS) fails to connect to the iSNS server.

#### **Corrective Action**

The iSNS failed to create a socket for communicating with the iSNS server. Check the Data ONTAP® network configuration to ensure that the address for the iSNS server is in the routing group for all Vserver Management LIFs for the Vserver and that they are reachable via the clustered Data ONTAP "network ping" command.

#### **Syslog Message**

The iSNS TCP socket connection failed for %s to %s: %s

#### **Parameters**

**vserver** (STRING): Name of the Vserver

**ip\_address** (STRING): IP address for the iSNS server.

**err\_msg** (STRING): Reported network error.

### **isns.socket.setup.failed**

#### **Severity**

ERROR

#### **Description**

This message occurs when the Internet Storage Name Service (iSNS) fails to create a socket for communicating with the iSNS server.

#### **Corrective Action**

Check the Data ONTAP® network configuration to ensure that the address for the iSNS server is in the routing group for all Vserver Management LIFs for the Vserver and that they are reachable via the clustered Data ONTAP "network ping" command.

### **Syslog Message**

The iSNS for %s failed to create a socket to %s; check the Data ONTAP network configuration.

### **Parameters**

**vserver** (STRING): Name of the Vserver

**ip\_address** (STRING): IP address for the iSNS server.

# kern events

## kern.cron events

### kern.cron.dstError

**Severity**

ERROR

**Description**

This event is issued when the kernel cron daemon is unable to reschedule an internal process due to an error in handling of daylight savings time.

**Corrective Action**

(None).

**Syslog Message**

Daylight Saving Time change caused %s to be scheduled at an invalid time could not reschedule it, deleting further scheduling

**Parameters**

**owner** (STRING): The name of the process that was supposed to be scheduled

### kern.cron.reschedDst

**Severity**

NOTICE

**Description**

This event is issued when the kernel cron daemon reschedules an event to run at a newly scheduled time as a result of a daylight savings time change.

**Corrective Action**

(None).

**Syslog Message**

Daylight Savings Time change: rescheduling %s to run at %s

**Parameters**

**owner** (STRING): The name of the process that was scheduled

**time** (STRING): The text version of the time string at which the event was scheduled

## kern.log events

### kern.log.rotate

**Severity**

NOTICE

## Description

This event is issued when the system messages log is rotated to a new name. This event will be the first event in the new message file. When in takeover mode, this event is also issued for the partner node.

## Corrective Action

(None).

## Syslog Message

System %s (ID %s) is running %s

## Parameters

**hostname** (STRING): The host name of the appliance.

**serialno** (STRING): The serial number of the host.

**short\_version** (STRING): The short version string of the OnTap kernel, in the form 'NetApp Release NNNN'.

# kern.rc events

## kern.rc.errorMsg

### Severity

NOTICE

### Description

This event is issued when an error printf is issued by the kernel in the context of executing the `/etc/rc` file.

### Corrective Action

(None).

### Syslog Message

%s

### Parameters

**msg** (STRING): The text of the message

## kern.rc.msg

### Severity

NOTICE

### Description

This event is issued when a printf is issued by the kernel in the context of executing the `/etc/rc` file.

### Corrective Action

(None).

### Syslog Message

%s

## Parameters

**msg** (STRING): The text of the message

# kern.shutdown events

## kern.shutdown

### Severity

NOTICE

### Description

This event is issued to indicate a pending shutdown is underway.

### Corrective Action

(None).

### Syslog Message

System shut down because : "%s".

## Parameters

**type** (STRING): The type of shutdown (halt or reboot) that is underway.

## kern.shutdown.cantDeleteEntry

### Severity

ERROR

### Description

This event is issued when we detect that a halt or reboot is about to occur but a registry entry cannot be deleted

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**key** (STRING): The registry key

# kern.syslog events

## kern.syslog.drops

### Severity

ERROR

### Description

This event is generated when we detect that syslog messages were dropped before being logged. Syslog messages may be dropped if one or more Data ONTAP subsystems are generating many syslog messages

over short period of time. That can be an indicator that those subsystems are experiencing problems that need to be resolved.

### Corrective Action

Look in the syslog messages file at the messages prior to this message. If they all seem to be coming from a common subsystem, it may indicate that there is a problem with that subsystem. Attempt to resolve the problem with that subsystem.

### Syslog Message

Dropped %d syslog messages starting at %s due to lack of internal log buffers

### Parameters

**numDrops** (INT): The number of messages that have been dropped.

**timestamp** (STRING): A timestamp that indicates the time when the syslog messages started being dropped.

## kern.syslog.msg

### Severity

NOTICE

### Description

This event is generated when a kernel syslog message is detected.

### Corrective Action

(None).

### Syslog Message

%s

### Parameters

**msg** (STRING): The text of the message

**vfilerName** (STRING): The name of the vfiler that generated the message

## kern.syslogd events

### kern.syslogd.error

### Severity

ERROR

### Description

This message occurs when an event is generated to log errors from the syslog daemon.

### Corrective Action

(None).

### Syslog Message

syslog daemon error %s.

## Parameters

**ErrMsg** (STRING): Specific error generated by the syslog daemon.

# kern.timezone events

## kern.timezone.change

### Severity

NOTICE

### Description

This message occurs when the configured time zone changes.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**old\_tz** (STRING): Previous time zone.

**old\_tz\_offset** (INT): Seconds east of UTC of the previous time zone.

**new\_tz** (STRING): New time zone.

**new\_tz\_offset** (INT): Seconds east of UTC of the new time zone.

# kern.uptime events

## kern.uptime.filer

### Severity

NOTICE

### Description

This message occurs to display the uptime status of the controller. Typically, this message is generated once per hour.

### Corrective Action

(None).

### Syslog Message

%s

## Parameters

**msg** (STRING): Text message describing the current status of the controller.

**secs** (LONGINT): Number of seconds since the controller was booted.

**nfsOps** (LONGINT): Number of NFS operations that have been performed.

**cifsOps** (LONGINT): Number of CIFS operations that have been performed.

**httpOps** (LONGINT): Number of HTTP operations that have been performed.

**fcpOps** (LONGINT): Number of FCP operations that have been performed.

**iscsiOps** (LONGINT): Number of iSCSI operations that have been performed.

**nvmeFcOps** (LONGINT): Number of NVMe/FC operations that have been performed.

**nvmeTcpOps** (LONGINT): Number of NVMe/TCP operations that have been performed.

**nvmeRoceOps** (LONGINT): Number of NVMe/RDMA over Converged Ethernet(RoCE) operations that have been performed.

## kern.version events

### kern.version.change

#### Severity

NOTICE

#### Description

This message occurs when you reboot your system with a version of the Data ONTAP® kernel that is different from the one you ran previously.

#### Corrective Action

(None).

#### Syslog Message

Data ONTAP kernel version was changed from %s to %s.

#### Parameters

**oldver** (STRING): Previous version of the Data ONTAP kernel.

**newver** (STRING): Current version of the Data ONTAP kernel.

## kern.vm events

### kern.vm.mmap.return

#### Severity

NOTICE

#### Description

This message occurs when an attempt to create a new mapping in the virtual address space of a process has failed.

#### Corrective Action

(None).

#### Syslog Message

mmap(2) by %s (pid %d) for size %ld failed: %s, limit %ld, error %d.

#### Parameters

**process\_name** (STRING): Name of the process with the failed attempt.

**process\_id** (INT): ID of the process with the failed attempt.

**size** (LONGINT): Size in bytes of the memory map attempt.

**message** (STRING): Details about the failed memory map attempt.

**limit** (LONGINT): Size in bytes of the process's virtual memory limit.

**errno** (INT): The error code returned to the process.

# km events

## km.cluster events

### km.cluster.okm.hierarchy.bad

#### Severity

ALERT

#### Description

This message occurs in a MetroCluster(tm) configuration, when one or both clusters have been configured with the Onboard Key Manager, but one or both of the Onboard Key Manager key hierarchies are corrupted. Specifically, the 'hashed\_pass' object does not match the 'hashed\_pass\_!' object in at least one cluster.

#### Corrective Action

Reboot each of the nodes in the MetroCluster configuration.

#### Syslog Message

This cluster is part of a MetroCluster configuration. The Onboard Key Manager key hierarchy on one or both of the clusters is corrupted. Specifically, the 'hashed\_pass' object does not match the 'hashed\_pass\_!' object, part of the 'cluster\_kdb' table, in either cluster.

#### Parameters

(None).

## km.cmek events

### km.cmek.gckms.available

#### Severity

NOTICE

#### Description

This message occurs when a configured Google Cloud Key Management Service (GCKMS) that was previously reported as unavailable for key operations is now available.

#### Corrective Action

(None).

#### Syslog Message

The GCKMS with project ID: "%s", key ring location: "%s", key ring: "%s" and key name: "%s" configured is now available.

#### Parameters

**projectId** (STRING): Project ID.

**keyringLocation** (STRING): Location of the key ring.

**keyringName** (STRING): Name of the key ring.

**keyName** (STRING): Name of the key.

## km.cmek.gckms.keyVersionChg

### Severity

NOTICE

### Description

This message occurs when a change is made to the current key version associated with the key name of the configured Google Cloud Key Management Service (GCKMS). The key version might have been auto-rotated or manually changed at the GCKMS. Additionally, the top-level internal key protection key is successfully re-wrapped with the current key version of the GCKMS key name.

### Corrective Action

(None).

### Syslog Message

The version of the key "%s" owned by GCKMS project ID "%s", with key ring "%s" at "%s", has been changed from "%s" to "%s".

### Parameters

**keyName** (STRING): Name of the key.  
**projectId** (STRING): Project ID of the GCKMS.  
**keyringName** (STRING): Name of the key ring.  
**keyringLocation** (STRING): Location of the key ring.  
**oldKeyVersion** (STRING): Prior key version.  
**newKeyVersion** (STRING): New key version.

## km.cmek.gckms.notAvailable

### Severity

ALERT

### Description

This message occurs when a check for the availability of the configured Google Cloud Key Management Service (GCKMS) fails. The GCKMS might be down or there might be a network-related problem preventing communication. Without access to the GCKMS, the system might not be able to restore encryption keys needed to mount encrypted volumes. If the GCKMS is not available, then the next time this system boots, the failure to restore the keys might prevent the system from booting successfully or the encrypted volumes hosted on this system from coming online.

### Corrective Action

Verify that the GCKMS configuration is correct and verify the permissions and connectivity are correct. If the issue still persists, contact technical support.

### Syslog Message

The GCKMS with project ID: "%s", key ring location: "%s", key ring: "%s" and key name: "%s" is not available.

### Parameters

**projectId** (STRING): Project ID.  
**keyringLocation** (STRING): Location of the key ring.  
**keyringName** (STRING): Name of the key ring.  
**keyName** (STRING): Name of the key.

## km.cmek.init.failed

### Severity

ALERT

### Description

This message occurs when the system fails to initialize the key hierarchy required for volume encryption and that is protected by the Customer Managed Encryption Key (CMEK). Reasons for failure include failure to create the key hierarchy, incorrect CMEK configuration, identity, networking or permission issues in communicating with the CMEK hosted service and failure to store the CMEK wrapped key hierarchy in an external store like etcd.

### Corrective Action

Ensure that the configuration, identity, networking and permissions required to communicate with the CMEK hosted service are configured correctly. If the issue persists, contact technical support.

### Syslog Message

Initialization of the CMEK protected key hierarchy fails. Reason: "%s".

### Parameters

**reason** (STRING): Reason for failure.

## km.cmek.init.success

### Severity

NOTICE

### Description

This message occurs when the system successfully initializes and protects the key hierarchy with a Customer Managed Encryption Key (CMEK). The system is ready to support encrypted volumes.

### Corrective Action

(None).

### Syslog Message

CMEK protected key hierarchy initialization successfully completed.

### Parameters

(None).

## km.extkeysvr events

### km.extkeysvr.details

### Severity

NOTICE

### Description

This message occurs when a key is retrieved or restored from an external KMIP server. This is an informational message that describes the external KMIP server where the key is stored.

### Corrective Action

(None).

### Syslog Message

Key ID "%s" restored/retrieved from external key server "%s".

### Parameters

**keyId** (STRING): Key ID of the key being restored or retrieved.

**hostPort** (STRING): Host port details of the external KMIP server.

## km.keyretrieve events

### km.keyretrieve.failed

#### Severity

ALERT

#### Description

This message occurs when a node fails to retrieve a complete set of encryption keys from the configured key servers by the time the management process comes online. Should this node take ownership of an encrypted volume associated with a missing key before the key becomes available, the encrypted volume cannot come online.

#### Corrective Action

Use the "security key-manager external restore -node <node> -vserver <vserver>" command to manually restore the keys.

#### Syslog Message

Key auto-retrieve failed on node %s for Vserver %s (ID %u, UUID %s).

#### Parameters

**node** (STRING): Name of the node whose management process goes online.

**vserver** (STRING): Name of the Vserver that could not retrieve all of the keys.

**vserverId** (INT): Vserver ID of the Vserver.

**vserverUuid** (STRING): UUID of the related Vserver.

## km.keyserver events

### km.keyserver.available

#### Severity

NOTICE

#### Description

This message occurs when a check by the key manager for connectivity with a configured key management server indicates that the key management server that was previously unavailable is now available.

#### Corrective Action

(None).

## Syslog Message

The external key management server "%s" is now available for Vserver "%s".

## Parameters

**vserver** (STRING): Name of the Vserver where the key management server is configured.

**address** (STRING): IP address of the key management server.

## km.keyserver.notavailable

### Severity

ALERT

### Description

This message occurs when a check by the key manager for connectivity with a configured key management server indicates that the key management server is not available. The key management server might be down, there might be a network-related problem preventing communication with the key server, or the security certificates used to authenticate with the key management server might have expired. Without access to the key management server, the node might not be able to restore authentication keys needed to unlock NSE drives or encryption keys needed to mount encrypted volumes. If the key management server is not available the next time this node boots, then the failure to restore the keys might prevent the node from booting successfully or prevent the encrypted volumes hosted on this node from coming online.

### Corrective Action

Ensure that the key management server is online using the server's management interface. If the server is online, use the "network ping -lif <lif> -vserver <vserver> -destination <address>" command to verify that the node can communicate with the server. If this command indicates that the server is available, use the "security key-manager external show -vserver <vserver>" command to get the certificate names, and then check whether they are expired with the "security certificate show-user-installed -vserver <vserver> -cert -name <cert>" command. If so, install the updated certificates with the "security certificate install" and "security key-manager external modify" commands.

## Syslog Message

The external key management server "%s" is not available for Vserver "%s", status: "%s".

## Parameters

**vserver** (STRING): Name of the Vserver where the key management server is configured.

**address** (STRING): IP address of the key management server.

**keyserver\_status** (STRING): Status of the key management server.

## km.mcc events

### km.mcc.okm.hierarchy.bad

### Severity

ALERT

### Description

This message occurs in a MetroCluster(tm) configuration, when one or both clusters have been configured with the Onboard Key Manager, but one or both of the Onboard Key Manager key hierarchies are corrupted. Specifically, the 'hashed\_pass' object does not contain the same value in each Onboard Key Manager key hierarchy.

**Corrective Action**

Reboot each of the nodes in the MetroCluster configuration.

**Syslog Message**

This cluster is part of a MetroCluster configuration. The Onboard Key Manager key hierarchy on one or both of the clusters is corrupted. The replication subsystem has failed to update the 'hashed\_pass' field in the 'cluster\_kdb' table.

**Parameters**

(None).

**km.mcc.okmkey.mismatch****Severity**

ALERT

**Description**

This message occurs in a NetApp MetroCluster configuration, where both peer clusters are configured with Onboard Key Manager (OKM) and the lists of OKM hierarchy keys on the peer clusters are not consistent. A mismatch in the OKM hierarchy keys can lead to a failure during a reboot or future switchover/switchback event.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

This cluster is part of a MetroCluster configuration. The list of OKM hierarchy keys on one or both of the clusters is potentially corrupted.

**Parameters**

(None).

**km.mcc.svmkek.missing.local****Severity**

ALERT

**Description**

This message occurs in a NetApp MetroCluster configuration, where both peer clusters are configured with Onboard Key Manager (OKM) and an SVM key encryption key is created on the remote peer, but due to various conditions, is not replicated to the local cluster. Creation of a new SVM key encryption key (KEK) on the local cluster is prevented to avoid failure during a reboot or future switchover/switchback event.

**Corrective Action**

Contact Contact NetApp technical support. for assistance.

**Syslog Message**

This cluster is part of a MetroCluster configuration. An SVM key encryption key created on the remote cluster has not been replicated to the local cluster.

**Parameters**

(None).

## km.okmdb events

**km.okmdb.read.failed****Severity**

ALERT

**Description**

This message occurs when a read of the Onboard Key Manager's database file fails. This may occur when the Onboard Key Manager has been configured to use a USB based mount-point and the USB device has not been mounted on the node.

**Corrective Action**

Check that the USB device is attached to the node.

**Syslog Message**

The system is not able to read from the Onboard Key Manager's database file.

**Parameters**

(None).

**km.okmdb.write.failed****Severity**

ALERT

**Description**

This message occurs when a write to the Onboard Key Manager's database file fails. This may occur when the Onboard Key Manager has been configured to use a USB based mount-point and the USB device has either not been mounted on the node or the USB device is write-protected.

**Corrective Action**

Check that the USB device is attached to the node and that it is not write-protected.

**Syslog Message**

The system is not able to write to the Onboard Key Manager's database file.

**Parameters**

(None).

## km.onboard events

**km.onboard.ccmode.wrongpass****Severity**

NOTICE

## Description

This message occurs when a cluster administrator supplies the wrong Onboard Key Manager cluster-wide passphrase more than three times in a row while attempting to enable Common Criteria (CC) mode.

## Corrective Action

(None).

## Syslog Message

The Onboard Key Manager cluster-wide passphrase has been entered incorrectly %s times by user "%s" while attempting to enable Common Criteria mode.

## Parameters

**username** (STRING): Name of the user who issued the command to enable CC mode.

**failure\_count** (STRING): Number of sequential times that the cluster-wide passphrase has been entered incorrectly.

# km.restore events

## km.restore.invalid.key

### Severity

ALERT

### Description

This message occurs when the key manager attempts to restore a key which has an invalid length.

### Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

### Syslog Message

ONTAP has attempted to restore an %s key which has an invalid key length. Vserver: %s, Key ID: %s, Key server: %s.

### Parameters

**keyType** (STRING): Key type (NSE, AES, XTS) that has invalid length.

**vserverName** (STRING): Vserver name.

**keyId** (STRING): Key ID of the key being restored.

**keyServer** (STRING): Key server from which the key is being restored.

# km.run events

## km.run.external.setup

### Severity

ERROR

### Description

This message occurs when a node successfully performs a join operation to join a cluster, but the other nodes in the cluster have the External Key Manager configured and the new node does not. The new node cannot perform External Key Manager-related tasks, such as creating encrypted volumes, until it has the

External Key Manager configured.

### Corrective Action

Set up the External Key Manager on the new node by using the "security key-manager setup" command.

### Syslog Message

External Key Manager setup required after the cluster "%s" operation for node "%s", serial "%s".

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**node** (STRING): Name of the node that successfully joined the cluster.

**serial** (STRING): System serial number of the node that successfully joined the cluster.

## km.run.extrnl.enable.needed

### Severity

ALERT

### Description

This message occurs when a cluster in a MetroCluster(tm) configuration has configured external key management via the "security key-manager external enable -key-servers <ip\_address:port> -client-cert <client\_cert\_name> -server-ca-certs <server\_ca\_cert\_name>" command. This is an alert that the external key management configuration on the two clusters is not consistent, and that the "security key-manager external enable -key-servers <ip\_address:port> -client-cert <client\_cert\_name> -server-ca-certs <server\_ca\_cert\_name>" command" should be run on the local cluster or peer cluster, specifying the same set of key servers. Otherwise, encrypted volumes and NSE drives will not come online after a future switchover or switchback event. This message will be generated on both the local cluster and the peer cluster.

### Corrective Action

Run the "security key-manager external enable" command on the local cluster or the peer cluster (identified in the "cluster" parameter), specifying the same set of configured key servers, to make the external key management consistent.

### Syslog Message

The external key management configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

### Parameters

**cluster** (STRING): Local cluster or peer cluster on which to run the command.

## km.run.extrnl.setup.needed

### Severity

ALERT

### Description

This message occurs when a cluster in a MetroCluster(tm) configuration has configured external key management via the "security key-manager setup" command. This is an alert that the external key management configuration on the two clusters is not consistent, and that the "security key-manager setup" command should be run on the local cluster or peer cluster. Otherwise, encrypted volumes and NSE drives

will not come online after a future switchover or switchback event. This message will be generated on both the local cluster and the peer cluster.

### Corrective Action

Run the "security key-manager setup" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the external key management configurations consistent.

### Syslog Message

The external key management configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

### Parameters

**cluster** (STRING): Local cluster or peer cluster on which to run the command.

## km.run.onboard.setup

### Severity

ERROR

### Description

This message occurs when a node successfully performs a join operation to join a cluster, but the other nodes in the cluster have the Onboard Key Manager configured and the new node does not. The new node cannot perform the Onboard Key Manager-related tasks, such as creating encrypted volumes, until it has the Onboard Key Manager configured.

### Corrective Action

Set up the Onboard Key Manager on the new node by using the "security key-manager setup" command.

### Syslog Message

The Onboard Key Manager setup required after the cluster "%s" operation for node "%s", serial "%s".

### Parameters

**operation\_type** (STRING): Type of cluster operation.

**node** (STRING): Name of the node that successfully joined the cluster.

**serial** (STRING): System serial number of the node that successfully joined the cluster.

## km.run.onboard.setup.needed

### Severity

ALERT

### Description

This message occurs when a cluster in a MetroCluster(tm) configuration has either configured the Onboard Key Manager via the "security key-manager setup" command or has reconfigured the cluster passphrase via the "security key-manager update-passphrase" command. This is an alert that the onboard key hierarchies on the two clusters are not consistent, and that the "security key-manager setup -sync -metrocluster-config yes" command should be run on the local cluster or peer cluster. Otherwise, a future switchover or switchback event could fail. This message will be generated on both the local cluster and the peer cluster.

## Corrective Action

Run the "security key-manager setup -sync-metrocluster-config yes" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the two onboard key hierarchies consistent.

## Syslog Message

The Onboard Key Manager configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

## Parameters

**cluster** (STRING): Local cluster or peer cluster on which to run the command.

## km.run.onboard.sync.needed

### Severity

ALERT

### Description

This message occurs when a cluster in a MetroCluster(tm) configuration has either configured the Onboard Key Manager via the "security key-manager onboard enable" command or has reconfigured the cluster passphrase via the "security key-manager onboard update-passphrase" command. This is an alert that the onboard key hierarchies on the two clusters are not consistent, and that the "security key-manager onboard sync" command should be run on the local cluster or peer cluster. Otherwise, a future switchover or switchback event could fail. This message will be generated on both the local cluster and the peer cluster.

## Corrective Action

Run the "security key-manager onboard sync" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the two onboard key hierarchies consistent.

## Syslog Message

The Onboard Key Manager configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

## Parameters

**cluster** (STRING): Local cluster or peer cluster on which to run the command.

## km.volume events

### km.volume.mount.fail

### Severity

ALERT

### Description

This message occurs during the recovery of the key manager when a volume is placed online, but fails to mount. Volumes need to be mounted manually.

## Corrective Action

The volume needs to be mounted manually with the provided junction using the "volume mount" command.

## Syslog Message

Vserver "%s" failed to mount volume: "%s" to junction path: "%s" during key manager recovery.

## Parameters

**vserver** (STRING): Name of the Vserver that owns the volumes being placed online.

**volume** (STRING): Name of the the volume being placed online.

**junction** (STRING): Name of the junction path to mount.

## km.volume.mount.mismatch

### Severity

ALERT

### Description

This message occurs during recovery of the key manager when a junction path cannot identify the volume to mount. Pair the supplied junction with its volume and mount manually.

### Corrective Action

The volumes are online but need to be mounted manually using the "volume mount" command.

## Syslog Message

During health monitor recovery of the key manager on Vserver "%s", the junction path "%s" cannot be associated with the volume to mount.

## Parameters

**vserver** (STRING): Name of the Vserver that owns the volume that could not be mounted.

**junction** (STRING): Name of the junction path to mount.

# kmip2 events

## kmip2.cannot events

### kmip2.cannot.import.NSE.key

#### Severity

ALERT

#### Description

This message occurs when the KMIP2 client cannot import an NSE key from a KMIP key server. A key was retrieved from a KMIP key server, but an error occurred when trying to add the key to an ONTAP® data structure.

#### Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

#### Syslog Message

KMIP2 client failed to import NSE key from KMIP key server, error: %d

#### Parameters

**err** (INT): Error code from system call to sysctlbyname().

### kmip2.cannot.import.NVE.key

#### Severity

ALERT

#### Description

This message occurs when the KMIP2 client cannot import an NVE key from a KMIP key server. A key was retrieved from a KMIP key server, but an error occurred when trying to add the key to an ONTAP® data structure.

#### Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

#### Syslog Message

KMIP2 client failed to import NVE key from KMIP key server, error: %d

#### Parameters

**err** (INT): Error code from system call to sysctlbyname().

### kmip2.cannot.read.client.cert

#### Severity

ALERT

#### Description

This message occurs when the client certificate cannot be read. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed

because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

### **Corrective Action**

Examine the KMIP client certificate and ensure that the certificate has been created properly.

### **Syslog Message**

KMIP Failed to read client certificate with error: %s

### **Parameters**

**err** (STRING): KMIP error code.

## **kmip2.cannot.read.private.key**

### **Severity**

ALERT

### **Description**

This message occurs when the client private key certificate can't be read. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

### **Corrective Action**

Examine the KMIP client private certificate and ensure that the certificate has been created properly.

### **Syslog Message**

KMIP Failed to read client private certificate with error: %s

### **Parameters**

**err** (STRING): KMIP error code.

## **kmip2.invalid events**

### **kmip2.invalid.key.length**

### **Severity**

ALERT

### **Description**

This message occurs when ONTAP cannot push a key to a KMIP key server because the key has an invalid length.

### **Corrective Action**

(None).

## Syslog Message

ONTAP failed to push an %s key to a KMIP key server due to invalid key length. Vserver Name: %s, Key ID: %s.

## Parameters

**keyType** (STRING): Key type (NSE, AES, XTS) that has invalid length.

**vserverName** (STRING): Vserver name.

**keyID** (STRING): Key ID of key being pushed to key server.

# kmip2.ssl events

## kmip2.ssl.cannot.connect

### Severity

ALERT

### Description

This message occurs when a KMIP SSL/TLS connection error is detected in either a Cloud ONTAP system with encrypted aggregates or a NSE system. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

### Corrective Action

Examine the KMIP certificates and ensure that the certificates have been created properly.

### Syslog Message

Unable to make SSL/TLS connection to KMIP server. Error: %s

### Parameters

**err** (STRING): KMIP error code with details.

# krb events

## krb.config events

### krb.config.updateFail

**Severity**

ERROR

**Description**

The CIFS server's security settings could not be written to the configuration file on this node.

**Corrective Action**

Modify any of the 'vserver cifs security' fields using the 'vserver cifs security modify' command, which will attempt to write to the configuration file again on every node. Change the setting back to its original value if desired. Afterward, verify that the event log does not contain any new instances of this error.

**Syslog Message**

The CIFS server's security settings could not be written to the configuration file on this node.

**Parameters**

(None).

# ktls events

## ktls.badauth events

### ktls.badAuth

#### Severity

NOTICE

#### Description

This message occurs when the system receives a TLS message with bad 'authentication' data. The connection is closed. It might indicate that this system is under attack.

#### Corrective Action

ONTAP software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

#### Syslog Message

ONTAP received a TLS message with incorrect authentication at local address %s local port %d from remote address %s remote port %d via IPspace %d.

#### Parameters

**localAddr** (STRING): Full internet address of the local end of this session.

**localPort** (INT): Local port number that was being reached.

**remoteAddr** (STRING): Full internet address of the remote end of this session.

**remotePort** (INT): Remote port number that sent the erroneous data.

**IPspace** (INT): IPspace in which the remote address was reached.

## ktls.cnxnhandshakelimit events

### ktls.cnxnHandshakeLimit

#### Severity

NOTICE

#### Description

This message occurs when the concurrent TLS connection handshake limit is reached. Any new TLS connection request will fail and an error status will be returned.

#### Corrective Action

Reduce the encrypted connection load on ONTAP to avoid reaching the maximum concurrent TLS handshake limit.

#### Syslog Message

ONTAP reached the maximum limit of %d concurrent TLS connection handshakes. If this limit is reached, subsequent TLS connections will fail.

## Parameters

**maxTLSConnHandles** (INT): Maximum number of concurrent TLS connection handshakes.

# ktls.failed events

## ktls.failed

### Severity

NOTICE

### Description

This message occurs when several successive Transport Layer Security (TLS) connections with a remote system have failed.

### Corrective Action

Corrective actions will necessarily depend on what condition is being reported.

### Syslog Message

"The TLS connections have failed several times with remote host '%s' in IPspace '%s', for which the latest reason given is: %s."

### Parameters

**peer** (STRING): Network address of the remote peer.

**ipsname** (STRING): IPspace within which the network address is defined.

**reason** (STRING): Reason for failure.

# ktls.health events

## ktls.health.actionQGrowing

### Severity

NOTICE

### Description

This message occurs when the depth of the action queue in the ktlsd subsystem is increasing in the majority of time intervals. It is a potential indication of back-pressure accumulating within ktlsd or the kernel.

### Corrective Action

(None).

### Syslog Message

"The depth of the action queue in the ktlsd subsystem has trended upward over the last "%d" intervals of "%d" seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.actionQHigh

### Severity

NOTICE

### Description

This message occurs when the depth of the action queue in the ktlsd subsystem accounts for a significant percentage of our total available handshake slots. It is a potential indication of back-pressure accumulating within ktlsd or the kernel.

### Corrective Action

(None).

### Syslog Message

"The depth of the action queue in the ktlsd subsystem has been at an elevated level over the last %d intervals of %d seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.backoffGrowing

### Severity

NOTICE

### Description

This message occurs when the number of backoffs in the ktlsd subsystem is increasing in the majority of time intervals. It is most likely an indication that handshake timeouts are occurring frequently.

### Corrective Action

(None).

### Syslog Message

"The number of self-imposed backoffs in the ktlsd subsystem has trended upward over the last "%d" intervals of "%d" seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.highStress

### Severity

ALERT

### Description

This message occurs when a combination of indicators suggest high stress within the Kernel Transport Layer Security (KTLS) subsystem. This subsystem does not perform adequately as a consequence.

## Corrective Action

There might be a variety of potential corrective actions. The first course of action should be to check for other `ktls.health.*` events around the same time. These might have their own guidance. In general it is likely that the resolution involves reducing the inbound load on KTLS, which requires different steps depending on the feature.

## Syslog Message

"The KTLS subsystem is exhibiting signs of high stress."

## Parameters

(None).

## `ktls.health.inactiveGrowing`

### Severity

NOTICE

### Description

This message occurs when the total length of time handshakes spend in an active state has been increasing in the majority of time intervals.

### Corrective Action

(None).

### Syslog Message

"The inactive period for TLS handshakes has trended upward over the last "%d" intervals of "%d" seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## `ktls.health.latencyGrowing`

### Severity

NOTICE

### Description

This message occurs when the latency of handshakes has been increasing in the majority of time intervals.

### Corrective Action

(None).

### Syslog Message

"The latency of TLS handshakes has trended upward over the last "%d" intervals of "%d" seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.lowCompletion

### Severity

ERROR

### Description

This message occurs when a significant percentage of handshakes initiated in the ktlsd subsystem over an interval of time do not succeed.

### Corrective Action

There might be a variety of potential corrective actions. Any ktls.failed events generated around the same time contain a "reason" parameter which provides a good starting point for probable causes of this condition.

### Syslog Message

"A high percentage of handshakes initiated in the ktlsd subsystem over the last "%d" intervals of "%d" seconds have not completed successfully."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.startLatencyHigh

### Severity

NOTICE

### Description

This message occurs when the amount of time handshakes are spending in the start queue in the ktlsd subsystem is at an elevated level over some time intervals. It is a potential indication of back-pressure accumulating within ktlsd.

### Corrective Action

(None).

### Syslog Message

"The amount of time handshakes have spent in the start queue of the ktlsd subsystem has been at an elevated level over the last "%d" intervals of "%d" seconds."

### Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.startQGrowing

### Severity

NOTICE

### Description

This message occurs when the depth of the start queue in the ktlsd subsystem is increasing in the majority of time intervals. It is a potential indication of back-pressure accumulating within ktlsd.

## Corrective Action

(None).

## Syslog Message

"The depth of the start queue in the ktlsd subsystem has trended upward over the last "%d" intervals of "%d" seconds."

## Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.startQHigh

### Severity

NOTICE

### Description

This message occurs when the depth of the start queue in the ktlsd subsystem accounts for a significant percentage of total available handshake slots. It is a potential indication of back-pressure accumulating within ktlsd.

## Corrective Action

(None).

## Syslog Message

"The depth of the start queue in the ktlsd subsystem has been at an elevated level over the last "%d" intervals of "%d" seconds."

## Parameters

**intervalQuantity** (INT): Number of intervals over which the problem was observed.

**intervalLength** (INT): Length of the observation intervals for this problem, in seconds.

## ktls.health.stress

### Severity

ERROR

### Description

This message occurs when a combination of indicators suggest moderate stress within the Kernel Transport Layer Security (KTLS) subsystem.

## Corrective Action

There might be a variety of potential corrective actions. The first course of action should be to check for other ktls.health.\* events around the same time. These might have their own guidance. In general it is likely that the resolution involves reducing the inbound load on KTLS, which requires different steps depending on the feature.

## Syslog Message

"The KTLS subsystem is exhibiting signs of moderate stress."

**Parameters**

(None).

# largevol events

## largevol.remount events

### largevol.remount.nfsclient

#### Severity

NOTICE

#### Description

This message occurs when the "is-large-size-enabled" property is set on a FlexVol volume or Flexgroup volume, which is NFS mounted for client access. Setting this field enables volumes to support large files, from 16TB to 128TB. If the volume has already been mounted via NFS, then the NFS client caches the older maximum file size, which is 16TB. For support of files up to 128TB to take effect, the NFS client needs to remount the volume. This issue does not occur if automount has been configured on NFS client to mount the volumes.

#### Corrective Action

To support 128TB as the maximum file size on the NFS client, stop the applications using the NFS mount, remount the FlexVol volume in the NFS client and then restart the applications. If the issue still persists, Contact NetApp technical support.

#### Syslog Message

Remount the volume on the NFS client.

#### Parameters

**vvolname** (STRING): Volume name.

**vserver** (STRING): Vserver name.

# Idap events

## Idap.false events

### Idap.false.configs.removed

**Severity**

NOTICE

**Description**

This message occurs when the last system to be upgraded in a cluster removes LDAP configurations that were marked as disabled.

**Corrective Action**

(None).

**Syslog Message**

All LDAP configurations with the "-client-enabled" parameter set to "false" were removed.

**Parameters**

(None).

# lib events

## lib.nvtrace events

### lib.nvtrace.syslog.relog.alert

#### Deprecated

This event is deprecated as of ONTAP 9.1.

#### Severity

ALERT

#### Description

This message occurs when the system sorts the syslog messages when syslog is not yet initialized, and the panic messages are relogged.

#### Corrective Action

(None).

#### Syslog Message

Relog syslog %s.

#### Parameters

**data** (STRING): Syslog data in NVRAM(Non Volatile RAM).

# lic events

## lic.cappool events

### lic.cappool.reassign.abort

#### Severity

NOTICE

#### Description

This message occurs when the system aborts an operation of reassigning nodes to a different capacity pool license, because another reassignment operation to a different capacity pool license in the same request has failed.

#### Corrective Action

Look for the "lic.cappool.failed" event that occurred about the same time, which caused the reassignment operation to abort.

#### Syslog Message

"Capacity pool license reassignment is aborted for nodes ("%s") to serial number "%s" due to failure to reassign other nodes to serial number "%s"."

#### Parameters

**aborted\_node\_names** (STRING): Aborted list of node names.

**aborted\_pool\_serial** (STRING): Aborted capacity pool license serial number.

**failed\_pool\_serial** (STRING): Another reassignment operation to this capacity pool serial number has failed.

### lic.cappool.reassign.done

#### Severity

NOTICE

#### Description

This message occurs when the system successfully completes an operation of reassigning nodes to a different capacity pool license.

#### Corrective Action

(None).

#### Syslog Message

"Capacity pool license reassignment successfully completed for nodes ("%s") to license serial number "%s"."

#### Parameters

**node\_names** (STRING): List of node names that are reassigned to the new capacity pool license.

**new\_pool\_serial** (STRING): Capacity pool license serial number to which the nodes are reassigned.

## lic.cappool.reassign.done.info

### Severity

NOTICE

### Description

This message occurs when the system successfully completes an operation of reassigning nodes to a different capacity pool license with with a non-critical error, which does not affect the outcome of the ultimate operation.

### Corrective Action

(None).

### Syslog Message

"Capacity pool license reassignment successfully completed for nodes ("%s") to license serial number "%s" with non-critical error "%s"."

### Parameters

**node\_names** (STRING): List of node names that are reassigned to the new capacity pool license.

**new\_pool\_serial** (STRING): Capacity pool license serial number to which the nodes are reassigned.

**non\_critical\_error** (STRING): Information about the non-critical error encountered during the reassignment operation.

## lic.cappool.reassign.failed

### Severity

ERROR

### Description

This message occurs when operation of reassigning nodes to a different capacity pool license fails.

### Corrective Action

Resolve the error, which should clearly indicate why the operation has failed. Follow the instructions shown on the ONTAP Select Deploy utility from which the operation was initiated.

### Syslog Message

"Capacity pool license reassignemnt to license serial number "%s" failed for nodes ("%s") with error: %s"

### Parameters

**failed\_pool\_serial** (STRING): Capacity pool license serial number to which the nodes failed to be reassigned.

**failed\_node\_names** (STRING): List of node names that failed to be reassigned to the new capacity pool license.

**error** (STRING): Reason for failure.

## lic.cappool.reassign.start

### Severity

NOTICE

## Description

This message occurs when the system starts an operation of reassigning nodes to a different capacity pool license.

## Corrective Action

(None).

## Syslog Message

"Capacity pool license reassignment started for nodes ("%s") to license serial number "%s"."

## Parameters

**node\_names** (STRING): List of node names that are reassigned to the new capacity pool license.

**new\_pool\_serial** (STRING): Capacity pool license serial number to which the nodes are reassigned.

# lic.lm events

## lic.lm.server.not.configured

### Severity

ALERT

### Description

This message occurs when ONTAP® software is running in the capacity pools licensing model and there is no License Manager configuration available. Without the License Manager configuration, the system cannot create or expand an aggregate.

### Corrective Action

Find the IP address of the ONTAP Select Deploy instance from which this ONTAP system was created. Use that IP address to manually configure the License Manager by using the "system license license-manager modify -host ip\_address\_of\_license\_manager" command. Verify that the correct License Manager is configured by using the "system license license-manger show" command. Use the "system license license-manager check" command to determine whether the License Manager is accessible. These commands are accessible through diagnostic privileges.

### Syslog Message

"License Manager has not been configured for capacity pools."

### Parameters

(None).

# license events

## license.capac events

### license.capac.enforce

#### Severity

ALERT

#### Description

This message occurs when the total storage capacity of all disks currently assigned to your system exceeds the limits of your capacity license. The system will shut down within the next 72 hours.

#### Corrective Action

To avoid disruption, either contact your sales representative immediately to obtain a license with a larger maximum capacity, or reduce the storage capacity of the system.

#### Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB. Forced system shutdown is imminent."

#### Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**max\_capacity** (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

### license.capac.eval

#### Severity

ALERT

#### Description

This message occurs when a capacity license intended only for evaluation purposes is approaching its end date. This expiration might result in the forced shutdown of the system.

#### Corrective Action

To avoid any disruption, copy the contents of the volumes of this system to a new location. Contact your sales representative to purchase a version of the system.

#### Syslog Message

"The system have %llu GB installed. Evaluation license ends on %s."

#### Parameters

**current\_capacity** (LONGINT): Current storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

### license.capac.eval.ending

#### Severity

ERROR

## Description

This message occurs when a capacity license intended only for evaluation purposes is approaching its end date. It will soon not be possible to either create data aggregates, expand them, mirror them, or bring them online.

## Corrective Action

To avoid any disruption, copy the contents of the volumes of this system to a new location. Contact your sales representative to purchase a version of the system.

## Syslog Message

"The system is using %llu GB. Evaluation license ends on %s."

## Parameters

**current\_capacity** (LONGINT): Current storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

## license.capac.eval.enforce

### Severity

ALERT

### Description

This message occurs when the evaluation period has expired. Creating aggregates, extending them, mirroring them, and bringing them online will be prohibited. However, if the effective version of the cluster precedes the version of ONTAP® software on this node, any node with this condition might shut down within the next 72 hours.

### Corrective Action

To avoid any disruption, move or copy volumes as needed from this system. Contact your sales representative immediately to purchase a version of this system.

### Syslog Message

"Evaluation version of capacity license expired. Capacity at %llu GB. Certain aggregate operations are not allowed after %s."

### Parameters

**current\_capacity** (LONGINT): Current storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

## license.capac.eval.shutdown

### Severity

EMERGENCY

### Description

This message occurs when the evaluation period has expired. The system will be shut down within the next 10 minutes.

### Corrective Action

Contact your sales representative immediately to purchase a version of this system. Restart the system as needed to move or copy volumes.

## Syslog Message

"Storage capacity is at %llu GB. Evaluation license ends on %s. Forced system shutdown is imminent."

## Parameters

**current\_capacity** (LONGINT): Current storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

## license.capac.invalidated

### Severity

ERROR

### Description

This message occurs when the system determines that its existing capacity license does not cover its current used capacity during an attempted upgrade. To allow the upgrade to proceed, the system has deleted the license.

### Corrective Action

Either delete enough data aggregates to bring the system into compliance with the existing capacity license, or contact your sales representative immediately to obtain a new license with a sufficient capacity value. In either case, apply the license after the upgrade is successfully completed.

## Syslog Message

"Storage capacity now %llu GB, max allowed is %llu GB. Capacity license removed for upgrade."

## Parameters

**current\_capacity** (LONGINT): Current capacity of the system, in gigabytes.

**max\_capacity** (LONGINT): Maximum usable storage capacity supported under the current license, in gigabytes.

## license.capac.promo.failed

### Severity

ERROR

### Description

This message occurs when an evaluation version of ONTAP® Select has failed to be promoted to production.

### Corrective Action

Remove the license used during promotion by using the "system license clean-up -unused true" command, and then retry promotion.

## Syslog Message

"ONTAP Select promotion from evaluation to production was unsuccessful. Failure reason: %s."

## Parameters

**reason** (STRING): Reason for promotion failure.

## license.capac.promo.incomp

### Severity

ALERT

### Description

This message occurs when an evaluation version of ONTAP® Select has fails to automatically reboot to complete promotion.

### Corrective Action

Manually reboot the node to complete the evaluation to production promotion process.

### Syslog Message

"ONTAP Select promotion from evaluation to production failed to automatically reboot node to complete promotion. Node will use license (serial number: %s) after the node is manually rebooted."

### Parameters

**license\_serial\_number** (STRING): License serial number of the license intended to be used by the node after promotion.

## license.capac.promo.partial

### Severity

ALERT

### Description

This message occurs when an evaluation version of ONTAP® Select has partially completed the promotion process.

### Corrective Action

Manually reboot the node to complete the evaluation to production promotion process.

### Syslog Message

"ONTAP Select promotion from evaluation to production is incomplete. Node will use license (serial number: %s) after the node reboots."

### Parameters

**license\_serial\_number** (STRING): License serial number of the license intended to be used by the node after promotion.

## license.capac.promoted

### Severity

NOTICE

### Description

This message occurs when an evaluation version of ONTAP® Select has been successfully promoted to production.

### Corrective Action

(None).

## Syslog Message

"ONTAP Select promotion from evaluation to production was successful with a license (serial number: %s)"

## Parameters

**license\_serial\_number** (STRING): License serial number being used by the promoted node.

## license.capac.shutdown

### Severity

EMERGENCY

### Description

This message occurs when the total storage capacity of all disks currently assigned to your system has exceeded the limits of your capacity license. The system will shut down within the next 10 minutes.

### Corrective Action

Contact your sales representative immediately to obtain your capacity license. Restart the system as needed to complete the license installation.

## Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB. Forced system shutdown is imminent."

## Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**max\_capacity** (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

## license.capac.unl.ending

### Severity

ERROR

### Description

This message occurs when a valid capacity license has not been installed. As a result, data aggregates cannot be created, expanded, mirrored, or brought online.

### Corrective Action

Contact your sales representative immediately to obtain your capacity license, to avoid any disruption.

## Syslog Message

"Now using %llu GB of storage capacity. Certain aggregate operations are prohibited after %s. The grace period for installing a valid capacity license is ending soon."

## Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**end\_date** (STRING): Date by which a valid license must be installed.

## license.capac.unl.enforce

### Severity

ALERT

## Description

This message occurs when a valid capacity license has not been installed. The system will not permit the creation, expansion, or mirroring of aggregates, or bringing aggregates online. However, if the effective version of the cluster precedes the version of ONTAP® on this node, any node with this condition may forcibly shut down.

## Corrective Action

Contact your sales representative immediately to obtain your capacity license, to avoid any disruption.

## Syslog Message

"The grace period for installing a valid capacity license has ended. Storage capacity is at %llu GB. Certain aggregate operations are prohibited as of %s."

## Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

## license.capac.unl.shutdown

### Severity

EMERGENCY

### Description

This message occurs when a valid capacity license has not been installed. The system will shut down within the next 10 minutes.

### Corrective Action

Contact your sales representative immediately to obtain your capacity license. Restart the system as needed to complete the license installation.

### Syslog Message

"Storage capacity is at %llu GB. License ends on %s. Forced system shutdown is imminent."

### Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**end\_date** (STRING): Evaluation period end date.

## license.capac.unlicensed

### Severity

ALERT

### Description

This message occurs when the system first detects that a valid capacity license has not been installed. As a result, data aggregates can be created, expanded, mirrored, and brought online only during the initial grace period. However, if the effective version of the cluster precedes the version of ONTAP® on this node, any node with this condition may be forcibly shut down after this grace period.

### Corrective Action

To avoid any disruption, contact your sales representative immediately to obtain your capacity license.

## Syslog Message

"No capacity license for system with %llu GB used. Certain aggregate operations are prohibited after %s."

## Parameters

**current\_capacity** (LONGINT): Current storage capacity of the system, in gigabytes.

**end\_date** (STRING): Unlicensed grace period end date.

## license.capac.valid

### Severity

NOTICE

### Description

This message occurs when a valid capacity license has been installed on your system.

### Corrective Action

(None).

## Syslog Message

"Capacity license allows %llu GB, you have %llu GB installed."

## Parameters

**max\_capacity** (LONGINT): Maximum storage capacity allowed under current license, in gigabytes.

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

## license.capac.warning

### Severity

NOTICE

### Description

This message occurs when the total storage capacity of all disks currently assigned to your system is in danger of exceeding the limits of your current license. Exceeding this capacity limit might result in the forced shutdown of the system.

### Corrective Action

To avoid disruption, either contact your sales representative immediately to obtain a license with a larger maximum capacity, or reduce the storage capacity of the system.

## Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB."

## Parameters

**current\_capacity** (LONGINT): Currently used storage capacity of the system, in gigabytes.

**max\_capacity** (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

## license.cappool events

## license.cappool.aggr.noncomp

### Severity

ALERT

### Description

This message occurs when an aggregate does not comply with the current Capacity Pool entitlement, as determined by the Licensing Manager. In an HA configuration, noncompliant aggregates are prevented from being sent home during an HA takeover/giveback situation. In a non-HA configuration, these aggregates cannot be brought online if they are already offline.

### Corrective Action

Use the "system license license-manager check" command to determine whether the License Manager is accessible. Use the "system license show-aggregates -compliant false" command to find all aggregates that do not comply. From the web interface of the ONTAP® Select Deploy® instance, check the Capacity Pool licensing status, and ensure that sufficient capacity remains within the capacity pool used by this instance of ONTAP. If the capacity is insufficient, reduce the usage by instances of ONTAP that use the pool (for example, by deleting aggregates). If no reduction is possible, Contact NetApp technical support..

### Syslog Message

Aggregate %s (UUID: %s) is not compliant with current Capacity Pool entitlement.

### Parameters

**aggr\_name** (STRING): Name of the aggregate.

**aggr\_uuid** (STRING): UUID of the aggregate.

## license.cert events

### license.cert.expired

#### Severity

ALERT

#### Description

This message occurs when the license validation certificate is expired. No new license can be validated.

#### Corrective Action

Contact your sales representative or reseller about renewing your license validation certificate.

#### Syslog Message

No new license can be validated. Certificate expired on %s.

#### Parameters

**exp\_date** (STRING): Expiration date.

### license.cert.expired.check

#### Severity

NOTICE

## Description

This message occurs when the license validation certificate is near its expiration date. After the certificate expires, no new license can be validated.

## Corrective Action

Contact your sales representative or reseller about renewing your license validation certificate.

## Syslog Message

Certificate to validate licenses will expire on %s.

## Parameters

**exp\_date** (STRING): Expiration date.

# license.check events

## license.check.expired

### Severity

ERROR

### Description

This message occurs when the license checker determines that the Base license has expired. If this is the case, you cannot add nodes to the cluster

### Corrective Action

Install a permanent Base license on this cluster.

### Syslog Message

License Checking: Expired Base license (%s)

### Parameters

**error** (STRING): Interpreted error string from the license validation check.

## license.check.failed

### Severity

ERROR

### Description

This message occurs when the license checker has run and has been unable to validate the Base license due to an internal error. If there is not a valid Base license, then no additional nodes can be added to the cluster.

### Corrective Action

Install a valid Base license on this cluster.

### Syslog Message

License Checking: internal error validating Base license (%s)

**Parameters**

**error** (STRING): Interpreted error string from the license validation check.

**license.check.invalid****Severity**

ERROR

**Description**

This message occurs when the license checker determines that the Base license is incorrect in some way. If Base license is invalid, you cannot add nodes to the cluster.

**Corrective Action**

Install a valid Base license on this cluster.

**Syslog Message**

License Checking: The Base license is invalid (%s)

**Parameters**

**error** (STRING): Interpreted error string from the license validation check.

**license.check.mirror****Severity**

ERROR

**Description**

This message occurs when the license checker has run and has determined that at least one volume is being mirrored but there isn't a valid Mirror license installed.

**Corrective Action**

Install a valid Mirror license on this cluster.

**Syslog Message**

License Checking: Mirror License failure: (%s)

**Parameters**

**volume** (STRING): The first volume detected that requires a Mirror license

**license.check.missing****Severity**

ERROR

**Description**

This message occurs when the license checker determines that the Base license is missing. If this is the case, you cannot add nodes to the cluster.

**Corrective Action**

Reinstall the Base license.

## Syslog Message

License Checking: Missing Base license

## Parameters

(None).

## license.check.nodes

### Severity

ERROR

### Description

This message occurs when the license checker determines that the number of nodes in the cluster exceeds the number of nodes allowed by the Base license

### Corrective Action

Install a Base license with the correct node count, or remove nodes from the cluster using the unjoin command until the number of total nodes is equal to, or less than, the specified node count limit.

## Syslog Message

License Checking: Current node count (%d) exceeds the licensed node limit (%d)

## Parameters

**nodecount** (INT): Number of nodes detected in the cluster  
**nodelimit** (INT): Number of nodes allowed by the Base license

## license.check.nonodes

### Severity

ERROR

### Description

This message occurs when the license checker determines that it cannot retrieve the number of nodes in the cluster to compare against the Base license node count. If this is the case, then you cannot add nodes to the cluster.

### Corrective Action

Re-install the Base license so that the node count is correctly reflected. If that fails to fix the problem please contact Customer Support.

## Syslog Message

License Checking: Cannot to retrieve the number of nodes in the cluster.

## Parameters

(None).

## license.check.warn.expired

### Severity

ERROR

## Description

This message occurs when the license checker determines that a license has expired.

## Corrective Action

Install a permanent license on this cluster.

## Syslog Message

The license for package "%s" expired on %s.

## Parameters

**package** (STRING): Name of the license package.

**expiration** (STRING): Expiration date.

## license.check.warn.expiring

### Severity

ERROR

### Description

This message occurs when the license checker determines that a license is within a week of its expiration date.

### Corrective Action

Install a permanent license on this cluster.

### Syslog Message

The license for package "%s" expires on %s.

### Parameters

**package** (STRING): Name of the license package.

**expiration** (STRING): Expiration date.

## license.feats.events

### license.feats.delete.failed

#### Severity

ERROR

#### Description

This message occurs when the system cannot successfully delete a license for a feature. (This message is currently used only for FlexCache® licenses.)

#### Corrective Action

The feature might be vetoing deletion for specific, valid reasons (e.g., it is still in use), or it might be in a state that is inconsistent with deletion. Examine the error condition for more information. Contact NetApp technical support.

#### Syslog Message

License for feature %s and serial %s not deleted: %s.

## Parameters

**feature** (STRING): Name of the feature.  
**serial** (STRING): Serial number associated with the license.  
**reason** (STRING): Error condition encountered.

## license.feats.deleted

### Severity

NOTICE

### Description

This message occurs when the system deletes a license for a feature. (This message is currently used only for FlexCache® licenses.)

### Corrective Action

(None).

### Syslog Message

License deleted: feature %s, serial %s.

## Parameters

**feature** (STRING): Name of the feature.  
**serial** (STRING): Serial number associated with the license.

## license.feats.install.failed

### Severity

ERROR

### Description

This message occurs when the system cannot successfully install a license for a feature. (This message is currently used only for FlexCache® licenses.)

### Corrective Action

Check whether the feature is supported by the target instance of ONTAP® software. Check whether the target instance supports the change in the entitlements as specified by the license. Contact NetApp technical support.

### Syslog Message

License for feature %s and serial %s not installed: %s.

## Parameters

**feature** (STRING): Name of the feature.  
**serial** (STRING): Serial number associated with the license.  
**reason** (STRING): Error condition encountered.

## license.feats.installed

### Severity

NOTICE

## Description

This message occurs when the system successfully installs a license for a feature. (This message is currently used only for FlexCache® licenses.)

## Corrective Action

(None).

## Syslog Message

License installed for feature %s: serial: %s, %s.

## Parameters

**feature** (STRING): Name of the feature.

**serial** (STRING): Serial number associated with the license.

**attrs** (STRING): Attributes of interest for this license, listed as a colon-separated key-value pairs.

# license.fpool events

## license.fpool.changed

### Severity

NOTICE

### Description

This message occurs when the maximum storage capacity limit for FabricPool is changed.

### Corrective Action

(None).

### Syslog Message

"FabricPool entitlement: maximum capacity limit now allows %u TB."

### Parameters

**max\_capacity** (LONGINT): Current maximum limit supported under the current entitlement, in TB.

## license.fpool.denied

### Severity

NOTICE

### Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied by FabricPool.

### Corrective Action

(None).

### Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u from %u TB."

## Parameters

**requested\_max\_capacity** (LONGINT): Requested maximum capacity supported, in TB.  
**current\_max\_capacity** (LONGINT): Current maximum capacity limit supported under the current entitlement, in TB.

## license.fpool.no.cloud

### Severity

NOTICE

### Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied, because there is no support for licensing FabricPool directly on instances of Cloud ONTAP(tm).

### Corrective Action

(None).

### Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB - licensing FabricPool directly on instances of Cloud ONTAP not supported."

## Parameters

**requested\_max\_capacity** (LONGINT): Requested maximum capacity supported, in TB.

## license.fpool.removed

### Severity

NOTICE

### Description

This message occurs when the license for FabricPool usage is deleted.

### Corrective Action

(None).

### Syslog Message

"FabricPool entitlement deleted."

## Parameters

(None).

## license.fpool.unsupported

### Severity

NOTICE

### Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied, because FabricPool is not supported on this instance of ONTAP(tm).

## Corrective Action

(None).

## Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB - feature is not supported."

## Parameters

**requested\_max\_capacity** (LONGINT): Requested maximum capacity supported, in TB.

## license.fpool.wrong.cluster

### Severity

ERROR

### Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is rejected. The license used in the attempt contains an incompatible cluster ID.

### Corrective Action

Determine the ID of the cluster by using the "cluster identity show" command. Within the license itself, determine the value of the "HostID" field. If the field exists, compare its value to the cluster ID. Confirm that these values match. If not, then the cluster is not the intended target of this license. Apply the license to the correct cluster if possible. For all other scenarios, contact NetApp technical support.

## Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB; license applies to cluster with ID %s."

## Parameters

**requested\_max\_capacity** (LONGINT): Requested maximum capacity supported, in TB.

**cluster\_ID** (STRING): Cluster ID as specified in license.

## license.ontapi events

### license.ontapi.eval

### Severity

NOTICE

### Description

This message occurs when ONTAPI enablement evaluation license is installed successfully.

### Corrective Action

Contact your sales representative to get a license if you wish to continue using ONTAPI past this expiration date.

## Syslog Message

ONTAPI enablement evaluation license installed. Expiration: "%s".

## Parameters

**expiration\_date** (STRING): Expiration date of ONTAPI enablement evaluation license.

## license.ontapi.valid

### Severity

NOTICE

### Description

This message occurs when a valid ONTAPI enablement license has been installed on your system.

### Corrective Action

(None).

### Syslog Message

ONTAPI enablement license installed. Expiration: "%s".

## Parameters

**expiration\_date** (STRING): Expiration date of ONTAPI enablement license.

## license.pool events

### license.pool.sfo.gb.veto

### Severity

ERROR

### Description

This message occurs when a storage failover giveback is vetoed because the aggregate has no valid capacity lease from the capacity pool. This might be because the capacity pool license has expired, because there is not sufficient capacity in the pool, or because the License Manager is not accessible.

### Corrective Action

If the node could not check the compliance status of an aggregate, check that the License Manager is accessible by using the "system license license-manager check" command. If the License Manager is not accessible, verify that it is up and running in ONTAP Select Deploy, and that there are no network connectivity issues. If an aggregate has been found to be out of compliance, verify on ONTAP Select Deploy that the capacity pool license has not expired, and that there is enough capacity remaining for the aggregate. For all other reasons, Contact NetApp technical support.

### Syslog Message

SFO giveback vetoed. %s.

## Parameters

**reason** (STRING): Explanation for the veto.

## license.sfo events

## license.sfo.gb.veto

### Severity

ERROR

### Description

This message occurs when a storage failover giveback is vetoed because a select capacity license has not been installed and the license installation grace period has ended.

### Corrective Action

Install a valid select capacity license, and then reissue the "storage failover giveback" command. Use the "system license show-status" command to determine which node is missing the capacity license.

### Syslog Message

SFO giveback vetoed. Missing select capacity license.

### Parameters

(None).

## license.sfo.gb.veto.eval

### Severity

ERROR

### Description

This message occurs when a storage failover giveback is vetoed because the evaluation period for the ONTAP® instance has ended.

### Corrective Action

Contact your sales representative for further assistance.

### Syslog Message

SFO giveback vetoed. Evaluation period ended.

### Parameters

(None).

## license.subscription.events

### license.subscription.enforcement

### Severity

EMERGENCY

### Description

This message occurs when your Cloud ONTAP® license subscription has expired but may still be renewed.

### Corrective Action

Contact your sales representative to have your subscription reactivated.

## Syslog Message

%s

## Parameters

**expiration\_msg** (STRING): Expiration message.

## license.subscription.reminder

### Severity

NOTICE

### Description

This message occurs when your Cloud ONTAP® license subscription is going to expire soon.

### Corrective Action

Contact your sales representative to renew your subscription as soon as possible.

## Syslog Message

%s

## Parameters

**reminder\_msg** (STRING): Reminder message.

## license.subscription.warning

### Severity

ALERT

### Description

This message occurs when your Cloud ONTAP® license subscription is nearly expired.

### Corrective Action

Contact your sales representative to renew your subscription immediately, to avoid any disruption.

## Syslog Message

%s

## Parameters

**warning\_msg** (STRING): Warning message.

## license.term events

### license.term.enforcement

#### Severity

ALERT

#### Description

This message occurs when your feature license has expired. The feature might no longer function.

**Corrective Action**

Contact your sales representative to have your feature license reactivated.

**Syslog Message**

%s

**Parameters**

**enforcement\_msg** (STRING): Enforcement message.

**license.term.reminder****Severity**

NOTICE

**Description**

This message occurs when your feature license is going to expire soon.

**Corrective Action**

Contact your sales representative to renew your feature license as soon as possible.

**Syslog Message**

%s

**Parameters**

**reminder\_msg** (STRING): Reminder message.

**license.term.warning****Severity**

ERROR

**Description**

This message occurs when your feature license has expired. The feature might stop working soon.

**Corrective Action**

Contact your sales representative to renew your feature license immediately to avoid any disruption.

**Syslog Message**

%s

**Parameters**

**warning\_msg** (STRING): Warning message.

# lifp events

## lifp.net events

### lifp.net.bdmismatch

#### Severity

ERROR

#### Description

This message occurs while assigning network ports to broadcast domains, when LIF Placement subnet discovery finds a port that is assigned to a broadcast domain that is different from the broadcast domain to which other ports in the same physical broadcast domain are assigned.

#### Corrective Action

Ports assigned to broadcast-domains need to be corrected by the admin. The ports in one physical broadcast domain must be assigned to a single broadcast-domain.

#### Syslog Message

In IPspace %s, other ports in the same physical broadcast domain are assigned to broadcast-domain %s but %s is assigned to broadcast-domain %s.

#### Parameters

**ipspacename** (STRING): IPspace name.

**broadcastdomainOnOtherPorts** (STRING): Broadcast-domain name.

**port** (STRING): Port name.

**broadcastdomainOnCurrentPort** (STRING): Broadcast-domain name.

# Ildp events

## Ildp.receive events

### Ildp.receive.maximum.entries

#### Severity

NOTICE

#### Description

This message occurs when the LLDP (Link Layer Discovery Protocol) daemon running on the storage controller receives more unique neighbor advertisements than it can cache. The storage controller can cache 64 unique entries and accommodates new entries after that by removing the oldest entries first. This event is typically observed when connected to Ethernet networks that do not support LLDP broadcasts.

#### Corrective Action

If the storage system is connected to an Ethernet network that is forwarding LLDP advertisements, disable LLDP on the storage system or disable forwarding LLDP advertisements on the switch.

#### Syslog Message

LLDP maximum entries exceeded, oldest record replaced by new record received on port %s.

#### Parameters

**port\_name** (STRING): The network port that received the LLDP advertisement.

# Imgr events

## Imgr.aggr events

### Imgr.aggr.CA.locks.dropped

#### Severity

EMERGENCY

#### Description

This message occurs when locks established through CIFS Continuously Available (CA) shares on an aggregate are dropped after takeover, giveback, or aggregate relocation. This causes clients to see a service disruption on the aggregate.

#### Corrective Action

Confirm that the aggregate is online by using the 'aggr show -aggregate [name of the aggregate] -fields state' command. Then reopen files to reestablish CA locks. For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "Imgr.aggr.CA.locks.dropped" keyword.

#### Syslog Message

Continuously Available (CA) locks were dropped on aggregate %s because %s.

#### Parameters

**aggregate** (STRING): Name of the aggregate where CA locks were dropped.

**reason** (STRING): Reason for dropping CA locks, such as "remote lock synchronization is in progress".

## Imgr.badstructure events

### Imgr.badStructure.found

#### Severity

ERROR

#### Description

This event is issued whenever the multi-protocol lock manager finds a bad file pointer and turns off the logging of lock manipulation to preserve trace information. This information can be of use during core analysis.

#### Corrective Action

(None).

#### Syslog Message

bad file pointer found, preserving trace information

#### Parameters

(None).

# Imgr.ca events

## Imgr.CA.recons.mcc.veto

### Severity

ALERT

### Description

This message occurs when the system vetoes MetroCluster(tm) switchback or negotiated switchover because one of the volumes affected by the switch has CIFS Continuously Available (CA) locks that are still being reconstructed.

### Corrective Action

Retry the switchback or negotiated switchover after verifying that lock reconstruction is complete by using the 'debug locks reconstruction show' diagnostic privilege command.

### Syslog Message

Vetoed MetroCluster switchback or negotiated switchover because CA lock reconstruction is in progress.

### Parameters

(None).

# Imgr.cb events

## Imgr.cb.waiting.limit.hit

### Severity

ERROR

### Description

This message occurs when a lock manager waiting lock callback object cannot be allocated due to reaching the limit for waiting lock callback objects in the associated pool. It is possible there are too many clients holding locks on files where other clients want locks. Clients will have problems accessing or locking files through NAS protocols while at or above the waiting lock callback object limit.

### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

### Syslog Message

The number of waiting callback objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u locks %u/%u owners %u/%u

### Parameters

**cb\_waiting\_total** (INT): Number of allocated waiting callback objects in the pool.  
**cb\_waiting\_limit** (INT): Allocated callback waiting objects limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.

**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

## Imgr.delegations events

### Imgr.delegations.limit.hit

#### Severity

ERROR

#### Description

This message occurs when a lock manager WAN FlexCache® delegation object cannot be allocated due to reaching the limit for WAN FlexCache delegation objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols using a FlexCache over a WAN to an origin volume on the node generating this message while at or above the WAN FlexCache delegation object limit.

#### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

#### Syslog Message

The number of WAN FlexCache delegation objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u locks %u/%u owners %u/%u

#### Parameters

**delegations\_total** (INT): Number of allocated WAN FlexCache delegation objects in the pool.  
**delegations\_limit** (INT): Allocated WAN FlexCache delegation objects limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

# Imgr.files events

## Imgr.files.limit.hit

### Severity

ERROR

### Description

This message occurs when a lock manager file object cannot be allocated due to reaching the limit for file objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the file object limit.

### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

### Syslog Message

The number of file objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: hosts %u/%u locks %u/%u owners %u/%u.

### Parameters

**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

# Imgr.gb events

## Imgr.gb.CA.locks.lost

### Severity

NOTICE

### Description

This message occurs when giveback veto is overridden. Locks established through CIFS continuously available (CA) shares on the aggregate being given back are dropped because the giveback occurs before lock sync completion.

### Corrective Action

(None).

## Syslog Message

Dropping partner aggregate locks during lock sync on aggregate %s.

## Parameters

**aggr** (STRING): Name of the aggregate for which CA locks are lost.

## Imgr.gb.CA.locks.may.lost

### Severity

ALERT

### Description

This message occurs when giveback veto is overridden. Locks established using CIFS continuously available (CA) shares on the aggregate being given back might be dropped, because giveback commit occurs simultaneously with lock sync completion.

### Corrective Action

(None).

## Syslog Message

Continuously Available (CA) locks may be lost on aggregate %s due to forced giveback commit occurring simultaneously with lock sync completion.

## Parameters

**aggr** (STRING): Name of the aggregate for which CA locks might be lost.

## Imgr.hostfile events

### Imgr.hostfile.cleared

### Severity

INFORMATIONAL

### Description

This message occurs when the volume lock manager hosts file is unusable. In such cases, the hosts files are cleared and reinitialized.

### Corrective Action

None.

## Syslog Message

Clearing lock manager file %s on volume %s due to error: %s.

## Parameters

**file\_name** (STRING): Name of the file that is being cleared.

**vol** (STRING): Name of the volume.

**error** (STRING): Error code.

## Imgr.hostfile.create.abort

### Severity

ERROR

### Description

This message occurs when the volume lock manager fails to create the hosts file.

### Corrective Action

None.

### Syslog Message

Creating lock manager file %s on volume %s failed due to error: %s.

### Parameters

**aggr** (STRING): The name of the volume.

**file\_name** (STRING): The name of the file that was being cleared.

**error** (STRING): Error code.

## Imgr.hostfile.init.failed

### Severity

ERROR

### Description

This message occurs when the volume lock manager hosts file initialization fails.

### Corrective Action

None.

### Syslog Message

Initializing lock manager file %s on volume %s failed due to error: %s.

### Parameters

**aggr** (STRING): The name of the volume.

**file\_name** (STRING): The name of the file that is being initialized.

**error** (STRING): Error code.

## Imgr.hosts events

### Imgr.hosts.limit.hit

#### Severity

ERROR

#### Description

This message occurs when a lock manager host object cannot be allocated due to reaching the limit for host objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the host object limit.

## Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

## Syslog Message

The number of host objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u locks %u/%u owners %u/%u.

## Parameters

**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

# Imgr.lock events

## Imgr.lock.reclaim.aborted

### Severity

ERROR

### Description

This message occurs when the system aborts the volume lock reclaim process. A volume attempts to reclaim file locks when you bring the volume online after a reboot or after a takeover or giveback event. This error is usually caused by the volumes going offline during the initialization process.

### Corrective Action

None;When the volumes come back online the reclaim process will be restarted.

### Syslog Message

Aborting Lock manager grace period initialization on volume %s due to error: %s.

### Parameters

**aggr** (STRING): The name of the aggregate.  
**error** (STRING): Error code.

## Imgr.lock.type.counts

### Severity

NOTICE

## Description

This message provides additional information about the current count of lock manager objects when a lock manager pool limit is reached. The combination of the counts from a message indicating a limit has been reached and this message provide context for investigating and resolving the limit issues.

## Corrective Action

(None).

## Syslog Message

The number of lock manager object types in pool %s are: share locks %u byte locks %u waiting locks %u callback waiting %u pfs (clustered Data ONTAP FlexCache delegations) %u cached locks %u WAN FlexCache delegations %u

## Parameters

**pool\_name** (STRING): Name of the limit pool.

**share** (INT): Number of allocated share locks in the pool.

**byte** (INT): Number of allocated byte locks in the pool.

**waiting** (INT): Number of allocated waiting locks in the pool.

**cb\_waiting** (INT): Number of allocated cb\_waiting locks in the pool.

**pfs** (INT): Number of allocated clustered Data ONTAP® FlexCache® delegations in the pool.

**cached** (INT): Number of allocated clustered Data ONTAP FlexCache cached locks in the pool.

**delegations** (INT): Number of allocated WAN FlexCache delegations in the pool.

# Imgr.locks events

## Imgr.locks.limit.hit

### Severity

ERROR

### Description

This message occurs when a lock manager lock object cannot be allocated due to reaching the limit for lock objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the lock object limit.

### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

### Syslog Message

The number of lock objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u owners %u/%u.

### Parameters

**locks\_total** (INT): Number of allocated locks in the pool.

**locks\_limit** (INT): Allocated locks limit for the pool.

**pool\_name** (STRING): Name of the limit pool.

**files\_total** (INT): Number of allocated files in the pool.

**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

## **Imgr.locks.sync.complete**

### **Severity**

NOTICE

### **Description**

This message occurs when synchronization of client file locks ("locks sync") with the partner node completes over the aggregates noted in the previous "Imgr.locks.sync.start" message. Lock sync occurs for locks that were established using CIFS continuously available (CA) shares.

### **Corrective Action**

(None).

### **Syslog Message**

Lock sync completed on %s.

### **Parameters**

**aggr** (STRING): Lock sync occurs in two cases: 1. Aggregate relocation 2. Giveback In the case of aggregate relocation, the aggregate name is provided. In the case of giveback, "aggr" indicates that lock sync is occurring over all aggregates on the node.

## **Imgr.locks.sync.start**

### **Severity**

NOTICE

### **Description**

This message occurs when synchronization of client file locks ("locks sync") with the partner node starts over one or more aggregates. Lock sync occurs for locks that were established using CIFS continuously available (CA) shares.

### **Corrective Action**

(None).

### **Syslog Message**

Lock sync started on %s.

### **Parameters**

**aggr** (STRING): Lock sync occurs in two cases: 1. Aggregate relocation 2. Giveback In the case of aggregate relocation, the aggregate name is provided. In the case of giveback, "aggr" indicates that lock sync is occurring over all aggregates on the node.

## **Imgr.locks.threshold.hit**

## Severity

ERROR

## Description

This message occurs when lock manager lock object has reached the threshold limit for lock objects in the associated pool. The system might become overloaded. Clients will have problems accessing files through NAS protocols while at or above the lock object limit.

## Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

## Syslog Message

The current number of lock objects %u, with maximum limit of %u has reached the threshold limit percentage of %u for pool "%s". The current number/limit of other lock manager objects are: files %u/%u, hosts %u/%u and owners %u/%u.

## Parameters

**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.  
**threshold\_percentage** (INT): Threshold locks limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.

# Imgr.lockstate events

## Imgr.lockstate.cleanup.fail

### Severity

ERROR

### Description

This message occurs when the system cannot clean up the lock state associated with the active file system. The stale lock state can lead to problems accessing files through NAS protocols.

### Corrective Action

Contact NetApp technical support for assistance.

### Syslog Message

Lock state cleanup failed for '%s' during '%s' on volume '%s%s%s' (DSID %llu) with error %d.

## Parameters

**lock\_type** (STRING): Type of locks being cleaned up.  
**cleanup\_reason** (STRING): Reason to clean up locks.  
**vol** (STRING): Name of the volume.  
**app** (STRING): Application UUID.  
**volident** (STRING): Unique identifier for the volume.  
**volDsid** (LONGINT): Data set identifier (DSID) of the volume.  
**code** (INT): Error code returned while trying to clean up lock state.

# Imgr.mcc events

## Imgr.mcc.oplock.recall.fail

### Severity

ERROR

### Description

This message occurs when the system vetoes MetroCluster™ switchback or negotiated switchover because CIFS oplock recall fails. Some oplocks could not be recalled because of CPU overload, slow CIFS client response, or a large number of open files.

### Corrective Action

Recall oplocks for Vservers participating in negotiated switchover or switchback operations by using the command 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' for volumes or qtrees with oplocks enabled. Then retry the MetroCluster operation, and reenable oplocks after the operation is complete. If the error persists, then contact NetApp technical support for assistance.

### Syslog Message

Vetoed MetroCluster switchback or negotiated switchover because CIFS oplock recall failed with internal error (%d).

### Parameters

**error** (INT): Error number.

# Imgr.meta events

## Imgr.meta.corrupted

### Severity

ERROR

### Description

This event occurs when the system detects that the lock manager host metafile is corrupted.

### Corrective Action

It is possible that the corruption affected other parts of the file system. Run wafliron on the volume to verify file system consistency.

## Syslog Message

Corrupted lock state file in volume %s: reinitializing.

## Parameters

**path** (STRING): Volume name.

# Imgr.mismatch events

## Imgr.mismatch.file.objects

### Severity

NOTICE

### Description

This message occurs when the current file object of a lock does not match the file object found through the file handle. This might be caused by a SnapMirror® promote operation where the Master Data Set ID (MSID) is remapped.

### Corrective Action

None.

### Syslog Message

(None).

### Parameters

**volume** (STRING): Name of the volume, based on the file handle.

**lockid** (STRING): Lock Universal Unique Identifier (UUID) of the sharelock.

**caller** (STRING): WAFL® spinnp operation that encountered this event.

# Imgr.move events

## Imgr.move.dump.lock.counts

### Severity

NOTICE

### Description

This message occurs when a volume move operation fails the cutover phase, due to volume quiesce timer expiration, and not all locks were transferred before the failure.

### Corrective Action

Run the "vserver locks show -vserver <vserver> -volume <volume>" command to check the locks and the client IP addresses they are associated with. For NFS v4 locks, run instead the "vserver locks nfsv4 show -fields client-name" command in all nodes to get the same information. Reduce locks so that the number of locks remaining in this volume is fewer than the number scanned, and then attempt the volume move cutover again.

### Syslog Message

The volume move of volume with DSID %llu did not cut over due to volume quiesce timer expiration. The volume move has scanned %d out of %d locks in the volume.

## Parameters

**volDsid** (LONGINT): Data set identifier (DSID) of the volume.

**scanned\_locks** (INT): Number of locks in the volume that were scanned before the failure.

**total\_locks** (INT): Total number of locks in the volume.

# Imgr.notify events

## Imgr.notify.host.skip.write

### Severity

INFORMATIONAL

### Description

This message occurs when the volume lock manager cannot write to the notify hosts file due to an error, for example, insufficient space. In such cases, writing to the notify hosts file is skipped.

### Corrective Action

(None).

### Syslog Message

Skipped writing to notify hosts file %s on volume %s due to error: %s.

## Parameters

**file\_name** (STRING): Name of the file that writing was skipped on.

**vol** (STRING): Name of the volume.

**error** (STRING): Error code.

# Imgr.owners events

## Imgr.owners.limit.hit

### Severity

ERROR

### Description

This message occurs when a lock manager owner object cannot be allocated due to reaching the limit for owner objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the owner object limit.

### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

### Syslog Message

The number of owner objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u, locks %u/%u.

## Parameters

**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.

## Imgr.owners.threshold.hit

### Severity

ERROR

### Description

This message occurs when a lock manager owner object has reached the threshold limit for owner objects in the associated pool. The system might become overloaded. Clients will have problems accessing files through NAS protocols while at or above the owner object limit.

### Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object Imgr\_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object Imgr\_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object Imgr\_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

### Syslog Message

The current number of owner objects %u with maximum limit of %u has reached the threshold limit percentage of %u for pool "%s". The current number/limit of other lock manager objects are: files %u/%u, hosts %u/%u and locks %u/%u.

## Parameters

**owners\_total** (INT): Number of allocated owners in the pool.  
**owners\_limit** (INT): Allocated owners limit for the pool.  
**threshold\_percentage** (INT): Threshold locks limit for the pool.  
**pool\_name** (STRING): Name of the limit pool.  
**files\_total** (INT): Number of allocated files in the pool.  
**files\_limit** (INT): Allocated files limit for the pool.  
**hosts\_total** (INT): Number of allocated hosts in the pool.  
**hosts\_limit** (INT): Allocated hosts limit for the pool.  
**locks\_total** (INT): Number of allocated locks in the pool.  
**locks\_limit** (INT): Allocated locks limit for the pool.

## Imgr.partner events

### Imgr.partner.locks.outOfSync

## Severity

ERROR

## Description

This message occurs when a partner node's mirrored lock state goes out of sync with the actual lock state.

## Corrective Action

Under normal conditions, no action is necessary. There is an automatic synchronize process that will attempt to resynchronize the lock state. You can wait for this process to synchronize the lock state, or you can manually resynchronize the lock state by running the 'debug locks mirrored sync' command in diag mode, with the Vserver, volume, and file ID supplied in this message.

## Syslog Message

Mirrored lock state is out of sync for %s%s/%s (DSID %08x) for file %d Snapshot copy %d (mirroring status %d communication status %d)

## Parameters

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.

**dsid** (LONGINT): Data set identifier.

**fileid** (INT): File identifier.

**snapid** (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.

**mirroring\_status** (INT): Error status from the mirroring operation.

**csn\_status** (INT): Communication status from the mirroring operation.

## Imgr.partner.locks.resynched

## Severity

INFORMATIONAL

## Description

This message occurs when a partner node's mirrored lock state is resynchronized with the actual lock state after having been out of sync previously.

## Corrective Action

The mirrored lock state is now synchronized between the partner nodes. You can verify the mirror state of the locks by running the 'debug locks mirrored show' command in diag mode, with the Vserver, volume, and file ID supplied in this message.

## Syslog Message

Mirrored lock state is now in sync for %s/%s (DSID %08x) for file %d Snapshot copy %d.

## Parameters

**vol** (STRING): Volume name.

**volident** (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.

**dsid** (LONGINT): Data set identifier.

**fileid** (INT): File identifier.

**snapid** (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.

# Imgr.persistent events

## Imgr.persistent.open.limit.hit

### Severity

NOTICE

### Description

This message occurs when the number of persistent open lock count reaches the maximum supported limit.

### Corrective Action

Run the "vserver locks show-mirrored-open-count -detailed" command to check the persisted open lock count and try closing the unused files to bring this count down to the currently supported maximum persistent open locks.

### Syslog Message

The number of persisted open locks count %u has reached the limit %u.

### Parameters

**locks\_total** (INT): Number of persisted open locks.

**locks\_limit** (INT): Maximum supported persisted open locks.

# Imgr.precommit events

## Imgr.precommit.oplock.recall.fail

### Severity

ALERT

### Description

This message occurs when the system fails aggregate giveback or relocation because SMB oplock or NFSv4 delegation recall fails. Giveback or relocation cannot proceed until all oplocks are recalled successfully or the lock manager pre-commit phase is forced, in which case cached writes in clients might be lost.

### Corrective Action

There are two options for allowing aggregate giveback or relocation to proceed: (1) Force the sendhome pre-commit phase. For aggregate relocation, this can be done by specifying the '-override-destination-checks true' option. For giveback, this can be done by specifying the '-require-partner-waiting false' option. (2) Recall oplocks for Vservers on aggregates participating in the operation by using the 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' command for volumes or qtrees with oplocks enabled. Then retry the operation, and reenale oplocks after the operation is complete. If the error persists, contact NetApp technical support for assistance.

### Syslog Message

Aggregate "%s" failed giveback or relocation because lock manager oplock recall failed. Error: %s.

### Parameters

**aggrname** (STRING): Aggregate name.

**error** (STRING): Error details.

## Imgr.precommit.oplock.recall.forced

### Severity

NOTICE

### Description

This message occurs when the lock manager oplock recall fails during aggregate giveback or relocation, but the pre-commit phase has been forced to proceed. It is possible that cached writes in clients might have been lost as a result.

### Corrective Action

(None).

### Syslog Message

Lock manager oplock recall failed for aggregate "%s" during giveback or relocation. The failure abort was overridden. Error: %s.

### Parameters

**aggrname** (STRING): Aggregate name.

**error** (STRING): Error details.

## Imgr.precommit.oplock.recall.timeout

### Severity

ALERT

### Description

This message occurs when the lock manager oplock recall fails during aggregate giveback or relocation because the recalls could not be completed within the internal timeout window. The timeout typically can expire due to CPU overload, slow client response, or a large number of open files.

### Corrective Action

The timeout can be ignored by specifying the '-override-vetoes true' option in the giveback or relocation command.

### Syslog Message

Lock manager oplock recall failed to be completed for aggregate "%s" within %d seconds.

### Parameters

**aggrname** (STRING): Aggregate name.

**timeout** (INT): Timeout value.

## Imgr.pruning.events

### Imgr.pruning.delayed

### Severity

NOTICE

## Description

This message occurs when there is a delay in pruning and removing unused entries in the volume lock manager hosts file. The current hosts file contents remain; unused entries were not removed.

## Corrective Action

(None).

## Syslog Message

Pruning lock manager on volume %s for file %s delayed due to error: %s.

## Parameters

**volume** (STRING): Name of the volume.

**file\_name** (STRING): Name of the host file being pruned.

**error** (STRING): Error description.

# Imgr.recons events

## Imgr.recons.CA.lock.dropped

### Severity

ERROR

### Description

This message occurs when locks established through CIFS Continuously Available (CA) shares are dropped after a takeover, giveback, or aggregate relocation. This is because the multi-protocol lock manager finds bad mirrored lock state for CA locks and skips reconstructing them. This causes a client to see a service disruption on the file to which the CA locks belong.

### Corrective Action

Reopen the file to reestablish CA locks.

### Syslog Message

A Continuously Available (CA) lock for volume %s%s/%s (DSID %08x) file %d snapshot copy %d reconnect key %d is dropped because of %s.

### Parameters

**vol** (STRING): Volume name.

**app** (STRING): Application UUID.

**volident** (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.

**dsid** (LONGINT): Data set identifier.

**fileid** (INT): File identifier.

**snapid** (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.

**reconnect\_key** (INT): Open identifier to uniquely identify a durable or persistent open on a volume

**reason** (STRING): Description of the reason for dropping a CA lock.

# Imgr.sendhome events

## Imgr.sendhome.veto.bootarg.override

### Severity

NOTICE

### Description

This message occurs during an SFO aggregate giveback or relocation. It implies that the automated nondisruptive update procedure will override any veto by the lock-manager, due to the presence of a bootarg.

### Corrective Action

(None).

### Syslog Message

Because bootarg.gb.override.imgr.veto is set to true, the ANDU procedure will override any lock-manager veto regarding the giveback of the "%s" aggregate.

### Parameters

**aggregate** (STRING): Name of the aggregate.

## Imgr.session events

### Imgr.session.failed

#### Severity

INFORMATIONAL

#### Description

This event occurs when a SpinNP session has failed, which causes session-scoped (e.g. CIFS) locks on the D-blade to be dropped. Only affects locks acquired using the failed session. This will cause clients to see a service disruption until they re-connect to the server.

#### Corrective Action

None — clients will automatically try to reconnect to the server, re-locking files as necessary.

#### Syslog Message

Dropped session-scoped locks from session %s:%s:%s due to failed session.

#### Parameters

**initiator** (STRING): The blade ID of the initiator.

**uniquifier** (STRING): The session uniquifier.

**target** (STRING): The blade ID of the target.

## Imgr.sf events

### Imgr.sf.up.ready

#### Severity

NOTICE

## Description

This message occurs when the lock manager non-disruption subsystem for CIFS continuously available (CA) shares notifies the high-availability (HA) module that transition into the up state is allowed. After the lock manager has sent this notification, the HA module will allow certain failover options to proceed such as aggregate relocation and giveback.

## Corrective Action

(None).

## Syslog Message

Lock manager allowed high availability module to transition to the up state for the following reason: %s.

## Parameters

**reason** (STRING): Reason for allowing transition to occur. Valid reasons include: 1. Lock-sync complete 2. Lock-sync timed out 3. CSM Invalid 4. Partner down 5. Mirroring disabled from bootarg 6. SMB3 disabled

# Imgr.sh events

## Imgr.sh.oplock.recall.fail

### Deprecated

This EMS was replaced by the new "Imgr.precommit.oplock.recall.\*" variants below and is no longer needed.

### Severity

ALERT

### Description

This message occurs when the system vetoes aggregate giveback or relocation because CIFS oplock recall fails. Some oplocks could not be recalled because of CPU overload, slow CIFS client response, or a large number of open files. Giveback or relocation cannot proceed until all oplocks are recalled successfully or the veto is overridden, in which case cached writes in clients might be lost.

### Corrective Action

Recall oplocks for Vservers on aggregates participating in the operation by using the command 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' for volumes or qtrees with oplocks enabled. Then retry the operation, and reenable oplocks after the operation is complete. If the error persists, contact NetApp technical support for assistance.

### Syslog Message

Aggregate "%s" vetoed giveback or relocation because CIFS oplock recall failed. Internal error: %s.

### Parameters

**aggrname** (STRING): Aggregate name.

**error** (STRING): Error details.

# Imgr.vol events

## **Imgr.vol.lock.reclaim.partial**

### **Severity**

NOTICE

### **Description**

This message occurs when a volume cannot reclaim certain file locks when the system attempts to bring it online. This can occur after a reboot, a takeover, a giveback or an MCC event.

### **Corrective Action**

(None).

### **Syslog Message**

Lock reclaims for volume %s are partial due to the following error: %s.

### **Parameters**

**vol** (STRING): The name of the volume.

**error** (STRING): Error code.

# logger events

## logger.usr events

### logger.usr

#### Severity

NOTICE

#### Description

This event is issued when the user runs the 'logger' command. The parameter indicates the message that is sought to be notified and is derived from the string passed in to the logger command.

#### Corrective Action

(None).

#### Syslog Message

%s

#### Parameters

**message** (STRING): Message passed by the user to the logger command.

# login events

## login.auth events

### login.auth.loginDenied

**Severity**

NOTICE

**Description**

This event is issued when a login attempt is refused due to authentication failure.

**Corrective Action**

Use a valid username/password combination to login.

**Syslog Message**

(None).

**Parameters**

**message** (STRING): Details about the failed login attempt.

# Ism events

## Ism.merge events

### Ism.merge.alog.problem

#### Severity

NOTICE

#### Description

This message occurs when a block store encounters an error while merging an append log. Normally these merges should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

#### Corrective Action

(None).

#### Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while merging an append log: "%u : %s"

#### Parameters

**Ism\_id** (INT): LSM identifier.  
**Ism\_level** (INT): LSM level.  
**keyspace\_id** (INT): Keyspace identifier.  
**volume\_name** (STRING): Volume name.  
**error\_code** (INT): Error code.  
**error\_string** (STRING): Error string.

### Ism.merge.slog.problem

#### Severity

NOTICE

#### Description

This message occurs when a block store encounters an error while merging a sorted log. Normally these merges should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

#### Corrective Action

(None).

#### Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while merging a sorted log: "%u : %s"

#### Parameters

**Ism\_id** (INT): LSM identifier.  
**Ism\_level** (INT): LSM level.  
**keyspace\_id** (INT): Keyspace identifier.

**volume\_name** (STRING): Volume name.  
**error\_code** (INT): Error code.  
**error\_string** (STRING): Error string.

## Ism.pal events

### Ism.pal.problem

#### Severity

NOTICE

#### Description

This message occurs when a block store PAL operation encounters an error. Normally these PAL operations should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

#### Corrective Action

(None).

#### Syslog Message

Block store PAL has encountered the following error while processing operation "%s": "%u"

#### Parameters

**pal\_op** (STRING): PAL operation being done.  
**error\_code** (INT): WAFL error code.

## Ism.rangedelete events

### Ism.rangeDelete.problem

#### Severity

NOTICE

#### Description

This message occurs when a block store encounters an error while performing a range delete operation. Normally these deletes should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

#### Corrective Action

(None).

#### Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while performing a range delete operation: "%u : %s"

#### Parameters

**Ism\_id** (INT): LSM identifier.  
**Ism\_level** (INT): LSM level.  
**keyspace\_id** (INT): Keyspace identifier.  
**volume\_name** (STRING): Volume name.  
**error\_code** (INT): Error code.

**error\_string** (STRING): Error string.

# lun events

## lun.clone events

### LUN.clone.log.full

#### Severity

NOTICE

#### Description

This message occurs when lun clone creation fails because the limit on the maximum number of supported clone log entries (32705) is exceeded.

#### Corrective Action

Retry upon the completion of the pending clone operations for this volume.

#### Syslog Message

Logging the LUN clone creation has failed because the limit on the maximum number of supported clone log entries in the volume %s (DSID %llu) has been exceeded.

#### Parameters

**volume\_name** (STRING): Name of the volume for which the LUN clone creation has failed.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which the LUN clone creation has failed.

### LUN.clone.snapshot.deleted

#### Severity

NOTICE

#### Description

This message occurs when the snapshot used to clone a LUN is deleted before the completion of the cloning process. Data may be inaccessible for this LUN, depending on how much of the data was copied before the snapshot was deleted.

#### Corrective Action

The LUN should be destroyed to prevent I/O errors from occurring.

#### Syslog Message

A snapshot containing a file or LUN used to create the LUN clone %s (Inode number %d) in volume %s (DSID %llu) was deleted before the completion of the cloning process.

#### Parameters

**lun\_path** (STRING): Path for the LUN clone for which the snapshot was deleted.

**lun\_inode\_num** (INT): Inode number of the LUN clone for which the snapshot was deleted.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.copy events

## LUN.copy.dstPresent

### Severity

INFORMATIONAL

### Description

This message occurs when a LUN appears in the public namespace of the destination volume during a LUN copy operation.

### Corrective Action

(None).

### Syslog Message

LUN copy job with UUID %s created destination LUN (%s) successfully.

### Parameters

**job\_uuid** (STRING): UUID of the LUN copy job.

**dst\_path** (STRING): Destination path of the LUN copy job.

## LUN.copy.started

### Severity

INFORMATIONAL

### Description

This message occurs when a LUN copy operation is successfully started.

### Corrective Action

(None).

### Syslog Message

LUN copy started from (DSID:%llu)%s to (DSID:%llu)%s with job-uuid %s.

### Parameters

**src\_vol\_dsid** (LONGINT): Source volume Data Set ID (DSID).

**src\_lun** (STRING): Source LUN.

**dst\_vol\_dsid** (LONGINT): Destination volume Data Set ID (DSID).

**dst\_lun** (STRING): Destination LUN.

**UUID** (STRING): UUID identifying the copy operation.

# lun.create events

## LUN.create.nvfailed.volume

### Severity

ERROR

## Description

This message occurs when a LUN is created in a volume that is in the nvfailed state.

## Corrective Action

Clear the nvfailed state of the containing volume, take the appropriate nvfail recovery action to recover from the possible data loss, and bring the LUN online. Note that the actual recovery steps vary based on the application and the host.

## Syslog Message

LUN %s was created in a volume %s (DSID %llu) that is in the nvfailed state. It is offline and in the nvfailed state.

## Parameters

**lun\_path** (STRING): Path for the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

## LUN.create.resized.base

### Severity

NOTICE

### Description

This message occurs when creating a LUN from a base file causes a permanent size change to that base file.

### Corrective Action

(None).

### Syslog Message

The base file of the LUN at path %s in volume %s (DSID %llu) has been resized.

### Parameters

**lun\_path** (STRING): Path for the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

## lun.data events

### LUN.data.unavailable

#### Severity

ERROR

#### Description

This message occurs when data is unable to be read from a capacity tier.

#### Corrective Action

Troubleshoot capacity tier connectivity problems.

## Syslog Message

Unavailable error was received for the object at path %s (fileid:%u) in volume %s (DSID %llu).

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace.

**file\_id** (INT): Identifying number for the suspect inode.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.destroy events

## LUN.destroy

### Severity

NOTICE

### Description

This message occurs when a LUN is destroyed.

### Corrective Action

(None).

## Syslog Message

LUN %s, vol %s (DSID %llu) destroyed (UUID: %s).

## Parameters

**lun\_path** (STRING): Path for the LUN that was destroyed.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

**object\_uuid** (STRING): UUID of the LUN or a hyphen (-) if the UUID cannot be determined.

**object\_type** (STRING): Type of object under notification.

# lun.inaccessible events

## LUN.inaccessible.restore

### Severity

NOTICE

### Description

This message occurs when a LUN or NVMe namespace that is inaccessible due to restore is found in a volume. Such an object can contain inconsistent data and will not be accessible for I/O or management operations.

### Corrective Action

The object can be destroyed using the option force-fenced for the command 'lun destroy'. It can also be restored from a snapshot or backup.

## Syslog Message

The LUN or NVMe namespace %s in volume %s (DSID %llu) is inaccessible due to restore.

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.inconsistent events

## LUN.inconsistent.blocks

### Severity

ERROR

### Description

This message occurs when the block containing a LUN or NVMe namespace's attributes is found to be inconsistent.

### Corrective Action

Recover the LUN or NVMe namespace from a good backup. If the unrecoverable RAID is in a Snapshot(tm) copy, delete the Snapshot copy. Contact NetApp technical support for more options.

## Syslog Message

RAID error was received for the attributes of the object at path %s (fileid:%u) in volume %s (DSID %llu).

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace.

**file\_id** (INT): Identifying number for the suspect inode.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

## LUN.inconsistent.filesystem

### Severity

EMERGENCY

### Description

This message occurs when a LUN or NVMe namespace is found whose on-disk structure is inconsistent in the WAFL® file system. Such a LUN or NVMe namespace is not accessible for I/O or management operations.

### Corrective Action

Run waffliron on the containing aggregate, and then recover the LUN from a backup. Contact NetApp technical support for more options.

## Syslog Message

The on-disk structure of the object at path %s in volume %s (DSID %llu) is inconsistent in the WAFL file system.

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

# lun.inplace events

## LUN.inplace.dmpRstrLUNonNS

### Severity

ERROR

### Description

This message occurs when an in-place restore from a dump fails and creates a metadata inconsistency because the source object type does not match the existing destination object. A LUN has been restored over an existing NVMe namespace at the same path.

### Corrective Action

Unmap the NVMe namespace for which the mismatched restore has created a metadata inconsistency by using the "subsystem map remove" command. Remove the NVMe namespace for which the mismatched restore has created a metadata inconsistency by using the "force-fenced" option for the "lun delete" command. Retry the dump restore. If the original restore location was chosen in error, recover that deleted NVMe namespace.

### Syslog Message

An in-place restore from dump to an existing destination at path %s in volume %s (DSID %llu) failed due to a vdisk type mismatch.

## Parameters

**lun\_path** (STRING): Path of the existing destination for which the restore failed.  
**volume\_name** (STRING): Name of the destination volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the destination volume.

## LUN.inplace.dmpRstrNSonLUN

### Severity

ERROR

### Description

This message occurs when an in-place restore from a dump fails and creates a metadata inconsistency because the source object type does not match the existing destination object. An NVMe namespace has been restored over an existing LUN at the same path.

### Corrective Action

Unmap the LUN for which the mismatched restore has created a metadata inconsistency by using the "lun unmap" command. Remove the object for which the mismatched restore has created a metadata inconsistency by using the "force-fenced" option for the "lun delete" command. Retry the dump restore. If the original restore location was chosen in error, recover that deleted LUN.

## Syslog Message

An in-place restore from dump to an existing destination at path %s in volume %s (DSID %llu) failed due to a vdisk type mismatch.

## Parameters

**lun\_path** (STRING): Path of the existing destination for which restore failed.  
**volume\_name** (STRING): Name of the destination volume.  
**volume\_dsids** (LONGINT): Data set ID (DSID) of the destination volume.

## LUN.inplace.dumpRestoreFail

### Severity

ERROR

### Description

This message occurs when an in-place restore of a LUN from a dump fails because the source LUN is of a higher version than this Data ONTAP® release supports.

### Corrective Action

To recover the source LUN's data from the dump, first restore the LUN to a new path on the destination volume where it will be restored as a regular file with the entire source data intact. Then create a new and unmapped LUN from this file using the 'lun create -f' command. The original destination LUN is inaccessible for I/O or management operations and can be deleted using the 'force-fenced' option for the command 'lun destroy'.

## Syslog Message

An in-place restore from dump to an existing destination LUN at path %s in volume %s (DSID %llu) failed.

## Parameters

**lun\_path** (STRING): Path of the existing destination LUN for which restore failed.  
**volume\_name** (STRING): Name of the destination volume.  
**volume\_dsids** (LONGINT): Data set ID (DSID) of the destination volume.

## LUN.inplace.restore.failed

### Severity

ERROR

### Description

This message occurs when an in-place SFSR (Single File SnapRestore®) operation fails and might have left a LUN or NVMe namespace in an inconsistent state.

### Corrective Action

To recover the LUN, restore it to a new path. After the LUN is restored it needs to be mapped and hosts need to discover the new device. The LUN in the original path can be deleted.

## Syslog Message

An in-place SFSR (Single File SnapRestore®) failed at path %s in volume %s (DSID %llu) and might have left the LUN in an inconsistent state.

## Parameters

**lun\_path** (STRING): Path of the LUN or NVMe namespace for which the restore operation failed.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.metadb events

## LUN.metadb.version.mismatch

### Severity

ERROR

### Description

This message occurs when a version mismatch is detected for the metafile containing LUN metadata.

### Corrective Action

Rebuild the LUN metadata metafile for the volume by running the 'lun rescan -build-oovc' command.

### Syslog Message

A version mismatch was detected for the metafile containing LUN metadata metafile in volume %s (DSID %llu).

## Parameters

**volume\_name** (STRING): Name of the volume for which a version mismatch of the metafile containing LUN metadata was detected.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the metafile containing LUN metadata was detected.

# lun.metafile events

## lun.metafile.dirCreateFailed

### Severity

ERROR

### Description

lun metafile directory creation failed

### Corrective Action

Check available space on the volume and make sure that the volume is not full or close to full.

### Syslog Message

Couldn't create vdisk metafile directory %s.

## Parameters

**path** (STRING): path for the metafile directory that Data ONTAP failed to create

## lun.metafile.OOVC.corrupt

**Severity**

ERROR

**Description**

This message occurs when inconsistent blocks are read while reading or writing to the Out Of Volume Container (OOVC) metafile. The OOVC metafile contains certain LUN and NVMe namespace configuration and metadata for the objects in a given volume. SAN management operations might be impaired while the OOVC is in this state.

**Corrective Action**

Use the 'lun rescan -build-oovc' command to rebuild the OOVC metafiles for the affected volume.

**Syslog Message**

RAID error inconsistency was received for the OOVC metafile in volume %s (DSID %llu).

**Parameters**

**volume\_name** (STRING): Name of the volume for which the OOVC metafile was found to be inconsistent.

**volume\_dsids** (LONGINT): Data set ID (DSID) of the volume for which the OOVC metafile was found to be inconsistent.

**lun.metafile.VTOC.corrupt****Severity**

ERROR

**Description**

This message occurs when inconsistent blocks are read while reading or writing to the Vdisk Table of Contents (VTOC) metafile. The VTOC metafile contains the inventory of LUNs and NVMe namespaces in a given volume. SAN management operations might be impaired while the VTOC is in this state.

**Corrective Action**

Use the 'lun rescan -build-vtoc' command to rebuild the VTOC metafile for the affected volume.

**Syslog Message**

RAID error inconsistency was received for the VTOC metafile in volume %s (DSID %llu).

**Parameters**

**volume\_name** (STRING): Name of the volume for which the VTOC metafile was found to be inconsistent.

**volume\_dsids** (LONGINT): Data set ID (DSID) of the volume for which the VTOC metafile was found to be inconsistent.

**lun.move events****LUN.move.dstPresent****Severity**

INFORMATIONAL

**Description**

This message occurs when a LUN appears in the public namespace of the destination volume during a LUN move operation.

## Corrective Action

(None).

## Syslog Message

LUN move job with UUID %s created destination LUN (%s) successfully.

## Parameters

**job\_uuid** (STRING): UUID of the LUN move job.

**dst\_path** (STRING): Destination path of the LUN move job.

## LUN.move.started

### Severity

INFORMATIONAL

### Description

This message occurs when a LUN move operation is successfully started.

### Corrective Action

(None).

## Syslog Message

LUN move started from (DSID:%llu)%s to (DSID:%llu)%s with job-uuid %s.

## Parameters

**src\_vol\_dsid** (LONGINT): Source volume Data Set ID (DSID).

**src\_lun** (STRING): Source LUN.

**dst\_vol\_dsid** (LONGINT): Destination volume Data Set ID (DSID).

**dst\_lun** (STRING): Destination LUN.

**UUID** (STRING): UUID identifying the move operation.

## lun.no events

### LUN.no.memory.available

#### Severity

NOTICE

#### Description

This message occurs when an operation on LUNs or NVMe namespaces on the node owning the given volume fails due to the unavailability of Data ONTAP® memory.

#### Corrective Action

Retry the operation.

#### Syslog Message

An operation on LUNs or NVMe namespaces on the node owning the volume %s (DSID %llu) failed due to unavailability of Data ONTAP® memory.

## Parameters

**volume\_name** (STRING): Name of the volume for which the operation has failed.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which the operation has failed.

# lun.nvfail events

## LUN.nvfail.option.on

### Severity

NOTICE

### Description

This message occurs when the nvfail option for the named volume is turned on. The volume contains LUNs or NVMe namespaces and it is recommended that you keep this option on for such volumes.

### Corrective Action

(None).

### Syslog Message

The nvfail option for the volume %s (DSID %llu) has been turned on. The volume contains LUN or NVMe namespaces and it is recommended that this option be kept on for such volumes.

## Parameters

**volume\_name** (STRING): Name of the volume for which the nvfail option was turned on.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which the nvfail option has been turned on.

## LUN.nvfail.vol.proc.complete

### Severity

ERROR

### Description

This message occurs when an inconsistency is detected in the nvlog during boot or takeover, resulting in the initiation of nvfail processing and the LUNs in the volume being brought offline. This behavior is expected and is intended to prevent any FC/iSCSI data access to LUNs in a volume that might have lost the last few updates to the nvlog.

### Corrective Action

Verify that the LUN maps are valid. After the LUNs are mapped properly, use the 'lun online' command to bring the LUNs online to make them available to hosts. Host side recovery actions may be required to check the consistency of the data in the LUNs.

### Syslog Message

LUNs in volume %s (DSID %llu) have been brought offline because an inconsistency was detected in the nvlog during boot or takeover.

## Parameters

**volume\_name** (STRING): Name of the volume for which nvfail processing was completed.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which nvfail processing was completed.

## LUN.nvfail.vol.proc.failed

### Severity

EMERGENCY

### Description

This message occurs when nvfail processing for LUNs in a volume fails to complete. Some of the LUNs in the volume might not be offline. FC/iSCSI data access to the LUNs in the volume is prevented until the nvfail state of the volume is cleared.

### Corrective Action

For any LUNs that are offline, use the 'lun online' command to bring them online and make them available to hosts. Host side recovery actions might be required to check the consistency of the data in the LUNs.

### Syslog Message

An inconsistency was detected in the nvlog during boot or takeover, and some or all LUNs in volume %s (DSID %llu) might not have been brought offline.

### Parameters

**volume\_name** (STRING): Name of the volume for which LUN nvfail processing failed.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which LUN nvfail processing failed.

## LUN.nvfail.vol.proc.started

### Severity

ERROR

### Description

This message occurs when an inconsistency is detected in the nvlog during boot or takeover, resulting in the initiation of nvfail processing and the LUNs in the volume being brought offline. This behavior is expected and is intended to prevent any FC/iSCSI data access to LUNs in a volume that might have lost the last few updates to the nvlog.

### Corrective Action

Verify that the LUN maps are valid. After the LUNs are mapped properly, use the 'lun online' command to bring the LUNs online to make them available to hosts. Host side recovery actions may be required to check the consistency of the data in the LUNs.

### Syslog Message

LUNs in volume %s (DSID %llu) have been brought offline because an inconsistency was detected in the nvlog during boot or takeover.

### Parameters

**volume\_name** (STRING): Name of the volume for which nvfail processing was initiated.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which nvfail processing was initiated.

## lun.offline events

### LUN.offline

**Severity**

NOTICE

**Description**

This message occurs when a LUN is brought offline manually.

**Corrective Action**

(None).

**Syslog Message**

LUN %s, vol %s (DSID %llu) was brought offline (UUID: %s).

**Parameters**

**lun\_path** (STRING): Path for the LUN that was brought offline.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsids** (LONGINT): Data set ID (DSID) of the containing volume.

**object\_uuid** (STRING): UUID of the LUN.

**object\_type** (STRING): Type of object under notification.

## lun.online events

**LUN.online****Severity**

NOTICE

**Description**

This message occurs when a LUN is brought online manually.

**Corrective Action**

(None).

**Syslog Message**

LUN %s, vol %s (DSID %llu) was brought online (UUID: %s).

**Parameters**

**lun\_path** (STRING): Path for the LUN that was brought online.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsids** (LONGINT): Data set ID (DSID) of the containing volume.

**object\_uuid** (STRING): UUID of the LUN.

**object\_type** (STRING): Type of object under notification.

## lun.oovc events

**LUN.oovc.rebuild.done****Severity**

NOTICE

## Description

This message occurs when the rebuilding of the Out Of Volume Container (OOVC) file is complete.

## Corrective Action

(None).

## Syslog Message

The OOVC has been rebuilt for the volume %s (DSID %llu).

## Parameters

**volume\_name** (STRING): Name of the volume for which the OOVC file was rebuilt.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which the OOVC file was rebuilt.

## LUN.oovc.version.mismatch

### Severity

ERROR

### Description

This message occurs when a version mismatch is detected for the Out Of Volume Container (OOVC) metafile.

### Corrective Action

Rebuild the OOVC metafile for the volume by running the 'lun rescan -build-oovc' command.

### Syslog Message

A version mismatch has been detected for the OOVC metafile in volume %s (DSID %llu).

### Parameters

**volume\_name** (STRING): Name of the volume for which a version mismatch of the OOVC metafile has been detected.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the OOVC metafile has been detected.

## lun.op events

### LUN.op.nvfail.offline

#### Severity

ERROR

#### Description

This message occurs when a LUN is restored or a LUN clone is created in a volume that is currently in the nvfailed state. It can also occur if the source LUN for the operation is in the nvfailed state.

#### Corrective Action

If the containing volume is in the nvfailed state, clear the nvfailed state and bring the LUN online. Host side recovery actions might be required to check the consistency of the data in the LUN before the LUN is brought online. Note that the actual recovery steps vary based on the application and the host.

## Syslog Message

LUN %s in volume %s (DSID %llu) is offline and in the nvfailed state.

## Parameters

**lun\_path** (STRING): Path for the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsids** (LONGINT): Data set ID (DSID) of the containing volume.

# lun.out events

## LUN.out.of.space

### Severity

EMERGENCY

### Description

This message occurs when a LUN is brought offline by the SCSI layer because of a write failure due to lack of space.

### Corrective Action

Add space to the volume, and then bring the LUN online using the "lun online" command.

## Syslog Message

LUN %s, vol %s (DSID %llu) is out of space (UUID: %s).

## Parameters

**lun\_path** (STRING): Path for the LUN that was brought offline.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsids** (LONGINT): Data set ID (DSID) of the containing volume.  
**object\_uuid** (STRING): UUID of the LUN.  
**object\_type** (STRING): Type of object under notification.

# lun.outplace events

## LUN.outplace.dumpRestoreFail

### Severity

ERROR

### Description

This message occurs when an out-of-place restore of a LUN from dump fails because the source LUN is of a higher version than this Data ONTAP® release supports.

### Corrective Action

Restore creates a regular file at the destination path, with the same data as in the source LUN. To recover the source LUN's data from the dump, you can create a new and unmapped LUN from this file using the 'lun create -f' command.

## Syslog Message

An out-of-place restore of a LUN from dump for the destination path %s in volume %s (DSID %llu) failed.

## Parameters

**lun\_path** (STRING): Destination path for the failed LUN restore.  
**volume\_name** (STRING): Name of the destination volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the destination volume.

# lun.provisioning events

## LUN.provisioning.failed

### Severity

ERROR

### Description

This message occurs during the creation of a LUN or NVME namespace when the provisioning for its metadata fails due to insufficient space in the aggregate. Attempts to map or bind the object will fail until the aggregate has sufficient free space for the metadata.

### Corrective Action

Add more space to the aggregate. Use the command 'lun map' or 'lun bind' to allow provisioning of the LUN's metadata to be completed.

## Syslog Message

LUN or NVMe namespace %s in volume %s (DSID %llu) was created, but provisioning of its metadata failed due to insufficient space in the aggregate.

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace for which metadata provisioning failed.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.restore events

## LUN.restore.complete

### Severity

INFORMATIONAL

### Description

This message occurs when the SFSR (Single File SnapRestore®) for a LUN or NVMe namespace is complete.

### Corrective Action

(None).

## Syslog Message

LUN or NVMe namespace was restored at path %s in volume %s (DSID %llu).

## Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace that was restored.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

# lun.scsi events

## LUN.SCSI.reservation.removal.failed

### Severity

ALERT

### Description

This message occurs when the SCSI reservation for one or more LUNs in the secondary or primary Vserver cannot be deleted during a Vserver disaster recovery(DR) resynchronize operation. This might result in the host accessing stale SCSI reservation entries for the LUN during a subsequent Vserver DR activate operation.

### Corrective Action

Use the "lun persistent-reservation clear" command to remove the LUN's SCSI reservation.

### Syslog Message

SCSI reservation for LUN %s in volume %s (DSID %llu) could not be deleted.

## Parameters

**lun\_path** (STRING): Path for the LUN whose SCSI reservation could not be removed.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

# lun.serial events

## lun.serial.timeWentBack

### Severity

INFORMATIONAL

### Description

This event occurs when the system clock has been set back in time. It prints the current LUN serial number counter.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**counter** (LONGINT): Current value of LUN serial number counter.

# lun.space events

## LUN.space.resv.not.honored

### Severity

NOTICE

### Description

This message occurs when the space reservation settings for the named volume are not honored in its containing aggregate.

### Corrective Action

Make sure that the space guarantee settings for the volume are set to 'file' or 'volume'. If the volume guarantee is disabled, make sure that there is enough free space in the aggregate to enable the volume guarantee.

### Syslog Message

Space reservations in volume %s (DSID %llu) are not honored, either because the volume space guarantee is set to 'none' or it is disabled due to lack of space in its containing aggregate.

### Parameters

**volume\_name** (STRING): Name of the volume for which reservations are not honored.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which reservations are not honored.

# lun.transition events

## LUN.transition.fail.no.i2p

### Severity

ERROR

### Description

This message occurs when the transition of a 7-Mode LUN to clustered Data ONTAP® fails because the i2p database for the destination volume is not fully built.

### Corrective Action

Wait a few seconds and then issue the 'lun transition start' command to retry the transition of LUNs in the volume.

### Syslog Message

LUNs in volume %s (DSID %llu) could not be transitioned because the i2p database for the volume has not been fully built.

### Parameters

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

## LUN.transition.fail.no.space

**Severity**

ERROR

**Description**

This message occurs when the transition of a 7-Mode LUN to clustered Data ONTAP® fails due to lack of space in the destination volume or containing aggregate.

**Corrective Action**

Set the 'filesystem-size-fixed' option to false for the volume, add 1MB space for each LUN in the volume, and then issue the 'lun transition start' command to retry the transition.

**Syslog Message**

LUN %s in volume %s (DSID %llu) could not be transitioned due to lack of space in the volume.

**Parameters**

**lun\_path** (STRING): Path for the LUN that could not be transitioned.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

**LUN.transition.failed****Severity**

ERROR

**Description**

This message occurs when the transition of a LUN to clustered Data ONTAP® fails.

**Corrective Action**

Determine the cause of failure and the specific corrective action by looking at other events issued for LUNs. Use the "lun transition start" command to retry the transition.

**Syslog Message**

LUN %s in volume %s (DSID %llu) could not be transitioned.

**Parameters**

**lun\_path** (STRING): Path for the LUN that could not be transitioned.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

**LUN.transition.incons.attrs****Severity**

ERROR

**Description**

This message occurs when a LUN is found whose 7-Mode on-disk structure is inconsistent in the WAFL® file system. This LUN cannot be transitioned and is not accessible for management.

**Corrective Action**

If the volume was being transitioned, destroy the LUN by using the "lun transition 7-mode delete" advanced-privilege command in clustered Data ONTAP®. Issue the command "lun transition 7-mode start"

to retry transition on the volume.

### **Syslog Message**

The 7-mode on-disk structure of the LUN at path %s in volume %s (DSID %llu) is inconsistent in the WAFL file system.

### **Parameters**

**lun\_path** (STRING): Path for the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

## **LUN.transition.no.type**

### **Severity**

NOTICE

### **Description**

This message occurs when Data ONTAP® encounters a LUN that is scheduled for transition and for which the multiprotocol type of the LUN cannot be determined. Data ONTAP substitutes a default value of "linux" for the type and calculates geometry values to match.

### **Corrective Action**

(None).

### **Syslog Message**

Multiprotocol type for LUN "%s" in volume "%s" (DSID: %llu) could not be determined. Once transitioned, this LUN will be assigned the default type "linux".

### **Parameters**

**lun\_path** (STRING): Path of the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsid** (LONGINT): Data Set ID (DSID) of the containing volume.

## **LUN.transition.unsupp.clone**

### **Severity**

ERROR

### **Description**

This message occurs when transition of a LUN to clustered Data ONTAP® fails because the LUN is a Snapshot® copy-backed LUN clone. This LUN cannot be transitioned and is not accessible for management.

### **Corrective Action**

Destroy the LUN by using the "lun transition 7-mode delete" advanced-privilege command in clustered Data ONTAP. To make your original LUN a supported candidate for transition, split your Snapshot copy-backed LUN clone prior to transition.

### **Syslog Message**

LUN %s in volume %s (DSID %llu) could not be transitioned.

## Parameters

**lun\_path** (STRING): Path for the LUN that cannot be transitioned.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsids** (LONGINT): Data set ID (DSID) of the containing volume.

## LUN.transition.unsupp.geom

### Severity

NOTICE

### Description

This message occurs when Data ONTAP® encounters a 7-Mode LUN that is scheduled for transition and for which the extent size or cylinder size is absent or unsupported. Data ONTAP substitutes reasonable geometry values upon transition.

### Corrective Action

(None).

### Syslog Message

LUN "%s" in volume "%s" (DSID: %llu) has a geometry that is not supported in clustered Data ONTAP. Once transitioned, this LUN will be assigned reasonable geometry values.

## Parameters

**lun\_path** (STRING): Path of the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsids** (LONGINT): Data Set ID (DSID) of the containing volume.

## LUN.transition.unsupported.type

### Severity

NOTICE

### Description

This message occurs when Data ONTAP® encounters a 7-Mode LUN that is scheduled for transition and for which the multiprotocol type is unsupported in clustered Data ONTAP. Data ONTAP substitutes a default value of "linux" for the type upon transition and calculates geometry values to match.

### Corrective Action

(None).

### Syslog Message

LUN "%s" in volume "%s" (DSID: %llu) has a multiprotocol type that is not supported in clustered Data ONTAP. Once transitioned, this LUN will be assigned the default type of "linux".

## Parameters

**lun\_path** (STRING): Path of the LUN.  
**volume\_name** (STRING): Name of the containing volume.  
**volume\_dsids** (LONGINT): Data Set ID (DSID) of the containing volume.

# lun.vdisk events

## LUN.vdisk.cnt.exceeded

### Severity

ERROR

### Description

This message occurs when a volume contains more than the supported limit of LUNs in the volume. Performance degradation in volume management operations may occur as a result and it will not be possible to create more LUNs in this volume.

### Corrective Action

It is recommended that LUNs be moved to other volumes.

### Syslog Message

Volume %s (DSID %llu) contains more than the supported limit for LUNs (%d).

### Parameters

**volume\_name** (STRING): Name of the volume which contains more than the supported limit of LUNs.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume which contains more than the supported limit of LUNs.

**max\_create\_limit** (INT): The maximum number of LUNs that can be created in a volume.

## LUN.vdisk.prov.cnt.exceeded

### Severity

ERROR

### Description

This message occurs when provisioning of metadata for some LUNs fails because the limit for provisioning LUNs in the volume has been exceeded.

### Corrective Action

It is recommended that LUNs be moved to other volumes and then mapped using the 'lun map' command.

### Syslog Message

Provisioning of metadata for some LUNs failed because the limit on the maximum supported LUNs in the volume %s (DSID %llu) has been exceeded. These LUNs cannot be discovered by hosts and will not be accessible for I/O. Metadata cannot be provisioned for more than %d LUNs.

### Parameters

**volume\_name** (STRING): Name of the volume for which the LUN provisioning failed.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which the LUN provisioning failed.

**max\_prov\_limit** (INT): Maximum number of LUNs for which metadata can be provisioned in a volume.

# lun.vol events

## LUN.vol.no.space

### Severity

ERROR

### Description

This message occurs when an operation on a LUN or NVMe namespace fails due to insufficient space in the volume.

### Corrective Action

Add space to the volume and retry the operation.

### Syslog Message

An operation on %s in volume %s (DSID %llu) failed due to lack of space in the volume.

### Parameters

**lun\_path** (STRING): Path for the LUN or NVMe namespace.

**volume\_name** (STRING): Name of the containing volume.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the containing volume.

## LUN.vol.proc.fail.no.space

### Severity

ERROR

### Description

This message occurs when the processing for LUNs in the volume has failed due to lack of space in the volume or containing aggregate.

### Corrective Action

Check accompanying event messages to determine whether the volume or containing aggregate lacks space. Add space to the volume or aggregate containing the volume as necessary before retrying the operation. If the volume was being transitioned, issue the command 'lun transition start' to retry; otherwise issue the command 'lun rescan -sync' to complete processing of LUNs in the volume.

### Syslog Message

Processing for LUNs in volume %s (DSID %llu) failed due to lack of space.

### Parameters

**volume\_name** (STRING): Name of the volume for which the processing failed.

**volume\_dsids** (LONGINT): Data Set ID (DSID) of the volume for which the processing failed.

## lun.vtoc events

### LUN.vtoc.rebuild.done

### Severity

NOTICE

**Description**

This message occurs when the rebuilding of the Vdisk Table of Contents (VTOC) file is complete.

**Corrective Action**

(None).

**Syslog Message**

The VTOC has been rebuilt for the volume %s (DSID %llu).

**Parameters**

**volume\_name** (STRING): Name of the volume for which the VTOC file was rebuilt.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which the VTOC file was rebuilt.

**LUN.vtoc.version.mismatch****Severity**

ERROR

**Description**

This message occurs when a version mismatch is detected for the Vdisk Table of Contents (VTOC) metafile.

**Corrective Action**

Rebuild the VTOC metafile for the volume by running the 'lun rescan -build-vtoc' command.

**Syslog Message**

A version mismatch has been detected for the VTOC metafile in volume %s (DSID %llu).

**Parameters**

**volume\_name** (STRING): Name of the volume for which a version mismatch of the VTOC metafile has been detected.

**volume\_dsid** (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the VTOC metafile has been detected.

# malloc events

## malloc.failure events

### malloc.failure

**Severity**

ERROR

**Description**

This event is generated if malloc is called unsafely.

**Corrective Action**

(None).

**Syslog Message**

%s %s %s %s %s %s %s %s %s %s %s %s

**Parameters**

- f2** (STRING): Third frame of backtrace.
- f3** (STRING): Fourth frame of backtrace.
- f4** (STRING): Fifth frame of backtrace.
- f5** (STRING): Sixth frame of backtrace.
- f6** (STRING): Seventh frame of backtrace.
- f7** (STRING): Eighth frame of backtrace.
- f8** (STRING): Ninth frame of backtrace.
- f9** (STRING): Tenth frame of backtrace.
- f10** (STRING): Eleventh frame of backtrace.
- f11** (STRING): Twelfth frame of backtrace.
- f12** (STRING): Thirteenth frame of backtrace.

### malloc.failure.detail

**Severity**

ERROR

**Description**

This event is generated if malloc is called unsafely.

**Corrective Action**

(None).

**Syslog Message**

%s %s

**Parameters**

- description** (STRING): Description of failure.
- buffers** (STRING): Details of buffers that were predirtied.

# master events

## master.cast events

### master.cast.cm.vote.against

#### Severity

NOTICE

#### Description

This message occurs when the master service of the associated node cannot connect to current cluster master. It tries to cast a vote against current cluster master in the global database. The current cluster master is demoted if more than half of the cluster nodes vote against it, and a new cluster master is promoted.

#### Corrective Action

(None).

#### Syslog Message

Service ID %u on node ID %u (UUID: %s) has voted against current cluster master with sequence number %u and service ID %u based on "%s". The current MVIP address connection state is "%s" with duration %s. The best connection state is "%s".

#### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**sequenceNumber** (INT): Sequence number of the cluster master.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

**reason** (STRING): Reason for casting the vote against current cluster master.

**currentState** (STRING): Current MVIP address connection state.

**currentStateDuration** (STRING): Duration of current MVIP address connection state.

**highestState** (STRING): Best MVIP address connection state reached since the node connected to current cluster master.

## master.couldnt events

### master.couldnt.cast.cm.vote

#### Severity

NOTICE

#### Description

This message occurs when the master service on the associated node is unable to cast a vote to update the connection status with current cluster master in global database since it has lost connection to the database server.

## Corrective Action

(None).

## Syslog Message

Service ID %u on node ID %u (UUID: %s) failed to cast a vote "%s" to cluster master with sequence number %u and service ID %u due to exception code: %s. The connection state is "%s" with duration %s. The best connection state is "%s".

## Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**voteToCast** (STRING): Vote which the master service failed to cast. It can be "true" or "false".

**sequenceNumber** (INT): Sequence number of current cluster master.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

**exceptionCode** (STRING): Exception code.

**currentState** (STRING): Current MVIP address connection state.

**currentStateDuration** (STRING): Duration of current MVIP address connection state.

**highestState** (STRING): Best MVIP address connection state reached since the node connected to current cluster master.

## master.couldnt.demote.cm

### Severity

NOTICE

### Description

This message occurs when the associated node tries to update the global database to demote current cluster master but the operation fails due to an exception. This could happen if another cluster node already made the same database change, or the connection to global database has been lost.

### Corrective Action

(None).

### Syslog Message

Service ID %u on node ID %u (UUID: %s) failed to update database to demote cluster master with service ID %u with exception code: %s.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

**exceptionCode** (STRING): Exception code.

## master.demote events

## master.demote.cm.committed

### Severity

NOTICE

### Description

This message occurs when the associated node successfully updates the global database to demote current cluster master. As a result, a new cluster is promoted.

### Corrective Action

(None).

### Syslog Message

Service ID %u on node ID %u (UUID: %s) successfully updated database to demote cluster master with sequence number %u and service ID %u.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**sequenceNumber** (INT): Sequence number of the cluster master last known by this node.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

## master.new events

### master.new.connection.state

#### Severity

NOTICE

#### Description

This message occurs when the connection state from the associated node to current cluster master has changed.

#### Corrective Action

(None).

#### Syslog Message

Service ID %u on node ID %u (UUID: %s) has a new MVIP address connection state "%s" to cluster master with service ID %u. The best connection state is "%s".

#### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**currentState** (STRING): Current management virtual IP (MVIP) address connection state.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

**highestState** (STRING): Best MVIP address connection state reached since the node connected to current cluster master.

# master.releasing events

## master.releasing.cm

### Severity

NOTICE

### Description

This message occurs when the node is demoted from being the cluster master.

### Corrective Action

(None).

### Syslog Message

Service ID %u on node ID %u (UUID: %s) releases control as the cluster master.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

# master.taking events

## master.taking.over.cm

### Severity

NOTICE

### Description

This message occurs when the node is promoted to the cluster master and takes control as the master.

### Corrective Action

(None).

### Syslog Message

Service ID %u on node ID %u (UUID: %s) takes over as the cluster master.

### Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

# master.try events

## master.try.demote.cm

### Severity

NOTICE

## Description

This message occurs when the associated node can not connect to current cluster master and tries to demote it by making associated global database change. The database change might fail if multiple cluster nodes try to do the same thing, and one of them has updated global database successfully.

## Corrective Action

(None).

## Syslog Message

Service ID %u on node ID %u (UUID: %s) tries to demote the cluster master with sequence number %u and service ID %u from the global database based on the votes (forVotes=%u, againstVotes=%u, staleVotes=%u).

## Parameters

**serviceID** (INT): Service ID that identifies the associated master service.

**nodeID** (INT): Node ID number of the associated node.

**nodeUuid** (STRING): Node UUID of the associated node.

**sequenceNumber** (INT): Sequence number of the cluster master last known by this node.

**lastKnownClusterMasterServiceID** (INT): Service ID number of the cluster master last known by this node.

**forVotes** (INT): Number of votes to keep current cluster master in the poll.

**againstVotes** (INT): Number of votes to demote current cluster master in the poll.

**staleVotes** (INT): Number of stale votes to update current cluster master in the poll.

# maxcid events

## maxcid.limit events

### maxCID.limit.exceeded

#### Severity

ALERT

#### Description

This message occurs when system exceeds the maximum number of open network data connections on the node.

#### Corrective Action

Balance the network load across all nodes within the cluster in order to avoid disruptions in service. Contact NetApp technical support.

#### Syslog Message

Number of active data connections is %d and system limit is %d.

#### Parameters

**activeCID** (INT): Number of open data connections on the node.

**maxCID** (INT): Maximum allowed limit of data connections per node.

## maxcid.threshold events

### maxCID.threshold.exceeded

#### Severity

ERROR

#### Description

This message occurs when the system is approaching the maximum number of open data connections supported on the node.

#### Corrective Action

Balance the network load across all nodes within the cluster.

#### Syslog Message

Number of active data connections is %d and maximum supported threshold is %d.

#### Parameters

**activeCID** (INT): Number of open data connections on the node.

**maxCIDThreshold** (INT): Maximum threshold of data connections supported per node.

# mc events

## mc.channel events

### mc.channel.create.failed

**Severity**

NOTICE

**Description**

This message occurs on failure in new channel creation in Mirror Cache.

**Corrective Action**

(None).

**Syslog Message**

Failure in Mirror Cache on new channel — Name: %s

**Parameters**

**channel** (STRING): Channel name

## mc.post events

### mc.post.replay.stats

**Severity**

NOTICE

**Description**

This message occurs post replay and conveys information regarding bdatas inserted, rejected, duplicate, hits and misses.

**Corrective Action**

(None).

**Syslog Message**

Mirror Cache post replay stats — Name: %s Inserted: %llu Rejected: %llu Duplicate: %llu Hits: %llu Misses: %llu.

**Parameters**

**name** (STRING): Aggr name

**inserted** (LONGINT): Bdatas inserted

**rejected** (LONGINT): Bdatas rejected

**duplicate** (LONGINT): Duplicate bdatas

**hits** (LONGINT): Bdata hits

**misses** (LONGINT): Bdatas misses

# mcc events

## mcc.auso events

### mcc.auso.trigFailed

#### Severity

EMERGENCY

#### Description

This message occurs when a trigger for automatic unplanned switchover fails to issue the operation.

#### Corrective Action

Verify the health of each node and that automatic unplanned switchover is enabled on both by using the "metrocluster node show" command. Use the "metrocluster switchover -forced-on-disaster true" command to switch over the DR-site storage manually.

#### Syslog Message

A trigger for Automatic Unplanned Switchover failed to issue the operation. Reason: %s.

#### Parameters

**probableCauseDescription** (STRING): Further description of the probable cause.

**alertId** (STRING): Identifier for this condition.

**alertingResource** (STRING): Unique name of the resource responsible for this condition.

**alertingResourceName** (STRING): Name of the resource responsible for this condition.

**possibleEffect** (STRING): Possible effect of the failure.

**probableCause** (STRING): Probable cause of the failure.

**additionalInfo** (STRING): Additional information about this failure.

### mcc.auso.triggered

#### Severity

NOTICE

#### Description

This message occurs when the node triggers an automatic unplanned switchover on detection of a failure of the DR partner node.

#### Corrective Action

(None).

#### Syslog Message

The node has triggered an Automatic Unplanned Switchover of the DR partner. Reason: %s. If Automatic Unplanned Switchover was triggered because of heartbeat loss, any ongoing dump on the partner may be aborted.

#### Parameters

**cause** (STRING): Cause for triggering automatic unplanned switchover.

# mcc.check events

## mcc.check.failed

### Severity

ERROR

### Description

This message occurs when the MetroCluster (tm) check job has failed to complete all checks for the system.

### Corrective Action

Run "metrocluster operation history show" command to check the reason for this failure. Make sure that all nodes in each of the clusters are healthy, and both clusters are in normal mode using the "metrocluster node show" and "metrocluster show" commands. Then retry the operation using the command "metrocluster check run". If the problem persists, contact NetApp technical support.

### Syslog Message

The MetroCluster (tm) check job has failed to complete all checks for the system in cluster %s.

### Parameters

**Cluster** (STRING): Cluster where the check was running.

# mcc.config events

## mcc.config.assignConfigFail

### Severity

ERROR

### Description

This message occurs when the MetroCluster(tm) local node configuration assignment to persistent storage failed.

### Corrective Action

Contact NetApp technical support for assistance.

### Syslog Message

(None).

### Parameters

**error** (STRING): Description of assign config error.

**nodeID** (STRING): Node UUID.

**dbladeID** (STRING): Dblade UUID.

## mcc.config.auso.enableIgnore

### Severity

ALERT

## Description

This message occurs when an attempt to enable automatic unplanned switchover fails because the capability has been manually disabled by the user or disabled because of a failed switchover or switchback operation.

## Corrective Action

If you want to keep automatic switchover enabled, enable it using the advanced mode command "metrocluster modify -automatic-switchover-onfailure true".

## Syslog Message

Failed to enable Automatic Unplanned Switchover because the capability has been manually disabled by the user or disabled because of a failed Switchover or Switchback operation.

## Parameters

(None).

## mcc.config.auso.stDisabled

### Severity

ERROR

### Description

This message occurs when automatic unplanned switchover capability is disabled.

### Corrective Action

Run the "metrocluster modify -node-name <nodename> -automatic-switchover-onfailure true" command for each node in the cluster to enable automatic switchover.

### Syslog Message

The state of Automatic Unplanned Switchover capability has been disabled.

### Parameters

**alertId** (STRING): Identifier for this condition.

**alertingResource** (STRING): Unique name of the resource responsible for this condition.

**alertingResourceName** (STRING): Display name of the resource responsible for this condition.

**possibleEffect** (STRING): Possible effect of the event.

**probableCause** (STRING): Probable cause of the event.

**probableCauseDescription** (STRING): Further description of the probable cause.

**additionalInfo** (STRING): Additional information about this event.

## mcc.config.auso.stEnabled

### Severity

NOTICE

### Description

This message occurs when automatic unplanned switchover capability is enabled.

### Corrective Action

(None).

## Syslog Message

The state of Automatic Unplanned Switchover capability has been enabled.

## Parameters

**alertId** (STRING): Identifier for this condition.

**alertingResource** (STRING): Unique name of the resource responsible for this condition.

## mcc.config.bootConfigNotRead

### Severity

ALERT

### Description

This message occurs when the MetroCluster(tm) configuration cannot be read from persistent storage. This could be because the partner has active reservations on the disk, the root aggregate is not assimilated, or the configuration has not been performed on the system yet. The system will try to retrieve or set the configuration try to retrieve or set the configuration automatically later during boot.

### Corrective Action

If the problem persists, contact NetApp technical support for assistance in resolving this issue.

## Syslog Message

Configuration could not be read from persistent storage due to internal error %s. The system will try to retrieve or set the configuration automatically later, during boot.

## Parameters

**error** (STRING): Actual error that caused configuration read to fail.

## mcc.config.checkPartnerError

### Severity

ERROR

### Description

This message occurs when an error is found during a MetroCluster(tm) configuration check. The checks include partner operational status and valid disaster recovery (DR) group configurations.

### Corrective Action

Make sure that all of the nodes are online and healthy by running the "cluster show" command and verifying that the "Health" and "Eligibility" fields displayed as true. Check the switch and controller configuration and make sure that all of the controllers in the DR group and HA/DR Interconnect ports are properly connected for DR group communication.

## Syslog Message

(None).

## Parameters

**partner\_names** (STRING): List of disaster recovery partner names.

**error** (STRING): Description of the error that occurred.

## **mcc.config.disableDrMirror**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets disabled persistently in a MetroCluster(tm) configuration.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

**reason** (STRING): Reason the disaster recovery (DR) NVlog mirroring is disabled persistently.

## **mcc.config.disableMirrorMem**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets disabled in a MetroCluster(tm) configuration.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

**reason** (STRING): Reason the DR NVlog mirroring is disabled in memory.

## **mcc.config.drPartner.mbxFail**

### **Severity**

ALERT

### **Description**

This message occurs when a node in a 2-node MetroCluster(tm) configuration fails to access its DR partner's mailbox. This may impact automatic unplanned switchover.

### **Corrective Action**

(None).

### **Syslog Message**

Read of DR partner's mailbox failed with error (%d).

**Parameters**

**err** (INT): Error returned from mailbox access.

**mcc.config.drPartner.mbxRead****Severity**

INFORMATIONAL

**Description**

This message occurs when a node in 2-node MetroCluster(tm) configuration is successfully able to access it's DR partner's mailbox.

**Corrective Action**

(None).

**Syslog Message**

Read of DR partner's mailbox successful.

**Parameters**

(None).

**mcc.config.enableDrMirror****Severity**

INFORMATIONAL

**Description**

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets persistently enabled in a MetroCluster(tm) configuration.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**mcc.config.enableMirrorMem****Severity**

INFORMATIONAL

**Description**

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets enabled in a MetroCluster(tm) configuration.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**mcc.config.headswapComplete****Severity**

NOTICE

**Description**

This message occurs when headswap update completes successfully on a node.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**mcc.config.headswapMsgSent****Severity**

NOTICE

**Description**

This message occurs when a headswap HA message is successfully sent to a partner node.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**role** (INT): Role of the node.

**mcc.config.headswapNoNotify****Severity**

ERROR

**Description**

This message occurs when the MetroCluster(tm) node cannot communicate with one or more of its partners after a headswap. In a MetroCluster configuration, partners need to be informed of the old and new system ID of the local node through an HA message, so that they use the correct partner system ID during disaster recovery(DR) operations. Data ONTAP® takes appropriate recovery actions.

### Corrective Action

Other than making sure that all of the partners are online, there is no explicit user intervention required; the node automatically retries the operation at regularly scheduled intervals (every 30 seconds).

### Syslog Message

Local node system ID changed from %d to %d. Local node could not inform its HA or DR partner node of this change due to error %s.

### Parameters

**old\_system\_id** (INT): Old system ID of the node.

**new\_system\_id** (INT): New system ID of the node.

**error** (STRING): Internal error description identifying the reason for the failure.

## mcc.config.headswapPartnerEr

### Severity

ERROR

### Description

This message occurs when the partner returns a failure during a MetroCluster(tm) headswap configuration update. This can be due to configuration mismatches on the remote partner, disk ownership reassignment failure, or persistent storage write failure.

### Corrective Action

This could potentially be because the partner that failed was not fully functional or was operating in a degraded state. Make sure that the partner is online by issuing the "metrocluster show" and the "metrocluster node show" command. The partner configuration update will be retried at regular intervals automatically. In case of other configuration mismatch failure, check the relevant subsystem cited in the error and run the "disk show" command to examine the disk state. If the problem persists, contact NetApp technical support.

### Syslog Message

Partner %s failed to update configuration due to error %s.

### Parameters

**partner** (STRING): Name of the partner node.

**error** (STRING): Error description returned by the partner.

## mcc.config.headswapRevert

### Severity

NOTICE

### Description

This message occurs when the receiver of a headswap HA message detects that the old head was brought back in before headswap processing completed. The receiver will undo any nvram id update it had processed earlier.

### Corrective Action

(None).

**Syslog Message**

(None).

**Parameters**

**old\_sys\_id** (INT): Old system id received from the HA message

**new\_sys\_id** (INT): New system id received from the HA message

**mcc.config.locHeadswapDetect****Severity**

NOTICE

**Description**

This message occurs when a headswap is detected on the local node.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**old\_system\_id** (INT): Old system ID of the node.

**new\_system\_id** (INT): New system ID of the node.

**mcc.config.restoreFailure****Severity**

NOTICE

**Description**

Error returned while recovering the Configuration.

**Corrective Action**

(None).

**Syslog Message**

MetroCluster configuration was not restored from persistent source because of reason :%d.

**Parameters**

**err** (INT): Error returned while recovering the mailbox.

**mcc.config.restoreSuccessful****Severity**

INFORMATIONAL

**Description**

This message occurs when the MetroCluster(tm) configuration is successfully restored from an alternate persistent configuration source.

**Corrective Action**

(None).

**Syslog Message**

MetroCluster configuration was successfully restored from persistent source %s.

**Parameters**

**source** (STRING): Source from which the MetroCluster configuration was retrieved.

**mcc.config.selfNodeInvalid****Severity**

ERROR

**Description**

This message occurs when the local node UUID and the node UUID returned by the Connectivity, Liveness, Availability Monitor (CLAM) do not match. This is a configuration error and can result in failures during disaster recovery operations.

**Corrective Action**

Contact NetApp technical support for assistance.

**Syslog Message**

Configuration error: Local node UUID and the node UUID reported by CLAM do not match.

**Parameters**

**local\_node\_uuid** (STRING): Local node UUID.

**clam\_node\_uuid** (STRING): Node UUID returned by the CLAM.

**mcc.config.sysidNoNotify****Severity**

ERROR

**Description**

This message occurs when the local node is unable to notify its HA or DR partners of its system ID after a reboot.

**Corrective Action**

Verify that the HA or DR partner node is healthy and can be reached over the intercluster network.

**Syslog Message**

The node could not notify its nvram system id to partner %s. Error: %s.

**Parameters**

**partner** (STRING): Name of the partner node.

**error** (STRING): Error description.

**mcc.config.teardown**

**Severity**

INFORMATIONAL

**Description**

This message is generated whenever CTRL connections to MetroCluster(tm) partners are torn down.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**reason** (STRING): Reason for tearing down the CTRL connections.

**mcc.config.update.role****Severity**

INFORMATIONAL

**Description**

This message is generated whenever the roles of CTRL connections to MetroCluster(tm) partners are updated.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**reason** (STRING): Reason for updating the role of the CTRL connections.

**mcc.config.vso.disabled****Severity**

NOTICE

**Description**

This message occurs when the "vserver configuration override" command is disabled for MetroCluster over IP after controller replacement operations are completed.

**Corrective Action**

(None).

**Syslog Message**

MetroCluster over IP Vserver configuration override is disabled.

**Parameters**

(None).

## **mcc.config.vso.enabled**

### **Severity**

NOTICE

### **Description**

This message occurs when the "vserver configuration override" command is enabled for MetroCluster over IP controller replacement operations.

### **Corrective Action**

(None).

### **Syslog Message**

MetroCluster over IP Vserver configuration override is enabled.

### **Parameters**

(None).

## **mcc.ctlbe events**

### **mcc.ctlbe.IODelayed**

#### **Severity**

INFORMATIONAL

#### **Description**

SCSI IO for RSM is delayed significantly in the iSCSI stack.

#### **Corrective Action**

(None).

#### **Syslog Message**

(None).

#### **Parameters**

**devSerial** (STRING): Device Serial Number

**lunId** (INT): The LUN ID.

**cdb** (STRING): A string containing the opcode byte of the CDB.

**delay** (LONGINT): The delay in milliseconds experienced by this IO in the software iSCSI stack.

### **mcc.ctlbe.IOResponseDelayed**

#### **Severity**

INFORMATIONAL

#### **Description**

SCSI IO for RSM is delayed significantly in the storage stack.

#### **Corrective Action**

(None).

## Syslog Message

(None).

## Parameters

**devSerial** (STRING): Device Serial Number

**lunId** (INT): The LUN ID.

**cdb** (STRING): A string containing the opcode byte of the CDB.

**delay** (LONGINT): The delay in milliseconds experienced by this IO in the D-blade storage stack.

# mcc.drdom events

## mcc.drdom.diskOwnerChange

### Severity

INFORMATIONAL

### Description

This message occurs when disk ownership changes are made by the disaster recovery disk ownership manager (DRDOM).

### Corrective Action

(None).

### Syslog Message

(%d) disks belonging to DR partner (%ld) underwent ownership change due to (%s).

### Parameters

**disk\_count** (INT): Number of disks that underwent ownership change.

**dr\_partner\_system\_id** (LONGINT): System ID of the DR partner whose disks underwent ownership change.

**reason** (STRING): Reason for the disk ownership change.

## mcc.drdom.diskReserveFail

### Severity

ERROR

### Description

This message occurs when one or more disks fails a disk reservation request from the disaster recovery disk ownership manager (DRDOM).

### Corrective Action

Make sure that none of the available DR partner disks are not in a failed or inconsistent state. Contact NetApp technical support if failed or misbehaving disks cannot be identified.

### Syslog Message

%d/%d DR disks failed disk reservation request from DRDOM, %d local disks.

### Parameters

**error\_count** (INT): Number of disks that failed disk reservation.

**disk\_num** (INT): Number of disks that have DR ownership.

**local\_disks** (INT): Number of disks that have local ownership.

## **mcc.drdom.disksAssignFail**

### **Severity**

ERROR

### **Description**

This message occurs when the disaster recovery disk ownership manager (DRDOM) fails to assign the ownership of one or more disks in the disk list enrolled in this operation to be reassigned.

### **Corrective Action**

Contact NetApp technical support for assistance.

### **Syslog Message**

DRDOM failed to assign the ownership of one or more disks in the disk list involved in disk ownership reassign request message during %s.

### **Parameters**

**operation** (STRING): The MetroCluster(tm) DR operation that issued the "assign disks" request.

**disks\_in\_request** (INT): Total number of disks for which the disk ownership change is requested.

**disks\_failed\_request** (INT): Total number of disks for which the disk ownership change request failed.

**error\_code** (INT): Internal error code for the failure.

## **mcc.drdom.hsAssignFail**

### **Severity**

ERROR

### **Description**

This message occurs when the node fails to change disk ownership for disaster recovery (DR) partner disks after a headswap. This can occur if the node is in switchover or it has disks that are left behind from previous DR operations.

### **Corrective Action**

Make sure that the DR partner disks with current-owner as local node are online and not in failed state or inconsistent state. Contact NetApp technical support if the failed or misbehaving disks cannot be identified.

### **Syslog Message**

Node failed to change disk ownership for DR partner disks after a headswap.

### **Parameters**

**disks\_in\_request** (INT): Total number of disks for which the disk ownership change is requested.

**disks\_failed\_request** (INT): Total number of disks for which the disk ownership change request failed.

**error\_code** (INT): Internal error code for the failure.

## **mcc.drgroup events**

### **mcc.drgroup.fetch.failed**

**Severity**

INFORMATIONAL

**Description**

This message occurs when MCC DR group information cannot be retrieved from RDB tables.

**Corrective Action**

(None).

**Syslog Message**

Unable to fetch DR-group information from RDB, error: %s.

**Parameters**

**reason** (STRING): Reason why RDB operation failed to fetch DR-group information.

## mcc.drmsg events

### mcc.drmsg.received

**Severity**

INFORMATIONAL

**Description**

This message occurs when a DR message is successfully received from a DR partner node.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**version** (INT): Version of the DR message.  
**type** (STRING): Type of message sent.  
**request** (STRING): Type of request being sent.  
**seq\_num** (LONGINT): Sequence number of the message.  
**rcv\_sysid** (LONGINT): System ID of receiving Node  
**sysid** (LONGINT): System ID of sending node.  
**rcv\_time** (LONGINT): Time when message was sent.  
**send\_time** (LONGINT): Time when message was sent.  
**status** (STRING): Status of the DR message.  
**fsm\_state** (STRING): FSM state of the responding node.  
**sb\_reason** (STRING): SB reason if any specified.  
**dr\_op\_state** (INT): DR operation state of the responding node.  
**ha\_fw\_state** (STRING): HA firmware state of the responding node.

### mcc.drmsg.sent

**Severity**

INFORMATIONAL

## Description

This message occurs when a DR message is successfully sent to a partner node.

## Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**version** (INT): Version of the DR message.

**type** (STRING): Type of message sent.

**request** (STRING): Type of request being sent.

**seq\_num** (LONGINT): Sequence number of the message.

**sysid** (LONGINT): System ID of sending Node.

**send\_time** (LONGINT): Time when message was sent.

# mcc.drsom events

## mcc.drsom.disk.filter.fail

### Severity

INFORMATIONAL

### Description

This message occurs when it cannot be determined whether a disk belongs to a root aggregate.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**disk** (STRING): Name of the disk.

**op** (STRING): Operation during which this check failed.

**status** (INT): Status of the check that failed.

## mcc.drsom.disk.skipped

### Severity

INFORMATIONAL

### Description

This message occurs when disaster recovery switchover manager determines that a disk needs to be skipped from an assign request.

### Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**disk** (STRING): Name of the disk.

**op** (STRING): Operation during which this check failed.

**reason** (STRING): Reason why the disk was skipped.

## mcc.drсом.fsm.execute

### Severity

INFORMATIONAL

### Description

This message occurs when the disaster recovery Switchover Monitor(DRSOM) FSM (Finite State Machine) starts processing an event.

### Corrective Action

(None).

## Syslog Message

DRSOM FSM state is (%s) and it will process the event (%s). Whether this event will be processed for the DR auxiliary partner: (%s)

## Parameters

**fsm\_state** (STRING): Current state of the DRSOM FSM.

**fsm\_event** (STRING): Event to be processed by the DRSOM FSM.

**DR\_aux** (STRING): Indication of whether the event will be processed for the DR auxiliary partner.

## mcc.drсом.fsm.invalid.state

### Severity

ALERT

### Description

This message occurs when the disaster recovery (DR) Switchover Monitor (DRSOM) FSM (Finite State Machine) reaches an invalid state.

### Corrective Action

If this problem is seen persistently, contact NetApp technical support for assistance in resolving this issue.

## Syslog Message

MCC DRSOM FSM state saw an invalid transition from %s to %s.

## Parameters

**prev\_st** (STRING): Previous DRSOM FSM state.

**st** (STRING): Current DRSOM FSM state.

## mcc.drсом.fsm.invalidState

**Severity**

ERROR

**Description**

This message occurs when an unexpected disaster recovery Switchover Monitor(DRSOM) FSM (Finite State Machine) event is generated.

**Corrective Action**

This can happen in cases where a new DR operation was issued before the previous one could finish and it might require a forced-recovery operation. Contact NetApp technical support for assistance in resolving this issue.

**Syslog Message**

DRSOM FSM event (%s) generated in state (%s) will cause an invalid FSM state transition.

**Parameters**

**fsm\_event** (STRING): DRSOM FSM event.

**fsm\_state** (STRING): DRSOM FSM state in which the event is generated.

**mcc.drsom.fsm.sb.rec.pending****Severity**

ALERT

**Description**

This message occurs when the disaster recovery switchover monitor (DRSOM) transitions to a switchback recovery pending state.

**Corrective Action**

If this node is booting up for the first time after a disaster, no action is required. If not, please check the states of all the nodes and contact NetApp technical support if they are incorrect.

**Syslog Message**

This node has entered the Switchback Recovery Pending State.

**Parameters**

(None).

**mcc.drsom.fsmState.EarlySb****Severity**

INFORMATIONAL

**Description**

This message occurs when the disaster recovery switchover monitor (DRSOM) recovers from unexpected error conditions by transitioning to perform an early switchback. An early switchback is performed in the following three cases: a node panics while processing a switchover; a node panics or reboots while retrying a switchover operation; or a node either encounters a subsystem failure, panics, or reboots while aborting a switchover operation. The switchover was reverted and the DRSOM state on all nodes is 'normal'.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

(None).

**mcc.drsom.mbxRecovery****Severity**

INFORMATIONAL

**Description**

This message occurs when the disaster recover Switchover Monitor(DRSOM) FSM (Finite State Machine) state stored persistently in the mailbox is inconsistent with the DRC (DR Coordinator) and has been recovered.

**Corrective Action**

(None).

**Syslog Message**

DRSOM FSM state stored in the mailbox is inconsistent with the DRC. It has been recovered and intialized to %s.

**Parameters**

**next\_fsm\_state** (STRING): State to which the DRSOM FSM will be initialized.

**mcc.drsom.process.op.fail****Severity**

ALERT

**Description**

This message occurs when the disaster recovery (DR) Switchover Monitor (DRSOM) cannot perform the DR operation.

**Corrective Action**

If this problem is seen persistently, contact NetApp technical support for assistance in resolving this issue.

**Syslog Message**

MCC state machine received invalid operation %s while it was in state %s.

**Parameters**

**op** (STRING): DR operation issued.

**st** (STRING): Current FSM (Finite State Machine) state.

**mcc.drsom.sbRecSt.change**

**Severity**

INFORMATIONAL

**Description**

This message occurs when there is a change in the disaster recovery Switchover Monitor(DRSOM) switchback recovery state.

**Corrective Action**

(None).

**Syslog Message**

Switchback recovery state changed from (%d) to (%d) due to (%s).

**Parameters**

**old\_state** (INT): Previous switchback recovery state.

**new\_state** (INT): New switchback recovery state.

**reason** (STRING): Reason for change of state.

**mcc.drsom.sstbl.configErr****Severity**

ERROR

**Description**

This message occurs during switchback processing, when the disaster recovery(DR) partner cannot be contacted to confirm that it is in a valid MetroCluster(tm) configuration state.

**Corrective Action**

Make sure that the DR partner is online and accessible by this node.

**Syslog Message**

(None).

**Parameters**

**partner** (STRING): Name of the failed partner.

**mcc.drsom.sstbl.sanownCompEr****Severity**

ERROR

**Description**

This message occurs during switchback processing, when the disaster recover(DR) partner cannot be contacted to enable or suspend a sanown completion event.

**Corrective Action**

Make sure that the DR partner is online and accessible by this node.

**Syslog Message**

(None).

## Parameters

**operation** (STRING): Disable or enable completion event.

**partner** (STRING): Name of the failed partner.

## mcc.drсом.sstblRunFailure

### Severity

ERROR

### Description

This message occurs when a particular subsystem cannot proceed with the disaster recovery (DR) operation.

### Corrective Action

Refer to the subsystem-specific error that would have been logged before this message.

### Syslog Message

(None).

## Parameters

**dr\_operation** (STRING): DR operation.

**sub\_system** (STRING): Name of the subsystem that encountered the failure.

## mcc.drсом.watch.conflict

### Severity

INFORMATIONAL

### Description

This message shows drсом watchdog information on conflicting operations

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**enabled** (INT): Current state of watchdog.

**extended** (INT): Current extended state of watchdog.

**last\_update\_time** (LONGINT): Last update time.

**current\_time** (LONGINT): Current time.

**last\_update\_count** (LONGINT): Last update count.

**last\_thread** (LONGINT): ID of last thread to update.

**last\_thread\_info** (STRING): Text describing last update.

**curr\_thread\_info** (STRING): Text describing current update.

## mcc.fabricpool events

## **mcc.fabricpool.license.absent**

### **Severity**

ERROR

### **Description**

This message occurs when a FabricPool license exists on only one of the two sites of a MetroCluster(tm) configuration.

### **Corrective Action**

Install a FabricPool license on the cluster that is missing the license.

### **Syslog Message**

The FabricPool license is installed on only one site of this MetroCluster configuration. The license is missing on cluster %s (ID: %s).

### **Parameters**

**cluster\_name** (STRING): Name of the cluster which is missing the license.

**cluster\_uuid** (STRING): UUID of the cluster.

## **mcc.fabricpool.license.diff**

### **Severity**

ERROR

### **Description**

This message occurs when the FabricPool license capacity or term limits are different for the two sites of a MetroCluster(tm) configuration.

### **Corrective Action**

Install a new license on one of the clusters so that the license limits match.

### **Syslog Message**

The FabricPool license limits are different for the two sites of this MetroCluster configuration. The license limits are %s and %s on site %s and %s and %s on site %s.

### **Parameters**

**local\_license\_limit** (STRING): License capacity limit from the local cluster.

**local\_term\_limit** (STRING): License term limit from the local cluster.

**local\_cluster\_name** (STRING): Name of the local cluster.

**remote\_license\_limit** (STRING): License capacity limit from the remote cluster.

**remote\_term\_limit** (STRING): License term limit from the remote cluster.

**remote\_cluster\_name** (STRING): Name of the remote cluster.

## **mcc.fabricpool.mirror.missing**

### **Severity**

ALERT

### **Description**

This message occurs when a FabricPool in a MetroCluster configuration does not have a mirror object store attached.

## Corrective Action

Use the "storage aggregate object-store mirror" command to add a mirror object store to the FabricPool.

## Syslog Message

FabricPool: "%s" UUID: "%s" in a MetroCluster configuration does not have synchronous data protection enabled because the mirror object store is missing.

## Parameters

**aggr** (STRING): Name of the FabricPool.

**UUID** (STRING): UUID of the FabricPool.

# mcc.forced events

## mcc.forced.auso.issued

### Severity

NOTICE

### Description

This message occurs when the node triggers a forced automatic unplanned switchover because the "allow-auto-forced-switchover" option is true.

### Corrective Action

(None).

### Syslog Message

The node has triggered a forced automatic unplanned switchover of the DR partner. Reason: "%s".

### Parameters

**reason** (STRING): Reason for triggering a forced automatic unplanned switchover with "allow-auto-forced-switchover" option.

# mcc.hwassist events

## mcc.hwassist.trap.AUSO

### Severity

NOTICE

### Description

This message occurs when a HW assist trap is received from the Service Processor of the DR-partner and is used to trigger an Automatic SwitchOver.

### Corrective Action

(None).

### Syslog Message

HW assist trap of type=%s, severity=%s received for event=%s from sysid=%s.

## Parameters

**type** (STRING): Type of event, such as `system_down`.  
**severity** (STRING): Severity of the event, such as `alert`.  
**event** (STRING): Specific event, such as `power_loss`.  
**sysid** (STRING): System-id of the node generating the event.

# mcc.ic events

## mcc.ic.process.node.adv

### Severity

INFORMATIONAL

### Description

This message occurs when the MetroCluster(tm) config module receives a node advertisement from any of its partners.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**sys\_id** (LONGINT): System id of the node sending the advertisements.  
**is\_local\_node\_assigned** (INT): Boolean specifying whether the local node has joined the cluster.  
**is\_partner\_assigned** (INT): Boolean specifying whether the node sending advertisements has joined the cluster.

# mcc.ipspace events

## mcc.ipspace.not.found

### Severity

ERROR

### Description

This message occurs when the IPspace is not found in a MetroCluster(tm) configuration while replicating the object store configuration. Until this is resolved, some MetroCluster and FabricPool operations will fail.

### Corrective Action

Create the missing MetroCluster IPspace. The configuration replication task will be completed automatically.

### Syslog Message

Object store "%s" configuration replication failed because IPspace "%s" was not found in cluster "%s".

## Parameters

**object\_store\_name** (STRING): Name of the object store.  
**ipspace\_name** (STRING): Name of the IPspace.

**cluster\_name** (STRING): Name of the cluster.

## mcc.kill events

### mcc.kill.received

#### Severity

INFORMATIONAL

#### Description

This message occurs when the node is halting because it received a "kill" message from the disaster recovery (DR) partner.

#### Corrective Action

(None).

#### Syslog Message

Node is halting because a kill message with reason %s has been received from the DR partner with system ID %ld.

#### Parameters

**reason** (STRING): Reason for halting the node.

**sender\_sysid** (LONGINT): System ID of the sender.

## mcc.lunmgr events

### mcc.lunmgr.lunid\_alloc\_failure

#### Severity

ERROR

#### Description

This message occurs when failing to allocate a CTL Target LUN ID to a target disk

#### Corrective Action

This indicates an internal error during the discovery of Target LUN devices.

#### Syslog Message

Device S/N %s - Failed to allocate a LUN ID

#### Parameters

**device\_serial\_number** (STRING): Device serial number

## mcc.network events

### mcc.network.congestion

#### Severity

NOTICE

## Description

This message occurs when a MetroCluster over IP configuration detects network congestion over the inter-cluster links (ISL) that connect sites and an action is taken to reduce further network congestion.

## Corrective Action

Verify that network between MetroCluster sites is following minimum SLA requirements and fix any such violations if needed. If the issue persists, contact NetApp technical support.

## Syslog Message

Network congestion detected. Action taken: %s.

## Parameters

**action\_taken** (STRING): Action taken to reduce network congestion.

# mcc.notify events

## mcc.notify.auto\_heal\_queue\_failure

### Severity

ERROR

### Description

Failed to queue the "MetroCluster Auto Heal" job

### Corrective Action

Manually complete the healing phase using the command "metrocluster heal aggregates" and "metrocluster heal root-aggregates"

### Syslog Message

(None).

### Parameters

**retries\_attempted** (INT): Number of retries attempted

# mcc.nso events

## mcc.nso.abort.dump

### Severity

NOTICE

### Description

This message occurs when dump/restore is aborted during a MetroCluster switch-over operation.

### Corrective Action

(None).

### Syslog Message

Dump/restore operations were aborted because %s is in progress.

## Parameters

**nso** (STRING): Describes whether a MetroCluster switch-over operation is progress.

## mcc.nso.veto.repl

### Severity

NOTICE

### Description

This message occurs when an MetroCluster(tm) switch-over is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

### Corrective Action

Either abort the replication transfer that is preventing the MetroCluster switch-over from being completed, retry the MetroCluster switch-over operation with the '-override-vetoes true' option, or wait for the transfer to finish.

### Syslog Message

Could not complete switch-over because a replication transfer with UUID %s is in progress.

## Parameters

**transferId** (STRING): UUID of the SnapMirror® replication transfer that vetoed MetroCluster switch-over.

## mcc.nvmeof events

### mcc.nvmeof.port.modify

#### Severity

NOTICE

#### Description

This message occurs when the mode of an NVMe-oF port is changed.

#### Corrective Action

(None).

#### Syslog Message

Changing NVMe-oF port %s to %s mode.

#### Parameters

**port** (STRING): Name of port being configured.

**mode** (STRING): Mode in which to configure port: network or storage.

### mcc.nvmeof.rdma.disconnect.event

#### Deprecated

Deprecated as of version 9.13.1.

#### Severity

NOTICE

## Description

This message occurs when the NVMe-oF driver detects an RDMA disconnect. There might be a decrease in performance while reconnecting.

## Corrective Action

(None).

## Syslog Message

NVMe-oF RDMA disconnect on subnqn %s, controller ID %d, qpair ID %d.

## Parameters

**subnqn** (STRING): Subsystem NVMe qualified name.

**ctrlr\_id** (INT): Controller ID.

**qpair** (INT): Qpair ID.

## mcc.nvmeof.rdma.disconnect.status

### Deprecated

Deprecated as of version 9.13.1.

### Severity

NOTICE

## Description

This message occurs when the NVMeoF driver detects a command that finishes with a disconnect status. There might be a decrease in performance while reconnecting.

## Corrective Action

(None).

## Syslog Message

NVMe-oF disconnect on subnqn %s, controller ID %d, qpair ID %d.

## Parameters

**subnqn** (STRING): Subsystem NVMe qualified name.

**ctrlr\_id** (INT): Controller ID.

**qpair** (INT): Qpair ID.

## mcc.nvmeof.subsystem.add

### Severity

NOTICE

## Description

This message occurs when an NVMe-oF subsystem is added.

## Corrective Action

(None).

## Syslog Message

NVMe-oF subsystem added at address %s.

## Parameters

**address** (STRING): IP address of subsystem.

## mcc.nvmeof.subsystem.delete

## Severity

NOTICE

## Description

This message occurs when an NVMe-oF subsystem is deleted.

## Corrective Action

(None).

## Syslog Message

NVMe-oF subsystem deleted at address %s.

## Parameters

**address** (STRING): IP address of subsystem.

## mcc.nvmeof.timeout

## Severity

NOTICE

## Description

This message occurs when the NVMeoF driver detects a timeout on a request. There might be a decrease in performance while retrying.

## Corrective Action

(None).

## Syslog Message

Timeout on subnqn %s, controller ID %d, qpair ID %d, sequence number %d.

## Parameters

**subnqn** (STRING): Subsystem NVMe qualified name.

**ctrlr\_id** (INT): Controller ID.

**qpair** (INT): Qpair ID.

**cid** (INT): NVMe-oF CID.

## mcc.sb events

### mcc.sb.abort.dump

## Severity

NOTICE

**Description**

This message occurs when dump/restore is aborted during a MetroCluster switchback operation.

**Corrective Action**

(None).

**Syslog Message**

Dump/restore operations were aborted because %s is in progress.

**Parameters**

**sb** (STRING): Describes whether a MetroCluster switchback operation is progress.

**mcc.sb.veto.repl****Severity**

NOTICE

**Description**

This message occurs when an MetroCluster(tm) switchback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

**Corrective Action**

Either abort the replication transfer that is preventing the MetroCluster switchback from being completed, retry the MetroCluster switchback operation with the '-override-vetoes true' option, or wait for the transfer to finish.

**Syslog Message**

Could not complete switchback because a replication transfer with UUID %s is in progress.

**Parameters**

**transferId** (STRING): UUID of the SnapMirror® replication transfer that vetoed the MetroCluster switchback.

**mcc.sbca events****mcc.sbca.mdvNotAvailable****Severity**

ERROR

**Description**

This message occurs when a MetroCluster (tm) system metadata volume that provides storage for the configuration replication services is not available.

**Corrective Action**

Contact technical support for assistance.

**Syslog Message**

A MetroCluster (tm) system metadata volume is not available in cluster %s.

## Parameters

**Cluster** (STRING): Cluster attempting to use the volume.

# mcc.scsipd events

## mcc.scsipd.iScsiSessionReconnectDestroySim

### Severity

NOTICE

### Description

iSCSI session maintenance thread was signaled to reconnect and destroy SIM paths.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**watchdogIdx** (INT): The watchdog thread index for the mcc\_scsipd driver.

**watchdogTimeLimit** (INT): The time limit in seconds that the watchdog thread waits before signaling the iSCSI session maintenance thread.

# mcc.so events

## mcc.so.nodeObjectLmt.chkFail

### Severity

ALERT

### Description

This message occurs when a MetroCluster(tm) switchover operation cannot be performed on this node because it is in the takeover state and one of the nodes in its disaster recovery(DR) group has the "node-object-limit" MetroCluster configuration option set to off.

### Corrective Action

Use the "storage failover giveback" command to take this node out of takeover state.

### Syslog Message

Switchover operation cannot be performed on this node because it is in the takeover state and one of the nodes in its DR group has the "node-object-limit" MetroCluster configuration option set to off.

### Parameters

(None).

# mcc.switchover events

## mcc.switchover.mdvInNvfailedState

### Severity

ERROR

### Description

This message occurs when a MetroCluster switchover operation finds a system metadata volume, used by config replication applications, in the nvfailed state.

### Corrective Action

Verify the configuration.

### Syslog Message

The 'in-nvfailed-state' was cleared on MetroCluster system metadata volume '%s'. The system will attempt to replicate all recent configuration updates (if any) to the local cluster. After the process completes, verify the configuration.

### Parameters

**Volume** (STRING): Volume

## mcc.toomany events

### mcc.toomany.vols.per.aggr

### Severity

ALERT

### Description

This message occurs when a volume is added to an aggregate in which the recommended maximum number of volumes for an aggregate in a MetroCluster setup is exceeded. An excessive number of volumes in a MetroCluster aggregate can result in high failover times, which may disrupt data availability from the affected node.

### Corrective Action

Re-distribute the volumes among the aggregates to comply with the volume limit per aggregate in a MetroCluster setup. The number of volumes in an aggregate can be found by using the "aggregate show -fields volcount" command. Volumes can be moved between aggregates by using the "volume move start -vserver <vserver\_name> -volume <vol\_name> -destination-aggregate <destination\_aggregate>" command.

### Syslog Message

MetroCluster protected aggregate %s has volume count %d, which exceeds the recommended maximum %d.

### Parameters

**aggregate** (STRING): Name of the aggregate.

**current\_volume** (INT): Current number of volumes on the aggregate.

**volume\_limit** (INT): Recommended maximum number of volumes per aggregate.

# mct events

## mct.channel events

### mct.channel.destroy

**Severity**

NOTICE

**Description**

This message occurs when the Mirror Cache Transport layer destroys a communication channel between two nodes.

**Corrective Action**

(None).

**Syslog Message**

Mirror Cache transport destroyed channel '%s'.

**Parameters**

**channel** (STRING): Name of the data channel.

## mct.control events

### mct.control.error

**Severity**

NOTICE

**Description**

This message occurs when the Mirror Cache Transport layer encounters an error in its control group.

**Corrective Action**

(None).

**Syslog Message**

Mirror Cache transport control error: '%s'.

**Parameters**

**error\_message** (STRING): Details for the encountered error.

# mdb events

## mdb.exit events

### mdb.exit

#### Severity

EMERGENCY

#### Description

This message occurs when the management process exits to recover from a database error.

#### Corrective Action

If the problem persists, contact NetApp technical support for assistance.

#### Syslog Message

MDB %s process exit due to "%s". Error code: %d (%s).

#### Parameters

**name** (STRING): Name of the M-Host process using the management database.

**table\_or\_operation** (STRING): Database table name or operation that encountered the error.

**error\_code** (INT): Numeric error code reported by the management database.

**error\_msg** (STRING): Error message reported by the management database.

# mes\_dimm events

## mes\_dimm.error events

### mes\_dimm.error

#### Severity

ALERT

#### Description

This message appears when an error is encountered by MES (Memory Error Statistics).

#### Corrective Action

DIMM error reported. Please contact NetApp technical support for further assistance.

#### Syslog Message

DIMM error - %s.

#### Parameters

**error** (STRING): Error message from Data ONTAP.

# mgmt events

## mgmt.aba events

### mgmt.aba.abortCloneParent

#### Severity

INFORMATIONAL

#### Description

This message occurs when Auto Balance Aggregate initiates a move of a volume that was then changed to a FlexClone® parent.

#### Corrective Action

(None).

#### Syslog Message

The Auto Balance Aggregate initiated move of volume %s from aggregate %s to aggregate %s was aborted when the move job detected that the volume was now a FlexClone parent.

#### Parameters

**volume** (STRING): Name of the volume.

**srcAggregate** (STRING): Name of the source aggregate.

**dstAggregate** (STRING): Name of the destination aggregate.

### mgmt.aba.abortMirrorMove

#### Severity

INFORMATIONAL

#### Description

This message occurs when Auto Balance Aggregate initiates a move of a volume that was then changed to be part of a SnapMirror® relationship".

#### Corrective Action

(None).

#### Syslog Message

The Auto Balance Aggregate initiated move of volume %s from aggregate %s to aggregate %s was aborted when the move job detected that the volume was now part of a SnapMirror relationship.

#### Parameters

**volume** (STRING): Name of the volume.

**srcAggregate** (STRING): Name of the source aggregate.

**dstAggregate** (STRING): Name of the destination aggregate.

### mgmt.aba.move.unbalanced

## Severity

INFORMATIONAL

## Description

This message occurs when Auto Balance Aggregate is running in auto mode and identifies an aggregate in which the used space has exceeded the high-water mark. Auto Balance Aggregate attempts to trigger moves to lower the aggregate's usage below the threshold.

## Corrective Action

Use the "volume move show" command to monitor active moves.

## Syslog Message

Auto Balance Aggregate has detected that aggregate %s has exceeded the threshold of %jd. The aggregate currently shows a usage of %jd.

## Parameters

**aggr** (STRING): Name of the aggregate.  
**usedSpace** (LONGINT): Aggregate's used space.  
**threshold** (LONGINT): Configured high-water mark.

## mgmt.aba.moveVolume

## Severity

INFORMATIONAL

## Description

This message occurs when Auto Balance Aggregate identifies a volume that can be moved to alleviate a low-space condition with an aggregate. The move will be initiated by Auto Balance Aggregate and can be monitored by using the "volume move show" command.

## Corrective Action

(None).

## Syslog Message

Auto Balance Aggregate is moving volume %s in Vserver %s from aggregate %s to aggregate %s. Upon completion of the move, the source aggregate is projected to be %d percent full and the destination aggregate is projected to be %d percent full.

## Parameters

**volume** (STRING): Volume that will be moved.  
**vserver** (STRING): Vserver hosting the volume.  
**srcAggr** (STRING): Aggregate the volume will be moved from.  
**dstAggr** (STRING): Aggregate the volume will be moved to.  
**afterSourceSpace** (INT): Projected percentage of used space in the source aggregate after the move is performed.  
**afterDestSpace** (INT): Projected percentage of used space in the destination aggregate after the move is performed.

## mgmt.aba.noMovableVols

## Severity

ERROR

## Description

This message occurs when Auto Balance Aggregate identifies an aggregate that is unbalanced but cannot identify a volume to move from that aggregate. Some of the more common reasons this can occur for an aggregate are that its volumes are being heavily accessed, its volumes have been recently moved, or Auto Balance Aggregate cannot identify an aggregate to move to.

## Corrective Action

Manually inspect the aggregate to determine whether any volumes can be moved.

## Syslog Message

Auto Balance Aggregate could not find any volumes to move from aggregate %s. The aggregate's calculated space is %jd and the threshold is %jd.

## Parameters

**aggregate** (STRING): Name of the aggregate.

**usedSize** (LONGINT): Recorded used size.

**threshold** (LONGINT): Configured threshold.

## mgmt.aba.rcmd.unbalanced

## Severity

ERROR

## Description

This message occurs when Auto Balance Aggregate is running in recommend mode and identifies an aggregate in which the used space has exceeded the high-water mark.

## Corrective Action

Use the "volume move recommend show" command to see the list of recommended actions.

## Syslog Message

Auto Balance Aggregate has detected that aggregate %s has exceeded the threshold of %jd. The aggregate currently shows a usage of %jd.

## Parameters

**aggr** (STRING): Name of the aggregate.

**usedSpace** (LONGINT): Aggregate's used space.

**threshold** (LONGINT): Configured high-water mark.

## mgmt.aba.recommendMove

## Severity

INFORMATIONAL

## Description

This message occurs when Auto Balance Aggregate identifies a volume that can be moved to alleviate a low-space condition with an aggregate. The move will not be initiated, but will be listed with other recommendations listed by running the "volume move recommend show" command.

## Corrective Action

If desired, initiate the recommended move by using the "volume move start" command.

## Syslog Message

Auto Balance Aggregate is recommending that volume %s in Vserver %s be moved from aggregate %s to aggregate %s. Upon completion of the move, the source aggregate is projected to be %d percent full and the destination aggregate is projected to be %d percent full.

## Parameters

**volume** (STRING): Volume identified as a candidate to move.

**vserver** (STRING): Vserver hosting the volume.

**srcAggr** (STRING): Aggregate the volume should be moved from.

**dstAggr** (STRING): Aggregate the volume should be moved to.

**afterSourceSpace** (INT): Projected percentage of used space in the source aggregate if the move is performed.

**afterDestSpace** (INT): Projected percentage of used space in the destination aggregate if the move is performed.

# mgmt.abv events

## mgmt.abv.service.filling

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ERROR

### Description

This message occurs when the percentage of data used on one or more data constituents in a storage service of a managed Infinite Volume exceeds the full watermark. Constituents that have exceeded the full watermark will receive no new content.

### Corrective Action

Either increase the size of this Infinite Volume by entering the "volume modify -size" command, or enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents within this storage service.

### Syslog Message

(None).

### Parameters

**vserver** (STRING): Vserver that hosts the constituent.

**storageService** (STRING): Storage service that holds the constituents.

**fullCount** (INT): Number of constituents that are full.

**totalCount** (INT): Total number of constituents within this storage service.

## mgmt.abv.service.full

## Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

## Severity

ALERT

## Description

This message occurs when the percentage of data used for all of the data constituents within an Infinite Volume's storage service have exceeded the Infinite Volume's full watermark. As a result, users cannot write any more data to this Infinite Volume that would be stored in this storage service by the create-time policy, and the post-ingest policy cannot move files to this storage service while all of its data constituents are in excess of the full watermark.

## Corrective Action

This storage service requires more capacity. Either increase the size of one or more of its data constituents, or add one or more new data constituents to it. After adding more capacity, it is strongly recommended that you enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents in this storage service.

## Syslog Message

The percentage of data used for all of the data constituents within an Infinite Volume's storage service has exceeded the Infinite Volume's full watermark. Vserver: %s, storage service: %s.

## Parameters

**vserver** (STRING): Vserver that hosts these constituents.

**storageService** (STRING): Storage service that holds the constituents.

## mgmt.abv.volume.filling

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ERROR

### Description

This message occurs when the percentage of data used on one or more data constituents in this Infinite Volume exceeds the full watermark. Constituents that have exceeded the full watermark will receive no new content.

### Corrective Action

Either increase the size of this Infinite Volume by entering the "volume modify -size" command, or enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents.

### Syslog Message

(None).

### Parameters

**vserver** (STRING): Vserver that hosts the constituent.

**fullCount** (INT): Number of full data constituents within this Infinite Volume.

**totalCount** (INT): Total number of data constituents within this Infinite Volume.

## mgmt.abv.volume.full

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ALERT

### Description

This message occurs when all of the data constituents within an Infinite Volume have exceeded the Infinite Volume's full watermark. Users cannot write any more data to this Infinite Volume.

### Corrective Action

Expand this Infinite Volume by entering the "volume modify -size" command. After expanding the Infinite Volume, it is strongly recommended that you enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents.

### Syslog Message

(None).

### Parameters

**vserver** (STRING): Vserver that hosts the constituents.

## mgmt.cifsserver events

### mgmt.cifsserver.failure

#### Severity

ERROR

#### Description

This message occurs when a CIFS server fails to be configured and, therefore, CIFS access might not be available.

#### Corrective Action

Check the reason for the error and take action accordingly. For further assistance, contact technical support.

#### Syslog Message

Failed to configure CIFS server. Error: %s.

#### Parameters

**reason** (STRING): Reason for the failure.

**vservername** (STRING): Name of the vservers.

**cifsservername** (STRING): Name of the cifs server.

### mgmt.cifsserver.success

#### Severity

INFORMATIONAL

## Description

This message occurs when a CIFS server is successfully configured after a failure.

## Corrective Action

(None).

## Syslog Message

(None).

## Parameters

**vservername** (STRING): Name of the vserver.

**cifsservername** (STRING): Name of the cifs server.

# mgmt.cifsshare events

## mgmt.cifsshare.duplicatesid

### Severity

NOTICE

### Description

This message occurs when a network client attempts to set a CIFS share's discretionary access control list (DACL) to a list where any security descriptor (SID) appears in more than one access control entry (ACE). The operation is failed and no changes are made to the share's DACL.

### Corrective Action

(None).

### Syslog Message

Duplicate SID not supported in CIFS share DACL %s

### Parameters

**vservername** (STRING): Name of the Vserver.

**cifssharename** (STRING): Name of the CIFS share.

**sid** (STRING): Textual SID.

## mgmt.cifsshare.failure

### Severity

ERROR

### Description

This message occurs when configuration of a CIFS share fails; CIFS access to the share might not be available.

### Corrective Action

Check the reason for the error and take action accordingly.

### Syslog Message

Failed to configure CIFS share. Error: %s.

## Parameters

**reason** (STRING): Reason for the failure.  
**vservername** (STRING): Name of the vserver.  
**cifsservername** (STRING): Name of the cifs server.  
**cifssharename** (STRING): Name of the cifs share.

## mgmt.cifsshare.success

### Severity

INFORMATIONAL

### Description

This message occurs when a CIFS share is successfully configured after a failure.

### Corrective Action

(None).

### Syslog Message

(None).

## Parameters

**vservername** (STRING): Name of the vserver.  
**cifssharename** (STRING): Name of the cifs share.

## mgmt.cifssuperuser events

### mgmt.cifssuperuser.failure

### Severity

ERROR

### Description

This message occurs when configuration of a CIFS super-user fails; CIFS access through this account may not grant full super-user privileges.

### Corrective Action

Check the reason for the error and take action accordingly.

### Syslog Message

Failed to configure CIFS superuser. Error: %s.

## Parameters

**reason** (STRING): Reason for the failure.  
**vservername** (STRING): Name of the vserver.  
**cifsservername** (STRING): Name of the cifs server.  
**cifsdomainname** (STRING): Name of the cifs domain.  
**accountname** (STRING): Name of the superuser account.

## mgmt.cifssuperuser.success

### Severity

INFORMATIONAL

### Description

This message occurs when a CIFS super-user is successfully configured after a failure.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**vservername** (STRING): Name of the vserver.  
**cifsservername** (STRING): Name of the cifs server.  
**cifsdomainname** (STRING): Name of the cifs domain.  
**accountname** (STRING): Name of the superuser account.

## mgmt.cifssymlink events

### mgmt.cifssymlink.failure

#### Severity

ERROR

#### Description

This message occurs when configuration of a CIFS symbolic link fails; the symbolic link might not be available through CIFS.

#### Corrective Action

Check the reason for the error and take action accordingly.

#### Syslog Message

Failed to configure CIFS symlink. Error: %s.

#### Parameters

**reason** (STRING): Reason for the failure.  
**vservername** (STRING): Name of the vserver.  
**unix\_path** (STRING): The UNIX path.

### mgmt.cifssymlink.success

#### Severity

INFORMATIONAL

#### Description

This message occurs when a CIFS symbolic link is successfully configured after a failure.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**vservername** (STRING): Name of the vserver.

**unix\_path** (STRING): The UNIX path.

## mgmt.cr events

### mgmt.cr.constituent.added

**Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

INFORMATIONAL

**Description**

This message occurs when a constituent volume is added to the Infinite Volume.

**Corrective Action**

(None).

**Syslog Message**

Constituent volume "%s" has been added to Infinite Volume "%s" in Vserver "%s". Its size is %ld bytes.

**Parameters**

**constituentName** (STRING): Name of the added volume.

**repositoryName** (STRING): Name of the Infinite Volume.

**vserverName** (STRING): Name of the Vserver.

**size** (LONGINT): Size of the added volume.

### mgmt.cr.constituent.deleted

**Deprecated**

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

**Severity**

INFORMATIONAL

**Description**

This message occurs when a constituent volume is deleted from the Infinite Volume.

**Corrective Action**

(None).

## Syslog Message

Constituent volume "%s" has been deleted from the Infinite Volume "%s" in Vserver "%s".

## Parameters

**constituentName** (STRING): Name of the deleted volume.

**repositoryName** (STRING): Name of the Infinite Volume.

**vserverName** (STRING): Name of the Vserver.

## mgmt.cr.constituent.failure

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ERROR

### Description

This message occurs when an Infinite Volume operation that operates on the constituent volumes succeeds, but fails on an individual constituent.

### Corrective Action

Fix the cause of the failure listed in the error, and then run the command again.

## Syslog Message

Repository job "%s" run on Infinite Volume "%s" in Vserver "%s" failed for constituent volume "%s": %s

## Parameters

**jobName** (STRING): Name of the repository job.

**repositoryName** (STRING): Name of the Infinite Volume.

**vserverName** (STRING): Name of the Vserver.

**constituentName** (STRING): Name of the constituent volume.

**reason** (STRING): Reason for the failure.

## mgmt.cr.constituent.resized

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

INFORMATIONAL

### Description

This message occurs when an Infinite Volume constituent volume is resized.

### Corrective Action

(None).

## Syslog Message

Constituent volume "%s" of Infinite Volume "%s" in Vserver "%s" has been resized to %ld bytes.

## Parameters

**constituentName** (STRING): Name of the resized volume.  
**repositoryName** (STRING): Name of the Infinite Volume.  
**vserverName** (STRING): Name of the Vserver.  
**size** (LONGINT): New size of the volume.

## mgmt.cr.job.failed

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ERROR

### Description

This message occurs when a repository job fails.

### Corrective Action

Fix the cause of the failure, listed in the error, and run the command again.

### Syslog Message

Repository job "%s" has failed for Infinite Volume "%s" in Vserver "%s": %s

## Parameters

**jobName** (STRING): Name of the repository job.  
**repositoryName** (STRING): Name of the Infinite Volume.  
**vserverName** (STRING): Name of the Vserver.  
**reason** (STRING): Reason for the failure.

## mgmt.cr.job.succeeded

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

INFORMATIONAL

### Description

This message occurs when a repository job is completed successfully.

### Corrective Action

(None).

### Syslog Message

Repository job "%s" has succeeded for Infinite Volume "%s" in Vserver "%s": %s

## Parameters

**jobName** (STRING): Name of the repository job.  
**repositoryName** (STRING): Name of the Infinite Volume.  
**vserverName** (STRING): Name of the Vserver.  
**reason** (STRING): Success message of the job.

## mgmt.cr.missing.footprint

### Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

### Severity

ERROR

### Description

This message occurs when Data ONTAP® is attempting to create or expand an Infinite Volume and cannot retrieve volume footprint information about a volume. The footprint information for all volumes on aggregates used by an Infinite Volume, even those in other Vservers, must be known to safely create or expand an Infinite Volume.

### Corrective Action

Ensure that the volume is healthy and online, and then retry the operation.

### Syslog Message

Unable to get footprint information about volume "%s" in Vserver "%s".;

### Parameters

**constituentName** (STRING): Name of the volume for which footprint information could not be retrieved.  
**vserverName** (STRING): Name of the Vserver the volume belongs to.

## mgmt.exovol events

### mgmt.exovol.transfer.failed

### Severity

ERROR

### Description

This message occurs when the replication engine fails to transfer exo-volume data.

### Corrective Action

If problem persists, Contact NetApp technical support.

### Syslog Message

The replication for volume dsid %jd, transfer-id %s failed to transfer %s exo-volume data, error: %d, failure reason: %s, extended failure reason: %s.

### Parameters

**volDsid** (LONGINT): Data set identifier of the volume.  
**transferId** (STRING): Replication transfer id.  
**streamType** (STRING): Type of data being transferred.  
**error** (INT): Transfer failure error code.  
**failureReason** (STRING): Basic reason for the failure.  
**extendendFailureReason** (STRING): Detailed reason for the failure.

## mgmt.exovol.xfer.dest.no.space

### Severity

ERROR

### Description

This message occurs when there is no free space left on the destination aggregate.

### Corrective Action

Please increase the amount of free space available on the destination aggregate.

### Syslog Message

The replication for volume dsid %jd, transfer-id %s failed to transfer %s exo-volume data because there is no free space left on the destination aggregate.

### Parameters

**volDsid** (LONGINT): Data set identifier of the volume.

**transferId** (STRING): Replication transfer id.

**streamType** (STRING): Type of data being transferred.

## mgmt.fpolicy events

### mgmt.fpolicy.policy.disabled

### Severity

INFORMATIONAL

### Description

This message occurs when a Vserver administrator disables an FPolicy® policy. No subsequent client requests will be processed and no notifications will be sent to FPolicy servers attached with this policy.

### Corrective Action

(None).

### Syslog Message

FPolicy policy %s is disabled on Vserver %s.

### Parameters

**policyname** (STRING): Name of the policy.

**vservername** (STRING): Name of the Vserver.

### mgmt.fpolicy.policy.enabled

### Severity

INFORMATIONAL

### Description

This message occurs when a Vserver administrator enables an FPolicy® policy. Based on the event configuration, subsequent client requests will be processed, notifications will be generated, and notifications might be sent (based on the policy configuration) to FPolicy servers attached with this policy.

**Corrective Action**

(None).

**Syslog Message**

FPolicy policy %s is enabled on Vserver %s.

**Parameters**

**polycname** (STRING): Name of the policy.

**vservername** (STRING): Name of the Vserver.

**mgmt.fpolicy.priv.failed****Severity**

ERROR

**Description**

This message occurs when the creation of privileged share ONTAP\_ADMIN\$ fails. Attempted connections to ONTAP\_ADMIN\$ share by the FPolicy servers will fail.

**Corrective Action**

Check the reason for failure and take action accordingly. If the problem persists, contact NetApp technical support for assistance.

**Syslog Message**

Failed to create privileged share ONTAP\_ADMIN\$ for Vserver "%s". Reason: "%s".

**Parameters**

**vserverName** (STRING): Name of the Vserver.

**reason** (STRING): Reason for failure.

**mgmt.fpolicy.replay.failed****Severity**

ERROR

**Description**

This message occurs when an FPolicy® configuration replication mechanism fails after a maximum number of retries.

**Corrective Action**

Restart the node or contact NetApp technical support for assistance.

**Syslog Message**

FPolicy configuration replication process failed.

**Parameters**

(None).

# mgmt.fsecurity events

## mgmt.fsecurity.failure

### Severity

ERROR

### Description

This message occurs when applying configuration of fsecurity fails.

### Corrective Action

Wait for a while and reapply using the "vserver security file-directory apply" command. See the "vserver security file-directory" man pages for information, or if the problem persists, contact NetApp technical support.

### Syslog Message

Failed to apply file security policy. Error: %s.

### Parameters

**reason** (STRING): Reason for the failure.

**vservername** (STRING): Name of the vserver.

## mgmt.fsecurity.success

### Severity

INFORMATIONAL

### Description

This message occurs when a file security policy was applied successfully after a previous failure.

### Corrective Action

(None).

### Syslog Message

(None).

### Parameters

**vservername** (STRING): Name of the Vserver.

# mgmt.keymgr events

## mgmt.keymgr.keyid.noDelete

### Severity

ERROR

### Description

This message occurs when the system cannot delete the key ID associated with the encrypted aggregate from the key management server.

### Corrective Action

Manually delete the key ID associated with the encrypted aggregate from the key management server.

### Syslog Message

Encrypted aggregate "%s" with UUID "%s" has been deleted. The key ID "%s" was associated with this aggregate and must be manually deleted from the key management server.

### Parameters

**name** (STRING): Aggregate name.

**uuid** (STRING): Unique identifier of the aggregate when the aggregate name by itself is insufficient.

**key\_id** (STRING): Unique key ID used by the encrypted aggregate.

## mgmt.mcc events

### mgmt.mcc.fsecurity.config.err

#### Severity

ERROR

#### Description

This message occurs when MetroCluster(tm) switchback or switchover happens while applying a file security (fsecurity) policy on the MetroCluster partner. The policy was not applied to the partner.

#### Corrective Action

Reapply the policy by using the "vserver security file-directory apply" command. See the "vserver security file-directory" man pages for information. If the problem persists, contact NetApp technical support.

#### Syslog Message

Failed to apply file security policy "%s" on Vserver "%s".

#### Parameters

**policy** (STRING): Fsecurity policy name.

**vservername** (STRING): Name of the Vserver.

## mgmt.nfslisteners events

### mgmt.nfslisteners.failure

#### Severity

ERROR

#### Description

This message occurs when the listener for the NFS service is not configured. If the problem persists, NFS access is not available.

#### Corrective Action

This problem might be resolved by subsequent automatic retries of the NFS request. If NFS service is not available, check the NFS configuration of the service and the external services it uses. To verify NFS configuration of the service, use the "nfs server show -vserver <vserver name> [-fields <field name>]" command. If the problem persists after you check the NFS configuration, delete the NFS Vserver, and then

re-create it. See the NFS man page guide for information about deleting and re-creating the NFS Vserver, or contact NetApp technical support.

### **Syslog Message**

Failed to configure NFS listener. Error: %s.

### **Parameters**

**reason** (STRING): Message provided by the NFS service when a listener configuration does not succeed.

## **mgmt.nfslisteners.success**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when the listener for the NFS service is configured after a failure.

### **Corrective Action**

(None).

### **Syslog Message**

(None).

### **Parameters**

(None).

## **mgmt.nfsserver events**

### **mgmt.nfsserver.failure**

### **Severity**

ERROR

### **Description**

This message occurs when a NFS server fails to be configured and, therefore, NFS access might not be available.

### **Corrective Action**

Check the reason for the error and take action accordingly. For further assistance, contact technical support.

### **Syslog Message**

Failed to configure NFS server. Error: %s.

### **Parameters**

**reason** (STRING): Reason for the failure.

**vservername** (STRING): Name of the vservers.

### **mgmt.nfsserver.success**

**Severity**

INFORMATIONAL

**Description**

This message occurs when a NFS server is successfully configured after a failure.

**Corrective Action**

(None).

**Syslog Message**

(None).

**Parameters**

**vservname** (STRING): Name of the nfs server.

## mgmt.rst events

### mgmt.rst.fail.dst.compressed

**Severity**

ERROR

**Description**

This message occurs when the SnapMirror® 'restore' command fails because compression is enabled on the destination volume.

**Corrective Action**

Force a cleanup of the failed operation by reissuing the 'restore' command with the parameter 'clean-up-failure', disable compression on the destination volume, create a Snapshot(tm) copy, and then reissue the 'restore' command.

**Syslog Message**

SnapMirror restore from source volume '%s' to destination volume '%s' failed with error: %s.

**Parameters**

**srcpath** (STRING): Path name of the source volume for restore.

**dstpath** (STRING): Path name of the destination volume for restore.

**error** (STRING): Error message.

## mgmt.s3 events

### mgmt.s3.sm.license.near.limit

**Severity**

NOTICE

**Description**

This message occurs when the total cluster-wide logical used size for S3 Snapmirror external object store relationships is near the license capacity limit but does not exceed the limit.

### **Corrective Action**

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

### **Syslog Message**

%s.

### **Parameters**

**message** (STRING): Capacity warning message for users

## **mgmt.s3.sm.license.over.limit**

### **Severity**

ERROR

### **Description**

This message occurs when the total cluster-wide bucket used size for S3 Snapmirror external object store relationships is over the license capacity limit.

### **Corrective Action**

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

### **Syslog Message**

%s.

### **Parameters**

**message** (STRING): Capacity warning message for users

## **mgmt.sm events**

### **mgmt.sm.cant.clear.autoinit**

### **Severity**

NOTICE

### **Description**

This message occurs when a SnapMirror® protect operation fails because the source volume is already protected with a SnapMirror relationship in the specified destination Vserver with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix and auto-initialize parameter set to true. The auto-initialize parameter cannot be cleared on a SnapMirror relationship once it is set to true.

### **Corrective Action**

(None).

### **Syslog Message**

Job ID %lld failed to disable auto-initialize for SnapMirror relationship on volume %s, destination vserver %s. This operation is not permitted.

## Parameters

**jobID** (LONGINT): Job ID.

**srcpath** (STRING): Path name of the source volume to be protected.

**dstvserver** (STRING): Destination Vserver name.

## mgmt.sm.cg.force.delete

### Severity

ERROR

### Description

This message occurs when a sync granular consistency group relationship is being deleted with the force option. Consistency Group relationship will be the deleted, however the items of the Consistency Group might not be made read-write or deletable after the operation.

### Corrective Action

Perform a volume offline and online on the destination volume to trigger the cleanup of any remaining relationship information on the volume.

### Syslog Message

Sync granular consistency group relationship with source path %s and destination path %s has been force deleted and items of the consistency group on the destination volume might not be read-write or deletable.

## Parameters

**src\_path** (STRING): Source path of the sync granular consistency group relationship that was force deleted.

**dst\_path** (STRING): Destination path of the sync granular consistency group relationship that was force deleted.

## mgmt.sm.dp.depr.msg

### Severity

NOTICE

### Description

SnapMirror relationships of type DP are deprecated. From the previous release, users were no longer able to initialize new relationships of type DP. From this release, relationships of type DP will no longer function.

### Corrective Action

Use SnapMirror relationships of type XDP instead of type DP.

### Syslog Message

SnapMirror relationships of type DP are deprecated in this ONTAP release.

## Parameters

(None).

## mgmt.sm.ep.cant.clr.autolnit

### Severity

NOTICE

## Description

This message occurs when a SnapMirror® protect operation fails because the source is already protected with a SnapMirror relationship that has the specified destination endpoint type and the same "-destination-volume-prefix" and "-destination-volume-suffix" parameter values, with the "-auto-initialize" parameter set to "true". The "-auto-initialize" parameter cannot be cleared on a SnapMirror relationship after it is set to "true".

## Corrective Action

To change the auto-initialize behavior, delete and release the existing SnapMirror relationship by using the "snapmirror delete" command and the "snapmirror release" command, and then establish another relationship without auto-initialize.

## Syslog Message

Job ID %lld: Failed to disable auto-initialize for SnapMirror relationship from source %s to destination endpoint type %s. This operation is not permitted.

## Parameters

**jobID** (LONGINT): Job ID.  
**srcpath** (STRING): Path name of the source to be protected.  
**dsteptype** (STRING): Destination endpoint type.

## mgmt.sm.expand.overprovision

### Severity

ERROR

### Description

This message occurs when a volume expand job starts for the source of a SnapMirror® relationship and the provisioning check finds that there isn't enough free space on the aggregates for destination volume. The source volume expand job is not impacted, but auto-expand will fail for the destination FlexGroup after the source FlexGroup is expanded.

### Corrective Action

Increase the size of the aggregates for the destination Flexgroup volume.

### Syslog Message

The aggregates on the cluster hosting destination FlexGroup volume '%s' do not have enough free space to be used for expanding the FlexGroup volume. Expansion of the destination will fail until the size of enough aggregates is increased to provide enough space.

### Parameters

**dstVolume** (STRING): Destination volume name of the SnapMirror® relationship.

## mgmt.sm.keymgr.not.setup

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation on an encrypted source volume fails because the Key Manager is not set up on the destination node. A SnapMirror relationship with the destination in the specified destination Vserver to protect the source volume will not be created until this condition is corrected.

### Corrective Action

Set up the Key Manager by using the "security key-manager setup" command on the destination.

### Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because the Key Manager was not set up on the destination cluster. Job ID: %llu.

### Parameters

**srcpath** (STRING): Path name of the source volume to be protected.

**dstvserver** (STRING): Destination Vserver name.

**jobID** (LONGINT): Job ID.

## mgmt.sm.license.near.limit

### Severity

NOTICE

### Description

This message occurs when the total cluster-wide physical used size for object store relationships is near the license capacity limit but does not exceed the limit.

### Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

### Syslog Message

%s.

### Parameters

**message** (STRING): Capacity warning message for users

## mgmt.sm.license.not.found

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation of a source volume fails because a required license on the destination cluster is missing. The error message contains the information about the missing license. A SnapMirror relationship with the destination in the specified destination Vserver to protect the source volume will not be created until this condition is corrected.

### Corrective Action

Install the license that is missing on the destination cluster. The error message contains information about the missing license.

### Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because there was a license missing on the destination cluster. Error: %s, Job ID: %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume to be protected.  
**dstvserver** (STRING): Destination Vserver name.  
**error** (STRING): Error message.  
**jobID** (LONGINT): Job ID.

## mgmt.sm.license.over.limit

### Severity

ERROR

### Description

This message occurs when the total cluster-wide physical used size for object store relationships is over the license capacity limit.

### Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

### Syslog Message

%s.

## Parameters

**message** (STRING): Capacity warning message for users

## mgmt.sm.obj.fanout.unsupp

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails because the source is already protected with a SnapMirror relationship with an object store destination. Creation of multiple SnapMirror relationships from a source endpoint to object store destinations is not supported.

### Corrective Action

View the existing SnapMirror relationship using the "snapmirror show" command, and correct as necessary.

### Syslog Message

Source endpoint "%s" is already protected in an object store. Job ID: %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume to be protected.  
**jobID** (LONGINT): Job ID.

## mgmt.sm.protect.internal.err

### Severity

ERROR

## Description

This message occurs when a SnapMirror® protect operation fails because of an unexpected internal error.

## Corrective Action

Retry the command after some time. If the problem persists, contact NetApp technical support.

## Syslog Message

SnapMirror protect failed because of an unexpected internal error. Error: %s, Job ID: %llu.

## Parameters

**error** (STRING): Error message.

**jobID** (LONGINT): Job ID.

## mgmt.sm.rel.exists

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails because the source volume is already protected with a SnapMirror relationship in the specified destination Vserver with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix.

### Corrective Action

If you want to protect the volume again, 1. Use a different destination volume suffix or destination volume prefix. 2. Use a different schedule or policy. 3. Use the "volume create" command to create a destination volume with a user defined name and then the "snapmirror create" command to create another SnapMirror relationship for the same source volume.

### Syslog Message

SnapMirror protect operation of source volume "%s" failed to destination Vserver "%s" because the source volume is already protected with a SnapMirror relationship in the specified destination Vserver with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix. Error: %s, Job ID: %llu.

### Parameters

**srcpath** (STRING): Path name of the source volume to be protected.

**dstvserver** (STRING): Destination Vserver name.

**error** (STRING): Error message.

**jobID** (LONGINT): Job ID.

## mgmt.sm.rename.ndu.error

### Severity

ERROR

### Description

This message occurs when the renaming of a SnapMirror® volume in another cluster fails, due to the lack of support for this operation in that cluster's effective version of ONTAP® software.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Failed to update Volume name "%s" in remote cluster "%s".

**Parameters**

**volume** (STRING): Volume for which the rename operation failed.

**clusName** (STRING): Remote cluster name.

**mgmt.sm.restore.fail****Severity**

ERROR

**Description**

This message occurs when the SnapMirror® 'restore' command fails.

**Corrective Action**

To retry the restore, reissue the command. Alternatively, force a cleanup of the failed operation without starting another restore by including the parameter 'clean-up-failure' when reissuing the 'restore' command.

**Syslog Message**

SnapMirror restore from source volume '%s' to destination volume '%s' failed with error: %s.

**Parameters**

**srcpath** (STRING): Path name of the source volume for restore.

**dstpath** (STRING): Path name of the destination volume for restore.

**error** (STRING): Error message.

**mgmt.sm.schd.invalid****Severity**

ERROR

**Description**

This message occurs when the SnapMirror® protect operation fails to find the specified schedule name or the schedule has not been specified. A SnapMirror relationship with the destination will be created and initialized, if auto-initialize is enabled, but subsequent periodic backup operations will not be initiated.

**Corrective Action**

Add a valid schedule.

**Syslog Message**

The schedule "%s" is not valid or has not been specified.

**Parameters**

**schd\_name** (STRING): Name of the schedule that is invalid.

## mgmt.sm.schd.unavailable

### Severity

ERROR

### Description

This message occurs when a schedule is not available on the secondary site for configuration replication of a SnapMirror® relationship of -type Load Sharing (LS) in a MetroCluster(tm) configuration.

### Corrective Action

Create a job schedule on the secondary site that is identical to that on the primary site by using the 'job schedule cron create' command.

### Syslog Message

Configuration replication of SnapMirror relationship of -type Load Sharing for destination path "%s" has failed because the schedule "%s" is not available.

### Parameters

**dstpath** (STRING): Destination path name of the SnapMirror relationship.

**schd\_name** (STRING): Name of the schedule that is unavailable on the secondary site.

## mgmt.sm.snap.create.fail

### Severity

ALERT

### Description

This message occurs when a SnapMirror® "snapshot create" task fails on the destination volume, after successfully converting a FlexVol® volume to a FlexGroup. Future SnapMirror transfers will be unsuccessful.

### Corrective Action

Create the baseline Snapshot copy on destination volume "%s" using the "volume conversion create-destination-snapshot" command, and then re-create the SnapMirror relationship using the "snapmirror create -destination-path %s -source-path %s -policy %s -throttle %d -schedule %s" command.

### Syslog Message

Create the baseline Snapshot copy on destination volume "%s" using the "volume conversion create-destination-snapshot" command, and then re-create the SnapMirror relationship using the "snapmirror create -destination-path %s -source-path %s -policy %s -throttle %s -schedule %s" command.

### Parameters

**volume** (STRING): Volume converted to a FlexGroup.

**dstPath** (STRING): Destination path for SnapMirror create.

**srcPath** (STRING): Source path for SnapMirror create.

**policy** (STRING): Policy for SnapMirror create.

**throttle** (STRING): Throttle for SnapMirror create.

**schedule** (STRING): Schedule for SnapMirror create.

## mgmt.sm.src.policy.creat

## Severity

ALERT

## Description

This message occurs when a reverse resync operation was performed from System Manager and the SnapMirror policy associated with an intercluster SnapMirror relationship was replicated to the source from the destination, but the retention period in the policy was not replicated. This will happen only if the source cluster ONTAP® version is earlier than ONTAP 9.13.1. Because the retention period was not associated with the Snapshot copies, the Snapshot copies are prone to deletion, which might lead to data protection issues.

## Corrective Action

Add the retention period to the appropriate rules of the SnapMirror policy in the source cluster using the command "snapmirror policy modify-rule -vserver <storage\_VM\_name> -policy <policy\_name> -snapmirror -label <snapmirror\_label\_name> -retention-period <retention\_period>".

## Syslog Message

The retention period setting in the destination SnapMirror policy "%s" has not been replicated to the source during a reverse resync, and it might need to be updated manually.

## Parameters

**policyName** (STRING): Name of the policy associated with the SnapMirror relationship that was replicated from the destination to source.

## mgmt.sm.src.vol.not.found

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails because the source volume was not found.

### Corrective Action

Check whether the source path is correct, and then retry the operation with the correct path.

### Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because the source volume was not found. Job ID: %llu.

### Parameters

**srcpath** (STRING): Path name of the source volume to be protected.

**dstvserver** (STRING): Destination Vserver name.

**jobID** (LONGINT): Job ID.

## mgmt.sm.sync.break.dp.error

### Severity

ERROR

## Description

This message occurs when a SnapMirror® break operation fails on a synchronous SnapMirror destination volume, because the destination is either in the "broken-off" state, or another state that is inconsistent with the operation.

## Corrective Action

Contact NetApp technical support.

## Syslog Message

SnapMirror break operation failed for sync SnapMirror relationship with destination volume "%s" because the destination volume is either in the broken-off state or the volume state is inconsistent.

## Parameters

**dstpath** (STRING): Path name of the destination volume.

## mgmt.sm.v2.upgrade.chk

### Severity

ERROR

### Description

This message occurs after booting, when there is a Data Protection relationship created in a Data ONTAP® release prior to 8.2.

### Corrective Action

Establish Vserver peering so that the system can convert the pre-8.2 relationships to 8.2 and later relationships. Vserver peering can only be established if both endpoints are running Data ONTAP 8.2 or later on all nodes in the cluster. To check whether the source cluster supports Data ONTAP 8.2 SnapMirror® relationships, run the "capability show -node \* -capability volume.snapmirror\_v2" command. If the capability is "true" on all nodes, create a Vserver peer relationship between the source and destination endpoint Vservers by issuing the "vserver peer create" command. If the capability is "false" on any node in the source cluster, upgrade and configure the source cluster by following instructions in the Upgrade and Revert/Downgrade Guide.

### Syslog Message

SnapMirror relationships from a pre-8.2 installation are present on this cluster but no Vserver peer relationships were found between the source and destination Vservers.

### Parameters

(None).

## mgmt.sm.vol.place.create.err

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails to find an aggregate with sufficient free space for a destination volume or fails to create the volume. A SnapMirror relationship with the destination in the specified destination Vserver to protect the source volume will not be created until this condition is corrected.

## Corrective Action

Use the "vserver show -vserver <vserver-name> -fields aggr-list" command to check whether there is a list of aggregates assigned to the destination Vserver. If there are aggregates listed, check the status of and the space left in the storage aggregates belonging to that Vserver. If there are no aggregates listed, then check the status of and the space left in all of the non-root, non-taken-over and non-SnapLock aggregates. To check whether storage aggregates are non-root, non-taken-over and non-SnapLock, run the "storage aggregate show -fields root, is-home, snaplock-type" command. To check the status of and the space left in a storage aggregate, run the "storage aggregate show -aggregate <aggr-name>" command for a particular aggregate or "storage aggregate show" for all storage aggregates on the cluster. If storage aggregates are offline, use "storage aggregate online -aggregate <aggr-name>" command to bring the storage aggregates online. If there is no space in the storage aggregates: 1) Use the "vserver add-aggregates -vserver <vserver-name> -aggregates <aggr-name>" command to add more storage aggregates to the destination Vserver. 2) If needed, use the "storage aggregate create -aggregate <aggr-name> -diskcount <number-of-disks> -node <node-name>" command to create new storage aggregates on available nodes. 3) Use the "storage aggregate add-disks -aggregate <aggr-name> -diskcount <number-of-disks>" command to add space to the storage aggregate. Even if there is free space on storage aggregates, it is possible that the maximum number of volumes already exist on a node. If so, additional volumes cannot be created on that node. If this is the case, add more aggregate space on other nodes. You can determine the number of volumes on a node by using the "volume show -node <node-name>" command. Note the entry count at the end of the show output. To check the overall status of the SnapMirror protect operation, use the "job show <jobID> -instance" or "job history show -id <jobID> -instance" commands. If the problem persists, contact NetApp technical support.

## Syslog Message

SnapMirror protect of source volume "%s" failed on destination Vserver "%s". Error: %s, Job ID: %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume to be protected.  
**dstvserver** (STRING): Destination Vserver name.  
**error** (STRING): Error message.  
**jobID** (LONGINT): Job ID.

## mgmt.sm.vol.style.unsupp

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails because the source volume style is not supported. The SnapMirror protect command only supports FlexVol® volumes. FlexGroups, FlexGroup constituents, Infinite Volumes, and Infinite Volume constituents are not supported. Temporary volumes are also not supported.

## Corrective Action

If you want to protect Infinite Volumes or FlexGroups, you must use the individual commands: 1. "volume create" of the destination volume 2. "snapmirror create" of the relationship 3. "snapmirror initialize" of the relationship Creating individual SnapMirror relationships on FlexGroup constituents or Infinite Volume constituents is not supported.

## Syslog Message

SnapMirror protect of source volume "%s" failed because the volume is not a FlexVol volume. Job ID: %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume to be protected.

**jobID** (LONGINT): Job ID.

## mgmt.sm.vsrs.not.peered

### Severity

ERROR

### Description

This message occurs when a SnapMirror® protect operation fails because either the source or destination Vservers do not exist or the source and destination Vservers are not peered. A SnapMirror relationship with the specified destination Vserver will not be created, and the source volume will not be protected, until this condition is corrected.

### Corrective Action

Use the 'vserver show' and 'vserver peer' commands to verify that the source and destination Vservers exist and are named uniquely. Also make sure that the 'snapmirror protect' operation targets the intended Vservers. See the man pages of these commands for further information.

### Syslog Message

SnapMirror protect operation of source volume "%s" failed because destination Vserver "%s" and source Vserver %s are not peered. Job ID: %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume to be protected.

**srcvserver** (STRING): Source Vserver name.

**dstvserver** (STRING): Destination Vserver name.

**jobID** (LONGINT): Job ID.

## mgmt.smbc events

### mgmt.smbc.config.not.repl

### Severity

NOTICE

### Description

This message occurs when the system fails to replicate the configuration of Report Target Group Port(RTPG) and Inter-Cluster(IC) LIF information.

### Corrective Action

(None).

### Syslog Message

Failure in configuration replication of RTPG, IC LIF information with relationship UUID "%s".

## Parameters

**srcpath** (STRING): Path name of the source group of the SnapMirror Business Continuity relationship.

**dstpath** (STRING): Path name of the destination group of the SnapMirror Business Continuity relationship.

**relationship\_id** (STRING): Relationship UUID.

## mgmt.smbc.proxy.create.fail

### Severity

ERROR

### Description

This message occurs when there is a failure to create proxy I/O path channel between the SMBC peer clusters.

### Corrective Action

Check the network connection between the source and destination volumes by using the "net interface show -role intercluster -status-admin up" command.

### Syslog Message

Failure in proxy initiator %s and target %s creation.

### Parameters

**proxy\_initiator** (STRING): Path name of the proxy initiator.

**proxy\_target** (STRING): Path name of the proxy target.

**relationship\_id** (STRING): Relationship UUID.

**error\_msg** (STRING): Description of the failure.

## mgmt.snapmir events

### mgmt.snapmir.dst.invalidType

#### Severity

ERROR

#### Description

This message occurs when the destination volume of a SnapMirror® relationship is not of -type Data Protection (DP) or Load Sharing (LS), and a 'snapmirror initialize' operation is attempted. A volume must be of -type DP or LS to accept a 'snapmirror initialize' operation.

#### Corrective Action

Use a different volume of -type DP or LS, or use the 'volume create' command to create a new volume of -type DP or LS to use as a destination of the SnapMirror relationship. You cannot modify the type of a volume using the 'volume modify' command.

#### Syslog Message

Destination volume '%s' of a SnapMirror relationship is not of -type DP or LS. Job ID %llu.

#### Parameters

**dstpath** (STRING): Path name of the destination volume of the SnapMirror relationship.

**jobID** (LONGINT): Job ID.

### mgmt.snapmir.fl.bkt.del.fail

#### Severity

ERROR

## Description

This message occurs when a bucket could not be deleted during a cleanup of a SnapMirror restore or create operation. Because the operation did not complete successfully, the bucket might be left in an inconsistent state.

## Corrective Action

Use the "object-store-server bucket delete" command to delete the bucket.

## Syslog Message

Bucket "%s" could not be deleted as part of the clean up of a SnapMirror create or restore operation.

## Parameters

**bucket** (STRING): Name of the bucket in the SnapMirror relationship.

## mgmt.snapmir.fl.crt.cleanup

### Severity

ERROR

### Description

This message occurs when the cleanup of a link failed when it encountered an error during a SnapMirror create operation. Because the link could not be cleaned up properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

### Corrective Action

1. Run the "snapmirror delete" command to delete the link.

### Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s".

### Parameters

**sourceBucket** (STRING): Name of the source bucket in the SnapMirror relationship.

**destBucket** (STRING): Name of the destination bucket in the SnapMirror relationship.

**error** (STRING): Error that was encountered.

## mgmt.snapmir.fl.failover.rmt

### Severity

ERROR

### Description

This message occurs when the remote bucket was not demoted during a failover operation. This could allow the remote bucket to still accept the traffic even though it is no longer permitted to so. Use the "demote bucket" command to avoid this situation.

### Corrective Action

Use the "fabriclink demote-bucket" command in the cluster where remote bucket "%s" is located.

### Syslog Message

Failover failed for remote bucket "%s".

## Parameters

**remoteBucket** (STRING): Name of the remote bucket for which the failover operation failed.

## mgmt.snapmir.fl.mod.rmt.fail

### Severity

NOTICE

### Description

This message occurs when the links on a remote cluster could not be modified during the execution of the "snapmirror modify" command. Even though the SnapMirror policy was modified, some of the links on the remote cluster could not be updated with new rpo/ throttle values. There is no detectable impact until a failover is performed. Only when a failover is performed would the reverse link be used, and it would still be functional even if the links on the remote cluster were not updated previously. They would just be using old rpo/throttle values.

### Corrective Action

(None).

### Syslog Message

Links on remote cluster "%s" were not modified.

## Parameters

**clusterUuid** (STRING): Cluster UUID of the cluster where the links were not updated.

## mgmt.snapmir.fl.rstr.bkt.cln

### Severity

ERROR

### Description

This message occurs when objects in a restore bucket were not deleted during the cleanup of a SnapMirror restore operation. The restore bucket has objects in it even though the restore relationship no longer exists.

### Corrective Action

Delete the objects in bucket "%s".

### Syslog Message

Objects in bucket "%s" were not deleted during a restore failure cleanup.

## Parameters

**restoreBucket** (STRING): Name of the restore bucket in the SnapMirror relationship.

## mgmt.snapmir.fl.rstr.cln.all

### Severity

ERROR

### Description

This message occurs when the deletion of objects and the cleanup of link failed when the operations encountered an error during a SnapMirror restore operation. Because the link could not be cleaned up

properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

### Corrective Action

1. Run the "snapmirror delete" command to delete the link.
2. Delete the objects in the restore bucket.

### Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s" and the objects in the restore bucket could not be deleted.

### Parameters

**sourceBucket** (STRING): Name of the source bucket in the SnapMirror relationship.

**destBucket** (STRING): Name of the destination bucket in the SnapMirror relationship.

**error** (STRING): Error that was encountered.

## mgmt.snapmir.fl.rstr.lnk.cln

### Severity

ERROR

### Description

This message occurs when the cleanup of a link failed when it encountered an error during a SnapMirror restore operation. Because the link could not be cleaned up properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

### Corrective Action

Run the "snapmirror delete" command to delete the link.

### Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s".

### Parameters

**sourceBucket** (STRING): Name of the source bucket in the SnapMirror relationship.

**destBucket** (STRING): Name of the destination bucket in the SnapMirror relationship.

**error** (STRING): Error that was encountered.

## mgmt.snapmir.init.fail

### Severity

ERROR

### Description

This message occurs when a SnapMirror@ 'initialize' or 'initialize-ls-set' command fails and no more retries will be attempted.

### Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

### Syslog Message

Initialize from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.  
**dstpaths** (STRING): Path names of the destination volumes to which the initialize failed.  
**error** (STRING): Error message.  
**jobID** (LONGINT): Job ID.

## mgmt.snapmir.ls.catchup.fail

### Severity

ALERT

### Description

This message occurs when a catch-up update for a lagging member in a load-sharing set fails.

### Corrective Action

Check the reason for the error and take action accordingly.

### Syslog Message

Load-share catch-up update transfer from source volume '%s' to destination volume '%s' failed with error '%s'. Job ID %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume of the SnapMirror® relationship.  
**dstpath** (STRING): Path name of the destination volume to which the catch-up update transfer failed.  
**error** (STRING): Error message.  
**jobID** (LONGINT): Job ID.

## mgmt.snapmir.resync.fail

### Severity

ALERT

### Description

This message occurs when a SnapMirror® 'resync' command fails and no more retries will be attempted.

### Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

### Syslog Message

Resync from source volume '%s' to destination volume '%s' failed with error '%s'. Job ID %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.  
**dstpath** (STRING): Path name of the destination volume to which the resync failed.  
**error** (STRING): Error message.  
**jobID** (LONGINT): Job ID.

## mgmt.snapmir.schd.trans.fail

**Severity**

ALERT

**Description**

This message occurs when a scheduled SnapMirror® transfer fails and no automatic retry will be attempted until the next scheduled transfer.

**Corrective Action**

Check the reason for the error and take action accordingly.

**Syslog Message**

Scheduled transfer from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

**Parameters**

**srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.

**dstpaths** (STRING): Path names of the destination volumes to which the scheduled transfer failed.

**error** (STRING): Error message.

**jobID** (LONGINT): Job ID.

**mgmt.snapmir.schd.trans.overrun****Severity**

ERROR

**Description**

This message occurs when a scheduled SnapMirror® transfer overruns the schedule window.

**Corrective Action**

Check the reason for the schedule overrun and take action accordingly.

**Syslog Message**

Scheduled transfer from source volume '%s' to destination volume(s) '%s' is taking longer than the schedule window. Job ID %llu.

**Parameters**

**srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.

**dstpaths** (STRING): Path names of the destination volumes of the scheduled transfer.

**jobID** (LONGINT): Job ID.

**mgmt.snapmir.unexpected.err****Severity**

ERROR

**Description**

This message occurs when a SnapMirror operation encounters an unexpected error. JobID might be zero if the job ID could not be determined at the time the error was generated.

**Corrective Action**

If the problem persists, contact NetApp technical support.

## Syslog Message

SnapMirror unexpected error '%s'. Job ID %llu.

## Parameters

**error** (STRING): Error message.

**jobID** (LONGINT): Job ID.

## mgmt.snapmir.update.fail

### Severity

ALERT

### Description

This message occurs when a SnapMirror® 'update' or 'update-ls-set' command fails and no more retries will be attempted.

### Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

## Syslog Message

Update from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

## Parameters

**srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.

**dstpaths** (STRING): Path names of the destination volumes to which the update failed.

**error** (STRING): Error message.

**jobID** (LONGINT): Job ID.

## mgmt.vdr events

### mgmt.vdr.fsecurity.config.err

### Severity

ERROR

### Description

This message occurs when a "snapmirror break" operation is executed while a file security job is running and the previous "snapmirror update" operation only partially transfers the changes made to the file system by the file security job. This results in the policy being applied only partially to the partner; that is, ACLs on the files are applied partially.

### Corrective Action

Verify that the file security job has been successfully applied on the Vserver DR partner by using the "job show" command on the source; it should display the "complete" status. Then resync the SnapMirror® relationship by using the "snapmirror resync -source-vserver <source-vserver-name> -destination-vserver <destination-vserver-name>" command. Alternatively, you can break the SnapMirror relationship, and then reapply the job on the destination by using the "vserver security file-directory apply -vserver <vserver-name> -policy-name <policy-name>" command. See the "vserver security file-directory" man pages for more information. If the problem persists, contact NetApp technical support.

## Syslog Message

Failed to apply file security policy "%s" on Vserver "%s".

## Parameters

**policy** (STRING): Fsecurity policy name.  
**vservername** (STRING): Name of the Vserver.

# mgmt.vopl.events

## mgmt.vopl.cleanup.failed

### Severity

ALERT

### Description

This message occurs when the system encounters an error trying to clean up after a failed 'volume move' operation.

### Corrective Action

Contact NetApp technical support..

## Syslog Message

'volume move' cleanup operation with job ID '%jd' failed in step (%s) with the error (%s) for volume '%s' in Vserver '%s'.

## Parameters

**jobID** (LONGINT): Job ID of the 'volume move' operation.  
**step** (STRING): Phase during cleanup where the error occurred.  
**error** (STRING): Error recorded during the cleanup phase.  
**volName** (STRING): Name of the source volume.  
**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.del.staleLunMaps

### Severity

ERROR

### Description

This message occurs when a 'volume delete' operation cannot delete LUN initiator group maps for the LUNs in the volume, resulting in stale LUN initiator group maps. Any attempt to delete these initiator groups that are mapped to nonexistent LUNs (provided that they are not mapped to any other LUNs) fails. 'lun mapped show -igroup <igroup name>' does not list any maps, but 'igroup delete -igroup <igroup name>' fails with an error, suggesting that the initiator group cannot be deleted because it is mapped to LUNs.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

Could not delete LUN initiator group maps for the volume with MSID '%llu' on Vserver '%s'. Error: %s.

## Parameters

**volMsid** (LONGINT): Master data set ID of the volume being deleted.

**vserver** (STRING): Vserver hosting the volume.

**error** (STRING): Internal software error.

## mgmt.vopl.fail.restart.nosvol

### Severity

ALERT

### Description

This message occurs when a 'volume move' operation fails in the restart phase because the source volume is not found. The system repeatedly attempts the phase until the restart can be completed. In the time between the first failure and when the restart can be completed, there might be disruption to client traffic for the volume being moved.

### Corrective Action

Verify that the job restart is completed by running the "volume move show -vserver <vservname> -volume <volName>" command. If the restart phase continues to fail, contact NetApp technical support.

### Syslog Message

'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' failed in the restart phase when attempting to retrieve the source volume.

## Parameters

**jobID** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.fail.status.entry

### Severity

ALERT

### Description

This message occurs when a 'volume move' operation fails to make an entry in the VLDB table for the 'volume move show' command. The system repeatedly attempts this operation until it exhausts the number of retries. Until an entry is made, the 'volume move show' command might return stale entries use 'job show -id' to show the status of the current volume move operation.

### Corrective Action

Use the 'job show -id' command to show the status of the current 'volume move' operation. Retry the 'volume move' operation. If the problem persists, contact NetApp technical support.

### Syslog Message

The 'volume move' operation with ID '%jd' for volume name '%s' in Vserver '%s' failed while attempting to make an entry in the VLDB table for the 'volume move show' command. Use 'job show -id' command to show the current status of the job.

## Parameters

**jobID** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the source Vserver.

## **mgmt.vopl.fail.status.modify**

### **Severity**

ALERT

### **Description**

This message occurs when a 'volume move' operation fails to modify the VLDB table for the 'volume move show' command. The system repeatedly attempts this phase. Until the modification succeeds, the 'volume move show' command might return stale information about the current 'volume move' operation.

### **Corrective Action**

If the problem persists, contact NetApp technical support.

### **Syslog Message**

The 'volume move' operation for volume '%s' with job ID '%jd' in Vserver '%s' cannot modify an entry in the VLDB table.

### **Parameters**

**volName** (STRING): Name of the source volume.

**jobId** (LONGINT): Job ID of the 'volume move' operation.

**vserverName** (STRING): Name of the source Vserver.

## **mgmt.vopl.made.status.entry**

### **Severity**

INFORMATIONAL

### **Description**

This message occurs when a 'volume move' operation makes an entry for the 'volume move show' command because the entry did not exist in the VLDB table.

### **Corrective Action**

(None).

### **Syslog Message**

Use the 'volume move show -vserver %s -volume %s' command to show the status of this 'volume move' operation.

### **Parameters**

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the source Vserver.

## **mgmt.vopl.move.badDstVol**

### **Severity**

ERROR

### **Description**

This message occurs when a 'volume move' operation cannot access the specified destination volume.

**Corrective Action**

Verify that the destination volume exists and is online.

**Syslog Message**

The move operation could not access the specified destination volume '%s'.

**Parameters**

**dstVol** (STRING): Name of the temporary destination volume for move operation.

**mgmt.vopl.move.badSourceVol****Severity**

ERROR

**Description**

This message occurs when a 'volume move' operation cannot access the specified source volume.

**Corrective Action**

Verify that the source volume exists and is online.

**Syslog Message**

The move operation could not access the specified source volume '%s' in Vserver '%s' for job ID '%jd'.

**Parameters**

**srcVol** (STRING): Name of the volume to be moved.

**vserverName** (STRING): Name of the Vserver.

**jobID** (LONGINT): Job ID of the volume move operation.

**mgmt.vopl.move.bytesLeft****Severity**

INFORMATIONAL

**Description**

This message occurs when a 'volume move' operation is in data copy phase and we want to know the bytes left.

**Corrective Action**

(None).

**Syslog Message**

The 'volume move' operation for volume '%s' in Vserver '%s' and job ID '%jd' is in data copy phase. We want to know the number of bytes left to transfer.

**Parameters**

**volpath** (STRING): Name of the source volume of the move job.

**vserverName** (STRING): Name of the source Vserver.

**jobID** (LONGINT): Job ID of the 'volume move' operation.

## mgmt.vopl.move.cantCrtDstVol

### Severity

ERROR

### Description

This message occurs when the volume move job cannot be completed because the destination volume cannot be created.

### Corrective Action

Check for space on the destination aggregate. Execute the "volume move" command with the "-perform-validation-only" parameter. If it succeeds, contact NetApp technical support. If it does not succeed, increase space on the destination aggregate, then try the "volume move" command again.

### Syslog Message

Volume move job failed because destination volume "%s" could not be created.

### Parameters

**volpath** (STRING): Name of the destination volume of the move.

## mgmt.vopl.move.cantCrtSrcSnp

### Severity

ERROR

### Description

This message occurs when the volume move job cannot be completed because creation of a Snapshot(tm) copy on the source volume failed.

### Corrective Action

Use the "volume show" to check if the volume has enough space for the Snapshot copy. Use the "snapshot show" command to check if the number of Snapshot copies have reached the maximum count. If the issue persists, contact Contact NetApp technical support..

### Syslog Message

Volume move job failed because creation of a Snapshot copy on source volume "%s" failed.

### Parameters

**volpath** (STRING): Name of the source volume of the move job.

## mgmt.vopl.move.cantDstCncl

### Severity

NOTICE

### Description

This message occurs when the 'volume move' job cannot conclude a transfer on the destination volume.

### Corrective Action

Contact NetApp technical support.

### **Syslog Message**

'volume move' job could not conclude a transfer on the destination volume '%s'.

### **Parameters**

**volpath** (STRING): Name of the destination volume of the move job.

## **mgmt.vopl.move.cantReadCfg**

### **Severity**

ERROR

### **Description**

This message occurs when the 'volume move' job cannot read the configuration information.

### **Corrective Action**

Check whether the replicated database is online.

### **Syslog Message**

The job configuration information for 'volume move' operation with job ID '%jd' could not be read.

### **Parameters**

**jobID** (LONGINT): Job ID of the 'volume move' operation.

## **mgmt.vopl.move.cantSaveToRdb**

### **Severity**

NOTICE

### **Description**

This message occurs when the 'volume move' job cannot save information to the replicated database. The 'volume move' job attempts to retry the operation.

### **Corrective Action**

The "volume move" job is retried automatically. Check the status of database with "cluster ring show" advanced command. If the problem persists, contact NetApp technical support.

### **Syslog Message**

The volume move job '%jd' for volume '%s' in Vserver '%s' could not save the information to the replicated database.

### **Parameters**

**jobId** (LONGINT): ID of the 'volume move' job.

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the Vserver.

## **mgmt.vopl.move.cantSrcCncl**

### **Severity**

NOTICE

**Description**

This message occurs when the 'volume move' job cannot conclude a transfer on the source volume.

**Corrective Action**

Verify that the source volume exists, is readable, and is not currently locked exclusively by another process. If the problem persists, contact NetApp technical support.

**Syslog Message**

'volume move' job could not conclude the transfer on the source volume '%s'.

**Parameters**

**volpath** (STRING): Name of the source volume of the move job.

**mgmt.vopl.move.ClnupFldDIVol****Severity**

ERROR

**Description**

This message occurs when a cleanup operation cannot delete the destination volume after a 'volume move' job fails.

**Corrective Action**

Delete the destination volume by using the 'volume delete' command.

**Syslog Message**

Could not delete destination volume '%s' following a failed 'volume move'.

**Parameters**

**volpath** (STRING): Name of the destination volume that could not be deleted.

**mgmt.vopl.move.cntRdDstDAttr****Severity**

NOTICE

**Description**

This message occurs when the 'volume move' job cannot read the attributes of the destination volume from disk. The 'volume move' job attempts to retry the operation.

**Corrective Action**

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

**Syslog Message**

The 'volume move' job could not fetch attributes of destination volume '%s' from the disk.

**Parameters**

**volpath** (STRING): Name of the destination volume involved in the move operation.

## mgmt.vopl.move.cntRdPostCutoverSrcDAttr

### Severity

ERROR

### Description

This message occurs when a 'volume move' operation cannot access the specified source volume after cutover to propagate final volume attributes. The attributes were set to values that were either obtained immediately before the cutover occurred, or were set to default values.

### Corrective Action

Verify that the attributes on the destination volume are correct. Specifically, check the value for the attribute "filesys-size-fixed".

### Syslog Message

The move operation could not read post-cutover attributes from the specified temporary source volume '%s' in Vserver '%s' for job ID '%jd'.

### Parameters

**dstVol** (STRING): Name of the temporary source volume for the move operation.

**vserverName** (STRING): Name of the Vserver.

**jobID** (LONGINT): Job ID of the volume move operation.

## mgmt.vopl.move.cntRdSrcDAttr

### Severity

NOTICE

### Description

This message occurs when the volume move operation cannot read the attributes of the source volume from disk. The volume move operation will attempt to retry the operation.

### Corrective Action

(None).

### Syslog Message

The volume move operation could not fetch the attributes of source volume '%s' from the disk.

### Parameters

**volpath** (STRING): Name of the source volume involved in the move operation.

## mgmt.vopl.move.cut.entryFail

### Severity

ERROR

### Description

This message occurs when the volume move operation cannot enter the cutover phase. The original source volume is functional. After a short delay, the volume move operation will reattempt cutover entry.

## Corrective Action

If the problem persists, reduce client traffic on the volume being moved and reduce the general load on the destination node.

## Syslog Message

The volume move operation of volume '%s' in Vserver '%s' to destination aggregate '%s' did not enter the cutover phase. The system provided the additional explanation: '%s'. After a short delay, the volume move operation will reattempt cutover entry. The job ID for the volume move job is '%jd'.

## Parameters

**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**aggrName** (STRING): Name of the destination aggregate.  
**reasonforFailure** (STRING): Reason for the failure.  
**jobID** (LONGINT): Job ID of the volume move operation.

## mgmt.vopl.move.cutover.deferred

### Severity

ALERT

### Description

This message occurs when the volume move job cannot be completed because the cutover phase has been deferred.

### Corrective Action

Address the reason for the cutover deferral, and then use the 'volume move trigger-cutover' command to reattempt the cutover phase for this volume move operation.

## Syslog Message

Cutover phase has been deferred for the volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s', because of '%s'. Space savings from efficiency could be lost.

## Parameters

**jobID** (LONGINT): Job ID of the volume move operation.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**aggrName** (STRING): Name of the destination aggregate.  
**reasonforDefer** (STRING): Reason for deferred cutover.

## mgmt.vopl.move.cutover.deferred.wait

### Severity

INFORMATIONAL

### Description

This message occurs when the volume move job cannot be completed because the cutover phase has been deferred due to the user specifying the cutover action as 'wait'.

### Corrective Action

Use the 'volume move trigger-cutover' command to attempt the cutover phase for this volume move operation.

## Syslog Message

Cutover phase has been deferred for the volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s', because of '%s'. Space savings from efficiency could be lost.

## Parameters

**jobID** (LONGINT): Job ID of the volume move operation.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**aggrName** (STRING): Name of the destination aggregate.  
**reasonforDefer** (STRING): Reason for the deferred cutover.

## mgmt.vopl.move.cutover.failed

### Severity

ERROR

### Description

This message occurs when the volume move job attempts to cut over and is unsuccessful. The system continues to retry the operation until it exhausts the number of cutover attempts allowed.

### Corrective Action

Reduce client traffic on the volume, that is scheduled to be moved.

## Syslog Message

The volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s' did not cut over because: '%s'. The volume move operation has tried to cut over '%d' out of '%d' times, %d forced.

## Parameters

**jobID** (LONGINT): Job ID of the volume move operation.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**aggrName** (STRING): Name of the aggregate.  
**reasonforFailure** (STRING): Reason for cutover failure.  
**actualcutoverAttempt** (INT): Number of actual cutover attempts made.  
**cutoverAttempt** (INT): Number of cutover attempts.  
**forcedCutoverAttempt** (INT): Number of forced cutover attempts.

## mgmt.vopl.move.cutoverMod

### Severity

INFORMATIONAL

### Description

This message occurs when a 'volume move' operation is in cutover and one of the modifiable parameters used by the 'move' job has been modified with the 'volume move modify' command. These modified values will be used for next cutover attempt.

### Corrective Action

(None).

## Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' is performing a cutover. Values modified with the 'volume move modify' command will not be used until the next cutover attempt.

## Parameters

**jobId** (LONGINT): Job ID of the 'volume move' operation.  
**volName** (STRING): Name of the source volume.  
**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.move.done

### Severity

NOTICE

### Description

This message occurs when the volume move job succeeds.

### Corrective Action

(None).

## Syslog Message

The volume move job with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s' succeeded.

## Parameters

**jobID** (LONGINT): Job ID of the volume move operation.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**aggrName** (STRING): Name of the destination aggregate.

## mgmt.vopl.move.dstPrepareFId

### Severity

ERROR

### Description

This message occurs when the volume move job cannot be completed because the destination volume cannot be prepared for a transfer.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

Volume move job failed because the destination volume '%s' could not be prepared for a transfer.

## Parameters

**volpath** (STRING): Name of the destination volume of the move job.

## mgmt.vopl.move.findSnpDltFId

**Severity**

ERROR

**Description**

This message occurs when the volume move job cannot be completed because the call to calculate the delta between a Snapshot(tm) copy and the active file system failed.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Volume move job failed because the call to calculate the delta between a Snapshot copy and the active file system on the source volume '%s' failed.

**Parameters**

**volpath** (STRING): Name of the source volume of the move job.

**mgmt.vopl.move.getNxtSnapFld****Severity**

ERROR

**Description**

This message occurs when the 'volume move' job cannot look up the Snapshot(tm) copy next in age to the currently referenced Snapshot copy. The 'volume move' job attempts to retry the operation.

**Corrective Action**

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

**Syslog Message**

The 'volume move' job could not to look up the Snapshot copy next in age to the currently referenced Snapshot copy on the source volume '%s'.

**Parameters**

**volpath** (STRING): Name of the source volume involved in the move operation.

**mgmt.vopl.move.gtDstSSLstFld****Severity**

ERROR

**Description**

This message occurs when the volume move job cannot be completed because a Snapshot(tm) copy list cannot be obtained from the destination volume.

**Corrective Action**

Check whether the destination volume is online. If the problem persists, contact NetApp technical support.

**Syslog Message**

Volume move job failed because a Snapshot copy list could not be obtained from the destination volume

'%s'.

#### Parameters

**volpath** (STRING): Name of the destination volume of the move job.

### **mgmt.vopl.move.gtSnpTgSrcFld**

#### Severity

ERROR

#### Description

This message occurs when the volume move job cannot be completed because a Snapshot(tm) copy tag cannot be read from the source volume.

#### Corrective Action

Check whether the source volume is online. If the problem persists, contact NetApp technical support.

#### Syslog Message

Volume move job failed because a Snapshot copy tag could not be read from the source volume '%s'.

#### Parameters

**volpath** (STRING): Name of the source volume of the move job.

### **mgmt.vopl.move.gtSrcSSLstFld**

#### Severity

ERROR

#### Description

This message occurs when the volume move job cannot be completed because a Snapshot(tm) copy list cannot be obtained from the source volume.

#### Corrective Action

Check whether the source volume is online. If the problem persists, contact NetApp technical support.

#### Syslog Message

Volume move job failed because a Snapshot copy list could not be obtained from the source volume '%s'.

#### Parameters

**volpath** (STRING): Name of the source volume of the move job.

### **mgmt.vopl.move.gtSSTgsDstFld**

#### Severity

ERROR

#### Description

This message occurs when the volume move job cannot be completed because the Snapshot(tm) copy tags on the destination volume cannot be read.

### Corrective Action

Retry the volume move job. If the problem persists, this indicates a system level problem. Contact NetApp technical support.

### Syslog Message

Volume move job failed because Snapshot copy tags on the destination volume '%s' in vserver '%s' for the volume move of source volume '%s' in vserver '%s' could not be read.

### Parameters

**dstVol** (STRING): Name of the destination volume of the move job.

**srcVol** (STRING): Name of the source volume of the move job.

**dstVserverName** (STRING): Name of destination vserver.

**srcVserverName** (STRING): Name of source vserver.

## mgmt.vopl.move.has.clones

### Severity

ERROR

### Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot delete the original volume instance on the source aggregate. This is because the original volume instance has volume clones.

### Corrective Action

The system usually reaps these types of volume after all clones have been deleted or split automatically. If space occupied by source needs to be freed immediately, then delete the original volume instance using the 'volume delete' command after all the volume clones have been deleted or split.

### Syslog Message

The 'volume move' operation with ID '%jd' could not delete the original volume %s in Vserver %s on %s aggregate following a successful volume move because the original volume instance has volume clones.

### Parameters

**jobId** (LONGINT): Job ID of the volume move operation.

**volName** (STRING): Name of the volume instance that could not be deleted.

**vserverName** (STRING): Name of the volume's Vserver.

**aggrName** (STRING): Name of the source aggregate.

## mgmt.vopl.move.invlDXfrState

### Severity

ERROR

### Description

This message occurs when the volume move job cannot be completed because a transfer is in an invalid state.

### Corrective Action

Contact NetApp technical support.

## Syslog Message

Volume move job with job ID '%jd' for volume '%s' in Vserver '%s' failed because a transfer was in an invalid state.

## Parameters

**jobID** (LONGINT): ID of the 'volume move' job.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.jobIgnoreQuit

### Severity

ERROR

### Description

This message occurs when a volume move job fails to stop when you issue a 'volume move abort' or 'job stop' command. If the command is not repeated, the volume move job might continue to run to completion.

### Corrective Action

Retry the 'volume move abort' or 'job stop' command before the volume move job is complete.

## Syslog Message

Volume move job '%jd' for volume '%s' in Vserver '%s' could not be stopped at this time. Retry the 'volume move abort' or 'job stop' command.

## Parameters

**jobID** (LONGINT): ID of the volume move job.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.jobQuit

### Severity

INFORMATIONAL

### Description

This message occurs when a 'volume move' job is not completed because a 'volume move abort' or 'job stop' command was issued.

### Corrective Action

Verify the status of the move job through the 'volume move show' command.

## Syslog Message

'volume move' job with ID '%jd' for volume '%s' in Vserver '%s' was not completed because a 'volume move abort' or 'job stop' command was issued.

## Parameters

**jobID** (LONGINT): Job ID of the 'volume move' operation.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.last.upd.fail

### Severity

ERROR

### Description

This message occurs when a 'volume move' operation fails to update attributes on the destination volume after the cutover has been completed.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' failed to update the attributes on the destination volume after the cutover has been completed.

### Parameters

**jobID** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.move.mark.source.reapable.failed

### Severity

ERROR

### Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot mark the original volume instance on the source aggregate for deletion. The original volume instance cannot be deleted immediately because it has volume clones.

### Corrective Action

Delete the original volume instance using the 'volume delete' command after all the volume clones have been deleted or split.

### Syslog Message

The 'volume move' operation with ID '%jd' could not mark the Volume %s containing volume clones in Vserver %s on %s aggregate for later deletion after a successful volume move.

### Parameters

**jobId** (LONGINT): Job ID of the volume move operation.

**volName** (STRING): Name of the volume instance that could not be marked for later deletion.

**vserverName** (STRING): Name of the volume's Vserver.

**aggrName** (STRING): Name of the destination aggregate.

## mgmt.vopl.move.memAllocFld

### Severity

NOTICE

## Description

This message occurs when the 'volume move' job cannot allocate memory. The 'volume move' job attempts to retry the operation.

## Corrective Action

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

## Syslog Message

The 'volume move' job ID '%jd' for volume '%s' in Vserver '%s' could not allocate memory.

## Parameters

**jobId** (LONGINT): ID of the 'volume move' job.  
**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.moveModlgr

### Severity

INFORMATIONAL

### Description

This message occurs when modifiable parameters of the 'move' job have been modified by 'volume move modify' command, but the 'volume move' operation finished with older values and did not use the newly modified values.

### Corrective Action

Use 'volume move show' command to verify the parameters used during cutover phase and the final state of the volume move operation.

### Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' has completed. Parameters modified during last cutover attempt through 'volume move modify' command have been ignored or 'volume move' operation failed on job restart before refreshing parameters from the VLDB.

### Parameters

**jobId** (LONGINT): Job ID of the 'volume move' operation.  
**volName** (STRING): Name of the source volume.  
**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.move.nosnapspace

### Severity

ERROR

### Description

This message occurs when a 'volume move' operation fails to create a Snapshot(tm) copy on source volume because the number of Snapshot copies in the volume exceeds the maximum limit or there is insufficient disk space in the volume.

## Corrective Action

Make sure that the Snapshot copy limit is not reached for the volume. The current Data ONTAP version allows a maximum of 255 Snapshot copies per volume. If required, delete old Snapshot copies of the volumes on the aggregate by running the 'volume snapshot delete' command.

## Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' present on Vserver '%s' cannot proceed (Reason: Cannot create a Snapshot copy on the volume).

## Parameters

**jobId** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the volume.

**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.nospace

### Severity

ERROR

### Description

This message occurs when there is not enough space on the volume or aggregate for a 'volume move' operation to proceed. It could be on the source or the destination node.

## Corrective Action

Reduce the amount of used space on the volume or aggregate, or increase the size of the volume or aggregate. To increase the size of the volume, run the 'volume modify' command. To create space on an aggregate, take one of the following actions: a. To free up more space on a volume, delete old Snapshot(tm) copies of the volumes on the aggregate by running the 'volume snapshot delete' command. b. To increase the size of a volume or an aggregate, add disks to the aggregate by running the 'storage aggregate add-disks' command.

## Syslog Message

The 'volume move' operation with ID '%jd' for volume '%s' present on Vserver '%s' cannot proceed (Reason: Not enough space in the volume or aggregate).

## Parameters

**jobId** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the volume.

**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.parent.online

### Severity

NOTICE

### Description

This message occurs when a "volume move" operation fails to take offline the quiesced volume remaining after moving a clone parent, because wafliron is running.

## Corrective Action

No action is required, because the system removes the quiesced clone parent automatically. To free some of the resources used by the volume, you can manually take it offline by using the "volume offline"

command after the wafiron operation has completed.

### **Syslog Message**

The "volume move" operation for the volume %s on vserver %s with job-id %jd could not offline the quiesced clone parent volume left behind.

### **Parameters**

**volName** (STRING): Name of the volume.  
**vserverName** (STRING): Name of the Vserver.  
**jobId** (LONGINT): Job ID of the "volume move" operation.

## **mgmt.vopl.move.queryDstFld**

### **Severity**

ERROR

### **Description**

This message occurs when the volume move job cannot be completed because a query of the destination for transfer status failed.

### **Corrective Action**

Its a system level problem. Contact Contact NetApp technical support. for further investigation.

### **Syslog Message**

Volume move job failed because a query for transfer status of the destination volume '%s' in vserver '%s' failed.

### **Parameters**

**volpath** (STRING): Name of the destination volume of the move job.  
**vserverName** (STRING): Name of destination vserver.

## **mgmt.vopl.move.querySrcFld**

### **Severity**

NOTICE

### **Description**

This message occurs when the 'volume move' job cannot be completed because a query of the source for transfer status failed. The 'volume move' job attempts to retry the operation.

### **Corrective Action**

Use the 'volume move show' command to get the status of the move operation. If the problem persists, contact NetApp technical support.

### **Syslog Message**

The 'volume move' job could not query the source '%s' for transfer status.

### **Parameters**

**volpath** (STRING): Name of the source volume involved in the move operation.

## mgmt.vopl.move.refVldbFld

### Severity

NOTICE

### Description

This message occurs when a 'volume move' operation fails to refresh modifiable parameters used by the 'move' job from the Volume Location Database (VLDB). Volume move operation will use current parameters until a refresh attempt succeeds.

### Corrective Action

(None).

### Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' could not refresh the modifiable parameters used by the 'move' job from the VLDB. Volume move operation will use current parameters until a refresh attempt succeeds.

### Parameters

**jobId** (LONGINT): Job ID of the 'volume move' operation.

**volName** (STRING): Name of the source volume.

**vserverName** (STRING): Name of the source Vserver.

## mgmt.vopl.move.restart.failed

### Severity

ERROR

### Description

This message occurs when a volume move job encounters conditions that prevent it from restarting; for example, required Snapshot(tm) copies have been deleted. This might result in loss of client access to the volume, stale temporary volumes and stale metadata.

### Corrective Action

Contact NetApp technical support.

### Syslog Message

Volume move job ID '%jd' could not restart correctly and might have left a stale temporary volume and stale persistent volume move data. Client access to the data stored on the source volume might be blocked. Reason: %s, error %d. Move job was started for volume '%s' in Vserver '%s'.

### Parameters

**jobID** (LONGINT): Job ID of the volume move job.

**reason** (STRING): Reason for restart failure.

**error** (INT): Error code for the restart failure.

**volName** (STRING): Name of the volume.

**vserverName** (STRING): Name of the Vserver.

## mgmt.vopl.move.snpNtDeletd

**Severity**

ERROR

**Description**

This message occurs when a 'volume move' operation cannot delete a reference Snapshot(tm) copy created by the move job.

**Corrective Action**

Use the 'snapshot show' command to verify that the Snapshot copy exists and is not locked by another process. Use the 'snapshot delete' command to delete the Snapshot copy manually.

**Syslog Message**

Snapshot copy for 'volume move' job ID %jd could not be deleted: name: %s; Vserver ID: %d; volume name: %s.

**Parameters**

**jobId** (LONGINT): ID of the volume move job.

**snapName** (STRING): Name of the Snapshot copy.

**vserverId** (INT): Destination Vserver ID.

**volName** (STRING): Name of the parent volume of the Snapshot copy.

**mgmt.vopl.move.source.cleanup.failed****Severity**

ERROR

**Description**

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot delete the original volume instance on the source aggregate.

**Corrective Action**

Delete the original volume instance using the 'volume delete' command after offlining the volume.

**Syslog Message**

The 'volume move' operation with ID '%jd' could not delete the Volume %s in Vserver %s on %s aggregate after a successful volume move.

**Parameters**

**jobId** (LONGINT): Job ID of the volume move operation.

**volName** (STRING): Name of the volume instance that could not be deleted

**vserverName** (STRING): Name of the volume's Vserver.

**aggrName** (STRING): Name of the destination aggregate.

**mgmt.vopl.move.srcVAttrGtFld****Severity**

ERROR

**Description**

This message occurs when the volume move job cannot be completed because the Volume Location Database (VLDB) attributes for the source volume cannot be read.

**Corrective Action**

To check whether the VLDB process is up and running, run the (privilege: advanced) "cluster ring show -unitname vldb" command. Contact NetApp technical support.

**Syslog Message**

Volume move job failed because the VLDB attributes for source volume "%s" could not be read.

**Parameters**

**volpath** (STRING): Name of the source volume of the move job.

**mgmt.vopl.move.srcVolInconst****Severity**

ERROR

**Description**

This message occurs when the volume move job cannot be completed because the source volume is inconsistent.

**Corrective Action**

Contact NetApp technical support.

**Syslog Message**

Volume move job failed because the source volume '%s' is inconsistent.
