accesscache events

accesscache.cfg events

accessCache.cfg.updateFailed

Severity

ERROR

Description

This message occurs when exports access cache configuration is modified but the new configuration could not be updated in the Nblade. The access cache is therefore operating with the older configuration.

Corrective Action

Retry the exports access cache configuration modification. If it continuosly fails, restart management gateway. If the problem persists, contact NetApp technical support.

Syslog Message

Access cache configuration change for Vserver "%s" on node "%s" could not be updated. Failure reason is "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.
node (STRING): Name of the Node on which the problem is occurring.
reason (STRING): The reason for the failure.

accesscache.nearlimits events

AccessCache.NearLimits

Severity

ALERT

Description

This message occurs when the access cache module is near its limit for entries. Reaching these limits can prevent new clients from being able to mount and perform I/O on the storage system, and can also cause clients to be granted or denied access based on stale cached information.

Corrective Action

Ensure that the number of clients accessing the storage system continues to be below the limits for access cache entries. If the set of clients accessing the storage system is constantly changing, consider using the "vserver export-policy access-cache config modify" command to reduce the harvest timeout parameter so that cache entries for clients that are no longer accessing the storage system can be evicted sooner.

Syslog Message

The exports access cache module is near its limit for entries (current entries count : %u, warning threshold : %u, entries limit : %u and current rules count : %u).

Parameters

    numEntriesCurrent (INT): Current number of entries in the cache.
    numEntriesWarningThreshold (INT): Warning threshold for number of entries.
    numEntriesLimit (INT): Limit on the number of entries.
    numRulesCurrent (INT): Current number of export rules in the cache.

accesscache.reachedlimits events

AccessCache.ReachedLimits

Severity

    EMERGENCY

Description

    This message occurs when the access cache module reaches its limit for entries. This condition can prevent new clients from being able to mount and perform I/O on the storage system. This condition can also cause clients to be granted or denied access based on stale information.

Corrective Action

    Ensure that the number of clients accessing the storage system is below the limits for access cache entries. If the set of clients accessing the storage system is constantly changing, consider using the "vserver export-policy access-cache config modify" command to reduce the harvest timeout parameter so that cache entries for clients that are no longer accessing the storage system can be evicted sooner.

Syslog Message

    The exports access cache module on this node reached its limit while trying to add %d new entries (current entries count : %u, entries limit : %u and current rules count : %u).

Parameters

    numEntriesDelta (INT): Number of new entries to be added.
    numEntriesCurrent (INT): Current number of entries in the cache.
    numEntriesLimit (INT): Limit on the number of entries.
    numRulesCurrent (INT): Current number of export rules in the cache.

acp events

acp.auto events

acp.auto.upgrade

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP Processor has an older firmware image compared to the file revision present in '/etc/acp/acpp_fw'. The ACP Administrator is performing an automatic firmware upgrade.

Corrective Action

(None).

Syslog Message

Performing automatic firmware upgrade (image: %s) on %s (%s).

Parameters

file (STRING): Command issued.
inband_id (STRING): Inband ID of the module.
ip (STRING): IP address of the module.

acp.bind events

acp.bind.error

Severity

ERROR

Description

This message occurs when the system encounters a socket binding error while setting up the Alternate Control Path (ACP) Management Ethernet port. ACP functionality is inactive after encountering this.

Corrective Action

Verify that the Ethernet cable is properly attached to the ACP port and the green LED is on. Reenable the ACP port using the "options acp.enabled" command.

Syslog Message

An error was encountered while configuring the ACP Management Ethernet Port: %s.

Parameters

ErrorString (STRING): Error string.

acp.commerr events

acp.commErr

Severity

ALERT

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the SAS shelf I/O module (IOM) that is configured for in-band ACP is experiencing communication errors.

Corrective Action

Examine the event log for I/O errors that might have a common source such as faulty cabling, and correct them. If the errors perist, the IOM might need to be replaced. Contact NetApp technical support.

Syslog Message

IOM %s is reporting multiple in-band ACP communication errors. Shelf serial number: %s.

Parameters

inband_id (STRING): Inband ID of the module.
shelf_sno (STRING): Storage shelf serial number of the shelf where the I/O module is seated.

acp.commerrpersist events

acp.commErrPersist

Severity

ALERT

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that a SAS shelf I/O module (IOM) configured for in-band ACP is experiencing persistent communication errors.

Corrective Action

Examine the event log for I/O errors that might have a common source with this problem, such as faulty cabling. If other devices are not experiencing failures, then contact NetApp technical support to replace the IOM.

Syslog Message

IOM %s has failed after reporting multiple in-band ACP errors. Shelf serial number: %s.

Parameters

inband_id (STRING): Inband ID of the module.
shelf_sno (STRING): Storage shelf serial number of the shelf where the IOM is seated.

acp.dev events

acp.dev.notify

Severity

ERROR

Description

This message occurs when the Alternate Control Path (ACP) Administrator encounters an error event in a development-only kernel.

Corrective Action

Notify ACP development. No user action is needed.

Syslog Message

ACP error: %s

Parameters

debug_string (STRING): Error statement that occurred in a developement kernel.

acp.downrev events

acp.downrev.acpp

Severity

ERROR

Description

This message occurs when the Alternate Control Path Administrator cannot successfully download up-to-date firmware to an Alternate Control Path Processor (ACPP) or when the most up-to-date firmware image is not present in the /etc/acpp_fw/ directory.

Corrective Action

Verify that the latest ACPP firmware is available in the firmware directory. If the firmware update continually fails to download up-to-date firmware, then replace the ACPP I/O module.

Syslog Message

ACPP module %s (%s) has downrev firmware.

Parameters

inband_id (STRING): In-band ID of the ACPP module.
ip (STRING): IP address of the ACPP module.

acp.exp events

acp.exp.power.cycle

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to power-cycle the SAS expander.

Corrective Action

(None).

Syslog Message

SAS expander power-cycle request sent to %s (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Status code returned by the 'expander power cycle' command.

acp.exp.power.cycle.failed

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to power-cycle the SAS expander.

Corrective Action

(None).

Syslog Message

SAS expander power-cycle request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Reason for the 'expander power-cycle' failure.
shelf_sno (STRING): Shelf serial number of the shelf where this I/O module is seated.

acp.exp.power.cycle.success

Severity

INFORMATIONAL

Description

This message occurs when an 'expander power cycle' command sent to the Alternate Controller Path (ACP) Processor succeeds.

Corrective Action

(None).

Syslog Message

SAS expander power cycle command sent to %s (%s) was successful, (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.exp.reset

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to reset a SAS expander.

Corrective Action

(None).

Syslog Message

SAS expander reset issued to %s (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Status code returned by the 'expander reset' command.

acp.exp.reset.failed

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to reset the SAS expander.

Corrective Action

(None).

Syslog Message

SAS expander reset request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Reason for the 'expander reset' failure.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.exp.reset.success

Severity

INFORMATIONAL

Description

This message occurs when an 'expander reset' command sent to the Alternate Controller Path (ACP) Processor succeeds.

Corrective Action

(None).

Syslog Message

SAS expander reset command sent to %s (%s) was successful, (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.exp.vpd.failed

Severity

INFORMATIONAL

Description

This message occurs when an attempt to get SAS expander VPD (Vital Product Data) data from the Alternate Control Path Processor fails.

Corrective Action

(None).

Syslog Message

An 'expander vpd' request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Reason for the failure to get the SAS expander vpd data.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.fw events

acp.fw.download

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to initiate a firmware download.

Corrective Action

(None).

Syslog Message

Firmware image %s will be downloaded to %s (%s), (disk shelf serial number: %s).

Parameters

    command (STRING): Firmware image name.
    inband_id (STRING): In-band ID of the module.
    ip (STRING): IP address of the module.
    status (STRING): Status code returned by the 'initiation' command.

acp.fw.download.failed

Severity

    INFORMATIONAL

Description

    This message occurs when the Alternate Controller Path Administrator fails in its attempt to download firmware.

Corrective Action

    (None).

Syslog Message

    Firmware download on %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

    inband_id (STRING): In-band ID of the module.
    ip (STRING): IP address of the module.
    status (STRING): Type of failure that occurred during the firmware download.
    shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.fw.download.success

Severity

    INFORMATIONAL

Description

    This message occurs when a 'firmware download' command sent to the Alternate Controller Path Processor succeeds.

Corrective Action

    (None).

Syslog Message

    Firmware download on %s (%s) was successful, (disk shelf serial number: %s).

Parameters

    inband_id (STRING): In-band ID of the module.
    ip (STRING): IP address of the module.
    shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.init events

acp.init.configIP

Severity

ERROR

Description

This message occurs when ONTAP® software cannot configure the Ethernet port designated for the Alternate Control Path (ACP) with 30 seconds, and marks the ACP as inactive.

Corrective Action

Verify the connection to the disk shelf ACP port, and make sure that it is not connected to a public network. Try plugging it into another Ethernet port with no devices.

Syslog Message

Could not configure the ACP Ethernet port within 30 seconds.

Parameters

(None).

acp.init.netmask

Severity

INFORMATIONAL

Description

This message occurs during initialization state, when the Alternate Control Path (ACP) Administrator netmask was configured incorrectly. The system sets the netmask to a default value.

Corrective Action

(None).

Syslog Message

Setting ACP Administrator netmask value to %s (reason: %s).

Parameters

value (STRING): Default netmask.
reason (STRING): Reason to choose the default.

acp.init.ssl

Deprecated

Deprecated as of ONTAP® version 9.2. The ACP process was never really responsible for initializing SSL, and has not tried to do so for a very long time.

Severity

ERROR

Description

This message occurs when the Alternate Control Path (ACP) process cannot initialize the underlying Secure Socket Library (SSL). The ACP Administrator will be inactive.

Corrective Action

(None).

Syslog Message

Could not initialize SSL.

Parameters

(None).

acp.invalid events

acp.invalid.vpd.info

Severity

ALERT

Description

This message occurs when the Alternate Control Path (ACP) system detects that an Alternate Control Path Processor (ACPP) has invalid VPD (Vital Product Data) info.

Corrective Action

Replace the Alternate Control Path Processor (ACPP).

Syslog Message

ACPP module %s (%s) has invalid VPD.

Parameters

inband_id (STRING): In-band ID of the ACPP module.
ip (STRING): IP address of the ACPP module.

acp.ioxm events

acp.ioxm.port.down

Severity

INFORMATIONAL

Description

This message occurs when the link status of one or more ports from the IOXM switch changes from "up" to "down".

Corrective Action

Verify that all cables in the IOXM switch ports are seated properly.

Syslog Message

IOXM switch port %d is down.

Parameters

port_num (INT): Switch port number of the IOXM switch.

acp.ioxm.port.up

Severity

INFORMATIONAL

Description

This message occurs when the link status of one or more ports from the IOXM switch changes from "down" to "up".

Corrective Action

(None).

Syslog Message

IOXM switch port %d is up.

Parameters

port_num (INT): Switch port number of the IOXM switch.

acp.locked events

acp.locked.wrench.link.down

Severity

INFORMATIONAL

Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "up" to "down".

Corrective Action

Verify that the cable in the port is seated properly.

Syslog Message

The on-board locked wrench port is down.

Parameters

(None).

acp.locked.wrench.port.down

Severity

ERROR

Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "up" to "down".

Corrective Action

Verify that the cable in the port is seated properly.

Syslog Message

The on-board locked wrench port is down; Alternate Control Path (ACP) management is inactive.

Parameters

(None).

acp.locked.wrench.port.up

Severity

INFORMATIONAL

Description

This message occurs when the link status of a locked wrench Ethernet port (on the back of the storage controller) changes from "down" to "up".

Corrective Action

(None).

Syslog Message

The on-board locked wrench port is up.

Parameters

(None).

acp.need events

acp.need.firmware.update

Severity

ERROR

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP processor is running an older firmware revision that supports only the Secure Socket Library (SSL) channel. The "/etc/acpp_fw" directory requires the latest firmware file for the update to succeed. This module is marked as inactive.

Corrective Action

Copy the latest firmware file for this module into "/etc/acpp_fw", and then use the "system node run -node <nodename> -command storage download acp" command to download the firmware.

Syslog Message

ACP module %s (%s) needs a firmware upgrade, (disk shelf serial number: %s).

Parameters

inband_id (STRING): Inband ID of the module.
ip (STRING): IP address of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.need.module.upgrade

Severity

ERROR

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the I/O module (IOM) does not support InBand ACP.

Corrective Action

Upgrade the IOM to IOM6 or later.

Syslog Message

IOM %s does not support InBand ACP. Upgrade the IOM to IOM6 or later for supportability (disk shelf serial number: %s).

Parameters

inband_id (STRING): Inband ID of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this IOM is seated.

acp.no events

acp.no.ip

Severity

ERROR

Description

This message occurs when the node cannot find a free IP address for the Alternate Control Path (ACP) Management port. ACP functionality is disabled.

Corrective Action

Check the connection to the disk shelf ACP port and verify that it is not connected to a public network. Try plugging it into another Ethernet port with no devices, to see whether it is changed.

Syslog Message

Could not assign a free IP address to the ACP Management Ethernet port, disabling ACP functionality.

Parameters

(None).

acp.post events

acp.post.data.failed

Severity

INFORMATIONAL

Description

This message occurs when a 'post data' request that was sent to the Alternate Controller Path Processor

fails.

Corrective Action

(None).

Syslog Message

A 'post data' request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Reason for the 'post data' failure.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.shelf events

acp.shelf.power.cycle.failed

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor fails to complete a power cycle of the disk shelf.

Corrective Action

(None).

Syslog Message

Disk shelf power cycle request issued to %s failed because %s.

Parameters

shelf_id (STRING): In-band ID or Shelf Serial Number of the module.
status (STRING): Reason for failure.

acp.shelf.power.cycle.success

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor successfully completes a power cycle of the disk shelf.

Corrective Action

(None).

Syslog Message

Disk shelf power cycle request issued to %s is successful.

Parameters

    shelf_id (STRING): In-band ID or Shelf Serial Number of the module.

acp.shelf.power.off

Severity

    INFORMATIONAL

Description

    This message occurs when the Alternate Control Path (ACP) Processor receives a command to power off the disk shelf.

Corrective Action

    (None).

Syslog Message

    Disk shelf power off request issued to %s

Parameters

    shelf_id (STRING): In-band ID of the module or Shelf Serial Number.

acp.shelf.power.off.failed

Severity

    INFORMATIONAL

Description

    This message occurs when the Alternate Controller Path Administrator fails in its attempt to power-off the SAS disk shelf.

Corrective Action

    (None).

Syslog Message

    Disk shelf power off request sent to %s failed with status %s

Parameters

    shelf_id (STRING): In-band ID of the module.
    status (STRING): Reason for the power-off failure.

acp.shelf.power.off.success

Severity

    INFORMATIONAL

Description

    This message occurs when a 'shelf power off' command sent to the Alternate Controller Path (ACP) Processor succeeds.

Corrective Action

(None).

Syslog Message

Disk shelf power off command sent to %s was successful

Parameters

shelf_id (STRING): In-band ID of the module or Shelf Serial Number.

acp.shelf.power.on

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Processor receives a command to power on a disk shelf.

Corrective Action

(None).

Syslog Message

Disk shelf power up request issued to %s

Parameters

shelf_id (STRING): In-band ID of the module or Shelf Serial Number.

acp.shelf.power.on.failed

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Controller Path Administrator fails in its attempt to power on the SAS disk shelf.

Corrective Action

(None).

Syslog Message

Disk shelf power on request sent to %s failed with status %s

Parameters

shelf_id (STRING): In-band ID or Shelf Serial Number of the module.
status (STRING): Reason for the 'power-on' failure.

acp.shelf.power.on.success

Severity

INFORMATIONAL

Description

This message occurs when a 'shelf power on' command sent to the Alternate Controller Path (ACP) Processor succeeds.

Corrective Action

(None).

Syslog Message

Disk shelf power on command sent to %s was successful

Parameters

shelf_id (STRING): In-band ID of the module or Shelf Serial Number.

acp.sock events

acp.sock.error

Severity

ERROR

Description

This message occurs when the system encounters a socket error while setting up the Alternate Control Path (ACP) Management Ethernet port. ACP functionality is subsequently inactive.

Corrective Action

Verify that the Ethernet cable is properly attached to the ACP port and that the green LED is on. Reenable the ACP using the "options acp.enabled on" command.

Syslog Message

An error was encountered while configuring the ACP Management Ethernet Port: %s.

Parameters

ErrorString (STRING): Error string.

acp.update events

acp.update.failed

Severity

ERROR

Description

This message occurs when the Alternate Control Path (ACP) Administrator receives notification from the ACP Processor that it cannot upgrade the firmware because it is in some faulty state or the firmware file is not valid. The ACP processor will continue to run with the older firmware version.

Corrective Action

Try issuing the firmware download again using the "system node run -node <nodename> -command storage download acp" command.

Syslog Message

ACP module %s (%s) failed to upgrade firmware, (disk shelf serial number: %s).

Parameters

inband_id (STRING): Inband ID of the module.
ip (STRING): IP address of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.updateconfiguration events

acp.updateConfiguration

Severity

ALERT

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the SAS shelf I/O module (IOM) supports only the in-band ACP configuration.

Corrective Action

> Use the "storage shelf acp configure -channel in-band -is-enabled true" command to enable in-band ACP.

Syslog Message

IOM %s in shelf S/N: %s does not support out-of-band ACP.

Parameters

inband_id (STRING): Inband ID of the module.
shelf_sno (STRING): Storage shelf serial number of the shelf where the IOM is seated.

acp.upgrade events

acp.upgrade.successful

Severity

INFORMATIONAL

Description

This message occurs when the Alternate Control Path (ACP) Administrator determines that the ACP Processor has successfully upgraded the firmware.

Corrective Action

(None).

Syslog Message

ACP module %s (%s) successfully upgraded firmware, (disk shelf serial number: %s).

Parameters

inband_id (STRING): Inband ID of the module.
ip (STRING): IP address of the module.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

acp.voltage events

acp.voltage.status.failed

Severity

INFORMATIONAL

Description

This message occurs when a 'voltage status' request that was sent to the Alternate Controller Path Processor fails.

Corrective Action

(None).

Syslog Message

A voltage status request sent to %s (%s) failed with status (%s), (disk shelf serial number: %s).

Parameters

inband_id (STRING): In-band ID of the module.
ip (STRING): IP address of the module.
status (STRING): Reason for the 'voltage status' failure.
shelf_sno (STRING): Disk shelf serial number of the shelf where this I/O module is seated.

adminapi events

adminapi.input events

adminapi.input.badXml

Severity

ERROR

Description

This message occurs when the Data ONTAP server receives a bad XML request that does not contain the API name to be executed.

Corrective Action

Correct the input XML with the API name to be executed.

Syslog Message

Input XML does not contain the API name to be executed.

Parameters

(None).

adminapi.xml events

adminapi.xml.encoding

Severity

ERROR

Description

This event is generated in case of a mismatched XML encoding received by ONTAP server.

Corrective Action

Correct the mismatched encoding and retry the API.

Syslog Message

ONTAP server got unexpected encoding (expected %s, got %s

Parameters

expEnco (STRING): The expected xml encoding.
recvEnco (STRING): The actual received encoding.

adminapi.xml.namespace

Severity

ERROR

Description

This event is generated in case of a mismatched xml namespace received by ONTAP server.

Corrective Action

Correct the XML namespace and retry the API.

Syslog Message

ONTAP server namespace (expected %s, got %s

Parameters

expNamesp (STRING): The expected xml namespace.
uri (STRING): The received uri

adt events

adt.aggrcb events

adt.aggrcb.unlinkfail

Severity

ALERT

Description

This message occurs when the auditing subsystem cannot remove a stale aggregate control block entry from the Audit aggregate hash table. This could happen if the hash table rearrangement fails because of insufficient memory. In this condition, the auditing subsystem might not function or data access might be denied.

Corrective Action

Reboot the node. For high-availability (HA) configurations, perform a takeover and giveback from the partner to reduce the impact on system availability

Syslog Message

Auditing subsystem internal error: Aggregate Control Block: %s unlink failed for SVM with UUID: %s because of insufficient memory.

Parameters

AggregateUuid (STRING): UUID of the aggregate with a stale file handle.
VserverUuid (STRING): UUID of the Storage Virtual Machine(SVM, formerly Vserver).

adt.aucb events

adt.aucb.overwrite

Severity

INFORMATIONAL

Description

This message occurs in the auditing subsytem, when the subsystem overwrite an existing audit control block during audit control block creation. The overwriting of the audit control block is because of a failure in audit control block deletion.

Corrective Action

(None).

Syslog Message

Overwriting of audit control block occured.

Parameters

(None).

adt.cmdq events

adt.cmdq.init.fail

Severity

ALERT

Description

This message occurs when an internal audit command queue fails to initialize.

Corrective Action

Available system resources are required for this feature to function. The audit subsystem might not function, or might function with reduced performance. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

Syslog Message

Audit subsystem internal error: Audit command queue failed to initialize, system reboot might be required.

Parameters

(None).

adt.cmdthrd events

adt.cmdthrd.create.fail

Severity

ALERT

Description

This message occurs when audit initialization fails because the necessary execution threads cannot be created.

Corrective Action

Available system resources are required for this feature to function. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

Syslog Message

Audit subsystem internal error: Could not start required audit command threads, system reboot might be required.

Parameters

(None).

adt.dest events

adt.dest.access.fail

Severity

ERROR

Description

This message occurs when the audit consolidation job fails to write audit logs to the destination directory because the destination directory is not available. This event can leads to denial of service on Security Access Control List (SACL) enabled objects.

Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to bring the volume online, or increase volume size. Use the "vserver audit modify" command to modify the destination volume.

Syslog Message

Audit consolidation job failed to access destination directory "%s" of Vserver "%s"; consolidation job type is "%s".

Parameters

destination (STRING): Destination directory of the Vserver into which the consolidation job failed to write audit logs.
vserver (STRING): Vserver name whose consolidation job failed to write audit logs to the destination directory.
descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.dest.directory.full

Severity

EMERGENCY

Description

This message occurs when the audit consolidation process fails to write audit logs to the destination directory because the destination directory is full. This event can lead to denial of service on Security Access Control List (SACL) enabled objects.

Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to increase volume size. Use the "vserver audit modify" command to modify the destination volume path.

Syslog Message

Audit destination directory "%s" of Vserver "%s" is full; consolidation job type is "%s".

Parameters

destination (STRING): Destination directory of the Vserver that is full.
vserver (STRING): Vserver name whose audit consolidation process failed to write audit logs to the destination directory.
descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.dest.directory.unavail

Severity

EMERGENCY

Description

This message occurs when the audit consolidation job fails to write audit logs to the destination directory because the destination directory has become unavailable or has run out of space. This event can lead to denial of service for Security Access Control List (SACL) enabled objects.

Corrective Action

Use the "volume show" command to check whether the destination volume exists, is online, and has sufficient free space. Use the "volume modify" command to bring the volume online, or increase volume size. Use the "vserver audit modify" command to modify the destination volume.

Syslog Message

Audit destination directory "%s" of Vserver "%s" is unavailable or out of space; consolidation job type is "%s".

Parameters

destination (STRING): Destination directory of the Vserver to which the consolidation job failed to write audit logs.
vserver (STRING): Name of the Vserver name whose consolidation job failed to write audit logs to the destination directory.
descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.max events

adt.max.record.size.exceeded

Severity

ERROR

Description

This message occurs when a management command or file operation tries to generate an audit record, that is greater than the max_audit_record_size value. The File Services Auditing subsystem might fail the operation or truncate the record.

Corrective Action

Contact NetApp technical support.

Syslog Message

File Services Auditing subsystem failed the operation or truncated an audit record because it was greater than max_audit_record_size value. Vserver UUID=%s, event_id=%u, size=%u

Parameters

VserverUuid (STRING): UUID of then Vserver.
eventId (INT): Event ID for internal use.
size (INT): Record size.

adt.nfs events

adt.nfs.root.access.no.map

Severity

ERROR

Description

This message occurs in the auditing subsytem, when the NFS root user is accessing the file without a valid CIFS credential. Access is being allowed because the "ignore-nt-acl-for-root" NFS option is set, and hence the BUILTIN\Administrator credential is used for auditing.

Corrective Action

If NFS root user access to the file without NT ACL check should be prohibited, disable the "ignore-nt-act-for-root" option by using the "nfs modify -ignore-nt-acl-for-root" command. If a more appropriate CIFS credential should be used for auditing, configure the SVM name-mapping by using the "vserver name-mapping" command.

Syslog Message

NFS root user is accessing the file without a valid CIFS credential. Access is being allowed because the "ignore-nt-acl-for-root" NFS option is set, and hence the BUILTIN\Administrator credential is used for auditing.

Parameters

VserverUuid (STRING): UUID of the Storage Virtual Machine (SVM, formerly Vserver).

adt.service events

adt.service.block

Severity

EMERGENCY

Description

This message occurs when the volume that hosts the destination path where the final audit logs are stored is not accessible or does not have sufficient space and the audit consolidation service is not able to write to the volume. This prevents the audit service from working properly. File access and file audit logging is blocked.

Corrective Action

Use the "vserver audit show" command to get the name of the volume that hosts the destination path. Use the "volume show" command to check whether the volume exists, is online, and has sufficient free space. Use the "volume modify" command to increase volume size. Use the "vserver audit modify" command to modify the destination path.

Syslog Message

Audit destination directory "%s" of Vserver "%s" is either not accessible or full for the consolidation job type "%s". File-Operations which need to be audited will be denied. File Audit Logging will also fail.

Parameters

    destinationPath (STRING): Destination path.
    vserverName (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).
    descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.service.ro.filesystem

Severity

    EMERGENCY

Description

    This message occurs when the volume that hosts the destination path where the final audit logs are stored is of type Data protection (DP) or Load sharing (LS). These volume types are read-only for the purposes of audit logging and logging will fail.

Corrective Action

    Use the "vserver audit modify" command to modify the destination volume.

Syslog Message

    Auditing and file-ops failing on SVM %s, the volume containing %s for consolidation job of type %s is read only filesystem.

Parameters

    vserverName (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).
    destinationPath (STRING): Destination path.
    descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.service.unblock

Severity

    INFORMATIONAL

Description

    This message occurs when the volume that hosts the destination path where the final audit logs are stored was resized or cleaned up and the audit consolidation service is able to write to the volume thereby unblocking the audit service. File access and file audit logging is unblocked.

Corrective Action

    (None).

Syslog Message

    Audit destination directory "%s" of Vserver "%s" for consolidation job of type "%s" is now accessible and File-Operations which need to be audited will be unblocked. File Audit Logging will also be unblocked.

Parameters

    destinationPath (STRING): Destination path.
    vserverName (STRING): Name of the Storage Virtual Machine (SVM, formerly Vserver).
    descriptor (STRING): Type of consolidation job - CIFS/S3.

adt.stgvol events

adt.stgvol.info.notavailable

Severity

ERROR

Description

This message occurs when retreiving staging volume information fails. This might be due to an internal system problem or the staging volume creation failed.

Corrective Action

Contact Cserver admin to check if staging volume has been created.

Syslog Message

Audit subsystem internal error: Either staging volume %s is not created or unable to retrieve staging volume information.

Parameters

volName (STRING): The Name of the staging volume.

adt.stgvol.missing

Severity

ALERT

Description

This message occurs when retrieving staging volume information fails. Either the staging volume was not created or information cannot be retrieved due to some internal error. As a result, auditing is not performed for operations on the corresponding volume.

Corrective Action

Use the command "vserver audit repair" in diagnostic mode to correct the problem.

Syslog Message

Audit subsystem internal error: Staging volume "%s" is either not created or not available.

Parameters

volName (STRING): Name of the volume that is missing.

adt.stgvol.nospace

Severity

EMERGENCY

Description

This message occurs when a staging volume does not have enough space and the audit service tries to create a new staging file or directory for writing audit logs.

Corrective Action

Check the volume for older staging files that are no longer required and remove those files. Then retry the operation.

Syslog Message

Audit subsystem internal error: Staging volume %s is full.

Parameters

volName (STRING): Name of the volume that is full.

adt.stgvol.offline

Severity

EMERGENCY

Description

This message occurs when a staging volume is offline and the audit service tries to write an audit log into the staging volume.

Corrective Action

Contact the Cserver administrator to set the staging volume status to online.

Syslog Message

Audit subsystem internal error: Staging volume %s is offline.

Parameters

volName (STRING): The Name of the volume which is offline.

adt.wrkrq events

adt.wrkrq.init.fail

Severity

ALERT

Description

This message occurs when an internal audit worker queue fails to initialize.

Corrective Action

Available system resources are required for this feature to function. The Audit subsystem might not function, or might function with reduced performance. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete,issue a "giveback" command to return services to this partner.

Syslog Message

Audit subsystem internal error: Audit worker queue failed to initialize; system reboot might be required.

Parameters

(None).

adt.wrkrthrd events

adt.wrkrthrd.create.fail

Severity

ALERT

Description

This message occurs when audit initialization fails because the necessary execution threads cannot be created.

Corrective Action

Available system resources are required for this feature to function. The best way to accomplish that is through a system reboot. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete,issue a "giveback" command to return services to this partner.

Syslog Message

Audit subsystem internal error: Could not start required audit worker threads; system reboot might be required.

Parameters

(None).

aggr events

aggr.full events

aggr.full

Severity

ALERT

Description

This message occurs when an aggregate is full.

Corrective Action

Ensure that all containers in the pod are online and healthy. Check if the REST server is up and responding.

Syslog Message

Aggregate "%s" is full.

Parameters

aggr_name (STRING): Name of the aggregate.

aggr.grow events

aggr.grow.completed

Severity

NOTICE

Description

This message occurs when request to grow an aggregate is completed successfully. The request to grow the aggregate could be DMAP-triggered or SDE-triggered.

Corrective Action

(None).

Syslog Message

Request to grow aggregate "%s" is complete. Old size: %lu, new size: %lu, old state: %d, new state: %d.

Parameters

aggr_name (STRING): Name of the aggregate.
old_size (LONGINT): Size of the aggregate before it is grown.
new_size (LONGINT): Size of the aggregate after it is grown.
previous_state (INT): State of the aggregate before it is grown.
current_state (INT): State of the aggregate after it is grown.

aggr.inconsistent events

aggr.inconsistent.modify

Severity

INFORMATIONAL

Description

This message occurs when the 'aggr inconsistent' command is used to modify a state of an aggregate.

Corrective Action

(None).

Syslog Message

Aggregate %s: 'aggr inconsistent' command used to change inconsistent state to '%s'.

Parameters

aggr (STRING): Name of the aggregate.
state (STRING): State of the action: "set" or "clear".

aggr.max events

aggr.max.size.increased

Severity

INFORMATIONAL

Description

This message occurs as a reminder that the maximum aggregate size limit is increased from the default value defined in the Platform Specific Module (PSM) table.

Corrective Action

(None).

Syslog Message

Maximum aggregate size limit is increased from %ld TB to %ld TB.

Parameters

old_limit (LONGINT): Original aggregate size limit as defined in the PSM table.
new_limit (LONGINT): New maximum aggregate size limit.

aggr.provisioning events

aggr.provisioning.unassigned.detected

Severity

NOTICE

Description

This message is issued when the aggregate provisioning recommendation generated for the cluster is found to be incomplete due to the presence of unassigned disks. Any spare disks that are not owned by a node in the cluster cannot contribute to the usable capacity of new aggregates.

Corrective Action

Use the following steps to resolve the issue: - Run 'storage disk show -container-type unassigned' to list all the unassigned disks in the cluster. To assign all unassigned disks, run 'storage disk assign -auto true -node [node-name]'. - If there are still unassigned disks in the cluster, refer to the Storage Management Guide for manual disk assignment best practices. - For further information or assistance, contact NetApp technical support.

Syslog Message

The generated aggr provisioning recommendation might be incomplete because of the following reason: %s

Parameters

details (STRING): Details of the number of unassigned disks visible to a given node
source (STRING): The source that generated this warning.

aggr.relocation events

aggr.relocation.failed

Severity

ERROR

Description

This message occurs when relocation of an aggregate fails.

Corrective Action

Refer to other generated error messages to identify the exact cause of failure and the corrective action.

Syslog Message

Relocation of aggregate %s failed by node %s because %s.

Parameters

aggr (STRING): Name of the aggregate that was not relocated.
node (STRING): Name of the node that failed the relocation.
msg (STRING): Error that prevented relocation.

aggr.resize events

aggr.resize.request.sent

Severity

NOTICE

Description

This message occurs when a request to resize an aggregate is sent to the REST server as part of the storage thin provisioning feature in Quark.

Corrective Action

(None).

Syslog Message

Triggering resizing of aggregate for %s. Current size: %lu, new size: %lu.

Parameters

aggr_name (STRING): Name of the aggregate.
current_size (LONGINT): Current size of the aggregate.
new_size (LONGINT): New size of the aggregate after being resized.

aggr.resize.response.failure

Severity

ALERT

Description

This message occurs when the REST server returns an error for a request to resize an aggregate.

Corrective Action

Ensure that all containers in the pod are online and healthy. Check if the REST server is up and responding.

Syslog Message

Server returned error: %d for the resizing request. Aggregate: %s, current size: %lu, new size: %lu".

Parameters

error (INT): Error returned from REST server.
aggr_name (STRING): Name of the aggregate.
current_size (LONGINT): Current size of the aggregate.
new_size (LONGINT): New size of the aggregate after being resized.

aggr.resize.response.success

Severity

NOTICE

Description

This message occurs when the REST server returns "success" as a response to the request to resize an aggregate.

Corrective Action

(None).

Syslog Message

Server returned "success" as a response to a resizing request. Aggregate: %s, current size: %lu, new size: %lu.

Parameters

aggr_name (STRING): Name of the aggregate.
current_size (LONGINT): Current size of the aggregate.
new_size (LONGINT): New size of the aggregate after being resized.

aggr.wafliron events

aggr.wafliron.attemptStart

Severity

INFORMATIONAL

Description

This message occurs when wafliron is started. A later message indicates the success or failure of wafliron.

Corrective Action

(None).

Syslog Message

(None).

Parameters

volname (STRING): Volume name.
arguments (STRING): Arguments supplied to wafliron on the command line.

aggrcopy events

aggrcopy.dst events

aggrcopy.dst.autoRestrictMsg

Severity

NOTICE

Description

This event is issued when an aggregate copy start is issued on an aggregate which is offline.

Corrective Action

Aggr copy start is issued on a restricted aggregate use "aggr restrict" to restrict the destination aggregate.

Syslog Message

Aggr copy automatically restricting destination aggregate %s (currently offline).

Parameters

dst (STRING): The aggr copy destination aggregate

aggrcopy.dst.noMemory

Severity

ERROR

Description

This event is issued when there is insufficient memory on the aggr copy destination for the transfer to continue.

Corrective Action

(None).

Syslog Message

System is low on memory, aborting aggr copy destination transfer.

Parameters

(None).

aggrcopy.dst.revert

Severity

NOTICE

Description

This event is issued when an aggr copy start operation has to revert the checksum state of the destination volume aggregate because the source and destination aggregates have differing checksum states.

Corrective Action

No corrective action required.

Syslog Message

An aggr copy transfer to destination aggregate %s has found that the source and destination aggregates have differing checksum states. Data ONTAP is aborting the transfer and reverting the checksum state for the destination aggregate. After ONTAP displays a message showing the revert is complete, you will need to retry the operation. You can use the "aggr status -c" command to see the progress of the reversion.

Parameters

dst (STRING): The aggr copy destination volume

aggrcopy.dst.revertErr

Severity

NOTICE

Description

This event is issued when a aggr copy start operation is not able to revert the checksum state of the destination aggregate.

Corrective Action

(None).

Syslog Message

ONTAP cannot revert the checksum state of destination aggregate %s.

Parameters

dst (STRING): The aggr copy destination

aggrcopy.dst.reverting

Severity

NOTICE

Description

This event is issued when an aggr copy start operation is issued on an aggregate which is reverting its checksum state.

Corrective Action

(None).

Syslog Message

Aborting aggr copy transfer to aggregate %s because it is reverting its checksum state.

Parameters

dst (STRING): The aggr copy destination aggregate

aggrcopy.restart events

aggrcopy.restart.dst.chkFail

Severity

NOTICE

Description

This message occurs when 'aggr copy' checks for restart capability on the destination storage system fail. The 'aggr copy' transfer operation cannot be restarted. It starts as usual from the beginning (0 %%) without any further user action.

Corrective Action

No action necessary

Syslog Message

Destination side checks fail; 'aggr copy' transfer starts from 0%%.

Parameters

(None).

aggrcopy.src events

aggrcopy.src.snapshotErr

Severity

ERROR

Description

This event is issued when we are not able to obtain all the snapshot information, from the vol copy source volume, required for a vol copy transfer.

Corrective Action

(None).

Syslog Message

Aggr copy not able to obtain snapshot information from source aggregate %s

Parameters

srcaggr (STRING): The aggr copy source volume

air events

air.certify events

air.certify.cancel

Severity

ALERT

Description

This message occurs when a metadata inconsistency is discovered inside a file system feature that is read-only and therefore cannot be immediately corrected. One or more processes in ONTAP® software might have been canceled when they encountered the inconsistency.

Corrective Action

No immediate corrective action is necessary, because the ONTAP process that encountered the inconsistency has been automatically canceled. If the condition persists, contact NetApp technical support for assistance.

Syslog Message

AIR certification of %s failed: %s, %s ; message %s canceled for subtype %d

Parameters

fh (STRING): File handle of the object with an inconsistency.
condition (STRING): Specific metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.
msg (STRING): The ONTAP process that encountered the inconsistency.
subtype (INT): Subtype of the inode encountering the inconsistency.

air.cleared events

air.cleared.qtm.entry

Severity

NOTICE

Description

This message occurs when the Automated Incremental Repair (AIR) subsytem clears an entry in the qtree metafile because of inconsistent data within that entry.

Corrective Action

(None).

Syslog Message

Qtree entry certification failed at %s. In the qtree metafile %d, AIR cleared an entry that corresponds to the TID %d in volume %s.

Parameters

source (STRING): Location where qtree entry certification failed.
inode (INT): Inode number of qtree metafile.

tid (INT): TID.
volume (STRING): Name of the volume.

air.corrected events

air.corrected.qtree.tid

Severity

NOTICE

Description

This message occurs when the Automated Incremental Repair (AIR) subsystem repairs an inode having a corrupted qtree ID.

Corrective Action

(None).

Syslog Message

Qtree entry certification failed at %s. AIR repaired qtree inode %d: old TID %d, new TID %d, fgindex %d.

Parameters

source (STRING): Location where qtree entry certification failed.
inode (INT): Inode number.
old_tid (INT): Old TID.
new_tid (INT): New TID.
fgindex (INT): Fgindex of the qtree root.

air.disable events

air.disable.async.delete.cli

Severity

ALERT

Description

This message occurs when any inconsistency is found with the async delete trashbin directory of a volume.

Corrective Action

The "asynchronous directory delete from the client" feature has been disabled on this volume. To re-enable the feature, use the (privilege: advanced) "volume file async-delete client enable" command

Syslog Message

The "async directory delete from the client" feature was disabled in volume %s, after an inconsistency was detected with the trashbin directory.

Parameters

volume (STRING): Name of the volume.
source (STRING): Location of the failing metadata validation.

air.disable.preserve.unlink

Severity

NOTICE

Description

This message occurs when any inconsistency is found with the trash directory that is used for the preserve unlink option of a volume. Then, the preserve unlink option is disabled for that volume. The trash directory that is used for the preserve unlink option is used to preserve deleted files for NFSv41 when they have existing share locks.

Corrective Action

None. The system reverts to the behavior it used before the preserve unlink option was enabled; that is, it will not preserve deleted files with share locks.

Syslog Message

The preserve unlink option of volume "%s", was disabled after an inconsistency with the trash directory was detected.

Parameters

volume (STRING): Name of the volume.
source (STRING): Location of the failing metadata validation.

air.enabled events

air.enabled.fg.qtree

Severity

NOTICE

Description

This message occurs in a FlexGroup, when the qtree support is enabled on the volume, but disabled on one or more constituent volumes. ONTAP® software automatically enabled the qtree support on the relevant constituent volumes.

Corrective Action

This message indicates that the qtree support is enabled on the volume, but disabled in one or more constituents within the FlexGroup. ONTAP® software automatically enabled the qtree support in the relevant constituent FlexGroup volumes.

Syslog Message

Enabled qtree support in FlexGroup constituent volume %s after detecting inconsistency in %s.

Parameters

volume (STRING): Name of the volume.
source (STRING): Location of the failing metadata validation.

air.evicted events

air.evicted.qtm.entry

Severity

NOTICE

Description

This message occurs when the Automated Incremental Repair (AIR) subsystem evicts an entry in the qtree metafile because of inconsistent data within that entry.

Corrective Action

(None).

Syslog Message

Qtree entry certification failed at %s. In the qtree metafile %d, AIR evicted an entry that corresponds to the TID %d in volume %s.

Parameters

source (STRING): Location where qtree entry certification failed.
inode (INT): Inode number of the qtree metafile.
tid (INT): TID.
volume (STRING): Name of the volume.

air.fc events

air.fc.origin.corrupt

Severity

ALERT

Description

This message occurs when inconsistencies are detected in the origin of this FlexCache® volume. The affected files remain inaccessible from this FlexCache volume until the corrective action is taken.

Corrective Action

If the origin of this FlexCache volume is a FlexVol® volume, then run wafliron on the origin FlexVol volume. If the origin is a FlexGroup volume, then list the affected files from a NFS or a CIFS client on the origin volume. For more information or assistance, contact NetApp technical support.

Syslog Message

The fh %s in Origin of this FlexCache volume %s%s contains inconsistencies.

Parameters

fh (STRING): File handle of the affected inode.
vol (STRING): FlexCache volume name.
volident (STRING): Unique identifier for the volume if volume name alone is insufficient.

air.qtm events

air.qtm.rebuild.scan.state

Severity

NOTICE

Description

This message occurs when the state of a scanner used to rebuild the qtree metafile changes.

Corrective Action

(None).

Syslog Message

Scanner to rebuild the qtree metafile is %s.

Parameters

state (STRING): State of the scanner.

air.removed events

air.removed.remote.lck.entry

Severity

NOTICE

Description

This message occurs when there is an inconsistency in the remote lock entry metafile. The inconsistent entry is removed upon detection.

Corrective Action

(None).

Syslog Message

Remote lock entry %s certification failed: expression %s, source %s, state (%s).

Parameters

entry (STRING): Lock entry type and origin file ID pair describing the entry.
rlem (STRING): Describes the metafile to which this lock entry belongs to.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.
state (STRING): Description of the remote lock entry metafile metadata state that was found to be inconsistent.

air.repair events

air.repair.prsist.lock.entry

Severity

NOTICE

Description

This message occurs when there is an inconsistency in the persistent lock entry metafile. The inconsistent entry is repaired upon detection if there is a corresponding in-core record.

Corrective Action

(None).

Syslog Message

Persistent lock entry %s certification failed: Condition: %s, source: %s, state: %s.

Parameters

entry (STRING): Lock entry type and origin file ID pair describing the entry.
condition (STRING): Initial validation test that fails.
source (STRING): Location of the failing metadata validation test.
state (STRING): Description of the remote lock entry metafile metadata state that is found to be inconsistent.

air.repaired events

air.repaired.bucket.header

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in a metadata bucket header record. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

TOC metadata (%s) has an inconsistent record for the bucket upload table (%s). %s.

Parameters

toc_fh (STRING): File handle of the TOC metadata file.
upload_table_fh (STRING): File handle of the bucket upload table file.
state (STRING): Description of the metadata that was found to be inconsistent.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.

air.repaired.cbmap

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the type/subtype of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

CloudBlockMap metafile %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the CloudBlockMap metafile that was found to be inconsistent.

air.repaired.cbmap.entry

Severity

NOTICE

Description

This message occurs when context mismatch is discovered in any entry of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

%s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the metafile that was found to be inconsistent.
pvbn (LONGINT): Inconsistency found in cbmap entry of this PVBN.

air.repaired.cbmap.header

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the header of CloudBlockMap metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

%s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.

condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the metafile that was found to be inconsistent.

air.repaired.chapter.entry

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Chapter metadata (%s) has inconsistent record for object (%s). Source %s (%s).

Parameters

chapter_fh (STRING): File handle of the metadata file.
object_fh (STRING): File handle of the object.
source (STRING): Location of the failing metadata validation test.
condition (STRING): Initial metadata validation test that failed.
state (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.cssSnapdbFh

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in a metadata bucket header record. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Inconsistency in the css snapdb filehandle information of the TOC metadata %s belonging to bucket %u is being repaired.

Parameters

toc_fh (STRING): File handle of the TOC metafile.
bucket_num (INT): Bucket number.
state (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.cssSnapdbHdr

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in the user header of the css snapdb metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Inconsistency in user header of css snapdb metafile %s belonging to bucket %u is being repaired.

Parameters

snapdb_fh (STRING): File handle of the snapdb metafile.
bucket_num (INT): Bucket number.
state (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.cssSnapdbInode

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in the css snapdb metafile inode. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Inconsistency in the css snapdb inode information of the TOC metadata %s belonging to bucket %u is being repaired.

Parameters

toc_fh (STRING): File handle of the TOC metafile.
bucket_num (INT): Bucket number.
state (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.cssSnapdbTid

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in the qtree id of the css snapdb metafile inode. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Inconsistency in the TID of the css snapdb metafile inode %s belonging to bucket %u is being repaired.

Parameters

> **snapdb_fh** (STRING): File handle of the snapdb metafile.
> **bucket_num** (INT): Bucket number.
> **state** (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.dir.hole

Severity

> NOTICE

Description

> This message occurs when an inconsistency is discovered in the hole list of a directory. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

> (None).

Syslog Message

> Directory hole list %s certification failed: %s, %s.

Parameters

> **fh** (STRING): File handle of the affected directory.
> **condition** (STRING): Initial metadata validation test that failed.
> **source** (STRING): Location of the failing metadata validation test.

air.repaired.dir.inode

Severity

> NOTICE

Description

> This message occurs when an inconsistency is discovered in a directory. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

> (None).

Syslog Message

> Directory %s certification failed: %s, %s.

Parameters

> **fh** (STRING): File handle of the affected directory.
> **condition** (STRING): Initial metadata validation test that failed.
> **source** (STRING): Location of the failing metadata validation test.

air.repaired.enc.vvol.info

Severity

> NOTICE

Description

This message occurs when an inconsistency is discovered in the encryptable aggregate metafile inodes encrypted flexvol information which stores vvol_btid and vvol_fid. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

Inode %s certification failed: %s, %s.

Parameters

fh (STRING): File handle of the affected inode.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.

air.repaired.fabriclink

Severity

NOTICE

Description

This message occurs when a metadata inconsistency is discovered and repaired within an object storage replication data structure.

Corrective Action

(None).

Syslog Message

AIR repaired %s, condition %s at %s, object "%s"

Parameters

fh (STRING): File handle of the replication data structure that was found to be inconsitent.
expr (STRING): The nature of the inconsistency that was discovered and repaired.
source (STRING): Location where the metadata inconsistency was detected.
object (STRING): Optionally represents the name of a particular object whose replication state was affected.

air.repaired.fc.dir

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in any directory in the volume. The inconsistency is repaired automatically as soon as it is discovered.

Corrective Action

(None).

Syslog Message

Evicted inconsistent directory with fh %s due to corruption in volume %s.

Parameters

fh (STRING): File handle of the affected inode.
volume (STRING): Name of the volume.

air.repaired.fc.qtree.id

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the qtree ID of an inode. The inconsistent inode is evicted automatically as soon as it is discovered.

Corrective Action

(None).

Syslog Message

Evicted inconsistent inode with fh %s due to a corrupted qtree ID: qtree ID %d, volume %s.

Parameters

fh (STRING): File handle of the affected inode.
tid (INT): Qtree ID.
volume (STRING): Name of the volume.

air.repaired.hardlink.i2p

Severity

NOTICE

Description

This message occurs when the AIR subsystem repairs an inconsistent inode and previously unreachable hard links are returned to availability.

Corrective Action

(None).

Syslog Message

AIR repaired inconsistent hardlink for inode %d: %d %d %s

Parameters

inode (INT): Inode number.
parent_inode (INT): Parent inode number.
link_count (INT): Inode link count.
volume (STRING): Name of the volume.

air.repaired.label.database

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered within a WAFL label database. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Label database %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the metadata that was found to be inconsistent.

air.repaired.lsm.bfc.lkp

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the LSM BFC Lookup file. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

LSM BFC Lookup file %s was corrected at block %d. Source %s.

Parameters

fh (STRING): File handle of the affected file.
block (LONGINT): Block number of the inconsistent block.
source (STRING): Location of the failing metadata validation test.

air.repaired.lsm.bloom.file

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the LSM Bloomfilter file. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

LSM Bloomfilter file %s was corrected at block %d. Source %s.

Parameters

fh (STRING): File handle of the affected file.
block (LONGINT): Block number of the inconsistent block.
source (STRING): Location of the failing metadata validation test.

air.repaired.lsm.info.file

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the LSM Info file. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

LSM Info file %s was corrected at block %d. Source %s.

Parameters

fh (STRING): File handle of the affected file.
block (INT): Block number of the inconsistent block.
source (STRING): Location of the failing metadata validation test.

air.repaired.lsm.keyspc.file

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the LSM Keyspace Information file. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

Inconsistent LSM Keyspace Information metafile on aggregate "%s" was repaired. Source %s.

Parameters

aggregate (STRING): Name of the aggregate.
source (STRING): Location of the failing metadata validation test.

air.repaired.lsm.lookup.file

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the LSM Lookup file. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

LSM Lookup file %s was corrected at block %d. Source %s.

Parameters

fh (STRING): File handle of the affected file.
block (LONGINT): Block number of the inconsistent block.
source (STRING): Location of the failing metadata validation test.

air.repaired.merkle

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the metadata (Merkle tree file). Repairs to the Merkle tree file have automatically been started.

Corrective Action

(None).

Syslog Message

Merkle file "%s" certification failed: %s, directory ID (%llu), branch ID (%llu), buffer level %d, fbn (%llu), Merkle tree level (%d)

Parameters

fh (STRING): File handle of the Merkle file that needs repairs.
condition (STRING): Initial validation test that failed.
dir_id (LONGINT): Slice directory ID of the Merkle file.
branch_id (LONGINT): Slice branch ID of the Merkle file.
level (INT): Buffer level of the Merkle file block.
fbn (LONGINT): File block number (FBN) of the Merkle file.
merkle_level (INT): Merkle checksum level of the Merkle file.
source (STRING): The location of the failing validation test.

air.repaired.mpu.catalog

Severity

NOTICE

Description

This message occurs when ONTAP® discovers an inconsistency in a multipart upload catalog record of a bucket upload table. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Bucket upload table (%s) has an inconsistent record for the multipart upload catalog (%s). %s.

Parameters

upload_table_fh (STRING): File handle of the bucket upload table file.
mp_catalog_fh (STRING): File handle of the multipart catalog file.
state (STRING): Description of the metadata that was found to be inconsistent.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.

air.repaired.multipart.database

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the metadata of a multipart inode. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The database validation test that failed.
source (STRING): The location of the failing database validation test.
state (STRING): A description of the metadata that was found to be inconsistent.

air.repaired.multipart.inode

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in a multipart inode. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Multipart inode %s certification failed: %s, %s

Parameters

fh (STRING): File handle of the affected file.

condition (STRING): The initial multipart inode validation test that failed.
source (STRING): The location of the failing multipart inode validation test.

air.repaired.multipart.record

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the metadata of the multipart inode. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The initial record validation test that failed.
source (STRING): The location of the failing record validation test.
state (STRING): A description of the record that was found to be inconsistent.

air.repaired.multipart.rectify

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the rectification metadata for a multipart file. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Multipart inode %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The initial record validation test that failed.
source (STRING): The location of the failing record validation test.
state (STRING): A description of the record that was found to be inconsistent.

air.repaired.multipart.userheader

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the userheader section of a multipart file. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Multipart inode %s userheader certification failed: %s, %s

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The initial userheader validation test that failed.
source (STRING): The location of the failing userheader validation test.

air.repaired.name.info.flags

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the name information flags of a directory. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

Name information flags for directory entry %s corrected at block %d and index %d. Source %s.

Parameters

fh (STRING): File handle of the affected directory.
block (INT): Block number that contains the affected entry
index (INT): Location within the block that holds the affected entry
source (STRING): Location of the failing metadata validation test.

air.repaired.pct.entry

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

PCT metadata has inconsistent record for bucket (%u) file (%u). Source %s (%s, %s).

Parameters

    bucketid (INT): Bucket identifier.
    fileid (INT): File identifier.
    source (STRING): Location of the failing metadata validation test.
    condition (STRING): Initial metadata validation test that failed.
    state (STRING): Description of the metadata that was found to be inconsistent.

air.repaired.qtree.id

Severity

    NOTICE

Description

    This message occurs when an inconsistency is discovered in the qtree ID of an inode. The inconsistency is repaired automatically as soon as it is discovered.

Corrective Action

    (None).

Syslog Message

    Repaired inconsistent inode with fh %s due to a corrupted qtree ID: Old qtree ID %d, new qtree ID %d, volume %s.

Parameters

    fh (STRING): File handle of the affected inode.
    old_tid (INT): Old qtree ID.
    new_tid (INT): New qtree ID.
    volume (STRING): Name of the volume.

air.repaired.qtree.metafile

Severity

    NOTICE

Description

    This message occurs when an inconsistency is discovered in a qtree metafile.The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

    (None).

Syslog Message

    Qtree metafile %s

Parameters

    details (STRING): Description of the metadata failure that has been fixed.

air.repaired.qtree.root

Severity

NOTICE

Description

This message occurs when the system discovers an inconsistency between the qtree file root and a qtree metafile entry. The system repairs this inconsistency automatically, as soon as it detects it.

Corrective Action

(None).

Syslog Message

Qtree root %s certification failed: %s, %s corrections: %s.

Parameters

fh (STRING): File handle of the affected qtree root.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.
state (STRING): Description of the metadata that has been fixed.

air.repaired.ral.clone.exp

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered between the source, clone created via ral retrieve and the clone expansion structure in source's remote state.

Corrective Action

(None).

Syslog Message

Remote RAL Clone %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected clone.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the source and clone files.

air.repaired.rclone.database

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered within the WAFL Remote Clone Database. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote Clone Database %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the metafile that was found to be inconsistent.

air.repaired.rclone.record

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in any record of the WAFL Remote Clone Database. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote Clone Record %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected record.
condition (STRING): The initial record validation test that failed.
source (STRING): The location of the failing record validation test.
state (STRING): A description of the entry that was found to be inconsistent.

air.repaired.remote.index

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered within the WAFL RAL index. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote index %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): The RAL index record that was discovered to be incorrect.

air.repaired.remote.inode

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered between a file and its RAL state within WAFL. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote inode %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the RAL state metadata that was found to be inconsistent.

air.repaired.remote.metafile

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered within a WAFL RAL metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote metafile %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the RAL metafile that was found to be inconsistent.

air.repaired.remote.tallies

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the tallies in Remote Entry metafile. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote metafile %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the RAL metafile that was found to be inconsistent.

air.repaired.remote.writeback.dirtylist.record

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered between a file and its writeback metadata within WAFL. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote inode %s writeback certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the writeback metadata that was found to be inconsistent.

air.repaired.rlem.tallies

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the tallies in Remote Lock Entry metafile(RLEM). The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

Remote lock entry metafile %s certification failed: %s, %s (%s)

Parameters

fh (STRING): File handle of the affected metafile.
rlem (STRING): Describes the metafile to which this lock entry belongs to.

condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
state (STRING): A description of the RLEM that was found to be inconsistent.

air.repaired.slice

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in the metadata (slice file). Repairs to the slice file from the secondary copy have automatically been started.

Corrective Action

(None).

Syslog Message

Slice file "%s" certification failed: %s, dir ID (%llu), branch ID (%llu), level %d, fbn (%llu)

Parameters

fh (STRING): File handle of the slice file that needs repairs.
condition (STRING): The initial validation test that failed.
dir_id (LONGINT): Slice directory ID of the slice file.
branch_id (LONGINT): Slice branch ID of the slice file.
level (INT): Buffer level of the slice file block.
fbn (LONGINT): File block number (FBN) of the slice file.
source (STRING): The location of the failing validation test.

air.repaired.snapinfo.block

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the persistent lock entry metafile. The inconsistent entry has been removed.

Corrective Action

(None).

Syslog Message

Repaired inconsistent block (%s) found in Snapinfo metafile on volume "%s".

Parameters

state (STRING): Description of the Snapinfo metafile block that was found to be inconsistent.
volume (STRING): Name of the volume.

air.repaired.ssm.iftp.inode

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered in ssm iftp metafile. The inconsistency is repaired automatically as soon as it is detected.

Corrective Action

(None).

Syslog Message

AIR vlist metafile %s certification failed: %s, %s.

Parameters

fh (STRING): File handle of the affected metafile.
condition (STRING): Initial metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.

air.repaired.toc.entry

Severity

ALERT

Description

This message occurs when an inconsistency is discovered in a metadata record. The inconsistency is automatically repaired immediately upon detection. But it can leave behind lost objects that are no longer pointed to by the namespace.

Corrective Action

The command "object-store-server lost-object-recovery start" under diag privilege can be used to add lost objects back into namespace. The progress of this command can be monitored using "object-store-server lost-object-recovery show" command.

Syslog Message

TOC metadata (%s) has inconsistent record for chapter (%s). %s (%s).

Parameters

toc_fh (STRING): File handle of the TOC metadata file.
chapter_fh (STRING): File handle of the chapter metadata file.
state (STRING): Description of the metadata that was found to be inconsistent.
condition (STRING): Initial metadata validation test that failed.

air.repaired.user.ind

Severity

ERROR

Description

This message occurs when an inconsistency is discovered in the user indirect block. The inconsistency is repaired automatically immediately upon detection.

Corrective Action

(None).

Syslog Message

User indirect %s certification failed: %s (%s)

Parameters

fh (STRING): File handle of the affected file.
condition (STRING): Initial metadata validation test that failed.
state (STRING): Description of the user indirect block that was found to be inconsistent.
source (STRING): Location of the failing metadata validation test.

air.repaired.vplus

Severity

NOTICE

Description

This message occurs when an indexed storage tree is rebuilt to repair a metadata inconsistency that was discovered.

Corrective Action

(None).

Syslog Message

AIR vplus rebuild of %s completed for subtype %d

Parameters

fh (STRING): File handle of the storage tree.
subtype (INT): Subtype of the inode encountering the inconsistency.

air.vplus events

air.vplus.certify.issue

Severity

NOTICE

Description

This message occurs when an inconsistency is discovered inside an indexed storage tree. The inconsistency is automatically repaired immediately upon detection.

Corrective Action

(None).

Syslog Message

AIR vplus certification of %s failed: %s, %s for subtype %d

Parameters

fh (STRING): File handle of the storage tree.
condition (STRING): Specific metadata validation test that failed.
source (STRING): Location of the failing metadata validation test.
subtype (INT): Subtype of the inode encountering the inconsistency.

am events

am.dest events

am.dest.check.failed

Severity

NOTICE

Description

Relocation of aggregates fails at the destination as we no longer accept aggregates from versions 8.2.0 or lower.

Corrective Action

User needs to upgrade to 8.2.1 before attempting ARL to 8.3.0 or higher. `

Syslog Message

Relocation of aggregates failed from node %s to current node as ARL is no longer supported from releases 8.2.0 or lower to 8.3.0 or higher.

Parameters

partner_node (STRING): Source of the aggregate migration

api events

api.engine events

api.engine.killed

Severity

EMERGENCY

Description

This event is posted when the ONTAPI® engine is unexpectedly terminated. The ONTAPI APIs cannot be executed until the system is rebooted.

Corrective Action

Reboot the controller. If the problem persists, contact Contact NetApp technical support.

Syslog Message

Error in API Engine. Engine name: %s.

Parameters

engineName (STRING): Name of the execution engine (e.g., "m" or "d").

api.fileio events

api.fileio

Severity

NOTICE

Description

This message occurs after a file I/O error that typically causes a Data ONTAP® API to fail. While processing Data ONTAP API requests, the system might write intermediate results to files. For example, a long running command returning quantities of data might send a batch of data and save remaining data in a file for subsequent delivery. An I/O error occurred during one of these operations.

Corrective Action

If the problem is related to creating a file, use the system's "df" and "df -i" commands to determine whether the root volume is full or all inodes are in use. If so, it might be possible to remove unneeded files to release space or inodes needed for Data ONTAP API operations. If the problem is that an intermediate file is being deleted because of its age, no action is needed. Probably the client that requested the API did not complete the API processing.

Syslog Message

(None).

Parameters

errorDescription (STRING): Description of the I/O error that occurred.
targetDescription (STRING): Description of the file or directory in which the error occurred.
errorCode (INT): Numeric error code.
errorDetail (STRING): Description of the error code.

api.input events

api.input.invalidSchema

Severity

ERROR

Description

This message occurs when an ONTAPI(tm) API receives extra input parameters as part of the API request or when a required input parameter is missing in the API request. Most often this is due to a bug in the application that initiates the API request.

Corrective Action

The error is due to strict schema validation. You can turn off the input schema validation by using the following CLI commands: $priv set advanced $registry set state.api.schema_input_validate.enable off

Syslog Message

Error in API input schema validation. API name: %s. Detailed error: %s.

Parameters

apiName (STRING): Name of the ONTAPI API in which something invalid was detected.
detailInfo (STRING): Description of the error in the API input, such as an extra input value or a missing input value.

api.output events

api.output.invalid

Severity

NOTICE

Description

This message occurs when An invalid character was detected while checking the output for a Data ONTAP® API. All Data ONTAP API output must be valid UTF-8 characters. From time to time invalid output is detected. Most often this is due to hardware errors, for example, a disk-list-info API might query a disk drive for its serial number but receive invalid data from a malfunctioning drive.

Corrective Action

Examine the information in detailInfo to see if it pinpoints defective hardware. If an API name is provided, that API can be executed to determine which field in the API output is being given invalid data.

Syslog Message

(None).

Parameters

detailInfo (STRING): Information regarding the circumstances in which the error was detected, for example, the API name and/or the piece of hardware that provided invalid data.
invalidValue (INTHEX): The character in the string that was invalid, printed as a hexadecimal number.

api.output.invalidSchema

Severity

ERROR

Description

This message occurs when an ONTAPI(tm) API generates output that violates the declared schema of the API. Most often this is due to a bug in the API handler.

Corrective Action

The error is due to strict schema validation. You can turn off the output schema validation by using the following CLI commands: $priv set advanced $registry set state.api.schema_output_validate.enable off

Syslog Message

Error in API output schema validation. API name: %s. Detailed error: %s.

Parameters

apiName (STRING): Name of the ONTAPI API in which something invalid was detected.
detailInfo (STRING): Description of the error in the API output, such as an extra output value or a missing output value.

app events

app.cg events

app.cg.snap.smbc.lookup.fail

Severity

ERROR

Description

This message occurs when a consistency group on either side of a SnapMirror® active sync relationship cannot be resolved to the remote consistency group for correctly replicating consistency group snapshots.

Corrective Action

Use the "volume snapshot show" command on the destination cluster to view the consistency group snapshot and "volume snapshot restore" (In ASA r2, available at privilege:diagnostic) for restoring each individual volume instead of the consistency group REST interface.

Syslog Message

Failed to resolve snapshot "%s" in consistency group "%s" on SVM "%s" to the remote consistency group. Error: "%s".

Parameters

snapshot_name (STRING): Name of the consistency group's snapshot.
consistency_group (STRING): Name of the consistency group.
vserver (STRING): Name of the storage virtual machine (SVM).
error (STRING): Error that was encountered while resolving the local consistency group to its corresponding remote consistency group.

app.log events

app.log.alert

Severity

ALERT

Description

This event is issued when an application is in a condition that should be corrected immediately.

Corrective Action

(None).

Syslog Message

%s: %s %s: (%u) %s: %s

Parameters

computerName (STRING): Client Computer connected to the Filer.
eventSource (STRING): Client application that generated this event.
appVersion (STRING): Client application version.
eventID (INT): Application eventID.

category (STRING): Event category.
subject (STRING): Event description.

app.log.emerg

Severity

EMERGENCY

Description

This message occurs when an application encounters a fatal error and requires immediate attention.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s: %s %s: (%u) %s: %s

Parameters

computerName (STRING): Client Computer connected to the Filer.
eventSource (STRING): Client application that generated this event.
appVersion (STRING): Client application version.
eventID (INT): Application eventID.
category (STRING): Event category.
subject (STRING): Event description.

app.log.err

Severity

ERROR

Description

This event is issued when an application encounters an error condition.

Corrective Action

(None).

Syslog Message

%s: %s %s: (%u) %s: %s

Parameters

computerName (STRING): Client Computer connected to the Filer.
eventSource (STRING): Client application that generated this event.
appVersion (STRING): Client application version.
eventID (INT): Application eventID.
category (STRING): Event category.
subject (STRING): Event description.

app.log.info

Severity

INFORMATIONAL

Description

This event is issued when an application's message is meant for informational purposes.

Corrective Action

(None).

Syslog Message

%s: %s %s: (%u) %s: %s

Parameters

computerName (STRING): Client Computer connected to the Filer.
eventSource (STRING): Client application that generated this event.
appVersion (STRING): Client application version.
eventID (INT): Application eventID.
category (STRING): Event category.
subject (STRING): Event description.

app.log.notice

Severity

NOTICE

Description

This event is issued when an application is notifing of a certain event.

Corrective Action

(None).

Syslog Message

%s: %s %s: (%u) %s: %s

Parameters

computerName (STRING): Client Computer connected to the Filer.
eventSource (STRING): Client application that generated this event.
appVersion (STRING): Client application version.
eventID (INT): Application eventID.
category (STRING): Event category.
subject (STRING): Event description.

app.temp events

app.temp.delete.s3bucket.fail

Severity

ERROR

Description

This message occurs when a S3 Bucket cannot be deleted as a part of an application destroy operation.

Corrective Action

Use the "object-store-server bucket delete" command to delete the S3 bucket manually. Retry the "application destroy" command on the specified application.

Syslog Message

Failed to delete S3 Bucket %s of application %s on Vserver %s. Error %s.

Parameters

s3bucket (STRING): Name of the S3 Bucket.
application_name (STRING): Name of the application that contains this S3 bucket.
vserver (STRING): Name of the Vserver.
error (STRING): The error that the application destroy service encountered while destroying the S3 bucket.

app.temp.destroy.flexcache.fail

Severity

ERROR

Description

This message occurs when a flexcache cannot be destroyed as a part of an application destroy operation.

Corrective Action

Use the "volume offline" command to take the flexcache offline, and then use the "flexcache delete" command to delete the flexcache manually. Retry the "application destroy" command on the specified application.

Syslog Message

Failed to destroy flexcache %s of application %s on Vserver %s. Error %s.

Parameters

flexcache (STRING): Name of the flexcache.
application_name (STRING): Name of the application that contains this volume.
vserver (STRING): Name of the Vserver.
error (STRING): The error that the application destroy service encountered while destroying the flexcache.

app.temp.destroy.volume.fail

Severity

ERROR

Description

This message occurs when a volume cannot be destroyed as a part of an application destroy operation.

Corrective Action

Use the "volume offline" command to take the volume offline, and then use the "volume delete" command to delete the volume manually. Retry the "application destroy" command on the specified application.

Syslog Message

Failed to destroy volume %s of application %s on Vserver %s. Error %s.

Parameters

> **volume** (STRING): Name of the volume.
> **application_name** (STRING): Name of the application that contains this volume.
> **vserver** (STRING): Name of the Vserver.
> **error** (STRING): The error that the application destroy service encountered while destroying the volume.

app.temp.mcc.sb.modify.abort

Severity

> ERROR

Description

> This message occurs on MetroCluster(tm) systems, as part of a failed "application modify" command. For this to happen, the primary site must be in the midst of modifying application provisioning when an unplanned MetroCluster switchover occurs. The secondary site must then successfully modify the same application. During MetroCluster switchback, the state of the original application provisioning job is checked before allowing the originally issued "application modify" command from the primary site to continue. If the state of the application has changed due to it being modified by the secondary site during switchover, the original "application modify" command is canceled during switchback. This is to prevent possible corruption to the application provisioning modifications from the secondary site.

Corrective Action

> Verify that the changes made by the MetroCluster secondary site are acceptable by using the "application show" command. If the changes are acceptable, no further action is required. Otherwise, rerun the "application modify" command as necessary.

Syslog Message

> Failed to modify application %s on Vserver %s.

Parameters

> **app_name** (STRING): Name of the application being modified.
> **vserver** (STRING): Name of the Vserver.

app.temp.mcc.veto.fail

Severity

> ERROR

Description

> This message occurs when a metrocluster switchover or switchback command fails due to unfinished application jobs running on the node.

Corrective Action

> Run the "job show -category APS" command to first verify that there are no application provisioning jobs running. Then Retry the metrocluster switchover or switchback command.

Syslog Message

> A metrocluster switchover or switchback command was vetoed due to application provisioning jobs still in progress: %s.

Parameters

error (STRING): Error returned by Metrocluster application provisioning.

app.temp.remove.app.fail

Severity

ERROR

Description

This message occurs when an application cannot be removed from the persistent database during an "application destroy" operation.

Corrective Action

Retry the "application destroy" command. Contact NetApp technical support if the failure persists.

Syslog Message

Failed to remove application %s on Vserver %s from the persistent database. Error %s.

Parameters

application_name (STRING): Name of the application.
vserver_name (STRING): Name of the Vserver.
error (STRING): The error that the application destroy service encountered while removing the application from the persistent database.

application events

application.volume events

application.volume.removed

Severity

ERROR

Description

This message occurs when an application is destroyed, but a member volume was not deleted after an error was encountered. This volume is no longer associated with the application and must be deleted manually.

Corrective Action

Delete the volume using the "volume delete" command. For ASA r2, contact NetApp technical support for assistance to resolve this internal error.

Syslog Message

Fails to destroy member volume %s in storage virtual machine %s during an application destroy operation. The volume must be deleted manually. The volume was previously associated with an application with UUID %s.

Parameters

volumeName (STRING): Name of the volume.
vserver (STRING): Storage virtual machine (SVM) containing the volume.
applicationUUID (STRING): Universal unique identifier (UUID) of the application.

arl events

arl.abort events

arl.abort.raid

Severity

ERROR

Description

This message occurs when a relocation of an aggregate is canceled due to activity in RAID.

Corrective Action

Reissue the "storage aggregate relocation start" command to initiate relocation of an aggregate to the specified destination node after the pending or in-progress operation on the aggregate is complete.

Syslog Message

Aggregate %s%s is %s; canceling 'storage aggregate relocation start' operation.

Parameters

owner (STRING): String indicating the owner of the affected aggregate.
vol (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing the aggregate relocation operation.

arl.aggrdesttimeout events

arl.aggrDestTimeout

Severity

NOTICE

Description

This message occurs during an aggregate relocation operation, when the source node does not receive notification from the destination node, within the specified time, that the aggregate is online.

Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online on the destination node.

Syslog Message

Node did not receive notification from the destination in %llu milliseconds that aggregate %s is online after relocation.

Parameters

time (LONGINT): Timeout, in milliseconds, for notification from the destination node that an aggregate is online after relocation.
aggrName (STRING): Name of the aggregate that was relocated.

arl.aggronlinefailed events

arl.aggrOnlineFailed

Severity

EMERGENCY

Description

This message occurs when the RAID or WAFL® subsystem fails to bring online the aggregate or its containing volumes after relocation.

Corrective Action

Check the EMS logs for messages from the RAID and WAFL subsystems to determine the exact cause of the failure and the corrective action.

Syslog Message

Bringing online of aggregate %s or its volumes failed after relocation with error %d.

Parameters

aggrName (STRING): Name of the aggregate that was relocated.
error (INT): Error that occurred while bringing online the aggregate or its volumes after relocation.

arl.aggronlinetimeout events

arl.aggrOnlineTimeout

Severity

ALERT

Description

This message occurs when a node fails to bring online the aggregate and its containing volumes within the specified time after relocation.

Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online.

Syslog Message

Node did not bring online the aggregate %s and its volumes after relocation for %llu milliseconds.

Parameters

aggrUUID (STRING): UUID of the aggregate that was relocated.
time (LONGINT): Timeout, in milliseconds, to bring online the aggregate and its volumes after relocation.

arl.aggrstart events

arl.aggrStart

Severity

NOTICE

Description

This message occurs when relocation of a storage failover aggregate starts.

Corrective Action

(None).

Syslog Message

Starting relocation of aggregate %s at time %llu.

Parameters

aggrName (STRING): Name of the aggregate being relocated.
time (LONGINT): Time at which relocation of the aggregate started.
aggrUUID (STRING): UUID of the aggregate being relocated.

arl.connecttodestfailed events

arl.connectToDestFailed

Severity

ALERT

Description

This message occurs when the local node cannot connect over the cluster network to the d-blade of the destination node while relocating an aggregate.

Corrective Action

1. Verify that the destination node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local node and the destination node are both up. 3. Retry the aggregate relocation command.

Syslog Message

Failed to connect with the destination node %s (d-blade ID: %s) over the cluster network while relocating aggregate %s.

Parameters

destName (STRING): Name of the destination node.
destDbladeid (STRING): D-blade ID of the destination node.
aggrName (STRING): Name of the aggregate being relocated.

arl.netra events

arl.netra.ca.check.failed

Severity

ERROR

Description

This message occurs during the relocation of an aggregate, when the destination node cannot reach the object stores.

Corrective Action

Verify that your intercluster LIF is online and functional by using the 'network interface show' command. Also, check network connectivity to the object store server by using the 'ping' command over the destination node intercluster LIF. Additionally, verify that the configuration of your object store has not changed and that login and connectivity information is still accurate by using the 'aggregate object-store config show' command. It is possible to override this error by using the 'override-destination-checks' parameter of the relocation command. For more information or assistance, contact NetApp technical support.

Syslog Message

Relocation of aggregate '%s' (uuid: %s) failed due to %s preventing object store access on the destination node.

Parameters

vol (STRING): Name of the aggregate.
aggr_uuid (STRING): UUID of the aggregate.
reason (STRING): Activity that is preventing the aggregate relocation operation.

arl.netra.ha.dskChkFailed

Severity

ALERT

Description

This message occurs when relocation of an aggregate fails because the destination node cannot see all disks belonging to the aggregate.

Corrective Action

If the destination is the source node's high-availability (HA) partner, identify the missing disks by using the "storage failover show -fields local-missing-disks, partner-missing-disks" command. If the destination is not the source node's HA partner, use the "storage disk show -aggregate" command to list the disks belonging to the aggregate, and then verify that those disks are visible from the destination by using the "storage disk show" command.

Syslog Message

Relocation of aggregate %s failed from node %s because the destination node cannot see all disks belonging to the aggregate.

Parameters

aggr (STRING): Name of the aggregate that was not relocated.
node (STRING): Name of the node that failed the relocation.

arl.netra.lmgr.limit.failed

Severity

ERROR

Description

This message occurs during the relocation of an aggregate, when the destination node fails the lock count limit checks.

Corrective Action

Ensure that the destination node supports the identified lock count limits, or select a different destination node and retry the operation.

Syslog Message

Aggregate '%s': Lock limits check failed on destination node. %s

Parameters

vol (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing the aggregate relocation operation.

arl.netra.lmgr.reserve.fail

Severity

ERROR

Description

This message occurs when an aggregate is being relocated, and the partner node fails to reserve lock resources needed for this aggregate.

Corrective Action

Take the appropriate action based on the reason supplied in the logged message: - 'Partner reconstructing locks': Retry the relocation after reconstruction is complete on the partner node. You can check the reconstruction progress by using the 'debug locks reconstruction show' diagnostic privilege command. - 'Partner does not have sufficient lock resources': Free up lock resources on the partner and retry the relocation. You can free lock resources on the partner as client applications using locks are closed for volumes contained on that node. You can also free lock resources by moving volumes with locks from the partner node to a different node in the cluster. - 'Memory allocation failure': The system is running low on memory. Monitor memory statistics on the node and retry the relocation when more memory is available. - For other reason messages, or for further assistance, contact NetApp technical support.

Syslog Message

Aggregate '%s': Lock reservation failed. Reason: %s.

Parameters

aggr (STRING): Name of the aggregate being relocated.
reason (STRING): Reason the lock reservation failed.

arl.netra.raid.failed

Severity

ERROR

Description

This message occurs during migration of an aggregate as part of aggregate relocation, when one of the aggregate checks fails on the destination node, which include duplicate aggregate name, duplicate Universally Unique Identifier (UUID), aggregate count, and capacity limits.

Corrective Action

1. If checks fail due to aggregate count or capacity limits, then relocate this aggregate to an alternate destination node that has enough capacity to receive the aggregate. 2. If checks fail due to duplicate aggregate name or UUID, delete the duplicate aggregate created from previous "storage failover

giveback" or "storage aggregate relocation" operations. Contact NetApp technical support for assistance with deletion of the unwanted duplicate aggregate.

Syslog Message

Aggregate '%s' (UUID = %s, type = %s, home_owner_id = %llu, dr_home_owner_id = %llu): RAID aggregate migration checks failed on destination node %s.

Parameters

vol (STRING): Name of the aggregate.
aggregate_uuid (STRING): UUID of the aggregate.
raid_type (STRING): RAID type of the volume.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
dr_home_owner_id (LONGINT): NVRAM system ID of the aggregate's disaster recovery (DR) home owner.
reason (STRING): Activity that is preventing the aggregate relocation or giveback operation.

arl.netra.wafl.mcc.veto

Severity

ERROR

Description

This message occurs during the relocation of an aggregate, when one or more online left-behind disaster recovery(DR) aggregates are found on the destination node and the "node-object-limit" option is set to off.

Corrective Action

Check whether there exists any online left-behind DR aggregates on the destination node from a previous switchover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner, and then retry the operation. If you cannot perform the corrective action, then use the "override-destination-checks" option in the "relocation" command to force the relocation.

Syslog Message

Aggregate '%s': One or more online left-behind DR aggregates were found on the destination node and the "node-object-limit" option is set to off.

Parameters

vol (STRING): Name of the aggregate.

arl.opaborted events

arl.OpAborted

Severity

ERROR

Description

This message occurs when an aggregate relocation operation is aborted.

Corrective Action

Refer to other generated error messages to identify the exact cause of failure and the corrective action.

Syslog Message

Aggregate relocation operation aborted by node %s because %s.

Parameters

node (STRING): Name of the node that aborted relocation.
msg (STRING): Error that prevented relocation.

arl.opfinished events

arl.OpFinished

Severity

NOTICE

Description

This message occurs when the aggregate relocation operation from the source node to the specified destination is finished. Use the "storage aggregate relocation show" command to check whether all aggregates were relocated successfully.

Corrective Action

(None).

Syslog Message

Aggregate relocation operation from the source node %s to the destination node %s finished in %llu milliseconds. 'override-vetoes' set to %s, and 'override-destination-checks' set to %s.

Parameters

srcName (STRING): Name of the source node.
destName (STRING): Name of the destination node.
time (LONGINT): Time, in milliseconds, taken to complete the relocation operation.
override_vetoes (STRING): Flag that indicates whether the system should override veto checks for a relocation operation. This flag corresponds to the "-override-vetoes" parameter of the "storage aggregate relocation start" command. When set to true, it might result in the relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive.
override_dest_checks (STRING): Flag that indicates whether the system should override checks done on the destination node. This flag corresponds to the "-override-destination-checks" parameter of the "storage aggregate relocation start" command. When set to true, it can be used to force relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive.

arl.opstart events

arl.OpStart

Severity

NOTICE

Description

This message occurs when the aggregate relocation operation starts. After this message is displayed, aggregates are relocated to the specified destination serially.

Corrective Action

(None).

Syslog Message

Starting relocation to destination %s at time %llu. 'override-vetoes' set to %s, and 'override-destination-checks' set to %s.

Parameters

destName (STRING): Name of the destination node.
time (LONGINT): Time at which relocation started.
override_vetoes (STRING): Flag that indicates whether the system should override veto checks for a relocation operation. This flag corresponds to the "-override-vetoes" parameter of the "storage aggregate relocation start" command. When set to true, it might result in the relocation proceeding even if the node detects outstanding issues that would make aggregate relocation dangerous or disruptive.
override_dest_checks (STRING): Flag that indicates whether the system should override checks done on the destination node. This flag corresponds to the "-override-destination-checks" parameter of the "storage aggregate relocation start" command. When set to true, it can be used to force relocation of aggregates even if the destination has outstanding issues. Note that this could make the relocation dangerous or disruptive.

arl.postmigrnotok events

arl.postMigrNotOk

Severity

ERROR

Description

This message occurs when the specified subsystem encounters an error during the post-migration phase of the aggregate relocation (ARL) operation.

Corrective Action

Check the event log for a subsystem-specific reason as to why the subsystem failed the post-migration phase of the relocation operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by that message.

Syslog Message

Relocation of aggregate '%s' encountered an error during post-migration processing. The error was encountered by the subsystem '%s'.

Parameters

aggr (STRING): Name of the aggregate on which the subsystem attempted the relocation operation.
subsystem (STRING): Name of the subsystem that failed the relocation operation.

arl.precmt events

arl.precmt.lmgr.resync.abrt

Severity

NOTICE

Description

This message occurs during aggregate relocation, when automatic lock resynchronization with the node's high-availability (HA) partner for files on this aggregate was aborted.

Corrective Action

(None).

Syslog Message

Automatic lock resynchronization was aborted for aggregate %s on forced relocation.

Parameters

aggr (STRING): Name of the aggregate for which resynchronization was aborted.

arl.precmt.lmgr.resyncing

Severity

ERROR

Description

This message occurs during aggregate relocation, when automatic lock resynchronization with the node's high-availability (HA) partner is in progress for files on this aggregate.

Corrective Action

Retry the relocation after verifying that lock synchronization is complete by using the 'debug locks auto-resync-status -aggregate <aggregate>' diagnostic privilege command. If lock state disruption for all CA locks on the aggregate is acceptable, retry the aggregate relocation with the '-override-vetoes true' option.

Syslog Message

Could not relocate aggregate %s because automatic lock resynchronization was in progress.

Parameters

aggr (STRING): Name of the aggregate with locks not yet in sync.

arl.precmt.lmgr.sync.failed

Severity

ERROR

Description

This message occurs when relocation of an aggregate has started but mirrored lock state cannot be created locally for the relocating aggregate. The relocate operation is aborted.

Corrective Action

Take the appropriate action based on the reason supplied in the logged message: - 'Timed Out': Retry the aggregate relocation with the '-override-destination-checks' option. Overriding the check might result in a longer administrative outage period during which no administrative operations can be performed for volumes on this aggregate. - 'Fatal Error': Contact NetApp technical support.

Syslog Message

Could not relocate the aggregate %s because creating locally mirrored lock state failed.

Parameters

aggr (STRING): Name of the aggregate being relocated.
reason (STRING): Reason the local mirrored lock state creation failed.

arl.precmt.lmgr.sync.forced

Severity

NOTICE

Description

This message occurs during aggregate relocation, when local mirrored lock state creation is allowed to proceed without any time restrictions. This might result in a longer administrative outage period during which no administrative operations can be performed for volumes on this aggregate.

Corrective Action

(None).

Syslog Message

Local mirrored lock state creation for relocating aggregate %s is proceeding without time restrictions.

Parameters

aggr (STRING): Name of the aggregate being relocated.

arl.precmt.repl

Severity

NOTICE

Description

This message occurs when all replication transfers are aborted because of aggregate relocation.

Corrective Action

(None).

Syslog Message

Replication transfers aborted due to aggregate relocation.

Parameters

(None).

arl.precmt.vdom.lowMem

Severity

ERROR

Description

This message occurs when an aggregate relocation fails due to the unavailability of Data ONTAP® memory on the source node.

Corrective Action

Free some memory and retry the aggregate relocation.

Syslog Message

Relocation of aggregate %s failed due to unavailability of Data ONTAP® memory on the source node.

Parameters

aggr (STRING): Name of the aggregate that was not relocated.

arl.precmt.wafl.volconversion

Severity

ERROR

Description

This message occurs when an active volume conversion is running on one or more volumes on the source aggregate. Pre-commit is aborted.

Corrective Action

When volume conversion is complete, re-run the command 'storage aggregate relocation start'.

Syslog Message

Aggregate relocation/takeover is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

Parameters

aggregate_name (STRING): The name of the aggregate containing the volume on which conversion is in progress.

arl.subsystemabort events

arl.subsystemAbort

Severity

ERROR

Description

This message occurs when the specified subsystem aborts relocation of the aggregate.

Corrective Action

Check the syslog/EMS output for a subsystem-specific reason for aborting the relocation operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the 'relocation' command. If you cannot perform the corrective action, then use the 'override-vetoes' option in the 'relocation' command to force the relocation.

Syslog Message

The relocation operation of '%s' was aborted by '%s'.

Parameters

    aggr (STRING): Name of the aggregate on which the subsystem attempted the relocation operation.
    subsystem (STRING): Name of the subsystem that aborted the relocation operation.

arl.veto events

arl.veto.coredump.saveinprog

Severity

    INFORMATIONAL

Description

    This message occurs when the coredump subsystem vetoes the use of storage failover (SFO) during takeover because a coredump save is in progress; cluster failover (CFO) will be used instead. The coredump save must be complete before the system can perform a takeover.

Corrective Action

    (None).

Syslog Message

    Takeover use of SFO vetoed because a coredump save was in progress.

Parameters

    (None).

arl.veto.coredump.unsavedcor

Severity

    ERROR

Description

    This message occurs when aggregate relocation (ARL) is vetoed because there is an unsaved kernel core file on one of the aggregate disks.

Corrective Action

    Use the "node coredump save" command to save any unsaved cores, or use the "-override-vetoes true" option when relocating aggregates.

Syslog Message

    Aggregate relocation vetoed due to an unsaved coredump %s on disk %s ("%s").

Parameters

    corefile (STRING): Name of the kernel core file.
    disk (STRING): Name of the disk containing the kernel core file.
    panic (STRING): Panic string of the unsaved kernel core file that caused the aggregate relocation (ARL) veto.

arl.veto.kmgr.keysmissing

Severity

ERROR

Description

This message occurs when an aggregate relocation fails due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the destination node.

Corrective Action

Wait a few minutes, and then try the aggregate relocation again. If the problem persists, run the "security key-manager external restore" command for external key manager, or the "security key-manager onboard sync" command for Onboard Key Manager. The commands retrieve the encryption keys for the encrypted volumes of the aggregate from the key manager. Then try the aggregate relocation again.

Syslog Message

Relocation of aggregate %s failed due to unavailability of volume encryption keys for the encrypted volumes of the aggregate on the destination node %s. Details: %s.

Parameters

aggr (STRING): Name of the aggregate that was not relocated.
node (STRING): Name of the destination node that is missing encryption keys.
details (STRING): Detailed reason for failure.

arl.veto.lmgr.CA.volmove

Severity

ERROR

Description

This message occurs when an aggregate relocation has started but cannot proceed because a volume move to or from this aggregate is in the cutover phase and the volume being moved has continuously available (CA) locks. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

Retry the relocation after volume move exits the cutover phase. To check for volume move state, run the 'volume move show' command.

Syslog Message

Could not complete aggregate relocation because volume move of '%s%s%s%s' is in the cutover phase and this volume has CA locks.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

arl.veto.lmgr.nonCA.broken

Severity

NOTICE

Description

This message occurs when an aggregate relocation is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

(None).

Syslog Message

Dropped non-CA locks on volume %s%s%s%s due to forced aggregate relocation of aggregate %s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

arl.veto.lmgr.nonCA.locks

Severity

ERROR

Description

This message occurs when an aggregate relocation has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate name" -continuously-available No' command. "aggregate name" is the aggregate for which relocation is being attempted. If lock state disruption for all existing non-CA locks is acceptable, retry the aggregate relocation by using the '-override-vetoes true' option.

Syslog Message

Could not complete aggregate relocation because of non-CA locks on volume %s%s%s%s aggregate %s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.

app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

arl.veto.lmgr.recons.left

Severity

ERROR

Description

This message occurs when an aggregate relocation has started, but cannot proceed because reconstruction of client file locks from mirrored lock information is not yet complete.

Corrective Action

Retry the relocation a few times after checking the status of reconstruction by using the 'debug locks reconstruction show' diagnostic privilege command. If the locks reconstruction operation is not completed, contact NetApp technical support.

Syslog Message

Could not relocate aggregate '%s' because lock reconstruction on node %s is in progress.

Parameters

aggregate (STRING): Name of the aggregate being relocated.
node (STRING): Name of the node reconstructing locks.

arl.veto.lmgr.syncing

Severity

ERROR

Description

This message occurs when an aggregate relocation has started but cannot proceed because synchronization of client file locks ("locks sync") with the partner is not yet complete.

Corrective Action

Retry the relocation after verifying that lock synchronization is complete,by using the 'debug locks lock-sync show' diagnostic privilege command.

Syslog Message

Could not relocate aggregate '%s' because locks sync from node %s to its partner node %s is in progress.

Parameters

aggregate (STRING): Name of the aggregate being relocated.
node (STRING): Name of the node performing locks sync with its partner.
partner (STRING): Name of the partner node with which locks sync is being performed.

arl.veto.repl

Severity

NOTICE

Description

This message occurs when an aggregate relocation is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

Corrective Action

Either abort the replication transfer that is preventing the aggregate relocation from being completed, retry the 'aggregate relocation start' command with the '-override-vetoes true' option, or wait for the transfer to finish.

Syslog Message

Could not complete giveback because a replication transfer with UUID %s involving the aggregate %s is in progress.

Parameters

transferId (STRING): UUID of the SnapMirror® replication transfer that vetoed the aggregate relocation.
aggr (STRING): Name of the aggregate.

arl.veto.snaprestore

Severity

ERROR

Description

This message occurs when the system cannot perform an aggregate relocation because a volume snaprestore operation is active. The relocation is aborted.

Corrective Action

Retry aggregate relocation after the snaprestore operation is finished.

Syslog Message

%s %s%s%s%s is running snaprestore. Canceling aggregate relocation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

arl.veto.volmove

Severity

ERROR

Description

This message occurs when an active volume move operation that cannot be automatically aborted prevents aggregate relocation from starting. When the volume move operation is completed, aggregate relocation can be retried using the 'storage aggregate relocation start' command.

Corrective Action

When the volume move operation is complete, reissue the 'storage aggregate relocation start' command. To abort the volume move immediately, include the '-override-vetoes true' command option.

Syslog Message

Unable to relocate aggregate while volume move for volume (DSID: %llu, NAME: %s) on aggregate %s is in progress.

Parameters

volume_dsid (LONGINT): Source/destination volume Data Set ID (DSID).
vol_name (STRING): The name of the volume.
aggr_name (STRING): The name of the containing aggregate.

arl.veto.wafl.volconversion

Severity

ERROR

Description

This message occurs when an active volume conversion against one or more of the volumes on the source aggregate vetoed aggregate relocation.

Corrective Action

When volume conversion is complete, re-run the command 'storage aggregate relocation start'.

Syslog Message

Aggregate relocation is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

Parameters

aggregate_name (STRING): The name of the aggregate containing the volume on which conversion is in progress.

arw events

arw.analytics events

arw.analytics.ext.report

Deprecated

This event is created and documented but never used.

Severity

NOTICE

Description

This message occurs when anti-ransomware analytics generates or updates the "suspicious file extensions" report for a volume.

Corrective Action

(None).

Syslog Message

Anti-ransomware file extension analytics has found %s across high entropy data on the volume "%s" in Vserver "%s". Report location: %s.

Parameters

fileExtension (STRING): Previously unseen file extension or suspicious file extension
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
fileExtensionReport (STRING): Link to report run after file extension analysis.

arw.analytics.high.entropy

Deprecated

This event is created and documented but never used.

Severity

ERROR

Description

This message occurs when the number of high entropy data log messages (pertaining to ransomware detection and analysis) that were generated for a volume cross the predefined threshold.

Corrective Action

To correct this issue: 1) Restore data from the last Snapshot copy that were saved before high entropy data was detected. 2) Refer to the anti-ransomware documentation to learn how to implement ransomware protection and mitigation strategies.

Syslog Message

A large amount of high entropy data was found on volume "%s" in Vserver "%s".

Parameters

> **volumeName** (STRING): Name of the volume.
> **vserverName** (STRING): Name of the Vserver.

arw.analytics.probability

Deprecated

> This event is created and documented but never used.

Severity

> ERROR

Description

> This message occurs when an anti-ransomware attack probability has changed from "low" to "high" on a volume.

Corrective Action

> To correct this issue: 1) Restore to the last safe Snapshot copy before attack probabilty became high. 2) Refer to the anti-ransomware documentation to diagnose further and take remedial measures.

Syslog Message

> Anti-ransomware attack probability changed from low to high on volume "%s" in Vserver "%s".

Parameters

> **volumeName** (STRING): Name of the volume.
> **vserverName** (STRING): Name of the Vserver.

arw.analytics.report

Deprecated

> This event is created and documented but never used.

Severity

> NOTICE

Description

> This message occurs when an anti-ransomware analytics report is generated or updated for a volume.

Corrective Action

> (None).

Syslog Message

> Anti-ransomware analytics report has been generated for volume %s of Vserver %s. The report is available at %s.

Parameters

> **volumeName** (STRING): Name of the volume.
> **vserverName** (STRING): Name of the Vserver.
> **report_path** (STRING): Path to anti-ransomware report.

arw.analytics.suspects

Deprecated

This event is created and documented but never used.

Severity

ERROR

Description

This message occurs when a list of suspects generated by anti-ransomware analytics grows to a point where further investigation is needed.

Corrective Action

(None).

Syslog Message

Anti-ransomware analytics on volume "%s" in Vserver "%s" has outstanding suspect files.

Parameters

volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

arw.auto events

arw.auto.switch.enabled

Severity

NOTICE

Description

This message occurs when anti-ransomware has been automatically switched from learning mode to enabled after various conditions have been satisfied, such as learning period, file creation, file write, and file extension discovery activities.

Corrective Action

(None).

Syslog Message

Anti-ransomware has been automatically switched from learning mode to enabled on volume "%s" in SVM "%s".

Parameters

VolumeName (STRING): Name of the volume.
VserverName (STRING): Name of the SVM.
LearningPeriod (INT): Number of days needed for learning.
IncomingWrite (INT): Amount of write (in MB) received during Learning mode.
DurationWithoutNewExtension (INT): Number of days without a new file extension being discovered.
FileCount (INT): Number of new files created in a volume.
FileExtensionCount (INT): Number of new file extensions discovered in a volume.

arw.new events

arw.new.file.extn.seen

Severity

NOTICE

Description

This message occurs when a new file extension is observed in anti-ransomware enabled volume. Its purpose is to promptly notify about the extension seen and enabling timely investigation.

Corrective Action

(None).

Syslog Message

A new file-extension "%s" is observed on volume "%s" (UUID: "%s") in SVM "%s" (UUID: "%s") at "%s".

Parameters

fileExtension (STRING): Name of the File-Extension seen.
volumeName (STRING): Name of the volume.
volumeUuid (STRING): UUID of the Volume.
vserverName (STRING): Name of the SVM.
vserverUuid (STRING): UUID of the SVM.
time (STRING): Time when new extension is seen.

arw.snapshot events

arw.snapshot.created

Severity

NOTICE

Description

This message occurs when a new ARP snapshot is created in anti-ransomware enabled volume. Additionally, it provides information about the reason behind the creation of the snapshot.

Corrective Action

(None).

Syslog Message

ARP snapshot created on volume "%s" (UUID: "%s") in SVM "%s" (UUID: "%s") at "%s". Reason: "%s".

Parameters

volumeName (STRING): Name of the volume.
volumeUuid (STRING): UUID of the Volume.
vserverName (STRING): Name of the SVM.
vserverUuid (STRING): UUID of the SVM.
time (STRING): Time when new ARP snapshot is created.
reason (STRING): Reason for snapshot creation.

arw.volume events

arw.volume.state

Severity

NOTICE

Description

This message occurs when the anti-ransomware state of a volume is changed.

Corrective Action

(None).

Syslog Message

Anti-ransomware state was changed to "%s" on volume "%s" (UUID: "%s") in Vserver "%s" (UUID: "%s").

Parameters

op (STRING): Monitoring state (enabled, disabled, dry-run).
volumeName (STRING): Name of the volume.
volumeUuid (STRING): UUID of the volume.
vserverName (STRING): Name of the Vserver.
vserverUuid (STRING): UUID of the Vserver.

arw.vserver events

arw.vserver.state

Severity

NOTICE

Description

This message occurs when the anti-ransomware state of a Vserver is changed.

Corrective Action

(None).

Syslog Message

Anti-ransomware was changed to "%s" on Vserver "%s" (UUID: "%s").

Parameters

op (STRING): Anti-ransomware state (enabled, disabled,or dry-run).
vserverName (STRING): Name of the Vserver.
vserverUuid (STRING): UUID of the Vserver.

asa events

asa.personality events

asa.personality.enable.end

Severity

NOTICE

Description

This message occurs when the cluster personality has been changed to an All SAN Array.

Corrective Action

(None).

Syslog Message

The cluster personality is now an All SAN Array.

Parameters

job_id (LONGINT): ID of the conversion job.

asa.personality.enable.fail

Severity

ERROR

Description

This message occurs when the job to change the cluster personality to an All SAN Array has failed.

Corrective Action

Attempt the failed command again. If the problem persists, contact NetApp technical support.

Syslog Message

The cluster personality was not changed to an All SAN Array. For more information, use the command "job show -id %llu" to see the job details.

Parameters

job_id (LONGINT): ID of the conversion job.

asa.personality.enable.start

Severity

NOTICE

Description

This message occurs when the cluster personality is being changed to All SAN Array.

Corrective Action

(None).

Syslog Message

The cluster personality is changing to All SAN Array.

Parameters

job_id (LONGINT): ID of the conversion job.

asup events

asup.aods events

asup.aods.response.overLimit

Severity

ERROR

Description

This message occurs when the size of the response from the AutoSupport OnDemand Server (AODS) goes over the AOD response buffer size limit in ONTAP.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

AutoSupport OnDemand Server (AODS) response went over the response buffer size limit in ONTAP. Size limit: %u bytes.

Parameters

SizeLimit (INT): AOD response buffer size limit in bytes.

asup.aods.response.timeOut

Severity

ERROR

Description

This message occurs when a response is not received from the AutoSupport OnDemand Server (AODS) before the system time limit.

Corrective Action

Check AOD Server connectivity using the "autosupport check show-details -check-type ondemand-server" command. If the issue persists, contact NetApp technical support.

Syslog Message

AutoSupport OnDemand Server (AODS) response was not received before the %u second time limit.

Parameters

TimeLimit (INT): System AODS response time limit in seconds.

asup.config events

asup.config.minimal.parse

Severity

INFORMATIONAL

Description

This event is issued when we are unable to parse /etc/asup_content.conf

Corrective Action

Either the /etc/asup_content.conf file was corrupt or it may have been accidentally modified, compare the file to the released version of the file and make the appropriate modifications.

Syslog Message

AutoSupport could not parse section %s in /etc/asup_content.conf

Parameters

section (STRING): The section that failed to parse.

asup.config.minimal.unavailable

Severity

ERROR

Description

This event is issued when we are unable to access /etc/asup_content.conf

Corrective Action

Either the /etc/asup_content.conf file does not exist or the permissions don't allow it to be accessed. Verify that the file is in the correct location and that the system has access to it.

Syslog Message

Minimal AutoSupports unavailable. Could not read /etc/asup_content.conf

Parameters

(None).

asup.general events

asup.general.drop

Severity

NOTICE

Description

This message occurs when the system cannot generate an AutoSupport message from a callhome EMS event.

Corrective Action

(None).

Syslog Message

Could not create AutoSupport message (sequence #: %u, ID: %s). %s.

Parameters

sequence (LONGINT): AutoSupport sequence number assigned to the callhome event.
trigger (STRING): AutoSupport callhome EMS event ID.

detail (STRING): Additional details about why an AutoSupport message could not be created for the callhome EMS event.
parameters (STRING): A comma-delimited list of the parameter name and value pairs passed to the callhome EMS event.

asup.general.optout

Severity

NOTICE

Description

This message occurs when an opt-out condition exists to notify you that you can turn off AutoSupport® reporting to NetApp, if desired. To disable AutoSupport reporting to NetApp, run the "system node autosupport modify -support disable" command within 24 hours of system initialization. Enabling AutoSupport can significantly speed problem determination and resolution, should a problem occur on your system.

Corrective Action

(None).

Syslog Message

AutoSupport will be enabled 24 hours after system initialization.

Parameters

(None).

asup.general.queue.deleted

Severity

INFORMATIONAL

Description

This event is issued when all entries have been deleted from the AutoSupport queue and the disk file spool. This should only occur when the autosupport.content option is changed from complete to minimal.

Corrective Action

(None).

Syslog Message

All AutoSupport message queue entries have been deleted.

Parameters

(None).

asup.general.reminder

Severity

INFORMATIONAL

Description

This message occurs when AutoSupport is not configured to send messages to NetApp.

Corrective Action

(None).

Syslog Message

AutoSupport is not configured to send messages to NetApp. Enabling AutoSupport can significantly speed problem determination and resolution should a problem occur on your system. More information about AutoSupport is available at http://support.netapp.com/autosupport/.

Parameters

(None).

asup.post events

asup.post.drop

Severity

ERROR

Description

This message occurs when the AutoSupport® mechanism quits trying to post to the NetApp URL after having retried for the specified number of times.

Corrective Action

Use the "system node autosupport check show-details" command to check for connectivity or certificate errors. If the connectivity check shows no errors and if the problem persists, contact NetApp technical support for further assistance.

Syslog Message

AutoSupport message (%s) was not posted to NetApp. The system will drop the message.

Parameters

subject (STRING): AutoSupport message title.

asup.smtp events

asup.smtp.drop

Severity

ERROR

Description

This message occurs when the AutoSupport® mechanism drops email messages after having retried for the specified times.

Corrective Action

Use the "system node autosupport check show-details" command to check for connectivity errors with the configured mailhost. If the connectivity check shows no errors and if the problem persists, contact NetApp technical support for further assistance.

Syslog Message

AutoSupport mail (%s) was not sent. The system will drop the message.

Parameters

subject (STRING): AutoSupport message title.

asup.smtp.invalid.credential

Severity

ERROR

Description

This message occurs when incorrect credentials are configured for the AutoSupport SMTP mailhost. AutoSupport will not be delivered to the configured email destinations until the credentials are corrected.

Corrective Action

Configure the AutoSupport SMTP mailhost with the correct credentials. Use the "system node autosupport modify -mail-hosts <username@mailhost>" command to update the mailhost configuration.

Syslog Message

AutoSupport SMTP connection to "%s" failed due to invalid credentials.

Parameters

mailhost (STRING): Mailhost name.

asup.smtp.missing.cert

Severity

ERROR

Description

This message occurs when the Root CA certificates to validate the SMTP server certificate is missing in ONTAP. AutoSupport will not be delivered to the configured email destinations until the correct Root CA certificate is installed.

Corrective Action

Install the correct Root CA certificates for the SMTP server using the "security certificate install" command.

Syslog Message

AutoSupport SMTP connection to "%s" failed due to missing Root CA certificate.

Parameters

mailhost (STRING): Mailhost name.

asup.throttle events

asup.throttle.drop

Severity

NOTICE

Description

This message occurs when an AutoSupport message is dropped because it is believed to be spam.

Corrective Action

To disable AutoSupport throttling, run the (privilege: diagnostic) "system node autosupport modify -throttle false -node <node name>" command.

Syslog Message

Too many AutoSupport messages in too short a time, throttling AutoSupport: %s

Parameters

subject (STRING): AutoSupport message title.

async events

async.igroup events

async.igroup.replication.error

Severity

ALERT

Description

This message occurs when an error occurs asynchronously replicating an initiator group.

Corrective Action

To get further details on initiator groups that have replication errors, use the command: "lun igroup show -replication-error !-".

Syslog Message

Asynchronous replication of an initiator group between source Vserver "%s" and peer Vserver "%s" has failed with error "%s".

Parameters

vserver_name (STRING): The name of the source Vserver.
peer_vserver_name (STRING): The name of the replication peer Vserver.
error (STRING): The error that occured.
vserver_uuid (STRING): The UUID of the source Vserver.
peer_vserver_uuid (STRING): The UUID of the replication peer Vserver.
peer_relationship_uuid (STRING): The UUID of the relationship between the source and peer.

asyncdelcli events

asyncdelcli.message events

asyncDelCli.message.finish

Severity

NOTICE

Description

This message occurs when an async-delete job has finished on the specified path.

Corrective Action

(None).

Syslog Message

Async-delete "%s" has finished on inode: %llu in volume (DSID: %llu, MSID: %llu).

Parameters

Job_Id (STRING): Async-delete job ID.
Inode (LONGINT): Inode to be deleted.
volume_dsid (LONGINT): DSID of the volume containing the directory.
volume_msid (LONGINT): MSID of the volume containing the directory.

asyncDelCli.message.start

Severity

NOTICE

Description

This message occurs when an async-delete job starts on the specified path.

Corrective Action

(None).

Syslog Message

Async-delete "%s" has started on inode: %llu in volume (DSID: %llu, MSID: %llu).

Parameters

Job_Id (STRING): Async-delete job ID.
Inode (LONGINT): Inode to be deleted.
volume_dsid (LONGINT): DSID of the volume containing the directory.
volume_msid (LONGINT): MSID of the volume containing the directory.

asyncdelcli.permscheck events

asyncDelCli.permsCheck.fail

Severity

ALERT

Description

This message occurs when an async-delete job fails to delete file/directory due to permission issues.

Corrective Action

Verify that the user has permission to delete the inode.

Syslog Message

Async-delete %s encountered permission failures for user (%s) when deleting inode: %llu in volume (DSID: %llu, MSID: %llu).

Parameters

Job_Id (STRING): Async-delete Job ID.
User_Id (STRING): User Identifier.
Path_Inode (LONGINT): Inode that has permission issues for deletion.
volume_dsid (LONGINT): DSID of the volume containing the directory.
volume_msid (LONGINT): MSID of the volume containing the directory.

asyncdelete events

asyncdelete.cancel events

asyncDelete.cancel.start

Severity

NOTICE

Description

This message occurs when cancellation of async delete jobs is started on a node due to Vserver migrate operation. The administrator will need to restart the jobs after the migration is complete or aborted.

Corrective Action

The administrator will need to restart the cancelled async delete jobs after the migration is complete or aborted. Command to start an async-delete job: "volume file async-delete start -volume <volume-name< -vserver <vserver-name< -path <directory path<".

Syslog Message

Cancellation of async delete jobs was started on node "%s" because of Vserver migration. The administrator will need to restart the jobs after the migration is complete or aborted.

Parameters

Node (STRING): Node where async delete jobs are running.

asyncdelete.message events

asyncDelete.message.fail

Severity

ALERT

Description

This message occurs when an async delete job fails.

Corrective Action

Ensure that all nodes in the cluster are online and healthy, and that all volumes needed for the directory traversal are online. Then retry the operation.

Syslog Message

Async delete job on path %s of volume (MSID: %llu) failed: %s.

Parameters

path (STRING): Path to be deleted.
volume_msid (LONGINT): MSID of the volume containing the directory.
error (STRING): Description of the error that occurred.

asyncDelete.message.start

Severity

NOTICE

Description

This message occurs when an async delete job starts on the path specified.

Corrective Action

(None).

Syslog Message

Async delete job started on path %s of volume (MSID: %llu).

Parameters

path (STRING): Path to be deleted.
volume_msid (LONGINT): MSID of the volume containing the directory.

asyncDelete.message.success

Severity

NOTICE

Description

This message occurs when an async delete job finishes successfully on the specified path.

Corrective Action

(None).

Syslog Message

Async delete job on path %s of volume (MSID: %llu) was completed. Number of files deleted: %llu, Number of directories deleted: %llu. Total number of bytes deleted: %llu.

Parameters

path (STRING): Path to be deleted.
volume_msid (LONGINT): MSID of the volume containing the directory.
file_count (LONGINT): Total number of files deleted.
dir_count (LONGINT): Total number of directories deleted.
deleted_size (LONGINT): Total number of bytes deleted.

ata events

ata.excessive events

ata.excessive.latency

Severity

NOTICE

Description

This message occurs when an I/O request to the ATA driver in ONTAP® Select takes longer than five seconds. This might be an indication of an overloaded or misconfigured back-end storage subsystem.

Corrective Action

If possible, reduce the I/O load on the system. Verify that the device is configured correctly and is functioning correctly.

Syslog Message

Excessive latency on ATA device %s

Parameters

ata_latency_message (STRING): ATA high latency message

ata.timeout events

ata.timeout.failed

Deprecated

Last used 9.2

Severity

NOTICE

Description

This message occurs when an I/O request to the ATA driver times out. This might be indicative of an overloaded back-end storage subsystem. The retries for this I/O operation have been exhausted; the I/O operation has failed and will not be retried.

Corrective Action

(None).

Syslog Message

ATA device timeout (%s).

Parameters

ata_timeout (STRING): Timeout message from the ATA driver.

ata.timeout.retry

Deprecated

This event is no longer used because of misleading text. See new EMS of EMS_cam_timeout_retry. Last used 9.7.

Severity

NOTICE

Description

This message occurs when an I/O request to the ATA driver times out. This might be indicative of an overloaded back-end storage subsystem. The I/O operation will be retried; this message does not indicate failure.

Corrective Action

(None).

Syslog Message

ATA device timeout (%s).

Parameters

ata_timeout (STRING): Timeout message from the ATA driver.

audit events

audit.cap events

audit.cap.staging.event.failure

Severity

NOTICE

Description

This message occurs when the system fails to generate an audit staging event as a part of the Central Access Policy (CAP) evaluation during access checks.

Corrective Action

(None).

Syslog Message

Failed to generate an audit staging event when evaluating CAPs for the Vserver "%s". Reason: "%s".

Parameters

vserverUuidStr (STRING): UUID of the Vserver.
errorStr (STRING): Error encountered.

audit.log events

audit.log.event

Severity

NOTICE

Description

This message occurs when there is an issue during message auditing. The system recovers by itself.

Corrective Action

(None).

Syslog Message

Auditing error (%s) occurred at %s.

Parameters

error (STRING): Error encountered during message auditing.
time (STRING): Time that this error occurred.

audit.log.file.recovered

Severity

NOTICE

Description

This message occurs when the system recovers a previously deleted log file as part of audit log policy.

Corrective Action

(None).

Syslog Message

Recovered previously deleted audit log file "%s".

Parameters

log_name (STRING): Log file name.
recovered_time (STRING): File recovery timestamp.

audit.log.queue.high

Severity

NOTICE

Description

This message occurs when the syslog queue reaches 75% of its maximum size.

Corrective Action

Verify remote server network reachability and processing performance.

Syslog Message

Log queue for destination %s, protocol %s has exceeded 75%% of capacity. Last audit log was sent successfully at %s, number of pending messages: %d.

Parameters

syslog_dest (STRING): Log forwarding destination for which messages are being dropped.
protocol (STRING): Protocol used for syslog destination.
last_sent (STRING): Time that the audit log was last successfully sent to the syslog destination.
pending_msg (INT): Number of pending messages in queue.

audit.log.queue.overflow

Severity

NOTICE

Description

This message occurs when an internal queue overflow causes the audit logging mechanism to drop messages destined for a particular log forwarding destination.

Corrective Action

Verify remote server network reachability and processing performance.

Syslog Message

Log queue overflowed for destination %s, protocol %s. Current drop count: %ld.

Parameters

    syslog_dest (STRING): Log forwarding destination for which messages are being dropped.
    protocol (STRING): Protocol used for syslog destination.
    drop_count (LONGINT): Number of messages dropped since the last drop was reported.

audit.log.queue.recovered

Severity

    NOTICE

Description

    This message occurs when the audit logging queue recovers after earlier message drops, and the current queue is less than 75% full.

Corrective Action

    (None).

Syslog Message

    Log queue recovered for destination %s, protocol %s. Issue start time: %s, end time: %s, total number of drops during this period: %ld.

Parameters

    syslog_dest (STRING): Log forwarding destination for which the queue has recovered.
    protocol (STRING): Protocol used for the syslog destination.
    issue_start_time (STRING): Time that the queue overflowed.
    recovered_time (STRING): Time that the queue recovered.
    drop_count (LONGINT): Total number of drops since the last time the queue overflowed.

audit.log.rotate.size.limit

Severity

    NOTICE

Description

    This message occurs when the system rotates a log file that has reached its size limit.

Corrective Action

    (None).

Syslog Message

    Log file %s has been rotated because size limit %ld was reached.

Parameters

    log_name (STRING): Log file name.
    max_log_size (LONGINT): Maximum log file size.

auditlog events

auditlog.change events

auditlog.change.detected

Severity
ERROR

Description
This message occurs when the system detects that audit log files have been tampered with.

Corrective Action
Contact Contact NetApp technical support. for assistance.

Syslog Message
Audit log file "%s" was tampered with.

Parameters
file_name (STRING): Name of the audit log file which was tampered with.

auto events

auto.cds events

auto.cds.feature.disable.failed

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.11.1 or later, when volume efficiency inactive data compression scan disablement failed on the existing compatible volumes.

Corrective Action

Manually try disabling the inline Volume Efficiency Inactive data compression on the volume using the "volume efficiency inactive-data-compression" command.

Syslog Message

Volume Inactive Data Compression disablement failed on Volume %s of Vserver %s.

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.
reason (STRING): Reason for failure.

auto.cds.feature.disable.success

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.11.1 or later, when volume efficiency inactive data compression scan is disabled on the existing compatible volumes.

Corrective Action

(None).

Syslog Message

Volume Inactive Data Compression disabled on Volume %s of Vserver %s.

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.

auto.policy events

auto.policy.feature.enable

Severity

NOTICE

Description

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we start enabling the "auto" efficiency policy on the existing compatible volumes on All-Flash Optimized nodes in the background.

Corrective Action

(None).

Syslog Message

Volume efficiency features will be enabled on Volumes of All-Flash Optimized nodes in the Cluster.

Parameters

(None).

auto.policy.feature.enable.done

Severity

NOTICE

Description

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we have completed enabling the "auto" efficiency policy on the existing compatible volumes.

Corrective Action

(None).

Syslog Message

Volume efficiency features were enabled on Volumes of All-Flash Optimized nodes in the Cluster.

Parameters

(None).

auto.policy.feature.enable.fail

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we fail to enable the "auto" efficiency policy on the existing compatible volume on All-Flash Optimized nodes.

Corrective Action

Manually try enabling the inline Volume Efficiency features on the volume using the "volume efficiency modify" command.

Syslog Message

Could not enable Volume Efficiency features for Volume %s of vserver %s.%s

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.
reason (STRING): Reason for failure.

auto.policy.feature.enabled

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.3 or later, when we enable the "auto" efficiency policy on the existing compatible volume on All-Flash Optimized nodes.

Corrective Action

(None).

Syslog Message

Volume Efficiency features enabled on Volume %s of Vserver %s.

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.

auto.update events

auto.update.action

Severity

NOTICE

Description

This message occurs when an action is applied to an automatic update request. This step requires input from the customer or a pre-configured default setting.

Corrective Action

(None).

Syslog Message

Automatic update: Applied the action "%s" to package: %s.

Parameters

action (STRING): Action selected for the automatic update request. Possible actions are "install", "schedule", or "dismiss".
package_description (STRING): Information about the package.
package_id (STRING): Unique identifier for the package.

auto.update.eula.accepted

Severity

NOTICE

Description

This message occurs when the customer has accepted the End User License Agreement (EULA). This is required before the Automatic update feature is enabled.

Corrective Action

(None).

Syslog Message

Automatic update: End User License Agreement accepted by "%s".

Parameters

user (STRING): Name of the user account that accepted the EULA.

auto.update.eula.reset

Severity

NOTICE

Description

This message occurs when the Automatic update feature is disabled and the End User License Agreement (EULA) is no longer considered accepted.

Corrective Action

(None).

Syslog Message

Automatic update: Feature has been disabled by "%s".

Parameters

user (STRING): Name of the user account that disabled the EULA.

auto.update.expired

Severity

NOTICE

Description

This message occurs when an automatic update request has not been acted upon before the request expiration date.

Corrective Action

(None).

Syslog Message

Automatic update: Request expired on %s for package: %s.

Parameters

expired_date_time (STRING): Date and time when the request expired.

package_description (STRING): Information about the package.
package_id (STRING): Unique identifier for the package.

auto.update.failure

Severity

ERROR

Description

This message occurs when an automatic update has failed to complete.

Corrective Action

Fix the issues causing the failure and retry the automatic update. If the issue persists, contact NetApp technical support.

Syslog Message

Automatic update: Failed update for package: %s. Error: %s.

Parameters

package_description (STRING): Information about the package.
error_msg (STRING): String containing details regarding the cause of the failure.
package_id (STRING): Unique identifier for the package.
stage (STRING): Stage at which the update failed.

auto.update.received

Severity

NOTICE

Description

This message occurs when the automatic update information is received from the AutoSupport OnDemand server.

Corrective Action

(None).

Syslog Message

Automatic update: Received update for package: %s.

Parameters

package_description (STRING): Information about the package.
package_id (STRING): Unique identifier for the package.

auto.update.retracted

Severity

NOTICE

Description

This message occurs when an automatic update request has been superseded, retracted or otherwise considered unnecessary.

Corrective Action

(None).

Syslog Message

Automatic update: Request retracted for package: %s.

Parameters

package_description (STRING): Information about the package.
package_id (STRING): Unique identifier for the package.

auto.update.success

Severity

NOTICE

Description

This message occurs when an automatic update has completed successfully.

Corrective Action

(None).

Syslog Message

Automatic update: Successfully updated package: %s.

Parameters

package_description (STRING): Information about the package.
package_id (STRING): Unique identifier for the package.

aws events

aws.dev events

aws.dev.diskFailure

Severity

ERROR

Description

This message occurs when ONTAP® is running as an instance in Amazon Web Services (AWS), and a data disk failure occurs because of an I/O hang. ONTAP marks the disk as broken and marks the data aggregrate as partial or degraded.

Corrective Action

Detach the failed device from the AWS instance.

Syslog Message

Disk failure detected after I/O to device %s hung for %d seconds.

Parameters

dev (STRING): Name of the device.
timeout (INT): Number of seconds the disk is hung.

aws.dev.diskNotUnique

Severity

ERROR

Description

This message occurs when Data ONTAP® is running as an instance in Amazon Web Services (AWS), and the volume being added has a UUID that is already used by the attached volumes. This usually happens when the user creates a Snapshot® copy from a volume, creates the volume from this copy and then tries to attach the volume to the instance.

Corrective Action

Detach the being added duplicate UUID device from the AWS instance.

Syslog Message

The volume #%d(%s) being added has a duplicate UUID which is already used by the attached volume #%d(%s).

Parameters

curr_unit (INT): Unit number of the device which is being attached.
curr_devname (STRING): Name of the device which is being attached.
orig_unit (INT): Unit number of the original device which is being duplicated.
orig_devname (STRING): Name of the original device which is being duplicated.

aws.dev.limitExceeded

Severity

ERROR

Description

This message occurs when Data ONTAP® is running as an instance in Amazon Web Services (AWS), and the volume being added is attached to an unsupported device name. Data ONTAP supports attaching a maximum of 51 Elastic Block Storage (EBS) volumes to a single instance. Supported device names are xvdf-xvdz, xvdaa-xvdaz, and xvdba-xvdbd.

Corrective Action

Detach the unsupported device from the AWS instance.

Syslog Message

The volume being added is attached to an unsupported device name #%d(%s). Data ONTAP supports attaching a maximum of 51 device volumes to a single instance. Supported device names are xvdf-xvdz, xvdaa-xvdaz, and xvdba-xvdbd.

Parameters

unit (INT): Device unit number.
devname (STRING): Device name.

aws.instance events

aws.instance.metadata.fail

Severity

ERROR

Description

This message occurs when instance metadata retrieval fails on a hypervisor hosting an Amazon Web Services (AWS) ONTAP instance. The Instance Metadata Service (IMDS) is not reachable at this time. Failure to retrieve the instance metadata indicates issues with the hypervisor.

Corrective Action

This error indicates an issue with the AWS environment. Contact AWS technical support for further assistance. Stopping and starting the instance can also resolve the issue because the instance will typically be relaunched on a different host.

Syslog Message

IMDS%s request fails to retrieve AWS instance metadata: %s.

Parameters

IMDS_Version (STRING): Metadata request version that generates this event.
metadataType (STRING): Metadata request type that generates this event.

aws.nic events

aws.nic.noTxIntr

Severity

ALERT

Description

This message occurs when Data ONTAP® is running in Amazon Web Services (AWS) and a network interface stops processing packets at the beginning of system boot.

Corrective Action

If the issue persists, reboot the node. If reboot does not help, contact NetApp technical support for troubleshooting assistance.

Syslog Message

No TX interrupt on NIC '%s' for %u seconds.

Parameters

nicName (STRING): Network interface or port name.
secElasped (INT): Seconds elapsed since the last send interrupt.
sigCnt (INT): Number of signals sent to the back-end host OS.
reqPending (INT): Number of outstanding send requests.
reqTotal (INT): Number of total send requests.
respPending (INT): Number of outstanding responses.
respTotal (INT): Number of total responses.
evtBackend (INT): Number of back-end events.
evtFrontend (INT): Number of front-end events.

backup events

backup.abort events

backup.abort.ROOLR

Severity

NOTICE

Description

This event is generated when backup event like dump has been aborted and currently ROOLR (Read Only On Line Replica) is running on the Filer. This event might have been aborted because of user intervention or device like bad tape has encountered backup failure.

Corrective Action

(None).

Syslog Message

The abort event, %s, is just notified.

Parameters

errmsg (STRING): Error Description

backup.abort.STSP

Severity

NOTICE

Description

This event is generated when a backup started by VERITAS NBU STSP Protocol has been aborted. This event might have been aborted because of user intervention or device like bad tape has encountered backup failure.

Corrective Action

(None).

Syslog Message

The abort event, %s, is just notified.

Parameters

errmsg (STRING): Error Description

backup.fail events

backup.fail.giveback

Severity

ERROR

Description

This message occurs during a giveback operation, when there are active dump or restore processes running on cfo aggregates of the partner node.

Corrective Action

Wait for backup operations like dump or restore running on cfo aggregates of the partner node to finish before retrying the giveback operation. To kill the active backup operations and proceed, retry the giveback operation with the -override-vetoes option set to true.

Syslog Message

Backup/restore services: There are active backup/restore sessions on the partner.

Parameters

(None).

backup.fail.logopen

Severity

ERROR

Description

This event is generated when we tried to open up the log file and it failed while opening the file

Corrective Action

Make sure that the log file exists with proper permission and the file is not corrupted.

Syslog Message

Failed to open backup log file: %s

Parameters

log_file_open_err (STRING): The error encountered during log file open

backup.fail.logwrite

Severity

ERROR

Description

This event is generated when we tried to write a log event to the log file and it failed while writing it to the file.

Corrective Action

Make sure that the log file exists with proper permission and the file is not corrupted.

Syslog Message

Failed to write to backup log file: %s

Parameters

log_file_write_err (STRING): The error encountered during log file write

backup.flip events

backup.flip.inodemap

Severity

INFORMATIONAL

Description

This message is generated while flipping inodemap.

Corrective Action

(None).

Syslog Message

Took %u seconds to flip inodemap.

Parameters

time (INT): Time in seconds taken to flip inodemap.

bcomd events

bcomd.fcnvmelifadded events

bcomd.fcNvmeLifAdded

Severity

NOTICE

Description

This message occurs when an FC NVMe (Nonvolatile Memory Express) logical interface (LIF) is added.

Corrective Action

(None).

Syslog Message

LIF %s (on Vserver %s), WWPN %s, was added to node %s, port %s.

Parameters

lifname (STRING): Name of the LIF that was added.
vserver (STRING): Name of the Vserver on which the LIF resides.
wwpn (STRING): WWPN that was added.
node (STRING): Name of the node on which the LIF is hosted.
port (STRING): Name of the port on which the LIF is hosted.

bcomd.fcnvmelifmovefail events

bcomd.fcNvmeLifMoveFail

Severity

EMERGENCY

Description

This message occurs when a LIF move failed and the recovery action to restore the LIF has also failed. Namespaces are no longer accessible through this LIF. The LIF must be recovered manually.

Corrective Action

Contact NetApp technical support.

Syslog Message

Moving FC-NVMe LIF %s of vserver %s from %s:%s to %s:%s failed. Manual recovery required.

Parameters

lif_name (STRING): LIF name.
vserver_uuid (STRING): Vserver Uuid.
src_node (STRING): LIF was moving from this node.
src_port (STRING): LIF was moving from this port.
dest_node (STRING): LIF was moving to this node.
dest_port (STRING): LIF was moving to this port.

bcomd.fcnvmelifremoved events

bcomd.fcNvmeLifRemoved

Severity

NOTICE

Description

This message occurs when an FC NVMe (Nonvolatile Memory Express) logical interface (LIF) is removed.

Corrective Action

(None).

Syslog Message

LIF %s (on Vserver %s), WWPN %s, was removed from node %s, port %s.

Parameters

lifname (STRING): Name of the LIF that was removed.
vserver (STRING): Name of the Vserver on which the LIF resided.
wwpn (STRING): WWPN that was removed.
node (STRING): Name of the node on which the LIF had been hosted.
port (STRING): Name of the port on which the LIF had been hosted.

bcomd.fcplifadded events

bcomd.fcpLifAdded

Severity

NOTICE

Description

This message occurs when a Fibre Channel logical interface (LIF) is added.

Corrective Action

(None).

Syslog Message

LIF %s (on Vserver %s), WWPN %s, was added to node %s, port %s.

Parameters

lifname (STRING): Name of the LIF that was added.
vserver (STRING): Name of the Vserver on which the LIF resides.
wwpn (STRING): WWPN that was added.
node (STRING): Name of the node on which the LIF is hosted.
port (STRING): Name of the port on which the LIF is hosted.

bcomd.fcplifremoved events

bcomd.fcpLifRemoved

Severity

NOTICE

Description

This message occurs when a Fibre Channel logical interface (LIF) is removed.

Corrective Action

(None).

Syslog Message

LIF %s (on Vserver %s), WWPN %s, was removed from node %s, port %s.

Parameters

lifname (STRING): Name of the LIF that was removed.
vserver (STRING): Name of the Vserver on which the LIF resided.
wwpn (STRING): WWPN that was removed.
node (STRING): Name of the node on which the LIF had been hosted.
port (STRING): Name of the port on which the LIF had been hosted.

bcomd.igroup events

bcomd.igroup.auto.delete.fail

Severity

ERROR

Description

This message occurs when an initiator group marked with the delete-on-unmap flag is not automatically deleted when it is no longer part of a LUN mapping relationship.

Corrective Action

Use the "lun igroup delete" command to delete the initiator group manually.

Syslog Message

Failed to delete initiator group %s on Vserver %s: %s

Parameters

igroup (STRING): Name of the initiator group.
vserver (STRING): Name of the Vserver.
error (STRING): The error encountered when deleting the initiator group.

bcomd.lun events

bcomd.lun.update.lost

Severity

ERROR

Description

This message occurs when the SAN Kernel Agent is unable to process a LUN metadata update resulting from a Snapshot® copy restore operation or other LUN event.

Corrective Action

Resolve the error and then reload the indicated Vserver with the command "debug san vserver reload".

Syslog Message

A metadata change notification for a LUN in VServer %s on volume %llu has been lost due to error: %s

Parameters

vserver (STRING): Name of the Vserver.
volume (LONGINT): MSID of the volume.
error (STRING): Error preventing the update from being processed.

bcomd.vdisk events

bcomd.vdisk.repl.failed

Severity

ERROR

Description

This message occurs after a replication failure of a LUN or an NVMe namespace configuration in a MetroCluster™ configuration.

Corrective Action

Use the "metrocluster vserver resync" command to resynchronize the Vserver configuration for the affected Vserver.

Syslog Message

Replication of a LUN or an NVMe namespace configuration failed on Vserver "%s". Reason: %s.

Parameters

vserver (STRING): Name of the Vserver.
error (STRING): Error encountered while replicating the configuration.

bcomd.vdisk.transition

Severity

NOTICE

Description

This message occurs when a user attempts to convert a LUN into an NVMe namespace or vice-versa.

Corrective Action

(None).

Syslog Message

Conversion for "%s", Vserver "%s" to type "%s" completed with status "%s".

Parameters

source_vdisk_path (STRING): Path to the LUN or NVMe namespace to be converted.
vserver (STRING): Name of the Vserver.
destination_vdisk_type (STRING): Destination vdisk type after conversion.
status (STRING): Status of conversion operation.

bcomd.volume events

bcomd.volume.update.lost

Severity

ERROR

Description

This message occurs when the SAN Kernel Agent is unable to process a volume LUN inventory update resulting from a Snapshot® copy restore operation. This might lead to stale LUN map entries in the system, which might have minimal impact and can be cleaned up manually.

Corrective Action

Resolve the error and then delete stale LUN maps with the command "lun mapping delete-stale".

Syslog Message

A volume LUN inventory change notification for SVM %s volume %llu has been lost due to error: %s

Parameters

vserver (STRING): Name of the storage virtual machine (SVM).
volume (LONGINT): MSID of the volume.
error (STRING): Error preventing the update from being processed.

bdfu events

bdfu.selected events

bdfu.selected

Severity

INFORMATIONAL

Description

This message occurs when background disk firmware update selects a disk for firmware download. The disk contents will be copied to a suitable spare, the disk will be removed from the raid group and then firmware will be downloaded to it. After the firmware download is complete, the contents of the disk will be restored.

Corrective Action

(None).

Syslog Message

Disk %s [%s %s %s] S/N [%s] selected for background disk firmware update.

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

block events

block.giveback events

block.giveback.during.aufo

Severity

ALERT

Description

This message occurs during a storage failover (SFO) aggregate giveback, when a SnapMirror® active sync automatic unplanned failover operation is in progress.

Corrective Action

Wait for the operation to finish. If giveback is required immediately, use the "override-veto true" parameter with the giveback command, or retry the operation with the "override-vetoes true" parameter. Note: Using this option might cause an I/O disruption.

Syslog Message

Storage Failover giveback cannot complete for aggregate "%s" because an SnapMirror® active sync automatic unplanned failover is in progress.

Parameters

aggrname (STRING): Name of the aggregate.

boot events

boot.bootmenu events

boot.bootmenu.issue

Severity

EMERGENCY

Description

This message occurs when an error is detected while booting into, or using, the system boot menu.

Corrective Action

Retry the boot. If the problem persists, contact NetApp technical support for assistance in replacing the boot device media.

Syslog Message

Failed to boot the system. Error: %s

Parameters

err_str (STRING): Error string.

boot.shutdown events

boot.shutdown.issue

Severity

ALERT

Description

This message occurs when an error is detected while shutting down the system.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to shutdown the system. Error: %s

Parameters

err_str (STRING): Error string.

boot.varfs events

boot.varfs.backup.issue

Severity

EMERGENCY

Description

This message occurs when an error is detected while trying to back up the /var file system to the boot media or node root volume (mroot).

Corrective Action

Contact NetApp technical support.

Syslog Message

Backup of the /var file system failed (%s)

Parameters

err_str (STRING): Error string.

boot.varfs.backup.success

Severity

NOTICE

Description

This message occurs when a subsequent backup is successful following a failure.

Corrective Action

(None).

Syslog Message

Backup of the /var file system is successful after previous failures.

Parameters

(None).

boot.varfs.repair.partial

Severity

ERROR

Description

This message occurs when the system is unable to restore all missing files detected by a scan of the /var file system during boot.

Corrective Action

Contact NetApp technical support.

Syslog Message

Unable to restore all missing files in /var file system.

Parameters

(None).

boot.varfs.repair.success

Severity

NOTICE

Description

This message occurs when missing files are restored during a scan of the /var file system during boot.

Corrective Action

(None).

Syslog Message

All missing files in /var are restored.

Parameters

(None).

boot.varfs.restore.issue

Severity

ALERT

Description

This message occurs when an error is detected while restoring the /var file system from a shutdown.

Corrective Action

The file system is automatically restored from the boot media. If the problem persists, contact NetApp technical support.

Syslog Message

Failed to restore the /var file system. Error: %s

Parameters

err_str (STRING): Error string.

boot.varfs.restore.success

Severity

NOTICE

Description

This message occurs when, following a failure, a subsequent restore of the /var file system is successful.

Corrective Action

(None).

Syslog Message

Successfully restored the /var file system.

Parameters

(None).

boot.verify events

boot.verify.kmods.disabled

Severity

ALERT

Description

This message occurs when the verification of digitally signed kernel modules has been disabled.

Corrective Action

Contact NetApp technical support immediately.

Syslog Message

The verification of digitally signed kernel modules has been disabled.

Parameters

(None).

boot.verify.kmods.success

Severity

NOTICE

Description

This message occurs when the verification of digitally signed kernel modules succeeds.

Corrective Action

(None).

Syslog Message

The verification of digitally signed kernel modules has completed.

Parameters

(None).

bootfs events

bootfs.env events

bootfs.env.issue

Severity

ERROR

Description

This message occurs when an error is detected while trying to access the environment file stored on the boot device. Environment variables on the system cannot be changed or saved.

Corrective Action

Reformat or replace the boot media. If the problem persists, contact NetApp technical support.

Syslog Message

Environmental variables cannot be accessed or saved on the boot device (%s).

Parameters

err_str (STRING): Error string.

bridge events

bridge.discovered events

bridge.discovered

Severity

INFORMATIONAL

Description

This message occurs when the system discovers an FC-to-SAS bridge.

Corrective Action

(None).

Syslog Message

FC-to-SAS bridge %s [%s %s %s] S/N [%s] was discovered.

Parameters

bridgeName (STRING): Name of the bridge.
bridgeVendor (STRING): Vendor name of the bridge.
bridgeModel (STRING): Model name of the bridge.
bridgeRevision (STRING): Firmware revision of the bridge.
bridgeSerialNum (STRING): Serial number of the bridge.

bridge.duplicate events

bridge.duplicate.ip.address

Severity

ALERT

Description

This message occurs when the system discovers an ATTO FibreBridge using the same IP address as some other device in the network.

Corrective Action

Using the IP and MAC addresses from the alert, attempt to locate the other device in the network, and change one of the IP addresses. If unsuccessful, contact NetApp support for assistance with this issue.

Syslog Message

FC-to-SAS bridge %s [%s] %s %s %s.

Parameters

bridgeName (STRING): Name of the bridge that detected the duplicate IP address.
bridgeSerialNum (STRING): Serial number of the bridge that detected the duplicate address.
duplicateIPAddress (STRING): Duplicate IP address detection message from the bridge log.
duplicateMAC (STRING): Duplicate MAC address detection message from the bridge log.
addlInfo (STRING): Additional information about the alert being generated, if available.

bridge.duplicate.wwn

Severity

ALERT

Description

This message occurs when the system discovers two FC-to-SAS bridges reporting the same WWN.

Corrective Action

Contact NetApp support for assistance with this issue.

Syslog Message

FC-to-SAS bridge %s [%s] and bridge %s [%s] are presenting a duplicate WWN [%s] %s.

Parameters

bridgeName1 (STRING): Name of the first bridge.
bridgeSerialNum1 (STRING): Serial number of the first bridge.
bridgeName2 (STRING): Name of the second bridge.
bridgeSerialNum2 (STRING): Serial number of the secondbridge.
bridgeWWN (STRING): World wide name of the bridges.
addlInfo (STRING): Additional information about the alert being generated, if available.

bridge.removed events

bridge.removed

Severity

INFORMATIONAL

Description

This message occurs when an FC-to-SAS bridge is removed from the system.

Corrective Action

(None).

Syslog Message

FC-to-SAS bridge %s [%s %s %s] S/N [%s] was removed.

Parameters

bridgeName (STRING): Name of the bridge.
bridgeVendor (STRING): Vendor name of the bridge.
bridgeModel (STRING): Model name of the bridge.
bridgeRevision (STRING): Firmware revision of the bridge.
bridgeSerialNum (STRING): Serial number of the bridge.

bridge.sas events

bridge.SAS.invalidTransition

Severity

ERROR

Description

This message occurs when the SAS disk shelves behind an FC-to-SAS bridge are not cabled correctly, indicating an invalid SAS2 to SAS3 transition.

Corrective Action

Follow the defined Fabric-attached or stretch MetroCluster cabling guide.

Syslog Message

An invalid SAS2 to SAS3 transition exists on FC-to-SAS bridge %s S/N [%s]: %s

Parameters

bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeError (STRING): Error string from the FC-to-SAS bridge.

bridge.timestamp events

bridge.timestamp.noSync

Severity

NOTICE

Description

This message occurs when the max number of retries is exceeded when attempting to apply SCSI SET TIMESTAMP command on one or more attached FC-to-SAS bridges. A timestamp that is not in sync does not affect the functional operation of the bridge. The SET TIMESTAMP operation is only used to synchronize timestamps between ONTAP® and the bridge to assist with correlating log events.

Corrective Action

A timestamp operation will always retry in 24 hours. If this notice persists, contact NetApp technical support.

Syslog Message

ONTAP timestamp sync did not complete on FC-to-SAS bridge with S/N: %s WWN: %s.

Parameters

bridgeSerialNum (STRING): Serial number of the bridge.
bridgeWWN (STRING): World Wide Name of the bridge.

bsdsocket events

bsdsocket.queuelimit events

bsdsocket.queueLimit.reached

Severity

ERROR

Description

This message occurs when the number of connection requests for a socket reaches the maximum number. These connection requests include partially completed connections and connections that are ready to be accepted. Network misconfigurations can cause ONTAP servers to slow down on a given TCP port and can be the cause of this message. This event can also be caused by a denial-of-service attack or an overloaded system.

Corrective Action

Try turning off and back on the LIF on which the last connection was received. If the issue remains after correcting any network misconfigurations, contact NetApp technical support.

Syslog Message

Number of connection requests for the socket bound to port %d having the IP address %s has reached the limit of %d connections. The last connection was received on IP address %s. The socket uses %s protocol. This event has occurred %llu times since the last warning.

Parameters

port (INT): Local port bound to the socket.
ipAddress (STRING): IP address of the socket.
limit (INT): Maximum number of connection requests per socket.
childRecvIpAddress (STRING): IP address on which the last connection request was received.
protocol (STRING): Protocol used by the socket.
count (LONGINT): Number of occurrences for this event since the last warning.

bucket events

bucket.soft events

bucket.soft.limit.exceeded

Severity

NOTICE

Description

This message occurs when a bucket exceeds the soft quota limit (block).

Corrective Action

(None).

Syslog Message

Bucket "%s" on volume "%s%s%s" has exceeded the soft block limit and is at %s capacity.

Parameters

whom (STRING): Entity for which this event is generated.
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
capacity (STRING): Capacity percentage.

bucket.soft.limit.normal

Severity

NOTICE

Description

This message occurs when a bucket's soft quota limit (block) returns to normal.

Corrective Action

(None).

Syslog Message

Bucket "%s" on volume "%s%s%s" is below the soft block limit and is at %s capacity.

Parameters

whom (STRING): Entity for which this event is generated.
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
capacity (STRING): Capacity percentage.

cache events

cache.ttl events

cache.ttl.settings.change

Severity

ERROR

Description

This message occurs on the last node during the upgrade to ONTAP® 9.3, if the default TTL values of any of the SecD or NFS export caches are changed.

Corrective Action

Use the "vserver services name-service cache" commands to configure TTL values after the system is fully upgraded to ONTAP 9.3.

Syslog Message

One or more default cache TTL values for SecD and NFS export caches have been changed.

Parameters

(None).

cachemirror events

cachemirror.offline events

cacheMirror.offline

Severity

ERROR

Description

This message occurs when Cache Mirror encounters an error and has to be taken offline. The system functions normally except that takeover and giveback operation times will be negatively affected.

Corrective Action

Reboot the node by performing a planned takeover and giveback. Contact NetApp technical support if the problem persists.

Syslog Message

Cache Mirror was taken offline because of an unrecoverable error. %s.

Parameters

error_reason (STRING): String providing information about why Cache Mirror was taken offline.

callhome events

callhome.aggr events

callhome.aggr.meta.repair

Severity

ERROR

Description

This message occurs after WAFL® Iron (wafliron) detects and repairs corruption in an aggregate metafile. Wafliron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Wafliron might need to be run on other volumes in aggregate or complete aggregate. Check for wafl.iron.cont.corrupt messages in the node's event log to find other corrupt volumes. Run wafliron on all corrupt volumes. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for WAFLIRON AGGREGATE METAFILE REPAIRED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.aggr.offline

Severity

ALERT

Description

This message occurs when an aggregate is inconsistent and is taken offline. The inconsistency might stem from one or more sources and might be related to previous operations or to current operations. Disabling access is a protective measure to ensure that further inconsistencies are avoided. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the operating environment for the system, storage, or associated cabling has changed in terms of temperature, humidity, vibration, unstable electrical power, or other physical factors, gracefully shut down and power off the system until the environment is restored to normal operations. If the operating environment has not changed, identify the source of the inconsistency by checking for previous errors and warnings. Also check for hardware statistics from Fibre Channel, SCSI, disk drives, other communications mechanisms, and previous administrative activities. Another approach is to consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the aggregate to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for AGGREGATE INCONSISTENT AND TAKEN OFFLINE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.aggr.restricted

Severity

ERROR

Description

This message occurs when a medium error is encountered during a reconstruction. Medium errors during reconstruction automatically invoke wafliron if your system's 'raid.reconstruct.wafliron.enable' option is set to "on". If the option is set to "off", the aggregate is moved offline. In this case, the option was set to "off" and the aggregate was moved offline. The failed disk drive's reconstruction continues and the aggregate stays offline until you repair it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run wafliron manually to bring this aggregate online. It is recommended that you contact NetApp technical support before attempting this. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for MEDIUM ERROR DURING RECONSTRUCTION (aggregate restricted)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.aggr.wafliron

Severity

ERROR

Description

This message occurs when a medium error is encountered during a reconstruction. Medium errors during reconstruction automatically invoke wafliron if your system's 'raid.reconstruct.wafliron.enable' option is set to "on". If the option is set to "off", the aggregate is moved offline. In this case, the option was set to "on" and the aggregate remains online. The failed disk drive's reconstruction continues and wafliron begins repairing the aggregate. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The corrective process of running wafliron has already begun. Wait until you see a message indicating that the wafliron process is complete and the inconsistency status of the aggregate is cleared. If this doesn't happen, or if you see subsequent error messages, contact NetApp technical support. If you need assistance in bringing the aggregate online, contact NetApp technical support.

Syslog Message

Call home for MEDIUM ERROR DURING RECONSTRUCTION (wafliron started)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.andu events

callhome.andu.completed

Severity

NOTICE

Description

This message occurs when the automated update of the cluster has been completed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.andu.pausederr

Severity

ALERT

Description

This message occurs when the automated update of the cluster has been paused due to an error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The automated update of the cluster has been paused due to an error. Determine the cause of the error by using the "cluster image show-update-progress" command. Correct the cause of the error, and then issue the "cluster image resume-update" command to continue the automated update of the cluster.

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multinode AutoSupport.

callhome.appdm events

callhome.appdm.snaprest.fail

Severity

ALERT

Description

This message occurs when the Application Data Management feature encounters an error while attempting to restore an application from a snapshot. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "application snapshot show -vserver <vserver> -application <app> -protection-group <pg>" command to determine if the snapshot exists. If it does, retry the operation. Contact NetApp technical support for assistance with reviewing the event log to determine the cause of the application snapshot restore failure.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
vserver_name (STRING): Vserver name related to this event.
application_name (STRING): Application name related to this event.
protection_group_name (STRING): Protection group name related to this event.
snapshot_name (STRING): Snapshot name related to this event.

callhome.arw events

callhome.arw.activity.seen

Severity

ALERT

Description

This message occurs when ransomware activity is detected. To protect the data, a snapshot has been created, which can be used to restore the original data. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "security anti-ransomware volume attack generate-report" command to generate the report file of the suspected attack on the volume. Search the knowledge base of the NetApp technical support web site for the "callhome.arw.activity.seen" keyword and refer to ONTAP anti-ransomware documentation to take remedial measures for ransomware activity. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home message for %s, Volume: %s (UUID: %s) in Vserver: %s (UUID: %s)

Parameters

subject (STRING): AutoSupport subject or title for this event.
volName (STRING): Name of the volume.
volUuid (STRING): UUID of the volume.
vserverName (STRING): Name of the Vserver.
vserverUuid (STRING): UUID of the Vserver.

callhome.bad events

callhome.bad.ram

Severity

ERROR

Description

This message occurs when correctable ECC errors are masked off, possibly due to bad or poorly seated memory or a faulty motherboard. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If anyone recently installed memory, try removing and reseating it. If problems persist, replace the memory module. If problems still persist, replace the motherboard. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for POSSIBLE BAD RAM

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.battery events

callhome.battery.failure

Severity

EMERGENCY

Description

This message occurs when the battery is either incapable of maintaining data during a power-outage, or is experiencing a failure that poses a physical threat. To prevent data loss and/or damage, the system will shut down momentarily. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s CRITICAL.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.battery.low

Severity

ALERT

Description

This message occurs when the NVRAM battery capacity is critically low. If your system is configured to do so, it generates and transmits an AutoSupport® (or 'call home') message to NetApp® technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "system node environment sensors show" command to view the battery's current status, capacity, and charging state. If the battery was recently replaced or the system was nonoperational for an extended period of time, monitor the battery to verify that it is charging properly. If the battery run time continues to decrease below critical levels, the storage system will automatically shut down. Contact NetApp technical support for assistance.

Syslog Message

Call home for BATTERY_LOW.

Parameters

subject (STRING): AutoSupport subject or title for this event.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

callhome.battery.notice

Severity

NOTICE

Description

This message occurs when the battery is operating near the limit of its supported environment. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery in the next three months. If you need assistance, contact NetApp technical support.

Call home for %s NOTICE.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.battery.overchg

Severity

ALERT

Description

This message occurs when the NVRAM card lithium battery is overcharged and is at risk of failure. The system is currently serving data but will shut down shortly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the NVRAM card/battery and start the system back up. The system will not boot with the battery in this state. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for BATTERY OVERCHARGED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.battery.overtemp

Severity

ALERT

Description

This message occurs when the sensor for the NVRAM card lithium battery over the intended temperature limit. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the system is excessively warm, allow it to cool gradually. If the battery temperature is still too high, replace the battery pack. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for BATTERY OVERTEMP

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.battery.warning

Severity

ALERT

Description

This message occurs when the battery is operating outside the limit of its supported environment. Under these conditions, the battery might not be capable of maintaining data during a power-loss event. To prevent data loss, the system will automatically shut down in 24 hours. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the condition persists, replace the NVRAM card/battery. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s WARNING.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.bcom events

callhome.bcom.vsinit.failed

Severity

ALERT

Description

This message occurs when multiple attempts to initialize the SAN Kernel Agent for a Vserver have failed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "cluster kernel-service show" (advanced) command to verify the cluster kernel quorum service is "in-quorum" on the source node. Contact NetApp technical support for assistance determining the root cause of the failed Vserver initialization.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
source (STRING): The name of the node that failed to initialize.
vserver (STRING): The name of the Vserver that failed to initialize.
vserver_uuid (STRING): The UUID of the Vserver that failed to initialize.
error (STRING): The error of the last failed initialization.

callhome.bdfu events

callhome.bdfu.suspended

Severity

ALERT

Description

This message occurs when drive unlock fails for firmware download on a FIPS-certified NetApp Storage Encryption SAS drive.

Corrective Action

Contact NetApp technical support for assistance with restoring valid authentication keys on the disk.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.bootfs events

callhome.bootfs.chkdsk

Severity

ALERT

Description

This message occurs when a consistency check of the boot media (compact flash or other type) has shown a problem and has not been corrected automatically. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The boot media should be reformatted and/or replaced. After corrective steps have been taken, the "bootfs chkdsk" command should be used to confirm the recovery has been successful. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for BOOTFS CHKDSK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.bridge events

callhome.bridge.reboot.unexp

Severity

ALERT

Description

This message occurs when a bridge reboots unexpectedly. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Analyze the bridge event log to determine the cause of the reboot. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
bridgeName (STRING): Name of the bridge.
bridgeVendor (STRING): Vendor name of the bridge.
bridgeModel (STRING): Model name of the bridge.
bridgeRevision (STRING): Firmware revision of the bridge.
bridgeSerialNum (STRING): Serial number of the bridge.
rebootReason (STRING): Reason for the bridge reboot.

callhome.c events

callhome.c.fan

Severity

ERROR

Description

This message occurs when there is an unexpected decrease in a chassis fan's spin rate, possibly due to a slight decrease in revolutions or to a failed chassis fan. A failed chassis fan can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. If a slight decrease in revolutions seems to have caused this event, and if this has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.c.fan.fru.degraded

Severity

ERROR

Description

This message occurs when a chassis fan might be operating in a degraded state. This condition can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.c.fan.fru.fault

Severity

ERROR

Description

This message occurs when a chassis fan might have failed. This failure can lead to overheating and can cause damage to your equipment. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the chassis fan to determine whether it is spinning. Replace the chassis fan if it failed or is not operating correctly. You might need to replace the motherboard to replace the chassis fan. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.c.fan.fru.rm

Severity

ERROR

Description

This message occurs when a chassis fan is removed. You have two minutes to install a replacement chassis fan or the system shuts down automatically to avoid overheating. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Install a replacement chassis fan within two minutes of removing the original to complete the hot-swap. Otherwise, install the replacement chassis fan when you are ready. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.c.fan.fru.shut

Severity

ERROR

Description

This message occurs when multiple chassis fans have failed. This failure can lead to overheating and can cause damage to your equipment. It is sent just before the system shutdown. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the chassis fans to determine whether they are spinning. Replace the chassis fans if any have failed or they are not operating correctly. You might need to replace the motherboard to replace the chassis fans. A slight decrease in revolutions might have caused this event. If this seems to be the case and has not happened often, you do not need to replace the chassis fan. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.carrier events

callhome.carrier.fault

Severity

ERROR

Description

This message occurs when all the disks in the carrier, that contains more than one disk in it, have failed. The carrier should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the carrier with the failed disks by looking for the carrier whose amber LED is on and the green LED does not indicate any disk activity. Replace the carrier with the failed disks. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ch events

callhome.ch.ps.degraded

Severity

ERROR

Description

This message occurs when a degraded chassis power supply unit (PSU) state exists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ch.ps.fan.bad.xmin

Severity

EMERGENCY

Description

This message occurs when a power supply fan has been detected as no longer working and the overheating is expected shortly. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the power supply unit or the power supply unit's fan. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ch.ps.fault

Severity

ERROR

Description

This message occurs when one chassis power supply unit (PSU) fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ch.ps.wrong.in

Severity

ERROR

Description

This message occurs when a power supply is not connected to the correct type of power source (voltage, amperage, type, etc. difference). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Connect the power supply to the proper power source or replace the power supply with the appropriate one for the available power source. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis events

callhome.chassis.hitemp

Severity

ERROR

Description

This message occurs when the chassis temperature is too warm and might cause an environmental problem, or when there is faulty hardware in the system, such as a fan failure or a malfunctioning temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CHASSIS OVER TEMPERATURE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.overtemp

Severity

EMERGENCY

Description

This message occurs when the chassis temperature is too hot. It is sent just before system shutdown and indicates a potential environmental problem or faulty hardware in the system, such as a fan failure or a malfunctioning temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If the environment is too hot, shut down and power off your system until the environmental conditions are restored to the normal operating temperature range. If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If

you need assistance, contact NetApp technical support.

Syslog Message

Call home for CHASSIS OVER TEMPERATURE SHUTDOWN

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.power

Severity

ERROR

Description

This message occurs when power is in a degraded state because of bad power supply units (PSUs), bad wall power, or bad components on the motherboard. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If spare PSUs are available, try exchanging them to see whether that alleviates the problem. If not, you might need to replace motherboard components or the motherboard. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.power.down

Severity

ERROR

Description

This message occurs when voltage and other power sensors for the system power show critical values. A power supply unit (PSU) might have failed or the sensors might be malfunctioning. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the faulty hardware. Most likely, you need to replace a PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.ps.degraded

Severity

ERROR

Description

This message occurs when a degraded chassis power supply unit (PSU) state exists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.ps.fault

Severity

ERROR

Description

This message occurs when one chassis power supply unit (PSU) fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

You might need to replace a chassis PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.ps.off

Severity

ERROR

Description

This message occurs when the system detects that a chassis power supply unit (PSU) is turned off. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to

NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Turn on the chassis PSU to restore normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.ps.ok

Severity

NOTICE

Description

This message occurs when the system detects that a chassis power supply unit (PSU) was restored to normal operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.ps.replace

Severity

ERROR

Description

This message occurs when a chassis power supply unit (PSU) fails. The PSU's DC power output was abnormal although the AC input power was within acceptable limits. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the affected chassis PSU. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Install a replacement chassis PSU within two minutes of removing the original to complete the hot-swap. Otherwise, install the replacement chassis PSU when you are ready. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.chassis.undertemp

Severity

EMERGENCY

Description

This message occurs when the chassis temperature is too cold. It is sent just before system shutdown and indicates a potential environmental problem or faulty hardware in the system, such as a fan failure or a malfunctioning temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If the environment is too cold, shut down and power off your system until the environmental conditions are restored to the normal operating temperature range. If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CHASSIS UNDER TEMPERATURE SHUTDOWN

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.checksum events

callhome.checksum

Severity

ALERT

Description

This message occurs when the system detects a RAID level checksum error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CHECKSUM ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.checksum.multiple

Severity

ALERT

Description

This message occurs when the system detects a RAID checksum error involving multiple disk drives. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CHECKSUM ERROR (multiple disks)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.clam events

callhome.clam.node.ooq

Severity

EMERGENCY

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, Availability Monitor (CLAM) determines that one of the nodes is out of "cluster quorum".

Corrective Action

One or more of the following actions may be needed: - Check if the node that is out of quorum is administratively down; if it is, enable it with: "cluster modify -node node_name -eligibility true"; - Check if the node that is out of quorum has panic'ed or hung; if it is, troubleshoot and resolve that problem. - Check the connectivity of the node that is out of quorum to the cluster interconnect. Fix any issues, if needed. - Check if there is a version incompatibility between the node that is out of quorum and the rest of the nodes in the cluster; if there is, upgrade nodes as needed so that they are compatible.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.clus events

callhome.clus.net.degraded

Severity

ALERT

Description

This message occurs when the cluster network has experienced an issue that could potentially affect connectivity, reliability, redundancy, or performance, as observed from the local node. A degraded cluster network might cause a cluster-wide outage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

See the EMS event log for additional information related to the issue. If the event_type is "Frequent Link Flapping", check the network cables that are connected to the specified port for any loose connections. If the event_type is "Large MTU Packet Loss", verify cluster switch MTU settings and ensure that all cluster

network ports are configured with the same MTU. If the event_type is "Total Packet Loss", verify all cluster network connectivity and configuration and ensure that all cluster network ports are reachable from one another. If the event_type is "Cluster LIF Not Assigned to Any Port" and the cluster ports are link "down", check the network cables that are connected to the specified port for any loose connnections. Ensure that the cluster ports are administratively configured link "up". If the cluster ports are link "up", attempt to manually migrate the cluster LIF to another cluster port. If the event_type is "Cluster LIF Administratively Down", use the "network interface modify" command to change the status-admin state of the cluster LIF to "up". If the event_type is "Insufficient L2 Reachability", verify that the network topology is correct and the ports are correctly assigned to the right broadcast domain. If the problem persists after correcting any issues, call NetApp technical support.

Syslog Message

Call home for %s: %s - %s

ERROR

Description

This message occurs when the active volume required to store the system data needed for cluster-wide storage cannot be created. This is typically due to not finding an aggregate with the specified size or mirrored attribute to create the volume. The specified feature cannot function without this volume. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume create failed because the aggregate is offline, use the 'aggr online -aggregate' command to bring it back online. If the error message does not indicate an obvious problem, run the 'aggregate show' command to find the state of the aggregate and 'metrocluster check config-replication show-aggregate-eligibility' command to find the eligibility of aggregates for configuration replication. If the aggregate is full, try to create space on it. Otherwise, if possible, create an aggregate with the specified mirror attribute and size by using the 'aggregate create -aggregate name -diskcount diskcount -disksize size -mirror mirrorattribute' command. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s. Could not create volume after %d attempts for feature %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
AttemptsMade (INT): Count of failed attempts to create the volume.
Feature (STRING): Feature using the cluster-wide storage.
ErrorMessage (STRING): Error message on create failure at time of event generation
Size (STRING): Size of the volume to be created.

Mirror (STRING): Mirrored attribute of the aggregate.

callhome.clus.vol.del.fail

Severity

ERROR

Description

This message occurs when the volumes that were used for cluster-wide storage cannot be deleted. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume delete failed because the aggregate is offline, use the 'aggr online -aggregate aggregate_name' command to bring it back online. If the error message does not indicate an obvious problem, contact NetApp technical support

Syslog Message

Call home for %s. Could not delete volumes "%s" and "%s" for feature %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
ActiveVolume (STRING): Active volume name.
StandbyVolume (STRING): Standby volume name.
Feature (STRING): Feature using the cluster-wide storage.

callhome.config events

callhome.config

Severity

ALERT

Description

This message occurs when the system detects a disk shelf configuration error for one or more disk shelves. The system continues to report this error until you resolve the problem. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the command "storage errors show" to display outstanding storage errors in the system. Use the "event log show" command to identify earlier EMS messages related to shelf configuration errors. Correct the cause of the configuration error. Common causes of configuration errors are as follows: - A previously attached disk shelf was removed - A loss of disk shelf enclosure services occurred - A disk shelf fan module failed - An invalid disk shelf drive configuration was created - An operating environment temperature was 50C (122F) degrees or higher - A disk shelf environment module failure occurred If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONFIGURATION_ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.coredump events

callhome.coredump.save.done

Severity

NOTICE

Description

This message occurs when all the core segments belonging to a coredump have been saved. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "system node coredump show" command to obtain coredump file details.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
file (STRING): Primary core segment file that was created.
node (STRING): Name of the node whose core was saved.
size (LONGINT): Size of primary core segment in bytes.
chksum (STRING): Checksum of primary core segment file's data.
ancillary_segment_directory (STRING): Directory which holds ancillary core segments.
ancillary_segments (STRING): List of ancillary segments.

callhome.corefile events

callhome.corefile.upload

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for corefile upload. This Autosupport collects and sends only the corefile specified as part of the payload. This autosupport is sent only when the transport is set to http or https. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

corefile upload callhome for %s

Parameters

subject (STRING): AutoSupport message subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this coredump AutoSupport message.
core_filename (STRING): Coredump filename to be included in the coredump AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.cpu events

callhome.cpu.fan

Severity

ERROR

Description

This message occurs when a CPU fan failed or the fan is spinning too slowly or too fast. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Analyze whether you need to replace the CPU fan. CPU fan replacement might require that you replace the motherboard as well. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.cpu.fan.fault

Severity

ERROR

Description

This message occurs when a CPU fan failed or the fan is spinning too slowly or too fast. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Analyze whether you need to replace the CPU fan. CPU fan replacement might require that you replace the motherboard as well. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.css events

callhome.css.toc.repair

Severity

ALERT

Description

This message occurs when an inconsistency is discovered in a metadata record of the Cloud Storage Service (CSS). The inconsistency is automatically repaired immediately upon detection. But it can leave behind lost objects that are no longer pointed to by the namespace. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The (privilege: diag) "object-store-server lost-object-recovery start" command can be used to add lost objects back into the namespace. The progress of this operation can be monitored with the "object-store-server lost-object-recovery show" command. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ctran events

callhome.ctran.gcror.timeout

Severity

ALERT

Description

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that one or more newly selected Group Coordinators (GCs) are taking too long to successfully complete the GC Ready on Reselect procedure. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for GROUP COORDINATOR ROR TIMEOUT.

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.ctran.jpc.splitbrain

Severity

ALERT

Description

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that there is a disagreement in the cluster - a split brain - about which node has the Join Proposal Coordinator (JPC). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for CTRAN JPC SPLIT BRAIN DETECTED.

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.ctran.proposal.stuck

Severity

ALERT

Description

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN) detects that the proposal is stuck. Proposal is the transaction between nodes in a cluster. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node ASUP.

callhome.dafs events

callhome.dafs.nic.stop

Severity

ALERT

Description

This message occurs when the DAFS (Direct Acess File System) NIC (Network Interface Controller) has stopped while DAFS was running. This is caused by a failure of the NIC processor firmware during heavy and complex workloads. DAFS can usually recover and continue. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Reboot the system to recover the NIC. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DAFS VI NIC HALTED - DAFS SERVICE MAY BE INACCESSIBLE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dbs events

callhome.dbs.assign.error

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) assignments reports a validation error. An assignment validation error may indicate that data is inaccessible or data loss has occurred. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

Parameters

subject (STRING): AutoSupport subject or title for this event.
evtMessage (STRING): Description of the data event, including context details.
evtType (STRING): Type of the original DBS event.
serviceID (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.
nodeID (INT): Node ID number of the associated node. It will be 0 if there is no associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
driveID (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.
driveUuid (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.
evtID (INT): DBS event ID number.
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
evtDetails (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

callhome.dbs.block.repair

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) attempts a new block repair or fails to repair block in maximum number of repair attempts allowed. See event details for more information. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate inconsistent data are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for help immediately.

Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

Parameters

subject (STRING): AutoSupport subject or title for this event.
evtMessage (STRING): Description of the data event, including context details.
evtType (STRING): Type of the original DBS event.
serviceID (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.
nodeID (INT): Node ID number of the associated node. It will be 0 if there is no associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
driveID (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.
driveUuid (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.
evtID (INT): DBS event ID number.
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
evtDetails (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

callhome.dbs.cannot.sync.blk

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects the cluster Block data is in a degraded state, and the auto-heal process to restore full Block data redundancy cannot proceed. Block resources need to be added or restored to the cluster. Too many nodes, Block services, FireStorm services or aggregates may be offline; or possibly the cluster Block services are full. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the storage capacity of the cluster. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

Syslog Message

The DBS cluster Block data cannot be made fully redundant.

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.clcap.full

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects the cluster (or node in the cluster) has completely consumed its capacity. The DBS is responsible for managing the data that backs the FlexVols®. The cluster data is now read-only. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the available capacity of this cluster relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by

FlexVols by deleting unneeded volumes. If the cluster's available capacity appears inconsistent with the calculated expected capacity, then contact NetApp technical support.

Syslog Message

The DBS cluster capacity is 100%% full.

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.clcap.near.full

Severity

ALERT

Description

This message occurs when the Distributed Block Store (DBS) detects the cluster (or node in the cluster) has consumed nearly all of its capacity. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the available capacity of this cluster relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

Syslog Message

The DBS cluster capacity is nearly full.

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.clst.ekm.server

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects one or more of the following: 1. An External Key Management server cannot be reached by any node and is considered down. 2. A fatal communication error has occured with an External Key Management server. Seek corrective-action immediately.

Corrective Action

Verify that the External Key Management server is running and can be reached by the management network. Verify that the correct root CA certificate and client certificate are configured for the Key Server (use openssl s_client to assist with troubleshooting). Check the logs on the External Key Management server for additional troubleshooting help. Contact NetApp technical support for assistance.

Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.data.unavail

Severity

EMERGENCY

Description

This message occurs when some portion of the Distributed Block Store (DBS) data cannot be accessed. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate data is unavailable are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for help immediately.

Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

Parameters

subject (STRING): AutoSupport subject or title for this event.

evtMessage (STRING): Description of the data event, including context details.

evtType (STRING): Type of the original DBS event.

serviceID (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.

nodeID (INT): Node ID number of the associated node. It will be 0 if there is no associated node.

nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

driveID (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.

driveUuid (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.

evtID (INT): DBS event ID number.

collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

evtDetails (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

callhome.dbs.dup.master

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects an internal database inconsistency. Master services have multiple entries for cluster master candidacy. Manual intervention is required.

Corrective Action

Contact NetApp technical support immediately.

Syslog Message

Callhome for %s. DBS has detected a critical issue. Cluster fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

cfType (STRING): DBS cluster fault type of the associated object.

cfID (INT): DBS cluster fault ID number associated with the fault.

cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

cfDetails (STRING): Details of the duplicate master candidates.

cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ekm.cert.emer

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that an External Key Management server configuration contains a certificate that is invalid, is expired, or will expire in less than 3 days. Seek corrective-action immediately.

Corrective Action

Renew or correct each listed certificate and update the associated Key Server configuration. Contact NetApp technical support for assistance.

Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ensemble.emer

Severity

ERROR

Description

This message occurs when the Distributed Block Store (DBS) loses the database connection to over half of the ensemble nodes (of 3 or 5 total). DB quorum has been lost and the DB is down. The cluster cannot operate without access to the DB.

Corrective Action

Bring offline nodes back online and/or restore node network connectivity. If that does not resolve the fault, contact NetApp technical support.

Syslog Message

Callhome for %s. DBS has lost network connectivity or power on ensemble node. Cluster fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

cfDetails (STRING): Description of the degraded ensemble.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ffmAggrFlagSet

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects one or more aggrs have a don't attach, don't mount or don't detach flag set.

Corrective Action

Resolve the issue that required the flag to be set, then remove the flag using the SetAggrFlags API command.

Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ffmFlexvolsOffl

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects one or more FlexVols are offline.

Corrective Action

Solve any issue contributing to the FlexVols being taken offline.

Syslog Message

Callhome for %s. Fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.generic.cfault

Severity

EMERGENCY

Description

This message occurs when a Distributed Block Store (DBS) emergency cluster fault is reported as a generic fault. The DBS is responsible for managing the data that backs the FlexVols®. Multiple faults are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for interpretation of this event.

Syslog Message

Call home for %s, fault %s (%u), sev %u, service %u, node %u/%s, drives %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfCodeName (STRING): Name of the original DBS cluster fault code.
cfCode (INT): DBS cluster fault code number.
cfSeverity (INT): Severity of the original DBS cluster fault. This is different than the EMS severity.
serviceID (INT): Service ID that identifies the associated cluster service. It will be "0" if there is no associated service.
nodeID (INT): Node ID number of the associated node. It will be "0" if there is no associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
cfDriveIDs (STRING): List of the drive IDs associated with the fault. The list might be empty.
cfDriveUuids (STRING): List of the drive UUIDs associated with the fault. The list might be empty.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only

done for newly reported faults (see cfStatus).

callhome.dbs.inv.block.data

Severity

EMERGENCY

Description

This message occurs when a block stored in the Distributed Block Store (DBS) has inconsistent data. The cluster is checking the compression, block ID and checksum of the block against expected values. The DBS is responsible for managing the data that backs the FlexVols®. Multiple DBS events that indicate inconsistent data are mapped to this one event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for help immediately.

Syslog Message

Call home for %s, event %s, type %s, service %u, node %u/%s, drive %u/%s, eventID %u.

Parameters

subject (STRING): AutoSupport subject or title for this event.
evtMessage (STRING): Description of the data event, including context details.
evtType (STRING): Type of the original DBS event.
serviceID (INT): Service ID that identifies the associated DBS service. It will be "0" if there is no associated service.
nodeID (INT): Node ID number of the associated node. It will be 0 if there is no associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
driveID (INT): Drive ID number of the associated drive. It will be 0 if there is no associated drive.
driveUuid (STRING): Drive UUID of the associated drive. It will be zeroes if there is no associated drive.
evtID (INT): DBS event ID number.
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
evtDetails (STRING): Specific details of the DBS data event. It may be a string, in JSON format, or empty.

callhome.dbs.mem.thresh.emer

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects container memory 100 percent consumed.

Corrective Action

Add additional nodes, or purge deleted volumes and run GC

Syslog Message

Callhome for %s. DBS has detected free memory is completely consumed on a node's container. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.
> **nodeID** (INT): Node ID number of the associated node.
> **nodeUUID** (STRING): Node UUID string of the associated node.
> **cfType** (STRING): DBS cluster fault type of the associated object.
> **cfID** (INT): DBS cluster fault ID number associated with the fault.
> **cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
> **collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
> **cfDetails** (STRING): Details of the memory usage threshold.
> **cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
> **skip_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.multSliceSvcDn

Severity

> EMERGENCY

Description

> This message occurs when the Distributed Block Store (DBS) detects multiple unhealthy slice services. This may cause some data to be unavailable.

Corrective Action

> If multiple slice services are unhealthy, repair offline nodes and drives to bring slice services back online. Contact NetApp technical support.

Syslog Message

> Call home for %s. Fault type %s, fault id %u, status %u, nodes %s. %s.

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.
> **cfType** (STRING): DBS cluster fault type of the associated object.
> **cfID** (INT): DBS cluster fault ID number associated with the fault.
> **cfStatus** (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
> **collectAsupNodes** (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
> **cfDetails** (STRING): Description of the cluster fault, including context details.
> **cfExtSrc** (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
> **skip_callhome** (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.node.ekm.server

Severity

> EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that a node is unable to reach an External Key Management server that is not considered down (other nodes are able to reach it). Seek corrective-action immediately.

Corrective Action

Perform troubleshooting at the network or node-specific level to determine why the listed node is unable to reach the External Key Management server. Contact NetApp technical support for assistance.

Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
nodeID (INT): Node ID number of the associated node.
nodeUUID (STRING): Node UUID string of the associated node.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.sec.cache.full

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that Slice volume secondary write cache is full. This is caused when Slice service write requests to the Block service (and by extension the FireStorm service) are not receiving replies. Client write performance may be reduced while this condition exists. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Verify that all nodes are online. Verify that all Block and FireStorm services, and associated aggregates, are online. Attempt repairs needed to bring nodes and aggregates online. If the reason for this condition cannot be found, contact NetApp technical support.

Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

serviceID (INT): Service ID that identifies the associated cluster service.

nodeID (INT): Node ID number of the associated node.

nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.

cfDriveIDs (STRING): List of the drive IDs associated with the fault. The list might be empty.

cfDriveUuids (STRING): List of the drive UUIDs associated with the fault. The list might be empty.

cfType (STRING): DBS cluster fault type of the associated object.

cfID (INT): DBS cluster fault ID number associated with the fault.

cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

cfDetails (STRING): Description of the cluster fault, including context details.

cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ssl.ndcert.exc

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that a node has a missing or corrupted certificate.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

nodeID (INT): Node ID number of the associated node.

nodeUUID (STRING): Node UUID string of the associated node.

cfType (STRING): DBS cluster fault type of the associated object.

cfID (INT): DBS cluster fault ID number associated with the fault.

cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).

collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.

cfDetails (STRING): Description of the cluster fault, including context details.

cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.

skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.ssl.ndcert.exp

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that a node contains an SSL certificate that has expired or will expire imminently.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Callhome for %s. Cluster fault node %u, node UUID %s, fault type %s, fault ID %u, status %u, nodes %s. %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
nodeID (INT): Node ID number of the associated node.
nodeUUID (STRING): Node UUID string of the associated node.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.svcap.full

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects a service (Slice or Block) that has completely consumed its capacity. The DBS is responsible for managing the data that backs the FlexVols®. The data for this service is now read-only. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the available capacity of this service relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes. If the services's available capacity appears inconsistent with the calculated expected capacity, then contact NetApp technical support.

Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
serviceID (INT): Service ID that identifies the associated cluster service.

nodeID (INT): Node ID number of the associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
cfDriveIDs (STRING): List of the drive IDs associated with the fault. The list might be empty.
cfDriveUuids (STRING): List of the drive UUIDs associated with the fault. The list might be empty.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.dbs.svcap.near.full

Severity

ALERT

Description

This message occurs when the Distributed Block Store (DBS) detects a service (Slice or Block) that has consumed nearly all of its capacity. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the available capacity of this service relative to its usage. If some capacity is currently unavailable due to drives or nodes being offline, attempt the repairs needed to bring them online. Free storage used by FlexVols by deleting unneeded volumes.

Syslog Message

Call home for %s, service %u, node %u/%s, drives %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
serviceID (INT): Service ID that identifies the associated cluster service.
nodeID (INT): Node ID number of the associated node.
nodeUuid (STRING): Node UUID of the associated node. It will be zeroes if there is no associated node.
cfDriveIDs (STRING): List of the drive IDs associated with the fault. The list might be empty.
cfDriveUuids (STRING): List of the drive UUIDs associated with the fault. The list might be empty.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only

done for newly reported faults (see cfStatus).

callhome.dbs.volumes.offline

Severity

EMERGENCY

Description

This message occurs when the Distributed Block Store (DBS) detects that one or more volumes in the storage cluster are offline. For the volumes listed, both copies of volume slice data are unavailable. The volumes are degraded and the primary slice service becomes unresponsive, as detected by the Cluster Master. The VolumesDegraded fault will also be present. The DBS is responsible for managing the data that backs the FlexVols®. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check for network connectivity issues and hardware errors. There should be other faults if specific hardware components have failed. Attempt to resolve these issues. The fault will clear when the primary slice service is responsive. Contact Support if there are no associated hardware faults and this fault persists long enough to affect client applications.

Syslog Message

Call home for %s. One or more DBS volumes offline.

Parameters

subject (STRING): AutoSupport subject or title for this event.
cfType (STRING): DBS cluster fault type of the associated object.
cfID (INT): DBS cluster fault ID number associated with the fault.
cfStatus (INT): Current status of the cluster fault. 1 = New (just reported), 2 = Existing (updated), 3 = Resolved (closed).
collectAsupNodes (STRING): List of the node universal unique identifiers (UUIDs) from which AutoSupport messages should be collected.
cfDetails (STRING): Description of the cluster fault, including context details.
cfExtSrc (STRING): DBS cluster fault externalSource label created by the CreateClusterFault API command and attached to the fault for testing purposes.
skip_callhome (INT): If 1, then the ASUP call home was not executed for this event. Call home is only done for newly reported faults (see cfStatus).

callhome.device events

callhome.device.qual

Severity

ALERT

Description

This message occurs when the system detected a disk drive device that did not receive qualification from NetApp. Unqualified disk drives can cause serious damage to the system, and the system shuts down within 72 hours to prevent this potential damage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination

and resolution.

Corrective Action

To correct this situation, complete one of the following steps: 1. Download and install the latest Drive Qualification Package (DPQ) from NetApp technical support. This automatically qualifies any disk drives that were provided by NetApp. Search the support site knowledge base for the "DQP" keyword for further information. 2. Remove the unqualified disk drives from the system. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DEVICE_QUALIFICATION_FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.disk events

callhome.disk.carrier.evacuation.notpossible

Severity

ALERT

Description

This message occurs when a system does not contain enough spares to correct existing disk failures. This message is seen only on systems containing disk carriers capable of holding more than one disk. When this message occurs, manual intervention is required because ONTAP® cannot automatically correct the existing issues with the system's disk configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

To correct this issue on systems that contain carriers with multiple disks, try the following (in the specified order): (1) Assign any unassigned disks that are contained within a multidisk carrier. (2) Add multidisk carriers. (3) If a replacement carrier is available, do the following: a) Fail ALL disks within the carrier. Do not remove a multidisk carrier that contains non-failed disks; doing so results in system degradation and might result in system failure. b) Wait until the disk's amber Attention LEDs stop flashing and are lit continuously. Do not remove a carrier while the shelf OPS panel is alternating between the shelf ID and the Attention Code H1, or while the disks within the carrier are flashing their amber Attention LEDs. c) Replace the carrier. (4) Reassign partner spare disks in the HA configuration. (5) If the problem persists, call NetApp technical support.

Syslog Message

Call home for DISK_CARRIER_EVACUATION_NOTPOSSIBLE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.disk.low.io

Severity

NOTICE

Description

This message occurs when the storage health monitor detected low disk drive throughput. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for DISK_LOW_THRUPUT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.disk.orphan

Severity

NOTICE

Description

This message occurs when RAID subsystem detects an orphan or broken drive and is processing it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.diskown events

callhome.diskown.AssignExceeded

Severity

ERROR

Description

This message occurs when too many disks have been installed. An attempt is made to assign more disks than the maximum that can be supported on this node. This problem must be resolved before the system is rebooted. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the system capacity limits and the assigned disks on this system. If possible, unassign the unused array LUNs. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for ATTEMPTED TO ASSIGN MORE DISKS THAN MAXIMUM SUPPORTED.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.disks events

callhome.disks.missing

Severity

ERROR

Description

This message occurs when the system detected simultaneously that multiple disk drives were missing from the system. It generated a single "MULTIPLE DISKS MISSING" message rather than multiple "DISK MISSING" messages. The problem might be due to a Fibre Channel loop (connection) or a disk shelf or disk drive operating incorrectly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you need assistance, contact NetApp technical support.

Syslog Message

Call home for MULTIPLE DISKS MISSING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dr events

callhome.dr.apply.failed

Severity

ERROR

Description

This message occurs when all attempts to replicate the configuration fails. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

To troubleshoot further, search the event management system (EMS) logs on the destination cluster for

events starting with "vsdr". Perform any provided corrective actions. For further assistance, contact NetApp technical support.

Syslog Message

Call home for DR CONFIG REPLICATION FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.
DestinationVserver (STRING): Destination Vserver of the DR relationship.
FailedReason (STRING): Failed reason.

callhome.dsk events

callhome.dsk.bypass

Severity

ERROR

Description

This message occurs when a disk drive failure occurred and the Embedded Switched Hub (ESH) removed the disk drive from the loop electronically—bypassing the disk drive on one or possibly both ports. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Depending on your system configuration, you might need to place the disk drive software into a failed state to match what the ESH module did. Then locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_FAIL - Bypassed by ESH

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.config

Severity

ERROR

Description

This message occurs when the system detects a configuration problem with a disk drive, Fibre Channel switch, or host bus adapter (HBA). A cabling issue might be causing the problem. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review and repair the cabling and SAN configuration. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK CONFIGURATION ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.disable

Severity

ERROR

Description

This message occurs when a disk drive failure occurred and the I/O Module (IOM) removed the disk drive from the system by disabling the PHY on one or possibly both ports. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Depending on your system configuration, you might need to place the disk drive software into a failed state to match what the IOM did. Then locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_FAIL - Disabled by IOM

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.fault

Severity

ERROR

Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.fw.needed

Severity

ERROR

Description

This message occurs when the system detects one or more disk drives with out of date or "downrev" disk firmware. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check and update all the disk drive firmware levels to the current the disk drive firmware level. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_FIRMWARE_NEEDED_UPDATE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.init

Severity

ERROR

Description

This message occurs when a disk drive failed to initialize. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK INIT FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.io.degraded

Severity

ERROR

Description

This message occurs when the storage health monitor detects degraded disk I/O (taking too long) that indicates a problem with a disk drive. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at a higher risk of failing. If your system is

configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Identify the disk drive that caused this event and verify that it is running the most recent firmware. If the firmware is not up to date, update it to ensure that problems do not continue. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_IO_DEGRADED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.label

Severity

ALERT

Description

This message occurs when a disk drive failed due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK BAD LABEL

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.label.broken

Severity

ERROR

Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK LABELED BROKEN

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.label.v

Severity

ERROR

Description

This message occurs when a disk drive failed due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK BAD LABEL VERSION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.missing

Severity

ERROR

Description

This message occurs when the system cannot detect a disk drive in the Fibre Channel network (or loop) that it previously discovered. The error might be caused by a failed disk drive in the chassis still awaiting replacement or a broken connection to the disk drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate and replace the defective disk drive. If you already replaced it, check the Fibre Channel network for network connectivity from the appliance to the disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK MISSING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.no.spin

Severity

ERROR

Description

This message occurs when a disk drive fails to start. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Logged message 'disk.init.failure.spinup' identifies the failed disk drive. Locate and replace the disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK NOT SPINNING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.noio

Severity

ERROR

Description

This message occurs when disk drive device commands to a disk drive are failing with link errors, adapter errors, or timeouts. With this type of problem, the disk drives's red or amber LED fault light may not be lit. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK NOT RESPONDING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.predict

Deprecated

Deprecated as of ONTAP 9.2. Last used in DOT 7.1.1.

Severity

ALERT

Description

This message occurs when the storage health monitor PFA (predictive failure analysis) determines that disk drive failure is forthcoming. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at higher risk of failing. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Identify the disk drive that caused this event and check whether the firmware is up-to-date. If the firmware is not up-to-date, update it to ensure that problems do not continue. If the firmware is up-to-date, manually fail the faulty disk drive and remove it from the system to ensure the integrity of data. At the earliest opportunity, install a replacement disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_FAILURE_PREDICTED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.redun.fault

Severity

ERROR

Description

This message occurs when redundant access to disk storage is lost. This message and associated Autosupport are issued at most once per day. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate disks which have lost redundancy by using the following command: "storage disk show -fields disk,primary-port,secondary-name,secondary-port,shelf,bay" Note all channels with single path connectivity. Check for failures using these commands: "system health node-connectivity shelf show" and "system health system-connectivity shelf show". If a module or cable failure is identified, replace the failed module or cable. Confirm redundancy has been restored with the following command: "storage disk show -fields disk,primary-port,secondary-name,secondary-port,shelf,bay" If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK REDUNDANCY FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.scrub

Severity

ALERT

Description

This message occurs when the weekly scheduled disk scrub detects checksum errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the results of the disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK SCRUB CHECKSUM ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.scrub.done

Severity

ERROR

Description

This message occurs when a disk scrub finishes bypassing media errors and places the aggregate in a normal state. This type of disk scrub is started automatically after walfiron when disk reconstruction is bypassing media errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the results of the disk reconstruction, wafliron, and disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK SCRUB COMPLETED (bypassing media errors)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.scrub.parity

Severity

ALERT

Description

This message occurs when the scheduled disk scrub detects parity inconsistencies. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp

technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the results of the disk scrub. Your next steps depend on the result of your review, and might include replacing the disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK SCRUB PARITY INCONSISTENCY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.sense

Severity

ERROR

Description

This message occurs when storage health monitor detects a SCSI sense error that indicates a problem with a disk drive. A disk drive might not be using the most recent disk drive firmware. If the disk drive is using the most recent firmware, it might be at a higher risk of failing. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Identify the disk drive that caused this event and verify that it is running the most recent firmware. If the firmware is not up-to- date, update it to ensure that problems do not continue. If the firmware is up-to-date, manually fail the faulty disk drive and remove it from the system to ensure the integrity of data. At the earliest opportunity, install a replacement disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK_RECOVERED_ERRORS

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dsk.shrank

Severity

ALERT

Description

This message occurs when either an aggregate or hot spare disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage disk show -broken" command to locate the failed drive. Confirm the location by looking for a drive whose red and amber LED fault lights are lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for DISK RAWSIZE SHRANK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.dumptriage events

callhome.dumptriage

Severity

NOTICE

Description

This message occurs when kernel dumptriage files are collected for a coredump event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
core_filename (STRING): Coredump filename used to find the correct set of dumptriage files.

callhome.encl events

callhome.encl.access

Severity

ERROR

Description

This message occurs when contact to one or more disk shelf enclosure services (environmental monitoring) is lost, possibly due to storage cabling, adapter, or configuration problems. The system uses the enclosure services to monitor the environment continuously to ensure that conditions remain at safe operating levels. If the system cannot contact the enclosure services, it cannot detect when operating conditions move into unsafe ranges and cannot minimize any damage that might result. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "storage errors show" command to display the current outstanding shelf error conditions. Use the "event log show" command to identify earlier EMS messages related to shelf connectivity errors. Restore connectivity to the disk shelf enclosure services. Check cabling for loose connections. Swap out adapters, if possible. Double-check the configuration. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for ENCLOSURE SERVICES ACCESS ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ext events

callhome.ext.cache.bad

Severity

ALERT

Description

This message occurs when a check of the external memory cache used for increasing system performance has failed and this cache has been disabled. System operations will continue with possibly reduced performance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The external memory cache should checked and possibly repaired to restore its service to the system. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for EXTERNAL CACHE FAILURE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fans events

callhome.fans.failed

Severity

EMERGENCY

Description

This message occurs when multiple fans inside the appliance case fail. This failure can lead to overheating and cause damage to your equipment. The system shuts down within 10 minutes unless you resolve the fan problems. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the fans within 10 minutes. If that is not possible, perform a graceful shutdown of the system and power it off. Then replace the fans when you can, power on the system, and restore it to normal operation. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for MULTIPLE FAN FAILURE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fc events

callhome.fc.al.link

Severity

ALERT

Description

This message occurs when a Fibre Channel arbitrated loop (FC-AL) has link failures. You need to resolve this issue promptly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the FC-AL itself and the connections to the FC-AL for poor or broken connections and misconfigurations. Examine the event log for messages related to FC or disk I/O errors and take the corrective actions found there. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fc.al.poor

Deprecated

Deprecated as of ONTAP 9.2. Last used in DOT 7.1.0.

Severity

ALERT

Description

This message occurs when the system detects that a Fibre Channel arbitrated loop (FC-AL) is unreliable or is too poor in quality for data exchange. You need to resolve this issue promptly. The link errors are recoverable in the sense that the system is up and running. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the FC-AL itself and the connections to the FC-AL for poor or broken connections and misconfigurations. Examine the event log for messages related to FC or disk I/O errors and take the corrective actions found there. Restore normal, error-free communication for the FC-AL as quickly as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FC-AL RECOVERABLE ERRORS

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fcp events

callhome.fcp.adapter.failed

Severity

ERROR

Description

This message occurs when a Fibre Channel Protocol (FCP) HBA Host Bus Adapter (HBA) in this node has failed to read a critical setting from the adapter's internal configuration. The adapter should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the FCP adapter in the slot specified in this message. Replace the adapter. If the adapter name starts with 0, the motherboard may need to be replaced. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fcp.sram.dump

Severity

ERROR

Description

This message occurs when a Fibre Channel Protocol (FCP) HBA Host Bus Adapter (HBA) in this node has recorded to disk a memory image from its Static Random Access Memory (SRAM). The SRAM dump has been performed as the result of several possible reasons, including a command directive and HBA firmware restart. Note that performing a dump of a HBA can disrupt data access operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If this event happens as a result of a command directive such as "fcp dump", the dump operation is expected. If this event happens as a result of HBA reset, the collected dump files can be used by technical support for subsequent analysis. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FCP SRAM DUMP.

Parameters

subject (STRING): AutoSupport subject or title for this event.
portInstance (INT): Instance number of the target port where the dump occurs.
dumpDirName (STRING): Directory location where the FC dumps are stored.
portName (STRING): FC HBA's name.

callhome.fdsk events

callhome.fdsk.admin

Severity

NOTICE

Description

This message occurs when you fail a file system disk drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for FILESYSTEM DISK ADMIN FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.fault

Severity

ERROR

Description

This message occurs when a disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.label

Severity

ERROR

Description

This message occurs when a disk drive fails due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM DISK BAD LABEL

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.label.v

Severity

ERROR

Description

This message occurs when a disk drive fails due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM DISK BAD LABEL VERSION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.missing

Severity

ERROR

Description

This message occurs when the system detects that a disk drive is not in a loop or is missing. This might also occur when a failed disk drive is still in the chassis awaiting replacement. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM DISK MISSING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.noio

Severity

ERROR

Description

This message occurs when disk drive device commands to a file system disk drive are failing with link errors, adapter errors, or timeouts. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM DISK NOT RESPONDING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fdsk.shrank

Severity

ERROR

Description

This message occurs when an aggregate disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an

AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. After the automated e-mail is sent to you with the case# and instructions, the case is closed. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM DISK RAWSIZE SHRANK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.flash events

callhome.flash.cache.degraded

Severity

ERROR

Description

This message occurs when Flash Management Module (FMM) detects that a percentage of a Flash Cache is offline that is above a warning threshold. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

A Flash Cache has degraded. This is an indication or the cause of a performance degradation. Exact impact cannot be estimated. This Flash Cache needs to be repaired or replaced. Contact customer support for more details.

Syslog Message

Call home for Flash Cache DEGRADED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.flash.cache.failed

Severity

ALERT

Description

This message occurs when Flash Management Module (FMM) detects that a Flash Cache has suffered a failure. Typically, this is the result of a hardware failure on the Flash Cache itself. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The Flash Cache can fail due to many reasons. If you see "iomem.dma.internal" in EMS log, reboot the system. If the state of the Flash Cache in system configuration shows 'Failed firmware', update the device (follow the corrective action of the "iomem.card.fail.fpga.rev" EMS message). For all other reasons, replace the Flash Cache. For further assistance, contact technical support.

Syslog Message

Call home for Flash Cache FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.flash.cache.offlined

Severity

ALERT

Description

This message occurs when Flash Management Module (FMM) detects that a critical percentage of a Flash Cache is offline, beyond which the device cannot operate. FMM turned off this device. FMM monitors all flash devices in the system that attach with it. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

A Flash Cache was offlined. This is an indication or the cause of a performance degradation. Exact impact cannot be estimated. This Flash Cache needs to be repaired or replaced. Contact customer support for more details.

Syslog Message

Call home for Flash Cache OFFLINED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.fs events

callhome.fs.lun.resized

Severity

ALERT

Description

This message occurs when the system has detected that a filesystem logical disk array or LUN (Logical Unit Number) stored raw size no longer matches the reported physical size of the LUN. Resizing of a filesystem gateway LUN is not supported. Only gateway LUNs that are spare (not used in a filesystem) may be resized. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Restore the logical disk array or LUN raw size to the expected file system size that system expects. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for FILESYSTEM LUN RESIZED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.hainterconnect events

callhome.hainterconnect.down

Severity

ALERT

Description

This message occurs when the high-availability (HA) interconnect is down. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Corrective action depends on the number and type of HA interconnect links supported by the platform,as well as the reason for which the interconnect is down. EMS event "ic.HAInterconnectDown" provides the reason information. a. If links are down: Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that the small form-factor pluggables (SFPs), if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the "ic link off" and "ic link on" commands. b. If links are disabled: Enable the links by using the "ic link on" command. c. If a peer is not connected: Disable and reenable the links one at a time by using the "ic link off" and "ic link on" commands. Contact NetApp technical support if the problem persists.

Syslog Message

Call home for %s due to %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
reason (STRING): Reason for interconnect down.

callhome.hba events

callhome.hba.failed

Severity

EMERGENCY

Description

This message occurs when a HBA port is taken offline due to read-after-write verification errors. This AutoSupport message and associated EMS messages are issued once for a given port. If your system is

configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Hardware components might need to be replaced. Contact NetApp technical support for assistance.

Syslog Message

Call home for %s. Keep the adapter offline and contact NetApp technical support for assistance.

Parameters

subject (STRING): AutoSupport subject or title for this event.
adapterName (STRING): Name of the adapter.

callhome.hm events

callhome.hm.alert.critical

Severity

ALERT

Description

This message occurs when an error is detected during the periodic health health monitoring of system health monitors. System health monitors create alerts for potential problems detected while monitoring the subsystem. The alerts contain information about probable cause along with recommended actions to rectify the problem. This message is generated after every polling interval if new alerts are detected during this interval. Polling interval is configurable. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run the "system health alert show" command to view details about new alerts in the system. Details of the alerts can be found in the AutoSupport. To correct the alert conditions, refer to the corrective actions described in the alert. Contact NetApp technical support for additional information.

Syslog Message

Call home for %s.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.hostport events

callhome.hostport.bypass

Severity

ALERT

Description

This message occurs when an Embedded Switched Hub (ESH) bypasses a host port due to excessive errors on the port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Depending on your system configuration, you might need to replace the ESH Module or replace the Fibre Channel cable to the host port. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for HOST_PORT_FAIL - Bypassed by ESH

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.hostport.disable

Severity

ALERT

Description

This message occurs when an I/O Module (IOM) disables a host port due to excessive errors on the port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Depending on your system configuration, you might need to replace the IOM or ensure that a good cable is attached to the host port. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for HOST_PORT_FAIL - Disabled by IOM

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.hwaccel events

callhome.hwaccel.qat.dump

Severity

NOTICE

Description

This message occurs when the hardware accelerator gets certain threshold number of errors and collects related diagnostic data concerning the device. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

callhome.ibretimerprog events

callhome.ibretimerprog.fail

Severity

EMERGENCY

Description

This message occurs when InfiniBand (IB) retimer programming of the high- availability (HA) interconnect link failed after multiple retry attempts. The affected InfiniBand HA interconnect link is down. The failure can be due to any of the following reasons: InfiniBand device not found, GPIO read failure, QSFP register dump failure, QSFP parse failure, or retimer failure. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

This failure can be due to defective hardware or cabling. Contact NetApp technical support for further assistance.

Syslog Message

Call home for INFINIBAND RETIMER PROGRAMMING FAILURE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.invoke events

callhome.invoke

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport® message, and the "type" of that message is set to "test". This message contains very little content and is intended for testing AutoSupport® end-to-end. When this message arrives at NetApp technical support, a confirmation email is sent to email destinations specified by the -to parameter. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.invoke.all

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport® message, and the "type" of that message is set to "all". For the benefit of technical support, the message also contains troubleshooting content, which might lengthen the collection time required. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

User triggered complete call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.invoke.remotesplog

Severity

NOTICE

Description

This message occurs when an administrator invokes an AutoSupport message on a node to collect the logs from the service processor of another node in the cluster. If the system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured destinations.

Corrective Action

(None).

Syslog Message

Call home (Remote SP LOG) for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.invoke.splog

Severity

NOTICE

Description

This message occurs when an administrator invokes an AutoSupport message for Service Processor (SP) log collection from ONTAP® CLI. If your system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured

destinations.

Corrective Action

(None).

Syslog Message

Call home (SP LOG %s)

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
for_node_id (STRING): Node where the log is being collected (local or partner node).

callhome.invoke.splog.full

Severity

NOTICE

Description

This message occurs when an administrator invokes an AutoSupport message for full Service Processor (SP) or baseboard management controller (BMC) log collection from ONTAP® CLI. If your system is configured to do so, it generates and transmits an AutoSupport message (or 'call home' message) to NetApp technical support and to the configured destinations.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.iscsi events

callhome.iscsi.hba.crash

Severity

ALERT

Description

This message occurs when the iSCSI host bus adapter (HBA crashes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the HBA is in use, reboot your system to reset the HBA and retrieve the crash-dump file. Contact NetApp technical support and provide the crash-dump file for support purposes.

Syslog Message

Call home for ISCSI HBA CRASH

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.isp events

callhome.isp.adapter.bad

Deprecated

Deprecated as of ONTAP 9.2. Last used in R8.2.x.

Severity

ERROR

Description

This message occurs when the system detects multiple Static Random Access Memory (SRAM) parity errors within a 30 day period. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Replace the Fibre Channel adapter that is exhibiting subsequent parity errors to insure continued operations. Look for the "fci.adapter.parity:info" EMS message in the event log to identify the adapter that is encountering the SRAM parity error and needs to be replaced. You can also check the output of the "FC-STATS" section in AutoSupport and look for the value of link state counter "adap_sram_parity_error_cnt" which will be more than one for the concerned adapter. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SRAM PARITY ERRORS ON FIBRE CHANNEL ADAPTER - replace adapter

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.jpc events

callhome.jpc.selection.fail

Severity

ALERT

Description

This message occurs when the Kernel Cluster Services (KCS) / Cluster Transaction Manager (CTRAN)

detects that the algorithm to reselect the Join Proposal Coordinator (JPC) is failing repeatedly. The JPC is reselected when the node that hosted the JPC goes out of quorum. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for JOIN PROPOSAL COORDINATOR SELECTION FAILING.

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.kernel events

callhome.kernel.core

Deprecated

Deprecated as of ONTAP 9.3. This event is replaced by the callhome.kernel.coreinfo event.

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for kernel coredump files. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Kernel coredump callhome for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this coredump AutoSupport message.
core_filename (STRING): Coredump filename to be included in the coredump AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.kernel.coreinfo

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for kernel coredump files. It contains content relevant to userspace cores. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Kernel coredump callhome for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this coredump AutoSupport message.
core_filename (STRING): Coredump filename to be included in the coredump AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.link events

callhome.link.change.stuck

Severity

ALERT

Description

This message occurs when a network port link state change cannot be confirmed for more than 5 minutes because another configuration task is still in progress. Network port states can change when the node reboots or is administratively changed by a system administrator. The affected port might still be operating in the state before the attempted change. While this condition exists, additional configuration changes or status queries will not be possible. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The link state change request will keep retrying until it succeeds. If the request does not succeed, it indicates that there is a configuration task that has not correctly completed and the node should be

rebooted. For further assistance, contact NetApp technical support.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.management events

callhome.management.log

Severity

NOTICE

Description

This message occurs when the MANAGEMENT_LOG AutoSupport or 'call home' event is sent. This message occurs on a daily basis and is sent from from clustered nodes only. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the node. If your node is configured to do so it generates and transmits an AutoSupport (or 'call home') to NetApp technical support and to the configured destinations on a daily basis. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for MANAGEMENT_LOG

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.management.log.rotate

Severity

NOTICE

Description

This message occurs when the (MANAGEMENT_LOG ROTATE) AutoSupport or 'call home' event is sent. This callhome message is a supplement to the daily callhome.management.log message. The callhome.management.log.rotate message occurs whenever a log file rotates due to size. This message avoids log information gaps when log files rotate. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the node. If your node is configured to do so it generates and transmits an AutoSupport (or 'call home') to NetApp technical support and to the configured destinations on a daily basis. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home %s for filename: %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
filename (STRING): The name of the log file that rotated.

callhome.mcc events

callhome.mcc.auso.2min

Severity

ALERT

Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover operation has completed and the outage window was longer than 120 sec. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check why switchover was triggered by using the "event log show" command and search for event "mcc.auso.triggered". Use the "metrocluster operation show" command to view the details of the switchover operation. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multinode ASUP.

callhome.mcc.auso.complete

Severity

ALERT

Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover operation has completed. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check why switchover was triggered by using the "event log show" command and search for event "mcc.auso.triggered". Use the "metrocluster operation show" command to view the details of the switchover operation. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multinode ASUP.

callhome.mcc.auso.trig.fail

Severity

EMERGENCY

Description

This message occurs when a MetroCluster(tm) automatic unplanned switchover trigger failed to initiate a switchover operation. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Verify the health of each node and that automatic unplanned switchover is enabled on both by using the "metrocluster node show" command. Use the "metrocluster switchover -forced-on-disaster true" command to switch over the DR-site storage manually. For further assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.auso.trig.shut

Severity

ALERT

Description

This message occurs when automatic unplanned switchover (AUSO) in a MetroCluster(tm) IP configuration is triggered due to remote site shutdown.

Corrective Action

Check the hardware conditions at the remote site for the cause of the environmental shutdown. Use the "metrocluster operation show" command to view the details the switchover operation. If you need assistance, contact NetApp technical support.

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.clst.dm.wd.gvup

Severity

ALERT

Description

This message occurs when the Cluster DM Watchdog thread has given up after retrying for over an hour. Cluster configuration replication services are affected and configuration updates might be lost. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Examine the event management system (EMS) logs for any related issues. Perform any provided corrective actions. For further assistance, contact NetApp technical support.

Syslog Message

Call home for METROCLUSTER CLUSTER DM WATCHDOG GAVE UP

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.cluster_dm.stream_in_error

Severity

ALERT

Description

This message occurs when cluster-domain sender/receiver stream has an error. The stream type is indicated through the flag. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER CLUSTER_DM SENDER/RECEIVER STREAM_IN_ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.
stream (STRING): Stream is sender or receiver.

callhome.mcc.config.complete

Severity

NOTICE

Description

This message occurs when the "metrocluster configure" operation is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message

significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER CONFIGURE COMPLETE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.encryption.enabled

Severity

NOTICE

Description

This message occurs when encryption for NVLog and storage replication is enabled in a MetroCluster(tm) IP configuration.

Corrective Action

(None).

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.fcvi.reset

Severity

NOTICE

Description

This message occurs when fcvi adapter has been reset. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER FCVI RESET

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.heal_aggr.failed

Severity

ALERT

Description

This message occurs when metrocluster heal aggregates operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER HEAL_AGGR FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.heal_root.failed

Severity

ALERT

Description

This message occurs when metrocluster heal root-aggregates operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER HEAL_ROOT FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.network.stats

Severity

NOTICE

Description

This message occurs when a MetroCluster over IP configuration detects network behavior change over the inter-cluster links (ISL) that connect sites. Diagnostic information is collected as part of this event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s. Number of times network changed since last callhome: %d.

Parameters

subject (STRING): AutoSupport subject or title for this event.
event_count (INT): Number of times network behavior change was flagged by the analysis engine since the last callhome message was sent.

callhome.mcc.okm.sync.needed

Severity

ALERT

Description

This message occurs when clusters in a MetroCluster(tm) configuration have inconsistent Onboard Key Manager (OKM) data, including differing cluster passphrases or differing OKM hierarchies. The "security key-manager onboard sync" command should be run to prevent any failures in future switchover or switchback events. This message will be generated on both the local cluster and the peer cluster. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER OKM SYNC NEEDED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.personality

Severity

ALERT

Description

This message occurs when the All-Flash Optimized node in a MetroCluster configuration detects that it has a different personality setting. This error can occur when a node loses its All-Flash Optimized setting. When this happens, the node may not function properly. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination

and resolution.

Corrective Action

A node configured with All-Flash Optimized personality recognizes only SSD disks and ignores hard disk drives(HDD). The personality is determined at boot time by checking the bootarg value "bootarg.init.flash_optimized". If the intended configuration of the node is All-Flash Optimized, any HDDs need to be removed and the bootarg needs to be set to true using the "setenv bootarg.init.flash_optimized true" command in maintenance mode. Otherwise, use the "unsetenv bootarg.init.flash_optimized" command to support HDDs on the system.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mcc.sb.vetoed

Severity

NOTICE

Description

This message occurs when the system detects that a MetroCluster (tm) switchback operation has been vetoed, and creates an AutoSupport message for delivery to NetApp technical support for further analysis.

Corrective Action

Enter "metrocluster operation show" to determine the failure reason and take appropriate corrective measures as indicated by the output of this command. Retry the operation following the corrective measure. If the failures persist, or you need further assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER SWITCHBACK VETOED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Correlating tag value used in the AutoSupport message. Other cluster nodes that have detected related events may also have sent AutoSupport messages with this value to NetApp technical support.

callhome.mcc.sbca

Severity

NOTICE

Description

This message occurs when metrocluster switchback continuation agent (SBCA) is run on the disaster site. This happens as part of the metrocluster switchback operation run on the surviving site. This ASUP provides troubleshooting information from the site which is being recovered (disaster hit). If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER SWITCHBACK CONTINUATION AGENT

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.so.vetoed

Severity

NOTICE

Description

This message occurs when the system detects that a MetroCluster (tm) switchover operation has been vetoed, and creates an AutoSupport message for delivery to NetApp technical support for further analysis.

Corrective Action

Enter "metrocluster operation show" to determine the failure reason and take appropriate corrective measures as indicated by the output of this command. Retry the operation following the corrective measure. If the failures persist, or you need further assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER SWITCHOVER VETOED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Correlating tag value used in the AutoSupport message. Other cluster nodes that have detected related events may also have sent AutoSupport messages with this value to NetApp technical support.

callhome.mcc.switchback.complete

Severity

NOTICE

Description

This message occurs when metrocluster switchback operation is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER SWITCHBACK COMPLETE

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.switchback.failed

Severity

EMERGENCY

Description

This message occurs when metrocluster switchback operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER SWITCHBACK FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.switchover.2min

Severity

NOTICE

Description

This message occurs when MetroCluster(tm) switchover operation is complete and the client outage window has exceeded two minutes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.switchover.complete

Severity

NOTICE

Description

This message occurs when metrocluster switchover operation is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for METROCLUSTER SWITCHOVER COMPLETE

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mcc.switchover.failed

Severity

EMERGENCY

Description

This message occurs when metrocluster switchover operation has failed. The failure could be partial or complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run 'metrocluster operation show' to determine the failure reason and take appropriate corrective measure. Retry the operation following the corrective measure. If the failures persists or need assistance, contact NetApp technical support

Syslog Message

Call home for METROCLUSTER SWITCHOVER FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.mccip events

callhome.mccip.auso.disabled

Severity

ALERT

Description

This message occurs when automatic unplanned switchover (AUSO) in a MetroCluster(tm) IP configuration is disabled because the mediator mailbox disk is not healthy. If a site failure occurs, a manual switchover will be required to restore data access.

Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that iSCSI connections to the mediator are up and healthy.

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mccip.collectstats

Severity

NOTICE

Description

This message occurs when MetroCluster IP statistics are collected daily. TCP/IP networking statistics for diagnostic purposes are collected.

Corrective Action

(None).

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mdb events

callhome.mdb.recovery.unsuccessful

Severity

EMERGENCY

Description

This message occurs after an unsuccessful recovery of an inconsistent management database. The message is from the management processes identified by name in the auto-support subject line. The unsuccessful recovery results in the loss of all records contained in the 'job history' and 'rdb statistics' databases. Also, no additional records will be collected until the problem is resolved by NetApp technical support. The affected management process will function normally without these databases.

Corrective Action

Contact NetApp technical support.

Call home for %s WARNING.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mhost events

callhome.mhost.core

Deprecated

Deprecated as of ONTAP 9.3. This event is replaced by the callhome.mhost.coreinfo event.

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for userspace coredump files. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

User space coredump callhome for %s

Parameters

subject (STRING): AutoSupport message subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this coredump AutoSupport message.
core_filename (STRING): Coredump filename to be included in the coredump AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.mhost.coreinfo

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for userspace coredump files. It contains content relevant to userspace cores. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport

message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

User space coredump callhome for %s

Parameters

subject (STRING): AutoSupport message subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport message should be generated and delivered even if the AutoSupport configuration is disabled. If "0" then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this coredump AutoSupport message.
core_filename (STRING): Coredump filename to be included in the coredump AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport message via AutoSupport OnDemand.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.micro events

callhome.micro.core

Severity

NOTICE

Description

This message occurs when a "micro-core" file is available. A "micro-core" file is a very small and simple binary image representing some state of ONTAP® and can be collected and reported to support. Transmission of a normal core file which can be several gigabytes or larger can take a significant time so isn't done. The subject line provides the filename of the micro- core file which is included as part of a special AutoSupport normally only sent to support. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for MICRO-CORE: %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mlm events

callhome.mlm.array.portOneController

Severity

ALERT

Description

This message occurs when all paths for an array LUN are connected to the same controller on the array. This configuration results in a single point of failure at the array. If an active-passive array is connected at the back end, then all the partner controller's paths go to the alternate controller, which results in a tug of war on mailbox I/O or other events that talk to the partner's array LUNs. If the system is running in Cluster-Mode, use the 'storage errors show' command to detect this error. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Reconfigure your back-end SAN so that array LUNs are presented from controllers in different fault domains on the target array. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for ALL PATHS FOR THE ARRAY LUN ARE CONNECTED TO THE SAME CONTROLLER.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.mlm.lun.OnePath

Severity

ALERT

Description

This message occurs when the logical devices (LDEVs) on an array LUN or group of array LUNs are connected using only one path. A proper configuration requires the LDEVs to be connected to at least two paths; otherwise, there is the potential for data loss caused by a single path failure. If an array LUN is assigned, an EMS message is logged to the console at least once a day indicating that it is a single-path assigned array LUN. If the system is running in Cluster-Mode, use the 'storage errors show' command to identify the error. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Verify the configuration and identify the LDEVs that are connected to only one path. After you identify the LDEVs, change the system configuration to ensure that there are at least two paths to all these LDEVs. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for ARRAY LUN CONNECTED USING ONLY ONE PATH.

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.

callhome.multi events

callhome.multi.dsk.cksum.err

Severity

> EMERGENCY

Description

> This message occurs when checksum verification errors are seen on two or more disks connected to the same HBA port, and the port is not taken offline or the "disk.offline_adapter.enable" option is disabled. This AutoSupport® message and associated EMS messages are issued once for a given port. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

> Contact NetApp technical support for assistance with troubleshooting the reason for the write verification errors. Hardware components might need to be replaced.

Syslog Message

> Call home for %s

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.
> **adapterName** (STRING): Name of the adapter.

callhome.ndo events

callhome.ndo.cr.canceled

Severity

> NOTICE

Description

> This message occurs when the controller replacement operation has been canceled by the administrator. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

> The controller replacement operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

> (None).

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.complete

Severity

> NOTICE

Description

> This message occurs when the controller replacement operation has been completed successfully in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

> (None).

Syslog Message

> Call home for CONTROLLER REPLACEMENT COMPLETE

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.dryrun.done

Severity

> NOTICE

Description

> This message occurs when the dry run of the controller replacement operation has completed for the HA pair. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

> (None).

Syslog Message

> Call home for CONTROLLER REPLACEMENT DRY RUN COMPLETE

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.canceled

Severity

> NOTICE

Description

> This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been canceled. If your system is configured to do so, it generates and

transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement NSO operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.complete

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been completed successfully. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for CONTROLLER REPLACEMENT NSO COMPLETE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.mccip.canceled

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been canceled. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement NSO-MCCIP operation on the cluster has been canceled. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

    (None).

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.mccip.complete

Severity

    NOTICE

Description

    This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been completed successfully. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    (None).

Syslog Message

    Call home for CONTROLLER REPLACEMENT NSO-MCCIP COMPLETE

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.mccip.paused.err

Severity

    ALERT

Description

    This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been paused due to an error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    The controller replacement (NSO-MCCIP) operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

Syslog Message

    (None).

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.mccip.started

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been started. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement NSO-MCCIP operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.paused.err

Severity

ALERT

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been paused due to an error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement (NSO) operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.nso.started

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been started. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement NSO operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.paused.err

Severity

ALERT

Description

This message occurs when the controller replacement operation has been paused due to an error in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement operation of the cluster has been paused due to an error. Determine the cause of the error by using the "system controller replace show" command. Correct the cause of the error, and then issue the "system controller replace resume" command to continue the controller replacement of the cluster.

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ndo.cr.started

Severity

NOTICE

Description

This message occurs when the controller replacement operation has started in the HA group. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

The controller replacement operation of the cluster has started. Issue the commands "system controller replace show" and "system controller replace show-details" to see the status of the operation."

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.netif events

callhome.netif.fatal.error

Severity

ERROR

Description

This message occurs when Network Interface Card encountered a fatal error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check for the following EMS message in the EMS log that has the EMS event name "netif.fatal.err". For example: "…netif.fatal.err:crit]: The network device in slot 1 Encountered Fatal Error" The netif.fatal.err EMS message provides the slot number of the NIC device which encountered fatal error. If you need assistance, contact NetApp technical support

Syslog Message

Call home for NETWORK INTERFACE CARD FATAL ERROR.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.netif.init.failed

Severity

ALERT

Description

This message occurs when initialization of a network interface failed due to an unexpected software error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the cabling and network configuration. Collect faulty NIC statistics. If you need assistance, contact NetApp technical support

Syslog Message

Call home for NETWORK INTERFACE INITIALIZATION FAILURE, port %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.netif.uncorEccError

Severity

ALERT

Description

This message occurs when a network interface controller encountered an unrecoverable ECC error. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Review the cabling and network configuration. Replace the faulty NIC device. If you need assistance, contact NetApp technical support

Syslog Message

Call home for NETWORK INTERFACE UNRECOVERABLE ECC ERROR, port %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.netinet events

callhome.netinet.dup.clustIP

Severity

EMERGENCY

Description

This message occurs when a new node that is trying to join the cluster is using the same IP address that is configured on this node's cluster interface. This can prevent data from being served to clients and potentially bring down the entire cluster. This event generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the Ethernet (MAC) address with the "network port show -mac <mac>" command to find network port. Use "network interface show -curr-port <port>" command to identify the cluster interface that is configured with the duplicate IP address. Remove the LIF on the cluster interface of the new node in the cluster network by using the **net int delete -vserver <vserver_name › -lif <lif_name** command. After removing the LIF, assign a new, unique IP address to the cluster interface.

Syslog Message

Call home for DUPLICATE CLUSTER IP.

Parameters

subject (STRING): AutoSupport subject or title for this event.
ipaddr (STRING): Duplicate IP address that was detected on the cluster network.
ethaddr (STRING): Ethernet (MAC) address that uniquely identifies the node configured with the duplicate IP address.

callhome.nht events

callhome.nht.data

Severity

NOTICE

Description

This message occurs when the weekly AutoSupport or 'call home' event is sent for any drive NHT data. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for DRIVE NHT DATA

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.no events

callhome.no.inodes

Severity

ERROR

Description

This message occurs when a volume is out of inodes, which refer to individual files, other types of files, and directories. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Modify the volume's maxfiles (maximum number of files) to increase the inodes on the affected volume. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for OUT OF INODES

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.

callhome.nse events

callhome.nse.ak.check.failed

Severity

> EMERGENCY

Description

> This message occurs when the node's key-management database lacks authentication keys (AKs) needed by self-encrypting drives that are owned by the node. The affected drives can be FIPS-certified drives (variously called FIPS drives, NetApp Storage Encryption drives, and NSE drives) or non-FIPS-certified self-encrypting drives (SEDs). A FIPS drive or SED is at risk of permanent data loss if authentication fails repeatedly after it is power-cycled. When FIPS keys are missing, operations such as encrypting sanitize and firmware download might also not succeed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

> Display the available keyIDs for encrypting drives using the "security key-manager key query -key-type NSE-AK" command; ONTAP uses these values for all its encrypting drives, whether FIPS/NSE drives or SEDs. Display keyIDs that the drives need using the command "storage encryption disk show", and for FIPS drives, "storage encryption disk show -fips". Each keyID in the disk lists must be present in the key-manager output, except for the default "0x0" (MSID) and "" (null) keyIDs that are not maintained by the key management system. Contact NetApp technical support for assistance. Avoid drive power-cycles and AK modifications until the issue is corrected.

Syslog Message

> Call home for %s, disk "%s".

Parameters

> **subject** (STRING): AutoSupport subject or title for this event.
> **disk** (STRING): Name of the first affected drive detected.

callhome.nvdimm events

callhome.nvdimm.cecc

Severity

> ERROR

Description

> This event occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVDIMM. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "system environment sensors show -hidden true" clustershell command to view the NVDIMM sensors values. Contact NetApp technical support for further assistance.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nvdimm.failure

Severity

EMERGENCY

Description

This event occurs when the NVDIMM card has experienced a critical hardware failure. The system may shut down to avoid potential data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the following clustershell commands to get more information about the failure: 1. "event log show -node localhost -event nvdimm*" 2. "system fru-check show -node localhost -ftype nvdimm -instance" Contact NetApp technical support to replace the NVDIMM module.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nve events

callhome.nve.digest.mismatch

Severity

EMERGENCY

Description

This message occurs when the digest of an NetApp Volume Encryption (NVE) or NetApp Aggregate Encryption (NAE) key being restored does not match the expected key digest. Because the key being restored is not the same key expected by the system, the volume associated with the NVE or NAE key will not be able to be onlined, resulting in data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for %s. key ID: %s, Key Server: %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
keyId (STRING): Key ID of the key being restored that had the digest mismatch.
keyServer (STRING): Address or name of the key server from which the key is being restored.

callhome.nvme events

callhome.nvme.exhausted

Severity

ALERT

Description

This message occurs when a directly attached NVMe module has worn out and is at the end of its write life. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact technical support for assistance with possible replacement of the module.

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
serial (STRING): Serial number of the NVMe device.
model (STRING): Model number of the NVMe device.
slot_subslot (STRING): PCI slot/subslot of the NVMe device.

callhome.nvme.offline

Severity

ALERT

Description

This message occurs when a directly attached NVMe module goes offline. When a module goes offline, it has either had a critical failure or is no longer reliable. In either case, the card is no longer functioning properly and was taken offline. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact technical support for assistance with possible replacement of the module.

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
serial (STRING): Serial number of the NVMe device.
model (STRING): Model number of the NVMe device.
slot_subslot (STRING): PCI slot/subslot of the NVMe device.
code (LONGINTHEX): Bit-encoded error that caused the event.

callhome.nvmem events

callhome.nvmem.volt.hi

Severity

ALERT

Description

This message occurs when the sensor for the Non-Volatile memory (NVMEM) card lithium battery has an excessively high voltage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

First, correct any environmental or battery problems. If the problem continues, replace the controller module. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for NVMEM VOLTAGE HIGH

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nvmem.volt.lo

Severity

ALERT

Description

This message occurs when the sensor for the Non-Volatile memory (NVMEM) card lithium battery has an excessively low voltage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

First, correct any environmental or battery problems. If the problem continues, replace the controller module. If you need assistance, contact NetApp technical support.

Call home for NVMEM VOLTAGE LOW

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nvram events

callhome.nvram.cecc

Severity

ERROR

Description

This message occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVRAM complex. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "system environment sensors show -hidden true" cluster shell command to view the current "NV Correctable ECC count" and "NV Correctable ECC rate" values. Contact NetApp technical support for further assistance.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nvram.failure

Severity

EMERGENCY

Description

This message occurs when the NVRAM card has experienced a critical hardware failure. The system will shut down to avoid potential data loss. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support to replace the NVRAM card.

Syslog Message

Call home for NVRAM FAILURE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.nvram.iofs.fail

Severity

ERROR

Description

This message occurs in a FireStorm instance when a read or write to its nonvolatile memory (NVRAM) device fails. The instance will panic. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Restart the FireStorm instance. If the issue persists, contact NetApp technical support.

Syslog Message

Call home for NVRAM failure at %s, I/O type %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
io_type (STRING): Type of failed operation (read or write).
tag (STRING): Supplemental event identifier.
error (LONGINT): I/O error code.

callhome.nvram.openfs.fail

Severity

ERROR

Description

This message occurs when a FireStorm instance is unable to open its nonvolatile memory (NVRAM) device. The instance will panic.

Corrective Action

Restart the instance. If the issue persists, contact NetApp technical support.

Syslog Message

Call home for open failure at %s on NVRAM file %s, error %d.

Parameters

subject (STRING): AutoSupport subject or title for this event.
nvram_backing (STRING): Name of the NVRAM backing file.
fileio_error (LONGINT): Open error code.

callhome.okm events

callhome.okm.sync.needed

Severity

ALERT

Description

This message occurs when the cluster has reached an inconsistent state with respect to the onboard key hierarchy. This is an alert that the "security key-manager onboard sync" command should be run on the local cluster to prevent any future usage failures with onboard key management. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to Netapp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for CLUSTER OKM SYNC NEEDED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ondemand events

callhome.ondemand.invoke

Severity

NOTICE

Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type TEST. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect only the information necessary to understand the configuration of the system and quickly deliver it. For this reason, the data collection is bounded by time taken to collect data and quantity of data collected. With less data collected, delivery over the internet is expected to be faster. The overall process from remote activation to delivery should be measurable in minutes. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.ondemand.invoke.all

Severity

NOTICE

Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type ALL. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect more data to aid in problem resolution. The collection is bounded by time and size limits but these are much larger as compared to most other AutoSupport messages. Collecting a larger amount of AutoSupport data can help support personnel diagnose difficult problems. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.ondemand.perf.snap

Severity

NOTICE

Description

This message normally occurs when NetApp technical support has remotely requested an AutoSupport or 'call home' message of type PERFORMANCE. This request is accomplished by use of the AutoSupport OnDemand Server (AODS) service. The intent of this AutoSupport is to collect statistics and other information to aid in understanding operations and other usage analysis related to networking, storage, memory and processor. This analysis might result in recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

(None).

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport. If set, this AutoSupport is delivered to this alternate destination.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.partner events

callhome.partner.down

Severity

EMERGENCY

Description

This message occurs when the storage failover partner is down and takeover cannot begin. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for PARTNER DOWN, TAKEOVER IMPOSSIBLE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.performance events

callhome.performance.archive

Severity

NOTICE

Description

This message occurs when you invoke an AutoSupport for performance archives. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Performance archive callhome for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this AutoSupport message. If this is set, this AutoSupport message is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If 0 then obey the normal "state" and "support" flags. If this is "1", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
case_number (STRING): Case number to be associated with this performance archive AutoSupport message.
aod_initiated (INT): This flag indicates that NetApp technical support has remotely requested for this AutoSupport via AutoSupport OnDemand.
start_date (STRING): Date at which data collection will begin.
end_date (STRING): Date at which data collection will end.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.
aod_req_id (STRING): AOD request ID

callhome.performance.data

Severity

NOTICE

Description

This message occurs when the weekly AutoSupport or 'call home' event is sent for performance data. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for PERFORMANCE DATA

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.performance.snap

Severity

NOTICE

Description

This message occurs some minutes after a reboot or storage takeover operation occurs so that performance information can be sent. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations.

Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for PERFORMANCE SNAPSHOT

Parameters

subject (STRING): AutoSupport subject or title for this event.
URI (STRING): Alternate destination for this ASUP. If this is set, this ASUP is delivered to this alternate destination.
force (INT): This flag indicates this AutoSupport should be generated and delivered even if the AutoSupport configuration is disabled. If zero then obey the normal "state" and "support" flags. If this is "one", then ignore the "state" and "support" configuration and deliver as if both "state" and "support" are enabled.
sequence (LONGINT): Sequence number to use to generate this Autosupport. Use value zero to auto-generate or a value higher than last used ASUP sequence number.

callhome.pool events

callhome.pool.aggr.noncomp

Severity

ALERT

Description

This message occurs when an aggregate does not comply with the current Capacity Pool entitlement, as determined by the Licensing Manager. In an HA configuration, noncompliant aggregates are prevented from being sent home during an HA takeover/giveback situation. In a non-HA configuration, these aggregates cannot be brought online if they are already offline. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "system license license-manager check" command to determine whether the License Manager is accessible. Use the "system license show-aggregates -compliant false" command to find all aggregates that do not comply. From the web interface of the ONTAP® Select Deploy® instance, check the Capacity Pool licensing status, and ensure that sufficient capacity remains within the capacity pool used by this instance of ONTAP. If the capacity is insufficient, reduce the usage by instances of ONTAP that use the pool (for example, by deleting aggregates). If no reduction is possible, Contact NetApp technical support..

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.raid events

callhome.raid.adp.disabled

Severity

NOTICE

Description

This message occurs when auto-partitioning for root aggregate creation is disabled on a system. When auto-partitioning is disabled, the root aggregate is created on whole disks. Systems with a root aggregate on partitioned disks can devote more space to non-root aggregates than systems with a root aggregate on whole disks. If this message occurs after root aggregate creation, then further partitioning of the disks is disabled.

Corrective Action

If the system is already initialized with root aggregate on partitioned disks, ONTAP will try to re-enable auto-partitioning after the system boots up and the root aggregate is online. The event raid.autoPart.enabled will be logged when auto-partitioning is re-enabled. To create a root aggregate on partitioned disks: 1. Halt the controller. 2. Replace any failed internal disks (see the "reason" field in the EMS message). 3. Reboot the controller. 4. Re-initialize the system. If this message is seen after the system initialization and the root aggregate is already created on partitioned disks, then the system will continue to function, as follows: 1. Expansion of existing aggregates created from partitioned disks may not work. 2. If a disk fails in a RAID group created out of partitioned disks, then a spare will fail to be partitioned and disk reconstruction will not start. 3. If a disk is marked for predictive failure in a RAID group created out of partition disks, then a spare will fail to be partitioned and the sick disk copy will not start. 4. If disks are available, then manually partition the disks and keep them as spares. 5. If you were previously directed to disable ADP by NetApp technical support, reach out to NetApp technical support to re-enable ADP.

Syslog Message

Disk auto-partitioning is disabled on this system: %s.

Parameters

subject (STRING): Reason that auto-partitioning was disabled.

callhome.raid.no.recover

Severity

EMERGENCY

Description

This message occurs when too many errors have been detected by the RAID (Redundant Array of Inexpensive Disks) software protection and recovery is not possible. The detected errors could be related to checksum calculations, lost write detection and on disk medium errors in combinations with disk and NVRAM failures. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Immediately contact NetApp technical support for assistance to help diagnose the failures. If the diagnosis points to malfunctioning hardware components, these should be replaced.

Syslog Message

Call home for RAID DETECTED UNRECOVERABLE ERRORS

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.raid.over.max

Severity

ALERT

Description

This message occurs when the maximum raw capacity of the file system (aggregate or RAID file system) is reached for this software release. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for Exceeded maximum raw capacity

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.raidtree events

callhome.raidtree.assim

Severity

EMERGENCY

Description

This message occurs when an aggregate experiences a configuration corruption error during assimilation of aggregate structures. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for RAIDTREE ASSIMILATION FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot events

callhome.reboot

Severity

NOTICE

Description

This message occurs after an appliance reboot—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If reboots continue to occur, contact NetApp technical support.

Syslog Message

Call home for REBOOT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.agentwatchdog

Severity

ALERT

Description

This message occurs when the system experiences an internal hardware watchdog timer reset. The system reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience watchdog timer resets, contact NetApp technical support.

Syslog Message

Call home for REBOOT (agent watchdog reset).

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.fw

Severity

NOTICE

Description

This message occurs when the appliance reboots after loading firmware—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REBOOT (after entering firmware)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.giveback

Severity

NOTICE

Description

This message occurs when the node boots to normal operations because of a successful storage giveback from the partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REBOOT (after giveback)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.glitch

Severity

NOTICE

Description

This message occurs when the appliance halts and reboots due to problems with inconsistent power. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience 'power glitch' reboots, contact NetApp technical support.

Syslog Message

Call home for REBOOT (power glitch)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.halt

Severity

NOTICE

Description

This message occurs when the appliance reboots after you use the 'halt' command to shut it down. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REBOOT (halt command)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.ioxm.removal

Severity

NOTICE

Description

This message occurs when the appliance halts and reboots due to the removal of the IOXM without powering down the appliance first. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Do not remove the IOXM without powering down the appliance first.

Syslog Message

Call home for REBOOT (IOXM removal)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.panic

Severity

ALERT

Description

This message occurs when the appliance reboots after a panic (also known as a 'system crash'). The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for REBOOT (panic)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.poweron

Severity

NOTICE

Description

This message occurs when the appliance reboots when it is powered on. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience 'power on' reboots, contact NetApp technical support.

Syslog Message

Call home for REBOOT (power on)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.reboot

Severity

NOTICE

Description

This message occurs when you reboot the appliance with the 'reboot' command. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REBOOT (reboot command)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.sk.halt

Severity

NOTICE

Description

This message occurs when the system is halted automatically to prevent damage or possible loss of data. The system reports this event after the reboot is complete. An internal halt might be caused by one of the following reasons: 1. If a disk drive fails and there are no available spares, the system enters degraded mode. The appliance halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If a spare disk drive becomes available while the system is running in degraded mode, the system immediately begins rebuilding the failed disk drive. 2. The system also halts automatically if the environmental conditions, such as temperature or power, are not within the safe operating limits or are inadequate to prevent possible damage. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience 'internal halt' reboots, contact NetApp technical support.

Syslog Message

Call home for REBOOT (internal halt)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.sk.reboot

Severity

NOTICE

Description

This message occurs when you halt, reset, or turn off power to the appliance without completing an orderly halt or shutdown sequence before rebooting. The appliance reports this event after the reboot is complete. To keep your data safe, always use the 'halt' command to halt the appliance, and then wait for an orderly halt or shutdown to be complete before you power down the appliance or perform any hardware maintenance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience 'internal reboot' reboots, contact NetApp technical support.

Syslog Message

Call home for REBOOT (internal reboot)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.sp.rst

Severity

NOTICE

Description

This message occurs when the appliance reboots when it has been reset through the Service Processor (SP) 'system reset' command. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REBOOT (sp system reset)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.takeover

Severity

NOTICE

Description

This message occurs when the partner appliance storage is taken over successfully by this appliance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you need assistance, contact NetApp technical support.

Syslog Message

Call home for PARTNER REBOOT (CONTROLLER TAKEOVER)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.takeover.p

Severity

NOTICE

Description

This message occurs when the partner appliance storage is taken over successfully by this appliance. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you need assistance, contact NetApp technical support.

Syslog Message

Call home for PARTNER REBOOT (CONTROLLER TAKEOVER ON PANIC)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.unknown

Severity

NOTICE

Description

This message occurs after an appliance reboot—the appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If reboots continue to occur, contact NetApp technical support.

Syslog Message

Call home for REBOOT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.reboot.watchdog

Severity

ALERT

Description

This message occurs when the appliance experiences an internal hardware watchdog timer reset. The appliance reports this event after the reboot is complete. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If you continue to experience watchdog timer resets, contact NetApp technical support.

Syslog Message

Call home for REBOOT (watchdog reset)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.rnode events

callhome.rnode.splog

Severity

NOTICE

Description

This messages occurs when a new set of log files has been collected from a Service Processor (SP) of one or more non-operational nodes in the cluster. When an abnormal node reboot is detected by its SP, log files are created. When this node is operational again, the SP log files are collected and included in subsequent AutoSupport messages sent by the node. In cases where nodes cannot return to operation immediately, the SP's log files are collected by another node in the cluster and sent via this AutoSupport message. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for REMOTE NODE SP LOG %s %s %s %s %s %s %s %s %s %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
node1_down_fn (STRING): Node-specific filename for the downfiler splog from the first node. If NULL is specified, this downfiler splog is not available.
node1_latest_fn (STRING): Node-specific filename for the latest splog from the first node.
node2_down_fn (STRING): Node-specific filename for the downfiler splog from the second node. If NULL is specified, this downfiler splog is not available.
node2_latest_fn (STRING): Node-specific filename for the latest splog from the second node.
node3_down_fn (STRING): Node-specific filename for the downfiler splog from the third node. If NULL is specified, this downfiler splog is not available.
node3_latest_fn (STRING): Node-specific filename for the latest splog from the third node.
node4_down_fn (STRING): Node-specific filename for the downfiler splog from the fourth node. If NULL is specified, this downfiler splog is not available.
node4_latest_fn (STRING): Node-specific filename for the latest splog from the fourth node.
node5_down_fn (STRING): Node-specific filename for the downfiler splog from the fifth node. If NULL is specified, this downfiler splog is not available.
node5_latest_fn (STRING): Node-specific filename for the latest splog from the fifth node.

callhome.root events

callhome.root.vol.recovery.reqd

Severity

    EMERGENCY

Description

    This message occurs when the root volume is not working properly and its recovery is required. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    Contact NetApp technical support to obtain the root volume recovery procedures and further assistance.

Syslog Message

    Call home for ROOT VOLUME NOT WORKING PROPERLY: RECOVERY REQUIRED.

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.rtc events

callhome.rtc.battery.low

Severity

    ERROR

Description

    This message occurs when the voltage for the Real-Time Clock (RTC) battery is low. The message is repeated once every hour until you replace the battery. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    Replace the RTC battery as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

    Call home for RTC BATTERY LOW

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.sas events

callhome.sas.init.failed

Severity

    ERROR

Description

This message occurs when the SAS adapter fails to initialize the link. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp Global Services and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the adapter is in use, check cabling and connected equipment. If the adapter is connected to storage shelves, check connected I/O modules (IOM).

Syslog Message

Callhome for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.
adapterName (STRING): Name of the associated SAS host bus adapter.

callhome.sb events

callhome.sb.pp.fcp.failo.err

Severity

ERROR

Description

This message occurs when the persistent port feature is not working during non-disruptive operations (NDO) such as takeover or giveback due to configuration errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sb.pp.fcp.init.err

Severity

ERROR

Description

This message occurs when persistent port object for a SAN FCP LIF fails to be configured during a LIF create operation. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade events

callhome.sblade.import.susp

Severity

ERROR

Description

This message occurs when LUN import cannot resume after takeover/giveback. All LUN import sessions have been suspended. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for LUN IMPORT SESSIONS SUSPENDED

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multinode AutoSupport.

callhome.sblade.lif.init

Severity

NOTICE

Description

This message occurs during Vserver initialization when partially initialized volumes do not complete initialization within the specified maximum timeout value. On timer expiration the Vserver data LIFs are brought online regardless of the volume initialization status. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for SCSIBLADE LIF INIT TIMEOUT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.lu.resync.to

Severity

EMERGENCY

Description

This message occurs when the SCSI target internal resynchronization of a LUN times out. This LUN is unavailable until one or more nodes that could not complete the internal resynchronization are taken over and given back or rebooted. If your system is configured to do so, it generates and transmits an AutoSupport® (or "call home") message. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support for further assistance.

Syslog Message

Call home for SCSIBLADE LU RESYNC TIMEOUT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.lu.rst.hung

Severity

EMERGENCY

Description

This message occurs when the SCSI target cannot complete an internal reset of a LUN. This LUN is unavailable until one or more nodes that could not complete the internal reset are taken over and given back or rebooted. If your system is configured to do so, it generates and transmits an AutoSupport® (or "call home") message. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support for further assistance.

Syslog Message

Call home for SCSIBLADE LU INTERNAL RESET HUNG

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.mgmt.wedged

Severity

EMERGENCY

Description

This message occurs when the SAN management plane encounters an error that prevents further SAN management commands from being processed. This usually means that all the threads of one (or more) of the SAN management plane modules are stuck. SAN configuration changes on this node and other nodes in the cluster will fail with timeout errors until corrected. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for SCSIBLADE MGMT WEDGED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.prop.fail

Severity

EMERGENCY

Description

This message occurs when an internal SAN management command fails. SAN management commands is not able to be completed for the Vserver which fails until the node is rebooted. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Refer to Knowledgebase article: 2017459 for recovery instructions.

Syslog Message

Call home for SCSIBLADE PROPOSAL FAIL

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.unavailable

Severity

ERROR

Description

This message occurs when the node has lost connectivity with the majority of the cluster and is unable to recover automatically. When this occurs both FCP and iSCSI traffic have been disabled on this node. Manual recovery is required to come back into service. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Reboot the node, and if the node is waiting for giveback then perform a giveback.

Syslog Message

Call home for SCSIBLADE SERVICE UNAVAILABLE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sblade.vol.ev.lost

Severity

ERROR

Description

This message occurs when LUNs (Logical Unit Numbers) in a volume are not accessible on all paths. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support for further assistance.

Syslog Message

Call home for SCSIBLADE VOLUME EVENT LOST

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi node ASUP.

callhome.sblade.vs.op.tt

Severity

ERROR

Description

This message occurs when a mangement command or other internal operation takes too long for a LUN (Logical Unit Number). When this situation occurs, the corresponding Vserver cannot handle any other management changes for the LUN until this condition no longer persists. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Call NetApp technical support immediately for further assistance.

Syslog Message

Call home for SCSIBLADE VSERVER OPERATION TIMEOUT

Parameters

subject (STRING): AutoSupport subject or title for this event.

epoch (STRING): Identifying tag for multi node ASUP.

callhome.scsi events

callhome.scsi.tgt.misconfig

Severity
ERROR

Description
This message occurs when a LUN (Logical Unit Number) mapping or igroup type misconfiguration has been detected when the cluster interconnect has transitioned from down to up. The detected misconfiguration problems will typically include cases of having a LUN on each storage controller mapped to the same LUN for the same initiator. When the cluster interconnect is down, LUN mapping changes are prevented unless overridden. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action
Run the "lun config_check" command which will list out the problems that caused this event and resolve this problem list. If you need assistance, contact NetApp technical support.

Syslog Message
Call home for FILER SCSI TARGET MISCONFIGURED

Parameters
subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk events

callhome.sdsk.admin

Severity
NOTICE

Description
This message occurs when you fail a hot spare disk drive.

Corrective Action
(None).

Syslog Message
Call home for SPARE DISK ADMIN REMOVED

Parameters
subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.fault

Severity

ERROR

Description

This message occurs when a spare disk drive fails. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.label

Severity

ERROR

Description

This message occurs when a disk drive fails due to unexpected RAID metadata. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SPARE DISK BAD LABEL

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.label.v

Severity

ERROR

Description

This message occurs when a disk drive fails due to a version number in its RAID metadata that is inconsistent with the operating system version installed. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SPARE DISK BAD LABEL VERSION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.missing

Severity

ERROR

Description

This message occurs when the system detects that a spare disk drive is not in a loop or is missing. This might also be due to a failed disk drive that is still in the chassis awaiting replacement. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate and replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SPARE DISK MISSING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.noio

Severity

ERROR

Description

This message occurs when disk drive device commands to a hot spare disk drive are failing with link errors, adapter errors, or timeouts. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SPARE DISK NOT RESPONDING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sdsk.shrank

Severity

ERROR

Description

This message occurs when a hot spare disk drive fails because its raw capacity was downsized due to a firmware change. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose red and amber LED fault lights are NOT lit. Replace the failed disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SPARE DISK RAWSIZE SHRANK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ses events

callhome.ses.drive.missing

Severity

ERROR

Description

This message occurs when the storage adapter detects a disk on the Fibre Channel loop or the SCSI bus, but enclosure services in the disk shelf does not report a disk with that address. This error indicates that the disk took an address other than what the disk shelf should have provided, or that enclosure services in the disk shelf cannot be contacted for address information. (Note: If the message "ses.drive.possShelfAddr" subsequently appears, follow the corrective actions in that message.) In this condition, the SCSI Enclosure Services (SES) process in the system might be unable to perform certain operations on the disk, such as setting failure LEDs or detecting disk swaps. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the disk is not part of an active aggregate or volume, pull out the disk and push it back into the slot to ensure that the disk is in place. If the problem persists, insert a spare disk into the slot. If the problem is then gone, replace the original disk with the spare one. If the problem occurs to multiple disks on the same loop, check the I/O modules at the back of the disk shelves on that loop for errors.

Syslog Message

Call home for SES: DRIVE MISSING

Parameters

subject (STRING): AutoSupport subject or title for this event.
ChannelName (STRING): Channel the disk shelf is on.

LoopIds (STRING): Loop or SCSI IDs of the missing disks.

callhome.sfo events

callhome.sfo.downrev

Severity

ERROR

Description

This message occurs when the appliance software boots and detects out-of-date motherboard firmware, which can cause serious issues. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Upgrade the motherboard open firmware (OFW) version to the recommended version for this software and appliance as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for HA GROUP DOWNREV BOOT FIRMWARE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.giveback

Severity

NOTICE

Description

This message occurs when this appliance successfully completed a giveback of the storage to its partner appliance. The partner appliance is expected to be performing normal operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for CONTROLLER GIVEBACK COMPLETE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.miscount

Severity

ERROR

Description

This message occurs when each partner in the High Availability (HA) storage configuration detects a different number of disk drives than its partner. This error is typically transient, and can occur for the following reasons: 1) A disk drive failed. 2) A disk drive was replaced. 3) One or more disk drives were added. The problem is usually corrected automatically within 60 seconds, requiring no action from you. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the problem persists, check the cabling on or reseat any replaced or added disk drives, and check for failed disk drives. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for HA GROUP ERROR: DISK/SHELF COUNT MISMATCH

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.personality

Severity

ALERT

Description

This message occurs when an All Flash Optimized node in a high-availability (HA) configuration detects its partner having a different personality setting. This mismatch might be due to either one node not being configured as All Flash Optimized, or the nodes being configured for different personalities (performance optimized or capacity optimized). Storage failover might be at risk of not functioning properly. HDDs taken over during failover events might not be able to serve data. If your system is configured to do so, it generates and transmits an AutoSupport® (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

An All-Flash Optimized node only recognizes SSDs and ignores HDDs. For the HA pair to be considered All-Flash Optimized, both nodes must be configured with the same personality (performance optimized or capacity optimized). Use the "system node show -instance" command to display each node's personality and optimization settings. If both nodes are configured with the same personality, all HDDs should be removed from the HA pair, because they will not be able to serve data. Contact NetApp technical support for assistance.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover

Severity

ALERT

Description

This message occurs when automatic takeover of the cluster partner is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Address the issue that caused the takeover, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.failed

Severity

ALERT

Description

This message occurs when automatic takeover of the cluster partner is not successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Determine why the takeover did not succeed. Restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER FAILED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.halt

Severity

NOTICE

Description

This message occurs when takeover of the HA partner is successful. The takeover occurred because of an administrative halt on the HA partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and

resolution.

Corrective Action

Address the issue that caused you to halt the HA partner and then restore it to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER COMPLETE HALT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.m

Severity

NOTICE

Description

This message occurs when manual takeover of the cluster partner is successful.

Corrective Action

Address the issue that caused you to take over the cluster partner manually, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER COMPLETE MANUAL

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.m.dr

Severity

ERROR

Description

This message occurs when manual takeover of the High Availability (HA) partner for disaster recovery (DR) is successful. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Address the issue that required you to perform a DR takeover of the HA partner. After the issue is resolved, restore the HA partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER COMPLETE MANUAL(DR)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.panic

Severity

EMERGENCY

Description

This message occurs when automatic takeover of the HA partner is successful. The controller takeover occurred because of a HA partner software failure or panic.

Corrective Action

Address the cause of the cluster partner software failure or panic, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER COMPLETE PANIC

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.takeover.reboot

Severity

NOTICE

Description

This message occurs when takeover of the HA partner is successful. The takeover occurred because of an administrative reboot on the HA partner. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Address the issue that caused you to reboot the HA partner and then restore it to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for CONTROLLER TAKEOVER COMPLETE REBOOT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sfo.to.comm.loss

Severity

EMERGENCY

Description

This message occurs when automatic takeover of the HA partner is successful. The controller takeover occurred because of a HA partner lost communication. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Address the cause of the cluster partner lost communication, then restore the cluster partner to normal operations. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.shlf events

callhome.shlf.fan

Severity

EMERGENCY

Description

This message occurs when the system detects faulty hardware on the disk shelf, such as a fan, power supply unit (PSU), or failing temperature sensor. The problem might be environmental (temperature or faulty power) or hardware-related. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SHELF COOLING UNIT FAILED

Parameters

If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SHELF_FAULT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.shlf.overtemp

Severity

ERROR

Description

This message occurs when the system detects a disk shelf problem. The problem might be due to environmental issues, such as temperature or faulty power, or by faulty hardware, such as a fan, power supply, or failing temperature sensor. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Evaluate the environment in which your system is operating and identify whether the problem is environmental or hardware-related. Your system should be in a room with an operating temperature of 18C

to 24C (65F to 75F). If faulty hardware caused the error, such as a bad temperature sensor or a broken fan, replace the faulty part as soon as possible. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.shlf.power.intr

Severity

ERROR

Description

This message occurs when your system detects that a disk shelf power supply reported either a sustained loss of DC voltage output for about 20 seconds or a failure condition. This issue can occur for a number of reasons: 1. The power supply was turned off or unplugged. 2. The power to the server room failed or fluctuated. 3. The disk shelf power supply malfunctioned and should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If necessary, replace the disk shelf power supply. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SHELF POWER INTERRUPTED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.shlf.ps.fault

Severity

ERROR

Description

This message occurs when your system detects that a disk shelf power supply reported a loss of DC voltage. This might be a transient issue. This issue can occur for a number of reasons: 1. The power supply was turned off or unplugged. 2. The power to the server room failed or fluctuated. 3. The shelf power supply malfunctioned and should be replaced. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If necessary, replace the shelf power supply. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SHELF POWER SUPPLY WARNING

callhome.shutdown events

callhome.shutdown.pending

Severity

ALERT

Description

This message occurs when a disk drive fails but there are no suitable spares available for reconstruction. To protect your data, the system enters degraded mode. The system halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If a spare drive becomes available while the system is running in degraded mode, the system immediately begins rebuilding the failed drive. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

To prevent the system from shutting down in 24 hours, perform either of the following actions: 1. Add a spare disk drive suitable for reconstructing the failed disk drive. 2. Change the timeout period with the following command: "storage raid-options modify -name raid.timeout -node local -value X" where X equals the number of hours for the new timeout value. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SHUTDOWN PENDING (degraded mode)

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sm events

callhome.sm.vsdr.break.fail

Severity

ERROR

Description

This message occurs when a break operation on a SnapMirror® relationship that is a part of VserverDR fails. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for additional information.

Syslog Message

Call home for SNAPMIRROR BREAK FAILURE.

Parameters

subject (STRING): AutoSupport subject or title for this event.
SourceVserver (STRING): Source Vserver of the SnapMirror relationship.
DestVserver (STRING): Destination Vserver of the SnapMirror relationship.

callhome.snapmirror events

callhome.snapmirror.oos

Severity

NOTICE

Description

This message occurs when a sync-granular consistency group (CG) transitions from in-sync status to out-of-sync status. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Look for the sm.syncmirror.out.of.sync event concerning this relationship in the EMS log file. The event provides the reason why the relationship has been transitioned to out-of-sync and an appropriate corrective action, if applicable.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.snapmirror.oos.pers

Severity

ALERT

Description

This message occurs when a sync-granular consistency group (CG) relationship transitions from in-sync status to out-of-sync status and remains out-of-sync for longer than expected. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Look for the sm.syncmirror.out.of.sync event concerning this relationship in the EMS log file on source node of SnapMirror relationship. The event provides the reason why the relationship has been transitioned to out-of-sync. Verify network connections between the primary cluster and the secondary cluster. Check for error information in the "snapmirror show" command output for the relationship. Quiesce the relationship if the condition cannot be addressed immediately.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sp events

callhome.sp.hbt.missed

Severity

NOTICE

Description

This message occurs when ONTAP® does not receive an expected "heartbeat" signal from the Service Processor (SP). Along with this message, log files from SP will be sent out for debugging. ONTAP will reset the SP to attempt to restore communication. The SP will be unavailable for up to two minutes while it reboots.

Corrective Action

Contact NetApp technical support.

Syslog Message

Call home for SP HBT MISSED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sp.hbt.stopped

Severity

ALERT

Description

This message occurs when ONTAP® is no longer receiving heartbeats from the Service Processor (SP). Depending on the hardware design, the system may continue to serve data or may determine to shut down to prevent data loss or hardware damage. The system continues to serve data, but because the SP might not be working, the system cannot send notifications of down appliances, boot errors, or Open Firmware (OFW) Power-On Self-Test (POST) errors. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the system has shut down, attempt a hard power cycle: Pull the controller out from the chassis, push it back in then power on the system. Contact NetApp technical support if the problem persists after the power cycle, or for any other condition that may warrant attention.

Syslog Message

Call home for SP HBT STOPPED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.spares events

callhome.spares.low

Severity

ERROR

Description

This message occurs when one or more RAID groups do not have an eligible spare disk drive available in case of a disk drive failure. An eligible spare disk drive must be the correct size and capacity, and must be in the appropriate pool. If a disk drive fails without a spare to reconstruct on, the system enters degraded mode. The system halts automatically to prevent a double disk drive failure, and possible loss of data, if it runs in degraded mode for the time interval given by the following command: "storage raid-options show -name raid.timeout -node local" The default timeout is usually 24 hours. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Add suitable spare disk drives for all RAID groups to ensure that you have at least one spare disk drive. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for %s: %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
rg (STRING): RAID groups on which spares low is identified.

callhome.spm events

callhome.spm.process.maxexit

Severity

ERROR

Description

This message occurs when a subsystem is not fully operational after one or more restarts and a restart threshold has been reached by the Service Process Manager (SPM). The inconsistency might be caused by external events such network data, previous configuration changes, software changes, firmware changes, or hardware changes. The message should not occur more then once per day. The underlying subsystem might be related to one or more operational systems such as management, authentication, network access, and so on. Performance issues and operational difficulties might have been exhibited before this event. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If necessary, undo recent changes to the system and to external services that the system uses to stabilize operations, and then contact NetApp technical support. They will help to identify the underlying issue and whether a software upgrade has been made available to resolve the issue. You might need to isolate the system from any suspect network traffic.

Syslog Message

Call home for MAXIMUM EXITS THRESHOLD OF A PROCESS MANAGED BY SPM IS REACHED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.stackmon events

callhome.stackmon.recon.failed

Severity

ALERT

Description

This message occurs when the system fails to assign the correct stack-id to one or more disk shelves. The shelf and disk names might not correctly reflect the storage topology. Shelf and disk operations might fail if multiple disks share the same name. If your system is configured to do so, it generates and transmits an AutoSupport(tm) (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Verify that the storage topology is correct. The (privilege: advanced) "storage stackmon repair" command can be used to diagnose and repair the issue. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for %s

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.fail

Severity

ERROR

Description

This message occurs when a Vserver migration fails. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run the "vserver migrate show" command to view the description of the error and the corrective action.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.pause.fail

Severity

ERROR

Description

This message occurs when a Vserver migration failed to be paused. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run the "vserver migrate show" command to view the description of the error and the corrective action.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.paused

Severity

NOTICE

Description

This message occurs when a Vserver migration is paused. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.pstCut.fail

Severity

ERROR

Description

This message occurs when the post-cutover phase of a Vserver migration has failed. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run the "vserver migrate show" command to view the description of the error and the corrective action.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.setCfg.fail

Severity

ERROR

Description

This message occurs when the setup configuration phase of a Vserver migration has failed. If the system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Run the "vserver migrate show" command to view the description of the error and the corrective action.

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svm.mig.started

Severity

NOTICE

Description

This message occurs when a Vserver migration has started successfully. If the system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s

Parameters

subject (STRING): AutoSupport subject or title for this event.
epoch (STRING): Identifying tag for multi-node AutoSupport.

callhome.svo events

callhome.svo.prevented

Severity

ERROR

Description

This message occurs when a write to a SnapValidator enabled volume failed to be validated and was rejected by the server. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the configuration of the server to insure correct 'svf_offset' setting on the lun (if applicable) and correct use of svo_options. This includes making sure that RMAN data is not being stored on a volume that does not have the svo_allow_rman option set. If the server appears to be correctly configured, the problem may exist at any point between Oracle client and the server. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SNAPVALIDATOR ERROR PREVENTED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sync events

callhome.sync.mirror.nospc

Severity

ALERT

Description

This message occurs when ONTAP® cannot create a new base snapshot in a SyncMirror aggregate after multiple attempts. Systems using RAID SyncMirror require aggregate snapshots for normal operation. Periodically, ONTAP creates a new base snapshot with a name similar to "mirror_resync.1201023128(filer_name)." Once created, ONTAP deletes the old base snapshot. The base snapshot is used to optimize resynchronization when one plex goes offline. Short-lived circumstances when a new aggregate snapshot cannot be created are not unusual. ONTAP initiates background processes to reclaim space and allow creation of new aggregate snapshots. This message is issued when ONTAP cannot create a new base snapshot after waiting a reasonable time. If the aggregate lacks an existing SyncMirror base snapshot, then if one plex goes offline, subsequent resynchronization must copy all data in the aggregate - this can be a very long process. ONTAP issues this message when there is no SyncMirror base snapshot and a new one cannot be created in repeated attempts in the last ten minutes (by default). If an old base snapshot is present, this condition is less urgent. However, since space reclamation is likely to be slower, ONTAP waits up to two hours (by default) before issuing this message. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

ONTAP continually retries to create a new SyncMirror Snapshot copy. This condition might autocorrect, even after issuing this message. If it does not, contact NetApp technical support.

Syslog Message

Call home for SYNCMIRROR SNAPSHOTS NOT ROTATING PROPERLY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.syncm events

callhome.syncm.isolation

Severity

ALERT

Description

This message occurs when both plexes of a SyncMirror® configuration have disk drives in the same hardware-based disk pool; that is, the plexes are not hardware-fault isolated. Therefore, a single hardware failure can cause both plexes to fail. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

To resolve this issue, complete the following steps: 1. Identify the problem aggregate from the system logs. 2. Determine which mirror plexes have disk drives in mixed pools. 3. Determine how this occurred: possible causes include a wiring problem, a reconstruction forced mixed pools, or the mirror was created explicitly so that the plexes have disk drives in mixed pools. 4. Based on the information you gather, determine how to correct the issue. For example, recable the disk drives to restore hardware-fault isolation. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SYNCMIRROR FAULT ISOLATION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.syncm.plex

Severity

ALERT

Description

This message occurs when a SyncMirror® plex fails. Therefore, the SyncMirror plex is in a degraded mode. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem aggregate and failed plex from the system logs. 2. Determine the reason for the plex failure, such as disk drive, disk shelf, or loop failure. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SYNCMIRROR PLEX FAILED

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.syncm.plex.offlined

Severity

    ALERT

Description

    This message occurs when a SyncMirror® plex is offlined. Therefore, the Syncmirror aggregate is in a degraded mode. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    To resolve this problem, complete the following steps: 1. Identify the problem aggregate and offlined plex from the system logs. 2. Determine the reason for the plex being offlined: a. Issue with backend array or adapter b. IO timeout errors on multiple disks c. SCSI errors 3. Replace any faulty components that you discover. 4. Online the plex manually. If you need assistance, contact NetApp technical support.

Syslog Message

    Call home for SYNCMIRROR PLEX OFFLINED

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.syncm.verify

Severity

    ERROR

Description

    This message occurs when the system finds one or more block inconsistencies between plexes of a SyncMirror® configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

    To resolve this issue, complete the following steps: 1. Determine the problem aggregate and failed plex from the system logs. 2. Take the aggregate offline. 3. Split the plexes into two aggregates. 4. Contact NetApp technical support for assistance, and then run WAFL® Iron (wafliron) on both aggregates. 5. Determine which is the 'good' aggregate by inspection. 6. Take offline and then destroy the 'bad' aggregate. 7. Re-mirror the 'good' aggregate. If you need assistance, contact NetApp technical support.

Syslog Message

    Call home for SYNCMIRROR VERIFY FAILED

Parameters

    subject (STRING): AutoSupport subject or title for this event.

callhome.syncsm events

callhome.syncsm.exception

Severity

ERROR

Description

This message occurs when critical thresholds are breached for a SnapMirror® Synchronous relationship. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Use the "snapmirror show" command to check for current status. Contact support personnel if this problem occurs repeatedly and prevents the relationship from moving to the InSync status.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.syncsm.oos.fatal

Severity

ALERT

Description

This message occurs when a resynchronize operation between the source volume and destination volume fails for a SnapMirror® Sync relationship. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Look for the sms.resync.attempt.failed event concerning this relationship in the EMS log file. The event provides the reason why the relationship has been transitioned to out-of-sync and an appropriate corrective action, if applicable.

Syslog Message

Call home for %s.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sys events

callhome.sys.config

Severity

ERROR

Description

This message occurs when the appliance has an unsupported PCI slot configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Examine the command-line interface and System Configuration Guide for more information about slot assignments and hardware configuration, and then correct the unsupported configuration. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SYSTEM CONFIGURATION WARNING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.sys.config.crit

Severity

ERROR

Description

This message occurs when the appliance has an unsupported PCI slot configuration. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Examine the command-line interface and System Configuration Guide for more information about slot assignments and hardware configuration, and then correct the unsupported configuration. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for SYSTEM CONFIGURATION ERROR

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.tgt events

callhome.tgt.lun.nospc

Severity

ERROR

Description

This message occurs when the SCSI Target subsystem begins failing SCSI Write commands due to to an out of space (ENOSPC) condition on the appliance. This event is seen only when thin provisioning is used together with FCP or iSCSI. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

When this event occurs the customer should verify that all volumes containing luns on the appliance are properly configured for thin provisioning. Under some conditions additional disks may need to be added to the volume/aggragate. Contact NetApp support for more information. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for LUN OUT OF SPACE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.unsupported events

callhome.unsupported.snaplock

Severity

ALERT

Description

This message occurs when the system generates an AutoSupport event to notify you that a SnapLock® disk is attached to a system running a release of ONTAP® that does not support SnapLock.

Corrective Action

Remove the SnapLock disks from this system and attach them to a system that supports SnapLock. You can also revert or upgrade this system to a release that supports SnapLock.

Syslog Message

Call home for SNAPLOCK DISKS IN UNSUPPORTED RELEASE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups events

callhome.ups.line

Severity

NOTICE

Description

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored and

the battery power is normal.

Corrective Action

Maintain the environment and ensure that the line power to the UPS continues to be normal. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS LINE POWER RESTORED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups.low.battery

Severity

ALERT

Description

This message occurs when battery power for an Uninterruptible Power Supply (UPS) system has under 5 minutes of charge left. The system is currently serving data but will eventually shut down if the UPS continues to run without line power. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the environment and restore the line power to the UPS as soon as possible to avoid system shutdown. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS LOW BATTERY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups.ok.low.battery

Severity

NOTICE

Description

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored but the battery power is low. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Maintain the environment and ensure that the line power to the UPS continues to be normal. As line power continues to be normal, the battery is recharged. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS PWR GOOD LOW BATTERY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups.ok.no.battery

Severity

NOTICE

Description

This message occurs when line power for an Uninterruptible Power Supply (UPS) system is restored but the battery power is very low. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Maintain the environment and ensure that the line power to the UPS continues to be normal. As line power continues to be normal, the battery is recharged. If line power is disrupted or leaves the normal range, the system might shut down immediately to protect your data. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS PWR GOOD CRITICAL BATTERY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups.on.battery

Severity

ALERT

Description

This message occurs when line power for an Uninterruptible Power Supply (UPS) system fails and the system is running on battery power. The server is currently serving data but will eventually shut down if the UPS continues to run without line power. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the environment and restore line power to the UPS as soon as possible to avoid system shutdown. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS ON BATTERY

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.ups.shutting.down

Severity

ALERT

Description

This message occurs when battery power for an Uninterruptible Power Supply (UPS) system is almost depleted and the system is shutting down to protect your data. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Restore the line power to the UPS immediately to prevent system shutdown. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for UPS SHUTTING DOWN

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.user events

callhome.user.snmp.trap

Severity

NOTICE

Description

This message occurs when a SNMP (Simple Network Management Protocol) has been configured to cause an SNMP trap. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for SNMP USER DEFINED TRAP

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.vdom events

callhome.vdom.reconcile

Severity

ERROR

Description

This message occurs when the virtual disk infrastructure (vdom) unsuccessfully reconciles the Out Of Volume Container (OOVC) and the Vdisk Table Of Contents (VTOC). The Out Of Volume Container or OOVC is an area of storage that resides in a per-vvol aggregate metadir and provides storage for LUN configuration (override) and metadata (PR, mode page, log page). OOVC will have a LUN inventory that is identical to the LUN inventory in the AFS. Therefore the VTOC and OOVC must contain the same set of LUNs. As a result of data management operations like volume snaprestore, the LUN inventory can differ between VTOC and OOVC. For these operations that affect LUN inventory, VDOM will need to reconcile the OOVC with the VTOC as part of the operation. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

(None).

Syslog Message

Call home for %s Could not reconcile vtoc and oovc for volume associated with DSID: %llu, due to VDOM error: %u.

Parameters

subject (STRING): AutoSupport subject or title for this event.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
vdom_error (INT): The vdom error code associated with the reconcile.

callhome.vfiler events

callhome.vfiler.move.to.dst

Severity

ALERT

Description

This message occurs on the destination controller during the final phase of migrating a vfiler when the 120 second time limit has been reached . During the final phase of migrating a vfiler from a source controller to a destination controller, input/output data access is stalled until the destination is ready. The amount of time spent with I/O data access stalled within 120 seconds, since many pre-checks have be done to ensure this can be achieved. With the time limit reached, operations will resume to using the vfiler on the source controller. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check that service has been restored to the vfiler on the source controller. If not, contact NetApp technical support. Many pre-checks have been done to ensure timely migration of the vfiler from one controller to another. It is unclear whether network or other conditions have changed, such as changes in controller loads have prevented successful vfiler migration. Check the network connectivity, network bandwidth, load on the source controller and load on the destination controller. If they are not within normal expecations,

resolve the issue. If they are within normal expectations, consult with NetApp technical support. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for VFILER MIGRATION EXCEEDED 120 SECONDS ON DESTINATION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.vfiler.move.to.src

Severity

NOTICE

Description

This message occurs on the source controller at the request of the destination controller. The destination controller has exceeded a 120 second time limit during the final phase of migrating a vfiler. During the final phase of migrating a vfiler from a source controller to a destination controller, input/output data access is stalled until the destination is ready. The amount of time spent with I/O data access stalled within 120 seconds, since many pre-checks have be done to ensure this can be achieved. With the time limit reached, operations will resume to using the vfiler on the source controller. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check that service has been restored to the vfiler on this controller. If not, contact NetApp technical support. Many pre-checks have been done to ensure timely migration of the vfiler from one controller to another. It is unclear whether network or other conditions have changed, such as changes in controller loads have prevented successful vfiler migration. Check the network connectivity, network bandwidth, load on the source controller and load on the destination controller. If they are not within normal expectations, please resolve. If they are within normal expectations, consult with NetApp technical support. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for VFILER MIGRATION TIME OUT EXCEEDED BY DESTINATION

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.vol events

callhome.vol.offline

Severity

ALERT

Description

This message occurs when the system detects an inconsistent volume and takes it offline. The file system inconsistency could be from one or more sources. The inconsistency might be related to previous operations or to current operations. Disabling access is a protective measure to ensure that further inconsistencies are avoided. If your system is configured to do so, it generates and transmits an

AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

If the operating environment for the system, storage, or associated cabling has changed in terms of temperature, humidity, vibration, unstable electrical power, or other physical factors, gracefully shut down and power off the system until the environment is restored to normal operations. If the operating environment has not changed, identify the source of the inconsistency by checking for previous errors and warnings. Also check for hardware statistics from Fibre Channel, SCSI, disk drives, other communications mechanisms, and previous administrative activities. Another approach is to consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the volume to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for VOLUME INCONSISTENT AND TAKEN OFFLINE

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.vol.space.crit

Severity

EMERGENCY

Description

This message occurs when a volume has overallocated space. It will be taken offline soon and the node will reboot. If your system is configured to do so, it generates and transmits an AutoSupport (or "call home") message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

For non-ASA r2 platforms, create space by increasing volume or aggregate size or by deleting data. While changing the provisioning from thick to thin will prevent further utilization of space, it is no longer sufficient to prevent the volume or aggregate from being offlined. In a volume, size can be increased with the "volume size" command. To change provisioning in a volume, reserved files can be unreserved using the "volume file reservation" command. In an aggregate, size can be increased by adding disks. To change provisioning in an aggregate, volume guarantees can be changed from "volume" to "none" using the "space-guarantee" parameter in the "volume modify" command. The nodeshell "vol status -S" and "aggr status -S" commands display "Total Used" and "Total Physical Used" values greater than 100% when the reserve is being used. The "vol.log.overalloc" and "volume.phys.overalloc" EMS events and their associated SNMP traps of "volumeLogicalOverallocated" and "volumePhysicalOverallocated" are issued when the volume or aggregate is consuming more than the recommended amount of reserve. For ASA r2 platforms, create space in aggregate or volume. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

Call home for VOLUME CRITICALLY OUT OF SPACE ERROR.

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafl events

callhome.wafl.check

Severity

ALERT

Description

This message occurs after a WAFL® check (wack) operation runs. WAFL check is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the appliance's log for valuable information that WAFL check might have reported. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for WAFL_check

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafl.inconsistent

Severity

ALERT

Description

This message occurs when the system detects that a volume is inconsistent. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous operations or to current operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Consult with NetApp technical support (it is recommended that you do so before attempting this step), and then run WAFL® Iron (wafliron) on the volume to identify and optionally repair the inconsistency. If you need further assistance, contact NetApp technical support.

Syslog Message

Call home for WAFL INCONSISTENT

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafl.inconsistent.block

Severity

ALERT

Description

This message occurs when the system detects a volume that contains an inconsistent block. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous data operations or to current data operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for further assistance.

Syslog Message

Call home for WAFL INCONSISTENT BLOCK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafl.inconsistent.user.block

Severity

ALERT

Description

This message occurs when the system detects inconsistent user data within a volume. The file system inconsistency can be from one or more sources. The inconsistency can be related to previous data operations or to current data operations. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Contact NetApp technical support for further assistance.

Syslog Message

Call home for WAFL INCONSISTENT USER BLOCK

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafl.iron.done

Severity

NOTICE

Description

This message occurs after a WAFL® Iron (wafliron) operation runs. WAFL® Iron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home')

message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Check the appliance's log for valuable information that WAFL Iron might have reported. If you need assistance, contact NetApp technical support.

Syslog Message

Call home for WAFL IRON COMPLETED

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.wafliron events

callhome.wafliron.chg.pending

Severity

NOTICE

Description

This message occurs when WAFL® Iron (wafliron) Optional Commit changes are pending. WAFL® Iron is a detection and repair process. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message significantly improves problem determination and resolution.

Corrective Action

Work with NetApp technical support on this issue. If you decide against this, it is recommended that the pending changes be committed.

Syslog Message

Call home for WAFLIRON CHANGES PENDING

Parameters

subject (STRING): AutoSupport subject or title for this event.

callhome.weekly events

callhome.weekly

Severity

NOTICE

Description

This message occurs when the weekly AutoSupport or 'call home' event is sent. Information is sent to NetApp technical support to ensure that subsequent communications work and to enable operations analysis. Some results of these analysis might include recommendations on upgrades, firmware changes, and configuration changes to improve the reliability and performance of the system. If your system is configured to do so, it generates and transmits an AutoSupport (or 'call home') message to NetApp technical support and to the configured destinations. Successful delivery of an AutoSupport message

significantly improves problem determination and resolution.

Corrective Action

(None).

Severity

ALERT

Description

This message occurs when the disk does not support the Forced Unit Access (FUA) feature bit. Using this disk with the write cache enabled can lead to data corruption.

Corrective Action

Use disks with the write cache disabled or disks where the FUA feature is supported.

Syslog Message

FUA feature is not supported for disk %s%d with target address %s.

Parameters

periph_name (STRING): Disk name.
unit (INT): Unit number.
target_addr (STRING): Disk target address.

cam.dev.fuaNotVerified

Severity

ALERT

Description

This message occurs when ONTAP® software fails to read the SCSI page containing the Forced Unit Access (FUA) feature bit. Using the disk with the write cache enabled and FUA not supported can lead to data corruption.

Corrective Action

Because ONTAP cannot determine the state of the FUA feature bit, disable the disk write cache if it is enabled by default. If the write cache cannot be disabled, replace the disk to avoid corruption.

Syslog Message

Unable to read the FUA settings for disk %s%d with target address %s.

Parameters

periph_name (STRING): Disk name.
unit (INT): Unit number.
target_addr (STRING): Disk target address.

cam.timeout events

cam.timeout.retry

Severity

NOTICE

Description

This message occurs when an I/O request to a Common Access Method (CAM) device driver times out. This might be indicative of an overloaded back-end storage subsystem. The I/O operation will be retried; this message does not indicate failure.

Corrective Action

(None).

Syslog Message

CAM device driver I/O timeout. %s%s%s.

Parameters

cam_timeout (STRING): Timeout message for an I/O request from a CAM device driver.
uuid (STRING): Unique identifier for the device.
outstanding (STRING): Command that timed out and its elapsed time.

cap events

cap.cache events

cap.cache.corrupt

Severity

ERROR

Description

This message occurs when a corrupt Central Access Policy (CAP) is encountered during access checks.

Corrective Action

Fix the CAP definitions on the Active Directory, and use the 'vserver cifs group-policy update' command to refresh the cache on the cluster.

Syslog Message

Encountered a corrupt CAP for Vserver %s.

Parameters

vserverUuidStr (STRING): UUID of the Vserver.

cap.cache.not.ready

Severity

ERROR

Description

This message occurs when the system attempts to access a Central Access Policy (CAP) for evaluation during access checks and finds the CAP cache database (DB) is not ready for access.

Corrective Action

Make sure that group-policy is enabled for the given Vserver and the Central Access Policies (CAPs) from the Active Directory (AD) can be applied to file system objects.

Syslog Message

CAP Cache DB not ready for Vserver %s.

Parameters

vserverUuidStr (STRING): UUID of the Vserver.

cap.cache.update.failed

Severity

ERROR

Description

This message occurs when refresh of the Central Access Policy (CAP) Cache database (DB) fails.

Corrective Action

Use the "vserver cifs group-policy update" command with the "force" flag to retry the operation manually.

Syslog Message

Failed to update the CAP cache DB for Vserver %s. (Reason: %s.)

Parameters

vserverUuidStr (STRING): UUID of the Vserver.
errString (STRING): Error string.

ccma events

ccma.disabled events

ccma.disabled

Severity

ERROR

Description

This message occurs when the Performance Archive has been disabled for more than an hour. This is caused by setting the -is-enabled flag to false. This message will be repeated every hour that the archiver is turned off. The messages will only displayed once a day.

Corrective Action

Run the 'statistics archive config modify -is-enable true' command. This will enable the Performance Archive.

Syslog Message

The Performance Archive has been disabled for more than an hour. It is Important for the analysis and diagnoses of performance related issues. Consider enabling it.

Parameters

(None).

ccma.perfstatd events

ccma.perfstatd.disabled

Severity

ERROR

Description

This message occurs when the Perfstat daemon (perfstatd) has been disabled for more than an hour. This is caused by setting the -perfstat-sampling-period value to 0. This message will be repeated every hour perfstatd is turned off. The messages will only displayed once a day.

Corrective Action

Run the 'statistics archive config modify -perfstat-sampling-period 5' command. This will enable the perfstatd and it will set the Perfstat sampling period to the default value of 5 minutes.

Syslog Message

The Perfstat daemon (perfstatd) has been disabled for more than an hour. It is important for the analysis and diagnoses of performance related issues. Consider enabling it.

Parameters

(None).

ccma.quota events

ccma.quota.datastore.leak

Severity

ERROR

Description

This message occurs when a datastore has been orphaned due to the system not having sufficient memory to keep track of itin the quota system. Orphaned datastpres will take up disk space and may build up over time if this problem recurs.

Corrective Action

Delete the orphaned datastore and/or restart the CM daemon once the out of memory condition has been resolved.

Syslog Message

A datastore may have been orphaned due to the system being out of memory. Please delete this datastore: %s

Parameters

datastore (STRING): Name of the datastore that has been orphaned and needs to be deleted.

ccma.quota.file.leak

Severity

ERROR

Description

This message occurs when an archiver file has been orphaned due to the system not having sufficient memory to keep track of the file in the quota system. Orphaned files will take up disk space and may build up over time if this problem recurs.

Corrective Action

Delete the orphaned file and/or restart the CM daemon once the out of memory condition has been resolved.

Syslog Message

An archiver file may have been orphaned due to the system being out of memory. Please delete this file: %s

Parameters

filename (STRING): Name of the archiver file that has been orphaned and needs to be deleted.

ccma.quota.throughput

Severity

NOTICE

Description

This message occurs when the performance archive data collection rate is too high for the amount of reserved disk space, possibly resulting in a shortened history of the system's performance (less than the

configured datastore-max-retention value). A shortened history might limit the ability of support staff to triage performance problems.

Corrective Action

Using the (diagnostic privilege) "statistics archive config" commands, increase the performance archive's datastore-max-percent configuration parameter so that the reported datastore-max-size value on this node is increased by the stated "size" amount.

Syslog Message

The performance archive data collection rate is too high for the amount of space available. The system can only keep %ld days of performance archive data at this rate, and needs %ld MB of additional space to maintain a system performance history equal to the datastore-max-retention configuration value.

Parameters

days (LONGINT): Number of days of performance archive data that can be stored at the current rate.
size (LONGINT): Size increase (in MB) needed to maintain a system performance history equal to the datastore-max-retention configuration value.

cde events

cde.undo events

cde.undo.abort

Severity

NOTICE

Description

This message occurs when undo of cde has to abort.

Corrective Action

(None).

Syslog Message

Undo of auto adaptive compression on volume %s%s aborted.

Parameters

vvol_name (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

cde.undo.done

Severity

NOTICE

Description

This message occurs when cde undo is done.

Corrective Action

(None).

Syslog Message

Auto adaptive compression undo is done for volume %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

cdpd events

cdpd.recv events

cdpd.recv.cacheOverflow

Severity

ERROR

Description

This message occurs when the CDP (Cisco Discovery Protocol) daemon running on the storage controller receives more unique neighbor advertisements than it can cache. The storage controller stops saving incoming CDP advertisements after the CDP neighbor cache has the maximum allowed neighbor entries. The CDP daemon will start processing new advertisements again after entries in the CDP neighbor cache start timing out.

Corrective Action

Use the 'cdpd show-stats' CLI command under the "Cache overflow" receive statistic to view the number of unique advertisements in excess of the maximum. Check the traffic statistics on the neighboring switches and bridges. If the storage controller has more than 64 CDP neighbors, you can ignore this message. Otherwise, take a packet trace on the network or on each network port of the storage controller to check the source of the CDP advertisements.

Syslog Message

The CDP neighbors table is full.

Parameters

(None).

cecc_log events

cecc_log.dropped events

cecc_log.dropped

Severity

NOTICE

Description

This message occurs when the ECC error logger dropped some correctable ECC errors without logging them. Typically, correctable ECC errors are logged in the system even though they are automatically corrected. They are dropped due to lack of buffer space in the ECC error logger. This might be a sign of high frequency of ECC errors. If the number of ECC errors dropped crosses a certain predefined threshold, the ECC error logger issues a cecc_log.masked message.

Corrective Action

(None).

Syslog Message

Dropped %lld additional correctable ECC error details.

Parameters

num_cecc_batch_dropped (LONGINT): Number of correctable ECC errors dropped without being logged.

cecc_log.entry events

cecc_log.entry

Severity

NOTICE

Description

Correctable ECC errors occurred in the system memory. The system automatically corrects these errors. All the corrected errors are reported by the ECC error logger to track the history of occurrence of these errors.

Corrective Action

(None).

Syslog Message

%lld: %s

Parameters

cecc_entry_num (LONGINT): Number of correctable ECC errors since boot.
cecc_msg (STRING): Information about the ECC error.

cecc_log.entry_no_syslog events

cecc_log.entry_no_syslog

Severity

NOTICE

Description

Correctable ECC errors occurred in the system memory. The system automatically corrects these errors. All the corrected errors are reported by the ECC error logger to track the history of occurrence of these errors.

Corrective Action

(None).

Syslog Message

(None).

Parameters

cecc_entry_num (LONGINT): Number of correctable ECC errors since boot.
cecc_msg (STRING): Information about the ECC error.

cecc_log.masked events

cecc_log.masked

Severity

ERROR

Description

This message occurs when the ECC error logger stops reporting the occurrence of correctable ECC errors because the frequency of their occurrence is too high. The ECC logger crossed the predefined threshold of ECC errors that can be dropped. Reporting is suppressed to control the log traffic, but the system sends out a periodic message as a reminder.

Corrective Action

Use the "system controller memory dimm show" command to check system memory.

Syslog Message

Error logging temporarily suspended due to excessive CECC errors.

Parameters

(None).

cecc_log.summary events

cecc_log.summary

Severity

NOTICE

Description

This message occurs when the ECC error logger reports its periodic summary of new correctable ECC

errors that occurred after the last report and the total number of ECC errors that occurred since boot. These errors were corrected by the system.

Corrective Action

(None).

Syslog Message

Total of %lld new correctable ECC errors just reported. You might want to check system memory. %lld correctable ECC errors reported since booting.

Parameters

num_ceccs (LONGINT): Number of new correctable ECC errors after the last summary.
total_num_ceccs (LONGINT): Number of correctable ECC errors since boot.

certificate events

certificate.insecure events

certificate.insecure.hash

Severity

ERROR

Description

This message occurs when an installed certificate uses a hash function that is no longer considered secure. Client-server communication using this certificate should be presumed insecure, and could be disrupted.

Corrective Action

Delete the insecure certificate by using the "security certificate delete" command. Install an appropriate replacement by using the "security certificate install" command or "security certificate create" command.

Syslog Message

A digital certificate with UUID %s in Vserver %s with name %s is using the insecure hash function %s.

Parameters

uuid (STRING): UUID of the offending certificate.
vserver (STRING): Name of the Vserver in which the offending certificate is installed.
cert_name (STRING): Name (unique within a Vserver) of the offending certificate.
hash_function (STRING): Hash function used by the offending certificate.

certificate.insecure.key

Severity

ERROR

Description

This message occurs when an installed certificate uses a key length that is no longer considered secure for the corresponding key algorithm. Client-server communication using this certificate should be presumed insecure, and could be disrupted.

Corrective Action

Delete the insecure certificate by using the "security certificate delete" command. Install an appropriate replacement by using the "security certificate install" command or "security certificate create" command.

Syslog Message

A digital certificate with UUID %s in Vserver %s with name %s has an insecure key of type %s and length %d.

Parameters

uuid (STRING): UUID of the offending certificate.
vserver (STRING): Name of the Vserver in which the offending certificate is installed.
cert_name (STRING): Name (unique within a Vserver) of the offending certificate.
key_algorithm (STRING): Algorithm (e.g., RSA) of the key for the corresponding certificate.
key_length (INT): Length of the key in bits for the corresponding certificate.

certificate.invalid events

certificate.invalid.chain

Severity

ERROR

Description

This message occurs when an installed certificate record contains multiple X.509 certificates. Such records are not treated consistently by the system, but were unintentionally permitted in prior releases.

Corrective Action

Delete the problematic record by using the "security certificate delete" command. Install the constituent certificates separately by using the "security certificate install" command once for each certificate.

Syslog Message

The certificate record with UUID %s, named "%s" in Vserver "%s", contains multiple certificates.

Parameters

uuid (STRING): UUID of the offending record.
cert_name (STRING): Name (unique within a Vserver) of the offending record.
vserver (STRING): Name of the Vserver in which the offending record is installed.

certificate.node events

certificate.node.vserver

Severity

ERROR

Description

This message occurs when an installed certificate record exists in a node Vserver. Such records are not treated consistently by the system, but were unintentionally permitted in prior releases.

Corrective Action

Delete the problematic record by using the "security certificate delete" command.

Syslog Message

The certificate record with UUID %s, named "%s" is installed in the node Vserver "%s".

Parameters

uuid (STRING): UUID of the offending record.
cert_name (STRING): Name (unique within a Vserver) of the offending record.
vserver (STRING): Name of the node Vserver in which the offending record is installed.

cf events

cf.autogbcanceled events

cf.autoGBCanceled.headswap

Severity

INFORMATIONAL

Description

This message occurs when an automatic giveback is canceled because of a headswap.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.badshelfcountmsg events

cf.badShelfCountMsg

Severity

ERROR

Description

This event occurs if we are sent an invalid negotiated failover shelf count message. The message size is incorrect. This is likely due to an InterConnect problem.

Corrective Action

Check for and resolve any interconnect errors. If the nodes are on different releases, upgrade the down-rev node.

Syslog Message

Invalid disk shelf count message was received from partner.

Parameters

(None).

cf.badshelfcountversion events

cf.badShelfCountVersion

Severity

ERROR

Description

This event occurs if we are sent a negotiated failover shelf count message with a version which we don't support. As a result, disk shelf count negotiated failover will not work. This is likely due to a kernel version mismatch.

Corrective Action

Upgrade the down-rev node so both nodes are on the same version.

Syslog Message

Disk shelf count message with unsupported version received from partner.

Parameters

(None).

cf.boot events

cf.boot.continuing

Severity

INFORMATIONAL

Description

This message occurs when the failover monitor continues booting after waiting for giveback.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.cdo events

cf.cdo.badMsg

Severity

ERROR

Description

This event is issued when the filer receives a disk operation message over the High Availability (HA) interconnect that it does not recognize. This is likely due to a change in the message protocol that the down-revision partner does not recognize. Fix this problem by upgrading the partner to a compatible version of Data ONTAP®. This message is not emitted for every message received to avoid spamming the console.

Corrective Action

Upgrade both nodes to the same release.

Syslog Message

unknown message %d received from partner (%d unknown messages since boot).

Parameters

msg (INT): Message which was not known.
count (INT): Number of unknown messages.

cf.cdo.reportOp

Severity

NOTICE

Description

This event is issued when the filer bypasses or unbypasses a disk after being requested to do so by its partner. The bypassing of a drive on a particular port may only be done by the host which is attached to that port; the High Availability (HA) software ensures that both ports of the drive are bypassed by communicating bypass requests to the partner.

Corrective Action

(None).

Syslog Message

%s disk %s on behalf of the partner.

Parameters

op (STRING): Operation description
driveName (STRING): Drive name

cf.disk events

cf.disk.invent.mismatchalt

Severity

ALERT

Description

This message occurs when one of the nodes in a high-availability (HA) pair reports that multiple disks in the disk inventory do not match what the partner node reported. This only occurs when sufficient mismatches have occurred to throttle the specific disk inventory mismatch message. The issue might be due to one of following reasons: (1) One node can see disks that the other node cannot. (2) Ownership of multiple disks has changed. (3) Multiple disks have been failed or unfailed. (4) Multiple disks have been inserted or removed.

Corrective Action

Rescan the disks on both nodes in the HA pair to determine the latest ownership by using the "storage disk refresh-ownership" command. If the inventory mismatch is not resolved, remove and replace any failed disks. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disks are not included in the inventory.

Syslog Message

Status of some of the disks has changed or the node (%s) is missing %u disks (detailed logs have been throttled).

Parameters

host (STRING): Name of the node not reporting the disks in its disk inventory.
nummissing (INT): Number of disks not reported in the disk inventory.

cf.disk.invent.mismatchOKalt

Severity

INFORMATIONAL

Description

This message occurs when previously detected disk inventory mismatches have been resolved and the detailed match events have been throttled.

Corrective Action

(None).

Syslog Message

%u disks now included in the inventory of node (%s) (detailed logs have been throttled).

Parameters

nummatches (INT): Number of disks found to match the partner disk inventory so far.
host (STRING): Name of the host where the disk is included in the inventory.

cf.disk.inventory.mismatch

Severity

ERROR

Description

This message occurs when one of the nodes in a high-availability (HA) pair has reported this disk in its disk inventory, but the HA partner node has not. This might be due to one of following reasons: (1) One node can see the disk, but the other node cannot. (2) Ownership of the disk has changed. (3) The disk has either been failed or unfailed. (4) The disk has been inserted or removed.

Corrective Action

Use the "storage disk refresh-ownership" command on both nodes in the HA pair to rescan the disks and to determine the latest ownership. For ASA r2, Use the "storage disk show -fields storage-pod-uuid" instead of the "storage disk refresh-ownership" command. If the inventory mismatch is not resolved, remove and replace any failed disks. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disk is not included in the inventory.

Syslog Message

Status of the disk %s (%s) has recently changed or the node (%s) is missing the disk.

Parameters

diskname (STRING): Name of the disk not reported in the inventory.
uid (STRING): Unique identifier of the disk that was not included in the inventory.

host (STRING): Name of the node not reporting the disk in its disk inventory.

cf.disk.inventory.mismatchOK

Severity

INFORMATIONAL

Description

This message occurs when a previously detected disk inventory mismatch is resolved.

Corrective Action

(None).

Syslog Message

The node (%s) included the disk %s (%s) in its inventory.

Parameters

host (STRING): Name of the host where the disk is included in the inventory.
diskname (STRING): Name of the disk included in the inventory.
uid (STRING): Unique identifier of the disk.

cf.disk.inventory.ver.notok

Severity

ERROR

Description

This message occurs when the local node does not support the partner's disk inventory message version.

Corrective Action

Upgrade the partner to the same Data ONTAP® version.

Syslog Message

cfdisk: The local node did not support the partner's disk inventory message version. The disk inventory check will not be performed during giveback.

Parameters

(None).

cf.disk.inventoryChange

Severity

INFORMATIONAL

Description

This event is issued when High Availability (HA) disk inventory is enabled/disabled.

Corrective Action

(None).

Failover monitor: disk inventory %s

Parameters

state (STRING): Parameter which describes if enabled or disabled.

cf.disk.releaseFailed

Severity

ERROR

Description

This message occurs when the release of reservation request on a disk fails. The error indicates that a disk is not ready, that it failed, or that it does not exist.

Corrective Action

Use the "disk show -broken" CLI command to check whether the disk is reporting a "FAILED" state, or use the "disk show -disk diskname" command to check the status of the disk. Also check the syslog for other errors pertaining to the same disk. The disk might need to be reseated or replaced.

Syslog Message

Disk reservation failed to release on disk %s because the error %d was encountered.

Parameters

diskname (STRING): Disk that reported the failure when a release of reservation request was attempted on it.
force (INT): Type of reservation release request. If non-zero, then the system was instructed to release reservations owned by the other systems. Otherwise, it only releases the reservation on the disks reserved by the local system.
error (INT): Error encountered while attempting to release the reservation on disk.
errortext (STRING): Error description as text.

cf.disk.reserveFailed

Severity

ERROR

Description

This message occurs when a disk reserve fails. The error indicates that a disk is not ready, that it failed, or that it does not exist.

Corrective Action

Check the specified disk for failure. You might need to replace it or reseat it. Then check the syslog for other errors pertaining to the same disk.

Syslog Message

(None).

Parameters

diskname (STRING): Disk that reported the failure when a reserve was attempted on it.
preempt (INT): Type of reservation request. If non-zero, then the system was instructed to preempt reservations from the other systems. Otherwise, it only reserves disks without existing reservations.

error (INT): Error encountered while attempting to reserve the disk.
errortext (STRING): Error description as text.

cf.disk.resumeDisks

Severity

NOTICE

Description

This message occurs when a node resumes partner disks after a takeover. If any disks fail to be resumed, the node makes another attempt to resume them after short delay.

Corrective Action

(None).

Syslog Message

Node attempted to resume %d disks, but failed with %d disks.

Parameters

fmdisk_count (INT): Number of disks resumed.
fmdisk_error_count (INT): Number of disks that had resume errors.

cf.disk.ResvFail

Severity

ALERT

Description

This message occurs when a node attempts to access a disk that has been reserved by the HA partner node. A node performing a takeover reserves the HA partner node's disks as part of a takeover operation. It is possible that the node being taken over can attempt to access a reserved disk before it has shut down as part of being taken over. The takeover node will automatically release the reservation prior to a giveback operation.

Corrective Action

The takeover node will automatically release the disk reservation before a giveback operation.

Syslog Message

Disk %s has been reserved by the High Availability (HA) partner as part of a takeover operation.

Parameters

DiskName (STRING): Name of the disk.

cf.disk.ResvTakeOver

Severity

NOTICE

Description

This event is issued when we find disks with reservation conflicts.

Corrective Action

(None).

Syslog Message

This node will wait for giveback and the disk reservations to be released.

Parameters

(None).

cf.disk.skipped

Severity

NOTICE

Description

This message occurs when the failover monitor skips an unresponsive disk.

Corrective Action

Use the "storage disk show" command to check whether the disk failed. Replace the disk if needed.

Syslog Message

The disk %s was skipped because it reported the status %s.

Parameters

diskname (STRING): Name of the disk that was skipped.
status (STRING): Status reported by the disk.

cf.diskinventory events

cf.diskinventory.cksum.fail

Severity

ALERT

Description

This message occurs when the computed checksum of the disk inventory message is different from the checksum sent as part of the disk inventory message.

Corrective Action

(None).

Syslog Message

Disk inventory checksum mismatch: old %d new %d.

Parameters

oldCkSum (INT): Old checksum, sent as part of the message.
newCkSum (INT): Checksum of the disk inventory message computed locally.

cf.diskinventory.many.disks

Severity

INFORMATIONAL

Description

This message occurs when a node receives more than maximum supported disks in the disk inventory message.

Corrective Action

(None).

Syslog Message

disk inventory: ndisks %d max_disks %d

Parameters

ndisks (INT): Number of disk descriptions sent in the inventory message.
maxdisks (INT): Maximum number of disks supported.

cf.fm events

cf.fm.cpuUtilDuringTOAndGB

Deprecated

Deprecated as of version 9.0.

Severity

NOTICE

Description

This message occurs at the start of a takeover, end of a successful takeover, start of a CFO giveback, and completion of an SFO giveback. It records the maximum, minimum, and average CPU and disk utilization on the node executing the takeover or giveback.

Corrective Action

(None).

Syslog Message

CPU and disk utilization during the %d seconds %s: cpu_util_high: %lld; cpu_util_low: %lld; cpu_util_avg: %lld; disk_util_high: %lld; disk_util_low: %lld; disk_util_avg: %lld

Parameters

window_sz (INT): Duration, in seconds, over which CPU and disk utilization are tracked.
when (STRING): Event during which CPU and disk utilization are tracked.
cpu_util_high (LONGINT): Maximum CPU utilization.
cpu_util_low (LONGINT): Minimum CPU utilization.
cpu_util_avg (LONGINT): Average CPU utilization.
disk_util_high (LONGINT): Maximum disk utilization.
disk_util_low (LONGINT): Minimum disk utilization.
disk_util_avg (LONGINT): Average disk utilization.

cf.fm.discardNvram

Severity

NOTICE

Description

This event is issued when we discover that the partner has previously taken us over, forcing us to invalidate our own nvram contents. This is a normal condition, subsequent to a takeover/giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: node was previously taken over, nvram may be discarded

Parameters

(None).

cf.fm.diskInventoryOff

Severity

ERROR

Description

This message occurs when the system discovers that disk inventory gathering has been disabled. During normal operation, the high-availability (HA) nodes transmit their disk inventory data at regular intervals. This is intended to prevent a situation in which loop connectivity problems are unnoticed until a takeover event occurs. If this event occurs, contact NetApp technical support.

Corrective Action

Use the "sysconfig" and "storage" nodeshell commands to determine whether there are problems with the loop, adapter, or shelf. Resolve those problems.

Syslog Message

Failover monitor: HA disk inventory disabled.

Parameters

(None).

cf.fm.diskRelease

Severity

INFORMATIONAL

Description

This event is issued when we're using a debug build and failover monitor reservations are released.

Corrective Action

n/a

Syslog Message

Failover monitor: released disk reservations.

Parameters

(None).

cf.fm.diskReleaseFail

Severity

NOTICE

Description

This message occurs when the release of a reservation on a disk fails in preparation for a giveback event. The error indicates that a disk is not ready, that it failed, or that it does not exist. If the reservation is detected by the partner node, it will reboot.

Corrective Action

Look for the cf.disk.releaseFailed event in the EMS log to find the name of the disk where the reservation could not be released. Follow the corrective action described in the cf.disk.releaseFailed event to address any problems with the disk.

Syslog Message

Could not release disk reservations of at least one disk.

Parameters

(None).

cf.fm.duplicateId

Severity

ALERT

Description

This message occurs when the local node system identifier is the same as the partner's. This could happen if the HA-Interconnect is configured for loopback in maintenance mode systems or if the system was not properly configured. The local node will halt in this case and the partner node will do a takeover of the local node resources, provided takeover is enabled.

Corrective Action

If this message occurs only while the system is configured in maintenance mode, it can be ignored as HA-interconnect loopback tests send a message with a node's own system identifier to itself. If this message occurs while a system is not in maintenance mode, check if the HA-interconnect cables are properly connected. If cabling is correct, contact NetApp technical support for assistance.

Syslog Message

Partner ID %u is the same as that of this node. This node will halt and the partner will perform a takeover, if takeover is enabled.

Parameters

id (INT): System ID.

cf.fm.earlyGivebackDone

Severity

NOTICE

Description

This event occurs when we are aborting a takeover that was initiated during a previous boot sequence. This event should only occur under unusual circumstances, indicating successful recovery from a software failure.

Corrective Action

(None).

Syslog Message

Failover monitor: giveback of previous takeover complete

Parameters

(None).

cf.fm.earlyTakeoverFailed

Severity

ALERT

Description

This message occurs when an error during early takeover prevents the node from booting into takeover mode. The node instead boots up without taking over its partner and also releases its partner resources, allowing the partner node to boot up. Note: Early takeover occurs when a node boots up after rebooting while in takeover mode.

Corrective Action

Check the EMS log for the cf.rsrc.takeoverFail error or other errors indicating why the node could not boot into takeover mode.

Syslog Message

Early takeover failed; node will boot without taking over partner node. Partner resources released, allowing partner node to boot.

Parameters

(None).

cf.fm.fastTimeoutBlocked

Severity

ERROR

Description

This event is issued if the monitor fast timeout thread has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected (false) takeover.

Corrective Action

Check CPU load and make sure system is not over subscribed.

Syslog Message

WARNING failover monitor fast timeout was blocked for %lld secs

Parameters

secs (LONGINT): Number of seconds that the High Availability (HA) node has been blocked

cf.fm.gbCancelledDuetoDR

Severity

ERROR

Description

This event is issued when a giveback has been cancelled due to an ongoing metrocluster disaster recovery operation.

Corrective Action

Check the status of metrocluster disaster recovery operation by executing command 'metrocluster operation show'. If the command reports metrocluster disaster recovery operation is in progress wait for it to complete and then issue a manual giveback.

Syslog Message

Failover monitor: giveback cancelled

Parameters

(None).

cf.fm.givebackCancelled

Severity

NOTICE

Description

This message occurs when a giveback is canceled due to a preexisting state, such as an active CIFS session, a reconstruction, and so on.

Corrective Action

To override, use the "storage failover giveback -override-vetoes true" command.

Syslog Message

Failover monitor: giveback canceled.

Parameters

partner_node_uuid (STRING): UUID of the partner node.

cf.fm.givebackComplete

Severity

NOTICE

Description

This message occurs when giveback succeeds.

Corrective Action

(None).

Syslog Message

Failover monitor: giveback completed

Parameters

token (STRING): Unique token that identifies a failover instance.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.givebackDuration

Severity

NOTICE

Description

This message occurs when a giveback is completed successfully.

Corrective Action

(None).

Syslog Message

Failover monitor: giveback duration time is %llu seconds.

Parameters

giveback_duration (LONGINT): Giveback duration time.

cf.fm.givebackFailed

Severity

ALERT

Description

This message occurs when the failover monitor determines that a giveback has failed. The reason code is a string that describes the reason for the failure.

Corrective Action

Resolve the issue based on the reason logged in the message.

Syslog Message

Failover monitor: giveback failed '%s'

Parameters

reason (STRING): Internal reason code for the failure.
token (STRING): Unique token that identifies a failover instance.

partner_node_uuid (STRING): UUID of the partner node.

cf.fm.givebackForced

Severity
ALERT

Description
This message occurs when the takeover node detects that the takeover process has not been completed within the expected time, and/or normal attempts to give back partner resources also fail. Subsequent to this event, the takeover node will panic and reboot.

Corrective Action
Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: http://mysupport.netapp.com/NOW/cgi-bin/pmsg/. Contact NetApp technical support to confirm the analysis.

Syslog Message
Failover monitor: forcing reboot to clear state.

Parameters
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.givebackStarted

Severity
NOTICE

Description
This message occurs when the failover monitor initiates a giveback.

Corrective Action
(None).

Syslog Message
Failover monitor: giveback started with token %s. "override-vetoes" set to %s, and "require-partner-waiting" set to %s.

Parameters
token (STRING): Unique token that identifies a failover instance.
override_vetoes (STRING): Flag that indicates whether the system overrides veto checks during a giveback operation. This flag corresponds to the "-override-vetoes" parameter of the "storage failover giveback" command. When the parameter is set to true, some veto checks made by subsystems on the source node might be overridden.
require_partner_waiting (STRING): Flag that indicates whether, during a giveback, the storage is given back regardless of whether the partner node is available to take back the storage. This flag corresponds to the "-require-partner-waiting" parameter of the "storage failover giveback" command. When set to true, the parameter might cause the giveback to proceed, even if the destination node is not ready to receive the aggregate being migrated.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.givebackUpdateFail

Severity

ALERT

Description

This message occurs when GIVEBACK_DONE is not written to the backup mailbox after all other giveback processing is done. The issuing node is no longer in takeover mode, but the partner node cannot boot (without operator intervention) because the partner mailbox claims it has been taken over.

Corrective Action

Boot the previously taken over node. During the boot operation, the node requests confirmation to proceed.

Syslog Message

Failover Monitor: Unexpected error %d while trying to update backup mailbox during giveback

Parameters

errcode (INT): Error code.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.haltUpdateFail

Severity

INFORMATIONAL

Description

This event is issued if we are unable to update the partner state as part of halt processing. This occurrence of this event should not affect the operation of the High Availability (HA) pair.

Corrective Action

(None).

Syslog Message

halt: Unable to update failover monitor with NoTakeover state

Parameters

(None).

cf.fm.hogger

Severity

ERROR

Description

This message occurs when the fast timeout thread is blocked for a very long time and the system can identify threads that might have been responsible for the fast timeout thread not being scheduled.

Corrective Action

Determine why the process is consuming the CPU, and either correct the problem, or end the offending process.

Failover monitor: Process %s ran continuously for %llu ms.

Parameters

procName (STRING): Name of the process that is consuming the CPU.
schedTime (LONGINT): Time for which the process ran without releasing the CPU.

cf.fm.initError

Severity

ALERT

Description

This message occurs when failover monitor initialization fails. If this event occurs, the failover monitor cannot be started. The node will reboot after this event.

Corrective Action

Check the logs for other messages from the failing component listed in the message by using the "event log show" command from the CLI. Also check for errors from other components or errors indicating hardware failures. If the problem occurs again after the node reboots, contact NetApp technical support.

Syslog Message

Failover monitor: initialize(%s) fails.

Parameters

component (STRING): Software component that has failed to initialize.

cf.fm.kernelMismatch

Severity

ERROR

Description

This event is issued when we detect a possible mismatch of kernel versions in the High Availability (HA) pair. This situation is allowed, although takeover may be disabled if the mismatch imposes version differences in the metadata formats (nvram, filesystem, etc.) of the system.

Corrective Action

Upgrade both nodes to the same release.

Syslog Message

Failover monitor: possible kernel mismatch detected local '%s', partner '%s'

Parameters

myVersion (STRING): My version
partnerVersion (STRING): The partner's version

cf.fm.kernelMismatchOk

Severity

INFORMATIONAL

Description

This event is issued when we detect a possible mismatch of kernel versions in the High Availability (HA) pair has been resolved.

Corrective Action

(None).

Syslog Message

Failover monitor: possible kernel mismatch resolved

Parameters

(None).

cf.fm.launch

Severity

INFORMATIONAL

Description

This event is issued when the failover monitor is launched. It occurs very early in the system startup sequence.

Corrective Action

(None).

Syslog Message

Launching failover monitor

Parameters

(None).

cf.fm.lmgrVetoOverride

Deprecated

Deprecated as of version 9.7.

Severity

NOTICE

Description

This message occurs during an SFO aggregate giveback, when system settings indicate that giveback should be vetoed but the veto was overridden by the automated nondisruptive update procedure. The automated nondisruptive update procedure verifies the expected state of aggregate.

Corrective Action

(None).

Syslog Message

"%s" subsystem veto was overridden during giveback operation of "%s" aggregate.

Parameters

subsystem (STRING): Name of the vetoed subsystem.
aggregate (STRING): Name of the aggregate.

cf.fm.localmbReadStatus

Severity

INFORMATIONAL

Description

This message reports the status of a local mailbox disk read.

Corrective Action

(None).

Syslog Message

(None).

Parameters

returncode (INT): Status returned by the read of the local mailbox disk.

cf.fm.lowMemory

Severity

ALERT

Description

This message occurs when the local node does not have sufficient memory to run failover monitor services.

Corrective Action

Verify that the recommended amount of memory is installed on the system. If there is sufficient memory, the error might be related to hardware issues. In this case, capture the console logs, and then call NetApp technical support.

Syslog Message

Takeover is disabled due to insufficient memory.

Parameters

(None).

cf.fm.MBstatusOnBoot

Severity

INFORMATIONAL

Description

This message occurs on system boot when the failover monitor detects that no takeover is in progress.

Corrective Action

(None).

Syslog Message

(None).

Parameters

status (INT): Failover monitor status as reported by the mailbox disk.

cf.fm.mirrorConsistencyOff

Severity

ERROR

Description

This message occurs when the system discovers that the NVRAM mirror consistency option has been disabled. This option should ONLY be disabled under operator control. If mirror consistency is disabled, a takeover can result in a loss of recently logged data.

Corrective Action

Run the "cf enable mirrorconsistency" advanced privilege nodeshell command to reenable mirror consistency.

Syslog Message

Failover monitor: NVRAM mirror consistency is disabled.

Parameters

(None).

cf.fm.missingAdapter

Severity

ERROR

Description

This message occurs when the high availability (HA) mode is set to "ha" but no interconnect adapter is found. This is an error indicating a misconfiguration of the system.

Corrective Action

Install the HA interconnect adapter, or if not using ASA r2, set the HA mode to "non_ha" by using the "storage failover modify -mode non_ha" command.

Syslog Message

Warning: HA mode is set to "ha" but the interconnect adapter is not found.

Parameters

(None).

cf.fm.monitorBlocked

Severity

ERROR

Description

This event is issued if the failover monitor has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected (false) takeover.

Corrective Action

Check CPU load and make sure system is not over subscribed.

Syslog Message

WARNING failover monitor was blocked for %lld secs

Parameters

secs (LONGINT): Number of seconds that the failover monitor has been blocked

cf.fm.noearlyrelease

Severity

INFORMATIONAL

Description

This message occurs when an early release of reservations is not done.

Corrective Action

(None).

Syslog Message

(None).

Parameters

state (INT): Partner firmware state.
version (INT): Partner firmware version.

cf.fm.nofwUpdateinTO

Severity

INFORMATIONAL

Description

This message occurs when there is no progress in the firmware status received from the partner.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.fm.noICbutFoundMb

Severity

INFORMATIONAL

Description

This message occurs when no firmware state is obtained over the High Availability (HA) interconnect but the mailbox disks are found.

Corrective Action

(None).

Syslog Message

(None).

Parameters

status (INT): Status of the active/active configuration based on the mailbox disks.

cf.fm.nombdisks

Severity

INFORMATIONAL

Description

This messages indicates the status of the local mailbox disks.

Corrective Action

(None).

Syslog Message

(None).

Parameters

returncode (INT): Return value from the call to read the local mailbox disks.
mbstatus (INT): Current status of the active/active configuration.

cf.fm.noMBdisksOnSFUP

Severity

ERROR

Description

This message occurs when no local mailbox disks are detected, even though the partner performed a giveback.

Corrective Action

Check connectivity to all disks by running the "run local storage show" command on each partner, and then comparing the results.

Syslog Message

Could not find the local mailbox disks after a giveback. Check connectivity to all disks.

Parameters

(None).

cf.fm.noMBDisksOrIc

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot access the local mailbox disks and cannot determine partner status through the high-availability (HA) interconnect.

Corrective Action

Check connectivity to all disks by running the "run local storage show" command on each partner, and then comparing the results. Verify that the interconnect cables are properly cabled.

Syslog Message

Could not find the local mailbox disks. Could not determine the firmware state of the partner through the HA interconnect.

Parameters

(None).

cf.fm.noPartnerVariable

Severity

ERROR

Description

This message occurs when the system cannot identify the serial number of the partner because the firmware variable is not set.

Corrective Action

1) Use the "storage failover show" command to verify that that high-availability (HA) is enabled. 2) If HA is enabled, there might be too many environment variables defined. Halt the system, and then enter the "printenv" command at the LOADER prompt. Use the "unsetenv" command to remove unneeded environment variables.

Syslog Message

Unknown partner serial number: firmware %s variable is not set.

Parameters

variable (STRING): Name of the firmware variable.

cf.fm.noTakeoverNoRc

Severity

ERROR

Description

This message indicates that we cannot do takeover during a no-rc boot.

Corrective Action

Reboot the node normally

Syslog Message

Failover monitor: reboot normally to enable takeover

Parameters

(None).

cf.fm.notkoverBadMbox

Severity

NOTICE

Description

This event is issued when we discover that a mailbox is uninitialized.

Corrective Action

(None).

Syslog Message

Failover monitor: uninitialized %s mailbox data detected

Parameters

whose (STRING): Indicates which mailbox is uninitialized

cf.fm.notkoverClusterDisable

Severity

ERROR

Description

This event is issued when we discover that failover between the High Availability (HA) pair has been
disabled. Failover may be disabled under operator control or when a condition has been discovered (e.g.,
kernel mismatch) that necessitates disabling of the HA pair.

Corrective Action

Resolve the reason provided in the message.

Syslog Message

Failover monitor: takeover disabled (%s)

Parameters

reason (STRING): The reason code for disabling the HA pair

cf.fm.notkoverOperatorDeny

Severity

ERROR

Description

This event is issued when we discover that the operator has disabled takeover-by-partner.

Corrective Action

If takeover by the partner is desired, re-enable takeover.

Syslog Message

Failover monitor: takeover by partner disabled

Parameters

(None).

cf.fm.notkoverOperatorDisableNvram

Severity

ERROR

Description

This event is issued when we discover that the operator has disabled the nvram mirror.

Corrective Action

Re-enable NVRAM mirroring

Syslog Message

Failover monitor: nvram mirror disabled

Parameters

(None).

cf.fm.overwriteState

Severity

NOTICE

Description

This event is issued when the operator has manually intervened and has forced an overwrite of failover monitor state.

Corrective Action

(None).

Syslog Message

System continuing after overwriting failover monitor state!

Parameters

(None).

cf.fm.panicAfterToDone

Severity

ALERT

Description

This message occurs when a node panics too soon after the completion of a takeover. The node reboots in normal mode to avoid recursive panics.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failover monitor: Panic occurred too soon after takeover was completed (currentTime %llu ms, Takeover completed %llu ms).

Parameters

currentTime (LONGINT): Time when the panic occurred.
ToDoneTime (LONGINT): Time when the takeover was completed.

cf.fm.panicInToMode

Severity

EMERGENCY

Description

This message occurs when the node panics after taking over the partner node. When the node comes back up, it will do so in takeover mode.

Corrective Action

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: http://mysupport.netapp.com/NOW/cgi-bin/pmsg/. Contact NetApp technical support to confirm the analysis.

Syslog Message

Failover monitor: Panic in takeover mode; takeover will occur on reboot.

Parameters

(None).

cf.fm.panicOnGBforced

Severity

ALERT

Description

This message occurs when a node panics while a forced giveback is in progress. The node performs giveback and releases partner resources on reboot.

Corrective Action

Capture the console log and contact NetApp technical support.

Failover monitor: Panic during forced giveback; node will release partner resources on reboot.

Parameters

(None).

cf.fm.panicToInProgress

Severity

ALERT

Description

This message occurs when a node panics while the takeover is in progress. The node reboots in normal mode with takeover disabled.

Corrective Action

Capture the console log and contact NetApp technical support.

Syslog Message

Failover monitor: Panic during takeover; takeover will be disabled on reboot.

Parameters

(None).

cf.fm.partner

Severity

INFORMATIONAL

Description

This event is issued to announce the name of the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: partner '%s'

Parameters

partner (STRING): The name of the High Availability (HA) partner

cf.fm.partnerChange

Severity

INFORMATIONAL

Description

This event is issued to announce a change in the name of the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: partner hostname has changed: '%s'

Parameters

partner (STRING): The name of the High Availability (HA) partner

cf.fm.partnerFwState

Severity

INFORMATIONAL

Description

This message reports the firmware status of the partner.

Corrective Action

(None).

Syslog Message

(None).

Parameters

state (INT): Partner firmware status.

cf.fm.partnerFwTransition

Severity

INFORMATIONAL

Description

This message occurs when there is a change in the partner firmware state.

Corrective Action

(None).

Syslog Message

(None).

Parameters

prevstate (STRING): Previously reported partner firmware state.
newstate (STRING): New firmware state, as reported by the partner.
progresscounter (LONGINT): New progress counter, as reported by the partner.

cf.fm.partnerICFwVersion

Severity

INFORMATIONAL

Description

This message occurs when the partner is using a different version of the interconnect firmware.

Corrective Action

(None).

Syslog Message

(None).

Parameters

version (INT): Partner firmware version.

cf.fm.partnerSysid

Severity

INFORMATIONAL

Description

This event is issued to announce the system id of the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: partner system id: %u

Parameters

sysid (LONGINT): The sysid of the High Availability (HA) partner

cf.fm.partnerSysidChange

Severity

INFORMATIONAL

Description

This event is issued to announce a change in the system id of the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: partner system id has changed: %u

Parameters

sysid (LONGINT): The sysid of the High Availability (HA) partner

cf.fm.partnerVolumesOnline

Severity

NOTICE

Description

This event is issued to indicate that the partner's volumes have been brought on-line as part of early takeover processing.

Corrective Action

(None).

Syslog Message

Failover monitor: partner volumes on-line

Parameters

(None).

cf.fm.replayOnlyTakeover

Severity

INFORMATIONAL

Description

This event is issued when the failover monitor initiates a replay-only takeover, which essentially means performing takeover till the partner logs have been replayed, and then initiating a giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: Starting replay-only takeover. A giveback will be initiated after the partner logs have been replayed.

Parameters

(None).

cf.fm.replayOnReboot

Severity

INFORMATIONAL

Description

This message occurs if a node panics in takeover mode and replay of the partner logs will be attempted on reboot.

Corrective Action

(None).

Syslog Message

Failover monitor: replay of partner logs will be attempted on reboot.

Parameters

(None).

cf.fm.reserveDisksOff

Severity

EMERGENCY

Description

This event is issued if we discover that disk reservations have been disabled. If this event occurs, contact NetApp technical support.

Corrective Action

(Call support).

Syslog Message

Failover monitor: disk reservations disabled

Parameters

(None).

cf.fm.reserveMBproblem

Severity

ERROR

Description

This message occurs when ONTAP® cannot reserve a high-availability (HA) partner mailbox disk during a takeover.

Corrective Action

Check connectivity to all disks by using the "storage disk show -fields diskpathnames" command to verify each node in the HA pair has access to all disks. If some disks are not fully accessible, confirm the disks are correctly cabled. To check whether one HA node cannot access disks that are visible to the HA partner node, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command.

Syslog Message

Takeover has been aborted because the partner mailbox disk: %s could not be reserved. Error: %u.

Parameters

diskname (STRING): Partner mailbox disk that ONTAP could not reserve.
disk_error (INT): Disk reservation error that was encountered.

cf.fm.slowTimeoutBlocked

Severity

NOTICE

Description

This message occurs when the High Availability slow timeout thread has been blocked for an unacceptable amount of time. The event indicates a heavy load on the system and may result in an unexpected takeover.

Corrective Action

Check CPU load and make sure system is not over subscribed. Contact NetApp technical support for further assistance.

High Availability slow timeout was blocked for %lld secs.

Parameters

secs (LONGINT): Number of seconds that the High Availability (HA) slow timeout thread has been blocked.

cf.fm.smsVetoOverride

Deprecated

Deprecated as of version 9.7.

Severity

NOTICE

Description

This message occurs during an SFO aggregate giveback, when the SnapMirror® subsystem indicates that giveback should be vetoed but the veto was overridden by the automated nondisruptive update procedure. The automated nondisruptive update procedure verifies the expected state of the aggregate.

Corrective Action

(None).

Syslog Message

"%s" subsystem veto was overridden during giveback operation of "%s" aggregate.

Parameters

subsystem (STRING): Name of the vetoed subsystem.
aggregate (STRING): Name of the aggregate.

cf.fm.softError

Severity

ERROR

Description

This event is issued when a "soft error" has occurred in the failover monitor.

Corrective Action

Resolve the failure listed in the message.

Syslog Message

Failover monitor: %s

Parameters

reason (STRING): Description of the failure.

cf.fm.takeoverComplete

Severity

NOTICE

Description

This message occurs when a takeover succeeds.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover completed

Parameters

token (STRING): Unique token that identifies a failover instance.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.takeoverDetectionSeconds.Default

Severity

ERROR

Description

This message occurs when the takeover detection time is set to a value less than the DEFAULT_FIRMWARE_TIMEOUTS setting. This can result in false takeovers and takeovers without diagnostic core dumps.

Corrective Action

Modify the takeover detection time to the recommended value by using the "storage failover modify -detection-time" command.

Syslog Message

Takeover detection time is set to %d seconds, which is below the recommended value of %d seconds. False takeovers and takeovers without diagnostic core dumps might occur.

Parameters

SECONDS (INT): Value that the takeover detection time is set to.
FIRMWARE_TIMEOUT_DEF (INT): Recommended value.

cf.fm.takeoverDetectionSeconds.Kernel

Severity

ERROR

Description

This message occurs when the takeover detection time is set to a value less than the KERNEL_TIMEOUT setting (as specified by the "sk.process.timeout.override" option). This can result in takeovers without accompanying diagnostic core dumps of the taken over node.

Corrective Action

Set the takeover detection time to the recommended value by using the "storage failover modify -detection-time" command.

Syslog Message

Takeover detection time is set to %d seconds, which is below %d (= sk.process.timeout.override + 5)

seconds. Takeovers without diagnostic core dumps might occur.

Parameters

SECONDS (INT): Value that the takeover detection time is set to.
KERNEL_TIMEOUT (INT): Minimum value that should be used.

cf.fm.takeoverDuration

Severity

INFORMATIONAL

Description

This message occurs when a takeover is completed successfully.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover duration time is %llu seconds.

Parameters

takeover_duration (LONGINT): Takeover duration time.

cf.fm.takeoverFailed

Severity

ALERT

Description

This message occurs when the failover monitor determines that a takeover has failed. The reason code is a string that describes the reason for the failure. Any data LIFs that were migrated as part of the takeover operation are not automatically reverted.

Corrective Action

Resolve the issue based on the reason logged in the message.

Syslog Message

Failover monitor: takeover failed '%s'

Parameters

reason (STRING): Internal reason code for the failure.
token (STRING): Unique token that identifies a failover instance.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.takeoverStarted

Severity

NOTICE

Description

This message occurs when the failover monitor initiates a takeover.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover started

Parameters

token (STRING): Unique token that identifies a failover instance.
partner_node_uuid (STRING): UUID of the partner node.

cf.fm.timeMasterStatus

Severity

INFORMATIONAL

Description

This event is when we determine our status as time master or slave.

Corrective Action

(None).

Syslog Message

Acting as time %s

Parameters

masterOrSlave (STRING): Master or Slave

cf.fm.TODetectionSecs.reset

Severity

INFORMATIONAL

Description

This message occurs when the current setting of takeover detection time is shorter than the minimum takeover detection time allowed by this version of Data ONTAP®. This can result in false takeovers or takeovers without diagnostic core dumps. Data ONTAP resets the takeover detection time to the new minimum.

Corrective Action

(None).

Syslog Message

Takeover detection time was set to %d seconds, shorter than the minimum allowed. Reset the detection time to a new minimum of %d seconds.

Parameters

SECONDS (INT): Current takeover detection seconds.
FIRMWARE_TIMEOUT_DEF (INT): New default takeover detection seconds.

cf.fm.transitTimeChange

Severity

INFORMATIONAL

Description

This message occurs when you set the takeover or giveback transit timeout to a value other than the default value. During takeover or giveback, if the timeout is exceeded by a subsystem during the takeover/giveback processing, a panic occurs. If the timeout is set too high, longer client outages might occur instead of aborting the takeover/giveback.

Corrective Action

(None).

Syslog Message

(None).

Parameters

SECONDS (INT): Transit timeout value (in seconds).
DEFAULT_VAL (INT): Default transit timeout value (in seconds).

cf.fm.undoFailedTakeover

Severity

NOTICE

Description

This event is issued when we initiate an undo of a failed takeover.

Corrective Action

(None).

Syslog Message

Failover monitor: initiate giveback due to failed takeover

Parameters

(None).

cf.fm.unexpectedPartner

Severity

ERROR

Description

This message occurs when the HA mode is set to "non_ha" but the HA mode was set to "ha" previously. This is not an error, but indicates a possible misconfiguration of the system.

Corrective Action

Determine whether the HA mode should be set to "ha", and if so, set it.

Warning: HA mode is set to "non_ha" but the node once had a storage failover partner.

Parameters

(None).

cf.fm.versionMismatch

Severity

ALERT

Description

This event occurs when a version mismatch is detected during internode initialization. Each node transmits its version information to its partner. If a mismatch is detected, the High Availability (HA) takeover capability is disabled.

Corrective Action

Boot both nodes on the same release.

Syslog Message

Failover monitor: %s version mismatch detected: %d/%d

Parameters

subsystem (STRING): The name of the versioned subsystem
myVersion (INT): My version
partnerVersion (INT): The partner's version

cf.fm.waitBeforeWFG

Severity

INFORMATIONAL

Description

This message occurs when a system waits, during boot, for a module to come up before declaring itself ready for giveback. Examples include waiting for the NVRAM battery to be charged.

Corrective Action

(None).

Syslog Message

Failover monitor: waited %llu seconds for module %s.

Parameters

secs (LONGINT): Amount of time spent waiting, in seconds.
module_name (STRING): Name of the module the system is waiting for.

cf.fmmbx events

cf.fmmbx.mccip.policy.enabled

Severity

NOTICE

Description

This message occurs when the system has enabled MCCIP mailbox disk IO policy

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.fmns events

cf.fmns.skipped.disk

Severity

NOTICE

Description

This message occurs when a node is in "Waiting For Giveback" state and the Failover Monitor Node State (fmns)module skips a local disk while releasing the reservations in that state.

Corrective Action

(None).

Syslog Message

While releasing the reservations in "Waiting For Giveback" state Failover Monitor Node State(fmns) module skipped the disk %s that is owned by %u and reserved by %u.

Parameters

uid_string (STRING): Name of the disk which was skipped by fmns.
down_owner (INT): The system ID of the node that owns this disk.
resvn_owner (INT): The system ID of the node that has a reservation on this disk.

cf.fsm events

cf.fsm.autoGBTkoverOnPanic

Severity

INFORMATIONAL

Description

This message occurs when a node initiates an automatic giveback to its partner following a takeover that was due to a panic on the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: Automatic giveback was initiated following a takeover that was caused by a panic on the partner.

Parameters

(None).

cf.fsm.autoGBTkoverOnReboot

Severity

INFORMATIONAL

Description

This message occurs when a node initiates an automatic giveback to its partner following a takeover that was due to a reboot of the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: Automatic giveback was initiated following a takeover that was caused by the partner reboot.

Parameters

(None).

cf.fsm.autoGivebackAttemptsExceeded

Severity

EMERGENCY

Description

This event is issued when auto giveback is disabled due to a ping-pong situation (autoGB followed by t/o followed by autoGB…)

Corrective Action

Examine the logs and/or console output from the partner node. Resolve the issue which prevents the node from staying up.

Syslog Message

Failover monitor: Automatic giveback is being disabled due to exceeding %d attempts in %d minutes.

Parameters

attempts (INT): Number of automatic givebacks attempted
minutes (INT): Time period where the automatic givebacks were attempted

cf.fsm.autoGivebackDelayed

Severity

INFORMATIONAL

Description

This message occurs when an automatic giveback is delayed because 'Delay Before Auto Giveback' is set to a non-zero number. If you want to eliminate the delay before automatic giveback occurs, you can use the command "storage failover modify -delay-seconds" to set it to zero.

Corrective Action

(None).

Syslog Message

Failover monitor: Automatic giveback was delayed by %d seconds due to a non-zero value of 'Delay Before Auto Giveback'.

Parameters

seconds (INT): Number of seconds by which automatic giveback was delayed.

cf.fsm.autoGivebackReleasingReservations

Severity

NOTICE

Description

This event is generated when we release the disk reservations in preparation for an automatic giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: Releasing disk reservations in preparation for an automatic giveback

Parameters

(None).

cf.fsm.autoGivebackStarted

Severity

INFORMATIONAL

Description

This event is issued when an automatic giveback is initiated.

Corrective Action

(None).

Syslog Message

Failover monitor: Automatic giveback started

Parameters

(None).

cf.fsm.autoGivebackVetoed

Severity

ERROR

Description

This event is issued when one or more subsystems have vetoed the automatic giveback.

Corrective Action

Terminate the long-running jobs and auto giveback will be successful next time it is attempted.

Syslog Message

Failover monitor: Automatic giveback has been deferred due to long running operations

Parameters

(None).

cf.fsm.autoTakeoverCancelled

Severity

NOTICE

Description

This event is issued when the failover monitor cancels a pending takeover.

Corrective Action

(None).

Syslog Message

Failover monitor: pending takeover cancelled

Parameters

(None).

cf.fsm.backupMailboxError

Severity

ERROR

Description

This message occurs when the failover monitor determines that an error was observed in the partner's mailbox.

Corrective Action

Correct the issues preventing the node from accessing the partner's mailbox disks. Check for cabling, host bus adapter (HBA), storage controller or drive/LUN issues. You can also use Multipathing to provide a redundant connection to the mailbox disk.

Syslog Message

Failover monitor: partner mailbox error detected.

Parameters

(None).

cf.fsm.backupMailboxOk

Severity

NOTICE

Description

This event is issued when the failover monitor has determined that an error in the backup's mailbox has been fixed.

Corrective Action

(None).

Syslog Message

Failover monitor: backup mailbox OK

Parameters

(None).

cf.fsm.checkingForBigJobs

Severity

INFORMATIONAL

Description

This event is generated when we want to initiate an automatic giveback and we're checking for long running operations which might veto our plans.

Corrective Action

(None).

Syslog Message

Failover monitor: Checking for long running operations in preparation for an automatic giveback.

Parameters

(None).

cf.fsm.clam.reqPartnerShtdwn

Severity

ALERT

Description

This message occurs when a node's connectivity, liveness, availability monitor (CLAM) requests a graceful shutdown of its HA partner to trigger a takeover. This shutdown request is made because both HA and cluster connectivity is down.

Corrective Action

Restore connectivity across the cluster and HA ports. If the cluster and HA ports are reporting the links are down, check the cabling and switch port configuration. If the connectivity cannot be repaired, contact NetApp technical support.

Syslog Message

CLAM requests graceful shutdown of the HA partner to initiate a takeover while NVLOG is out of sync. Cluster and HA connectivity is down.

Parameters

(None).

cf.fsm.clam.shtdwnThruMbx

Severity

ALERT

Description

This message occurs when a node acknowledges a shutdown request from its HA partner. The node shuts down immediately.

Corrective Action

Restore connectivity across the cluster and HA ports. If the cluster and HA ports are reporting the links are down, check the cabling and switch port configuration. If the connectivity cannot be repaired, contact NetApp technical support.

Syslog Message

A connectivity, liveness, availability monitor (CLAM) shutdown request was acknowledged through mailbox.

Parameters

(None).

cf.fsm.cliTakeoverCancelled

Severity

NOTICE

Description

This event is issued when the failover monitor cancels a pending takeover issued through a CLI.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover cannot be performed because of reason (%s)

Parameters

reason (STRING): Reason why takeover cannot occur

cf.fsm.firmwareStatus

Severity

INFORMATIONAL

Description

This event is issued when we detect an altered firmware status update from the partner.

Corrective Action

(None).

Syslog Message

Failover monitor: partner %s

Parameters

reason (STRING): Partner status

cf.fsm.givebackHung

Severity

ALERT

Description

This event occurs when the failover monitor detects that the giveback process is hung.

Corrective Action

Collect the resulting core file and provide it to Customer Support.

Syslog Message

Failover monitor: giveback process is hung ('%s')

Parameters

moduleName (STRING): The name of the module that the hang occurred in.

cf.fsm.givebackMaxRetries

Severity

ALERT

Description

This event is called when the giveback retry count has been exceeded. This situation exists when the system is unable either to takeover or giveback. It may be due to either a hardware bug (e.g., the disk subsystem is hung) or a software bug.

Corrective Action

Examine the logs and determine why the giveback is failing. Correct that problem and retry the giveback.

Syslog Message

Failover monitor: giveback has exceeded max retry count

Parameters

> **retries** (INT): Number of retries attempted.

cf.fsm.nfo.acceptTakeoverReq

Severity

> NOTICE

Description

> This message occurs when the system starts a negotiated takeover of its partner, and requests a graceful shutdown of the partner.

Corrective Action

> (None).

Syslog Message

> Negotiated failover: starting takeover and shutdown of partner (%s), will take over in at most %d secs. Reason: %s.

Parameters

> **partnerName** (STRING): Name of partner node.
> **maxTakeoverTime** (INT): Maximum amount of time to wait for the partner to shut down before starting takeover, in seconds.
> **partnerReason** (STRING): Reason for the initiation of the takeover.

cf.fsm.nfo.clearReqTakeover

Severity

> NOTICE

Description

> This event is called when the system clears a request for takeover by its partner.

Corrective Action

> (None).

Syslog Message

> Negotiated failover: clearing partner takeover request

Parameters

> (None).

cf.fsm.nfo.delayingGracefulShutdown

Severity

> ERROR

Description

> This event is called when the system has been asked to shutdown by its partner as the result of the negotiated failover mechanism, but the system can not shut down due to a specific reason.

Corrective Action

Using the information provided in the message, determine why shutdown cannot be invoked. Resolve that problem and retry the takeover request.

Syslog Message

Negotiated failover: delaying shutdown due to %s

Parameters

why (STRING): Indicates the cause of the delay.

cf.fsm.nfo.disable

Severity

ERROR

Description

This event is called when negotiated failover is disabled for a particular module.

Corrective Action

Examine previous messages for failures related to the type of NFO.

Syslog Message

Negotiated failover: disabling negotiated failover for module %s

Parameters

mod (STRING): Negotiated failover module or type.

cf.fsm.nfo.disable.shelfversion

Severity

ERROR

Description

This event is called when negotiated failover is disabled due to Shelf Count message version mismatch.

Corrective Action

Upgrade both nodes to the same release.

Syslog Message

Negotiated failover: disabling negotiated failover due to version mis-match.

Parameters

(None).

cf.fsm.nfo.enable

Severity

NOTICE

Description

This event is called when negotiated failover is enabled for a particular module.

Corrective Action

(None).

Syslog Message

Negotiated failover: enabling negotiated failover for module %s

Parameters

mod (STRING): NFO module (or type)

cf.fsm.nfo.gracefulShutdownTimerExpired

Severity

NOTICE

Description

This event is called when the maximum time the system will wait for the partner to shutdown gracefully has passed. At this point the system takes over by force.

Corrective Action

(None).

Syslog Message

Negotiated failover: partner graceful shutdown appears hung, taking over

Parameters

(None).

cf.fsm.nfo.moduleImpairmentChange

Severity

ERROR

Description

This event is called when a module which is participating in negotiated failover changes from "unimpaired" to "impaired" or vice versa.

Corrective Action

Check the state of the module listed in the message.

Syslog Message

Negotiated failover: module %s is now %s

Parameters

mod (STRING): Type of negotiated failover
impairment (STRING): Either unimpared or impaired

cf.fsm.nfo.partnerShutdown

Severity

NOTICE

Description

This event is called when the system sees that the partner has finished shutting down gracefully during negotiated failover.

Corrective Action

(None).

Syslog Message

Negotiated failover: partner has shutdown

Parameters

(None).

cf.fsm.nfo.rejectTakeoverReqDueToImpairment

Severity

ERROR

Description

This message occurs when the system rejects a request by its partner to take it over because the system is itself impaired.

Corrective Action

Use the "storage failover show" command to determine why takeover is not possible. Resolve that problem and retry the takeover request.

Syslog Message

Negotiated failover: rejecting takeover request by partner due to own impairment.

Parameters

(None).

cf.fsm.nfo.rejectTakeoverReqDueToOwnReq

Severity

ERROR

Description

This event is called when the system rejects a request by its partner to take it over because the system has itself recently requested takeover by its partner. Rejecting this request prevents each system trying to takeover its partner simultaneously. If the partner persists and the system doesn't become impaired the request will soon be granted.

Corrective Action

Resolve any impairment issues reported in previous messages that would cause takeover. If takeover is requested by the operator, it should only be requested on one node.

Negotiated failover: rejecting takeover request by partner due to own recent takeover request.

Parameters

(None).

cf.fsm.nfo.startingGracefulShutdown

Severity

NOTICE

Description

This event is called when the system has been asked to shutdown by its partner as the result of the negotiated failover mechanism. The system responds by shutting down gracefully, shutting down services in an orderly manner.

Corrective Action

(None).

Syslog Message

Negotiated failover: starting graceful shutdown.

Parameters

(None).

cf.fsm.nfo.takeoverPendingCancel

Severity

ERROR

Description

This message occurs when the system is waiting for the partner to shutdown gracefully and failover is disabled, canceling the pending takeover.

Corrective Action

Use the "storage failover modify -enabled true" command to reenable failover.

Syslog Message

Negotiated failover: pending takeover canceled.

Parameters

(None).

cf.fsm.partnerNotResponding

Severity

NOTICE

Description

This event is issued when we detect that the partner node is not responsive.

Corrective Action

(None).

Syslog Message

Failover monitor: partner not responding

Parameters

(None).

cf.fsm.partnerOk

Severity

NOTICE

Description

This event is issued when we detect that the partner node, which was previously not responsive, is now OK.

Corrective Action

(None).

Syslog Message

Failover monitor: partner ok

Parameters

(None).

cf.fsm.releasingReservations

Severity

INFORMATIONAL

Description

This event is generated when we release the disk reservations in preparation for a manual giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: Releasing disk reservations in preparation for giveback

Parameters

(None).

cf.fsm.shelfCount.fewerShelves

Severity

ALERT

Description

This event is emitted when we detect that the partner sees more of our disk shelves than we do. In other words, it sees more shelves on its FCAL B loop than we see on our A loop. This is probably due to a

cabling problem or a broken FCAL host adaptor. If "disk_shelf" negotiated failover is enabled, this condition should lead to a takeover by the partner if the partner is otherwise able to take us over.

Corrective Action

Resolve cabling issues which are preventing both nodes from seeing the same disks.

Syslog Message

Disk shelf count mismatch: partner sees more of our A shelves on its B loop (%d) than we do (%d).

Parameters

bShelves (INT): Number of our shelves which the partner can see
aShelves (INT): Number of shelves which we can see

cf.fsm.stateTransit

Severity

INFORMATIONAL

Description

This event is issued when a state transition is detected. Typically, this indication means that the failover monitor is about to either takeover its partner or giveback to its partner. This can happen as the result of timers going of, operator command, or an indication from the partner that a fault has been detected.

Corrective Action

(None).

Syslog Message

Failover monitor: %s -→ %s

Parameters

oldState (STRING): The old failover monitor state.
newState (STRING): The new failover monitor state.
elem (STRING): The name of the FSM element that has caused the state transition to occur. This value is dependent upon the FSM implementation.

cf.fsm.takeover.bootingExp

Severity

ALERT

Description

This event is issued when an automatic takeover is initiated after detecting that the partner boot process is hung trying to load the kernel.

Corrective Action

Please capture console log of partner filer and contact Customer Support

Syslog Message

Failover monitor: automatic takeover attempted after detecting that partner is hung loading kernel while booting

Parameters

(None).

cf.fsm.takeover.disaster

Severity

INFORMATIONAL

Description

This message occurs when an operator-requested disaster recovery (DR) takeover is initiated.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover attempted after "cf forcetakeover -d" command.

Parameters

(None).

cf.fsm.takeover.early

Severity

INFORMATIONAL

Description

This event is issued when a filer takes over its partner while booting up in takeover mode.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover resumption attempted after reboot

Parameters

(None).

cf.fsm.takeover.forced

Severity

INFORMATIONAL

Description

This message occurs when an operator-requested forced takeover is initiated.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover attempted after "cf forcetakeover" or "storage failover takeover -option force" in advanced privilege.

Parameters

(None).

cf.fsm.takeover.mdp

Severity

ALERT

Description

This event is issued when an automatic takeover is initiated after detecting that the partner has panicked due to a multi-disk failure

Corrective Action

Please check the connectivity of the partner to it's disks and shelves and contact customer support.

Syslog Message

Failover monitor: takeover attempted after multi-disk failure on partner

Parameters

(None).

cf.fsm.takeover.ndu

Severity

INFORMATIONAL

Description

This message occurs when an operator-requested takeover is initiated with the "cf takeover -n" or "storage failover takeover -option allow-version-mismatch" command.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover attempted after "cf takeover -n" or "storage failover takeover -option allow-version-mismatch" command.

Parameters

(None).

cf.fsm.takeover.nfo

Severity

INFORMATIONAL

Description

This message occurs when an operator-requested takeover is initiated with the "storage failover takeover" command.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover attempted after "storage failover takeover" command.

Parameters

(None).

cf.fsm.takeover.noHeartbeat

Severity

ALERT

Description

This message occurs when a node detects no heartbeat from the partner, indicating that the partner is not functioning. The node will attempt an automatic takeover.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failover monitor: Takeover initiated after no heartbeat was detected from the partner node.

Parameters

(None).

cf.fsm.takeover.normal

Severity

INFORMATIONAL

Description

This message occurs when an operator-requested takeover is initiated with the "storage failover takeover -option immediate" command, or when Kernel Cluster Services Connectivity, Liveness and Availability Monitor (CLAM) triggers a takeover after determining that the partner node is out of "CLAM quorom".

Corrective Action

(None).

Syslog Message

Failover monitor: %s attempted

Parameters

reason (STRING): Reason a takeover of the partner was triggered. Possible values are "Operator initiated immediate takeover" and "CLAM initiated takeover".

cf.fsm.takeover.on.halt

Severity

INFORMATIONAL

Description

This message occurs when one node in a high-availability (HA) pair initiates an automatic takeover after detecting that its partner node has halted.

Corrective Action

(None).

Syslog Message

Failover monitor: Node initiated automatic takeover after detecting that its partner node has halted.

Parameters

(None).

cf.fsm.takeover.on.reboot

Severity

INFORMATIONAL

Description

This message occurs when one node in a High Availability (HA) pair initiates an automatic takeover after detecting that its partner node is rebooting.

Corrective Action

(None).

Syslog Message

Failover monitor: One node initiated automatic takeover after detecting that its partner node is rebooting.

Parameters

(None).

cf.fsm.takeover.operatorExp

Severity

NOTICE

Description

This event is issued when an automatic takeover is initiated after detecting that the operator timer has expired. This may happen when the operator has failed to respond to a question or not entered a required command during boot.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover attempted after operator timeout expired on partner

Parameters

(None).

cf.fsm.takeover.panic

Severity

ALERT

Description

This message occurs when an automatic takeover is initiated after detecting that the partner has panicked.

Corrective Action

Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: http://mysupport.netapp.com/NOW/cgi-bin/pmsg/. Contact NetApp technical support to confirm the analysis.

Syslog Message

Failover monitor: takeover attempted after partner panic.

Parameters

(None).

cf.fsm.takeover.postFailed

Severity

ALERT

Description

This event is issued when an automatic takeover is initiated after detecting that the partner's power-on self-test has failed.

Corrective Action

Please run hardware diagnostics on partner filer and contact Customer Support

Syslog Message

Failover monitor: takeover attempted after partner POST failed

Parameters

(None).

cf.fsm.takeover.rebootExp

Severity

ALERT

Description

This message occurs when an automatic takeover is initiated after detecting that the partner boot process is hung.

Corrective Action

Capture console log of partner node and contact NetApp technical support.

Syslog Message

Failover monitor: automatic takeover attempted after detecting that partner is hung in boot.

Parameters

(None).

cf.fsm.takeover.shortUptime

Severity

ALERT

Description

This message occurs when an automatic takeover is initiated after detecting that the partner died very shortly after booting up.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failover monitor: takeover attempted after partner went down shortly after booting up

Parameters

(None).

cf.fsm.takeover.sparecoreExp

Severity

ALERT

Description

This message occurs when an automatic takeover is initiated by the local node after it detects that the partner node has panicked, and that the partner has not initiated a main memory core dump to disk in a reasonable amount of time.

Corrective Action

Capture the console log of the partner node, and then contact NetApp technical support.

Syslog Message

A takeover was attempted by the local node after sparecore timeout expired on the partner node.

Parameters

(None).

cf.fsm.takeoverByPartnerDisabled

Severity

ERROR

Description

This message occurs when the failover monitor determines that takeover by the partner is disabled.

Corrective Action

Find the reason for the error message (it is surrounded by parentheses). Based on that reason, the corrective action is one of the following: -allowed: Takeover is allowed; you do not need to take any action. -Controller failover (CFO) is not initialized: Make sure that the high-availability (HA) pair is set up correctly. Contact NetApp technical support if you need assistance. -Controller is in non-HA mode: Set the HA mode to "ha" by using the "storage failover modify -mode ha" command to activate HA functionality. This corrective action does not apply for ASA r2. -Takeover disabled: Use the "storage failover modify -enabled true" command to reenable HA functionality. -partner mailbox disks not accessible or invalid: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. Failover monitor version mismatch: Make sure that both the local and partner node are running the same version of Data ONTAP®. -Takeover disabled by partner: Use the "storage failover modify -enabled true" command to reenable HA functionality. -Takeover disabled by operator: Use the "storage failover modify -enabled true" command to reenable HA functionality. -NVRAM size mismatch: Make sure that the local NVRAM (nonvolatile random-access memory) size matches the partner node. -version mismatch: Make sure that both the local and partner nodes are running the same version of Data ONTAP. -interconnect error: Make sure that the interconnect link is connected and functioning. -partner booting: Wait for the partner node to complete its booting process, and then try takeover. -shelf too hot: Make sure that the disk shelf temperature is properly regulated. -partner is performing revert: Wait for the partner node to complete the revert process, and then try takeover. -revert is in progress: Wait for the local node to complete the revert process, and then try takeover. -partner is attempting takeover: Cannot perform a takeover operation while the partner node is attempting a takeover. -takeover is in progress: The local node is already taken over or is trying to take over the partner node. -partner halted in notakeover mode: The partner node was most likely halted using the "halt -f" command; reboot the partner node, and then try again. -unsynchronized log: Make sure that the interconnect link is connected and functioning. -unknown notakeover reasons: Contact NetApp technical support. -waiting for partner to recover: The partner has not booted completely after giveback; wait for the partner to come back up completely. -low memory: Contact NetApp technical support to upgrade. -local halt in progress: The local node is about to halt; try again after the reboot. -status of backup mailbox is uncertain: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. -automatic takeover disabled: Use the "storage failover takeover" command manually. -metrocluster disaster recovery operation is in progress: The local node is performing a MetroCluster(tm) disaster recovery operation; wait for it to finish, and then try again. This corrective action does not apply for ASA r2. -This node or partner node is in switchover state and the MetroCluster configuration option "node-object-limit" is off in the disaster recovery(DR) group of this node: Retry takeover after doing a switchback. This corrective action does not apply for ASA r2.

Syslog Message

Failover monitor: takeover of %s by %s disabled (%s).

Parameters

local (STRING): Name of the local node.
partner (STRING): Name of the partner node.
reason (STRING): Reason takeover is disabled.

cf.fsm.takeoverByPartnerEnabled

Severity

    NOTICE

Description

    This event is issued when the failover monitor determines that takeover by the partner has been enabled.

Corrective Action

    (None).

Syslog Message

    Failover monitor: takeover of %s by %s enabled

Parameters

    local (STRING): Name of local node
    partner (STRING): Name of partner node

cf.fsm.takeoverCountdown

Severity

    INFORMATIONAL

Description

    This event is issued as part of the takeover countdown processing in the FSM.

Corrective Action

    (None).

Syslog Message

    Failover monitor: takeover scheduled in %d seconds

Parameters

    secsTillTakeover (INT): Number of seconds until takeover occurs

cf.fsm.takeoverDelayed

Severity

    NOTICE

Description

    This event is issued when we are delaying takeover due to status indications received from the partner.

Corrective Action

    (None).

Syslog Message

    Failover monitor: takeover delayed, partner %s

Parameters

    reason (STRING): Description of why takeover is being delayed
    secsTillTakeover (INT): Number of seconds until takeover will be started

cf.fsm.takeoverHung

Severity
EMERGENCY

Description
This message occurs when the failover monitor detects that the takeover process is hung. Subsequent to this event, the takeover node will panic.

Corrective Action
Attempt to find the panic string in the event logs by using the "event log show" command from the CLI, and then look up the string by using the Panic Message Analyzer tool on the NetApp support site: http://mysupport.netapp.com/NOW/cgi-bin/pmsg/. Contact NetApp technical support to confirm the analysis.

Syslog Message
Failover monitor: takeover process is hung ('%s').

Parameters
moduleName (STRING): Name of the module that the hang occurred in.

cf.fsm.takeoverOfPartnerDisabled

Severity
ERROR

Description
This message occurs when the failover monitor determines that takeover of the partner is disabled.

Corrective Action
Find the reason for the error message (it is surrounded by parentheses). Based on that reason, the corrective action is one of the following: -allowed: Takeover is allowed; you do not need to take any action. -Controller failover (CFO) is not initialized: Make sure that the high-availability (HA) pair is set up correctly. Contact NetApp technical support for assistance. -Controller is in non-HA mode: Set HA mode to "ha" by using the "storage failover modify -mode ha" command to activate HA functionality. This corrective action does not apply for ASA r2. -HA takeover disabled: Use the "storage failover modify -enabled true" command to reenable HA functionality. -partner mailbox disks not accessible or invalid: Check connectivity to all disks by running the "storage show" nodeshell command on each node and comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. -failover monitor version mismatch: Make sure that both the local and partner node are running the same version of Data ONTAP®. -Takeover disabled by partner: Use the "storage failover modify -enabled true" command to reenable HA functionality. -Takeover disabled by operator: Use the "storage failover modify -enabled true" command to reenable HA functionality. -NVRAM size mismatch: Make sure that the local NVRAM (nonvolatile random-access memory) size matches the partner node. -version mismatch: Make sure that both the local and partner nodes are running the same version of Data ONTAP. -interconnect error: Make sure that the interconnect link is connected and functioning. -partner booting: Wait for the partner node to complete its booting process, and then try takeover. -shelf too hot: Make sure that the disk shelf temperature is properly regulated. -partner is performing revert: Wait for the partner node to complete the revert process, and then try takeover. -revert is in progress: Wait for the local node to complete the revert process, and then try takeover. -partner is attempting takeover: Cannot perform a takeover operation while the partner node is attempting a takeover. -takeover is in progress: The local node is already taken over or is trying to take over the partner node. -partner halted in notakeover mode: The partner node was most likely halted using the "halt -f" or "system node halt -inhibit-takeover" command; reboot the partner node, and then try again. -unsynchronized log: Make sure that the interconnect link is connected and functioning.

-unknown notakeover reasons: Contact NetApp technical support. -waiting for partner to recover: The partner has not booted completely after giveback; wait for the partner to come back up completely. -low memory: Contact NetApp technical support to upgrade. -local halt in progress: The local node is about to halt; try again after the reboot. -status of backup mailbox is uncertain: Check connectivity to all disks by running the "run local storage show" command on each node, and then comparing the results. Resolve the differences in disks visible to both systems. Verify that the interconnect cables are properly cabled. -automatic takeover disabled: Use the "storage failover takeover" command manually. -metrocluster disaster recovery operation is in progress: The local node is performing a MetroCluster(tm) disaster recovery operation; wait for it to finish, and then try again. This corrective action does not apply for ASA r2. -This node or the partner node is in switchover state and the MetroCluster configuration option "node-object-limit" is off in the disaster recovery(DR) group of this node: Retry takeover after doing a switchback. This corrective action does not apply for ASA r2.

Syslog Message

Failover monitor: takeover of %s disabled (%s).

Parameters

partner (STRING): Name of the partner node.
reason (STRING): Description of why takeover cannot occur.

cf.fsm.takeoverOfPartnerEnabled

Severity

NOTICE

Description

This event is issued when the failover monitor determines that takeover of the partner has been enabled.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover of %s enabled

Parameters

partner (STRING): Name of partner node

cf.giveback events

cf.giveback.delayed.cleanup

Severity

INFORMATIONAL

Description

This message occurs when giveback of a partner node is delayed due to the cleanup of a previous giveback event.

Corrective Action

(None).

Failover monitor: giveback process was delayed because of a previous giveback event.

Parameters

(None).

cf.giveback.disk.check.fail

Severity

ALERT

Description

This message occurs when the giveback failed due to a disk inventory check failure.

Corrective Action

If the giveback failed or is disabled because the node did not receive the disk inventory information from the partner, then retry giveback after a few minutes. If the giveback failed or is disabled because the partner is missing its disks, make sure that the partner has connectivity to all of its disks. To check the list of disks that the partner can see, boot the partner in Maintenance mode and use the "disk show" command or "storage show disk" command to list its disks. To check for missing disks, use the "storage failover show -instance" command. If you want to override the disk inventory check, use the "cf disable diskInventory" command from the advanced privilege level of the nodeshell on the takeover node. However, disabling the disk inventory check can lead to client outage if the partner cannot see all of its disks.

Syslog Message

cf giveback failed: %s.

Parameters

reason (STRING): Reason for the disk inventory failure.

cf.giveback.keepingPartnerAggr

Severity

ERROR

Description

This message occurs during the giveback process following a failed takeover attempt, when an aggregate belonging to the partner node is not given back to the partner node. The reason is that the aggregate was already under the control of the node performing the takeover before the takeover attempt. Only aggregates that are acquired during the failed takeover attempt are given back.

Corrective Action

Give back the aggregate to the partner node by using the "storage failover giveback" command.

Syslog Message

Not giving back aggregate '%s' because it was under the control of this node prior to the failed takeover attempt.

Parameters

aggr (STRING): Name of the aggregate that was not given back.

cf.headswap events

cf.headswap.abort

Severity

INFORMATIONAL

Description

This message occurs when the headswap on the partner node is aborted.

Corrective Action

(None).

Syslog Message

(None).

Parameters

partner_sysid (LONGINT): Value of the partner system ID after aborting the headswap.

cf.headswap.clear.partner

Severity

INFORMATIONAL

Description

This message occurs when the disks are manually reassigned to a new partner. The head swap information has been cleared.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.headswap.complete

Severity

INFORMATIONAL

Description

This message occurs when the headswap of a node is completed.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_sysid (LONGINT): Value of the partner system ID before completion of the headswap.
new_sysid (LONGINT): Value of the partner system ID after completion of the headswap.

cf.headswap.detected.local

Severity

INFORMATIONAL

Description

This message occurs when a headswap on the local node is detected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_local_sysid (LONGINT): System ID of the node that is being replaced.
new_local_sysid (LONGINT): System ID of the new node that is replacing the old node.

cf.headswap.detected.partner

Severity

INFORMATIONAL

Description

This message occurs when a headswap on the partner node is detected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_partner_sysid (LONGINT): System ID of the partner that is being replaced.
new_partner_sysid (LONGINT): System ID of the new partner that is replacing the old partner.

cf.headswap.state.change

Severity

INFORMATIONAL

Description

This message occurs when the headswap state changes. The headswap state is written to the primary mailbox. The possible values are HEADSWAP_NONE, HEADSWAP_START, HEADSWAP_CFO_START, HEADSWAP_CFO_END, and HEADSWAP_SFO_START.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_state_string (STRING): Old value of the headswap state.
new_state_string (STRING): New value of the headswap state.

cf.hwassist events

cf.hwassist.Default.NodemgmtAddr

Severity

INFORMATIONAL

Description

This message occurs when the hardware-assist module automatically picked a local IP address for the hardware-assisted takeover feature.

Corrective Action

(None).

Syslog Message

The system automatically chose %s as the local hardware-assist IP address.

Parameters

defaultip (STRING): Default hardware-wassist IP address chosen to receive hardware assist alerts.

cf.hwassist.DefaultEnabled

Severity

INFORMATIONAL

Description

This message occurs when the system automatically enables the hardware-assist takeover feature. With hardware-assisted takeover, certain failures, such as watchdog reset, POST error, and so on, trigger hardware-assisted takeover through hardware components such as Remote LAN Module (RLM) or Service Processor (SP).

Corrective Action

(None).

Syslog Message

Hardware-assisted takeover feature is enabled on this system. The partner can take over this node faster during certain failures.

Parameters

(None).

cf.hwassist.DefaultPrtnrAddr

Severity

NOTICE

Description

This message occurs when the hardware-assist partner address is not configured and the system automatically picked a partner IP address for the hardware-assisted takeover feature. If a partner node has multiple node management IP addresses, a different partner node management IP address can optionally be set by using the "storage failover modify -hwassist-partner-ip" command. Note: the automatically configured IP address cannot be modified on some platforms.

Corrective Action

(None).

Syslog Message

The system automatically chose %s as the hardware-assisted takeover partner address.

Parameters

defaultip (STRING): Default hardware-assist partner IP address chosen to send hardware-assisted takeover alerts.

cf.hwassist.DefaultPrtnrPort

Severity

NOTICE

Description

This message occurs when the partner's port for the hardware-assisted takeover feature is not configured and the system sets the hardware-assist partner port to a default port number. A different partner port number can optionally be set by using the "storage failover modify -hwassist-partner-port" command. Note: the default port number cannot be modified on some platforms.

Corrective Action

(None).

Syslog Message

The system set the default hardware-assist partner port number to %d.

Parameters

defaultport (INT): Default hardware-assist partner port number.

cf.hwassist.empty.MgmtAddr

Severity

ERROR

Description

This message occurs when the local hardware-assist module cannot find at least one node management IP address that has the same capabilities as the partner's hardware components, such as Remote LAN Module (RLM) or Service Processor (SP).

Corrective Action

Complete or correct the setup of the Remote LAN Module (RLM) or Service Process (SP) for each node in your cluster.

Syslog Message

Cannot find hardware-assist node management IP address for partner node.

Parameters

(None).

cf.hwassist.empty.NodemgmtAddr

Deprecated

Deprecated as of version 9.1.

Severity

ERROR

Description

This message occurs when the local hardware-assist module cannot find at least one node management IP address that has the same capabilities as the partner's hardware components, such as Remote LAN Module (RLM) or Service Processor (SP).

Corrective Action

Complete or correct the setup of the Remote LAN Module (RLM) or Service Process (SP) for each node in your cluster.

Syslog Message

Cannot find hardware-assist node management IP address for partner node.

Parameters

(None).

cf.hwassist.FwUpgrade

Severity

ERROR

Description

This message occurs when hwassist thread detects that partner's hw_assist hardware firmware does not support hw_assist feature.

Corrective Action

Upgrade the partner hw_assist hardware firmware to the latest version.

Syslog Message

HA hw_assist: Partner(%s) %s firmware does not support the hw_assist feature.

Parameters

partnerName (STRING): Partner's name.
hwassist_hrdwr (STRING): Type of hw_assist hardware, for example, Remote LAN module(RLM) or

Service Processor(SP).

cf.hwassist.hwasstActive

Severity

INFORMATIONAL

Description

This message occurs when hw_assist successfully binds to a port to listen for alerts.

Corrective Action

None.

Syslog Message

hw_assist: hw_assist functionality is active on IP address: %s port: %d

Parameters

ipaddress (STRING): IP address to which bind was attempted.
port (INT): Port on which bind was attempted.

cf.hwassist.invalidConfig

Severity

NOTICE

Description

This message occurs when the system encounters invalid hardware-assist configurations.

Corrective Action

(None).

Syslog Message

Invalid hardware-assist configurations. IPv4: %s IPv6: %s port: %d keep_alive_interval: %d

Parameters

ipv4 (STRING): Partner node IPv4 address.
ipv6 (STRING): Partner node IPv6 address.
port (INT): Partner node hardware-assist port number.
keep_alive_interval (INT): Hardware-assist keep-alive interval.

cf.hwassist.IpNotConfigured

Severity

ERROR

Description

This message occurs when the hwassist thread detects that the partner's hw_assist hardware is not configured with an IPv4 or IPv6 address.

Corrective Action

Configure a valid IPv4 or IPv6 address for the partner's hw_assist hardware by using the "storage failover

modify -hwassist-partner-ip" command.

Syslog Message

cf hw_assist: Partner(%s)'s %s is not configured with the right IP address family. Use the "storage failover hwassist show" command for details.

Parameters

partnerName (STRING): Partner's name.
hwassist_hrdwr (STRING): Type of hw_assist hardware, for example, RLM.

cf.hwassist.keyMismatch

Severity

NOTICE

Description

This message occurs when hwassist receives a alert with wrong key. EMS displays both the expected and the received keys.

Corrective Action

(None).

Syslog Message

(None).

Parameters

expectedKey (STRING): Expected key, generated by Failover Monitor(FM).
receivedKey (STRING): Received key from hwassist hardware.
systemid (STRING): Received systemid.

cf.hwassist.localMonitor

Severity

ERROR

Description

This message occurs when hwassist thread is inactive because of problems on local node.

Corrective Action

check console log for cf.hwassist_socBindFailed message. If message exist, take corrective action for that message.

Syslog Message

hw_assist: hw_assist functionality is inactive.

Parameters

(None).

cf.hwassist.missedKeepAlive

Severity

ERROR

Description

This message occurs when the HW-assisted takeover process on this node has not received keep-alive messages from its HA partner.

Corrective Action

Use the "storage failover hwassist show" command to verify the status of the HW-assisted takeover feature. If the 'Keep Alive Status' field reports "healthy", it is functional. If the "storage failover hwassist show" command "Keep Alive Status" field reports "did not receive hwassist keep alive alerts from partner" and the "storage failover hwassist stats show" command shows the value of the "ID_mismatch" is incrementing, disable the service-processor (SP or BMC) IPv4 or IPv6 network interfaces and then reenable them, as stated below. Use the "system service-processor network show" command to display the current network configuration. Note whether the IPv4 or IPv6 address-family is enabled. You need this information in the next steps. Perform the following on each node that has an issue: Disable the interface for an address-family by using the "sp network modify -node {name} -address-family {IPv4|IPv6} -enable false" command. Then, reenable the interface for an address-family by setting "-enable true" via the above command.

Syslog Message

HW-assisted takeover missing keep-alive messages from HA partner (%s).

Parameters

partnerName (STRING): HA partner name.

cf.hwassist.noConfigRecv

Severity

ERROR

Description

This message occurs when hwassist thread has not received any config info from partner.

Corrective Action

None.

Syslog Message

hw_assist: hw_assist functionality inactive. No config received from partner(%s).

Parameters

partnerName (STRING): Partner's name.

cf.hwassist.notCapable

Severity

ERROR

Description

This message occurs when the currently installed firmware version of the hardware module doesn't support the hardware-assisted takeover feature.

Corrective Action

Upgrade the hardware module firmware to the latest version.

Syslog Message

Currently installed version of %s's firmware doesn't support the hardware-assist takeover feature. Install a latest firmware for the hardware-assist takeover feature to work.

Parameters

hwtype (STRING): Hardware module type.

cf.hwassist.notifyCfgFailed

Severity

ALERT

Description

This message occurs when a controller module fails to update the hardware-assist configuration with its partner node. This is most likely because the SP component is not ready. The controller module will retry the hardware-assist configuration update automatically.

Corrective Action

Use the ""system node service-processor show"" command to check whether the SP is online. The SP must be online to update the hardware-assist configuration. If the SP is operational and online, use the ""system node service-processor reboot-sp"" command to reboot the SP.If the message persists, contact NetApp technical support.

Syslog Message

Failed to update the hardware-assist configuration with hardware component (%s): %s(%d).

Parameters

hwtype (STRING): Hardware component type.
errorstr (STRING): Error string returned by the hardware component.
error (INT): Error number returned by the hardware component.

cf.hwassist.notifyEnableOff

Severity

INFORMATIONAL

Description

This message occurs when the hwassist thread detects that 'notify enable' is turned off on the partner node.

Corrective Action

None.

Syslog Message

HA hw_assist: hw_assist functionality on the partner node has been disabled by the user.

Parameters

(None).

cf.hwassist.notifyEnableOn

Severity

INFORMATIONAL

Description

This message occurs when the user enables hw_assist functionality on the partner node. hw_assist will try to bind to the specified IP address and port.

Corrective Action

None.

Syslog Message

HA hw_assist: hw_assist functionality on the partner node has been enabled by the user.

Parameters

(None).

cf.hwassist.ptnStartThrottle

Severity

INFORMATIONAL

Description

This message occurs when partner has started throttling hw_assist alerts. UDP socket will be closed and no alerts will be received.

Corrective Action

(None).

Syslog Message

Failover Monitor hw_assist: Partner(%s) node has started throttling hw_assist alerts.

Parameters

partnerName (STRING): Partner's name

cf.hwassist.ptnStopThrottle

Severity

INFORMATIONAL

Description

This message occurs when partner has stopped throttling hw_assist alerts. hw_assist will bind to UDP socket and wait for alerts.

Corrective Action

(None).

Syslog Message

hw_assist: Partner(%s) has stopped throttling hw_assist alerts.

Parameters

partnerName (STRING): Partner's name

cf.hwassist.recvKeepAlive

Severity

INFORMATIONAL

Description

This message occurs when hwassist thread receives hw_assist KeepAlive alert after missing at least two consecutive KeepAlive alerts.

Corrective Action

(None).

Syslog Message

hw_assist: Received hw_assist KeepAlive alert from partner(%s).

Parameters

partnerName (STRING): Partner's name

cf.hwassist.socBindFailed

Severity

ERROR

Description

This message occurs when hwassist thread fails to bind to a socket on a particular ipaddress. The error indicates why bind failed.

Corrective Action

Check if specified port and IP address is valid. You may want to try with a different recommended port number.

Syslog Message

hw_assist: bind failed to port %d on IP address %s. Error %d

Parameters

port (INT): Port on which bind was attempted.
ipaddress (STRING): IP address to which bind was attempted.
error (INT): error returned by bind call

cf.hwassist.socInitFailed

Severity

NOTICE

Description

This message occurs when hwassist thread fails to create socket.

Corrective Action

None.

Syslog Message

hw_assist: Fail to create socket.

Parameters

(None).

cf.hwassist.startThrottle

Severity

NOTICE

Description

This message occurs when the hardware assist subsystem thread detects that it is receiving hardware assist alerts at a rate higher than the maximum configurable rate and has temporarily stopped listening for hardware assist alerts. This can be an indication that another client is configured to send SNMP traps to the hardware assist trap IP address and port. If the partner node fails while listening for hardware assist alerts is disabled, detection of the partner failure can take slightly longer as loss of heartbeat from the partner or other non-hardware-assisted mechanism is instead needed to detect the failure. Subsequent receipt of the cf.hwassist.stopThrottle message indicates the hardware assist thread is again listening for hardware assist alerts.

Corrective Action

Check whether some other client is configured to send SNMP alerts to the IP address and port on which hardware assist is configured. You can obtain the IP address using the ""storage failover hwassist show"" command. If this is the case, direct those SNMP alerts to the correct IP address and port. If not, contact NetApp technical support to further diagnose the issue.

Syslog Message

hw_assist: Received %llu hw_assist alerts in %llu secs. Throttling alerts for %llu secs.

Parameters

num_of_traps (LONGINT): Number of traps received.
time_interval (LONGINT): Time window in which the traps were received.
throttle_time (LONGINT): Time for which throttle will happen.

cf.hwassist.stopThrottle

Severity

NOTICE

Description

This message occurs when a node has stopped throttling hardware assist alerts from the partner. This indicates the hardware assist thread has restarted listening for hardware assist alerts subsequent to the receipt of the cf.hwassist.startThrottle event.

Corrective Action

(None).

Syslog Message

Failover monitor hw_assist: Shutting off throttle for hw_assist alerts from partner(%s).

Parameters

partnerName (STRING): Partner's name.

cf.hwassist.takeoverTrapRecv

Severity

NOTICE

Description

This message occurs when hwassist thread receives a hw_assist alert which will result in partner takeover. EMS displays trap type as well as reason for the trap.

Corrective Action

(None).

Syslog Message

hw_assist: Received takeover hw_assist alert from partner(%s), %s because %s.

Parameters

partnerName (STRING): Partner's name
trap_type (STRING): Type of trap received
trap_event (STRING): Type of trap event

cf.hwassist.unknownSig

Severity

INFORMATIONAL

Description

This message occurs when hwassist thread receives an unknown signal.

Corrective Action

None.

Syslog Message

hw_assist: Received unknown signal 0x%x.

Parameters

sigmask (INT): Signal received by hwassist thread.

cf.ic events

cf.ic.cc.config.changed

Severity

NOTICE

Description

This message occurs when the controller configuration is changed from a single enclosure HA configuration to a dual enclosure HA configuration.

Corrective Action

If the controller is part of a dual enclosure HA configuration, make sure that the psm-cc-config? environment variable is unset and reboot.

Syslog Message

HA interconnect: Controller configuration was changed from single enclosure HA configuration to dual enclosure HA configuration.

Parameters

(None).

cf.ic.clientinitFailed

Severity

ERROR

Description

This message occurs when the interconnect client fails to initialize due to remote VI setup failure.

Corrective Action

Reboot the controller. Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: Initialization failure for %s client.

Parameters

client (STRING): Name of the client that failed to initialize.

cf.ic.disabled

Severity

ERROR

Description

This message occurs when the HA interconnect is disabled by the ic-type environment variable.

Corrective Action

Either remove the HA interconnect from the controller or change the ic-type environment variable.

Syslog Message

HA interconnect: Card in slot %d has been disabled because of the ic-type environment variable.

Parameters

slot (INT): Slot that the interconnect is in.

cf.ic.driver.flush.idWarn

Severity

NOTICE

Description

This message occurs when the HA interconnect cannot process a flush request for a particular driver I/O request.

Corrective Action

(None).

Syslog Message

HA interconnect: Flush %s failed for channel %d and ID %d.

Parameters

s (STRING): Name of the error.
nvidx (INT): Interconnect channel.
wrid (INT): Work request ID.

cf.ic.failed.memReg

Severity

INFORMATIONAL

Description

This message occurs when memory registration fails.

Corrective Action

(None).

Syslog Message

HA interconnect: Memory registration operation failed at %d.

Parameters

source (INT): Source for the memory operation.

cf.ic.flush.ACKWarn

Severity

NOTICE

Description

This message occurs when the HA interconnect cannot send acknowledgments through its completion channel.

Corrective Action

(None).

Syslog Message

HA interconnect: Flush completion %s error.

Parameters

s (STRING): Name of the error.

cf.ic.flush.MemError

Severity

ERROR

Description

This message occurs during boot time initialization, when the HA interconnect encounters an error with memory registration or allocation.

Corrective Action

Reboot the controller to restart the HA interconnect. Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: Flush memory %s error.

Parameters

s (STRING): Name of the error.

cf.ic.flush.oodlinitFailed

Severity

ERROR

Description

This message occurs when there is a failure in the initialization of a NIC to enable out-of-order delivery on the HA interconnect.

Corrective Action

Reboot the controller to enable HA interconnect flushing. Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: Flush out-of-order delivery initialization failed.

Parameters

(None).

cf.ic.heartBeatFailed

Severity

ERROR

Description

This message occurs when heartbeats cannot be sent or received over the HA interconnect.

Corrective Action

Verify that both controllers in the HA pair are operational. If this message persists, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

Syslog Message

HA interconnect: Heartbeat failed.

Parameters

(None).

cf.ic.initFailed

Severity

ERROR

Description

This message occurs when the driver fails to find an HA interconnect adapter or the interconnect is nonfunctional.

Corrective Action

Verify that the High Availability interconnect card is present and operational on the system. Reboot the controller. Contact NetApp technical support if this problem persists.

Syslog Message

HA interconnect: Unable to initialize process.

Parameters

(None).

cf.ic.non.cc.config.changed

Severity

NOTICE

Description

This message occurs when the controller configuration is changed from a dual enclosure HA configuration to a single enclosure HA configuration.

Corrective Action

If the controller is part of single enclosure HA configuration, make sure that that the other controller is physically present in the chassis and that the psm-cc-config? environment variable is set to true, and then reboot.

Syslog Message

HA interconnect: Controller configuration was changed from dual enclosure HA configuration to single enclosure HA configuration.

Parameters

(None).

cf.ic.notifyTimeout

Severity

NOTICE

Description

This message occurs when data transfer over the HA interconnect times out.

Corrective Action

(None).

Syslog Message

HA interconnect: %s transfer timed out.

Parameters

qp_name (STRING): Queue-pair name.

cf.ic.portsCrossConnected

Severity

ALERT

Description

This message occurs when the HA interconnect driver determines that the ports between this controller and its partner are cross-connected.

Corrective Action

Connect port 1 on this controller to port 1 on the partner, and connect port 2 on this controller to port 2 on the partner. If the interconnect cables have serial number tags on both ends, use the serial numbers to verify that the ports are properly connected. If the interconnect cables do not have serial number tags, disconnect one of the HA interconnect ports from one of the controllers. The LEDs of this port and one of the ports on the partner turn off. If the two ports have different port numbers, the cables are cross-connected. Reversing the connection on one of the controllers rectifies the problem.

Syslog Message

HA interconnect: Port %d of this controller seems to be connected to port %d on the partner.

Parameters

localPort (INT): Local port number.
remotePort (INT): Remote port number.

cf.ic.probe.error

Severity

ALERT

Description

This event is generated when we fail to detect an High Availability (HA) interconnect communication device during system initialization. If this error occurs, internode communication within the HA pair is down.

Corrective Action

Examine the logs for messages regarding the HA interconnect. Resolve the HA interconnect problems.

Syslog Message

Failover monitor: no interconnect found WARNING: Failover monitor operating in degraded mode

Parameters

errorCode (INT): The internal error code

cf.ic.sbb

Severity

NOTICE

Description

This message occurs when a system SBB (Storage Bridge Bay) Compatibility event occurs. SBB Compatibility events determine the presence or absence of the HA partner controller on some platforms.

Corrective Action

(None).

Syslog Message

HA interconnect: SBB Compatibility Event. %s

Parameters

event_description (STRING): Presence or absence of the partner controller and what action has been taken on the interconnect device.

cf.ic.xferTimedOut

Severity

ERROR

Description

This message occurs when data transfer over the HA interconnect times out. This is usually seen when the interconnect link goes down. It can also be encountered when the interconnect hardware, firmware, or driver experiences a hang.

Corrective Action

Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: %s transfer timed out.

Parameters

qp_name (STRING): Name of the connection queue-pair that timed out.

cf.ic.xferTimedOutVSA

Severity

NOTICE

Description

This message occurs when data transfer over the high-availability (HA) interconnect times out on virtual platforms. This is usually seen when the underlying network is busy or the system is operating under heavy load.

Corrective Action

Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: %s transfer timed out.

Parameters

qp_name (STRING): Name of the connection queue-pair that timed out.

cf.mccip events

cf.mccip.med.auso.stDisabled

Severity

ERROR

Description

This message occurs when automatic switchover in a MetroCluster(tm) IP configuration is disabled because the mediator mailbox disk is not healthy.

Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that iSCSI connections to the mediator are up and healthy.

Syslog Message

Automatic switchover disabled: Mediator mailbox disk not healthy.

Parameters

(None).

cf.mccip.med.auso.stEnabled

Severity

NOTICE

Description

This message occurs when automatic switchover in a MetroCluster(tm) IP configuration is enabled because the mediator mailbox disk is online.

Corrective Action

(None).

Syslog Message

Automatic switchover enabled.

Parameters

(None).

cf.misc events

cf.misc.givebackPartnerNotReady

Severity

NOTICE

Description

The message occurs when a giveback is initiated before the partner has reached waiting-for-giveback state.

Corrective Action

(None).

Syslog Message

Giveback is being initiated before the partner is in the waiting-for-giveback state. The partner is in the %s state.

Parameters

state (STRING): Current state of the partner.

cf.misc.operatorDisable

Severity

ERROR

Description

This message occurs when the operator disables the high-availability (HA) pair.

Corrective Action

Use the "storage failover modify -enabled true" command to reenable failover.

Syslog Message

Failover monitor: operator initiated disabling of takeover.

Parameters

(None).

cf.misc.operatorDisableOption

Severity

ERROR

Description

This event is issued when the operator disables a High Availability (HA) option.

Corrective Action

Re-enable the option

Syslog Message

(None).

Parameters

option (STRING): Name of the option

cf.misc.operatorEnable

Severity

NOTICE

Description

This event is issued when the operator enables failover between the 2 nodes.

Corrective Action

(None).

Syslog Message

Failover monitor: operator initiated enabling of failover.

Parameters

(None).

cf.misc.operatorEnableOption

Severity

NOTICE

Description

This event is issued when the operator enables a controller failover option.

Corrective Action

(None).

Syslog Message

(None).

Parameters

option (STRING): Name of the option

cf.misc.operatorForcedTakeover

Severity

NOTICE

Description

This event is issued when a forced takeover is initiated by the operator.

Corrective Action

(None).

Syslog Message

Failover monitor: forced takeover initiated by operator

Parameters

(None).

cf.misc.operatorGiveback

Severity

INFORMATIONAL

Description

This event is issued when a giveback is initiated by the operator.

Corrective Action

(None).

Syslog Message

Failover monitor: %s initiated by operator

Parameters

strengthString (STRING): External string
strengthCode (INT): Internal code for strength

cf.misc.operatorTakeover

Severity

NOTICE

Description

This event is issued when a takeover is initiated by the operator.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover initiated by operator

Parameters

(None).

cf.misc.ProgTakeover

Severity

NOTICE

Description

This message is issued when a takeover is initiated programmatically by Data ONTAP®.

Corrective Action

(None).

Syslog Message

Failover monitor: takeover initiated.

Parameters

(None).

cf.misc.ProgTakeoverFail

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails.

Corrective Action

Check the reason string and repair the problem reported.

Syslog Message

Failover monitor: Programmatic takeover failed (%s)

Parameters

errorstr (STRING): Error string returned by the failover monitor.

cf.misc.ProgTakeoverFailInit

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails because the controller is set to "non_ha" mode or is not initialized.

Corrective Action

Set the HA mode to "ha" by using the "storage failover modify -mode ha" command, and then reboot the node.

Syslog Message

Failover monitor: Programmatic takeover failed due to initialization issues.

Parameters

(None).

cf.misc.ProgTakeoverFailInTO

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the node is already in takeover mode.

Corrective Action

(None).

Syslog Message

Failover monitor: Programmatic takeover failed due to previous takeover.

Parameters

(None).

cf.misc.ProgTakeoverFailNotUp

Severity

NOTICE

Description

This message occurs when a negotiated takeover is initiated programmatically by Data ONTAP® and the partner node is not up.

Corrective Action

Bring up the partner node.

Syslog Message

Failover monitor: Programmatic takeover failed because the partner node is not up.

Parameters

(None).

cf.misc.ProgTakeoverFailPartnerDeny

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the partner node denies the takeover request.

Corrective Action

Check previous EMS messages to determine why takeover was denied.

Syslog Message

Failover monitor: Programmatic takeover failed because the partner node denied the takeover request.

Parameters

(None).

cf.misc.ProgTakeoverFailShutdown

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and a shutdown is in progress.

Corrective Action

Verify that both nodes are booted.

Syslog Message

Failover monitor: Programmatic takeover failed because shutdown was in progress.

Parameters

(None).

cf.mode events

cf.mode.auto.HA

Severity

NOTICE

Description

This message occurs when the controller is automatically set to High Availability(HA) mode because of the configuration values in the Field Replaceable Unit(FRU) or the slot of the interconnect/NVRAM card (depending on the hardware type of the controller).

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.mode.auto.non.HA

Severity

NOTICE

Description

This message occurs when the controller is automatically set to non-High Availability (non-HA) mode because of the configuration values in the Field Replaceable Unit (FRU) or the slot of the interconnect/NVRAM card (depending on the hardware type of the controller).

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.mode.HA

Severity

INFORMATIONAL

Description

This message occurs when the user sets the controller to High Availability(HA) mode through the command-line interface.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.mode.HA.onboot

Severity

INFORMATIONAL

Description

This message occurs when the controller is set to High Availability (HA) mode according to options detected at boot.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.mode.non.HA

Severity

INFORMATIONAL

Description

This message occurs when the user sets the controller to non-High Availability (non-HA) mode through the command-line interface.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.mode.non.HA.onboot

Severity

INFORMATIONAL

Description

This message occurs when the controller is set to non-High Availability (non-HA) mode according to options detected at boot.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.multidisk events

cf.multidisk.fatalProblem

Severity

ERROR

Description

This message occurs when the node is waiting for the partner to take over, after the node encounters a multidisk error or some other fatal error.

Corrective Action

(None).

Syslog Message

Node encountered a multidisk error or other fatal error while waiting to be taken over. %s.

Parameters

mdp_msg (STRING): Multi Disk Panic (MDP) string.

cf.nducomplete events

cf.nduComplete

Severity

INFORMATIONAL

Description

This message occurs when a nondisruptive upgrade is completed successfully.

Corrective Action

(None).

Syslog Message

(None).

Parameters

token (STRING): Unique token that identifies an instance of a nondisruptive upgrade.
host (STRING): Name of system that completed the nondisruptive upgrade.

cf.nduincomplete events

cf.nduIncomplete

Severity

INFORMATIONAL

Description

This message occurs when a nondisruptive upgrade fails.

Corrective Action

Resolve the reason for the failure and retry the nondisruptive upgrade from the failed step.

Syslog Message

(None).

Parameters

token (STRING): Unique token that identifies an instance of a nondisruptive upgrade.
host (STRING): Name of the node that failed the nondisruptive upgrade.
reason (STRING): Reason for the upgrade failure.

cf.ndustart events

cf.nduStart

Severity

INFORMATIONAL

Description

This message occurs when a nondisruptive upgrade starts.

Corrective Action

(None).

Syslog Message

(None).

Parameters

token (STRING): Unique token that identifies an instance of a nondisruptive upgrade.
host (STRING): Name of system that started the nondisruptive upgrade.

cf.nm events

cf.nm.nicReset

Severity

NOTICE

Description

This message occurs when the controller performs a soft reset of the HA interconnect card as part of automatic recovery from a timeout or link error.

Corrective Action

(None).

Syslog Message

HA interconnect: Initiating soft reset on card %d due to %s.

Parameters

nic_num (INT): Interconnect NIC number.
reason (STRING): Describes why the soft reset was initiated. Possible reasons: rendezvous jammed rendezvous fm timeout rendezvous peer-connect timeout

cf.nm.nicViError

Severity

INFORMATIONAL

Description

This message occurs when any error is detected in any virtual interface while handling a link transition.

Corrective Action

(None).

Syslog Message

HA interconnect: NIC %d has an error on %s (virtual interface #%d): %s.

Parameters

nic_num (INT): Interconnect NIC number.
vi_name (STRING): Name of the virtual interface.
vinum (INT): Virtual interface number.
origin (STRING): Origin of the error.

cf.noautogb events

cf.noAutoGB.ptnrLowerVersion

Severity

NOTICE

Description

This message occurs when an automatic giveback operation is cancelled because the high-availability (HA) partner is using an earlier and incompatible Data ONTAP® version than the local node. Subsequent failover events might not be successful when HA partners are not using compatible Data ONTAP versions.

Corrective Action

Run the "system node image show" command to determine which image on the partner should be booted to be compatible with the local node. After rebooting the node, automatic giveback is performed.

Syslog Message

Auto-giveback cancelled because the HA partner is using a lower Data ONTAP version than the local node.

Parameters

(None).

cf.nopartner_takeover events

cf.noPartner_takeover

Severity

ERROR

Description

This message occurs when the partner node fails but requested not to be taken over to prevent multiple, simultaneous RAID reconstructs from starting.

Corrective Action

Check the partner node for multiple disk or disk shelf failures, and then correct that situation. If you want takeover to occur, use the "storage failover takeover" command. If you want takeover to occur when disk or shelf failures occur, change the setting of the "raid.panic.missing.disks" option to '0' from the nodeshell.

Syslog Message

Failover monitor: Partner node is down, but requested not to be taken over.

Parameters

(None).

cf.nullshelfcountmsg events

cf.nullShelfCountMsg

Severity

ERROR

Description

This event occurs if we are sent a NULL negotiated failover shelf count message. * This is likely due to an InterConnect problem.

Corrective Action

Check for and resolve any interconnect errors.

Syslog Message

Invalid disk shelf count message was received from partner.

Parameters

(None).

cf.partner events

cf.partner.login

Severity

INFORMATIONAL

Description

This event is issued when a login to the console of the partner occurs as a result of the 'partner' command being issued with no arguments.

Corrective Action

(None).

Syslog Message

Login to partner shell: %s

Parameters

hostname (STRING): The name of this node

cf.partner.logoff

Severity

INFORMATIONAL

Description

This event is issued when a logoff from the console of the partner occurs as a result of the 'partner' command being issued with no arguments.

Corrective Action

(None).

Syslog Message

Logoff from partner shell: %s

Parameters

hostname (STRING): The name of this node

cf.partner.nvram.notSync

Severity

INFORMATIONAL

Description

This message occurs during takeover, when the system finds the partner nonvolatile memory (NVRAM) unsynchronized. There might be data loss.

Corrective Action

(None).

Syslog Message

Partner NVRAM was not synchronized. Some data might be lost.

Parameters

(None).

cf.partner.nvram.state

Severity

INFORMATIONAL

Description

This message occurs during takeover, when the system determines that the partner mailbox is stale. This might mean that partner nonvolatile memory (NVRAM) is unsynchronized and might have some data loss.

Corrective Action

(None).

Syslog Message

Partner mailbox was stale. Partner NVRAM might not be synchronized and some data might be lost.

Parameters

(None).

cf.partner.ready.giveback

Severity

INFORMATIONAL

Description

This message occurs when the partner is booted and ready for giveback.

Corrective Action

Verify that network connectivity is restored, and then use the "storage failover giveback" command to initiate giveback to the partner.

Syslog Message

Partner is booted and ready for giveback.

Parameters

(None).

cf.partner.shortUptime

Severity

ERROR

Description

This message occurs when a node in a controller failover pair determines that the partner node has stayed up for a very short time period. This might result in a takeover

Corrective Action

Check the disk connectivity to the partner node. If the problem persists and the partner node restarts multiple times, perform hardware diagnostics in maintenance mode, and then consult the EMS logs to determine why this is happening.

Syslog Message

Partner up for %llu seconds only.

Parameters

seconds (LONGINT): Time duration for which the partner was up.

cf.reservation events

cf.reservation.disk.notFound

Severity

NOTICE

Description

This message occurs when the system does not halt on a disk reservation conflict and the reservation is not found on the disk.

Corrective Action

(None).

Syslog Message

Reservation found on disk %s; not halting due to sanown_pr_test_mode.

Parameters

   diskName (STRING): Disk name.

cf.rsrc events

cf.rsrc.givebackFail

Severity

   ALERT

Description

   This message occurs when a failure is detected during giveback. The giveback operation will be cancelled.

Corrective Action

   Check the logs for other messages regarding the listed subsystem using the "event log show" CLI command. Resolve those problems and perform a planned giveback operation using "storage failover giveback" command.

Syslog Message

   Failover monitor: giveback during %s failed; giveback cancelled.

Parameters

   op (STRING): Name of the giveback subsystem that has suffered a fatal error.

cf.rsrc.givebackForceFail

Severity

   ERROR

Description

   This event occurs if a failure is forced during giveback. This event should only occur in debugging kernels.

Corrective Action

   Retry the takeover.

Syslog Message

   Failover monitor: giveback during %s forced fail

Parameters

   op (STRING): Name of the takeover operation

cf.rsrc.givebackForceVeto

Severity

   ERROR

Description

   This event occurs if a veto is forced during giveback. This event should only occur in debugging kernels.

Corrective Action

Check the state of the subsystem listed in this message. Retry the giveback.

Syslog Message

Giveback during %s forced veto

Parameters

op (STRING): Name of the takeover operation

cf.rsrc.givebackOpFail

Severity

ERROR

Description

This event occurs if a failure is detected during giveback. This error is not fatal to the giveback process but indicates that the related service could not be shutdown cleanly.

Corrective Action

Check the state of the subsystem listed in the message and validate it is working correctly. Validate that there are no configuration errors for the listed subsystem.

Syslog Message

Failover monitor: giveback during %s failed; giveback continuing…

Parameters

op (STRING): Name of the giveback operation that has suffered a non-fatal error.

cf.rsrc.givebackUnexpected

Severity

ALERT

Description

This event occurs if we detect an unexpected failover monitor state during a giveback operation. This indicates a software bug.

Corrective Action

Retry the giveback.

Syslog Message

(None).

Parameters

op (STRING): Name of the giveback operation
state (INT): Value of the failover monitor state

cf.rsrc.givebackVeto

Severity

ALERT

Description

This message occurs when a veto is indicated during giveback. A veto occurs when the active partner state is detected during the giveback process. A veto can be overridden by using the "cf giveback -f" or "storage failover takeover -override-vetoes true" command.

Corrective Action

Check the preceeding messages for reasons why the giveback was vetoed. Check the state of the subsystem listed in this message. Retry the giveback.

Syslog Message

Failover monitor: %s: giveback canceled due to active state.

Parameters

op (STRING): Name of the takeover operation.

cf.rsrc.raidReplayOnlyTODone

Severity

INFORMATIONAL

Description

This event occurs when a node is booting after having panicked too soon after takeover or during takeover. In that event we want to replay the partner RAID logs, before we perform a giveback. This message indicates the point at which we have committed partner RAID logs to the disk and are now going to initiate a giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: Raid replay-only takeover completed. Initiating giveback.

Parameters

(None).

cf.rsrc.replayOnlyTakeoverDone

Severity

NOTICE

Description

This event occurs when a node is booting after having panicked too soon after takeover or during takeover. In that event we want to replay the partner logs, before we perform a giveback. This message indicates the point at which we have committed partner logs to the disk and are now going to initiate a giveback.

Corrective Action

(None).

Syslog Message

Failover monitor: replay-only takeover completed. Initiating giveback.

Parameters

(None).

cf.rsrc.takeoverFail

Severity

ALERT

Description

This message occurs when a failure is detected during takeover. The takeover operation will be cancelled.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failover monitor: takeover during %s failed; takeover cancelled.

Parameters

op (STRING): Name of the takeover operation that has suffered a fatal error.

cf.rsrc.takeoverForceFail

Severity

ERROR

Description

This event occurs if a failure is forced during takeover. This event should only occur in debugging kernels.

Corrective Action

Retry the takeover request.

Syslog Message

Failover monitor: takeover during %s forced fail

Parameters

op (STRING): Name of the takeover operation

cf.rsrc.takeoverOpFail

Severity

ERROR

Description

This event occurs if a failure is detected during takeover. This error is not fatal to the takeover process but indicates that the related service may be inaccessible during takeover of the partner.

Corrective Action

After takeover completes, check the state of the subsystem listed in the message. Check that the configuration of the subsystem listed in the messsage is correct.

Syslog Message

Failover monitor: takeover during %s failed; takeover continuing…

Parameters

op (STRING): Name of the takeover operation that has suffered a non-fatal error.

cf.rsrc.takeoverUnexpected

Severity

ERROR

Description

This event occurs if we detect an unexpected failover monitor state during a takeover operation. This indicates a software bug.

Corrective Action

Check the state of the subsystem listed in 'op' parameter. Retry the giveback.

Syslog Message

(None).

Parameters

op (STRING): Name of the giveback operation
state (INT): Value of the failover monitor state

cf.rv events

cf.rv.connected

Severity

INFORMATIONAL

Description

This message occurs when an HA connection agent connects on an HA interconnect device.

Corrective Action

(None).

Syslog Message

HA interconnect: Connection for '%s' succeeded.

Parameters

rv_name (STRING): Logical name of the successful HA connection.

cf.rv.flush.handleExchange

Severity

INFORMATIONAL

Description

This message occurs when HA interconnect exchanges flushing information with the partner.

Corrective Action

If the flush handle exchange reports "inactive", the remote controller might be running a version of Data ONTAP® that does not support flushing. Make sure that the controller and its partner are running compatible versions of the software.

Syslog Message

HA interconnect: Flushing is %s.

Parameters

s (STRING): Flushing status.

cf.rv.localNoConn

Severity

INFORMATIONAL

Description

This message occurs when the local controller votes not to connect to the HA partner. This can be caused by incompatibility between the software versions running on the two controllers.

Corrective Action

Install compatible versions of software on both controllers.

Syslog Message

HA interconnect: Local controller voted not to connect.

Parameters

(None).

cf.rv.nicReset

Severity

ERROR

Description

This message occurs when HA interconnects are reset due to NVRAM log being unsynchronized for longier time than 15seconds.

Corrective Action

Contact NetApp technical support if the problem persists.

Syslog Message

HA interconnect: Reset due to unsynchronized log.

Parameters

(None).

cf.rv.notConnected

Severity

ALERT

Description

This message occurs when an HA connection agent fails to connect on an HA interconnect device.

Corrective Action

Verify that both controllers in the HA pair are operational. If this message persists, disable and reenable the link by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

Syslog Message

HA interconnect: Connection for '%s' failed.

Parameters

rv_name (STRING): Logical name of the failing HA connection.

cf.rv.partnerNoConn

Severity

ERROR

Description

This message occurs when the HA partner votes not to connect to this controller. This can happen if the HA partner detects an incompatibility between the software versions running on the two controllers.

Corrective Action

Install compatible versions of software on both controllers.

Syslog Message

HA interconnect: Partner voted not to connect.

Parameters

(None).

cf.shutdown events

cf.shutdown.info

Severity

NOTICE

Description

This message occurs when the controller receives a message from its partner over the HA interconnect that indicates a condition related to the partner's attempted graceful shutdown.

Corrective Action

(None).

Syslog Message

(None).

Parameters

eventType (STRING): Event type, such as "Long shutdown".
eventSummary (STRING): Last task executed and its duration.
shutdownSummary (STRING): Shutdown phase summary for the event.

cf.sysid events

cf.sysid.sent

Severity

INFORMATIONAL

Description

This message occurs when a node sends its system ID and its HA partner's system ID successfully across the HA interconnect.

Corrective Action

(None).

Syslog Message

(None).

Parameters

sysid (LONGINT): Value of the local system ID that was sent successfully .
host (STRING): This parameter is obsolete from Data ONTAP®8.3 and later because the parter's systemID is also sent in the message.
partner_sysid (LONGINT): Value of the partner system ID that was sent successfully.

cf.takeover events

cf.takeover.aborted.bdfu

Severity

NOTICE

Description

This message occurs when negotiated takeover is aborted because the background disk firmware update took more than 120 seconds to finish.

Corrective Action

Rerun the takeover command.

Syslog Message

(None).

Parameters

(None).

cf.takeover.delayed.bdfu

Severity

INFORMATIONAL

Description

This message occurs when negotiated takeover is initiated on a node while the background disk firmware update (BDFU) is in progress. If update is not completed within 120 seconds, takeover is aborted.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

cf.takeover.delayed.cleanup

Severity

INFORMATIONAL

Description

This message occurs when takeover of a node by the node's high-availability (HA) partner was delayed due to the cleanup being performed after the previous giveback event.

Corrective Action

(None).

Syslog Message

(None).

Parameters

delay (LONGINT): Amount of time (in milliseconds) the takeover was delayed.

cf.takeover.disabled

Severity

ALERT

Description

This message occurs when takeover of a node by the node's high-availability (HA) partner is disabled.

Corrective Action

Resolve the issue, as identified by the message, for takeover being disabled. Use the "storage failover show -instance" command to determine whether the disks are accessible by both nodes in the HA pair, also check the HA interconnect between both nodes is installed and functioning correctly. If not, fix the cabling, disk, or adapter issues to resolve the connectivity issues.

Syslog Message

%s.

Parameters

reason (STRING): Reason for takeover being disabled.

cf.takeover.missing.ptnrDiskInventory

Severity

EMERGENCY

Description

This message occurs when a takeover request is denied because the node did not receive the partner disk inventory information.

Corrective Action

Wait five minutes and then try takeover again. If you want to disable the disk inventory check instead, you can use the "cf disable diskInventory" command from the advanced privilege level of the nodeshell. However, disabling the disk inventory check might lead to a client outage when the local node cannot see the partner disks during takeover.

Syslog Message

(None).

Parameters

(None).

cf.takeover.missingPtnrDisks

Severity

EMERGENCY

Description

This message occurs when a takeover request is denied because the node cannot see some of the partner's drives.

Corrective Action

Make sure that the local node has connectivity to all file system drives owned by the partner. Use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the drive and to determine latest ownership. Drives might not be visible if partner drives have failed or the node is having issues accessing the partner node's drives. Verify that the HA interconnect cabling is correct, replace any failed drives and then check whether the issue is resolved. If you want to disable the drive inventory check instead, use the "storage failover takeover -allow-disk-inventory-mismatch true" command. However, disabling the drive inventory check during takeover is not advisable, because it might lead to client outage.

Syslog Message

Failover monitor: Takeover failed because the node cannot see some of the partner node's drives.

Parameters

(None).

cf.transition events

cf.transition.info

Severity

NOTICE

Description

This message occurs when a failover event is completed successfully. It displays the protocol transition information for the event.

Corrective Action

(None).

Syslog Message

%s %s.

Parameters

eventType (STRING): Takeover, aggregate relocation, SFO phase of takeover, or SFO giveback event type.
eventSummary (STRING): Transition duration for protocols during the event.

cifs events

cifs.does events

cifs.does.not.exist

Severity

ERROR

Description

This message occurs when a Vserver or Cluster administrator tries to initialize Snapmirror on Async VserverDR ID Discard setup without creating a CIFS server at destination. Snapmirror initialize will not complete successfully and will remain uninitialized.

Corrective Action

Create CIFS server at destination(DP-destination) vserver. Reissue snapmirror initialize.

Syslog Message

CIFS server does not exist on Vserver '%s'.

Parameters

vserverName (STRING): Name of the DP-destination Vserver on which CIFS server does not exist.

cifs.domainpwd events

cifs.domainpwd.job.deletion

Severity

NOTICE

Description

This message occurs when disabling of CIFS domain password change schedule fails to delete the job for a Vserver.

Corrective Action

Delete the job on the owning node using 'job delete -id ' command.

Syslog Message

An attempt to delete the CIFS domain password change job with ID %d for Vserver %s failed. Reason %s.

Parameters

jobid (LONGINT): CIFS password change job ID that failed to delete.
vserver (STRING): Name of the Vserver for which the password change job failed to delete.
reason (STRING): Reason for the failure to delete the job.

cifs.domainpwd.job.not.sched

Severity

ERROR

Description

This message occurs when the scheduled job for a CIFS domain password change fails for a Vserver.

Corrective Action

Disable and enable the feature for the Vserver by using the 'vserver cifs domain password schedule modify -is-schedule-enabled false' and 'vserver cifs domain password schedule modify -is-schedule-enabled true' commands. If the error persists, do the following: 1. Disable the scheduling feature for the password change on the Vserver by using the command specified above. 2. Change password manually by using the 'vserver cifs domain password change' command. 3. Contact NetApp technical support.

Syslog Message

An attempt to schedule a job to update the domain account password for Vserver %s failed.

Parameters

vserver (STRING): Name of the Vserver for which the password change job failed.

cifs.domainpwd.not.updated

Severity

ERROR

Description

This message occurs when the CIFS domain password update for a Vserver fails.

Corrective Action

Try updating the password manually by using the 'vserver cifs domain password change' command. Review recent event logs for addtional information. If the error persists, contact NetApp technical support.

Syslog Message

An attempt to update the domain account password for Vserver %s failed during %s with the following error: %s

Parameters

vserver (STRING): Name of the Vserver for which the password update failed.
method (STRING): Method used to update the password.
reason (STRING): Reason for the failure.

cifs.lug events

cifs.lug.import.fail

Severity

ERROR

Description

This message occurs when the job to import CIFS local users and groups is completed successfully only at a primary site within a MetroCluster® configuration or Vserver DR setup. CIFS local users and groups have either not been applied or only partially applied at the secondary site.

Corrective Action

Use the "metrocluster vserver resync -vserver <vserver name>" command to resynchronize the Vserver configuration.

Syslog Message

CIFS local users and groups import job failed for Vserver %s. Reason: %s.

Parameters

vserver (STRING): Name of the Vserver.
reason (STRING): Reason for the failure.

cifs.replay events

cifs.replay.failure

Severity

ALERT

Description

This message occurs when configuration is not synchronized. This might cause the node experiencing the problem to become unresponsive to data access.

Corrective Action

Contact NetApp technical support. Be prepared to provide log files to technical support, particularly the "mgwd.log" and "sktrace.log" files.

Syslog Message

Failed to replay configuration for %s module.

Parameters

module (STRING): Name of the module for which configuration is not synchronized.

cifs.server events

cifs.server.auth.StyleMismatch

Severity

ERROR

Description

This message occurs when the Vserver DR subsystem detects that the authentcation style (domain or workgroup) of the source Vserver's CIFS server does not match the authentication style of the destination Vserver's CIFS server

Corrective Action

Use the 'vserver cifs modify' command to configure the source or destination Vserver's CIFS server into a domain or workgroup as necessary for the authentication styles to match.

Vserver DR check found that the CIFS server authentication style of the source Vserver, %s, did not match the authentication style of the destination Vserver, %s.

Parameters

source_vserver (STRING): Name of the source Vserver of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.

cifs.shadowcopy events

cifs.shadowcopy.abort

Severity

NOTICE

Description

This message occurs when a shadow copy set is automatically aborted when no activity has been detected for a certain period of time. This condition could be caused by improper operation of the backup application and/or the Volume Shadow Copy Service (VSS) client, or the loss of network connection to the host.

Corrective Action

Check the backup application and VSS client. Verify the network connection between the file server and the client.

Syslog Message

The shadow copy set (Client Shadow Copy Set ID : %s , Filer Shadow Copy Set ID : %s) has been automatically aborted. No activity has been seen for at least %d minutes.

Parameters

clientShadowCopySetId (STRING): Client Shadow Copy Set ID.
filerShadowCopySetId (STRING): File Server Shadow Copy Set ID.
timeout (INT): No activity timeout in minutes.

cifs.shadowcopy.failure

Severity

ERROR

Description

This message occurs when a shadow copy operation has failed.

Corrective Action

Using the information provided in the event message, here are some things to check on your system: Shadow copy configuration; Is the feature enabled? Are the appropriate licenses installed? Share(s) on which the shadow copy operation is performed; Is the share name correct? Does the share path exist? State of the shadow copy set and its shadow copies.

Syslog Message

A shadow copy operation has failed: %s. (Operation : %s , Client Shadow Copy Set ID : %s , Filer Shadow Copy Set ID : %s , Client Shadow Copy ID : %s , Filer Shadow Copy ID : %s , Share Name : %s, Object type is: %s with UUID: %s)

Parameters

errMsg (STRING): Reason the Shadow Copy operation failed.
operation (STRING): Shadow Copy operation that failed.
clientShadowCopySetId (STRING): Client Shadow Copy Set ID.
filerShadowCopySetId (STRING): File Server Shadow Copy Set ID.
clientShadowCopyId (STRING): Client Shadow Copy ID.
filerShadowCopyId (STRING): File Server Shadow Copy ID.
shareName (STRING): Share Name.
object_type (STRING): Type of resource object.
object_uuid (STRING): UUID of the resource object.

cifs.static events

cifs.static.homedir.create

Severity

ERROR

Description

This message occurs when a user creates a static home directory without a substitution value (%u or %w) to uniquely identify a home directory share. If multiple users from the same client access their home directories at the same time, unprotected access to each other's files can occur. This might cause unexpected \"access denied\" errors on those files, and data corruption within those files. Note: multiple users from a single client is most likely in a Citrix or Windows Terminal Services environment.

Corrective Action

Ensure that a substitution value (%u or %w) is provided to the name of the home directory share.

Syslog Message

A static home directory share "%s" without a substitution value (%%u or %%w) is created on Vserver: %s.

Parameters

shareName (STRING): Name of the share that the user has created.
vserverName (STRING): Name of the Vserver associated with this operation.

clam events

clam.disable events

clam.disable

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is disabled by either turning off the KCS capability or by setting the 'clam sysctl/bootarg' variable.

Corrective Action

If you want CLAM functionality disabled, no action is needed. Otherwise, reenable CLAM and reboot the node to make CLAM operational again.

Syslog Message

CLAM functionality is disabled.

Parameters

(None).

clam.disable.takeover

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is disabled from initiating storage failover requests. This capability is automatically disabled in a NAS-only configuration. To control the setting of CLAM takeover, additional interfaces, such as sysctl bootarg, are provided.

Corrective Action

No action is needed.

Syslog Message

CLAM is disabled from performing storage failover.

Parameters

(None).

clam.enable events

clam.enable

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is enabled to operate on this node. When all nodes in the cluster are upgraded to a KCS-available image, KCS capability gets turned on. This event is an indication that CLAM will be now begin to function.

Corrective Action

No action is needed.

Syslog Message

CLAM functionality is enabled.

Parameters

(None).

clam.enable.takeover

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is enabled to initiate storage failover requests when the CLAM OOQ (Out Of Quorum) condition is detected on the partner node. This capability is automatically enabled in a scalable SAN configuration. To control the setting of CLAM takeover, additional interfaces, such as sysctl bootarg, are provided.

Corrective Action

No action is needed.

Syslog Message

CLAM is enabled to perform storage failover when partner node is OOQ.

Parameters

(None).

clam.failover events

clam.failover.event

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) receives a failover event from high-availability(HA) subsystem.

Corrective Action

(None).

Syslog Message

CLAM on node (id=%llu) received an HA failover event for partner (ID=%llu) indicating that %s.

Parameters

> **localnodeid** (LONGINT): Node ID of the local node.
> **partnernodeid** (LONGINT): Node ID of the partner node.
> **event_description** (STRING): Description of the event that CLAM received from the HA subsystem.

clam.heartbeat events

clam.heartbeat.state.change

Severity

> INFORMATIONAL

Description

> This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) detects that the state of the heartbeats to a node changed(that is, either the heartbeats started succeeding or they started failing).

Corrective Action

> Take one or more of the following actions: - A repeated toggling of the heartbeat state indicates intermittent network issues. Check the connectivity of the node to the cluster interconnect and fix any problems. - In all the other cases, the heartbeat failure will eventually result in the node going out of quorum. If that happens, take the actions prescribed for "EMS_clam_node_ooq event".

Syslog Message

> Heartbeats to node (name=%s, ID=%llu) are %s.

Parameters

> **hostname** (STRING): Host name of the node.
> **nodeid** (LONGINT): Node ID of the node.
> **state** (STRING): New state of the heartbeats to this node.

clam.invalid events

clam.invalid.config

Severity

> ERROR

Description

> This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that the local node is in an invalid configuration for providing CLAM functionality.

Corrective Action

> Take one or more of the following actions, as appropriate: - Enable failover on the node by running the 'storage failover modify -node node_name -enabled true' command. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed.

Syslog Message

> Local node (name=%s, id=%llu) is in an invalid configuration for providing CLAM functionality. CLAM cannot determine the identity of the HA partner.

Parameters

    localhostname (STRING): Host name of the local node.
    localnodeid (LONGINT): Node ID of the local node.

clam.mailbox events

clam.mailbox.initialized

Severity

    INFORMATIONAL

Description

    This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has written to the high availability (HA) mailboxes that it has initialized and is ready to participate in CLAM quorum.

Corrective Action

    (None).

Syslog Message

    CLAM on local node has initialized its mailboxes and is ready to participate in quorum.

Parameters

    (None).

clam.node events

clam.node.disabled

Severity

    INFORMATIONAL

Description

    This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) concludes that the local node is now disabled.

Corrective Action

    This EMS is logged when the local node has lost connectivity with the rest of the nodes in the cluster and the connectivity has not been restored in time for the local node to participate in cluster quorum. Take the actions prescribed for "EMS_clam_node_ooq" event.

Syslog Message

    CLAM published an event indicating the local node is now disabled(reason: %s).

Parameters

    disabled_reason (STRING): Reason for the node getting disabled.

clam.node.inq

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that a node in the cluster has transitioned to "cluster quorum".

Corrective Action

(None).

Syslog Message

Cluster node (name=%s, ID=%llu) is in "CLAM quorum".

Parameters

hostname (STRING): Host name of the cluster node that transitioned to quorum.
nodeid (LONGINT): Node ID of the cluster node that transitioned to quorum.

clam.node.ooq

Severity

EMERGENCY

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that a node in the cluster is out of "cluster quorum".

Corrective Action

Take one or more of the following actions: - Follow the KB article 2022109 to troubleshoot the resolve the issue. - Check the connectivity of the node to the cluster interconnect and fix any problems. - If the local node is administratively disabled, enable it by running the following command from the clustershell 'cluster modify -node node_name -eligibility true'. - If the node is supposed to be in an HA pair but is not, enable the HA pair. You can check whether a node is in an HA pair by running 'storage failover show' command from the clustershell. You can enable storage failover by running the 'storage failover modify -enabled true' command from the clustershell. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed. You can see the software version of all the nodes from the clustershell using the 'version -node *' command.

Syslog Message

Node (name=%s, ID=%llu) is out of "CLAM quorum" (reason=%s).

Parameters

hostname (STRING): Host name of the node that is out of quorum.
nodeid (LONGINT): Node ID of the node that is out of quorum.
reason (STRING): Reason for the out of quorum transition.

clam.node.paused

Severity

INFORMATIONAL

Description

This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) entered a paused state.

Corrective Action

(None).

Syslog Message

CLAM published an event indicating the local node has paused.

Parameters

(None).

clam.node.resumed

Severity

INFORMATIONAL

Description

This message occurs when the local Connectivity, Liveliness and Availability Monitor (CLAM) was previously in a paused state and has now resumed.

Corrective Action

(None).

Syslog Message

CLAM published an event indicating the local node has resumed.

Parameters

(None).

clam.node.start.voting

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) on a local node has started to vote for its high-availability (HA) partner node.

Corrective Action

(None).

Syslog Message

CLAM on local node (ID:%llu) has started to vote for its HA partner node (ID:%llu).

Parameters

local_id (LONGINT): Node ID of the local node.
partner_id (LONGINT): Node ID of the partner node.

clam.node.stop.voting

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) on a local node has stopped voting for its high-availability (HA) partner node.

Corrective Action

(None).

Syslog Message

CLAM on local node (ID:%llu) has stopped to vote for its HA partner node (ID:%llu).

Parameters

local_id (LONGINT): Node ID of the local node.
partner_id (LONGINT): Node ID of the partner node.

clam.partner events

clam.partner.halting

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, Availability Monitor (CLAM) is notified that its high-availability (HA) partner node is undergoing a planned shutdown.

Corrective Action

(None).

Syslog Message

CLAM is notified that its HA partner node is undergoing a planned shutdown (reason: %s).

Parameters

reason (STRING): Reason for the partner beginning the halt process.

clam.peer events

clam.peer.halting

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveness, and Availability Monitor (CLAM) is notified that its high-availability (HA) partner node is undergoing a planned shutdown.

Corrective Action

(None).

Syslog Message

CLAM is notified that node %s (ID=%llu) is undergoing a planned shutdown.

Parameters

hostnode (STRING): Name of node beginning the halt process.
nodeid (LONGINT): ID of node beginning the halt process.

clam.reenable events

clam.reenable

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) is reenabled to operate on this node after being intentionally disabled. The intentional disabling could have been through turning off KCS capability or setting the 'clam bootarg/sysctl' variable. Reenabling CLAM functionality warrants a reboot, upon which CLAM will be functional.

Corrective Action

Reboot the node to make CLAM operational.

Syslog Message

CLAM functionality is reenabled. Reboot the node to make CLAM operational.

Parameters

(None).

clam.start events

clam.start.mailbox.polling

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has started a poll to read CLAM mailboxes.

Corrective Action

(None).

Syslog Message

CLAM on local node (ID=%llu) has started a poll to read HA partner (ID=%llu) mailbox.

Parameters

    local_id (LONGINT): Node ID of the local node.
    partner_id (LONGINT): Node ID of the partner node.

clam.stop events

clam.stop.mailbox.polling

Severity

    INFORMATIONAL

Description

    This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) has stopped polling the CLAM mailboxes.

Corrective Action

    (None).

Syslog Message

    CLAM on local node (ID=%llu) has stopped the poll to read HA partner (ID=%llu) mailbox.

Parameters

    local_id (LONGINT): Node ID of the local node.
    partner_id (LONGINT): Node ID of the partner node.

clam.takeover events

clam.takeover

Severity

    INFORMATIONAL

Description

    This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) triggers takeover of a partner node after determining that the local node is in "CLAM quorum" and the partner node is out of "CLAM quorum".

Corrective Action

    Take one or more of the following actions: - If the node panicked or is hung, troubleshoot and resolve the problem. - Check the connectivity of the node to the cluster interconnect and fix any problems. - If the local node is administratively disabled, enable it by running the following command from the clustershell 'cluster modify -node node_name -eligibility true'. - If the node is supposed to be in an HA pair but is not, enable the HA pair. You can check whether a node is in an HA pair by running the 'storage failover show' command from the clustershell. You can enable storage failover by running the 'storage failover modify -enabled true' command from the clustershell. - If there is a version incompatibility between the local node and the other nodes in the cluster, upgrade the nodes as needed. You can see the software version of all the nodes from the clustershell using the 'version -node *' command.

Syslog Message

    Local node (name=%s, ID=%llu) initiated takeover of partner node (name=%s, ID=%llu, state=%llu)

result=%s, type=%s.

Parameters

localhostname (STRING): Host name of the local node.
localnodeid (LONGINT): Node ID of the local node.
partnerhostname (STRING): Host name of the partner node.
partnernodeid (LONGINT): Node ID of the partner node.
partnerstate (LONGINTHEX): The high-availability state of the partner node
result (STRING): Result of the takeover initiation operation.
type (STRING): Takeover Type.

clam.takeover.disallowed

Severity

INFORMATIONAL

Description

This message occurs when Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) cannot initiate takeover operations. Takeover is disallowed by High Availability (HA) susbsystem on the partner node.

Corrective Action

(None).

Syslog Message

CLAM on node %s (ID=%llu) cannot proceed with a takeover operation of partner node %s (ID=%llu) because HA disallowed takeover. Reason :%s

Parameters

local_host_name (STRING): Host name of the local node.
localnodeid (LONGINT): Node ID of the local node.
partner_host_name (STRING): Host name of the partner node.
partnernodeid (LONGINT): Node ID of the partner node.
reason (STRING): Reason takeover was disabled.

clam.update events

clam.update.partner.state

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) updates the failover state of the partner.

Corrective Action

(None).

Syslog Message

CLAM on node (ID=%llu) updated failover state of partner (ID=%llu) to %s.

Parameters

localnodeid (LONGINT): Node ID of the local node.
partnernodeid (LONGINT): Node ID of the partner node.
partner_state (STRING): Description of the partner state.

clam.valid events

clam.valid.config

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services (KCS) Connectivity, Liveliness, Availability Monitor (CLAM) determines that the local node is in a valid configuration for providing CLAM functionality.

Corrective Action

No action is needed.

Syslog Message

Local node (name=%s, id=%llu) is operating in a suitable configuration for providing CLAM functionality.

Parameters

localhostname (STRING): Host name of the local node.
localnodeid (LONGINT): Node ID of the local node.
partnerhostname (STRING): Host name of the partner node.
partnernodeid (LONGINT): Node ID of the partner node.

clam.voting events

clam.voting.state.change

Severity

INFORMATIONAL

Description

This message occurs when the Kernel Cluster Services Connectivity, Liveliness, Availability Monitor (CLAM) detects that the voting state of the node changed.

Corrective Action

(None).

Syslog Message

CLAM on node (name=%s, ID=%llu) has %s voting for its HA partner node(name=%s, ID=%llu).

Parameters

local_hostname (STRING): Host name of the local node.
localId (LONGINT): Node ID of the local node.
state (STRING): New voting state of the node.
partner_hostname (STRING): Host name of the HA partner node.

partnerId (LONGINT): Node ID of the HA partner node.

clone events

clone.split events

clone.split.objcopy.failed

Severity

ERROR

Description

This message occurs when the volume clone split object copy operation (which copies objects from source volume to a clone) fails because it is unable to read source objects due to unauthorized access to the object store container. The volume clone split object copy operation will be aborted and must be restarted manually after a valid access token is added to the object store configuration.

Corrective Action

Ensure that you have added the shared access signature token to the object store configuration. The access token can be added to the configuration using the "storage aggregate object-store config modify" command. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. The volume clone split object copy operation can be restarted using the "volume clone split start -match-parent-storage-tier true" command. If the condition persists, contact NetApp technical support.

Syslog Message

Clone split object copy operation to copy objects from source volume to clone failed on volume "%s" (aggregate %s) because of unauthorized access to the object store container. Aborting the volume clone object copy split operation.

Parameters

volume_name (STRING): Clone volume.
aggregate_name (STRING): FabricPool aggregate.

cloud events

cloud.aws events

cloud.aws.iamCredsExpired

Severity

ERROR

Description

This message occurs when the IAM Role thread acquires Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials that have already expired. The credentials are acquired from the AWS metadata server using the IAM role, and are used in signing API requests to AWS S3.

Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

Syslog Message

ONTAP acquired AWS credentials associated with the AWS IAM role named '%s' on the AWS metadata server that have already expired. Node %s.

Parameters

iamRole (STRING): Name of the IAM role associated with this ONTAP Cloud® instance.
nodeUuid (STRING): UUID of the node.

cloud.aws.iamCredsInvalid

Severity

ERROR

Description

This message occurs when the system acquires Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials that are not valid.

Corrective Action

In the AWS EC2 Management Console, find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also, verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

Syslog Message

AWS credentials that were acquired by ONTAP are not valid. AWS IAM role: %s. Node: %s.

Parameters

iamRole (STRING): Name of the IAM role associated with this ONTAP Cloud instance.
nodeUuid (STRING): UUID of the node.

cloud.aws.iamCredsNotFound

Severity

ERROR

Description

This message occurs when the cloud credentials thread cannot acquire Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials from the AWS metadata server. The credentials are used in signing API requests to AWS S3.

Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

Syslog Message

ONTAP cannot acquire credentials associated with the AWS IAM role or GCP Service Account named '%s' on the metadata server. Node %s.

Parameters

iamRole (STRING): Name of the AWS IAM role associated associated with this Cloud Volumes ONTAP® instance.
nodeUuid (STRING): UUID of the node.

cloud.aws.iamNotInitialized

Severity

NOTICE

Description

This message occurs when a module attempts to access Amazon Web Services (AWS) Identity and Access Management (IAM) role-based credentials from the cloud credentials thread before the cloud thread is finished initializing.

Corrective Action

Wait for the cloud credential thread, and by extension the system, to complete initialization.

Syslog Message

A module attempted to access credential information before the cloud credential thread initialized on node %s.

Parameters

nodeUuid (STRING): UUID of the node.

cloud.aws.iamRoleInvalid

Severity

ERROR

Description

This message occurs when the system acquires an Amazon Web Services (AWS) Identity and Access Management (IAM) role on the AWS metadata server that is not valid.

Corrective Action

In the AWS EC2 Management Console, find and check the health of the instance pertaining to this ONTAP Cloud deployment. Also, verify that the AWS IAM role associated with the instance exists and grants proper privileges to the instance.

Syslog Message

IAM role "%s" on the AWS metadata server is not valid for this ONTAP instance (node %s).

Parameters

iamRole (STRING): Name of the IAM role associated with this ONTAP Cloud instance.
nodeUuid (STRING): UUID of the node.

cloud.aws.iamRoleNotFound

Severity

ERROR

Description

This message occurs when the IAM Role thread cannot find an Amazon Web Services (AWS) Identity and Access Management (IAM) role on the AWS metadata server. The IAM role is needed to obtain role-based credentials used in signing API requests to AWS S3.

Corrective Action

Log in to the AWS EC2 Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this ONTAP Cloud® deployment. Also verify that the AWS IAM role associated with the instance exists.

Syslog Message

ONTAP node %s cannot find an IAM role on the AWS metadata server.

Parameters

nodeUuid (STRING): UUID of the node.

cloud.aws.metadataConnFail

Severity

ERROR

Description

This message occurs when the IAM Role thread cannot establish a communication link with the Amazon Web Services (AWS) metadata server. Communication must be established to acquire the necessary AWS Identity and Access Management (IAM) role-based credentials used in signing API requests to AWS S3.

Corrective Action

Log in to the AWS EC2 Engine Management Console, click on the 'Instances' page, and then find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment.

Syslog Message

ONTAP cannot communicate with the AWS metadata server needed to acquire IAM role-based or Service Account based credentials for access to AWS S3 Storage. Error returned: %s Node: %s

Parameters

error (STRING): Error code and string, if applicable.
nodeUuid (STRING): UUID of the node.

cloud.azurecredsinvalid events

cloud.azureCredsInvalid

Severity

ERROR

Description

This message occurs when the system acquires Azure Managed Service Identity (MSI) credentials that are not valid.

Corrective Action

In the Azure Portal, find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also, verify that the MSI associated with the instance is enabled and grants proper privileges to the instance.

Syslog Message

Azure MSI credentials that were acquired by ONTAP are not valid. Node UUID: %s.

Parameters

nodeUuid (STRING): UUID of the node.

cloud.bin events

cloud.bin.objcopy.failed

Severity

ERROR

Description

This message occurs when the cloud bin object copy operation (which copies objects from a source object store to a destination object store) fails because it is unable to read source objects due to unauthorized access to the object store container.

Corrective Action

Ensure that you have added the shared access signature token to the source object store configuration. The access token can be added to the configuration using the "storage aggregate object-store config modify" command. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Cloud bin object copy operation to copy objects from a source object store to destination object store failed for "%s" operation because of unauthorized access to the source object store container ("%s").

Parameters

op_name (STRING): Operation context in which object copy is called. This can be either clone split or svm migrate.
container_name (STRING): Source object store container name

cloud.creds events

cloud.creds.metadataConnFail

Severity

ERROR

Description

This message occurs when the system cannot establish a communication link with the cloud provider's metadata server, in order to acquire the necessary temporary credentials used in signing API requests to the cloud object store server.

Corrective Action

Log in to the cloud provider's management console to examine the current set of running instances. Find the instance pertaining to this deployment of Cloud Volumes ONTAP® deployment, and then check its health from the console.

Syslog Message

ONTAP cannot communicate with the cloud provider's metadata server needed to acquire the temporary credentials used to access an object store server. Command: %s Error returned: %s Node: %s

Parameters

command (STRING): Command used to contact the metadata server.
error (STRING): Error text received as response to the metadata server command.
nodeUuid (STRING): UUID of the node.

cloud.creds.notFound

Severity

ERROR

Description

This message occurs when the system cannot acquire the temporary credentials from the cloud provider's metadata server that are necessary for signing API requests to the object storage server.

Corrective Action

Log in to the management console of the cloud provider to examine the current set of running instances. Find and check the health of the instance pertaining to this Cloud Volumes ONTAP deployment. Also verify that the role associated with the instance exists and grants the proper privileges.

Syslog Message

ONTAP cannot acquire credentials associated with the instance named '%s' on the metadata server. Node %s.

Parameters

role (STRING): Name of the AWS IAM role or GCP Service Account or Azure Managed Service Identity associated with this Cloud Volumes ONTAP® instance.
nodeUuid (STRING): UUID of the node.

cloud.creds.notInitialized

Severity

NOTICE

Description

This message occurs when the system attempts to access credentials before initialization is complete.

Corrective Action

(None).

Syslog Message

Module on node %s attempted to access credential information before initialization was complete

Parameters

nodeUuid (STRING): UUID of the node.

cloud.gcpcredsinvalid events

cloud.gcpCredsInvalid

Severity

ERROR

Description

This message occurs when the system acquires Google Cloud Platform (GCP) Service Account based credentials that are not valid.

Corrective Action

In the Google Cloud Console, find and check the health of the instance pertaining to this Cloud Volumes ONTAP® deployment. Also, verify that the Service Account associated with the instance exists and grants proper privileges to the instance.

Syslog Message

GCP credentials that were acquired by ONTAP are not valid. Node: %s.

Parameters

nodeUuid (STRING): UUID of the node.

clus events

clus.net events

clus.net.noNeighbors

Severity

ALERT

Description

This message occurs when the cluster network ports with "link" reported as "up" are neither receiving CDP nor LLDP neighbor announcements. This is not a supported configuration and can negatively impact the performance of the cluster.

Corrective Action

Use the "network port show -ipspace Cluster -link up" command to list the ports expected to receive CDP and/or LLDP announcements. Verify that CDP and/or LLDP is enabled on the switch the cluster ports are wired to. Use the "network device-discovery show" command to view the announcements for each of the cluster ports.

Syslog Message

The cluster ports with "link" reported as "up" are neither receiving CDP nor LLDP neighbor announcements.

Parameters

(None).

clus.net.switchlessInv

Severity

NOTICE

Description

This message occurs when the "switchless-cluster" option is disabled, but one or more cluster ports are directly wired to a cluster port on another node. This could result in packet loss across the cluster network, causing file operations to fail as well as loss of quorum.

Corrective Action

Use the "network options switchless-cluster modify" command to enable support for switchless clusters.

Syslog Message

One or more cluster ports are directly wired to a cluster port on another node, but the "switchless-cluster" option is not enabled.

Parameters

(None).

clus.net.switchlessMismatch

Severity

NOTICE

Description

This message occurs when the "switchless-cluster" option is enabled, but all of the cluster ports are wired to a switch. This configuration will negatively impact the performance of the cluster network.

Corrective Action

Use the "network options switchless-cluster modify" command to disable support for switchless clusters.

Syslog Message

All of the cluster ports are wired to a switch, but the "switchless-cluster" option is enabled.

Parameters

(None).

clus.reboot events

clus.reboot.internalError

Severity

ALERT

Description

This message occurs when the cluster reboot detection feature detects an internal software error due to insufficient system resources.

Corrective Action

Reboot the node by using the "system node reboot -node <nodename>" command. Contact NetApp technical support if further assistance is needed.

Syslog Message

Cluster reboot detection feature detected an internal software error. Error: '%s'.

Parameters

error (STRING): Internal software error.

clus.reboot.noBootSequence

Severity

ERROR

Description

This message occurs when the cluster reboot detection feature fails to obtain the node boot sequence from the /var/BOOT_SEQ file.

Corrective Action

Contact NetApp technical support.

Syslog Message

Cluster reboot detection feature failed to obtain the node boot sequence from /var/BOOT_SEQ file.

Parameters

(None).

clus.reboot.persistencyError

Severity

ERROR

Description

This message occurs when the cluster reboot detection feature fails to save the node reboot information persistently.

Corrective Action

Reboot the node by using the "system node reboot -node nodename" command. Contact NetApp technical support if further assistance is needed.

Syslog Message

Cluster reboot detection feature failed to save the node reboot information persistently. Error: '%s'.

Parameters

error (STRING): Error returned by the save operation.

clus.reboot.rebootDetected

Severity

NOTICE

Description

This message occurs when a cluster reboot is detected.

Corrective Action

(None).

Syslog Message

Cluster reboot was detected at %s. Sequence number for the cluster reboot was %d. Estimated beginning time of the cluster reboot was %s.

Parameters

endtime (STRING): End time of the cluster reboot.
sequence (LONGINT): Sequence number of the detected cluster reboot.
begintime (STRING): Estimated beginning time of the cluster reboot based on the last known time the cluster was operational.

cluster events

cluster.epsilon events

cluster.epsilon.assign.fail

Severity

ERROR

Description

This message occurs when automatic assignment of epsilon to a node fails, alerting the customer that there is no epsilon on their system. Attempts to assign epsilon continue until automatic assignment succeeds or epsilon is assigned manually.

Corrective Action

Try to manually assign epsilon to a healthy node using the command 'cluster modify -node node-name -epsilon true'. Contact NetApp technical support if epsilon cannot be assigned.

Syslog Message

Epsilon could not be automatically assigned to node %s with error %s.

Parameters

node (STRING): Name of the node that epsilon was being assigned to.
error (STRING): Error string detailing why epsilon assignment failed.

cluster.epsilon.assigned

Severity

INFORMATIONAL

Description

This message occurs when epsilon is assigned to a node either manually by a user-initiated command or automatically by the system.

Corrective Action

(None).

Syslog Message

Epsilon was assigned to node %s by %s.

Parameters

node (STRING): Name of the node epsilon was assigned to.
actor (STRING): Whether the change was made manually by a user command or automatically by the system.

cluster.epsilon.removed

Severity

INFORMATIONAL

Description

This message occurs when epsilon is removed from a node either manually by a user-initiated command or automatically by the system.

Corrective Action

(None).

Syslog Message

Epsilon was removed from node %s by %s.

Parameters

node (STRING): Name of the node that epsilon was removed from.
actor (STRING): Whether the change was made manually by a user command or automatically by the system.

cluster.ha events

cluster.ha.not.configured

Severity

ERROR

Description

This message occurs when cluster HA has not been configured on a 2-node cluster with HA mode enabled.

Corrective Action

Use the 'cluster ha modify -configured true' command to configure cluster HA.

Syslog Message

Cluster HA has not been configured. Cluster HA must be configured on a 2-node cluster to ensure data access availability in the event of storage failover.

Parameters

(None).

cluster.image events

cluster.image.update.aborted

Severity

INFORMATIONAL

Description

This message occurs when a non-disruptive data ONTAP upgrade of the cluster was aborted by the user.

Corrective Action

(None).

Syslog Message

A non-disruptive data ONTAP upgrade of the cluster was aborted by the user

Parameters

(None).

cluster.network events

cluster.network.config

Severity

NOTICE

Description

This message occurs when a two node cluster transitions between a switched and switchless configuration.

Corrective Action

(None).

Syslog Message

The cluster network configuration transitioned to %s.

Parameters

current_configuration (STRING): Displays if the current configuration is switched or switchless.

cluster.op events

cluster.op.fail

Severity

ERROR

Description

This message occurs when a "cluster create" or a "cluster join" or a "cluster unjoin" operation is attempted but does not succeed.

Corrective Action

Run the command specified to complete the cluster operation. Resolve the issue, and then try the command again.

Syslog Message

(None).

Parameters

operation_type (STRING): Type of cluster operation.
node (STRING): Name of the node that attempted the cluster operation.
serial (STRING): System serial number of the node that attempted the cluster operation.

cluster.op.not.complete

Severity

ERROR

Description

This message occurs when a cluster create or cluster join operation fails to complete. The node is not fully operational and many commands will not work properly until this is resolved.

Corrective Action

Run the command specified to complete the cluster operation. Resolve the issue, and then try the command again.

Syslog Message

Cluster operation (%s) failed to complete for node %s. The node is not fully operational.

Parameters

command (STRING): Command for the cluster operation.
node (STRING): Name of the node.

cluster.op.rerun.fail

Severity

ERROR

Description

This message occurs when a previously failed cluster create or cluster join operation that is automatically rerun in background fails. The operation is automatically retried a maximum of 'max_retry_count' times at an interval of 'retry_interval' seconds.

Corrective Action

To view the reason for failure, run the operation manually. Alternatively, allow the automatic reruns to execute in case the issue is temporary or fixed. To view the progress of these background attempts, use the command 'event log show -event cluster.op.rerun*'. You may rerun the operation manually at any time, without waiting for these background runs to complete.

Syslog Message

Attempt to %s cluster named '%s' in the background failed. This was retry attempt %d of %d.

Parameters

operation_type (STRING): Type of cluster operation.
cluster_name (STRING): Name of the cluster that is being created or joined.
retry_count (INT): Number of attempts made to rerun the cluster create or join operations in the background.
max_retry_count (INT): Maximum number of retry attempts allowed to rerun the cluster create or join operation in the background.
retry_interval (INT): Interval of time, in seconds, between each rerun attempt.

cluster.op.rerun.start

Severity

INFORMATIONAL

Description

This message occurs when a previously failed cluster create or cluster join operation is rerun in the background in an attempt to successfully complete the operation. The operation is automatically retried a maximum of 'max_retry_count' times at an interval of 'retry_interval' seconds.

Corrective Action

To view the reason for failure, run the operation manually. Alternatively, allow the automatic reruns to execute in case the issue is temporary or fixed. To view the progress of these background attempts, use the command 'event log show -event cluster.op.rerun*' You may rerun the operation manually at any time, without waiting for these background runs to complete.

Syslog Message

Attempt to %s cluster named '%s' in the background. This is retry attempt %d of %d.

Parameters

operation_type (STRING): Type of cluster operation.
cluster_name (STRING): Name of the cluster that is being created or joined.
retry_count (INT): Number of attempts to retry the cluster create or join operation in the background.
max_retry_count (INT): Maximum number of rerun attempts allowed.
retry_interval (INT): Interval of time, in seconds, between each rerun attempt.

cluster.op.rerun.success

Severity

INFORMATIONAL

Description

This message occurs when a previously failed cluster create or cluster join operation automatically rerun in the background is successful.

Corrective Action

(None).

Syslog Message

Cluster %s operation run in the background completed successfully for cluster name '%s'.

Parameters

operation_type (STRING): Type of cluster operation.
cluster_name (STRING): Name of the cluster that is being created or joined.

cluster.op.start

Severity

INFORMATIONAL

Description

This message occurs when a "cluster create" or a "cluster join" or a "cluster unjoin" operation is run.

Corrective Action

(None).

Syslog Message

(None).

Parameters

operation_type (STRING): Type of cluster operation.
node (STRING): Name of the node being operated on or empty if the name is not yet set.
serial (STRING): System serial number of the node being operated on or empty if the serial number is not set.

cluster.op.success

Severity

INFORMATIONAL

Description

This message occurs when a cluster has been successfully created or a node has successfully joined or unjoined the cluster.

Corrective Action

(None).

Syslog Message

(None).

Parameters

operation_type (STRING): Type of cluster operation.
node (STRING): Name of the node that successfully performed the cluster operation.
serial (STRING): System serial number of the node that successfully performed the cluster operation.

cluster.port events

cluster.port.unsupport.speed

Severity

ERROR

Description

This message occurs when the cluster ports are operating at an unsupported speed.

Corrective Action

Ensure that the cluster port has a supported network interface card installed, and that it is operating at the supported speed.

Syslog Message

%s node %s cluster ports are not operating at a supported speed. Ensure that ports %s have supported network interface card installed, and are operating at a supported speed: %s.

Parameters

model_name (STRING): Model on which the misconfigured ports reside.
node (STRING): Node on which the misconfigured ports reside.
portlist (STRING): List of misconfigured ports.
supported_speed (STRING): Speed at which the port is supported.

cluster.repl events

cluster.repl.localNW.unreachable

Severity

NOTICE

Description

This message occurs when the cluster replication heartbeat to a peer cluster cannot reach the local management gateway process for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

Corrective Action

(None).

Syslog Message

The cluster replication heartbeat could not reach the local management gateway process for at least %d seconds.

Parameters

durationSinceLastSuccess (INT): Number of seconds since the problem first occurred.

cluster.repl.peer.reachable

Severity

NOTICE

Description

This message occurs when the cluster replication heartbeat can now reach the peer cluster, after previous failures resulted in raising one of the following events: cluster.repl.localNW.unreachable, cluster.repl.peerNW.unreachable, or cluster.repl.remoteApp.unreachable.

Corrective Action

(None).

Syslog Message

The cluster replication heartbeat can now reach peer cluster %s.

Parameters

peerIPaddress (STRING): Peer cluster IP address that can now be reached.

cluster.repl.peerNW.unreachable

Severity

ALERT

Description

This message occurs when the cluster replication heartbeat to the peer cluster fails for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

Corrective Action

Verify network connectivity between the local cluster and the peer cluster. Check the cluster peer EMS messages for more information.

Syslog Message

The cluster replication heartbeat to peer cluster %s failed for at least %d seconds.

Parameters

peerIPaddress (STRING): Cluster peer IP address that could not be reached.
durationSinceLastSuccess (INT): Number of seconds since the problem first occurred.

cluster.repl.remoteApp.unreachable

Severity

ALERT

Description

This message occurs when the cluster replication heartbeat to the remote cluster replication application fails for a minimum of 300 seconds. This potentially affects MetroCluster(tm) and Vserver disaster recovery (DR) applications.

Corrective Action

Check the state of the replication application process running on the peer cluster by issuing the 'cluster ring show -unitname crs' command.

Syslog Message

The cluster replication heartbeat to the remote application running on peer cluster %s failed for at least %d seconds.

Parameters

peerIPaddress (STRING): Remote application cluster IP address that could not be reached.
durationSinceLastSuccess (INT): Number of seconds since the problem first occurred.

cluster.switch events

cluster.switch.count

Severity

ALERT

Description

This message occurs when an insufficient number of cluster switches are discovered for a redundant cluster network configuration.

Corrective Action

1) Ensure that a redundant pair of cluster switches exist in the network. 2) Ensure that cluster ports are connected to both switches. 3) Enable Cisco Discovery Protocol (CDP), Industry Standard Discovery Protocol (ISDP) or Link Layer Discovery Protocol (LLDP) on the switches, if you previously disabled it. CDP/ISDP/LLDP is enabled by default. Refer to your switch documentation for instructions. 4) If ONTAP cannot automatically discover a switch, use the "system switch ethernet create" command to configure discovery and monitoring of the switch.

Syslog Message

Cluster switches discovered: %d, but %d switches required for redundancy.

Parameters

count (INT): Number of cluster switches discovered.
required (INT): Number of cluster switches required.

cluster.switch.pwr.count

Severity

INFORMATIONAL

Description

The power supply on the switch is missing. The remaining power supply is a single point of failure. The switch might shut down with the next PSU failure.

Corrective Action

1) Check whether the switch's power supply unit is properly inserted into the chassis of the switch.

Syslog Message

Cluster switch: %s has: %d power supplys and requires %d.

Parameters

switch_name (STRING): Cluster switch name
count (INT): The switch power supply count found.
required (INT): The switch power supply count required.

cluster.switch.pwr.fail

Severity

INFORMATIONAL

Description

The power supply on the switch is missing or is not operational.

Corrective Action

1) Ensure that the power supply mains supplying power to the switch is turned on. 2) Ensure that the power cord is connected to the power supply of the switch. 3) Contact technical support if the alert persists.

Syslog Message

Cluster switch: %s power supply: %s status: %s.

Parameters

> **switch_name** (STRING): Cluster switch name
> **pwr_supply_name** (STRING): The power supply name that is failing.
> **status** (STRING): The power supply status.

cluster.switch.pwr.non.operational

Severity

> INFORMATIONAL

Description

> The power supply on the switch is not operational.

Corrective Action

> 1) Ensure that the power supply unit is turned on through switch CLI. 2) Run diagnostics on the switch to check the operational status of the power supply unit (PSU). For instructions about how to run switch diagnostics, see the switch's configuration guide. 3) Contact technical support if the alert persists.

Syslog Message

> Cluster switch: %s power supply: %s status: %s.

Parameters

> **switch_name** (STRING): Cluster switch name
> **pwr_supply_name** (STRING): The power supply name that is failing.
> **status** (STRING): The power supply status.

cluster.switch.reboot

Severity

> INFORMATIONAL

Description

> The cluster switch has recently rebooted. Communication problems and cluster connectivity issues might occur.

Corrective Action

> 1) If the cluster switch was not rebooted on purpose, then check the switch to ensure that it is operating normally. 2) If errors persist, contact technical support for further assistance.

Syslog Message

> Cluster switch: %s rebooted at: %ld

Parameters

> **switch_name** (STRING): Cluster switch name
> **time** (INT): Last reported time before reboot.

cluster.switch.unsupported

Severity

> INFORMATIONAL

Description

Unsupported cluster switch is detected. Communication problems and cluster connectivity issues occur.

Corrective Action

Unsupported cluster switch found. Connect a supported cluster switch to cluster network.

Syslog Message

Cluster switch: %s model: %s not supported.

Parameters

switch_name (STRING): Cluster switch name
model (STRING): The switch model.

cluster.vol events

cluster.vol.create.success

Severity

NOTICE

Description

This message occurs when the volume required to store the system data needed for cluster-wide storage is created successfully after one or more attempts to create it failed. An event was previously raised for the failures.

Corrective Action

(None).

Syslog Message

Successfully created the volume for feature %s, after earlier attempts to create it failed.

Parameters

Feature (STRING): Feature using the cluster-wide storage.

cluster.vol.delete.failed

Severity

ALERT

Description

This message occurs when the volume that was used for cluster-wide storage cannot be deleted.

Corrective Action

Study the error message and take steps to rectify the problem. For example, if the error message indicates that the volume delete operation failed because the aggregate is offline, use the "aggr online -aggregate aggregate_name" command to bring it back online. If the error message does not indicate an obvious problem, contact NetApp technical support.

Syslog Message

Could not delete volume %s %d times on aggregate %s for feature %s. Most recent delete before this EMS failed with error message: "%s".

Parameters

Volume (STRING): Volume name.
AttemptsMade (INT): Count of failed attempts to delete the volume.
Aggregate (STRING): Aggregate name.
Feature (STRING): Feature using the cluster-wide storage.
ErrorMessage (STRING): Error message resulting from the delete failure at the time of EMS generation.

cluster.vol.delete.success

Severity

NOTICE

Description

This message occurs when the volume that was used for cluster-wide storage is deleted successfully after one or more attempts to delete it failed. An event was previously raised for the failures.

Corrective Action

(None).

Syslog Message

Successfully deleted volume %s on aggregate %s for feature %s, after earlier attempts to delete it failed.

Parameters

Volume (STRING): Volume name.
Aggregate (STRING): Aggregate name.
Feature (STRING): Feature using the cluster-wide storage.

cluster.vol.feature.inoper

Severity

ALERT

Description

This message occurs when it is detected that a feature relying on cluster-wide storage has been unable to create its storage. This condition leaves the feature inoperative.

Corrective Action

Look for any instances of the callhome.clus.vol.cre.fail event and follow any corrective action suggested there. For more information or assistance, contact NetApp technical support.

Syslog Message

Feature %s is inoperative due to failures creating the cluster-wide storage that it requires.

Parameters

Feature (STRING): Feature using the cluster-wide storage.

cluster.vol.feature.ok

Severity

INFORMATIONAL

Description

This message occurs when it is detected that a feature relying on cluster-wide storage has been able to create its storage after previously not being able to.

Corrective Action

(None).

Syslog Message

Feature %s degraded state has been cleared.

Parameters

Feature (STRING): Feature using the cluster-wide storage.

cluster.vol.on.same.aggr

Severity

ALERT

Description

This message occurs when both active and standby volumes used for cluster-wide storage are hosted on the same aggregate. This is typically due to there not being a suitable second aggregate to host the standby volume. In this configuration, the loss of the single aggregate would remove all cluster-wide storage for the feature, which would severely affect its functionality.

Corrective Action

Use the "volume show" command to identify the size of the specified volumes and on which aggregate they are hosted. Use the "storage aggregate show -fields mirror" command to identify if the aggregate that currently hosts the volumes is mirrored. Use the "storage aggregate show -fields mirror,size,usedsize,state" command to find an online aggregate with the same mirror attribute and with enough free space to host the standby volume. If a suitable aggregate cannot be found, then bring an offline aggregate back online using the "storage aggregate online" command or create a new aggregate using the "storage aggregate create" command. If creating a new aggregate, ensure that it is large enough to host the volume and that it has the same mirror attribute as the current aggregate. After a suitable aggregate has been identified or created, move the standby volume to this aggregate using the "volume move start" command. For more information or assistance, contact NetApp technical support.

Syslog Message

Both active and standby cluster-wide storage volumes (%s, %s) for %s feature are on the same aggregate.

Parameters

ActiveVolume (STRING): Active volume name.
StandbyVolume (STRING): Standby volume name.
Feature (STRING): Feature using the cluster-wide storage.

cmd events

cmd.result events

cmd.result.reboot

Severity

NOTICE

Description

This message occurs when the system reboots as a consequence of executing the specified command.

Corrective Action

(None).

Syslog Message

System rebooted for ('%s').

Parameters

cmd (STRING): Command for which the system rebooted.

cmd.sasadmin events

cmd.sasadmin.fw_update.fail

Severity

ERROR

Description

This message occurs when an adapter firmware update failure occurs.

Corrective Action

Verify that the firmware file is valid and try updating the firmware again. If the firmware update still fails, contact NetApp technical support.

Syslog Message

Adapter firmware update failed for adapter: %s.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.

cmd.shelfchk events

cmd.shelfchk.config.OK

Severity

INFORMATIONAL

Description

This event is generated while verifying disk shelf cabling and configuration. The operator indicates that the correct disk LEDs have illuminated.

Corrective Action

(None).

Syslog Message

Disk Configuration - No Errors Identified.

Parameters

(None).

cmd.shelfchk.config.warning

Severity

ERROR

Description

This event is generated while verifying disk shelf cabling and configuration on a channel. The operator has indicated that the intended set of disk LEDs is not illuminated.

Corrective Action

Verify that the adapters and storage shelves are cabled correctly.

Syslog Message

Disk Configuration - Failure Identified by Operator.

Parameters

(None).

cmd.start events

cmd.start.unsuccessful

Severity

ERROR

Description

This message occurs when the Counter Manager daemon (cmd) fails to start. The failure impacts the continuous archiving of performance data, which is used by technical support to troubleshoot system issues.

Corrective Action

The startup failure might be due to improper permissions for the '/mroot/etc/log' directory, or a full disk. Verify that the permissions of the '/mroot/etc/log' directory are 'rwxr-xr-x' by executing the 'fsecurity show /vol/vol0/etc/log' command from the nodeshell. Verify that the '/mroot' file system is not full. After fixing the cause of the failure, restart the cmd by running the 'spmctl -e -h cmd' command from the freebsd shell.

Syslog Message

The cmd startup failed.

Parameters

(None).

cmds events

cmds.config events

cmds.config.file.delete

Severity
    NOTICE

Description
    This message occurs when there is an error in deleting the specified file.

Corrective Action
    (None).

Syslog Message
    %s: Error in deleting %s: (%s).

Parameters
    funcname (STRING): Function name.
    fname (STRING): File name.
    errMessage (STRING): Error message.

cmds.software events

cmds.software.dirErr

Severity
    ERROR

Description
    This message occurs because the system cannot create the directory at the designated path.

Corrective Action
    (None).

Syslog Message
    Could not create directory %s: %s

Parameters
    path (STRING): Path where directory was supposed to be created.
    errorMsg (STRING): Error message.

cmds.software.installDone

Severity
    INFORMATIONAL

Description

This message occurs during software update and installation to inform you that the installation is complete.

Corrective Action

(None).

Syslog Message

Software: Installation of %s was completed.

Parameters

fileName (STRING): Name of the file to be updated/installed.

cmds.software.installNotDone

Severity

INFORMATIONAL

Description

This message occurs during software update and installation to inform you that installation failed.

Corrective Action

(None).

Syslog Message

Software: Installation of %s failed.

Parameters

fileName (STRING): Name of the file to be updated/installed.

cmds.sysconf events

cmds.sysconf.haltERR1

Severity

ALERT

Description

This message occurs to log the reason for system halt, before actually system is halted.

Corrective Action

(None).

Syslog Message

Halting system due to %d configuration problems.

Parameters

errCount (INT): Number of error which caused the system halt.

cmds.sysconf.haltERR2

Severity

ALERT

Description

This message occurs to log the reason for system halt, before actually system is halted.

Corrective Action

(None).

Syslog Message

Halting system due to a configuration problem.

Parameters

(None).

cmds.sysconf.inconstRule

Severity

INFORMATIONAL

Description

This message occurs because the rule for the card is applicable to both non_cluster_only and cluster_only systems, which is inconsistent.

Corrective Action

(None).

Syslog Message

Rule for model %s card %s is inconsistent: it applies both to cluster-only and non-cluster-only.

Parameters

model (STRING): Model ID.
card (STRING): Card ID.

cmds.sysconf.logErr

Severity

NOTICE

Description

This message occurs to log the error through syslog as an Error or Informational message depending upon the error count which is in this case greater than 0.

Corrective Action

(None).

Syslog Message

%s.

Parameters

errMsg (STRING): Error message to be logged.

cmds.sysconf.logInfo

Severity

INFORMATIONAL

Description

This message occurs to log the error through syslog as an Error or informational message depending upon the error count which is in this case less than or equal to 0.

Corrective Action

(None).

Syslog Message

%s.

Parameters

errMsg (STRING): Error message to be logged.

cmds.sysconf.perIntSmall

Severity

INFORMATIONAL

Description

This message occurs because the value for a periodic interval for internal testing is set too small, less than the minimum allowed.

Corrective Action

(None).

Syslog Message

options.sysconfig.periodic_interval of %d minutes is too small; using %d.

Parameters

valueUsed (INT): Value used for testing purpose.
defaultMinValue (INT): Minimum value allowed for a periodic interval.

cmds.sysconf.syslogger

Severity

NOTICE

Description

This message occurs to send the output to syslog rather than command prompt because the option '-l' with sysconfig command is not documented and is included in DEBUG builds only.

Corrective Action

(None).

Syslog Message

%s.

Parameters

message (STRING): 'sysconfig -l' Command output message.

cmpr events

cmpr.algo events

cmpr.algo.not.enabled

Severity

ALERT

Description

This message occurs when compression algorithm specified has not been enabled on the node.

Corrective Action

Contact technical support.

Syslog Message

Volume '%s' has '%s' compression enabled but the necessary bootarg(s) have not been set on the node.

Parameters

vol (STRING): Volume name.
comp_algo (STRING): Compression Algorithm.

cna events

cna.dump events

cna.dump

Severity

NOTICE

Description

This message occurs when an unexpected event or illegal condition is detected by the Converged Network Adapter (CNA) driver and the contents of the adapter's static RAM and memory must be dumped. After the dump, the adapter is reset and the contents of the dump are stored in a file in the /etc/log/ directory.

Corrective Action

No corrective action is needed; the adapter was reset.

Syslog Message

CNA coredump generated for CNA adapter CNA_%s, %s

Parameters

adapter (STRING): Name of the Converged Network Adapter.
reason (STRING): Reason for the dump.

cna.dump.saved

Severity

NOTICE

Description

This message occurs when an unexpected event or illegal condition is detected by the Converged Network Adapter (CNA) driver and the contents of the adapter's static RAM and memory are saved. The dump files are stored on the appliance's root volume in the /etc/log/ directory, with the following file name format: *[date]*[time].bin

Corrective Action

Send the dump file to technical support for analysis.

Syslog Message

A dump for CNA adapter CNA_%s was stored in %s

Parameters

adapter (STRING): Name of the CNA.
filename (STRING): Name of the file containing the dump.

cna.initfailed events

cna.initFailed

Severity

ALERT

Description

This message occurs when the converged network adapter (CNA) fails to initialize.

Corrective Action

Take corrective action based on the reason indicated for the failure.

Syslog Message

Initialization of adapter %s failed, reason: %s.

Parameters

adapter (STRING): Name of the Adapter.
reason (STRING): Reason for the failure.

cna.sfp events

cna.sfp.notSupported

Severity

ERROR

Description

This message occurs when the converged network adapter (CNA) detects an unsupported small form-factor Pluggable (SFP) in the adapter.

Corrective Action

Replace the unsupported SFP with a supported SFP.

Syslog Message

The SFP in adapter %s is not supported.

Parameters

adapter (STRING): Name of the adapter.

command events

command.complex events

command.complex.query

Severity

ERROR

Description

This message occurs when a custom role associated with a Storage Virtual Machine has a command directory with complex query.

Corrective Action

Remove the complex query. See BUG 915877 for more information.

Syslog Message

The %s command directory in %s role under Storage Virtual Machine %s, will not be available in merged role.

Parameters

vserver (STRING): Name of the Storage Virtual Machine.
rolename (STRING): Name of the role associated with the Virtual Storage Machine, with a command directory with a complex query.
cmddirname (STRING): Name of the command directory with complex query.

config events

config.atanotsupported events

config.ATAnotSupported

Severity

ERROR

Description

This message occurs when an ATA disk is found, but the appliance does not support it.

Corrective Action

Remove the ATA disks or upgrade your appliance to a model that supports ATA disks. Check your support provider's web site or knowledgebase for more information about appliance models that support ATA disks.

Syslog Message

ATA disks are not supported on this appliance. Disk %s is an ATA disk and should be removed.

Parameters

disk (STRING): Name of the disk.

config.badlocalswitch events

config.BadLocalSwitch

Severity

ALERT

Description

This message occurs when a disk is found to be attached to a switch, but there are also disks attached via local connections. Mixed switch-attached and direct-attached disks are an illegal configuration.

Corrective Action

Correct the cabling so that all disks are attached either directly or through switches. Consult the hardware cabling guides at the NetApp technical support site.

Syslog Message

Disk %s is attached to a switch. However, there are also local attached disks. This is an illegal configuration.

Parameters

disk (STRING): Name of the disk.

config.badpoolassign events

config.BadPoolAssign

Severity

ERROR

Description

This message occurs when SyncMirror® is in use and disks are assigned to different pools on the same interface or loop. This affects the fault isolation of the plexes in mirrored aggregates such that if a single interface fails, both plexes in an aggregate might fail or become degraded. If both plexes of an aggregate fail, the system enters multidisk panic.

Corrective Action

If the disk is a spare disk, use the "storage disk assign -pool [0|1]" command to change the pool assignment of the disks on the interface so that they are assigned to only one pool. If the disk is a file system disk, use the "storage disk replace" command to replace the disk from the incorrect pool with a spare disk from the correct pool.

Syslog Message

Disk %s is in %s and other disks on this loop/domain are in %s. Disks/interfaces need to be in separate pools for SyncMirror.

Parameters

disk (STRING): Name of the disk that fails.
disk_pool (STRING): Name of the pool that the disk is in.
other_pool (STRING): Name of the other pool.

config.badslot events

config.BadSlot

Severity

ALERT

Description

This message occurs when a disk is found to be attached to an invalid Host Adapter (HA) controller slot.

Corrective Action

Consult the NetApp technical support guides for the supported slots for adapters in the hardware platform. If the adapter is in a supported slot, contact NetApp technical support for further assistance.

Syslog Message

Disk %s is attached to an invalid HA slot. This is an illegal configuration.

Parameters

disk (STRING): Name of the disk.

config.badswitchlocal events

config.BadSwitchLocal

Severity

ALERT

Description

This message occurs when a disk is found to be attached locally, but there are also disks attached via switches. Mixed switch-attached and direct-attached disks are an illegal configuration.

Corrective Action

Correct the cabling so that all disks are attached either directly or through switches. Consult the hardware cabling guides at the NetApp technical support site.

Syslog Message

Disk %s is attached locally. However, there are also switch attached disks. This is an illegal configuration.

Parameters

disk (STRING): Name of the disk.

config.bridge events

config.bridge.adapter.invalid

Severity

ERROR

Description

This message occurs when an FC-to-SAS bridge is attached to an unsupported FC adapter port. Only QLogic® 4-Gb/s or 8-Gb/s adapters are supported.

Corrective Action

Attach the FC-to-SAS bridge to a supported FC adapter port on the controller.

Syslog Message

FC-to-SAS bridge %s S/N [%s] is attached to unsupported FC adapter port %s.

Parameters

bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
adapterName (STRING): Name of the associated FC host bus adapter.

config.bridge.extra.port

Severity

ERROR

Description

This message occurs when both FC ports of an FC-to-SAS bridge are attached to the same controller.

Corrective Action

Follow the defined Fabric or Stretch MetroCluster wiring guide.

Syslog Message

Both FC ports of FC-to-SAS bridge %s S/N [%s] are attached to this controller.

Parameters

bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.

config.bridge.fw.mismatch

Severity

ERROR

Description

This message occurs when two or more attached FC-to-SAS bridges are running different firmware revisions.

Corrective Action

For more information about downloading and installing updated firmware, check your support provider's web site or knowledgebase.

Syslog Message

Two or more %s FC-to-SAS bridges are running different firmware revisions.

Parameters

bridgeModel (STRING): Name of the FC-to-SAS bridge model.

config.bridge.SAS.miswired

Severity

ERROR

Description

This message occurs when the SAS disk shelves behind an FC-to-SAS bridge are not wired in the correct order.

Corrective Action

Follow the defined Fabric or Stretch MetroCluster wiring guide.

Syslog Message

The SAS disk shelves behind FC-to-SAS bridge %s S/N [%s] are not correctly wired.

Parameters

bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.

config.bridge.SAS2Domain

Severity

ERROR

Description

This message occurs when a disk is multipathed to one SAS domain; that is, both ports of the disk are visible from the same bridge FC port.

Corrective Action

Recable the disk shelf containing the specified disk, so that the two disk ports are in different SAS domains.

Syslog Message

Disk %s is multipathed to the same SAS domain. The two disk ports must be in different SAS domains.

Parameters

disk (STRING): Name of the disk.

config.bridge.unsupp.shelf

Severity

ALERT

Description

This message occurs when an FC-to-SAS bridge discovers a disk shelf that it does not support.

Corrective Action

Verify the bridge firmware is up-to-date with minimum FW rev required for support of this shelf type. If the bridge firmware supports the disk shelf but the error condition persists, remove the disk shelf.

Syslog Message

FC-to-SAS %s bridge with S/N: %s WWN: %s has unsupported %s shelf type attached.

Parameters

bridgeType (STRING): Type of FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the bridge.
bridgeWWN (STRING): World Wide Name of the bridge.
shelfType (STRING): Type of shelf.

config.cfobothabmodule events

config.CFObothABmodule

Severity

ALERT

Description

This message occurs when a disk shelf in a node is cabled for multipathing and the configuration does not support it. Multipathing means that the disk shelf is connected to one node through both disk shelf module A and module B. In HA configurations, multipathing is only supported if software disk ownership is being used and the storage shelf supports it.

Corrective Action

For a standard HA configuration, identify the miscabled disk shelf and attach either module A or module B to the partner node. For a shared storage or multipathed HA, assign disk ownership to the partner node by using the "disk assign" command in Maintenance mode.

Syslog Message

The disk shelf where disk %s resides is connected to this node through both disk shelf module A and module B; one of the modules must be connected to the partner node instead.

Parameters

> **disk** (STRING): Name of the disk that is cabled for multipathing.

config.cfomixedabmodule events

config.CFOmixedABmodule

Severity

> ALERT

Description

> This message occurs when a disk shelf attached to a node is miscabled so that one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

Corrective Action

> Identify the miscabled disk shelf, and then recable it. For FC shelves, ensure that each disk shelf's module A is connected Output to Input to the next disk shelf's module A, and that the disk shelf's module B is connected Output to Input to the next disk shelf's module B. For SAS shelves, connect the port identified with a circle on disk shelf module A to the port identified with a square on the next disk shelf's module A, and the "circle" port on module B to the next disk shelf's "square" port.

Syslog Message

> Host adapter %s has miscabled disk shelves; one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

Parameters

> **adapter** (STRING): Adapter that the miscabled disk shelf is on.

config.differentswitchport events

config.DifferentSwitchPort

Severity

> ALERT

Description

> This message occurs when the two ports of the disk are connected to different switch ports.

Corrective Action

> (None).

Syslog Message

> Disks on port %s:%d are also connected to port %s:%d. They need to be connected via the same port on different switches. This is an illegal configuration.

Parameters

> **switch1** (STRING): (None).
> **port1** (INT): (None).
> **switch2** (STRING): (None).
> **port2** (INT): (None).

config.diffpool events

config.DiffPool

Severity

ALERT

Description

This message occurs when a disk is found to be multipathed to two different mirroring pools. This configuration is illegal.

Corrective Action

See the NetApp technical support site for guidelines about assigning disks or array LUNs to SyncMirror® pools.

Syslog Message

Disk %s is dual-attached to two separate mirrored pools. This is an illegal configuration.

Parameters

disk (STRING): Name of the disk.

config.disknoswitch events

config.DiskNoSwitch

Severity

ALERT

Description

This message occurs when a disk is found to be attached to a switch, but it's not supported for a switch configuration.

Corrective Action

Ensure that the Disk Qualification Package (DQP) is up-to-date. Visit the NetApp technical support site for information on DQP files and installation. If the error persists for more than 10 minutes after installing an updated DQP file, remove the drive.

Syslog Message

Disk %s is not supported in a switch configuration.

Parameters

disk (STRING): Name of the disk.

config.exceededha events

config.ExceededHA

Severity

ERROR

Description

This message occurs when the number of local attached FC adapters exceeds the maximum allowed.

Corrective Action

(None).

Syslog Message

%d Fibre Channel disk adapters were detected and the maximum allowed is only %d.

Parameters

numHA (INT): (None).
maxHA (INT): (None).

config.fcsameloop events

config.FCSameLoop

Severity

ERROR

Description

This message occurs when a disk is multipathed to the same Fibre Channel loop.

Corrective Action

Recable the disk shelf containing the specified disk so that it is multipathed to different Fibre Channel loops.

Syslog Message

Disk %s is attached to the same Fibre Channel loop. The disk should be multipathed to different loops.

Parameters

disk (STRING): Name of the disk.

config.habadbank1 events

config.HABadBank1

Severity

ALERT

Description

This message occurs when a local host adapter is connected to a different switch bank (on ports 8-15) than other adapters on this controller, which are connected to ports 0-7. This is an illegal configuration.

Corrective Action

Connect all of the adapters of this controller to the same bank of switch ports.

Syslog Message

Other local host adapters are connected to Switch bank 1 (ports 0-7). Host adapter %s is connected to Switch bank 2 (ports 8-15). This is an illegal configuration.

Parameters

ha (STRING): Name of the host adapter.

config.habadbank2 events

config.HABadBank2

Severity

ALERT

Description

This message occurs when a local host adapter is connected to a different switch bank (on ports 0-7) than other adapters on this controller, which are connected to ports 8-15. This is an illegal configuration.

Corrective Action

Connect all of the adapters of this controller to the same bank of switch ports.

Syslog Message

Other local host adapters are connected to Switch bank 2 (ports 8-15). Host adapter %s is connected to Switch bank 1 (ports 0-7). This is an illegal configuration.

Parameters

ha (STRING): Name of the host adapter.

config.habadremote events

config.HABadRemote

Severity

ALERT

Description

This message occurs when a remote host adapter is connected to the wrong switch bank.

Corrective Action

Examine the cabling to determine which switch bank the local controller host adapters are attached to (the lower-numbered ports or the higher-numbered ports.) Recable the HA of the remote controller to be in the other bank of switch ports.

Syslog Message

A remote host adapter is connected to the same switch bank as the local host adapters. This is an illegal configuration.

Parameters

(None).

config.invalid events

config.invalid.PortToPort

Severity

ERROR

Description

This message occurs when a SAS (Serial Attached SCSI) port is attached to another SAS port. This is not a valid connection.

Corrective Action

Check and correct the cabling; connecting two SAS ports together in this configuration is not permitted.

Syslog Message

SAS adapter "%s" is attached to another SAS adapter.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.

config.localswitch events

config.localswitch

Severity

EMERGENCY

Description

This message occurs when a disk is found attached via both local connection and a switch. This is permitted in debug. The system will be halted in non-debug.

Corrective Action

(None).

Syslog Message

Disk %s is attached via a local connection and a switch. This is an illegal configuration.

Parameters

disk (STRING): Name of the disk.

config.mirroring events

config.mirroring.failure

Severity

ERROR

Description

This message occurs when the name-service configuration is not replicated in the node. The out-of-sync configuration file can impact access during data access attempts.

Corrective Action

Use the "vserver services name-service unix-user load-from-uri" or "vserver services name-service unix-group load-from-uri" command to reload the configuration file. Use the (privilege: advanced) "vserver services name-service unix-user file status" or "vserver services name-service unix-group file status" command to verify that the configuration file was successfully loaded and corresponding database was successfully generated.

Syslog Message

Failed getting the latest %s file for Vserver %s on node %s with error %s.

Parameters

configuration (STRING): Name of the configuration.
vserver_name (STRING): Name of the vserver, for which the configuration was not successfully replicated.
node_name (STRING): Name of the node on which configuration failed to replicate.
error_string (STRING): Error encountered while extracting package.

config.mirrornotmultipath events

config.MirrorNotMultiPath

Severity

ERROR

Description

This message occurs when a disk is not multipathed but synchronous mirroring is enabled.

Corrective Action

Multipath the disk shelf stack by also attaching it to a different host adapter via the other shelf module in each disk shelf in the stack.

Syslog Message

Disk %s and other disks on this loop/domain are not multipathed and should be for synchronous mirroring configuration.

Parameters

disk (STRING): Name of the disk.

config.mirrorscsidisk events

config.MirrorSCSIdisk

Severity

ALERT

Description

This message occurs when a SCSI disk is found in a SyncMirror® configuration.

Corrective Action

Unconfigure SyncMirror on the aggregate that contains the SCSI disk. Configure SyncMirror using aggregates that do not contain SCSI disks.

Disk %s is a SCSI disk, and is illegal in a SyncMirror configuration.

Parameters

disk (STRING): Name of the SCSI disk that was found.

config.mixedabmodule events

config.mixedABmodule

Severity

ERROR

Description

This message occurs when the disk shelf stack is miscabled so that one disk shelf's module A is connected to the next disk shelf's module B, or vice versa.

Corrective Action

Identify the miscabled disk shelf, and then recable it. For fibre channel shelves, ensure that each disk shelf's module A is connected Output to Input to the next disk shelf's module A, and that the disk shelf's module B is connected Output to Input to the next disk shelf's module B. For SAS shelves, connect the port identified with a circle on disk shelf module A to the port identified with a square on the next disk shelf's module A, and the "circle" port on module B to the next disk shelf's "square" port on disk shelf module B.

Syslog Message

Host adapter %s has miscabled disk shelves; one disk shelf's module A is connected to the next disk shelf's module B, or vice versa. This is not a recommended configuration.

Parameters

adapter (STRING): Name of the adapter on the miscabled disk shelf stack.

config.more2path events

config.More2Path

Severity

ERROR

Description

This message occurs when a disk is found to have more than two connections to the storage controller.

Corrective Action

Remove connections to the disk so there are only two.

Syslog Message

Disk %s and other disks on this loop/domain are attached with more than two connections. Only two connections are supported.

Parameters

disk (STRING): Name of the disk.

config.move events

config.move.fail.lost.lif.address

Severity

ERROR

Description

This message occurs when a logical interface (LIF) migration fails in such a way that there might have been a resulting internal loss of the LIF IP address.

Corrective Action

Use the "network interface modify" command to toggle the LIF's "-status-admin" parameter down and then up. This reinstalls the LIF address in the network stack.

Syslog Message

LIF migration for IP address %s from port %s to port %s failed because of an internal error: %s.

Parameters

address (STRING): LIF IPv4 or IPv6 address being moved.
migrateFromPort (STRING): Name of the migrate-from port.
migrateToPort (STRING): Name of the migrate-to port.
internalError (STRING): Internal error message.

config.multipath events

config.MultiPath

Severity

INFORMATIONAL

Description

This message occurs when the filer configuration is configured for High Availability (HA) multipathing.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

config.noadisk events

config.noAdisk

Severity

ALERT

Description

This message occurs when the local node in an HA configuration is connected to its disk shelves through the shelf B module instead of the shelf A module. In an HA configuration, the local node must be connected to its disk shelves through the shelf A module, and the partner node must be connected to those disk shelves through the shelf B module.

Corrective Action

For a standard HA configuration, identify and connect the local node's disk shelves to the local node using the shelf's module A. Then connect those disk shelves to the partner node using the shelf module B. For a shared storage or multipathed HA, assign disk ownership to the local and partner nodes by using the "disk assign" command in Maintenance mode.

Syslog Message

All disk shelves are attached to the local node through shelf module B. Some of these shelves should be attached via shelf module A.

Parameters

(None).

config.nobconnect events

config.noBconnect

Severity

EMERGENCY

Description

This message occurs when the local node in an HA configuration has no access to its partner node's disk shelves because the partner node's shelves are not connected to the local node through the shelf's module B.

Corrective Action

For an HA configuration that uses software disk ownership, verify that both the local and partner nodes can access the disks.

Syslog Message

The local node cannot access the partner node's disk shelves because the partner node's shelves are not connected to the local node through their shelf module B.

Parameters

(None).

config.nocheck events

config.NoCheck

Severity

NOTICE

Description

This message occurs when the system should be halting, but it cannot because the "no-config-check? " environment variable is set to true.

Corrective Action

(None).

Syslog Message

This is an illegal configuration. However the Filer is not halting due to no-config-check? being set to true.

Parameters

(None).

config.nomultipath events

config.NoMultiPath

Severity

ALERT

Description

This message occurs when a disk is found with multiple paths and it does not support them.

Corrective Action

Remove the second path from the disk shelf.

Syslog Message

Disk %s cannot be multipathed.

Parameters

disk (STRING): Name of the disk that was found.

config.nopartnerdisks events

config.noPartnerDisks

Severity

ERROR

Description

This message occurs in a High-Availablity (HA> configuration when there are no partner disks.

Corrective Action

Ensure that both nodes of the HA pair are cabled so they have access to all the disks. Check that the adapter interface to the disk shelves is up using the "storage adapter show" command. Ensure that any switches are correctly zoned for disk visibility by the nodes.

Syslog Message

No disks were detected for the partner; this node cannot perform takeover correctly.

Parameters

(None).

config.nopartnerluns events

config.noPartnerLUNs

Severity

EMERGENCY

Description

This message occurs in a High-Availablity (HA) configuration with array LUNS when there is no attachment to both local and partner LUNs.

Corrective Action

Ensure that both nodes of the HA pair are cabled so they have access to all of the LUNs. Check that the adapter interface to the array is up by using the "storage adapter show" command. Ensure that any switches are correctly zoned for LUN visibility by the nodes. Verify that the array or bridge is correctly exporting its LUNs on the proper interface.

Syslog Message

No LUNs were detected for the partner; this node cannot perform takeover correctly.

Parameters

(None).

config.noswitchcount events

config.NoSwitchCount

Severity

NOTICE

Description

This message occurs when an attempt to obtain the switch port count fails because it does not exist.

Corrective Action

(None).

Syslog Message

Unable to obtain switch port count information for attached switches.

Parameters

(None).

config.noswitchcountfordisk events

config.NoSwitchCountForDisk

Severity

NOTICE

Description

This message occurs when an attempt to obtain the switch port count fails because it does not exist.

Corrective Action

(None).

Syslog Message

Unable to obtain switch port count information for disk %s.

Parameters

disk (STRING): Name of the disk.

config.notmultipath events

config.NotMultiPath

Severity

ERROR

Description

This message occurs when a disk is not multipathed.

Corrective Action

Multipath the disk shelf stack by also attaching it to a different host adapter via the other shelf module in each disk shelf in the stack.

Syslog Message

Disk %s and other disks on this loop/domain are not multipathed and should be for improved availability.

Parameters

disk (STRING): Name of the disk.

config.oneswitch events

config.OneSwitch

Severity

ALERT

Description

This message occurs when the disk is only connected to one switch.

Corrective Action

(None).

Syslog Message

Disk %s and other disks on this loop are only connected to one switch. For availability reasons, it should be connected to two separate switches.

Parameters

disk (STRING): name of the disk

config.pvlan events

config.pvlan.created

Severity

NOTICE

Description

This message occurs when a pseudo-VLAN port is created.

Corrective Action

(None).

Syslog Message

Pseudo-VLAN "%s" was created on the network interface "%s".

Parameters

pvlanName (STRING): Pseudo-VLAN name.
interface (STRING): Interface name that the pseudo-VLAN will be on.

config.pvlan.deleted

Severity

NOTICE

Description

This message occurs when a pseudo-VLAN port is deleted.

Corrective Action

(None).

Syslog Message

Pseudo-VLAN "%s" was deleted from the network interface "%s".

Parameters

pvlanName (STRING): Pseudo-VLAN name.
interface (STRING): Interface name that the pseudo-VLAN is on.

config.repl events

config.repl.bypass.disabled

Severity

NOTICE

Description

This message occurs when the configuration replication bypass has been disabled. Configuration replication to any partner clusters will now resume.

Corrective Action

(None).

Syslog Message

The configuration replication bypass has been disabled.

Parameters

(None).

config.repl.bypass.enabled

Severity

NOTICE

Description

This message occurs when the configuration replication bypass has been enabled. Configuration replication to any partner clusters will cease until the bypass is disabled using the 'debug crs replication-bypass disable' command.

Corrective Action

(None).

Syslog Message

The configuration replication bypass has been enabled.

Parameters

(None).

config.sameha events

config.sameHA

Severity

ERROR

Description

This message occurs when a disk is multipathed to the same host adapter. The second disk interface should be attached to a different host adapter.

Corrective Action

Move one of the connections attaching the disk shelf to a different host adapter.

Syslog Message

Disk %s and other disks attached to the same port are dual-attached to the same adapter. For improved availability you should dual-attach them to separate adapters.

Parameters

disk (STRING): Name of the disk.

config.sameslot events

config.sameSlot

Severity

ERROR

Description

This message occurs when a SAS disk is multipathed to host adapters in the same controller slot. The second disk interface should be attached to a host adapter in a different slot.

Corrective Action

Move one of the connections attaching the disk shelf to a host adapter in a different slot.

Syslog Message

Disk %s and other disks attached to the same port are dual-attached to adapters in the same slot . For improved availability you should dual-attach them to adapters in separate slots.

Parameters

disk (STRING): Name of the disk.

config.sameswitch events

config.SameSwitch

Severity

ALERT

Description

This message occurs when both ports of a disk is found to be attached to the same switch.

Corrective Action

(None).

Syslog Message

Disks on port %s:%d are also connected to the same switch at port %s:%d. This is an illegal configuration.

Parameters

switch1 (STRING): name of the switch
port1 (INT): port number of 1st connection.
switch2 (STRING): (None).
port2 (INT): port number of 2nd connection.

config.sameswitchwarn events

config.SameSwitchWarn

Severity

ALERT

Description

This message occurs when both ports of a disk are found to be attached to the same switch. Higher availability is achieved by cabling disk ports to different switches.

Corrective Action

Recable one of the indicated ports to a different switch.

Syslog Message

Disks on port %s:%d are also connected to the same switch at port %s:%d. For availability reasons, they should be connected to two separate switches.

Parameters

switch1 (STRING): Name of the switch.
port1 (INT): Port number of first connection.
switch2 (STRING): (None).
port2 (INT): Port number of second connection.

config.sas2domain events

config.SAS2Domain

Severity

ERROR

Description

This message occurs when a disk is multipathed to one SAS domain; that is, both ports of the disk are visible from the same HBA port.

Corrective Action

Recable the disk shelf containing the specified disk, so that the two disk ports are in different SAS domains.

Syslog Message

Disk %s is multipathed to the same SAS domain. The two disk ports must be in different SAS domains.

Parameters

disk (STRING): Name of the disk.

config.scsidisk events

config.SCSIdisk

Severity

NOTICE

Description

This message occurs when a SCSI disk is found in a CFO configuration.

Corrective Action

(None).

Syslog Message

Disk %s is a SCSI disk, and is illegal in a Clustered Failover configuration.

Parameters

disk (STRING): Name of the SCSI disk which was found.

configbr events

configbr.backupcompleted events

configbr.backupCompleted

Severity

NOTICE

Description

This message occurs when a scheduled configuration backup is successfully created.

Corrective Action

(None).

Syslog Message

Scheduled configuration backup %s was created successfully.

Parameters

backup (STRING): Backup file.

configbr.backupfailed events

configbr.backupFailed

Severity

ALERT

Description

This message occurs when when the configuration backup cannot be created.

Corrective Action

Verify the root volume file system is available and has enough space to create a backup with the "volume show" command or adjust the size of the memory-backed scratch space using the "configuration backup settings modify" command (privilege: diagnostic). If the scheduled backup could not be created, create a backup file manually with the (privilege: advanced) "system configuration backup create" command, find the remote URL for uploading with the (privilege: advanced) "system configuration backup settings show -fields destination" command, and upload the backup with the (privilege: advanced) "system configuration backup upload" command.

Syslog Message

The %s configuration backup %s cannot be created. Error: '%s'.

Parameters

type (STRING): Type of backup, either cluster or local.
backup (STRING): Backup file.
reason (STRING): Reason for the error.

configbr.deletefailed events

configbr.deleteFailed

Severity

ERROR

Description

This message occurs when an old configuration backup cannot be deleted.

Corrective Action

Ensure that the node is accessible and healthy. If necessary, delete the backup manually with the (privilege: advanced) "system configuration backup delete" command.

Syslog Message

The %s configuration backup %s on node %s cannot be deleted. Error: '%s'.

Parameters

type (STRING): Type of backup, either cluster or local.
backup (STRING): Backup file.
node (STRING): Node on which the backup file exists.
reason (STRING): Reason for the error.

configbr.distributefailed events

configbr.distributeFailed

Severity

ERROR

Description

This message occurs when a configuration backup cannot be distributed to another node in the cluster.

Corrective Action

Ensure that the destination node is accessible and healthy. If necessary, upload the backup file to the remote URL to increase the availability of the backup file with the (privilege: advanced) "system configuration backup upload" command.

Syslog Message

Configuration backup %s cannot be distributed to node %s. Error: '%s'.

Parameters

backup (STRING): Backup file.
destination_node (STRING): Destination node to which the backup file failed to be distributed.
reason (STRING): Reason for the error.

configbr.initfailed events

configbr.initFailed

Severity

ERROR

Description

This message occurs when the configuration backup and restore feature cannot initialize the necessary software components. Given time, the system might recover by retrying the initialization.

Corrective Action

Verify the root volume file system is available and has enough space to create a backup with the "volume show" command. If replicated database entries could not be populated, wait five minutes and verify that the backup schedules are listed with the (privilege: advanced) "system configuration backup settings show -instance" command. If the backup jobs could not be created, wait five minutes and verify that backup jobs are displayed for each schedule with the "job show" command.

Syslog Message

Configuration backup and restore feature could not be initialized. Error: '%s'.

Parameters

reason (STRING): Reason for the initialization failure.

configbr.interror events

configbr.intError

Severity

ERROR

Description

This message occurs when an attempt to create a configuration backup file encountered an internal software error.

Corrective Action

Create the configuration backup file manually by using the (privilege: advanced) "system configuration backup create" command.

Syslog Message

Configuration backup and restore detected an internal software error. Error: '%s'.

Parameters

error (STRING): Internal software error.

configbr.nodesturl events

configbr.noDestURL

Severity

ERROR

Description

This message occurs when the cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

Corrective Action

Configure an offsite configuration backup destination URL as soon as possible, using the commands "system configuration backup settings modify -destination <destination-url> -username <username-on-destination-url>" and "system configuration backup settings set-password".

Syslog Message

Cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

Parameters

(None).

configbr.snapshotdelfailed events

configbr.snapshotDelFailed

Severity

ERROR

Description

This message occurs when a Snapshot(tm) copy on the root volume cannot be deleted. The Snapshot copy was created during a configuration backup.

Corrective Action

Ensure that the root volume file system is available with the "volume show" command.

Syslog Message

Snapshot copy %s on the root volume cannot be deleted on node %s. Error: '%s'.

Parameters

name (STRING): Name of the Snapshot copy.
node (STRING): Node on which the Snapshot copy was created.
reason (STRING): Reason for the error.

configbr.unpubfailed events

configbr.unpubFailed

Severity

ERROR

Description

This message occurs when the configuration backup and restore feature fails to unpublish a package by using the file replication service. The configuration backup process creates file packages and registers them with the file replication service, which stores the package in the root file system. When the configuration backup process is complete, it cleans up these files by unpublishing the package by using the file

replication service. When unpublishing fails, these files are not be cleaned up and remain in the root file system. This message does not indicate a failure in the configuration backup process, which continues despite the event. You can monitor the status of an ongoing configuration backup process by using the "job show" command. The completed configuration backup files are visible when you run the "system configuration backup show" command.

Corrective Action

Obtain diagnostic privilege and view the file replication packages by using the "system services replication show" command. Unpublish the file replication packages by issuing the "system services replication unpublish" command, for which you also need diagnostic privilege. Check the "cluster ring show" command to ensure that the node is in quorum; management quorum is required for the unpublish command to succeed. Do not take these actions while an active configuration backup process is running.

Syslog Message

Configuration backup and restore failed to unpublish package %s; Error: '%s'.

Parameters

package_name (STRING): Name of the package.
reason (STRING): Reason for the unpublishing failure.

configbr.uploadfailed events

configbr.uploadFailed

Severity

ERROR

Description

This message occurs when the configuration backup cannot be uploaded to the destination URL.

Corrective Action

Ensure that the destination URL is reachable, the protocol in the URL is supported, and the user credentials are valid.

Syslog Message

Configuration backup file %s cannot be uploaded to the destination URL %s. Error: '%s'.

Parameters

backup (STRING): Backup file.
destination (STRING): Destination URL.
reason (STRING): Reason for the upload failure.

connectx events

connectx.cmdinterface events

connectx.cmdInterface.hung

Severity

NOTICE

Description

This message occurs when the command interface of ConnectX HA interconnect hardware is temporarily hung. If the command interface fails to recover, the HA interconnect goes down.

Corrective Action

Typically, the command interface recovers after a few seconds. If not, an AutoSupport message is generated when the HA interconnect goes down.

Syslog Message

HA interconnect ConnectX hardware command interface is temporarily hung.

Parameters

(None).

connectx.fatalerror events

connectx.fatalError

Severity

ERROR

Description

This message occurs when a fatal error is polled from the ConnectX(tm) InfiniBand® adapter. Controller failover will be disabled.

Corrective Action

Contact NetApp technical support. ConnectX registers have been dumped to the /etc/mlxlog/ConnectX_regdump file.

Syslog Message

HA interconnect HBA failure, ConnectX fatal error was polled.

Parameters

(None).

connectx.ibcabledetected events

connectx.IbCableDetected

Severity

INFORMATIONAL

Description

This message occurs when an InfiniBand cable is detected on the InfiniBand port.

Corrective Action

(None).

Syslog Message

Detected %s of length %dM on InfiniBand port %s.

Parameters

cable_type (STRING): InfiniBand cable type.
cable_length (INT): Length of the InfiniBand cable in meters.
port_str (STRING): InfiniBand port in which the cable is plugged.

connectx.iblinkretrainnotreqd events

connectx.IBLinkRetrainNotReqd

Severity

INFORMATIONAL

Description

This message occurs when the software detects that the previous InfiniBand link training was successful.

Corrective Action

(None).

Syslog Message

InfiniBand Link training was successful for ConnectX in slot %d, port %d.

Parameters

pcie_slot (INT): PCIe slot in which ConnectX is present.
port_num (INT): Port number where the success was detected.

connectx.iblinkretrainreqd events

connectx.IBLinkRetrainReqd

Severity

NOTICE

Description

This message occurs when the software detects that the previous InfiniBand link training was unsuccessful.

Corrective Action

(None).

Syslog Message

InfiniBand Link training failed for ConnectX in slot %d, port %d. Link Retraining Request status %d.

Parameters

pcie_slot (INT): PCIe slot in which ConnectX is present.
port_num (INT): Port number where the issue was detected.
status (INT): Status of the link retraining request.

connectx.ibqsfpdumpctrl events

connectx.IbQsfpDumpCtrl

Severity

ERROR

Description

This message occurs when InfiniBand retimer programming fails due to a quad small form-factor pluggable (QSFP) transceiver register dump failure, causing the control registers of QSFP to be dumped.

Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

Syslog Message

InfiniBand retimer programming failed on port %s due to %s. Dumping registers: control 0x%0x, data 0x%0x, timeout 0x%0x, clock 0x%0x.

Parameters

port_str (STRING): InfiniBand port in which the cable is plugged.
reason (STRING): Reason for the failure of InfiniBand retimer programming.
ctrlreg (INTHEX): Contents of the QSFP control register in hexadecimal notation.
datareg (INTHEX): Contents of the QSFP data register in hexadecimal notation.
timeoutreg (INTHEX): Contents of the QSFP timeout register in hexadecimal notation.
clockreg (INTHEX): Contents of the QSFP clock register in hexadecimal notation.

connectx.ibqsfpdumpdata events

connectx.IbQsfpDumpData

Severity

ERROR

Description

This message occurs when InfiniBand retimer programming fails due to a quad small form-factor pluggable (QSFP) transceiver parse error, and 128 bytes of QSFP data are dumped.

Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

Syslog Message

InfiniBand retimer programming failed on port %s due to %s. Dumping registers: %s.

Parameters

port_str (STRING): InfiniBand port in which the cable is plugged.
reason (STRING): Reason for the failure of InfiniBand retimer programming.
qsfp_data (STRING): Contents of QSFP data registers from offset 128 to 256 in hexadecimal notation.

connectx.ibretimerfailcount events

connectx.IbRetimerFailCount

Severity

ERROR

Description

This message occurs when InfiniBand retimer programming fails due to one of the following reasons: InfiniBand device not found, GPIO read failure or retimer chip failure.

Corrective Action

Automatic retry of InfiniBand retimer programming will be done and an AutoSupport(tm) message will be generated if two retries fail.

Syslog Message

InfiniBand retimer programming failed on port %s due to %s.

Parameters

port_str (STRING): InfiniBand port in which the cable is plugged.
reason (STRING): Reason for the failure of InfiniBand retimer programming.

connectx.ibretimerprogrmpass events

connectx.IbRetimerProgrmPass

Severity

INFORMATIONAL

Description

This message occurs when InfiniBand retimer programming is succesfully completed after the system detects that a cable is plugged in.

Corrective Action

(None).

Syslog Message

InfiniBand retimer programming was successful on port %s.

Parameters

port_str (STRING): InfiniBand port in which the cable is plugged.

connectx.ibretimerskipprogrm events

connectx.IbRetimerSkipProgrm

Severity

INFORMATIONAL

Description

This message occurs when InfiniBand retimer programming is skipped after the system detects that a cable is plugged in, because there was no change in the cable's type and length.

Corrective Action

(None).

Syslog Message

InfiniBand retimer programming was skipped on port %s for %s cable.

Parameters

port_str (STRING): InfiniBand port in which the cable is plugged.
cable_type (STRING): InfiniBand cable type.

connectx.ibunsupportcable events

connectx.IbUnsupportCable

Severity

ERROR

Description

This message occurs when an unsupported InfiniBand cable is detected on the InfiniBand port.

Corrective Action

Unplug the unsupported InfiniBand cable and plug in a supported cable. Search the support site "Hardware Universe" for information about supported InfiniBand cables.

Syslog Message

Detected unsupported %s on InfiniBand port %s.

Parameters

cable_type (STRING): InfiniBand cable type.
port_str (STRING): InfiniBand port in which the cable is plugged.

connectx.portdisabled events

connectx.portDisabled

Severity

ALERT

Description

This message occurs when the HA interconnect port experiences persistent node advertisement send timeouts. Port reinitialization does not correct the problem. The port is disabled.

Corrective Action

Reboot the controller. Contact NetApp technical support if the problem persists.

Syslog Message

Node advertisement send timed out for the ConnectX device in slot %d, port %d. The port is disabled. Device registers have been dumped to the /etc/mlxlog/ConnectX_regdump file.

Parameters

phys_slot (INT): Physical slot in which ConnectX is present.
port_num (INT): Port number that is disabled.

copy events

copy.dst events

copy.dst.raid.convert.fail

Severity

NOTICE

Description

This event is issued when a SnapMirror or aggregate copy operation attempts to update a flexible volume RAID block on the destination but is unable to do so.

Corrective Action

Verify the source and destination have flexible volumes with compatible versions.

Syslog Message

Unable to convert volume RAID block %llu during copy transfer.

Parameters

block (LONGINT): Block with the error

coredump events

coredump.all events

coredump.all.disks.used

Severity

ERROR

Description

All disks available to coredump already contain unsaved cores.

Corrective Action

There are three choices. First, add more disks to the system. Second, delete any unsaved cores by running "savecore -k". Third, save any unsaved cores by running "savecore". It may be necessary to run "savecore -f" to save the cores, if previous attempts to save these cores have failed.

Syslog Message

No disks available for dumpcore

Parameters

(None).

coredump.compress events

coredump.compress.failed

Severity

ERROR

Description

An error was encountered while compressing data for the coredump. This core will be deleted.

Corrective Action

(None).

Syslog Message

Error compressing core data: %s

Parameters

msg (STRING): The error message

coredump.compression events

coredump.compression.details

Severity

INFORMATIONAL

Description

This message occurs when a compressed kernel core is generated. Details about compression are reported.

Corrective Action

(None).

Syslog Message

%s, compression time %llu msec, compression count %llu, bytes before compression %llu, bytes after compression %llu, compression ratio %llu%%, compression bandwidth %llu MB/s, total compression time %llu msec, all-zero chunk count %llu.

Parameters

type (STRING): Type of dump. Possible types are compressed core, compressed spraycore, spraycore and sparecore.
compressTime (LONGINT): Compression time, in milliseconds.
compressCount (LONGINT): Number of compressions.
compressBytesIn (LONGINT): Number of bytes before compression.
compressBytesOut (LONGINT): Number of bytes after compression.
compressRatio (LONGINT): Compression ratio expressed as a percentage.
compressBandwidth (LONGINT): Compression bandwidth, in MBps.
totalCompressTime (LONGINT): Total compression time, in milliseconds.
allZeroChunks (LONGINT): Number of all-zero chunks.

coredump.coreid events

coredump.coreid.not.found

Severity

INFORMATIONAL

Description

Could not find the specified core

Corrective Action

Double-check the core id, and try again.

Syslog Message

Core %d could not be found

Parameters

coreid (INT): The core id that could not be found

coredump.delete events

coredump.delete.denied

Severity

INFORMATIONAL

Description

This message occurs when a requested coredump delete cannot occur because an aggregate relocation or a takeover is in progress. The system cannot delete a core while either an aggregate relocation or a takeover is in progress.

Corrective Action

Retry the coredump delete after aggregate relocation or takeover completes.

Syslog Message

Coredump delete disallowed because an aggregate relocation or a takeover in progress.

Parameters

(None).

coredump.disk events

coredump.disk.write.details

Severity

INFORMATIONAL

Description

This message occurs when a kernel core is written to disk. Details about disk operations are reported.

Corrective Action

(None).

Syslog Message

%s, disk write time %llu msec, disk write count %llu, disk write bytes %llu, disk write bandwidth %llu MB/s.

Parameters

type (STRING): Type of dump. Possible types are compressed core, compressed spraycore, spraycore and sparecore.
writeTime (LONGINT): Disk write time, in milliseconds.
writeCount (LONGINT): Number of disk writes.
writeBytes (LONGINT): Number of bytes written to disk.
writeBandwidth (LONGINT): Disk write bandwidth, in MBps.

coredump.dr events

coredump.dr.dump.not.started

Severity

ERROR

Description

This message occurs when coredump subsystem detects that disaster recovery (DR) partner sparecore dump did not start.

Corrective Action

Log in to service processor and power cycle the DR partner that may not have started dumping core.

Syslog Message

DR partner sparecore dump failed to start.

Parameters

(None).

coredump.dr.spare.abort

Severity

INFORMATIONAL

Description

This message occurs when coredump subsystem attempts to abort any sparecore dump that might be in progress on disaster recovery (DR) partner. This process can take up to 60 seconds. During this time, other coredump operations are not serviced.

Corrective Action

(None).

Syslog Message

Pausing to abort DR partner sparecore dump on %s because %s.

Parameters

diskuid (STRING): UID of DR partner sparecore dump disk.
reason (STRING): Reason for aborting the DR partner sparecore dump.

coredump.dr.spare.noAbort

Severity

ERROR

Description

This message occurs when coredump subsystem is unable to abort any sparecore dump that might be in progress on disaster recovery (DR) partner.

Corrective Action

Log in to service processor and power cycle the DR partner that is still dumping core.

Syslog Message

DR partner sparecore dump could not be aborted on disk %s because %s.

Parameters

diskuid (STRING): UID of DR partner sparecore dump disk.
reason (STRING): Reason for abort failure.

coredump.dump events

coredump.dump.abort

Severity

ERROR

Description

This message occurs when there is an unsaved core on the dump device. The abort prevents a new crash from overwriting the original dump core, which is expected to contain more interesting information for analysis.

Corrective Action

If the default behavior is not desired, then set the boot option 'save-latest-core?' to true.

Syslog Message

Dump is aborted because a core in the dump device is not saved yet.

Parameters

(None).

coredump.dump.disk.failed

Severity

NOTICE

Description

This message occurs once for each core disk that has read or write errors while dumping the core. Each disk is marked as failed, so further writes to the disks are dropped. Dumpcore tries to recover from this error, and continue dumping the core.

Corrective Action

(None).

Syslog Message

Disk %s had %u read and %u write error(s) during dumpcore.

Parameters

disk (STRING): Name of this core disk marked failed with read or write errors.
readErrorCount (INT): Number of read errors seen on this core disk.
writeErrorCount (INT): Number of write errors seen on this core disk.

coredump.dump.disk_failed.count

Severity

ERROR

Description

During the last dumpcore attempt, disk write errors are ignored, and dumpcore continues. In this case, too many disks failed during the last dump attempt for savecore to create a core file. The core will be deleted, and no core will be available from this panic.

Corrective Action

(None).

Syslog Message

%d of %d disks failed during dumpcore

Parameters

failed (INT): Number of failed disks
total (INT): Number of disks used

coredump.dump.disks.count

Severity

ERROR

Description

This message occurs when the system fails to write a coredump due to lack of disk space.

Corrective Action

Disk space needed for a coredump can be reduced by enabling sparse cores, which is the default setting. Verify that sparse cores are enabled by using the "system node coredump config show" command. If not, enable them by using the "system node coredump modify -node local -sparse-enabled true" command. If there is still not enough disk space to write a coredump, add a spare disk that is at least 0.6 times the sum of primary memory size and NVRAM memory size. You can obtain sizes of primary memory and NVRAM memory by using the "run local sysconfig" command and reading entries for system board and NVRAM.

Syslog Message

Not enough disks to write core dump.

Parameters

(None).

coredump.dump.dont

Severity

INFORMATIONAL

Description

This message occurs when a core dump is not performed because the system was configured to not dump cores or dump is disabled in the code path that caused the system to panic. Any of the following configuration methods can disable coredump: - Environment variable "dont-dump-core?" is "true" - Parameter "-coredump-attempts" in the command "system node coredump config" is "0".

Corrective Action

If the reason is "dump disabled in the current code path", there is no corrective action that can be taken. If the reason is "coredump configured to not dump cores", 1. "-coredump-attempts" parameter might be set to "0". Check the "Max Dump Attempts" value in the output of the "system node coredump config show -node node_name" command. If "0", use the "system node coredump config modify ←node node_name> -coredump-attempts <number_of_attempts>" command to set a non-zero value. The default is 2 attempts. 2. "dont-dump-core?" environment variable might be set to "true". From the nodeshell, use the (priv: diag) "bootargs dump" command to check whether "dont-dump-core?" exists and is set to "true". To unset the variable, use the "bootargs unset dont-dump-core?" command.

Coredump not performed because %s.

Parameters

reason (STRING): Reason that coredump was not performed.

coredump.dump.failed

Severity

EMERGENCY

Description

Coredump failed to complete.

Corrective Action

Previously logged coredump.dump.* events should help explain the exact cause of the failure.

Syslog Message

Dumpcore failed

Parameters

(None).

coredump.dump.find.all.used

Severity

ERROR

Description

Unsaved cores occupy all the disks available to dumpcore.

Corrective Action

Save the unsaved cores using "savecore" or "savecore -f". If the cores aren't needed, run "savecore -k" to delete them.

Syslog Message

All available disks contain unsaved cores

Parameters

(None).

coredump.dump.find.disks.failed

Severity

ERROR

Description

Could not find any suitable disks for dumping a core.

Corrective Action

Make sure there are non-broken disks connected to (and owned by) the panicing host.

Syslog Message

No valid disks found

Parameters

(None).

coredump.dump.find.spare.failed

Severity

ERROR

Description

A sparecore dump is supposed to be done, but no suitable spare disk can be found. In these situations, it is more important to allow a fast takeover than it is to get the core, so the dump is terminated, and takeover begins.

Corrective Action

Add a spare disk to the system, or disable the "cf.takeover.on_panic" option.

Syslog Message

No valid spare disk found

Parameters

(None).

coredump.dump.nvram.copy.failed

Severity

ERROR

Description

Error while copying NVRAM into main memory during dumpcore. The resulting coredump will have dummy data in the NVRAM segment.

Corrective Action

(None).

Syslog Message

Error while copying NVRAM contents into main memory

Parameters

(None).

coredump.dump.raid.notready

Severity

ERROR

Description

RAID has not yet processed the labels on the, disks, so dumpcore cannot proceed. This is typically the case for panics very early during boot.

Corrective Action

(None).

Syslog Message

RAID not ready to dump cores

Parameters

(None).

coredump.dump.recursive.late

Severity

ERROR

Description

A recursive panic situation has been encountered. The location of the second panic makes it unsafe to attempt another dump.

Corrective Action

(None).

Syslog Message

Late recursive panic caused dumpcore to abort

Parameters

(None).

coredump.dump.save.latest.core

Severity

ERROR

Description

The boot option save-latest-core? is set to true. This will discard all unsaved cores during coredump.

Corrective Action

If the behavior is not desired then set the boot option save-latest-core? to false.

Syslog Message

Saving the latest core and discarding all unsaved cores.

Parameters

(None).

coredump.dump.scrub.skipped

Severity

NOTICE

Description

This message occurs when the coredump process was asked to scrub sensitive memory areas but could not do so. The dump must be aborted to avoid saving such memory areas to disk.

Corrective Action

(None).

Syslog Message

Could not scrub protected memory regions.

Parameters

(None).

coredump.dump.segments.count

Severity

ERROR

Description

Dumpcore ran out of space for the core segments in the header. This core cannot be dumped.

Corrective Action

Disable the "coredump.metadata_only" option.

Syslog Message

Out of segment space in the core header

Parameters

(None).

coredump.dump.spare.no.space

Severity

ERROR

Description

The selected spare disk might not be big enough to hold the core. The dump attempt has been aborted.

Corrective Action

Make sure a spare disk is available that is at least as big as the sum of main memory and NVRAM. Set the option "coredump.metadata_only" to "on". If the problem persists, turn off the option "cf.takeover.on_panic". This will disable the sparecore feature, and delay takeovers until the panicing partner has finished dumping the core.

Syslog Message

Spare disk too small for coredump

Parameters

(None).

coredump.dump.started

Severity

INFORMATIONAL

Description

Basic info about start of dumpcore

Corrective Action

(None).

Syslog Message

%s starting with %d disks

Parameters

type (STRING): Type of dump. Possible types are compressed, sprayed, and sparecore.
disks (INT): Number of disks being used

coredump.dump.time

Severity

INFORMATIONAL

Description

Information about how long dumpcore took to complete.

Corrective Action

(None).

Syslog Message

%s completed in %d seconds

Parameters

type (STRING): Type of dump. Possible types are compressed, sprayed, and sparecore.
seconds (INT): Number of seconds spent on the dump

coredump.dump.write.blocks.failed

Severity

ERROR

Description

Failed to write dump data blocks to disk. If the write failed because of disk problems, dumpcore will restart, without the disk that failed. If the write failed for other reasons (eg. attempt to write to a bad position on the disk), dumpcore will be aborted.

Corrective Action

(None).

Syslog Message

Error dumping %llu blocks starting at block %llu to disk %s

Parameters

blocks (LONGINT): Number of blocks trying to be dumped
start (LONGINT): Starting block number
disk (STRING): Name of disk on which the write failed

coredump.dump.write.error

Severity

ERROR

Description

An i/o error occurred while attempting to write a coredump to disk.

Corrective Action

(None).

Syslog Message

An i/o error occurred while attempting to dump core.

Parameters

(None).

coredump.dump.write.header.failed

Severity

ERROR

Description

Failed to write the core header to disk during dumpcore.

Corrective Action

(None).

Syslog Message

Error writing core header to block %llu on disk %s

Parameters

header (LONGINT): Block number of the core header block
disk (STRING): Name of disk on which the write failed

coredump.encryption events

coredump.encryption.disabled

Severity

ERROR

Description

This message occurs when encryption is configured on the controller, but the coredump subsystem cannot encrypt data. A system panic in this situation results in no core file being produced.

Corrective Action

(Call support).

Syslog Message

Coredump encryption cannot encrypt data. Core file will not be saved in this state.

Parameters

(None).

coredump.encryption.restored

Severity

NOTICE

Description

This message occurs when encryption is configured on the controller, the coredump subsystem experienced a transient problem encrypting data, but has since recovered and will be able to save encrypted core dump files in the event of a system panic.

Corrective Action

(None).

Syslog Message

Coredump encryption experienced a failure in the past but has recovered. Core files can now be saved.

Parameters

(None).

coredump.findcore events

coredump.findcore.error

Severity

ERROR

Description

This message occurs when the core dump process detects an error while checking for an unsaved core in the dump device. The dump is not aborted.

Corrective Action

(None).

Syslog Message

Ignored the error (%d: %s) when trying to find an unsaved core in the dump device.

Parameters

errCode (INT): Error code.
errString (STRING): Error code represented as a string.

coredump.findcore.nospace

Severity

ERROR

Description

There are too many unsaved cores on the system to handle them all at one time. Some cores are being ignored.

Corrective Action

Run "savecore" multiple times to save all the cores. Alternatively, run "savecore -k" to delete all of them.

Syslog Message

Too many unsaved cores

Parameters

(None).

coredump.findcore.partial

Severity

ERROR

Description

This message occurs during a core dump, when only a partial core is found. Although enough of this core is present for the core to be partially saved, there might be errors while doing so. These occur when data essential to the core creation process is lost with the missing disks.

Corrective Action

Run the "savecore" command to attempt to save the partial core, or run the "savecore -k" command to delete all unsaved cores.

Syslog Message

Partial core %s is missing %d of %d disks.

Parameters

corefile (STRING): Name of the kernel core file.
missing (INT): Number of disks that are missing.
total (INT): Total number of disks used in this dump.

coredump.findcore.partial.nosave

Severity

ERROR

Description

This message occurs when a partial core is found with too much missing to be saved.

Corrective Action

Run the "savecore -k" command to delete all unsaved cores.

Syslog Message

Cannot save partial core %s, missing %d of %d disks.

Parameters

corefile (STRING): Name of the kernel core file.
missing (INT): Number of disks that are missing.
total (INT): Total number of disks used in this dump.

coredump.host events

coredump.host.spare.none

Severity

INFORMATIONAL

Description

This message occurs when no sparecore disk is found at boot/takeover time.

Corrective Action

(None).

Syslog Message

No sparecore disk was found for host %d.

Parameters

host (INT): Host for which no sparecore disk was found.

coredump.host.spare.save

Severity

INFORMATIONAL

Description

This message occurs to tell you which disk was identified as the sparecore disk at boot/takeover time.

Corrective Action

(None).

Syslog Message

Disk %s was identified as the sparecore disk at boot/takeover time for host %d.

Parameters

    diskname (STRING): Name of the sparecore disk.
    host (INT): Host that the sparecore disk belongs to.

coredump.host.spare.set

Severity

    INFORMATIONAL

Description

    This message occurs when a disk is identified as a sparecore disk and the host's sparecoreinfo is updated during assimilation.

Corrective Action

    (None).

Syslog Message

    (None).

Parameters

    disk (STRING): Name of the sparecore disk
    host (INT): Host whose sparecoreinfo was updated.

coredump.job events

coredump.job.notstarted

Severity

    ERROR

Description

    This message occurs when the system can not automatically save a core failed.

Corrective Action

    Use the 'system node coredump save' command to save the core.

Syslog Message

    (None).

Parameters

    (None).

coredump.job.notswitchedback

Severity

    ERROR

Description

    This message occurs when the system cannot automatically save cores because a MetroCluster(tm) switchback was not performed.

Corrective Action

Return storage to the MetroCluster member by using the "metrocluster switchback" command, and then use the "coredump save-all" command to save any unsaved cores.

Syslog Message

System cannot automatically save cores because a MetroCluster switchback was not performed.

Parameters

(None).

coredump.long events

coredump.long.queued.msg

Severity

NOTICE

Description

This message occurs when the coredump manager thread detects that a message has been queued longer than expected, as defined by an internal threshold. System features and performance are not affected.

Corrective Action

(None).

Syslog Message

Coredump manager starts processing a long queued message: "%s" queued "%lu" ms.

Parameters

message_type (STRING): Coredump message type.
queue_time (LONGINT): Message queued duration, in milliseconds.
threshold (LONGINT): Message queued threshold, in milliseconds.

coredump.long.running.msg

Severity

NOTICE

Description

This message occurs when the coredump manager thread has finished processing a message that took longer than expected, as defined by an internal threshold.

Corrective Action

(None).

Syslog Message

Coredump manager finished processing a long running message: %s took %lu ms.

Parameters

message_type (STRING): Coredump message type.
duration (LONGINT): Message processing duration, in milliseconds.
threshold (LONGINT): Message processing threshold, in milliseconds.

coredump.mcc events

coredump.mcc.nso.veto

Severity

INFORMATIONAL

Description

This message occurs when the coredump subsystem vetoes MetroCluster(tm) negotiated switchover because a coredump save is in progress.

Corrective Action

Use the "node coredump status" command to verify the completion of the active coredump save, or use the "-override-vetoes true" option when performing MetroCluster switchover. Using the "-override-vetoes true" option will abort the active coredump save.

Syslog Message

MetroCluster switchover vetoed because a coredump save was in progress.

Parameters

(None).

coredump.micro events

coredump.micro.completed

Severity

INFORMATIONAL

Description

Microcore generation has completed.

Corrective Action

(None).

Syslog Message

Microcore (%s) generation completed

Parameters

file (STRING): Pathname of microcore that was created

coredump.micro.failed

Severity

ERROR

Description

Microcore generation has failed.

Corrective Action

(Call support).

Syslog Message

Generation of microcore failed

Parameters

(None).

coredump.nosavecore events

coredump.nosavecore.noflush

Severity

NOTICE

Description

This message occurs when the process that saves a coredump is not able to flush to the boot device at the end of coredump.

Corrective Action

(None).

Syslog Message

Coredump was not able to flush the remaining data to the boot device. Error: %llu.

Parameters

dumpcore_error (LONGINTHEX): Coredump error code.

coredump.nvlog events

coredump.nvlog.replay.dump.dont

Severity

NOTICE

Description

This message occurs when one or more unsuccessful attempts have been made to process information in the WAFL ® NVlog after a previous failure. The number of allowed core dumps has been exceeded and this core dump will not be taken.

Corrective Action

The node will reboot. No further action is necessary.

Syslog Message

Core dump was not taken for the latest failure while processing the WAFL NVlog.

Parameters

(None).

coredump.save events

coredump.save.aborted

Severity

NOTICE

Description

This message occurs when the savecore operation is aborted while saving a kernel core. The core is preserved for a future iteration of savecore.

Corrective Action

(None).

Syslog Message

%s processing savecore aborted%s%s.

Parameters

file (STRING): Name of the kernel core file being created.
operation (STRING): Type of operation that is being attempted when the abort occurs.
action (STRING): Type of action being taken when the abort occurs.

coredump.save.attempts.count

Severity

NOTICE

Description

Previous attempts to save this core have failed, either due to reboots or panics. To prevent a panic loop, savecore is aborting this attempt.

Corrective Action

Use either "savecore -f" to save the core, or "savecore -k" to erase the core.

Syslog Message

Too many attempts to save this core

Parameters

(None).

coredump.save.completed

Severity

NOTICE

Description

This message occurs when all the core segments belonging to a coredump have been saved.

Corrective Action

(None).

Syslog Message

Saved core %s for node %s in %llu seconds. Core size is %llu bytes.

Parameters

file (STRING): Primary core segment file that was created.
node (STRING): Name of the node whose core was saved.
seconds (LONGINT): Number of seconds spent on saving all the core segments.
size (LONGINT): Size of primary core segment in bytes.
chksum (STRING): Checksum of primary core segment file's data.

coredump.save.denied

Severity

INFORMATIONAL

Description

This message occurs when the coredump subsystem cannot finish saving a core because an aggregate relocation or a takeover is in progress. The system cannot save a core while either an aggregate relocation or a takeover is in progress.

Corrective Action

(None).

Syslog Message

Coredump save disallowed because an aggregate relocation or a takeover in progress.

Parameters

(None).

coredump.save.disk.missing

Severity

INFORMATIONAL

Description

A disk being used by coredump is now missing. This could be due to the ownership of the disk changing, the disk being removed, etc. Most savecore operations will proceed, but if further errors are encountered, or an expected core cannot be found, corrective action will be necessary.

Corrective Action

If this disk has failed, no action is possible. If this message was seen while running a "savecore -s", "savecore -i", or "savecore -l" operation, replace the missing disk. This might be done by undoing the ownership change, or reinserting the missing disk. If this message was seen while saving the core, and no further errors were seen, no action is necessary. If more errors were seen, replace the missing disk as above, and run "savecore" again.

Syslog Message

Disk %s being used by coredump is missing

Parameters

disk (STRING): Name of the missing disk

coredump.save.diskio.zone

Severity

ERROR

Description

A disk IO operation was attempted outside of the allowed regions on the disk. This behavior indicates a corrupt core, and it will be deleted.

Corrective Action

(None).

Syslog Message

IO to %d block(s) starting at %llu on disk %s is not allowed

Parameters

count (INT): Number of blocks in IO request
start (LONGINT): Starting block number on the disk
disk (STRING): Name of the disk causing trouble

coredump.save.error

Severity

NOTICE

Description

A correctable error was encountered while saving the core. Savecore will continue saving other cores.

Corrective Action

Once savecore finishes, address errors that may have appeared, and restart savecore.

Syslog Message

%s processing encountered error

Parameters

file (STRING): The core file that savecore was attempting to create

coredump.save.failed

Severity

NOTICE

Description

An unrecoverable error was encountered while saving the core. This core will be deleted, and savecore will continue saving other cores.

Corrective Action

(None).

Syslog Message

%s processing failed

Parameters

file (STRING): The core file that savecore was attempting to create

coredump.save.internal.error

Severity

ERROR

Description

An internal coredump error was encountered. This indicates the dumped core is corrupt, and will be deleted.

Corrective Action

(None).

Syslog Message

Internal coredump error

Parameters

(None).

coredump.save.nospace

Severity

ALERT

Description

This message occurs when there is not enough space in the root volume to save the core. Savecore is making a worst-case estimate when determining how much space might be needed to save the core, and does not start unless that much space is available.

Corrective Action

Try performing the following steps to make sufficient room in root volume: Delete old or unneeded core files by using the "coredump delete" command. Delete old or unneeded core file segments by using the "coredump segment delete" command. Delete any Snapshot® copies that include the deleted files. Adjust minimum free space on the root file system by using "coredump config modify" command. Once there is sufficient room, take the following steps to save the cores: To save all core files using "coredump save-all" command, run the "coredump status -instance" command and ensure that "Space Available On Internal Filesystem" is greater than "Space Needed to Save All Unsaved Cores" plus "Minimum Free Bytes on Root Filesystem". To save a specific core file, run the "coredump save" command, when available space of "Space Needed To Save Core" (from the "coredump show" command) plus "Minimum Free Bytes on Root Filesystem" is sufficient.

Syslog Message

Available space (%llu %dKB blocks) is not enough to save the core image (requires up to %llu blocks) and maintain the minimum free space of %llu blocks.

Parameters

avail (LONGINT): Number of blocks available for saving the core image.
blocksize (INT): Block size in kilobytes.
needed (LONGINT): Number of blocks needed for saving the core image.
minfree (LONGINT): Number of blocks reserved for normal system operation.

coredump.save.partial.not.ok

Severity

INFORMATIONAL

Description

Can not save partial core that was dumped using disks with different sizes. Savecore can not determine the size of the missing disks. Attempting a save in this condition will most likely end up in an error.

Corrective Action

Run "savecore -k" to delete all unsaved cores.

Syslog Message

Cannot save partial core (%s) that used disks with different sizes, missing %llu of %llu disks

Parameters

panic (STRING): Panic string of the partial core.
missing (LONGINT): The number of disks that are missing
total (LONGINT): Total number of disks used in this dump

coredump.save.read.header.failed

Severity

NOTICE

Description

An error was encountered while trying to read the core header block from disk.

Corrective Action

(None).

Syslog Message

Could not read core header block (%llu) from disk %s

Parameters

block (LONGINT): Block number being searched for the core header
disk (STRING): Name of the disk that could not be read

coredump.save.started

Severity

INFORMATIONAL

Description

This message occurs when the savecore operation starts saving a kernel core.

Corrective Action

(None).

Syslog Message

Saving %llu MB to %s via %s ("%s") for node %s.

Parameters

    size (LONGINT): Number of MB being saved.
    file (STRING): Name of the kernel core file to be created.
    dumpcoretype (STRING): Kernel coredump type.
    panic (STRING): Panic string of the kernel core being saved.
    node (STRING): Name of the node whose core is being saved.

coredump.segment events

coredump.segment.auto.fail

Severity

    NOTICE

Description

    This message occurs when the system enounters an error while trying to send a core segment request.

Corrective Action

    (None).

Syslog Message

    Failed to start automatic segmenting for core file, %s , for host %d.

Parameters

    file (STRING): Name of the core file that would have been segmented.
    host (INT): Host that owns the core file.

coredump.segment.auto.pfail

Severity

    INFORMATIONAL

Description

    This message occurs when the system cannot start the segmenting of a core file because the node is no longer in takeover mode.

Corrective Action

    (None).

Syslog Message

    Cannot start segmenting a core file, %s. Node is no longer in takeover mode.

Parameters

    file (STRING): Name of core file that would have been segmented.

coredump.segment.completed

Severity

    NOTICE

Description

This message occurs when the segmenting of a full core file has been completed.

Corrective Action

(None).

Syslog Message

Saved core segment %s for node %s. Core size is %llu bytes and core data checksum is %s.

Parameters

file (STRING): Name of the core file segmented.
node (STRING): Name of the node whose core segment was saved.
size (LONGINT): Size of core segment in bytes.
chksum (STRING): Checksum of the core segment file's data.

coredump.shutdown events

coredump.shutdown.trace

Severity

NOTICE

Description

This message occurs when a core is about to be generated. Durations of various activities at that time are reported.

Corrective Action

(None).

Syslog Message

coredump shutdown times: kmod dumper start %llu, panic_info set %llu, sf_dumpcore sent %llu, sparecore id sent %llu, fmot_outage info sent %llu, disk_dump_start done %llu, coredump begin %llu (all in msec).

Parameters

kmodDumperStartTime (LONGINT): Duration from panic start to dump processing start, in milliseconds.
panicInfoTime (LONGINT): Duration until panic information is collected, in milliseconds.
sfDumpcoreSentTime (LONGINT): Duration until SF_DUMPCORE state is sent over the interconnect, in milliseconds.
sparecoreSentTime (LONGINT): Duration for sending the sparecore ID over the interconnect, in milliseconds.
fmotOutageSentTime (LONGINT): Duration for sending FMOT (Failover Monitor Outage Tracker) Outage information over the interconnect, in milliseconds.
diskDumpStartTime (LONGINT): Duration until disk dump start stage, in milliseconds.
coredumpBeginTime (LONGINT): Duration until the start of the actual core dump, in milliseconds.

coredump.spare events

coredump.spare.abort

Severity

INFORMATIONAL

Description

This message occurs when coredump attempts to terminate any sparecore dump that might be in progress on the partner. This process can take up to 60 seconds. During this time, other coredump operations are not serviced.

Corrective Action

(None).

Syslog Message

Pausing to abort partner sparecore dump because %s.

Parameters

reason (STRING): Reason for aborting the partner sparecore dump.

coredump.spare.abort.failed

Severity

ERROR

Description

Unable to reserve the sparecore disk. This disk cannot be used by RAID until it is successfully reserved.

Corrective Action

If the other partner can be booted, do a giveback. Otherwise, periodic attempts will automatically be made to reserve the disk in question.

Syslog Message

Sparecore disk could not be reserved

Parameters

(None).

coredump.spare.abort.release

Severity

NOTICE

Description

This message occurs when the system enounters an error while trying to release the disk reservation from a disk.

Corrective Action

(None).

Syslog Message

Could not release disk reservation from disk %s (0x%x)

Parameters

    diskname (STRING): Name of the disk whose disk reservation could not be released.
    diskid (INTHEX): ID of the disk whose disk reservation could not be released.

coredump.spare.dump

Severity

    INFORMATIONAL

Description

    This message occurs to tell you which disk was used as the sparecore disk at dumpcore time.

Corrective Action

    (None).

Syslog Message

    Disk %s was used as the sparecore disk at dumpcore time.

Parameters

    diskname (STRING): Name of the sparecore disk.

coredump.spare.invalid.size

Severity

    ERROR

Description

    This message occurs when coredump subsystem encounters a spare disk with an invalid size. If an unsaved core file exists on this disk, it will be deleted because it can no longer be saved.

Corrective Action

    Run the "storage disk show -disk disk_name" command to make sure that the disk is still connected as a spare disk. If so, replace the disk. If not, the disk is part of an aggregate or is in the process of being assigned to one, and no action is required.

Syslog Message

    sparecore disk: %s has invalid size: %llu, skipping it from all coredump subsystem operations

Parameters

    disk (STRING): Name of the disk.
    size (LONGINT): Size available on the disk, reported by RAID.

coredump.sparecore events

coredump.sparecore.killed

Severity

    INFORMATIONAL

Description

Sparecore was aborted by partner.

Corrective Action

(None).

Syslog Message

Sparcore was aborted by partner.

Parameters

(None).

coredump.sparecoreinit events

coredump.sparecoreinit.times

Severity

NOTICE

Description

This message occurs when sparecore initialization is completed. Durations of constituent activities within sparecore initialization are reported.

Corrective Action

(None).

Syslog Message

sparecore_init: update firmware %llu msec, write partial headers %llu msec, clear abort area %llu msec, write node status %lld msec.

Parameters

fwUpdateTime (LONGINT): Time taken to update firmware, in milliseconds.
partialHeaderTime (LONGINT): Time taken to write partial headers, in milliseconds.
clearAbortAreaTime (LONGINT): Time taken to clear sparecore abort area, in milliseconds.
writeNodeStatusTime (LONGINT): Time taken to write the node status information to the sparecore disk, in milliseconds, if any.

cpeer events

cpeer.access events

cpeer.access.restricted

Severity

ERROR

Description

This message occurs when an access request from a peer cluster is rejected, either because the request is made to a restricted Vserver or to a restricted table.

Corrective Action

Check the Vserver peering relationships with the peer cluster. If additional Vserver access is required, use the "vserver peer create" command to initiate the peering relationship with the peer cluster.

Syslog Message

An access request from peer cluster %s (IP: %s) was denied. Reason: %s.

Parameters

peer (STRING): Name of the peer cluster making the request to the local cluster.
address (STRING): Source IP address of the incoming request.
reason (STRING): Reason for the access restriction.

cpeer.addr events

cpeer.addr.bad.dns

Severity

ERROR

Description

This message occurs when a stable address for the peer cluster cannot be resolved because of a bad name-server. This will make the peer cluster unreachable and cross-cluster operations will fail. Stable addresses are normally provided by the administrator during cluster peer creation.

Corrective Action

Delete the incorrect DNS server entry for the local cluster using the 'vserver services dns delete' command.Create a new DNS entry with the correct name-server using the 'vserver services dns create' command. If you need further assistance,contact NetApp technical support.

Syslog Message

Failed to resolve address %s of peer cluster %s, Reason:bad name-server.

Parameters

addr (STRING): Peer cluster stable IP addresses that cannot be contacted.
peer (STRING): Name of the peer cluster whose stable address cannot be contacted.

cpeer.addr.bad.host

Severity

ERROR

Description

This message occurs when a stable IP address for the peer cluster is no longer valid. This will make the peer cluster unreachable and cross-cluster operations will fail. Stable addresses are normally provided by the administrator during cluster peer creation.

Corrective Action

Correct the stable IP address using the 'cluster peer modify' command. If you need further assistance, contact NetApp technical support.

Syslog Message

Failed to resolve address %s of peer cluster %s, Reason:invalid address.

Parameters

addr (STRING): Peer cluster stable addresses that is not valid.
peer (STRING): Name of the peer cluster whose stable address is not valid.

cpeer.addr.stable.down

Severity

ERROR

Description

This message occurs when a stable address cannot be contacted. Stable addresses are provided by the administrator during peer creation.

Corrective Action

Verify network connectivity between the local cluster and the peer cluster. Check the logs, trace buffers, and UI output for more information about the nature of the failure.

Syslog Message

Stable address %s of cluster %s, in IPspace %s, cannot be contacted.

Parameters

addr (STRING): Stable address that cannot be contacted.
peer (STRING): Name of the peer cluster whose address cannot be contacted.
ipspace (STRING): IPspace in which the contact attempt was made.

cpeer.addr.warn.host

Severity

ALERT

Description

This message occurs when a stable IP address for the peer cluster is no longer valid, making the peer cluster unreachable and causing cross-cluster operations to fail.

Corrective Action

Correct the stable IP address using the "cluster peer modify" command. Valid addresses for the remote ("peer") cluster are given under "Active IP Addresses" when you use the "cluster peer show -instance" command. Verify connectivity by using the "cluster peer ping" command. If you need further assistance, contact NetApp technical support.

Syslog Message

Address %s is not any of the addresses that peer cluster %s considers valid for the cluster peer relationship; Details: %s

Parameters

addr (STRING): Peer cluster stable address that is not valid.
peer (STRING): Name of the peer cluster whose stable address is not valid.
complaint (STRING): Details, if any, of the issue with the stable address.

cpeer.authentication events

cpeer.authentication.create

Severity

NOTICE

Description

This message occurs when authentication is successfully established with a peer cluster.

Corrective Action

(None).

Syslog Message

The peering relationship with cluster %s is now authenticated.

Parameters

peer (STRING): Peer cluster with which this cluster is now mutually authenticated.

cpeer.authentication.disable

Severity

NOTICE

Description

This message occurs when authentication is disabled for a cluster peer relationship.

Corrective Action

(None).

Syslog Message

The peering relationship with cluster %s is now unauthenticated.

Parameters

peer (STRING): Peer cluster that is now peered to this cluster without authentication.

cpeer.authentication.revoke

Severity

ERROR

Description

This message occurs when authentication is revoked for a cluster peer relationship.

Corrective Action

Modify the relationship to match on both of the peered clusters. To have them agree on an unauthenticated relationship, use the 'cluster peer modify -authentication no-auth' command. To have them agree on an authenticated relationship, use the same passphrase with the 'cluster peer modify -authentication use-auth' command.

Syslog Message

The peering relationship with cluster %s is now revoked and is no longer functional.

Parameters

peer (STRING): Peer cluster for which the peering relationship has had its peering authentication revoked.

cpeer.authentication.viol

Severity

NOTICE

Description

This message occurs when a cross-cluster access should be authenticated, but is not. The access has been denied successfully.

Corrective Action

(None).

Syslog Message

Access as peer cluster %s was claimed from network address %s, but has not been granted because %s.

Parameters

peer (STRING): Peer cluster on behalf of which this access was made.
remoteAddress (STRING): Remote network address of the violating connection.
reason (STRING): Justification for the violation claim.

cpeer.create events

cpeer.create.reciprocal.fail

Severity

ERROR

Description

This message occurs when a peer cluster reciprocal join fails.

Corrective Action

Verify network connectivity between the local cluster and the peer cluster. Check the logs, trace buffers, and UI output for more information about the nature of the failure.

Syslog Message

Cluster %s attempted to create a reciprocal peer relationship with this cluster but failed.

Parameters

peer (STRING): Peer cluster which executed the reciprocal join.

cpeer.create.reciprocal.ok

Severity

NOTICE

Description

This message occurs when a peer cluster reciprocal join succeeds.

Corrective Action

(None).

Syslog Message

Cluster %s is now peered with this cluster.

Parameters

peer (STRING): Peer cluster that executed the reciprocal join.

cpeer.dns events

cpeer.dns.family.mismatch

Severity

ERROR

Description

This message occurs when an attempt is made to resolve and insert a stable address that is a Domain Name System (DNS) style host name. If it resolves to an address family that does not match the family style specified for the cluster peer relationship, it is indicative of incorrect addresses being provided by the administrator or DNS configuration issues. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship.

Corrective Action

Correct the stable IP address by using the 'cluster peer modify' command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Confirm that the DNS services are appropriately specified by using the 'vserver services dns show' command. Also, the DNS server in question should be configured correctly to be able to resolve the DNS style host name to an IP address belonging to the appropriate address family. If you need further assistance, contact NetApp technical support.

Syslog Message

Host name %s of peer cluster %s resolved to %s, which does not match the peer relationship's selected address type.

Parameters

addr (STRING): Peer cluster host name that is being inserted.
peer (STRING): Name of the peer cluster for which an address family mismatch was seen.
resolved_address (STRING): Address resolved to, which belongs to the incorrect address family.

cpeer.duplicate events

cpeer.duplicate.remote.addr

Severity

ERROR

Description

This message occurs when an IP address from a peer cluster is also in use by the local cluster in the same IPspace. This may prevent the cluster peering relationship from reaching an available state.

Corrective Action

Replace the duplicate address on the local cluster with a different address.

Syslog Message

Cannot use address %s from peer cluster %s because it is already in use on the local cluster.";

Parameters

address (STRING): Duplicate address from the peer cluster.
peer (STRING): Name of the peer cluster.

cpeer.ip events

cpeer.ip.family.mismatch

Severity

ERROR

Description

This message occurs when an attempt is made to insert an IP address whose address family does not match the family style specified for the cluster peer relationship. This is indicative of incorrect addresses being provided by the administrator. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship.

Corrective Action

Correct the stable IP address by using the 'cluster peer modify' command. Ensure that the LIFs of the appropriate address family exist on both the local cluster and the remote peer. If you need further assistance, contact NetApp technical support.

Syslog Message

Failed to insert address %s of peer cluster %s, reason: %s

Parameters

> **addr** (STRING): Peer cluster address that is being inserted.
> **peer** (STRING): Name of the peer cluster for which an address family mismatch was seen.
> **reason** (STRING): Reason that the EMS message was sent.

cpeer.localid events

cpeer.localid.bad

Severity

> ERROR

Description

> This message occurs when there is an issue reading the local cluster ID. This indicates a serious problem with the cluster which may affect processes outside of cluster peering.

Corrective Action

> (Call support).

Syslog Message

> Unexpected local cluster ID: %s.

Parameters

> **id** (STRING): The string representation of the bad cluster ID.

cpeer.long events

cpeer.long.remote.update

Severity

> ERROR

Description

> This message occurs when a cross-cluster update takes longer than 15 minutes. This indicates a communication failure between the clusters.

Corrective Action

> Ensure cross-cluster network connectivity by performing network diagnostics using the "cluster peer ping" command and either the "network ping" or "network ping6" command. Correct IP address issues by using the "cluster peer modify" command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Confirm that the DNS services are appropriately configured by using the "vserver services dns show" command. You can use "cluster peer show" to list the state of all peer clusters. This is a point-in-time command and the health of remote clusters might not have been updated yet. If you need further assistance, contact NetApp technical support.

Syslog Message

> Cross-cluster update job took longer than 15 minutes. Potential network connectivity issues.

Parameters

> (None).

cpeer.modify events

cpeer.modify.address.family

Severity

NOTICE

Description

This message occurs when the address family for a peering relationship is modified. The same configuration change should be made at the peered cluster in a timely manner. Peering services are maintained while intercluster LIFs of both address families are configured on each cluster.

Corrective Action

This is a notification of a configuration change. No corrective action applies.

Syslog Message

Address family change for peer cluster %s to address family %s.

Parameters

peer (STRING): Name of the peer cluster affected by the address family change.
family (STRING): The new address family of the peering relationship.

cpeer.out events

cpeer.out.pp.mismatch

Severity

ERROR

Description

This message occurs when an outgoing cluster peer request authentication fails due to a passphrase mismatch.

Corrective Action

For multiple occurrences of this event, verify the peering request with the admin of this local cluster. If the admin is not responsible for the attempts, the local cluster might be under attack.

Syslog Message

This cluster did not accept a cluster peering authentication offer from cluster %s//%s due to a passphrase mismatch. Acceptance was attempted on session %s, command %s, application %s, location %s, port %s, user name %s, auth_method %s, and PSK method %s.

Parameters

remotename (STRING): Name of the cluster to which the contact was made.
remoteuuid (STRING): UUID of the cluster to which the contact was made.
session (STRING): Session ID over which the contact was made.
command (STRING): Command ID for which the contact was made.
application (STRING): Application used for the contact.
location (STRING): Location from which the contact was made.
port (STRING): Port over which the contact was made.
username (STRING): User name for the contact.

authMethod (STRING): Authentication method for the user.
offerStyle (STRING): Style of authentication offer.

cpeer.passphrase events

cpeer.passphrase.expired

Severity

NOTICE

Description

This message occurs when the cluster peer offer for anonymous cluster with system-generated passphrase expired and deleted.

Corrective Action

If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

Syslog Message

The cluster peer offer with system-generated passphrase (%s) expired and deleted.

Parameters

passphase_details (STRING): Cluster peer passphrase details.

cpeer.ping events

cpeer.ping.family.mismatch

Severity

ERROR

Description

This message occurs when an attempt is made to check the cluster peering relationship and no intercluster LIFs of the same address family and the correct IPspace are found on this node. Stable addresses are typically provided by the administrator during cluster peer creation and can be modified by modifying the peer relationship. The IPspace for a cluster peer relationship may be supplied when creating or modifying the relationship.

Corrective Action

Correct the stable IP address by using the "cluster peer modify" command. Ensure that LIFs of the appropriate address family exist on both the local cluster and the remote peer. Ensure that LIFs of the local cluster exist in the given IPspace.

Syslog Message

Failed to find LIFs of type %s on node %s for destination address %s in IPspace %s belonging to destination cluster %s.

Parameters

peering_family (STRING): IP address family.
node (STRING): Originating node.
dest_address (STRING): Destination IP address.

ipspace (STRING): IPspace for the relationship.
dest_cluster (STRING): Destination cluster.

cpeer.ping.no.lifs

Severity

ERROR

Description

This message occurs when an attempt is made to check the cluster peering relationship and no intercluster LIFs in the correct IPspace are found on this node.

Corrective Action

Create intercluster LIFs with the same address family and IPspace as the peering relationship. If the peering relationship is obsolete, remove it by using the "cluster peer delete" command.

Syslog Message

Failed to find intercluster LIFs in IPspace %s on node %s.

Parameters

ipspace (STRING): IPspace for the relationship.
node (STRING): Originating node.

cpeer.pm events

cpeer.pm.update.warn

Severity

ERROR

Description

This message occurs when the peer manager job experiences a transient failure. The peer manager job periodically contacts one peer cluster and performs updates of cluster-wide state necessary to support cross-cluster enabled features.

Corrective Action

Verify network connectivity between the local cluster and its peer clusters. It might be necessary to manually correct the peer clusters' configurations using the 'cluster peer modify' command if peer addresses have changed recently. Verify that each cluster is up.

Syslog Message

Periodic update of peer information from %s failed. The following operations are incomplete: %s

Parameters

peer (STRING): Peer whose updates failed.
failures (STRING): Failed peer updates.

cpeer.pp events

cpeer.pp.mismatch

Severity

ERROR

Description

This message occurs when an incoming cluster peer authentication request fails due to a passphrase mismatch.

Corrective Action

For multiple occurrences of this event, verify the peering request with the admin of the remote cluster. If the admin is not responsible for the attempts, the local or remote cluster might be under attack.

Syslog Message

Remote cluster %s//%s did not accept a cluster peering authentication offer (from address %s in IPspace %s) due to a passphrase mismatch. Local offer made on %s, valid for %s, with the %s PSK method.

Parameters

remotename (STRING): Name of the cluster for which the contact was made.
remoteuuid (STRING): UUID of the cluster for which the contact was made.
address (STRING): Network address from which the authentication attempt was made.
ipspace (STRING): IPspace from which the contact attempt was made.
offerTime (STRING): Time at which the offer from the local cluster was generated.
offerDuration (STRING): Duration of the offer from the local cluster.
offerStyle (STRING): Style of authentication offer.

cpeer.psk events

cpeer.psk.cluster.revoked

Severity

ERROR

Description

This message occurs when the system receives an authentication request for a remote cluster whose peer authentication has been revoked by the local cluster administrator. It might indicate that this system is under attack.

Corrective Action

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

Syslog Message

ONTAP received a TLS request to authenticate with the pre-shared key of remote cluster %s, but the relationship with the remote cluster has been revoked by the administrator of this cluster. The request was sent from address %s in IPspace %s.

Parameters

clustername (STRING): Name of the remote cluster being probed.
sourceIP (STRING): IP address that is the source of the probe.

sourceIPspace (STRING): IPspace in which the probe arrived.

cpeer.psk.cluster.unauth

Severity

ERROR

Description

This message occurs when the system receives an authentication request for a remote cluster whose peer relationship is unauthenticated. It might indicate that this system is under attack. The request was sent from address %s in IPspace %s.

Corrective Action

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

Syslog Message

ONTAP received a TLS request to authenticate with a cluster's pre-shared key, but there is no authenticated relationship with this remote cluster. Instead, the relationship is unauthenticated and has no keying information associated with it.

Parameters

clustername (STRING): Name of the remote cluster being probed.
sourceIP (STRING): IP address that is the source of the probe.
sourceIPspace (STRING): IPspace in which the probe arrived.

cpeer.psk.disabled

Severity

NOTICE

Description

This message occurs when the system is unable to find a suitable pre-shared key (PSK) cipher suite required for cluster peering. This is likely because the PSK cipher suites are disabled in the ONTAP security configuration. Cluster peering connections and associated applications may fail as a result.

Corrective Action

View the enabled cipher suites with the "security config show" command. Enable the PSK cipher suites with the "security config modify" command.

Syslog Message

The system was unable to find a suitable pre-shared key (PSK) cipher suite required for cluster peering. This is likely because the PSK cipher suites are disabled in the ONTAP security configuration. Cluster peering connections and associated applications may fail as a result.

Parameters

(None).

cpeer.psk.unknown.cluster

Severity

ERROR

Description

This message occurs when the system receives an authentication request from an unknown cluster. It might indicate that this system is under attack.

Corrective Action

ONTAP® software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

Syslog Message

ONTAP received a TLS request to authenticate with a remote cluster's pre-shared key, but the remote cluster UUID (%s) is unrecognized. The probe arrived from address %s in IPspace %s.

Parameters

clusterUUID (STRING): Cluster UUID being probed.
sourceIP (STRING): IP address that is the source of the probe.
sourceIPspace (STRING): IPspace in which the probe arrived.

cpeer.receiver events

cpeer.receiver.noindex

Severity

NOTICE

Description

This message occurs when an incoming cluster peer request using the system-generated passphrase. However, the cluster peer request failed because there is no matching outstanding cluster peer offers for the request in the system.

Corrective Action

Verify the peer request with peer cluster admin. If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

Syslog Message

The cluster peer request from the remote cluster (%s) using the system-generated passphrase (Index: %d) has failed because cluster peer offer with system-generated passphrase is not available for this index.

Parameters

remote_cluster_details (STRING): Remote cluster name.
ppindex (INT): Cluster peer passphrase index.

cpeer.recv events

cpeer.recv.pp.mismatch

Severity

NOTICE

Description

This message occurs when there is an incoming cluster peer request using the system-generated passphrase. However, the cluster peer request authentication failed due to passphrase mismatch and so the cluster peer offer is deleted.

Corrective Action

Verify the peer request with peer cluster admin. If required, use the "cluster peer create" command with "generate-passphrase" option to generate the additional cluster peer offers.

Syslog Message

The cluster peer offer with system-generated passphrase was attempted for cluster peering by the remote cluster (%s:%s) with address %s but cluster peer request failed due to passphrase mismatch. So, the offer is deleted.

Parameters

remotename (STRING): Remote cluster name.
remoteuuid (STRING): Remote cluster UUID.
address (STRING): Remote cluster IP address.

cpeer.unavailable events

cpeer.unavailable

Severity

ALERT

Description

This message occurs when a peer cluster becomes unavailable.

Corrective Action

Verify network connectivity between the local cluster and the peer cluster. It might be necessary to manually correct the peer configuration using the 'cluster peer modify' command if peer addresses have changed recently. Verify that the peer cluster is up.

Syslog Message

Peer cluster %s is no longer available.

Parameters

peer (STRING): Peer cluster that became unavailable.

cpeer.xcm events

cpeer.xcm.addr.disc.warn

Severity

ERROR

Description

This message occurs when address discovery fails for a peer cluster.

Corrective Action

Verify network connectivity between the local cluster and the peer cluster. It might be necessary to manually correct the peer configuration using the 'cluster peer modify' command if peer addresses have changed recently. Verify that the peer cluster is up.

Syslog Message

Address discovery failed for peer cluster %s. Reason: %s.

Parameters

peer (STRING): Peer cluster whose address discovery failed.
reason (STRING): Reason for address discovery failure.

cpeer.xcm.update.warn

Severity

ERROR

Description

This message occurs when the cross-cluster manager job experiences a transient failure. The cross-cluster manager job periodically contacts each peer cluster, requests configuration information, and maintains the node-local network configuration for the remote peer cluster.

Corrective Action

Verify network connectivity between the local cluster and its peer clusters. It might be necessary to manually correct the peer clusters' configurations using the 'cluster peer modify' command if peer addresses have changed recently. Verify that each cluster is up.

Syslog Message

Periodic update of peer network information failed. The following operations are incomplete: %s.

Parameters

failures (STRING): Failed peer updates.

cr events

cr.data events

CR.Data.File.Inaccessible

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the namespace scanner skips an inode for which it cannot access the data file. This might be due to the data volume being offline.

Corrective Action

Bring the data volume back online using the "volume online" command. If the problem persists, retry the scan operation.

Syslog Message

The redirector file [%s] on namespace volume [%s] will be skipped by "Volume Check" because the corresponding data file on data volume [%s] in Vserver [%s] is not accessible.

Parameters

redirPath (STRING): Path of the redirector file that will be skipped.
nsVol (STRING): Name of the constituent namespace volume that hosts the redirector file.
dataVol (STRING): Name of the constituent data volume that hosts the data file.
vserver (STRING): Vserver hosting the constituent volumes.

cr.del events

CR.Del.CrptStreamData.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when an attempt to delete corrupt stream data fails.

Corrective Action

(None).

Syslog Message

Deletion failed for corrupt stream data [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the stream resides.
vserver (STRING): Vserver hosting the volume.

CR.Del.CrptStreamRedir.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when an attempt to delete corrupt stream redirector failed.

Corrective Action

(None).

Syslog Message

Deletion failed for corrupt stream redirector [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the stream resides.
vserver (STRING): Vserver hosting the volume.

CR.Del.DangStreamData.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when an attempt to delete dangling stream data fails. This stream was created when there was a failure in cleaning up stream data on the data constituent, which left dangling data that is unnecessarily consuming resources.

Corrective Action

(None).

Syslog Message

Deletion failed for dangling stream data [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the stream data resides.
vserver (STRING): Vserver hosting the volume.

CR.Del.DangStreamRedir.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when an attempt to delete dangling stream redirector failed.

Corrective Action

(None).

Syslog Message

Deletion failed for dangling stream redirector [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the redirector resides.
vserver (STRING): Vserver hosting the volume.

cr.fix events

CR.Fix.Corrupt.Redir.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when corrective action for corrupt redirector file failed.

Corrective Action

(None).

Syslog Message

Corrective action failed for corrupt redirector of data file [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): File path.
volume (STRING): Name of the constituent volume where the data file resides.
vserver (STRING): Vserver hosting the volume.

CR.Fix.Crpt.Data.Dir.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when the corrective action for a corrupt data directory fails. These entries were created when they were moved to the [lost+found] folder by waflIron, on the data constituents.

Corrective Action

(None).

Syslog Message

Corrective action failed for corrupt data directory [%s] on volume [%s].

Parameters

path (STRING): Directory path.
volume (STRING): Name of the constituent volume where the directory resides.
vserver (STRING): Vserver hosting the volume.

CR.Fix.Crpt.Data.File.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the corrective action for a corrupt data file fails.

Corrective Action

(None).

Syslog Message

Corrective action failed for corrupt data file [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): File path.
volume (STRING): Name of the constituent volume where the file resides.
vserver (STRING): Vserver hosting the volume.

CR.Fix.CrptStreamRedir.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the fix for corrupt stream redirector fails.

Corrective Action

(None).

Syslog Message

Corrective action failed for corrupt stream redirector of stream data [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the stream redirector resides.
vserver (STRING): Vserver hosting the volume.

CR.Fix.Dang.Data.File.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the corrective action for a dangling data file fails. This file was created when there was a failure in cleaning up a file on the data constituent, which left a dangling file that is unnecessarily consuming resources.

Corrective Action

(None).

Syslog Message

Corrective action failed for dangling data file [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): File path.
volume (STRING): Name of the constituent volume where the file resides.
vserver (STRING): Vserver hosting the volume.

CR.Fix.Nlinks.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the corrective action for an Nlinks (number of hardlinks on the file) mismatch fails.

Corrective Action

(None).

Syslog Message

Corrective action failed for Nlinks mismatch on file [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): File path.
volume (STRING): Name of the constituent volume where the file resides.
vserver (STRING): Vserver hosting the volume.

cr.rdb events

CR.RDB.Counters.Not.Updated

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when the RDB (replicated database) cannot be updated with the inode counters for a particular scan.

Corrective Action

(None).

Syslog Message

The inode counters [percentage scan complete: %d], [estimated time remaining: %s], [number of issues detected: %d] and [number of issues fixed: %d] could not be updated in the RDB due to [error: %s] for [volume: %s] in [Vserver: %s].

Parameters

percentComplete (INT): Percentage of the inodes scanned.
estimatedTime (STRING): Estimated time remaining for the scan to finish.
issuesDetected (INT): Number of issues detected by the scan so far.
issuesFixed (INT): Number of issues fixed by the scan so far.
reason (STRING): Reason for the failed update.
volume (STRING): Name of the constituent volume for which the RDB could not be updated.
vserver (STRING): Vserver hosting the volume.

CR.RDB.State.Not.Updated

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the RDB (replicated database) cannot be updated with the final state of the scan, that is, success/failure.

Corrective Action

Run the 'volume check stop' command on the respective volume.

Syslog Message

The final state [%s] of the 'volume check' scan could not be updated in the RDB due to [error: %s] for volume [%s] in Vserver [%s].

Parameters

state (STRING): Final state of the scan that has to be updated.
reason (STRING): Reason for the failed update.
volume (STRING): Name of the constituent volume for which the RDB could not be updated.
vserver (STRING): Vserver hosting the volume.

cr.redir events

CR.Redir.File.Inaccessible

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when the data scanner skips an inode for which it cannot access the redirector file. This might be due to the namespace volume being offline.

Corrective Action

Bring the namespace volume back online using the "volume online" command. If the problem persists, retry the scan operation.

Syslog Message

The data file [%s] on data volume [%s] will be skipped by "Volume Check" because the corresponding redirector file on namespace volume [%s] on Vserver [%s] is not accessible.

Parameters

dataFilePath (STRING): Path of the data file that will get skipped.
dataVol (STRING): Name of the constituent data volume that hosts the data file.
nsVol (STRING): Name of the constituent namespace volume that hosts the redirector file.
vserver (STRING): Vserver hosting the constituent volumes.

cr.snapshot events

CR.Snapshot.Not.Deleted

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when a temporary Snapshot(tm) copy created by the 'volume check' command could not be deleted.

Corrective Action

Delete the Snapshot copy by using the following command from "diag" mode: volume snapshot delete -vserver <vserver> -volume <volume> -snapshot <snapshot-name> -ignore-owners

Syslog Message

The temporary Snapshot copy [%s] created by the 'volume check' command for volume [%s] in Vserver [%s] could not be deleted [error: %s].

Parameters

snapshot (STRING): Name of the Snapshot copy.
volume (STRING): Name of the constituent volume for which the Snapshot copy could not be deleted.
vserver (STRING): Vserver hosting the volume.
reason (STRING): Reason for the failure.

cr.sync events

CR.Sync.ACL.Fail

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when an attempt to synchronize the ACL from data to redirector fails.

Corrective Action

(None).

Syslog Message

ACL synchronizing failed for file [%s] on volume [%s] in Vserver [%s].

Parameters

path (STRING): Stream path.
volume (STRING): Name of the constituent volume where the file resides.
vserver (STRING): Vserver hosting the volume.

crypto events

crypto.debug events

crypto.debug

Severity

INFORMATIONAL

Description

The Crypto module debug event.

Corrective Action

(None).

Syslog Message

%s.

Parameters

debug_string (STRING): Description of the event being logged.

crypto.export events

crypto.export.failed

Severity

ALERT

Description

This message occurs when the export of a cryptographic key fails.

Corrective Action

This message might be seen when attempting to create an encrypted volume. Contact NetApp technical support if further attempts to create the encrypted volume fail.

Syslog Message

ERROR: Export of key with key ID %s failed. Additional information: %s.

Parameters

key_id (STRING): Key ID for the cryptographic key.
msg (STRING): Associated failure message.

crypto.import events

crypto.import.failed

Severity

ALERT

Description

This message occurs when the import of a cryptographic key fails.

Corrective Action

This message might be seen when attempting to bring an encrypted volume online. Contact NetApp technical support if manual attempts to bring the encrypted volume online fail.

Syslog Message

ERROR: Import of key with key ID %s failed. Additional information: %s.

Parameters

key_id (STRING): Key ID for the cryptographic key.
msg (STRING): Associated failure message.

crypto.key events

crypto.key.deleted

Severity

NOTICE

Description

This message occurs when a cryptographic key is deleted.

Corrective Action

(None).

Syslog Message

Deleted key with key ID %s. Reason %s.

Parameters

key_id (STRING): Key ID for the cryptographic key.
reason (STRING): Reason for deletion.

crypto.key.stored

Severity

NOTICE

Description

This message occurs when a cryptographic key is stored.

Corrective Action

(None).

Syslog Message

Stored key with key ID %s. Key digest: %s.

Parameters

key_id (STRING): Key ID for the cryptographic key.

key_digest (STRING): Key digest for the cryptographic key.

crypto.okmrecovery events

crypto.okmrecovery.failed

Severity

ALERT

Description

This message occurs when the Onboard Key Manager (OKM) recovery command in the boot menu fails to recover the OKM hierarchy. Without the the OKM hierarchy, volumes encrypted using OKM will not come online, and you will not be able to use OKM to encrypt volumes.

Corrective Action

This message is usually seen when an incorrect cluster passphrase was entered during a previous boot menu recovery command. Often, using the "security key-manager onboard sync" command will resolve the situation. If that does not fix the problem, the OKM hierarchy can be recovered during the boot process. To recover the OKM hierarchy during the boot process, enter option 10 ("Set Onboard Key Manager recovery secrets.") at the boot menu prompt. You will need to have the cluster passphrase and a copy of the output from the "security key-manager backup show" command. If the boot menu recovery process fails again, contact NetApp technical support.

Syslog Message

Import of the Onboard Key Manager (OKM) hierarchy has failed: %s. Additional information: %s.

Parameters

failure_msg (STRING): Message describing which operation failed.
additional_msg (STRING): Additional information regarding the failure.

crypto.ssal events

crypto.ssal.failed

Severity

ALERT

Description

This message occurs when a Secure Storage Access Layer(SSAL) operation fails. This might cause import of the onboard key hierarchy to fail and might result in a temporary loss of access to any data secured using the SSAL.

Corrective Action

(Call support).

Syslog Message

SSAL operation failed: %s. %s

Parameters

failure_msg (STRING): Message describing which operation failed.
additional_msg (STRING): Additional information regarding the failure.

crypto.ssal.tpm.clear

Severity

NOTICE

Description

This message occurs when a Trusted Platform Module(TPM) clear operation is performed successfully. A TPM clear operation can happen while reverting to a previous release or when the "security tpm clear" command was executed. A TPM clear operation clears out the TPM and resets it with a new seed for the TPM's storage hierarchy.

Corrective Action

(None).

Syslog Message

A TPM clear operation has been completed successfully.

Parameters

(None).

crypto.ssal.tpm.reset

Severity

NOTICE

Description

This message occurs when a Trusted Platform Module(TPM) reset operation is performed successfully. A TPM reset operation can happen when the node boots up for the first time or when the "security tpm reset" command was executed. A TPM reset operation clears out the TPM and resets it with a new seed for the TPM's storage hierarchy. The TPM then generates a new primary key under the same hierarchy and makes it persistent.

Corrective Action

(None).

Syslog Message

A TPM reset operation has been completed successfully.

Parameters

(None).

cs events

cs.create events

cs.create.inprogress

Severity

ALERT

Description

This message occurs when there is an attempt to release SnapMirror resources for a volume as a result of volume delete while a Cloud Snapshot create operation is in progress.

Corrective Action

Ensure no Cloud Snapshot create opeartion is in-progress when the volume is deleted. Either abort the create operation or wait for the creation to complete before deleting the volume.

Syslog Message

Failed to delete the volume "%s" as one or more Cloud Snapshot operations are in progress. Number of Cloud Snapshot operations in progress: "%d".

Parameters

volumeUUID (STRING): UUID of the volume.
in_transfer_snap_count (INT): Number of Cloud Snapshot create in-progress.

cs.endpoint events

cs.endpoint.has.no.snapshots

Severity

ALERT

Description

This message occurs when volume delete operations attempts to clean-up snapmirror resources and finds that there are no cloud snapshots associated with the volume. The cloud endpoint is automatically deleted on deletion of last cloud snapshot. So it's unusual to find a cloud snapshot endpoint with no snapshots.

Corrective Action

(None).

Syslog Message

The volume "%s" has no cloud snapshots associated with it.

Parameters

volumeUUID (STRING): UUID of the volume.

csm events

csm.badauthaccess events

csm.badAuthAccess

Severity

NOTICE

Description

This message occurs when a blade fails an attempt to authenticate as a given peer cluster, and Cluster Session Manager (CSM), which establishes and manages SpinNP sessions between blades in the cluster, denies access of the unauthenticated blade. This could indicate that an interloper is attempting to gain access to the cluster.

Corrective Action

(None).

Syslog Message

Access as peer cluster %s was claimed from network address %s, but has not been granted because %s.

Parameters

clusterUuid (STRING): UUID of the cluster to which the blade claimed to belong.
addrstr (STRING): Remote network address of the blade.
msg (STRING): Reason that access could not be authenticated.

csm.badconnection events

csm.badConnection

Severity

ALERT

Description

This message occurs when ONTAP® software receives a Cluster Session Manager (CSM) connection with unrecognizable content. This might indicate that the system is under attack. As a precaution, the connection used to receive that data has been closed.

Corrective Action

Carefully inspect the networking configuration, event messages, and logs of both the local and remote nodes. If any evidence exists of an intrusion attempt, configure site networking equipment to avoid forwarding data to the local address and port, and if necessary, from forwarding data from the remote address and port. Check external site security tools for unauthorized access attempts. Audit site security logs.

Syslog Message

ONTAP received a CSM connection with unrecognizable content at local address %s local port %d, from remote address %s remote port %d, via IPspace %d.

Parameters

> **localAddr** (STRING): Full internet address of the local end of the connection.
> **localPort** (INT): Local port number.
> **remoteAddr** (STRING): Full internet address of the remote end of the connection.
> **remotePort** (INT): Remote port number.
> **IPspace** (INT): Identifier of the IPspace within which the remote address was reached.

csm.badplainaccess events

csm.badPlainAccess

Severity

> NOTICE

Description

> This message occurs when a blade attempts to access the local cluster without encrypting its communication channel, and Cluster Session Manager (CSM), which establishes and manages SpinNP sessions between blades in the cluster, denies access of the unencrypted communication channel. This could indicate that an interloper is attempting to gain access to the cluster.

Corrective Action

> (None).

Syslog Message

> Access as peer cluster %s was claimed from network address %s, but has not been granted because it was not using TLS.

Parameters

> **clusterUuid** (STRING): UUID of the cluster to which the blade claimed to belong.
> **addrstr** (STRING): Remote network address of the blade.

csm.ctfallbackactiveopen events

csm.ctFallbackActiveOpen

Severity

> NOTICE

Description

> This message occurs when the Cluster Session Manager (CSM) uses CT (TCP transport) as the default when creating LIF pairs because connections running CSM over remote direct memory access (RDMA) repeatedly fail during successive retry attempts.

Corrective Action

> (None).

Syslog Message

> Cluster Session Manager (CSM) could not successfully create the RDMA connections for session "%s" even after several retry attempts. CSM will use TCP connections as defaults.

Parameters

uniquifier (STRING): Unique identifier for this session.

csm.ctfallbackswitchless events

csm.ctFallbackSwitchless

Severity

NOTICE

Description

This message occurs when the Cluster Session Manager (CSM) defaults to use CT (TCP transport) when creating LIF pairs because remote device ID information is not available on switchless clusters running CSM over remote direct memory access (RDMA).

Corrective Action

(None).

Syslog Message

Cluster Session Manager (CSM) could not determine the cluster ports that are directly connected between the switchless cluster nodes to create the RDMA connections for session "%s". CSM will use TCP connections as defaults.

Parameters

uniquifier (STRING): Unique identifier for this session.

csm.homeportinfounexpected events

csm.homePortInfoUnexpected

Severity

NOTICE

Description

This message occurs when the Cluster Session Manager (CSM) establishes a connection between nodes over the cluster network interface of a switchless cluster and detects that the logical interface's (LIF's) home port and the corresponding remote device information are not the expected values.

Corrective Action

This message can occasionally happen during normal operations on a system startup or a LIF migration event. If the message repeats every few minutes, it might indicate a problem in the cluster interface configuration or the physical cabling of the switchless cluster.

Syslog Message

CSM reports unexpected information for cluster LIF ID "%d" (home port: "%s", remote device ID: "%s").

Parameters

vifId (INT): ID of the local cluster LIF over which the connection gets established.
homePort (STRING): Home port hosting the LIF.
remoteDeviceId (STRING): Remote device associated with the home port.

csm.mismatchremotedevice events

csm.mismatchRemoteDevice

Severity

ERROR

Description

The message occurs when the Cluster Session Manager (CSM) establishes a connection between nodes over the cluster network interface, but the node's remote device IDs do not match.

Corrective Action

Ensure that the Cisco Discover Protocol (CDP) is running on the nodes and switches. In addition, ensure that the cluster ports are up and the cluster LIFs are configured and hosted according to the suggested cluster configuration.

Syslog Message

CSM connection between source LIF %d and destination address %s might not be optimal for session %s. The source is currently connected to %s remote device and the destination is currently connected to %s remote device.

Parameters

sourceLIF (INT): Source logical interface.
destAddr (STRING): Destination IP address.
uniquifier (STRING): Unique identifier for this session.
sourceRemoteDevice (STRING): Remote device associated with the source logical interface.
destRemoteDevice (STRING): Remote device associated with the destination IP address.

csm.nomemory events

csm.noMemory

Severity

ERROR

Description

This message occurs when the memory allocator temporarily runs out of memory that can be allocated or when the entire node has an insufficient amount of free system memory. If the issue persist, the cluster session manager (CSM) might not be able to create connections to remote cluster nodes to serve data traffic.

Corrective Action

If the condition persists, contact NetApp technical support.

Syslog Message

CSM was unable to process events due to insufficient free memory.

Parameters

filename (STRING): Name of the file where the event occurred.
lineno (INT): Line number where the event occurred.

csm.rdmarecoveractiveopen events

csm.rdmaRecoverActiveOpen

Severity

NOTICE

Description

This message occurs when the Cluster Session Manager (CSM) attempts to restore the use of the preferred remote direct memory access (RDMA) transport for the eligible sessions because the condition which triggered the CSM to use CT (TCP transport) as default might have resolved.

Corrective Action

(None).

Syslog Message

Cluster Session Manager (CSM) is attempting to restore the use of the preferred RDMA connections for eligible sessions, which had previously defaulted to use TCP connections due to repeated active open failures.

Parameters

(None).

csm.rdmarecoverswitchless events

csm.rdmaRecoverSwitchless

Severity

NOTICE

Description

This message occurs when the Cluster Session Manager (CSM) attempts to restore the use of the preferred remote direct memory access (RDMA) transport for the eligible sessions because the condition which triggered the CSM to use CT (TCP transport) as default might have been resolved in the switchless cluster.

Corrective Action

(None).

Syslog Message

Cluster Session Manager (CSM) is attempting to restore the use of the preferred RDMA connections for eligible sessions, which had previously defaulted to use TCP connections in the switchless cluster.

Parameters

(None).

csm.unmarshallerror events

csm.unmarshallError

Severity

ERROR

Description

The message occurs when the Cluster Session Manager (CSM) fails to unmarshal a packet.

Corrective Action

Unmarshal errors reported in CSM indicate corrupted packet(s) were delivered to CSM. Often this can be attributed to network layer problems. TCP checksum errors should be checked for if unmarshal errors continue to increment.

Syslog Message

Cluster Session Manager (CSM) failed to unmarshall packet for session %s.

Parameters

sessionId (STRING): Full session ID of this session.

ctl events

ctl.ctlbe events

ctl.ctlbe.IOInternalError

Severity

ERROR

Description

IO failure due to internal error

Corrective Action

The command failure associated with the device specified in this event is caused by some internal error.

Syslog Message

Device Serial Number %s - Internal error reason: %s - SCSI error : %s

Parameters

devSerial (STRING): Device Serial Number
reason (STRING): Internal error
scsiError (STRING): SCSI error code

ctl.ctlbe.lunCreationFailed

Severity

ERROR

Description

LUN creation failed in the CAM target layer.

Corrective Action

The creation of a CAM target end point for the LUN failed. This will cause the disk or partition to not be exported to the DR cluster, and therefore cannot be used for storage mirroring.

Syslog Message

LUN %d - endpoint creation failed, reason: %s

Parameters

lunId (INT): The LUN ID
errorString (STRING): Description of the error

ctl.ctlbe.lunError

Severity

ERROR

Description

The LUN has been deleted or is not configured properly

Corrective Action

The command failure associated with the device specified in this event is caused by the device being not configured or in error state. The device may be in the process of being deleted or the path to this device may not be accessible. Check the state of the device.

Syslog Message

Device Serial Number %s - Device is not configured or in error state - SCSI error : %s - LUN flags : 0x%x

Parameters

devSerial (STRING): Device Serial Number
scsiError (STRING): SCSI error code
lunFlags (INT): Internal CTL Backend LUN flags

ctl.ctlbe.lunNotConfigured

Severity

ERROR

Description

The LUN is not configured

Corrective Action

The command failure associated with the device specified in this event is caused by the device not being configured. Check the state of the device.

Syslog Message

Device Serial Number %s - Device is not configured - SCSI error : %s

Parameters

devSerial (STRING): Device Serial Number
scsiError (STRING): SCSI error code

ctl.session events

ctl.session.stateChanged

Severity

NOTICE

Description

This message occurs when iSCSI CAM target layer session status is changed.

Corrective Action

If the identified iSCSI CAM target layer session is experiencing unexpected events (disconnecting, reconnecting, or connected), examine the link for excessive errors or latency.

Syslog Message

iSCSI CAM target layer's session state is changed to %s for the initiator %s (address: %s). %s

Parameters

ctl_session_state (STRING): New iSCSI CAM target layer session state.

ctl_initiator (STRING): iSCSI CAM target layer initiator's name.

ctl_initiator_address (STRING): iSCSI CAM target layer initiator's address.

ctl_session_state_change_reason (STRING): Reason for the iSCSI CAM target layer session state change.

ctl_timeout_value (INT): iSCSI CAM target layer timeout value.

ctran events

ctran.disabled events

ctran.disabled

Severity

INFORMATIONAL

Description

This message occurs when Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) subsystem is disabled.

Corrective Action

This happens only when the local node went out of CLAM quorum. Take the corrective action specified in EMS_clam_node_ooq event.

Syslog Message

CTRAN subsystem is now disabled.

Parameters

(None).

ctran.enabled events

ctran.enabled

Severity

INFORMATIONAL

Description

This message occurs when Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) subsystem is enabled.

Corrective Action

No action is needed.

Syslog Message

CTRAN subsystem is now enabled.

Parameters

(None).

ctran.gbuf events

ctran.gbuf.alloc.unsuccessful

Severity

NOTICE

Description

This message occurs when one or more attempts to allocate a message buffer to convey messages between nodes for the Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) has been unsuccessful.

Corrective Action

If this message occurs more than 10 times in a hour KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node * -message "ctran.gbuf.alloc.unsuccessful" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.gbuf.alloc.unsuccessful" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

Attempt to allocate a message buffer for CTRAN has been unsuccessful. Total number of unsuccessful attempts is %u.

Parameters

attempts_failed (LONGINT): Total number of message buffer allocation attempts that have been unsuccessful.

ctran.gc events

ctran.gc.proposal.stuck

Severity

EMERGENCY

Description

This message occurs when the Cluster Transaction Manager (CTRAN) Group Coordinator (GC) of a group runs a prop-done probe for a proposal longer than anticipated.

Corrective Action

KCS CTRAN logs need to be collected for further analysis. Trigger an ALL AutoSupport® message by using the "autosupport invoke -node * -message "ctran.gc.proposal.stuck" -type all" command. Also trigger a diagnostic AutoSupport by using the "autosupport invoke-diagnostic -node * -message "ctran.gc.proposal.stuck" -subsystem kcs" command. Then contact NetApp technical support support.

Syslog Message

CTRAN group %s has attempted a prop_done probe %d times against gm_id %ld on node %s with UUID %s for txn %ld with opcode %d.

Parameters

group_name (STRING): Name of the group being polled.
attempts (LONGINT): Number of attempts.
gm_id (LONGINT): Group member (GM) ID.
node_name (STRING): Name of the node the GM resides on.
node_uuid (STRING): UUID of the node the GM resides on.
trans_id (LONGINT): ID of the stuck transaction.
opcode (INT): Operation type of the stuck transaction.

ctran.gc.reselection.failed

Severity

ALERT

Description

This message occurs when some Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) groups lose their Group co-ordinator (GC) and a subsequent GC reselection process fails to complete.

Corrective Action

Reboot the node, and if the node is waiting for giveback then perform a giveback.

Syslog Message

CTRAN GC Reselection failed on local node (name=%s, id=%llu).

Parameters

localhostname (STRING): The host name of the local node.
localnodeid (LONGINT): The node ID of the local node.

ctran.group events

ctran.group.reset.failed

Severity

EMERGENCY

Description

This message occurs when an attempt to reset a group by Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN) fails.

Corrective Action

KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using "autosupport invoke -node * -message "ctran.group.reset.failed" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.group.reset.failed" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

Group reset for %s has failed on node %s.

Parameters

localhostname (STRING): The host name of the local node.
group_name (STRING): The group on which the group reset operation is attempted.

ctran.jpc events

ctran.jpc.assigned

Severity

INFORMATIONAL

Description

This message occurs when a Join Proposal Coordinator (JPC) node is assigned by Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN).

Corrective Action

(None).

Syslog Message

Cluster node (name=%s, ID=%llu) is the Join Proposal Coordinator (JPC) node.

Parameters

nodename (STRING): Host name of the JPC node.
node_id (LONGINT): Node id of the JPC node.

ctran.jpc.multiple.nodes

Severity

EMERGENCY

Description

This message occurs when multiple Join Proposal Coordinator (JPC) nodes for the Cluster Transaction Manager (CTRAN) are detected.

Corrective Action

KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node * -message "ctran.jpc.multiple.nodes" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.jpc.multiple.nodes" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

Cluster node %u detected multiple JPC nodes (node %u reports JPC %u, node %u reports JPC %u)

Parameters

local_node_id (LONGINT): ID of the local node.
src_node_id_1 (LONGINT): ID of the first node reporting a JPC.
jpc_node_id_1 (LONGINT): ID of the JPC node reported by src_node_id_1.
src_node_id_2 (LONGINT): ID of the second node reporting a JPC.
jpc_node_id_2 (LONGINT): ID of the JPC node reported by src_node_id_2.

ctran.jpc.not.found

Severity

EMERGENCY

Description

This message occurs when this node cannot find a a Join Proposal Coordinator (JPC) within the cluster for Kernel Cluster Services (KCS) Cluster Transaction Manager (CTRAN). Until this error is resolved the reporting node will not be able to participate in distributed operations.

Corrective Action

Perform a planned takeover/giveback sequence to reset the reporting node non-disruptively by using the "takeover -ofnode (reporting node)" and "giveback -ofnode (reporting node)" commands. If the error

message is still seen KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node * -message "ctran.jpc.not.found" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.jpc.not.found" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

This node was unable to locate a Join Proposal Coordinator (JPC) node.

Parameters

(None).

ctran.jpc.valid.failed

Severity

EMERGENCY

Description

This message occurs when the Join Proposal Coordinator (JPC) validation fails due to an inconsistent state of some of the Cluster Transaction Manager (CTRAN) group members following a JPC reselection event. In some cases, this can result in loss of SAN data access, CLI command failures and/or giveback failures.

Corrective Action

Reset the CTRAN subsystem during a maintenance window by placing the node specified ineligible by using "cluster modify -node (node reporting error) -eligibility false". Once complete return the node to serivce by entering "cluster modify -node (node reporting error) -eligibility true". Note, making a node ineligible impacts all protocols on that node. During the time that a node is ineligible, it will not serve any data. If a non-disruptive resolution is desired, takeover the reporting node by using "takeover -of-node (reporting-node)", and then returning it to service by "giveback -of-node (reporting-node)" when it is ready. If the error is still seen KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using "autosupport invoke -node * -message "ctran.jpc.valid.failed" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.jpc.valid.failed" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

CTRAN JPC validation failed on local node (name=%s, id=%llu, num_groups=%llu).

Parameters

localhostname (STRING): Host name of the local node.
localnodeid (LONGINT): Node ID of the local node.
numgroups (LONGINT): Number of inconsistent groups.

ctran.net events

ctran.net.unreachable

Severity

ALERT

Description

This message occurs when the Cluster Transaction Manager (CTRAN) on the local node is unable to reach a peer node that it believes is in CLAM quorum.

Corrective Action

Check all cluster interfaces on the node initiating this error message and the peer node specified in the message. * Ensure all interfaces are in up state with "network interface show -role cluster". * Ensure that each node initiating this message can reach their peer node with "cluster ping". * Check the cluster interconnect switches and correct any issues found with the health or configuration found. If the error still persists KCS CTRAN logs will need to be collected for further analysis. Trigger an ALL autosupport by using, "autosupport invoke -node * -message "ctran.net.unreachable" -type all", a diagnostic autosupport by using "autosupport invoke-diagnostic -node * -message "ctran.net.unreachable" -subsystem kcs" and contact NetApp technical support support.

Syslog Message

Node %s (id=%llu) is unable to reach peer node %s (id=%llu) on connection %s (ACN=0x%016llx).

Parameters

local_node_name (STRING): Node name of the local node.
local_node_id (LONGINT): Node ID of the local node.
peer_node_name (STRING): Node name of the unreachable peer node.
peer_node_id (LONGINT): Node ID of the unreachable peer node.
connection (STRING): Name of connection that is unreachable.
acn (LONGINTHEX): The ACN value.

ctrl events

ctrl.link events

ctrl.link.degraded

Severity

ERROR

Description

This message occurs when the software detects either symbol errors or out-of-sequence errors on HA interconnect links.

Corrective Action

If possible, replace the degraded interconnect cables and reenable automatic switchover by using the "options -option-name rdma.link_monitor -option-value on" command. If the problem persists after replacing both interconnect cables, replace the interconnect hardware on both nodes.

Syslog Message

Link errors detected on card in slot %d. Number of symbol errors (Port1:Port2): %d:%d; Number of OOS errors(RQ:SQ): %d:%d.

Parameters

slot (INT): Slot number of the HA Interconnect device.
sym_err1 (INT): Symbol errors on the first port.
sym_err2 (INT): Symbol errors on the second port.
rq_oos (INT): Out-of-sequence errors on the receive queue.
sq_oos (INT): Out-of-sequence errors on the send queue.

ctrl.link.switchover

Severity

INFORMATIONAL

Description

This message occurs when the software initiates a switchover of the active interconnect link, which has been declared degraded.

Corrective Action

If possible, replace the degraded interconnect cable and reenable the automatic switchover by using the "options -option-name rdma.link_monitor -option-value on" command. If the problem persists after replacing both the interconnect cables, replace the interconnect hardware on both nodes.

Syslog Message

Link switchover initiated to switch active interconnect link %s.

Parameters

degraded_port_name (STRING): Port name of the degraded link that is being switched from.

ctrl.rdma events

ctrl.rdma.badSystemId

Severity

NOTICE

Description

This message occurs when an invalid system ID is found.

Corrective Action

(None).

Syslog Message

Invalid system ID %d. High-availability interconnect might not work properly.

Parameters

name (INT): Invalid system ID value.

ctrl.rdma.heartBeat

Severity

INFORMATIONAL

Description

This message logs heartbeat messages.

Corrective Action

(None).

Syslog Message

HA interconnect: %s.

Parameters

hb (STRING): Heartbeat string.

ctrl.rdma.partnerOK

Severity

INFORMATIONAL

Description

This message occurs when the partner resumes from pause state.

Corrective Action

(None).

Syslog Message

Partner node (system ID: %lld IP address: %s) has resumed from pause state.

Parameters

    sysid (LONGINT): Partner system ID.
    ipaddr (STRING): Partner IP address.

ctrl.rdma.partnerPause

Severity

    INFORMATIONAL

Description

    This message occurs when the partner enters pause state.

Corrective Action

    (None).

Syslog Message

    Partner node (system ID: %lld IP address: %s) has entered pause state.

Parameters

    sysid (LONGINT): Partner system ID.
    ipaddr (STRING): Partner IP address.

ctrl.rdma.portStateChange

Severity

    INFORMATIONAL

Description

    This message occurs when the state of the HA interconnect link changed frequently in the last hour.

Corrective Action

    Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

Syslog Message

    HA interconnect: Link to %s changed state %d times in the last hour.

Parameters

    ip (STRING): IP address of the peer.
    num_times (INT): Number of times the state changed.

daasync events

daasync.capacity events

daasync.capacity.changed

Severity

    NOTICE

Description

    This message occurs when the capacity data of a target device changes.

Corrective Action

    (None).

Syslog Message

    Capacity data has changed for device path %s with target address %s.

Parameters

    path (STRING): Device path.
    targ_addr (STRING): Target address.

daasync.inquiry events

daasync.inquiry.changed

Severity

    NOTICE

Description

    This message occurs when the inquiry data of a target device changes.

Corrective Action

    (None).

Syslog Message

    Inquiry data has changed in path %s with target address %s.

Parameters

    path (STRING): Device path.
    targ_addr (STRING): Target address.

daasync.periph events

daasync.periph.alloc.fail

Severity

    ERROR

Description

This message occurs when the system cannot attach a drive.

Corrective Action

Use the "disk show -fields vmdisk-target-address" command to get the list of drives that are visible to the system and to verify that the missing drive is connected properly.

Syslog Message

Unable to attach new device %s due to status 0x%x.

Parameters

device_name (STRING): Drive name.
status (INTHEX): Status of the system.

daregister events

daregister.periph events

daregister.periph.lost

Severity

ERROR

Description

This message occurs when a peripheral device is lost during registration.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

Lost peripheral device during registration in path %s with respect to target address %s.

Parameters

path (STRING): Device path.
targ_addr (STRING): Target address.

dbs events

dcs events

dcs.framework events

dcs.framework.disabled

Severity

NOTICE

Description

This message occurs when the DCS framework has been disabled on this node. This node will not allow any updates to any counters stored in the DCS framework on this node. However, the values for existing counters may be retrieved for display purposes.

Corrective Action

(None).

Syslog Message

The DCS framework is disabled on this node.

Parameters

(None).

dcs.framework.enabled

Severity

INFORMATIONAL

Description

This message occurs when the DCS framework has been enabled on this node.

Corrective Action

(None).

Syslog Message

The DCS framework is enabled on this node.

Parameters

(None).

dev events

dev.driver events

dev.driver.throttling

Severity

NOTICE

Description

This message occurs when an I/O driver is throttling I/O requests because the underlying controller is overloaded with I/O requests.

Corrective Action

(None).

Syslog Message

%s driver unit %d throttling I/O requests due to %s.

Parameters

devname (STRING): Name of the device.
unit (INT): Unit number of the controller.
reason (STRING): Reason for throttling.
current_throttle_sendq (INT): Current throttle value for send requests
lowest_throttle_sendq (INT): Lowest throttle value for send requests

dev.path events

dev.path.inquiry.failed

Severity

ERROR

Description

This message occurs when the system fails to discover the drive.

Corrective Action

Use the "disk show -fields vmdisk-target-address" command to get the list of drives that are visible to the system and to verify that the missing drive is connected properly.

Syslog Message

Failed to discover drive (device name:%s%d).

Parameters

periph_name (STRING): Drive name.
unit_no (INT): Drive unit number.

device events

device.install events

device.install.successful

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP® successfully installs one or more devices after a prior installation failure.

Corrective Action

(None).

Syslog Message

Device type %s installation successful for one or more devices that reported installation failure previously.

Parameters

devtype (STRING): SCSI device type.

device.latency events

device.latency.threshold

Severity

NOTICE

Description

This message occurs when a device exceeds the latency threshold for the 30- second monitoring period. The event provides the name of the device, the target device (if applicable), the current threshold value, the average execution latency, and total latency for this period. The event also displays the number of I/O operations for the period, which is used to calculate latency.

Corrective Action

Contact your hypervisor provider if this issue persists. This usually indicates undersized storage in terms of allowed operations per second.

Syslog Message

The device latency in microseconds exceeded the threshold value for device "%s%d" and the associated target device "%s". The threshold is "%d", execution latency is "%d", total latency is "%d", and the number of operations for this period is "%d".

Parameters

devname (STRING): Name of the device. The device name can be "isl" (local to this node), "isp" (local to the partner node) or "ism" (the mediator with no associated target device), which represents the ISCSI name. Any other device name will be the name of the actual target device. If the device name is not "isl", or "isp", or the target device name, the name will always be "n/a".
unit (INT): Unit number of the device.

target_dev (STRING): Name of the target device. The name will be the target (end point) device name if the device name is either "isl" or "isp". Otherwise it is the actual underlying device on this node.
threshold (INT): Monitoring threshold in microseconds.
exec_lat (INT): Execution latency in microseconds for this period.
total_lat (INT): Total latency in microseconds for this period.
num_operations (INT): Number of I/O operations for this period.

device.max events

device.max.count.exceeded

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot install one or more discovered devices since the device type count is at full capacity.

Corrective Action

If possible, remove an existing device of the same type so that device installation can proceed. If the failure persists, contact NetApp technical support.

Syslog Message

Unable to install one or more %s devices discovered on initiator port %s, target port WWNN: %s, WWPN: %s. The device limit (%d) has been reached.

Parameters

devtype (STRING): SCSI device type.
adapter (STRING): Name of the initiator port discovering the device(s).
wwnn (STRING): World Wide Node Name of the target port exporting the device(s).
wwpn (STRING): World Wide Port Name of the target port exporting the device(s).
limit (INT): Device maximum count.

dfu events

dfu.badbridgeshelfconfig events

dfu.badBridgeShelfConfig

Severity

ERROR

Description

This message occurs when the disk firmware update aborts because it cannot contact the two peer FC-to-SAS bridges.

Corrective Action

Make sure that the storage controller is correctly cabled to the two peer FC-to-SAS bridges and that the bridges are correctly cabled to the SAS disk shelves. Then retry the 'disk_fw_update' command.

Syslog Message

Error contacting two peer FC-to-SAS bridges. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.clusterdisknotready events

dfu.clusterDiskNotReady

Severity

ERROR

Description

This message occurs when the controller failover partner reports that a disk selected for download is in the NOT READY state.

Corrective Action

Only disks in the READY state can be downloaded to. If a disk is in the NOT READY state, it indicates that the disk has probably failed for some reason and should be returned for RMA.

Syslog Message

Controller failover partner reports disk as NOT READY. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.

productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.clustericdown events

dfu.clusterIcDown

Severity

ERROR

Description

This message occurs when the high-availability (HA) interconnect is not available.

Corrective Action

The HA interconnect was not functional. Make sure that controller failover is enabled. Check that the HA interconnect cables are connected properly, and if applicable (based on the HA interconnect type), that the SFPs (Small Form-Factor Pluggables) are seated properly on both controllers.

Syslog Message

HA interconnect not available (cf disabled?). Unable to download firmware to disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.clustericerror events

dfu.clusterIcError

Severity

ERROR

Description

This message occurs when communication with the controller failover partner cannot be established.

Corrective Action

Typically, these errors are related to cable or transmission errors from the HA interconnect. Check that the HA interconnect cables are connected properly, and if applicable (based on the HA interconnect type), that the SFPs (Small Form-Factor Pluggables) are seated properly on both controllers.

Syslog Message

HA interconnect error %d encountered. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

Parameters

clusterError (INT): High-availability (HA) interconnect error number.
diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.

productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.clusterpartner events

dfu.clusterPartner

Severity

ERROR

Description

This message occurs when automatic firmware download is performed as part of system boot and partner disks are downrev.

Corrective Action

Firmware download is not allowed to update partner disks automatically. Manual invocation of the "storage disk firmware update" command is required. See the "storage disk firmware update" man page for details.

Syslog Message

Operator must issue disk_fw_update command to download firmware to partner Disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.clustertakeover events

dfu.clusterTakeover

Severity

ERROR

Description

This message occurs when firmware download is attempted while in takeover mode.

Corrective Action

Firmware download is not allowed while in takeover mode. Exit takeover mode and attempt the "storage disk firmware update" command again. See the "storage disk firmware update" man page for details.

Syslog Message

Unable to download firmware while in takeover mode to Disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product id of the disk.

fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.disksizechanged events

dfu.diskSizeChanged

Severity

NOTICE

Description

This message occurs when a size change is detected after a firmware update. This can be either an increase or decrease in physical size of the disk.

Corrective Action

The disk might not be usable any longer by the RAID subsystem because of the size change that occurred. If RAID cannot access the disk any longer, it will be failed and should be returned for RMA. If the disk is still accessible, leaving it in the system is perfectly fine.

Syslog Message

Disk %s [%s %s %s] S/N [%s] size changed (%x:%x %llx:%llx %llx:%llx %llx:%llx %llx:%llx)

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.
oldSectorSize (INTHEX): Old sector size of the disk.
newSectorSize (INTHEX): New sector size of the disk.
oldLastSector (LONGINTHEX): Old right-size of the disk.
newLastSector (LONGINTHEX): New right-size of the disk.
oldDiskBlocks (LONGINTHEX): Old right-sized blocks on the disk.
newDiskBlocks (LONGINTHEX): New right-sized blocks on the disk.
oldRealLastSector (LONGINTHEX): Old raw size of the disk.
newRealLastSector (LONGINTHEX): New raw size of the disk.
oldRealDiskBlocks (LONGINTHEX): Old raw blocks on the disk.
newRealDiskBlocks (LONGINTHEX): New raw blocks on the disk.

dfu.firmwaredownloading events

dfu.firmwareDownloading

Severity

INFORMATIONAL

Description

This message occurs when firmware is being downloaded for a specific product ID of disks on the system.

Corrective Action

(None).

Syslog Message

Now downloading firmware file %s on %d disk(s) of plex [%s]…

Parameters

file (STRING): Firmware file which is being downloaded.
diskcount (INT): Number of disks being downloaded to.
plex (STRING): Plex name being downloaded to.

dfu.firmwaredownrev events

dfu.firmwareDownrev

Severity

ERROR

Description

This message occurs when the system finds disks with a downrev version of firmware, as defined by the installed version of Data ONTAP®.

Corrective Action

Use the "storage disk firmware update" command to update the downrev firmware on the disks. Check your support provider for more information about obtaining the latest disk firmware. If the problem persists, contact NetApp technical support.

Syslog Message

Downrev firmware on %d disks.

Parameters

downrev (INT): Number of disks with downrev firmware.

dfu.firmwareuptodate events

dfu.firmwareUpToDate

Severity

NOTICE

Description

This message occurs when all eligible disks are determined to be updated to the latest version of firmware available on the system.

Corrective Action

(None).

Syslog Message

Firmware is up-to-date on all eligible disks.

Parameters

(None).

dfu.fwdownloadfailedmultfiles events

dfu.fwDownloadFailedMultFiles

Severity

ERROR

Description

This message occurs when more than one file is found for downloading to an ATA drive. Because there is no version string control, only one file at a time is allowed on the system.

Corrective Action

Two or more firmware files were found for download. Delete all except the one that should be downloaded to the drive. Background firmware update should download on the next check cycle.

Syslog Message

Download failed due to multiple firmware files found for Disk type [%s %s].

Parameters

vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.

dfu.fwdownloadfailedstatus events

dfu.fwDownloadFailedStatus

Severity

ERROR

Description

This message occurs when a firmware download failure occurs.

Corrective Action

Decode sense codes based on drive supplier to determine the reason for the failure. Most situations can be recovered by attempting to download firmware again using the "disk_fw_update" command. See the disk_fw_update man page for complete details.

Syslog Message

Status: (0x%x/0x%x/0x%x) (SCSI sense 0x%x/0x%x/0x%x/0x%x)

Parameters

OpStatus (INTHEX): Status of the passthru I/O.
HostStatus (INTHEX): Host Status of the passthru I/O.
TargetStatus (INTHEX): Target Status of the passthru I/O.
sense_key (INTHEX): SCSI Sense key.
sense_code (INTHEX): SCSI Sense Code.
sense_code_qualifier (INTHEX): SCSI Sense Code Qualifier.

fru (INTHEX): SCSI Sense Code FRU identifier.

dfu.fwdownloadfailedwbuf events

dfu.fwDownloadFailedWbuf

Severity

ERROR

Description

This message occurs when retries are exhausted on the write buffer command that is used to download firmware to a disk.

Corrective Action

Disk firmware might still need to be updated. See the disk_fw_update man page for complete details on performing this.

Syslog Message

Write buffer command failed to Disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.init events

dfu.init.noMemory

Severity

ERROR

Description

This message occurs when the disk firmware update initialization routine cannot allocate memory.

Corrective Action

Memory allocation relies on the availability of memory resources in the system. If possible, reduce the workload so that fewer resources are needed. If the failure persists after reducing the workload, contact NetApp technical support.

Syslog Message

Could not allocate memory for disk firmware update. Requested size=%d bytes.

Parameters

size (INT): Size (in bytes) of the memory allocation request.

dfu.mallocfailed events

dfu.mallocFailed

Severity

ALERT

Description

This message occurs when Data ONTAP® cannot allocate memory to read the disk firmware file and aborts the disk firmware update.

Corrective Action

Inability to allocate memory for this action indicates a failure within Data ONTAP. Take a core for reference, and then open a support case to address the underlying issue. The reboot process when you take the core resolves the immediate problem.

Syslog Message

Cannot allocate memory to read disk firmware file %s; disk firmware update aborted.

Parameters

filename (STRING): Name of the disk firmware file.

dfu.nomemory events

dfu.noMemory

Severity

ERROR

Description

This message occurs when the disk firmware update routine cannot allocate memory to update the disk firmware.

Corrective Action

Memory allocation relies on the availability of memory resources in the system. If possible, reduce the workload so that fewer resources are needed. Rebooting the system can recover memory resources that might have been lost. If the failure persists after reducing the workload and rebooting, contact NetApp technical support for assistance in determining whether additional system memory is indicated.

Syslog Message

Could not allocate memory for disk firmware update. Unable to download firmware to disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Name of the vendor of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.readtestfailed events

dfu.readTestFailed

Severity

ERROR

Description

This message occurs when a read of the disk fails after downloading firmware to a disk.

Corrective Action

Disk was unable to be read from after a firmware update occurred. I/O will be retried. If the retries are not successful, you should fail the disk and return it for RMA.

Syslog Message

Media Access test failed on Disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.readTestFailed.fatal

Severity

ERROR

Description

This message occurs when a read of the disk fails after downloading firmware to a disk and all retries have been exhausted.

Corrective Action

Disk was unable to be read from after a firmware update occurred. I/O will be retried. If the retries are not successful, you should fail the dise and return it for RMA.

Syslog Message

Unable to access media after firmware update on Disk %s [%s %s %s] S/N [%s].

Parameters

diskName (STRING): Name of the disk.
vendorName (STRING): Vendor name of the disk.
productId (STRING): Product ID of the disk.
fwVersion (STRING): Firmware version of the disk.
serialno (STRING): Serial number of the disk.

dfu.readtestfailedstatus events

dfu.readTestFailedStatus

Severity

ERROR

Description

This message occurs when a read test failure occurs after a firmware download.

Corrective Action

Decode sense codes based on drive supplier to determine the reason for the failure. Most situations can be recovered by the system automatically retrying the I/O operation.

Syslog Message

Status: (0x%x/0x%x/0x%x) (SCSI sense 0x%x/0x%x/0x%x/0x%x)

Parameters

OpStatus (INTHEX): Status of the read I/O.
HostStatus (INTHEX): Host Status of the read I/O.
TargetStatus (INTHEX): Target Status of the read I/O.
sense_key (INTHEX): SCSI Sense key.
sense_code (INTHEX): SCSI Sense Code.
sense_code_qualifier (INTHEX): SCSI Sense Code Qualifier.
fru (INTHEX): SCSI Sense Code FRU identifier.

dfu.refreshinquiryfailed events

dfu.refreshInquiryFailed

Severity

ERROR

Description

This message occurs after a successful disk firmware update, when the 'SCSI inquiry' command, which is issued to all disks as part of the disk firmware download process, fails to finish. It is also possible to get messages indicating that disks have downrev firmware.

Corrective Action

When this error happens, check the connection to the partner node and manually retry the firmware download process. If the problem still persists, open a support case to investigate the underlying cause.

Syslog Message

(None).

Parameters

retryCount (INT): Number of times the command was retried and failed.

dfu.suspended_disasterrecovery events

dfu.suspended_DisasterRecovery

Severity

ERROR

Description

This message occurs in a MetroCluster™ environment when firmware download to remote disks is suspended during disaster recovery. This event is signaled at most once during disaster recovery, the first time firmware download to a remote disk is suspended.

Corrective Action

Firmware download to remote disks is suspended during MetroCluster disaster recovery. Wait until switchback has completed, and either allow the firmware to be downloaded automatically, or run the "storage disk firmware update" command. See the "storage disk firmware update" man page for details.

Syslog Message

Suspend firmware download to remote disks while in MetroCluster Disaster Recovery state %s

Parameters

dr_state (STRING): Current MetroCluster disaster recovery state.

diff events

diff.svcs events

diff.svcs.setting.topartner

Severity

ERROR

Description

This message occurs when the system cannot automatically apply the Differentiated Services (diff-svcs) setting to the High Availability (HA) partner. In the event there is a setting mismatch between HA pairs the node with the incorrect setting may produce an incorrect At-Risk-System (ARS) report.

Corrective Action

Manually apply the diff-svcs setting to the HA partner to ensure the setting is consistent across both nodes in the HA pair. In the event of a failure, issue the following command on the HA partner: "system node modify -node nodename -diff-svcs true|false" .

Syslog Message

Differentiated services setting was not automatically applied to the HA partner of node %s: %s.

Parameters

node (STRING): Name of the node where the setting was successfully applied. A failure occurred while trying to apply the same setting to its HA partner.
error (STRING): Error reported when attempting to apply the setting to the HA partner.

dipmon events

director events

discover events

discover.7500 events

discover.7500.supported

Severity

NOTICE

Description

This message occurs when discovery of a 7500N FC-to-SAS bridge is enabled.

Corrective Action

(None).

Syslog Message

FC-to-SAS bridge ATTO 7500N discovery is enabled.

Parameters

(None).

discover.7500.unsupported

Severity

NOTICE

Description

This message occurs when discovery of a 7500N FC-to-SAS bridge is disabled.

Corrective Action

(None).

Syslog Message

FC-to-SAS bridge ATTO 7500N discovery is disabled.

Parameters

(None).

discoveryd events

discoveryd.search events

discoveryd.search.request

Severity

NOTICE

Description

This message occurs when the discoveryd service is contacted during the initial cluster setup phase with an M-SEARCH multicast and a follow up HTTP GET to get the device description document.

Corrective Action

(None).

Syslog Message

The discoveryd service was contacted by a device (IP address: %s) to discover information about this node.

Parameters

client_ip (STRING): IP address of the client machine requesting the discoveryd information.

disk events

disk.adaptererror events

disk.adapterError

Severity

ALERT

Description

This message occurs when an adapter error is detected.

Corrective Action

(None).

Syslog Message

Disk %s: unexpected adapter error 0x%x

Parameters

diskName (STRING): Name of the device.
error (INTHEX): Adapter status.

disk.bdfu events

disk.bdfu.suspended

Severity

ERROR

Description

This message occurs when the background drive firmware update process fails to unlock SAS NetApp® Storage Encryption (NSE) drives in FIPS-compliance mode. The FIPS-certified SAS NSE drives must be unlocked with a valid authentication key before firmware can be downloaded to them. If the number of failed unlock attempts reaches a certain threshold, the drives will be locked out, leading to permanent loss of data in certain conditions. The system will automatically suspend the background drive firmware update for 12 hours, after which it is reenabled.

Corrective Action

Contact NetApp technical support for assistance with restoring valid authentication keys on the drive.

Syslog Message

Background drive firmware update is suspended because FIPS NSE drives cannot be unlocked. Reason: %s.

Parameters

suspend_reason (STRING): Reason for the drive unlock failure.

disk.capacity events

disk.capacity.changed

Severity

NOTICE

Description

This message occurs when a media size change is reported for the underlying storage device. The new size and previous size are measured in 4096-byte blocks.

Corrective Action

(None).

Syslog Message

A storage device reported a size change for device "%s". New size: %llu, previous size: %llu (4096-byte blocks).

Parameters

diskName (STRING): Name of the disk.
new_size (LONGINT): The new size measured in 4096-byte blocks.
previous_size (LONGINT): The previous size measured in 4096-byte blocks.

disk.checksum events

disk.checksum.offlineAdapter

Severity

ALERT

Description

This message occurs when multiple errors are detected during checksum verification. The adapter is taken offline.

Corrective Action

Replace the adapter. Contact Contact NetApp technical support. for assistance with a Return Material Authorization.

Syslog Message

Adapter %s taken offline due to checksum verification failure on multiple disks. Keep the adapter offline and contact Contact NetApp technical support. for assistance.

Parameters

adapterName (STRING): Name of the adapter.

disk.checksum.verifyFailed

Severity

ALERT

Description

This message occurs when disk checksum verify fails.

Corrective Action

(None).

Syslog Message

Disk level checksum verification failed on WRITE VERIFY: Disk %s, Block #%llu: Volume %s, FileId %d, Block #%llu

Parameters

diskName (STRING): Name of the device.
bno (LONGINT): block id
vol (STRING): Volume name.
fileid (INT): File ID.
block (LONGINT): File block ID.

disk.cksum events

disk.cksum.bno.verifyFailed

Severity

ALERT

Description

This message occurs when the system detects a block number mismatch during disk checksum verification. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location.

Corrective Action

(None).

Syslog Message

Block number mismatch on WRITE VERIFY: Disk %s, expected_dbn = %u, stored_dbn = %u, expected_vbn = %llu, stored_vbn = %llu, Volume %s, FileId %d, Block #%llu.

Parameters

diskName (STRING): Name of the device.
expected_dbn (INT): Expected physical disk block number.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
vol (STRING): Volume name.
fileid (INT): File ID.
block (LONGINT): File block ID.

disk.ddr events

disk.ddr.dqp.out.of.date

Severity

NOTICE

Description

This message occurs when the Dynamic Drive Recognition (DDR) Scanner detects a disk that is not part of its qualification table.

Corrective Action

Check your support provider's web site or knowledgebase for more information about downloading and installing an updated Disk Qualification Package (DQP) file.

Syslog Message

The DDR Scanner has detected that the latest DQP is not present on this system.

Parameters

(None).

disk.ddr.invalid.azcs.capacity

Severity

ERROR

Description

This event is generated when the DDR Scanner detects a capacity value that does not match with the alias string associated with it.

Corrective Action

(None).

Syslog Message

The DDR Scanner has detected an invalid AZCS alias capacity on disk %s

Parameters

diskname (STRING): Name of the disk.
capacity_value (LONGINT): The value of the invalid capacity

disk.ddr.invalid.bcs.capacity

Severity

ERROR

Description

This event is generated when the DDR Scanner detects a capacity value that does not match with the alias string associated with it.

Corrective Action

(None).

The DDR Scanner has detected an invalid BCS alias capacity on disk %s

Parameters

>**diskname** (STRING): Name of the disk.
>**capacity_value** (LONGINT): The value of the invalid capacity

disk.ddr.scanner.ddr.failure

Severity

>NOTICE

Description

>This event is issued when a the ddr scanner has failed to read the new DDR label it just placed on the disk.

Corrective Action

>(None).

Syslog Message

>Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] [%s]: DDR label verify Failure - DDR Error

Parameters

>**disk_name** (STRING): The name of the disk
>**shelf** (STRING): Shelf identifier where the disk is located
>**bay** (STRING): Disk bay within the shelf where disk is located
>**vendor** (STRING): Name of the vendor of the disk
>**model** (STRING): Model string of the disk drive
>**firmware_revision** (STRING): Firmware revision of the disk
>**serialno** (STRING): Serial number of the disk
>**ddr_error** (STRING): DDR Error string which has been parsed

disk.ddr.scanner.label.done

Severity

>NOTICE

Description

>This event is issued when a the ddr scanner has completed has completed scanning a disk successfully

Corrective Action

>(None).

Syslog Message

>Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label write complete

Parameters

>**disk_name** (STRING): The name of the disk
>**shelf** (STRING): Shelf identifier where the disk is located
>**bay** (STRING): Disk bay within the shelf where disk is located
>**vendor** (STRING): Name of the vendor of the disk
>**model** (STRING): Model string of the disk drive

firmware_revision (STRING): Firmware revision of the disk
serialno (STRING): Serial number of the disk

disk.ddr.scanner.verify.failure

Severity

NOTICE

Description

This event is issued when a the ddr scanner has failed to read the new DDR label it just placed on the disk.

Corrective Action

(None).

Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label verify Failure

Parameters

disk_name (STRING): The name of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision of the disk
serialno (STRING): Serial number of the disk

disk.ddr.scanner.write.failure

Severity

NOTICE

Description

This event is issued when a the ddr scanner has failed to write a new DDR label to the disk

Corrective Action

(None).

Syslog Message

Disk %s Shelf %s Bay %s [%s %s %s] S/N [%s] : DDR label write Failure

Parameters

disk_name (STRING): The name of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision of the disk
serialno (STRING): Serial number of the disk

disk.ddr.unable.add.disk

Severity
ALERT

Description
This event is generated when the DDR Scanner is unable to re-add a disk to the filer after trying for 2 minutes. This means there are no more spare disk_Cbs in the filer.

Corrective Action
(None).

Syslog Message
The filer has not freed a disk_Cb for over 2 mintues for %s.

Parameters
diskuid (STRING): The unique identifier of the disk

disk.diagnostic events

disk.diagnostic.logs.saved

Severity
NOTICE

Description
This message occurs when ONTAP retrieves the diagnostic logs from the disk. The logs are saved at /etc/logs/drive_failure_logs/.

Corrective Action
(None).

Syslog Message
Diagnostic logs retrieved for disk "%s".

Parameters
diskName (STRING): Name of the disk.

disk.duplicate events

disk.duplicate.name

Severity
ERROR

Description
This message occurs when duplicate disk names are detected. This can be caused by corruption of the disk's shelf id or bay number or failure to determine the stack id. There is no known impact to functional systems, but failure to correct this error may result in operations taken on the wrong disk and ambiguity where the disks are referenced.

Corrective Action

If any disk reports a shelf id or bay number not corresponding to its physical location, choose one of the following options: 1. Perform a takeover and giveback of the affected systems. 2. Remove the disk for at least 20 seconds, and then reinsert it. Note: If the disk is part of an aggregate, this option will result in a degraded RAID group and disk reconstruction will be initiated. Otherwise: 1. Verify cabling. 2. Contact NetApp technical support.

Syslog Message

Multiple disks detected with the same name %s. Disks: %s (%s).

Parameters

disk_name (STRING): Name of the disks.
disk_uid_list (STRING): UIDs of disks with the same name.
disk_serialno_list (STRING): Serial numbers of disks with the same name.

disk.dynamicqual events

disk.dynamicqual.fail.parse

Severity

ERROR

Description

This message occurs when dynamic device qualification fails due to an invalid /etc/qual_devices file. The system is unable to properly recognize disk drives or fully enable all resiliency and performance features.

Corrective Action

For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "[disk.dynamicqual.fail.parse]" keyword. Request an updated qual_devices file from NetApp.

Syslog Message

Device qualification information file (/etc/qual_devices) is invalid. The following error, "%s" has been detected. For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "[disk.dynamicqual.fail.parse]" keyword.

Parameters

errorstring (STRING): Error string for parsing error in /etc/qual_devices file.

disk.dynamicqual.failure.cleared

Severity

NOTICE

Description

This message occurs when a previous dynamic device qualification error has been corrected.

Corrective Action

(None).

Syslog Message

Device qualification failure condition has been corrected. All devices have been qualified.

Parameters

(None).

disk.dynamicqual.failure.invalidFile

Severity

ALERT

Description

This message occurs when dynamic device qualification fails due to an invalid /etc/qual_devices file.

Corrective Action

See the qual_devices man page for information about updating device qualification data. Request an updated qual_devices file from NetApp.

Syslog Message

Device qualification information file (/etc/qual_devices) is invalid. See the qual_devices man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

Parameters

time (INT): Time until forced shutdown.
disklist (STRING): List of disks that are still not qualified.

disk.dynamicqual.failure.missingFile

Severity

ALERT

Description

This message occurs when dynamic device qualification fails with a missing qualification file.

Corrective Action

See the qual_devices man page for information about updating device qualification data. Request a qual_devices file from NetApp.

Syslog Message

Device Qualification information file (/etc/qual_devices) is missing. See the qual_devices man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

Parameters

time (INT): Time until forced shutdown.
disklist (STRING): List of disks that are still not qualified.

disk.dynamicqual.failure.occurred

Severity

ALERT

Description

This message occurs when dynamic device qualification fails with an unknown error.

Corrective Action

See the qual_devices man page for information about updating device qualification data.

Syslog Message

Device qualification failure occurred. See the qual_devices man page for corrective action. This problem must be corrected within %d hour(s) to avoid a forced system shutdown. The following disk(s) remain unqualified: %s.

Parameters

time (INT): Time until forced shutdown.
disklist (STRING): List of disks that are still not qualified.

disk.dynamicqual.failure.shutdown

Severity

EMERGENCY

Description

This message occurs when one or more disks are not recognized by Data ONTAP®. This can result in a forced system shutdown if the offending disks are not removed or recognized properly within the allowed window of time.

Corrective Action

Download the latest Drive Qualification Package (DQP) from NetApp technical support, and then install it on your system.

Syslog Message

Device qualification failure has not been corrected for the past %d hour(s). The following disk(s) remain unqualified: %s. System is SHUTTING DOWN.

Parameters

time (INT): Time until forced shutdown.
disklist (STRING): List of disks that are still not qualified.

disk.encrypt events

disk.encrypt.destroy.complete

Severity

INFORMATIONAL

Description

This message occurs when the disk encrypt destroy operation is completed.

Corrective Action

(None).

Syslog Message

Disk %s [S/N %s] has completed encrypt destroy.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.

disk.encrypt.range.check

Severity

ERROR

Description

This message occurs when ONTAP® software detects that the reported capacity of an encrypting drive is different from the protected range capacity of the drive.

Corrective Action

Contact NetApp technical support.

Syslog Message

Drive %s["%s"] - The protected range capacity (%llu) of this encrypting drive is different from its reported capacity (%llu).

Parameters

diskName (STRING): Name of the disk.
productID (STRING): Product name of the disk.
advertisedDriveCapacity (LONGINT): Capacity reported by the drive(in bytes).
protectedDriveCapacity (LONGINT): Protected capacity of the drive(in bytes), specifically the drive capacity that is protected using an authentication key.

disk.encrypt.revert.complete

Severity

NOTICE

Description

This message occurs when the disk encrypt revert operation is completed.

Corrective Action

(None).

Syslog Message

Disk %s [S/N %s] has completed encrypt revert.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.

disk.encryptaccesserr events

disk.encryptAccessErr

Severity

ERROR

Description

This message occurs when a disk reports a data protection error, and ONTAP® cannot restore permission to access the data through storage encryption methods.

Corrective Action

If the disk is known to be an encrypting disk, then ONTAP might not have the correct storage encryption passphrase for this device. If possible, import the proper passphrase. If the passphrase cannot be recovered, or if the disk is not an encrypting disk, then all data on the disk is permanently inaccessible. You can return an encrypting disk to service as a spare through the use of the 'disk encrypt sanitize' command. If the device cannot be recovered, then it must be removed from the system.

Syslog Message

Unable to restore data access on encrypting disk %s; status %s (0x%x).

Parameters

diskName (STRING): Name of the disk.
status_string (STRING): Status code description.
status (INT): Status code from the SCSI driver.

disk.encryptaccessfwerr events

disk.encryptAccessFWErr

Severity

ERROR

Description

This message occurs when a disk reports a SCSI data protection error on an attempt to download firmware and ONTAP® cannot restore permission to access the firmware through storage encryption methods.

Corrective Action

If the disk is known to be an encrypting disk, then ONTAP might not have the correct storage encryption passphrase for this device. If possible, import the proper passphrase. If the passphrase cannot be recovered, or if the disk is not an encrypting disk, then the firmware cannot be downloaded. If the device cannot be recovered, then it must be removed from the system.

Syslog Message

Unable to restore firmware download access on encrypting disk %s; status %s (0x%x).

Parameters

diskName (STRING): Name of the disk.
status_string (STRING): Status code description from the SCSI driver.
status (INT): Status code from the SCSI driver.

disk.encryptcmdfailed events

disk.encryptCmdFailed

Severity

ERROR

Description

This message occurs when the indicated "storage encryption disk" command fails on an encrypting disk that supports storage encryption methods.

Corrective Action

Verify that storage encryption key servers, if required, are available and functioning, or that expected on-board keys are present.

Syslog Message

Encrypting disk %s failed disk encrypt %s command with error status %s (0x%x).

Parameters

disk (STRING): Name of the disk.
command (STRING): Storage encryption disk command.
error_string (STRING): Error status code description.
error (INT): Error status code.

disk.encryptfipspassphnosync events

disk.encryptFIPSPassphNoSync

Severity

NOTICE

Description

This message occurs when a system with NetApp® Storage Encryption (NSE) enabled detects that the authentication keys (AKs, or passphrases) for the internal FIPS-compliance authorities in a FIPS-certified drive are inconsistent. This can occur when a previous attempt to modify the FIPS-compliance passphrases failed.

Corrective Action

Use the "security key-manager" commands to display the available AKs from external KMIP key-management servers or onboard key management (OKM). Use the "storage encryption disk modify -fips -key-id" command to assign the desired AK to the FIPS-compliance authorities in the drive. If the condition persists, either replace the drive, or use the "storage encryption disk revert-to-original-state" command to reset the drive to its original condition. Warning: This command also removes all user data from the drive.

Syslog Message

The FIPS-compliance authorities for NSE drive %s have inconsistent authentication keys (AKs).

Parameters

diskName (STRING): Name of the drive.

disk.encryptgetmsidfailed events

disk.encryptGetMSIDFailed

Severity

NOTICE

Description

This message occurs when an encrypting disk reports a SCSI data protection error, but Data ONTAP® cannot obtain the Manufacturer's Secure ID (MSID) that is mandatory on disks that support storage encryption methods. Some conditions can cause this error temporarily.

Corrective Action

If the error persists, replace the disk or remove it from the system.

Syslog Message

Unable to obtain MSID from disk %s; status "%s" (0x%x).

Parameters

diskName (STRING): Name of the disk.
status_string (STRING): Status code description from the SCSI driver.
status (INT): Status code from the SCSI driver.

disk.encryptnosupport events

disk.encryptNoSupport

Severity

ALERT

Description

This message occurs when ONTAP® software detects one or more FIPS-certified self-encrypting drives, but the environment variable 'bootarg.storageencryption.support' is not present or is set to "false" to indicate that FIPS-certified drives are not supported.

Corrective Action

Remove all FIPS-certified drives.

Syslog Message

Detected FIPS-certified encrypting drive %s, but FIPS drives are not supported on this node. %d of %d disks checked are FIPS-certified.

Parameters

disk (STRING): Name of a FIPS-certified drive.
FIPS_disks (INT): Number of FIPS-certified drives detected.
disk_count (INT): Total number of drives checked. For a high-availability pair, this might be fewer than the total number of drives.

disk.encryptprotdiff events

disk.encryptProtDiff

Severity
NOTICE

Description
This message occurs when self-encrypting drives have different settings of data-at-rest protections; that is, some are protected, having a nondefault Data Key ID, and some are not, having one of the default Data Key IDs. Best protection is provided when all encrypting drives are protected, including spares that might be assigned automatically to an aggregate.

Corrective Action
Use the "storage encryption disk show -protection-mode !data" command to display the drives that are not protected; use the "storage encryption disk show -protection-mode data" command to show the drives that are protected. Use the "storage encryption disk modify -data-key-id" command to set the Data Key ID to a nondefault value.

Syslog Message
Self-encrypting drives on the system have dissimilar data protection settings.

Parameters
(None).

disk.encryptsupportreqd events

disk.encryptSupportReqd

Severity
ALERT

Description
This message occurs when ONTAP® software detects one or more nonencrypting drives or non-FIPS-certified self-encrypting drives (SEDs), but the environment variable 'bootarg.storageencryption.support' is set to "true" to indicate that all drives must be FIPS-certified.

Corrective Action
Remove all non-FIPS-certified SEDs and standard drives.

Syslog Message
Detected nonencrypting drive or non-FIPS-certified drive %s, but only FIPS-certified drives are supported on this node. %d of %d drives checked are FIPS-certified.

Parameters
disk (STRING): Name of a drive that is not FIPS-certified.
encrypting_disks (INT): Number of FIPS-certified drives detected.
disk_count (INT): Total number of drives checked. For a high-availability pair, this might be fewer than the total number of drives.

disk.eos events

disk.EOS.OS.error

Severity

ALERT

Description

This message occurs when a disk is detected that is not supported in this version of Data ONTAP® or later

Corrective Action

Remove the disk and replace it with a disk that is supported.

Syslog Message

%s support ended in version of %s. Current version is %s.

Parameters

disk_information (STRING): Disk information.
EOS_OS_version (STRING): Latest version of Data ONTAP supported by the disk.
cur_OS_version (STRING): Current version of Data ONTAP.

disk.exceed events

disk.exceed.cmd.completeTime

Severity

INFORMATIONAL

Description

This event is generated during disk qualification testing when READ/WRITE I/O requests exceed their expected maximum completion time.

Corrective Action

(None).

Syslog Message

Disk %s has exceeded %d ms limit — required %llu ms to complete command %s.

Parameters

diskName (STRING): Name of the disk.
timeLimit (INT): Time limit to complete command.
timeTaken (LONGINT): Time taken to complete command.
commandSTR (STRING): Disk qualification command in string.

disk.fail events

disk.fail.ssdstats

Severity

INFORMATIONAL

Description

This message occurs when a disk is marked failed, is being sanitized, or has entered Maintenance Center.

Corrective Action

(None).

Syslog Message

Disk %s (%s) failed with rated life used %s, percent spare blocks %s, spare blocks %s.

Parameters

diskName (STRING): Name of the disk.
serialno (STRING): Serial number.
ratedLife (STRING): Rated life used.
percentSpare (STRING): Percent spare blocks consumed.
spareBlks (STRING): Spare blocks consumed limit.

disk.failmsg events

disk.failmsg

Deprecated

Deprecated as of ONTAP 9.5 - replaced by disk.outOfService.

Severity

NOTICE

Description

This message occurs when a drive is marked failed, is being sanitized, or has entered Maintenance Center.

Corrective Action

(None).

Syslog Message

Disk %s (%s)%s. %d %s

Parameters

diskName (STRING): Name of the drive.
serialno (STRING): Serial number.
reason (STRING): Reason for the failure.
powerOnTime (INTHEX): Time, in minutes, that the drive was powered on when the failure occurred.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.fakereassignsuccess events

disk.fakereassignSuccess

Severity

NOTICE

Description

This message occurs when a fake reassign is detected on a disk and the sector verify succeeds.

Corrective Action

(None).

Syslog Message

disk %s: A fake reassign was issued on sector %llu for disk %s. Disable with boot arg disable-disk-fake-reassign? true.

Parameters

diskName (STRING): Name of the disk.
sector (LONGINT): Sector where the error was detected.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.fli events

disk.fli.abort.ioSent

Severity

NOTICE

Description

This message occurs when an I/O operation below the SCSI layer is aborted because a Foreign LUN Import (FLI) abort message was issued.

Corrective Action

(None).

Syslog Message

An I/O with the opcode %s has been aborted on disk %s.

Parameters

opcode (STRING): Opcode that specifies the operation that was aborted.
diskName (STRING): Name of the disk.

disk.fli.abort.ioUnSent

Severity

NOTICE

Description

This message occurs when an I/O operation in the disk class layer is aborted because a Foreign LUN Import (FLI) abort message was issued.

Corrective Action

(None).

Syslog Message

An I/O with the block count %llu starting at offset %llu has been aborted on disk %s.

Parameters

blockCount (LONGINT): Number of blocks that this I/O operation spans.
offset (LONGINT): Start of the I/O operation.
diskName (STRING): Name of the disk.

disk.fli.tmf.complete

Severity

NOTICE

Description

This message occurs when a Foreign LUN Import (FLI) message (abort or LUN reset) is completed.

Corrective Action

(None).

Syslog Message

Foreign LUN Import (FLI) message: %s completed on disk %s with status %d.

Parameters

msgType (STRING): Specifies which type of FLI message: either abort or LUN reset.
diskName (STRING): Name of the disk to which this FLI message was sent.
returnStatus (INT): Completion status of the FLI message.

disk.fw events

disk.fw.autodownrev

Severity

INFORMATIONAL

Description

This message occurs when the system detects disks with firmware that is not up-to-date. The background firmware update program will update the firmware automatically if the correct firmware files are in place.

Corrective Action

Download the correct firmware file onto the system. Check your support provider's web site or knowledgebase for more information about obtaining the latest disk firmware.

Syslog Message

%d disks have downrev firmware. They will be updated automatically using background disk firmware update if the correct firmware files are in place.

Parameters

    driveCount (INT): Number of disks that need to have updated firmware.

disk.fw.downrevWarning

Severity

    ERROR

Description

    This message occurs when the system detects disks with firmware that is not up-to-date.

Corrective Action

    Download and install the latest disk firmware file. Check your support provider's web site or knowledgebase for more information about obtaining the latest disk firmware.

Syslog Message

    %d disks have downrev firmware that you need to update.

Parameters

    driveCount (INT): Number of disks that need to have updated firmware.

disk.healthtrigger events

disk.healthTrigger

Severity

    NOTICE

Description

    This message occurs when the disk returns a health trigger event.

Corrective Action

    No action is required because this message is informational only. If the disk is having problems processing I/O, an error will be returned.

Syslog Message

    Disk %s received NHT health trigger (0x%x 0x%x 0x%x 0x%x)

Parameters

    diskName (STRING): Name of the device.
    sense_key (INTHEX): SCSI sense key.
    sense_code (INTHEX): SCSI sense code.
    qualifier (INTHEX): SCSI sense code qualifier.
    fru_failed (INTHEX): SCSI FRU code.

disk.init events

disk.init.badSectorSize

Severity

    ERROR

Description

    This message occurs when a disk reports a sector size that does not match the drive qualification table.

Corrective Action

    Replace the disk.

Syslog Message

    Disk %s has an unexpected sector size (%d bytes) and cannot be used.

Parameters

    diskName (STRING): Name of the disk.
    sector_size (INT): Invalid sector size.

disk.init.err.capacityFlash

Severity

    ERROR

Description

    This message occurs when a capacity-optimized flash solid-state drive (SSD) is detected by a node that does not support this type of SSD.

Corrective Action

    Remove the disk from the system.

Syslog Message

    Disk %s cannot be used on a node that does not support capacity-optimized flash.

Parameters

    diskName (STRING): Name of the disk.

disk.init.err.flashOptimized

Severity

    ERROR

Description

    This message occurs when a hard disk drive (HDD) is detected by a node configured with the All-Flash Optimized personality. With this personality, only solid-state drives (SSD) can be used.

Corrective Action

    Remove the disk from the system.

Syslog Message

    Disk %s cannot be used on a node configured as All-Flash Optimized.

Parameters

diskName (STRING): Name of the disk.

disk.init.err.not.NVMe

Severity

ERROR

Description

This message occurs when a non-NVMe drive is detected by a node that only supports NVMe drives.

Corrective Action

Remove the drive from the system.

Syslog Message

Drive %s cannot be used on a node that only supports NVMe drives.

Parameters

diskName (STRING): Name of the drive.

disk.init.err.not.SED

Severity

ERROR

Description

This message occurs when a non-self-encrypting drive (non-SED) is detected by a node that only supports self-encrypting drives (SEDs).

Corrective Action

Remove the drive from the system.

Syslog Message

Drive %s cannot be used on a node that only supports SEDs.

Parameters

diskName (STRING): Name of the drive.

disk.init.err.unsupp.shelf

Severity

ERROR

Description

This message occurs when an unsupported NVMe solid-state drive (SSD) is discovered in an external NVMe shelf. This NVMe SSD is only supported as an internal drive on the A800 system.

Corrective Action

Remove the drive from the external NVMe shelf.

Syslog Message

Drive %s cannot be used in an external NVMe shelf.

Parameters

disk_name (STRING): Name of the SSD.
disk_information (STRING): Formatted information about the SSD. This includes the drive's vendor, model, firmware revision, and serial number.

disk.init.err.unsupported

Severity

ERROR

Description

This message occurs when an unsupported disk is detected on a node.

Corrective Action

Remove the disk from the system.

Syslog Message

Disk %s is not recognized as a supported disk and cannot be used on this node.

Parameters

diskName (STRING): Name of the disk.

disk.init.err.zns

Severity

ERROR

Description

This message occurs when a zoned namespace solid-state drive (SSD-ZNS) is detected by a node that does not support this type of SSD.

Corrective Action

Remove the disk from the system.

Syslog Message

Disk "%s" cannot be used on a node that does not support SSD-ZNS disks.

Parameters

diskName (STRING): Name of the disk.

disk.init.error.capacity

Severity

ERROR

Description

This message occurs when a disk reports an unexpected capacity.

Corrective Action

Replace the disk.

Syslog Message

Disk %s has an unexpected capacity (%llu sectors) and cannot be used. Replace it.

Parameters

diskName (STRING): Name of the disk.
lastSector (LONGINT): Last sector of the disk.
productID (STRING): Product name of the disk.

disk.init.error.serialno

Severity

ERROR

Description

This message occurs when the inquiry command does not return a valid serial number or device ID for the device. The device is failed during initialization.

Corrective Action

Replace the disk.

Syslog Message

Serial number or device ID not available for %s.

Parameters

disk_name (STRING): Disk name.
page_code (INT): Page code that was sent.
error_pcode (INT): Page code received in error.

disk.init.failure.error

Severity

ERROR

Description

This message occurs when a drive fails initialization. For NVMe drives, the returned error information is translated into the SCSI equivalent.

Corrective Action

Replace the drive.

Syslog Message

Drive %s failed initialization due to error %d, sense code(%x %x %x %x).

Parameters

diskName (STRING): Name of the drive.
errorCode (INT): Internal E_SCSI return code.
sense_key (INTHEX): Sense key.
sense_code (INTHEX): Additional sense code.

qualifier (INTHEX): Additional sense code qualifier.
fru_failed (INTHEX): FRU code.

disk.init.failure.spinup

Severity

ERROR

Description

This message occurs when a disk cannot spin up during initialization. The disk is marked as failed and is not used.

Corrective Action

Removed the disk from the system.

Syslog Message

Disk %s has failed to spin up and cannot be used. Replace it with a new drive.

Parameters

diskName (STRING): Name of the disk.

disk.init.failureBytes

Severity

ERROR

Description

This message occurs when the system discovers a previously failed disk. The system will not use the disk and it should be replaced.

Corrective Action

Replace the failed disk.

Syslog Message

Failed disk %s detected during disk initialization.

Parameters

diskName (STRING): Name of the disk.

disk.init.invalidDDR

Severity

INFORMATIONAL

Description

This message occurs when a disk contains a Dynamic Drive Recognition (DDR) label entry that is not for this disk. The system rewrites the DDR label with proper values.

Corrective Action

(None).

Syslog Message

Disk %s has an invalid DDR entry. DDR label will be corrected and rewritten automatically.

Parameters

diskName (STRING): Name of the disk.
vendorID (STRING): Vendor name of the disk.
productID (STRING): Product name of the disk.

disk.init.prottype.incompat

Severity

ERROR

Description

This message occurs when a hard disk drive (HDD) has a protection type enabled that is not supported. Protection type is a disk option that determines how information is physically saved on the disk.

Corrective Action

Remove the disk from the system.

Syslog Message

Disk %s has protection type %x enabled and cannot be used. %s

Parameters

diskName (STRING): Name of the disk.
protType (INTHEX): Value indicating the version of the enabled protection type.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.init.recognizedDDR

Severity

INFORMATIONAL

Description

This message occurs when a Dynamic Drive Recognition (DDR) label on a drive with dynamically qualified data is properly updated with aliased data.

Corrective Action

(None).

Syslog Message

Disk %s has been updated with the proper drive name alias. The DDR label will be rewritten automatically.

Parameters

diskName (STRING): Name of the disk.
vendorID (STRING): Vendor name of the disk.
productID (STRING): Product name of the disk.

disk.init.unknownDisk

Severity

ERROR

Description

This message occurs when a unique identifier cannot be created for a disk due to internal disk problems.

Corrective Action

The disk needs to be replaced, remove it from the system.

Syslog Message

Unable to identify disk %s.

Parameters

diskName (STRING): Name of the disk.

disk.iomediumerror events

disk.ioMediumError

Severity

NOTICE

Description

This message occurs when the drive reports a medium error.

Corrective Action

(None).

Syslog Message

Medium error on disk %s: op %s sector %llu %s - %s %s (%x %x %x %x) (%d) %s

Parameters

diskName (STRING): Name of the disk.
op (STRING): I/O operation being performed.
sector (LONGINT): Sector where the error was detected.
senseInfo (STRING): Sense data.
sCode (STRING): Sector code.
disk_info (STRING): Static description of events on the disk.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.
CTime (INT): Time, in milliseconds, from when the command was first issued until this I/O operation completed.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.ioreassignfailed events

disk.ioReassignFailed

Severity

ALERT

Description

This message occurs when a disk reports a medium error and the sector reassignment fails. The system will fail the disk after possible recovery of retrieviable disk data.

Corrective Action

Replace the disk when the system indicates that you should remove it in subsequent logged events.

Syslog Message

disk %s: sector %llu failed to be reassigned (%d). %s

Parameters

diskName (STRING): Name of the disk.
sector (LONGINT): Sector where the error was detected.
ETime (INT): Time, in milliseconds, from when the command was first issued until this I/O operation failed.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.ioreassignsuccess events

disk.ioReassignSuccess

Severity

NOTICE

Description

This message occurs when a medium error is detected on a disk and the sector reassignment succeeds.

Corrective Action

(None).

Syslog Message

disk %s: sector %llu was reassigned (%d). %s

Parameters

diskName (STRING): Name of the disk.
sector (LONGINT): Sector where the error was detected.
CTime (INT): Time, in milliseconds, from when the command was first issued until this I/O operation completed.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.iorecoverederror events

disk.ioRecoveredError.pfa

Severity

ERROR

Description

This message occurs when a disk determines that it will fail shortly. This occurs when a threshold internal to the disk indicates that a failure is imminent.

Corrective Action

To avoid an uncontrolled failure, replace the disk as soon as possible. If the disk is a member of a RAID volume, the disk will be failed by RAID when this error occurs on a RAID I/O and the RAID group is not in degraded mode.

Syslog Message

Recovered error predictive failure alert on disk %s: op %s sector %llu %s - %s (%x %x %x %x)

Parameters

diskName (STRING): Name of the disk.
op (STRING): I/O operation being performed.
sector (LONGINT): Sector where the error was detected.
senseInfo (STRING): Sense data.
disk_info (STRING): Static description of events on the disk.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.ioRecoveredError.reassign

Severity

NOTICE

Description

This message occurs when a disk automatically reassigns a sector on a disk.

Corrective Action

(None).

Syslog Message

Recovered error on disk %s: op %s sector %llu %s - %s (%x %x %x %x) %s

Parameters

diskName (STRING): Name of the disk.
op (STRING): I/O operation being performed.
sector (LONGINT): Sector where the error was detected.
senseInfo (STRING): Sense data.

disk_info (STRING): Static description of events on the disk.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.ioRecoveredError.retry

Severity

INFORMATIONAL

Description

This message occurs when a recovered error is detected on a disk.

Corrective Action

(None).

Syslog Message

Recovered error on disk %s: op %s sector %llu %s - %s (%x %x %x %x) (%d) %s

Parameters

diskName (STRING): Name of the disk.
op (STRING): I/O operation being performed.
sector (LONGINT): Sector where the error was detected.
senseInfo (STRING): Sense data.
disk_info (STRING): Static description of events on the disk.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.
ETime (INT): Time, in milliseconds, from when the command was first issued until this I/O operation failed.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.lipstormdetect events

disk.lipStormDetect

Severity

NOTICE

Description

This message occurs when a Fibre Channel disk detects a large number of Loop Initialization Procedure requests (a LIP storm) and has reset itself.

Corrective Action

None required. If this happens a second time, the disk will be failed.

Syslog Message

shm: disk %s reports a LIP storm reset. %s. Error %x/%x/%x/%x.

Parameters

diskName (STRING): Name of the disk (host adapter, loop ID).
disk_info (STRING): Static description of events on the disk.
sense_key (INT): Actual sense key.
sense_code (INT): Actual sense code.
qualifier (INT): Actual sense code qualifier.
fru_failed (INT): Actual FRU code.

disk.lostwritedetected events

disk.lostwriteDetected

Severity

ERROR

Description

This message occurs when the system detects a lost write.

Corrective Action

(None).

Syslog Message

Disk level lost write detected on WRITE VERIFY: Disk %s, Block #%llu: Volume %s, FileId %d, Block #%llu: Expected 0x%x, Recomputed as 0x%x.

Parameters

diskName (STRING): Name of the device.
bno (LONGINT): Block ID.
vol (STRING): Volume name.
fileid (INT): File ID.
block (LONGINT): File block ID.
cksum (INTHEX): Expected checksum.
cksum2 (INTHEX): Computed checksum.

disk.lun events

disk.lun.allMemoryAvailable

Severity

NOTICE

Description

This message occurs to confirm that enough memory is present to successfully allocate command blocks for all of the disks in the system and for additional LUNS.

Corrective Action

(None).

Syslog Message

disk_init :Allocated all memory required for array LUNs.

Parameters

(None).

disk.lun.outOfMemory

Severity

NOTICE

Description

This message occurs when the system cannot allocate the additional memory for LUNs.

Corrective Action

(None).

Syslog Message

disk_init: Unable to allocate memory for array LUN commands on %s.

Parameters

diskName (STRING): Name of the device that could not allocate memory.

disk.lun.sizeTooLarge

Severity

ALERT

Description

This message occurs when an array LUN on an external RAID storage subsystem or a virtual disk is too large to be used as storage by the controller.

Corrective Action

Reduce this array LUN size, or re-create the virtual disk within the parameter limit.

Syslog Message

Array LUN or virtual disk %s is too large (%s bytes) and cannot be used. The maximum permissible array LUN or virtual disk size is %s. Reduce this array LUN size by %lld bytes, or re-create the virtual disk within the parameter limit (%lld %d byte blocks).

Parameters

diskName (STRING): Name of the array LUN or virtual disk that is too large.
lunSize (STRING): Size, expressed in bytes, of the array LUN or virtual disk that is too large.
maxSize (STRING): Maximum permissible array LUN or virtual disk size, expressed in bytes.
byteDiff (LONGINT): Difference, expressed in bytes, between the array LUN or virtual disk size and the maximum size Data ONTAP® supports.
blockDiff (LONGINT): Difference, expressed in blocks, between the array LUN or virtual disk size and the maximum size Data ONTAP supports.
blockSize (INT): Block size of the array LUN or virtual disk.

disk.lun.sizeTooSmall

Severity

ALERT

Description

This message occurs when an array LUN on an external RAID storage subsystem or a virtual disk is too small to be used as storage by the controller.

Corrective Action

Delete the array LUN or virtual disk and re-create it within the parameter limit.

Syslog Message

LUN or virtual disk %s is too small (%s bytes) and cannot be used. The minimum permissible LUN or virtual disk size is %s. Increase this LUN or virtual disk size by %lld bytes (%lld %d byte blocks).

Parameters

diskName (STRING): Name of the LUN or virtual disk that is too small.
lunSize (STRING): Size, in bytes, of the LUN or virtual disk that is too small.
minSize (STRING): Minimum permissible LUN or virtual disk size, expressed in bytes.
byteDiff (LONGINT): Difference, in bytes, between the LUN or virtual disk size and the minimum size Data ONTAP® supports.
blockDiff (LONGINT): Difference, in blocks, between the LUN or virtual disk size and the minimum size Data ONTAP supports.
blockSize (INT): Block size of the LUN or virtual disk.

disk.lun.unsupportedBlkSize

Severity

ALERT

Description

This message occurs when an array logical unit (LUN) on the external RAID storage subsystem reports an unsupported block size.

Corrective Action

Reformat the array LUN with a supported block size.

Syslog Message

disk_init: Array LUN %s reports a block size of %u bytes and it cannot be used. Reformat the array LUN with a supported block size.

Parameters

diskName (STRING): Name of the array LUN with the unsupported block size.
sector_size (INT): Unsupported block size.

disk.maint events

disk.maint.test.end

Severity

NOTICE

Description

This message occurs when maintenance testing has completed.

Corrective Action

(None).

Syslog Message

Disk %s Model [%s] S/N [%s] has completed maintenance testing with status %d (0x%x,0x%x,0x%x,0x%x).

Parameters

disk_name (STRING): Name of the disk.
productID (STRING): Product name of the disk.
serialno (STRING): Serial number of the disk.
status (INT): Maintenance test completion status where 0 represents successful completion of the test.
fa0 (INTHEX): Failure byte 0.
fa1 (INTHEX): Failure byte 1.
fa2 (INTHEX): Failure byte 2.
fa3 (INTHEX): Failure byte 3.

disk.maint.test.start

Severity

NOTICE

Description

This message occurs when maintenance testing begins on a disk.

Corrective Action

(None).

Syslog Message

Disk %s Model [%s] S/N [%s] has started maintenance testing.

Parameters

disk_name (STRING): Name of the disk.
productID (STRING): Product name of the disk.
serialno (STRING): Serial number of the disk.

disk.max events

disk.max.partitions

Severity

ERROR

Description

This message occurs when ONTAP® software cannot partition a disk because the system already has the maximum number of partitioned disks.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

Disk %s cannot be partitioned as the system already has %d partitioned disks.

Parameters

diskName (STRING): Name of the disk.
maxPartitionLimit (INT): Maximum number of disks which can be partitioned.

disk.min events

disk.min.OS.error

Severity

ERROR

Description

This message occurs when a disk is detected that is not supported in this version of Data ONTAP®.

Corrective Action

Remove the disk and replace it with a disk that is supported, or upgrade the kernel to the required version.

Syslog Message

%s is not supported because it requires a minimum kernel version of %s. Current version is %s.

Parameters

disk_information (STRING): Disk information.
min_OS_version (STRING): Disk's minimum supported Data ONTAP version.
cur_OS_version (STRING): Current version of the Data ONTAP.

disk.outofservice events

disk.outOfService

Severity

NOTICE

Description

This message occurs when a drive is removed from service because it has been marked failed, is being sanitized, or has entered Maintenance Center.

Corrective Action

(None).

Syslog Message

Drive %s (%s)%s. Power-On Hours: %s, GList Count: %d, Drive Info: %s.

Parameters

diskName (STRING): Name of the drive.
serialno (STRING): Serial number of the drive.
reason (STRING): Reason for removal from service.
powerOnHours (STRING): Time, in hours, that the drive was powered on when the failure occurred.
glistEntries (INT): Number of grown defect list entries.
disk_information (STRING): Formatted information about the drive. This includes the drive's vendor, model, firmware revision, and serial number.

disk.partdisknotsuppmcc events

disk.partDiskNotSuppMCC

Severity

NOTICE

Description

This message occurs when a partitioned disk is found in a MetroCluster™ configuration.

Corrective Action

Remove the partitioned disk, because it is not supported in a MetroCluster configuration.

Syslog Message

Ignoring disk %s because partitioned disks are not supported in a MetroCluster™ configuration.

Parameters

diskName (STRING): Name of the disk.

disk.partition events

disk.partition.exceeded

Severity

ERROR

Description

This message occurs when the disk partition layout contains more partitions than are supported by the system.

Corrective Action

Fix the unsupported disk partition layout by using the 'disk unpartition' command to make the disk a spare disk.

Syslog Message

Disk %s has %d partitions, which exceeds the maximum of %d partitions.

Parameters

disk_name (STRING): Name of the disk.
partition_count (INT): Number of partitions on the disk.
max_partition_count (INT): Maximum number of partitions supported per disk.

disk.partner events

disk.partner.encrRevertDone

Severity

NOTICE

Description

This message occurs when a node receives notice that a partner node has completed a disk encrypt revert operation.

Corrective Action

(None).

Syslog Message

The partner has completed reverting drive %s to its original state.

Parameters

diskName (STRING): Name of the device.

disk.partner.encrRevertStart

Severity

NOTICE

Description

This message occurs when a node receives notice that a partner node has started a disk encrypt revert operation.

Corrective Action

(None).

Syslog Message

The partner has started reverting drive %s to its original state.

Parameters

diskName (STRING): Name of the device.

disk.partner.sanitizeStart

Severity

INFORMATIONAL

Description

This message occurs when a message is received from the partner for a disk sanitize start.

Corrective Action

(None).

Syslog Message

The partner has started a disk sanitize on %s.

Parameters

diskName (STRING): Name of the disk.

disk.readreservationfailed events

disk.readReservationFailed

Severity

ERROR

Description

This message occurs when a SCSI (Small Computer System Interface) read reservation fails.

Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, open a support case to investigate the underlying cause.

Syslog Message

Disk read reservation failed on %s CDB %s - %s (%x %x %x)

Parameters

diskName (STRING): Name of the device.
cdb (STRING): CDB (Command Descriptor Block) containnig the I/O operation being performed.
sSenseKey (STRING): Sense key value.
iSenseKey (INTHEX): Actual sense key.
iASC (INTHEX): SCSI Additional Sense Code.
iASCQ (INTHEX): SCSI Additional Sense Code Qualifier.
sm (STRING): SCSI Persistent Reservation state machine.
state (INT): SCSI Persistent Reservation state machine step.
out_status_flags (INTHEX): Status flag contains bits describing which of the following status values are valid.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
target_status (INTHEX): Value returned by the target describing completion status of I/O request.
target_rsp_code (INTHEX): Target response code.

disk.releasefailed events

disk.releaseFailed

Severity

ERROR

Description

This message occurs when a SCSI release reservation fails.

Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, open a support case to investigate the underlying cause.

Syslog Message

Disk release failed on %s CDB %s - %s (%x %x %x)

Parameters

diskName (STRING): Name of the device.
cdb (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.
sSenseKey (STRING): Sense key value.
iSenseKey (INTHEX): Actual sense key.
iASC (INTHEX): SCSI Additional Sense Code.
iASCQ (INTHEX): SCSI Additional Sense Code Qualifier.
sm (STRING): SCSI Persistent Reservation state machine.
state (INT): SCSI Persistent Reservation state machine step.
out_status_flags (INTHEX): Status flag contains bits describing which of the following status values are valid.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
target_status (INTHEX): Value returned by the target describing completion status of I/O request.
target_rsp_code (INTHEX): Target response code.

disk.reservedelay events

disk.reserveDelay

Severity

NOTICE

Description

This message occurs when a SCSI reservation command has a longer latency than expected during takeover. This delay could cause a system outage in which case the disk should be removed to prevent further problems. .

Corrective Action

If you see this message before an outage on takeover, remove the specified disk.

Syslog Message

The disk reservation command sent to %s has taken longer than expected: %d msecs during takeover.

Parameters

diskName (STRING): Name of the device.
elapsed_time (INT): Number of milliseconds for the command to complete.

disk.reserveerror events

disk.reserveError

Severity

NOTICE

Description

This message occurs when a SCSI reservation is requested for a disk or LUN that is no longer seen.

Corrective Action

A disk or LUN might have been removed from the storage subsystem or the path to a disk or LUN has been lost. Verify that all paths to the disk or LUN are visible to the appliance using the storage show disk -p command.

Syslog Message

disk_reserve: %s was not found: CDB %s - %s (%x %x %x)

Parameters

diskName (STRING): Name of the device.
cdb (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.
sSenseKey (STRING): Sense key string.
iSenseKey (INTHEX): Sense key value.
iASC (INTHEX): SCSI Additional Sense Code.
iASCQ (INTHEX): SCSI Additional Sense Code Qualifier.
sm (STRING): SCSI Persistent Reservation state machine.
state (INT): SCSI Persistent Reservation state machine step.
out_status_flags (INTHEX): Status flag containing bits describing which of the following status values are valid.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
target_status (INTHEX): Value returned by the target describing completion status of I/O request.
target_rsp_code (INTHEX): Target response code.

disk.reservefailed events

disk.reserveFailed

Severity

ERROR

Description

This message occurs when a SCSI reservation fails.

Corrective Action

This is not a problem if seen occasionally. If this message is seen repeatedly, or is blocking access to a LUN for longer than 10 minutes, contact NetApp technical support to open a support case to investigate the underlying cause.

Syslog Message

Disk reservation failed on %s CDB %s - %s (%x %x %x)

Parameters

diskName (STRING): Name of the device.
cdb (STRING): CDB (Command Descriptor Block) containing the I/O operation being performed.

sSenseKey (STRING): Sense key string.
iSenseKey (INTHEX): Actual sense key.
iASC (INTHEX): SCSI Additional Sense Code.
iASCQ (INTHEX): SCSI Additional Sense Code Qualifier.
sm (STRING): SCSI Persistent Reservation state machine.
state (INT): SCSI Persistent Reservation state machine step.
out_status_flags (INTHEX): Status flag containing bits describing which of the following status values are valid.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
target_status (INTHEX): Value returned by the target describing completion status of I/O request.
target_rsp_code (INTHEX): This is the target response code

disk.rewritedatafailed events

disk.rewriteDataFailed

Severity

ALERT

Description

This message occurs when the system encounters an error and cannot rewrite data that was difficult to read on ATA drives.

Corrective Action

(None).

Syslog Message

Unable to rewrite %s on disk %s.

Parameters

command (STRING): SCSI command that reported a problem.
diskName (STRING): Name of the device.

disk.sanit events

disk.sanit.complete

Severity

INFORMATIONAL

Description

This message occurs when disk sanitization has been completed.

Corrective Action

(None).

Syslog Message

Disk %s [S/N %s] has completed sanitization.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.

disk.sanit.error

Severity

ERROR

Description

This message occurs when a disk returns an error during sanitization.

Corrective Action

Verify that the drive is capable of sanitization and check the knowledgebase of the support vendor website for the error codes.

Syslog Message

Disk %s has received an error %d (0%xh/0%xh/0%xh/0%xh) during sanitization.

Parameters

diskName (STRING): Name of the disk.
scsi_error (INT): SCSI error code.
sense_key (INT): Actual sense key.
sense_code (INT): Actual sense code.
qualifier (INT): Actual sense code qualifier.
fru_failed (INT): Actual FRU code.

disk.sanit.formatComplete

Severity

INFORMATIONAL

Description

This message occurs when the disk sanitization format phase is complete.

Corrective Action

(None).

Syslog Message

Disk sanitization format complete for disk %s [S/N %s], begin pattern writes.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.

disk.sanit.formatError

Severity

ERROR

Description

This message occurs when disk sanitization formatting fails.

Corrective Action

(None).

Syslog Message

Disk %s has received an error %d (0%xh/0%xh/0%xh) during the formatting of the drive. Format will be retried within fifteen minutes.

Parameters

diskName (STRING): Name of the device.
status (INT): Error code.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.

disk.sanit.formatFailed

Severity

ERROR

Description

This message occurs when disk sanitization reformatting has been retried unsuccessfully the maximum number of times.

Corrective Action

Disk sanitization reformatting attempts have been unsuccessful. To make the disk usable, it must be reformatted. You can do this in maintenance mode with the SCSI "format" command.

Syslog Message

Disk sanitization reformat has failed for disk %s.

Parameters

diskName (STRING): Name of the device.

disk.sanit.patternDone

Severity

INFORMATIONAL

Description

This message occurs when disk sanitization has completed a cycle of a pattern write.

Corrective Action

(None).

Syslog Message

Disk %s [S/N %s] cycle %d pattern write of 0x%02x completed in %02d:%02d:%02d.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.
cycle (INT): Sanitization cycle.
pattern (INT): Pattern byte.
hours (INT): Time in hours.
minutes (INT): Time in minutes.
seconds (INT): Time in seconds.

disk.sanit.randomPatternDone

Severity

INFORMATIONAL

Description

This message occurs when disk sanitization has completed a cycle of random data write.

Corrective Action

(None).

Syslog Message

Disk %s [S/N %s] cycle %d pattern write of random data completed in %02d:%02d:%02d.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.
cycle (INT): Sanitization cycle.
hours (INT): Time in hours.
minutes (INT): Time in minutes.
seconds (INT): Time in seconds.

disk.sanit.reformatComplete

Severity

INFORMATIONAL

Description

This message occurs when disk sanitization reformatting is complete.

Corrective Action

(None).

Syslog Message

Disk %s has been successfully reformatted. To sanitize disk, restart the disk sanitize command. To bypass format, use -s option.

Parameters

diskName (STRING): Name of the device.

disk.sanit.sanitComplete

Severity

INFORMATIONAL

Description

This message occurs when the SCSI sanitize command phase of a 'disk sanitize' command is complete, and the data pattern write phase begins.

Corrective Action

(None).

Syslog Message

Sanitization phase of the 'disk sanitize' command was completed for disk %s [S/N %s]. Pattern writes have begun.

Parameters

diskName (STRING): Name of the device.
serialno (STRING): Serial number of the device.

disk.selectiontimeout events

disk.selectionTimeout

Severity

ERROR

Description

This message occurs when a selection timeout is received.

Corrective Action

(None).

Syslog Message

Disk %s: selection timeout

Parameters

diskName (STRING): Name of the device.

disk.senseerror events

disk.senseError

Severity

ERROR

Description

This message occurs when the drive reports an error.

Corrective Action

Check the event log for related error messages and corrective actions.

Syslog Message

Disk %s: op %s sector %llu %s - %s (%x %x %x %x)

Parameters

diskName (STRING): Name of the disk.
op (STRING): I/O operation being performed.
sector (LONGINT): Sector where the error was detected.
senseInfo (STRING): Sense data.
sCode (STRING): Sector code.
sense_key (INTHEX): SCSI sense key.
sense_code (INTHEX): SCSI sense code.
qualifier (INTHEX): SCSI sense code qualifier.
fru_failed (INTHEX): SCSI FRU code.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

disk.senseinfonotvalid events

disk.senseInfoNotValid

Severity

ERROR

Description

This message occurs when invalid sense information is returned.

Corrective Action

(None).

Syslog Message

Disk %s: sense data information field is not valid.

Parameters

diskName (STRING): Name of the device.

disk.setarraylqd events

disk.setArrayLQD

Severity

INFORMATIONAL

Description

This message occurs when you set the LUN queue depth for all the LUNs of an array.

Corrective Action

(None).

All the LUNs on array '%s' have a LUN queue depth value set to %d.

Parameters

arrayName (STRING): Name of the array.
lqd (INT): LUN queue depth value.

disk.sizegrew events

disk.sizeGrew

Severity

NOTICE

Description

This message occurs when the controller detects an increase in the capacity of a virtual disk.

Corrective Action

(None).

Syslog Message

Size of virtual disk %s has been changed from %s to %s, an increase of %lld bytes (%lld %d-byte blocks).

Parameters

diskName (STRING): Name of the virtual disk that has an increased capacity.
Size (STRING): Original size of the virtual disk in bytes.
NewSize (STRING): Current size of the virtual disk in bytes.
byteDiff (LONGINT): Difference in bytes between the original size and the current size of the virtual disk.
blockDiff (LONGINT): Difference in blocks between the original size and the current size of the virtual disk.
blockSize (INT): Block size in bytes of the virtual disk.

disk.sizeshrank events

disk.sizeShrank

Severity

NOTICE

Description

This message occurs when the controller detects a decrease in the capacity of a virtual disk.

Corrective Action

(None).

Syslog Message

Size of virtual disk %s has changed from %s to %s, a decrease of %lld bytes (%lld %d-byte blocks).

Parameters

diskName (STRING): Name of the virtual disk that has a decreased capacity.
Size (STRING): Orignal size of the virtual disk in bytes.

NewSize (STRING): Current size of the virtual disk in bytes.
byteDiff (LONGINT): Difference in bytes between the original size and the current size of the virtual disk.
blockDiff (LONGINT): Difference in blocks between the original size and the current size of the virtual disk.
blockSize (INT): Block size in bytes of the virtual disk.

disk.spindleerror events

disk.spindleError.detect

Severity

ERROR

Description

This message occurs when a disk returns a spindle detect error. The disk will be recommended for failure.

Corrective Action

Disk firmware has detected spindle motor problems. The disk will be recommended for failure. If the disk is a member of a RAID volume,it will be failed by RAID when this error occurs on a RAID I/O and the raid group is not in degraded mode.

Syslog Message

Disk %s has reported a spindle detect error: (%x %x %x %x)

Parameters

diskName (STRING): Name of the disk.
sense_key (INTHEX): Actual sense key
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.

disk.spindleError.notice

Severity

INFORMATIONAL

Description

This message occurs when a disk returns a spindle detect error.

Corrective Action

Disk firmware has detected spindle motor problems. The option to recommend the drive for failure is not set, so the disk will not be automatically recommended for failure.

Syslog Message

(None).

Parameters

diskName (STRING): Name of the disk.
sense_key (INT): Actual sense key.
sense_code (INT): Actual sense code.
qualifier (INT): Actual sense code qualifier.
fru_failed (INT): Actual FRU code.

disk.stalledtoolong events

disk.stalledTooLong

Severity

ERROR

Description

This message occurs when a disk has been stalled too long.

Corrective Action

(None).

Syslog Message

I/O for disk %s has been suspended %d times for %d seconds.

Parameters

diskName (STRING): Name of the device.
count (INT): Count of times suspended.
error (INT): Time suspended.

disk.timeout events

disk.timeout.flush.end

Severity

NOTICE

Description

This message occurs when the disk driver stops flushing aggressive timeout I/Os.

Corrective Action

(None).

Syslog Message

Aggressive timeout flush ended on disk %s S/N %s.

Parameters

disk_name (STRING): Name of the disk.
serial_num (STRING): Serial number of the disk.

disk.timeout.flush.start

Severity

NOTICE

Description

This message occurs when an I/O operation is taking longer than expected and aggressive timeout I/Os are
flushed from the disk driver.

Corrective Action

(None).

Syslog Message

Aggressive timeout flush started on disk %s S/N %s. Details: %s.

Parameters

disk_name (STRING): Name of the disk.
serial_num (STRING): Serial number of the disk.
details (STRING): Additional information.

disk.toomanynvmespindles events

disk.tooManyNvmeSpindles

Severity

ALERT

Description

This message occurs when Data ONTAP® finds more NVMe disks present on a platform than the platform actually supports. Additional disks above the support number are ignored. Correct this issue before rebooting the system.

Corrective Action

Too many NVMe disks have been installed. Reconfigure the system to the maximum number of NVMe disks supported.

Syslog Message

Reached the maximum number of NVMe disks that are supported on this system of %d NVMe disks. All additional NVMe disks will be ignored. This problem must be resolved before the system is rebooted.

Parameters

maxSpindle (INT): Maximum number of NVMe disks supported on this platform.

disk.toomanypartitioneddisks events

disk.tooManyPartitionedDisks

Severity

ALERT

Description

This message occurs when Data ONTAP® finds more partitioned disks present on a platform than the platform supports. The system ignores any partitioned disks above the limit, and they will be unusable.

Corrective Action

Too many partitioned disks have been installed. Reconfigure the system to the maximum number of partitioned disks supported.

Syslog Message

Ignoring partitioned disk %s because the maximum limit of %d partitioned disks supported on this system has been reached.

Parameters

diskName (STRING): Name of the disk.
maxPartitionedDisks (INT): Maximum number of partitioned disks supported on this platform.

disk.toomanyreassignments events

disk.tooManyReassignments

Severity

NOTICE

Description

This message occurs when a reassignment fails due to table overflow.

Corrective Action

(None).

Syslog Message

Disk %s: sector %llu was NOT reassigned, too many reassignments.

Parameters

diskName (STRING): Name of the device.
error (LONGINT): Bad sector.

disk.toomanyspindles events

disk.tooManySpindles

Severity

ALERT

Description

This message occurs when Data ONTAP® finds more disks present on a platform than the platform actually supports. Additional disks above the support number are ignored. Correct this issue before rebooting the system.

Corrective Action

Too many disks have been installed. Reconfigure the system to the maximum number of disks supported.

Syslog Message

Found %d disks, but maximum of %d disks are supported on this system. All additional disks will be ignored. This problem must be resolved before the system is rebooted.

Parameters

actualSpindle (INT): Actual number of disks configured.
maxSpindle (INT): Maximum number of disks supported on this platform.

disk.uid events

disk.uid.changed

Severity

NOTICE

Description

This message occurs when a SCSI (Small Computer System Interface) INQUIRY command done during a disk drive initialization sequence finds different data in the INQUIRY response for page 0x83. The unique id (UID) derived from this information has changed unexpectedly.

Corrective Action

Locate the failed disk drive by looking for a disk drive whose amber LED fault light is lit. Replace the disk drive.

Syslog Message

Disk %s has unexpectedly changed its unique ID. vendor:%s product:%s serial_number:%s

Parameters

diskName (STRING): Name of the disk that had the UID change.
disk_vendor_id (STRING): Vendor name of the disk that had the UID change.
disk_product_id (STRING): Product name of the disk that had the UID change.
disk_serialno (STRING): Serial number of the disk that had the UID change.

disk.unabletorewritedata events

disk.unableToRewriteData

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP® receives too many errors reading from a particular location on an ATA disk drive, but its attempt to rewrite the data to the disk drive fails.

Corrective Action

(None).

Syslog Message

Difficulty reading disk drive %s with the command %s; could not rewrite the data.

Parameters

diskName (STRING): Name of the disk drive with the problem.
command (STRING): SCSI command that reported a problem.

disk.vendorspecificcode events

disk.vendorSpecificCode

Severity

ERROR

Description

This message occurs when a disk returns a vendor-specific error.

Corrective Action

Replace the disk.

Syslog Message

Drive %s has failed with a vendor specific error: class 0x%x segment 0x%x sense_key 0x%x info 0x%x 0x%x 0x%x 0x%x length 0x%x resv_1 0x%x sense_code %d sense_code_qualifier %d fru_failed 0x%x flags 0x%x field_pointer 0x%x.

Parameters

diskName (STRING): Name of the disk.
class (INTHEX): Sense class.
segment (INTHEX): Segment.
sense_key (INTHEX): Actual sense key.
info0 (INTHEX): Vendor-specific information[0].
info1 (INTHEX): Vendor-specific information[1].
info2 (INTHEX): Vendor-specific information[2]
info3 (INTHEX): Vendor-specific information[3].
len (INTHEX): Length.
resv (INTHEX): Resv field.
sense_code (INT): Actual sense code.
qualifier (INT): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.
flags (INTHEX): Flags of the error.
field_ptr (INTHEX): Sense field pointer.

disk.writeverifyerror events

disk.writeVerifyError

Severity

ERROR

Description

This message occurs when a write verify error occurs.

Corrective Action

(None).

Syslog Message

WRITE VERIFY on disk %s received an unexpected status %d.

Parameters

diskName (STRING): Name of the device.

error (INT): Returned error code

diskown events

diskown.aashelf events

diskown.AAShelf.InterPools

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign a disk because disks on the shelf and disks on the loop have the same owner but belong to different pools.

Corrective Action

1) Find all of the disks belonging to the same shelf, loop and owners as disk %s (S/N %s) by using the "storage disk show" command with the "-fields shelf, owner, dr-home, pool" option. 2) Assign all of the disks with the same owners on this shelf and other shelves to the same pool. Alternatively, manually assign all unowned disks belonging to this shelf.

Syslog Message

The controller could not automatically assign disk %s (S/N %s) and any other unassigned disks in the same shelf because the disks are shared across multiple pools within the same loop.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.AAShelf.MoreShelf

Severity

ERROR

Description

This message occurs when more than the supported number of shelves are connected to a storage stack.

Corrective Action

1) Check which adapter has more than the supported number of shelves attached by using the "run local storage show shelf" command. 2) Reconfigure the shelves so that the adapter is not connected to more than the supported number of shelves.

Syslog Message

(None).

Parameters

(None).

diskown.AAShelf.MultiOwners

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign disks because the disks on the shelf are owned by multiple systems.

Corrective Action

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Either assign all of the disks on this shelf to a single system, or assign all unowned disks belonging to this shelf.

Syslog Message

The controller could not automatically assign disk %s (S/N %s) because disks on the shelf are owned by multiple systems. Because of this problem, the controller also could not assign any unowned disks on this shelf.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.AAShelf.MultiPools

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign a disk because the disks on the shelf are shared across multiple pools.

Corrective Action

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of pools by using the "run local disk show -v" command. 3) Either assign all of the disks on this shelf to a single pool, or assign all unowned disks belonging to this shelf.

Syslog Message

The controller could not automatically assign disk %s (S/N %s) and any other unassigned disks in the same shelf because the disks are shared across multiple pools.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.AAShelf.NoMemory

Severity

ALERT

Description

This message occurs when the node cannot allocate memory for shelf-level automatic assignment.

Corrective Action

Initiate the automatic disk assign by running the "storage disk assign -auto true -node node-name" CLI command. If the out-of-memory condition persists, perform a manual disk assign.

Syslog Message

Memory not allocated for shelf-level automatic assignment.

Parameters

(None).

diskown.AAShelf.NoOwner

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign a disk because none of the disks on the shelf are owned by any system.

Corrective Action

1) Find all of the disks belonging to the same shelf as disk %s (S/N %s) by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Either assign all of unowned disks in this shelf or assign one of the disks on this shelf by using the "storage disk assign" command.

Syslog Message

The controller could not automatically assign disk %s (S/N %s) (and other unassigned disks in the same shelf, if any) because no disks on the shelf are owned by any system.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.assign events

diskown.assign.splitOwner

Severity

INFORMATIONAL

Description

This message occurs when the "storage disk assign" command fail to assign a disk to a different owner from the other disks within the carrier. This is because the "storage disk assign" command with the -f option must be used in such cases.

Corrective Action

Use the "storage disk assign" command with the -f option to assign the disk to a different owner from the other disks within the carrier.

Assigning ownership failed for disk %s. Use the "storage disk assign" command with the -f option to assign the disk to a different owner from the other disks within the carrier.

Parameters

diskname (STRING): Name of the disk.

diskown.assignexceeded events

diskown.AssignExceeded

Severity

ERROR

Description

This message occurs when an attempt is made to assign more disks than are supported by this node.

Corrective Action

Review the system capacity limits and the assigned disks on this system.

Syslog Message

The maximum number of disks that can be assigned to this node has been exceeded. Attempted to assign %d, maximum supported: %d.

Parameters

attempted (INT): Number of disks attempted to assign.
supported (INT): Number of disks supported.

diskown.autoassign events

diskown.AutoAssign.MultipleOwners

Severity

ERROR

Description

This message occurs when automatic assigning of a disk fails because the disks on the loop are owned by multiple systems.

Corrective Action

Use the "storage disk show" command to view the list of systems, and then assign all of the disks on this loop to a single system. Or use the "storage disk assign" command to manually assign this disk.

Syslog Message

Automatic assigning failed for disk %s (S/N %s) because the disks on the loop are owned by multiple systems. Automatic assigning failed for all unowned disks on this loop.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.AutoAssign.MultiplePools

Severity

ERROR

Description

This message occurs when automatic assigning of a disk fails because the disks on the loop are shared across multiple pools.

Corrective Action

Use the "storage disk assign -pool" command to assign all of the disks on this loop to a single pool. Or use the "storage disk assign" command to manually assign this disk.

Syslog Message

Automatic assigning failed for disk %s (S/N %s) because the disks on the loop are shared across multiple pools. Automatic assigning failed for all unowned disks on this loop.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.AutoAssign.NoOwner

Severity

ERROR

Description

This message occurs when automatic assigning of a disk fails because none of the disks on the loop are owned by any system.

Corrective Action

Use the "run local disk show -v" command to get the list of systems and unowned disks. Manually assign one of the disks on this loop by using the "storage disk assign" command.

Syslog Message

Automatic assigning failed for disk %s (S/N %s) because none of the disks on the loop are owned by any system. Automatic assigning failed for all unowned disks on this loop.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.

diskown.autoassignproblem events

diskown.AutoAssignProblem

Severity

ERROR

Description

This message occurs when Data ONTAP® attempts to assign a disk automatically, but the request fails. The failure could be due to a disk error or a user simultaneously assigning the disk to a storage system.

Corrective Action

Use the "disk show -v" nodeshell command to determine the status of the disk. Use the "storage disk assign" command to assign the disk.

Syslog Message

Automatic assigning failed for disk %s (S/N %s). Reason: %s

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.
reason (STRING): Reason for the failure.

diskown.bayctrlr events

diskown.bayctrlr

Severity

NOTICE

Description

This message occurs if the controller address is determined when the bay policy override option has been set. The controller address "A/B" is used to automatically assign the disks in odd/even bays.

Corrective Action

(None).

Syslog Message

Determined controller address %s based on shelf ID %d and slot number %d.

Parameters

ctrlr (STRING): Controller address.
shelfId (INT): ID of the shelf chosen to determine the controller address.
slot (INT): Slot number of the shelf chosen to determine the controller address.

diskown.bayctrlr.unknown

Severity

NOTICE

Description

This message occurs when disks in a shelf are not assigned to the current node.

Corrective Action

(None).

Cannot make determination of controller address.

Parameters

(None).

diskown.changingowner events

diskown.changingOwner

Severity

NOTICE

Description

This message occurs when the ownership of a disk is being changed.

Corrective Action

(None).

Syslog Message

The ownership of disk %s (S/N %s) is being changed from node "%s" (ID: %u, home ID: %u, DR home ID: %u) to node "%s" (ID: %u, home ID: %u, DR home ID: %u).

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.
oldownername (STRING): Name of the former owner node.
oldownerid (LONGINT): System ID of the former owner node.
oldhomeownerid (LONGINT): System ID of the former home node.
olddrhomeownerid (LONGINT): System ID of the former disaster recovery home node.
newownername (STRING): Name of the new owner node.
newownerid (LONGINT): System ID of the new owner node.
newhomeownerid (LONGINT): System ID of the new home node.
newdrhomeownerid (LONGINT): System ID of the new disaster recovery home node.
thread (STRING): Name of the thread that issued the ownership change request.
APIname (STRING): Name of the API that issued the ownership change request.

diskown.cleaningownership events

diskown.cleaningOwnership

Severity

INFORMATIONAL

Description

This message occurs when a "storage disk assign -f" command is run for an SES drive and the system discovers that the newly assigned owner already owns an SES drive on the same loop and shelf as the supplied drive. The assign is completed because it is a forced assign, but the error message is generated as an alert.

Corrective Action

(None).

Syslog Message

Disk %s (S/N %s) contains software-based disk ownership information that indicates it was previously in use by system ID %u. The ownership information is being cleared.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.
ownerid (INT): System ID of the system that owned the disk.

diskown.completion events

diskown.completion.timer.reEnabled

Severity

INFORMATIONAL

Description

This message occurs when the COMPLETION events from sanown layer remain after an aggregate is migrated form a source to a destination. Typically the events are enabled automatically, and if that doesn't happen with in a certain amount of time, the system reenables the COMPLETION events and logs this message.

Corrective Action

(None).

Syslog Message

Sanown completion event timer reenabled after a giveback.

Parameters

(None).

diskown.delayed events

diskown.delayed.completionEvent

Severity

INFORMATIONAL

Description

This message occurs when the software disk ownership module completes the process of updating its view of the disks attached to the system but delays notifying other layers of the completion of this process. Typically, this happens when an SFO aggregate giveback is in progress on the HA partner.

Corrective Action

(None).

Software disk ownership module temporarily delayed notification that it has completed updating its view of the disks.

Parameters

(None).

diskown.disk events

diskown.disk.already.deleted

Severity

ERROR

Description

This message occurs during an attempt to assign a disk that is being deleted. This can happen if the disk is deleted at the storage layer while disk assignment is in progress.

Corrective Action

Run the "run local disk show -v" command to see the list of available disks, and then retry the operation using one of the listed disks.

Syslog Message

Assign request failed for disk %s because it is being deleted.

Parameters

disk_name (STRING): Name of the disk that is being deleted.

diskown.diskhaswronginfo events

diskown.diskHasWrongInfo

Severity

ERROR

Description

This message occurs when the disk ownership information on a disk does not belong to the disk that it was read from. This could be a result of a read going to the wrong disk or a prior write intended for some other disk getting written to the disk.

Corrective Action

On the controller that owns the disk, use the "storage disk assign" command to rewrite the ownership information to the disk.

Syslog Message

Disk %s (S/N %s) has ownership information for disk %s (S/N %s) on it.

Parameters

diskname (STRING): Name of the disk from which the ownership information was read.
serialno (STRING): Serial number of the disk from which the ownership information was read.

infoForDiskname (STRING): Name of the disk that the ownership information is for.
infoForSerialno (STRING): Serial number of the disk that the ownership information is for.

diskown.disknotsup events

diskown.diskNotSup

Severity

INFORMATIONAL

Description

This message occurs when newly inserted disks are only supported with software disk ownership enabled, but it is not enabled.

Corrective Action

Halt the system by using the "halt" command, and then turn on software disk ownership by using the "storage disk assign" command. After you assign the disks, the system can recognize them.

Syslog Message

Newly added disk %s (and others) is only supported with software disk ownership enabled.

Parameters

disk (STRING): Name of the disk.

diskown.diskwasstolen events

diskown.diskWasStolen

Severity

NOTICE

Description

This event is issued when the ownership of a disk owned by the system is changed such that the disk is no longer owned by the system.

Corrective Action

(None).

Syslog Message

Disk %s (S/N %s) has had its ownership changed so that it is no longer owned by this system. This can lead to a system panic if the disk is a filesytem disk.

Parameters

diskname (STRING): The name of the disk
serialno (STRING): The serial number of the disk

diskown.drawer events

diskown.drawer.assignStatus

Severity

NOTICE

Description

This message occurs when drawer-based drive assignment for shelves with drawers is enabled or disabled.

Corrective Action

(None).

Syslog Message

Drawer-based automatic drive assignment for shelf "%d" is "%s".

Parameters

shelf_id (INT): Shelf identifier.
state (STRING): Drawer-based automatic drive assignment state..

diskown.drawer.invalidShlf

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign disks because the shelf is either offline, or temporarily unavailable, and therefore cannot be queried for the information that is required to properly assign the disks to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic disk assignment fails for the disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

Corrective Action

Use the "storage shelf show" command to verify that the specified shelf is online and to verify connectivity from the controller to all of the paths to the shelf. If multiple shelves in a cluster have the same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

Syslog Message

The system cannot automatically assign disks for shelf "%d" because the shelf is in an invalid state.

Parameters

shelf_id (INT): Shelf identifier.

diskown.drawer.MultiOwners

Severity

ERROR

Description

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple systems in a conflicting manner.

Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show" command. 2) View the list of systems by using the "disk show -v" command. 3) Ensure that disks assigned on lower half bays of each drawer are owned by a single owner, and ensure that disks assigned on higher half bays of each drawer are owned by a different single owner. Disks assigned on lower half bays of each drawer must have a different owner than disks assigned on higher half bays.

Syslog Message

The system cannot automatically assign disks because the disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

Parameters

shelf_id (INT): Shelf identifier.

diskown.duplicatesoftentries events

diskown.duplicateSoftEntries

Severity

NOTICE

Description

This event is issued when we find duplicate entries in the sanown filer table.

Corrective Action

(None).

Syslog Message

%s

Parameters

ems_txt (STRING): The warning message

diskown.errorduringio events

diskown.errorDuringIO

Severity

ERROR

Description

This event is issued when an I/O error occurs during a sanown disk operation.

Corrective Action

(None).

Syslog Message

error %d (%s) on disk %s (S/N %s) while %s

Parameters

> **errorno** (INT): The error number that occurred
> **errortext** (STRING): The error description as text
> **diskname** (STRING): The name of the disk
> **serialno** (STRING): The serial number of the disk
> **details** (STRING): The operation that was going on

diskown.errorreadingownership events

diskown.errorReadingOwnership

Severity

> NOTICE

Description

> This event is issued when we get an error while reading all the DOWNs at once. The recovery is to read them individually.

Corrective Action

> (None).

Syslog Message

> error %d (%s) while reading ownership on disk %s (S/N %s)

Parameters

> **errorno** (INT): The error that occurred
> **errortext** (STRING): The error description as text
> **diskname** (STRING): The name of the disk
> **serialno** (STRING): The serial number of the disk

diskown.generated events

diskown.generated.completionEvent

Severity

> INFORMATIONAL

Description

> This message occurs when the software disk ownership module notifies other layers that it has completed the process of updating its view of the disks attached to the system. These notifications were previously disabled for a short time.

Corrective Action

> (None).

Syslog Message

> Software disk ownership module notified other layers that it has completed updating its view of the disks.

Parameters

(None).

diskown.hlfshlf events

diskown.hlfShlf.assignStatus

Severity

NOTICE

Description

This message occurs when half-shelf based drive assignment is enabled or disabled.

Corrective Action

(None).

Syslog Message

Half-shelf based automatic drive assignment for shelf "%d" is "%s".

Parameters

shelf_id (INT): Shelf identifier.
state (STRING): Half-shelf based automatic drive assignment state.

diskown.hlfShlf.invalidShlf

Severity

NOTICE

Description

This message occurs when the controller cannot automatically assign disks to a shelf using half shelf-based disk assignment, either because the shelf is offline, or is temporarily unavailable and therefore cannot be queried for the information required to properly divide the disks for assignment to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic half shelf-based disk assignment is bypassed for disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

Corrective Action

Use the "storage shelf show" command to ensure that the specified shelf is online and to ensure connectivity from the controller to all paths to the shelf. If there are multiple shelves in a cluster with the same same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

Syslog Message

Half shelf based disk assignment will be skipped for shelf "%d" because the shelf is in invalid state.

Parameters

shelf_id (INT): Shelf identifier.

diskown.hlfShlf.MultiOwners

Severity

NOTICE

Description

This message occurs when the controller cannot automatically assign disks using half shelf based disk assignment because disks in a shelf are assigned to multiple systems in a conflicting manner.

Corrective Action

1) Find all of the disks belonging to the shelf specified by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Ensure that disks assigned on lower half bays of the shelf are owned by a single owner. Similarly, ensure that disks assigned on higher half bays of that shelf are owned by a single owner. Ensure that disks assigned on lower half bays have a different owner than disks assigned on higher half bays.

Syslog Message

The controller cannot automatically assign disks using half shelf based disk assignment because disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

Parameters

shelf_id (INT): Shelf identifier.

diskown.ilv events

diskown.ilv.hShlf.invShlf

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign drives to a shelf using interleaved-half-shelf-based drive assignment, either because the shelf is offline, or is temporarily unavailable and therefore cannot be queried for the information required to properly divide the drives for assignment to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic interleaved-half-shelf-based drive assignment is bypassed for drives in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

Corrective Action

Use the "storage shelf show" command to ensure that the specified shelf is online and to ensure connectivity from the controller to all paths to the shelf. Ensure that each shelf within the cluster has a unique shelfID.

Syslog Message

Interleaved-half-shelf-based drive assignment will be skipped for shelf "%d" because the shelf is in invalid state.

Parameters

shelf_id (INT): Shelf identifier.

diskown.ilv.hShlf.mOwners

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign drives using interleaved-half-shelf based drive assignment because drives in a shelf are assigned to multiple systems in a conflicting manner.

Corrective Action

1) Find all of the drives belonging to the shelf specified by using the "storage disk show" command. 2) View the list of systems by using the "run local disk show -v" command. 3) Ensure that drives assigned on first and third quarter bays of the shelf are owned by a single owner. Similarly, ensure that drives assigned on second and fourth quarter bays of that shelf are owned by a single owner. Ensure that drives assigned on first and third quarter bays have a different owner than drives assigned on second and fourth quarter bays.

Syslog Message

The controller cannot automatically assign drives using interleaved-half-shelf based drive assignment because drives in shelf "%d" are assigned to multiple systems in a conflicting manner.

Parameters

shelf_id (INT): Shelf identifier.

diskown.ilv.hShlf.status

Severity

NOTICE

Description

This message occurs when interleaved-half-shelf based drive assignment is either enabled or disabled.

Corrective Action

(None).

Syslog Message

Interleaved-half-shelf based automatic drive assignment for shelf %d is "%s".

Parameters

shelf_id (INT): Shelf identifier.
state (STRING): Interleaved-half-shelf based automatic drive assignment state.

diskown.incorrectownername events

diskown.IncorrectOwnerName

Severity

INFORMATIONAL

Description

This event is issued when we find a system finds a disk that it owns, but which has a different owner name than the system name.

Corrective Action

(None).

Syslog Message

Disk %s has incorrect owner name information (%s). It will be changed to match the system name (%s).

Parameters

diskname (STRING): The name of the disk for which this was observed
wrong_ownername (STRING): The owner name, which is incorrect, that the disk currently has
system_name (STRING): The system name that should be the owner name for the disk

diskown.isbeingenabled events

diskown.isBeingEnabled

Severity

INFORMATIONAL

Description

This event is issued when the system is being converted from non-software based disk ownership to software based disk ownership

Corrective Action

(None).

Syslog Message

System is being changed to use software based disk ownership

Parameters

(None).

diskown.isenabled events

diskown.isEnabled

Severity

INFORMATIONAL

Description

This event is issued when enable sanown.

Corrective Action

(None).

Syslog Message

software ownership has been enabled for this system

Parameters

(None).

diskown.mcc events

diskown.mcc.AssignExceeded

Severity

ERROR

Description

This message occurs when the number of drives assigned in the MetroCluster(tm) configuration exceeds the supported limit.

Corrective Action

Review the system capacity limits and the assigned drives on this system. If possible, unassign the unused array LUNs. If you need further assistance, contact NetApp technical support.

Syslog Message

The maximum number of drives that can be assigned in the configuration has exceeded. Total physical drive count: %d, maximum supported: %d.

Parameters

total_disk_count (INT): Total number of drives assigned in the configuration.
supported (INT): Number of drives supported.

diskown.mccip events

diskown.mccip.assignStatus

Severity

NOTICE

Description

This message occurs when MetroCluster(tm) quarter-shelf based drive assignment is enabled or disabled. It is enabled when the system is a member of an AFF HA pair in a 4-node MetroCluster IP configuration.

Corrective Action

(None).

Syslog Message

MetroCluster quarter-shelf based automatic drive assignment for shelf "%d" is "%s".

Parameters

shelf_id (INT): Shelf identifier.
state (STRING): MetroCluster quarter-shelf based automatic drive assignment state.

diskown.mccip.invalidShlf

Severity

ERROR

Description

This message occurs when the controller cannot automatically assign disks because the shelf is either offline, or temporarily unavailable and therefore cannot be queried for the information that is required to properly assign the disks to the controller. This can also occur when multiple shelves in a cluster have the same shelf ID. Automatic disk assignment fails for the disks in this shelf until the shelf is back online or any shelf ID conflicts within a cluster are resolved.

Corrective Action

Use the "storage shelf show" command to verify that the specified shelf is online and to verify connectivity from the controller to all of the paths to the shelf. If multiple shelves in a cluster have the same shelf ID, resolve that and ensure that shelves in that cluster have different shelf IDs.

Syslog Message

The system cannot automatically assign disks for shelf "%d" because the shelf is in an invalid state.

Parameters

shelf_id (INT): Shelf identifier.

diskown.mccip.MultiOwners

Severity

ERROR

Description

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple systems in a conflicting manner.

Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show" command. 2) View the list of systems by using the "disk show -v" command. 3) Ensure that the disks on each shelf are assigned such that lower half bays are assigned to the local high-availability (HA) pair and the higher half bays are assigned to the remote HA pair. Additionally within each half shelf, ensure that the disks are assigned equally to the HA pair such that the lower quarter bays are assigned to one node and the higher quarter bays are assigned to the node's HA partner.

Syslog Message

The system cannot automatically assign disks because the disks in shelf "%d" are assigned to multiple systems in a conflicting manner.

Parameters

shelf_id (INT): Shelf identifier.

diskown.ownerchangefailed events

diskown.ownerChangeFailed

Severity

ERROR

Description

This message occurs when a disk ownership change request fails.

Corrective Action

Verify that there are no disk connectivity issues, that disks are not in a failed state, and that the procedures for executing the "storage disk assign" command are being followed.

Syslog Message

Disk ownership change request failed on disk %s (S/N %s). Reason: %s.

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.
status (STRING): Description of the error in the ownership change request.
thread (STRING): Name of the thread that issued the ownership change request.
APIname (STRING): Name of the API that issued the ownership change request.

diskown.ownernameupdatefailed events

diskown.OwnerNameUpdateFailed

Severity

NOTICE

Description

This event is issued when we have to rewrite a DOWN because it is out of date wrt the other DOWNs.

Corrective Action

(None).

Syslog Message

owner name update failed for disk %s (S/N %s)

Parameters

diskname (STRING): The name of the disk
serialno (STRING): The serial number of the disk

diskown.ownerreservationmismatch events

diskown.ownerReservationMismatch

Severity

ERROR

Description

This message occurs when the system discovers a disk that is supposed to be owned by one node, but the persistent reservation is owned by another node.

Corrective Action

1) Find the disk causing the conflict from EMS messages. 2) If the disk is in the spare pool, go to step 5. 3) Run the "storage aggr status -r" command to find the aggregate containing the disk. 4) If the aggregate is online, bring it offline by using the "storage aggr modify -aggr aggr_name -state offline" command. 5) Run the "storage disk show -fields owner-id,reserver-id" command to identify the reservation owner of the disk. 6) Run the "storage disk assign disk_name -s partner_sys_id -f" command to perform the disk assignment change from the node that owns the reservation for the disk.

Syslog Message

disk %s (S/N %s) is supposed to be owned by this node but has a persistent reservation placed by node %s (ID %u).

Parameters

diskname (STRING): Name of the disk.
serialno (STRING): Serial number of the disk.
resvownername (STRING): Name of the system owning the reservation.
resvowner (INT): System ID of the node owning the reservation.

diskown.raid events

diskown.RAID.Ownershipchange

Severity

ERROR

Description

This message occurs when a disk assign or disk remove ownership request is rejected at the RAID layer.

Corrective Action

Review the error message and verify that the request was not for a file system disk.

Syslog Message

%s

Parameters

err_msg (STRING): Reason the request failed.

diskown.reassignfailed events

diskown.ReassignFailed

Severity

ERROR

Description

This message occurs when a disk reassign request fails.

Corrective Action

Verify that there are no disk connectivity issues and that the procedures for executing the 'storage disk reassign' command are being followed.

Syslog Message

Disk reassign request failed. Reason: %s.

Parameters

reason (STRING): Reason for failure.

diskown.releasingmismatchedreservation events

diskown.releasingMismatchedReservation

Severity

NOTICE

Description

This event is issued when we release the reservation because the DOWN says the disk is owned by someone else.

Corrective Action

(None).

Syslog Message

%s is releasing reservation on disk %s (S/N %s) as it is owned by %s (ID %u)

Parameters

originator (STRING): The internal component of diskown issuing the event
diskname (STRING): The name of the disk
serialno (STRING): The serial number of the disk
filername (STRING): The name of the filer that owns the disk
systemid (INT): The system id of the filer that owns the disk

diskown.replayingownership events

diskown.replayingOwnership

Severity

INFORMATIONAL

Description

This event occurs during a boot or takeover when a disk ownership request is replayed from NVRAM.

Corrective Action

(None).

Syslog Message

Replaying ownership request for %d disks

Parameters

diskcount (INT): The number of disks in the ownership request

diskown.replayingOwnership.Nv

Severity

ERROR

Description

This message occurs during takeover, when a disk ownership request is replayed from NVRAM but NVRAM corruption is detected.

Corrective Action

1) If you changed the ownership of disks on the partner in the last five minutes prior to takeover, verify their ownerships were stored by using the "storage disk show" command. 2) If you see this message often or in other modules, the partner's NVRAM card might be faulty and might need to be replaced.

Syslog Message

Failed to replay disk ownership because NVRAM corruption was detected.

Parameters

(None).

diskown.rescan events

diskown.rescan.notConnected

Severity

ERROR

Description

This message occurs when the high-availability (HA) messaging layer fails to connect to the specified node for disk ownership updates.

Corrective Action

Run the command "run local disk show -v" from the node specified in the node parameter to correct disk ownership.

Syslog Message

HA messaging layer on the local node failed to connect to node %s for disk ownership updates.

Parameters

node (STRING): Name of the node where disk ownership might be outdated.
status (INT): Error number returned by the HA messaging layer from the HA message error space.
scope (INT): Internal scope identifier for the module that returned the error.
scope_err (INT): Internal error number returned by the module.

diskown.rescan.notSent

Severity

ERROR

Description

This message occurs when the high-availability (HA) messaging layer fails to send a disk ownership update message.

Corrective Action

Run the command "run local disk show -v" from the node specified in the node parameter to correct disk ownership.

Syslog Message

HA messaging layer on the local node failed to send a disk ownership update message to node %s.

Parameters

node (STRING): Name of the node where disk ownership might be outdated.
status (INT): Error number returned by the HA messaging layer from the HA message error space.
scope (INT): Internal scope identifier for the module that returned the error.
scope_err (INT): Internal error number returned by the module.

diskown.rescanmessagefailed events

diskown.RescanMessageFailed

Severity

ERROR

Description

This message occurs while transferring the ownership of a disk to another node, when a rescan message is sent but does not go through.

Corrective Action

Use the "disk show" command on the nodeshell of %s for the node to rescan the disks which changed ownership.

Syslog Message

Could not send rescan message to %s.

Parameters

hostname (STRING): Name of the host that the message was sent to.

diskown.rescanwait events

diskown.rescanWait

Severity

INFORMATIONAL

Description

This message occurs when the disk ownership rescan code waits.

Corrective Action

(None).

Syslog Message

(None).

Parameters

status (STRING): Description on the type of wait.

diskown.rewriteowner events

diskown.rewriteOwner

Severity

NOTICE

Description

This event is issued when we have to rewrite a DOWN because it is out of date wrt the other DOWNs.

Corrective Action

(None).

Syslog Message

rewriting ownership information for disk %s (S/N %s)

Parameters

diskname (STRING): The name of the disk
serialno (STRING): The serial number of the disk

diskown.shareddsk events

diskown.sharedDsk.nonHACfg

Severity

ERROR

Description

This message occurs when a disk is shared by multiple nodes in a non-HA or stand-alone configuration. If the procedure to convert an HA configuration to a non-HA configuration is not followed properly, the system may end up either having disks whose partitions are owned by another node, or owning partitions on non-local disks.

Corrective Action

Refer to the High-Availability Configuration Guide.

Syslog Message

Either some local disks have partitions that are not owned by the local node, or the local node owns partitions on non-local disks.

Parameters

(None).

diskown.shlf events

diskown.Shlf.assignStatus

Severity

NOTICE

Description

This message occurs when shelf granular-based drive assignment is enabled or disabled. This is currently applicable for an MetroCluster(tm) IP configurations.

Corrective Action

(None).

Syslog Message

Shelf-based automatic drive assignment for shelf "%d" is "%s".

Parameters

shelf_id (INT): Shelf identifier.
state (STRING): Shelf-based automatic drive assignment state.

diskown.Shlf.MultiOwners

Severity

ERROR

Description

This message occurs when the system cannot automatically assign disks because some of the disks are assigned to multiple nodes in a conflicting manner. Until the disk assignments are corrected, the specified shelf will be excluded during auto assignment, and unowned disks on the shelf will be skipped.

Corrective Action

1) Find all of the disks belonging to the specified shelf by using the "storage disk show -fields owner,shelf" command. 2) Ensure that the disks on the shelf are assigned to a single system by manually assigning disks in the shelf to a single owner.

Syslog Message

The system cannot automatically assign disks because the disks in shelf %d are assigned to multiple nodes in a conflicting manner.

Parameters

shelf_id (INT): Shelf identifier.

diskown.split events

diskown.split.shelf.assignStatus

Severity

    NOTICE

Description

    This message occurs when any type of split-shelf automatic drive assignment is disabled.

Corrective Action

    (None).

Syslog Message

    Split-shelf based automatic drive assignment is "%s".

Parameters

    state (STRING): All split-shelf based drive assignment states.

diskown.statusreadownership events

diskown.statusReadOwnership

Severity

    INFORMATIONAL

Description

    This message occurs when an event is logged to track that an error was encountered while reading all data ownership blocks at once. Data ONTAP® will attempt to recover by reading each disk ownership block individually.

Corrective Action

    (None).

Syslog Message

    (None).

Parameters

    errorno (INT): Error that occurred.
    errortext (STRING): Error description as text.
    diskname (STRING): Name of the disk.
    serialno (STRING): Serial number of the disk.

diskown.stealingdisk events

diskown.StealingDisk

Severity

    NOTICE

Description

    This event is issued when a user reassigns a disk that is owned and has a reservation from another system.

Corrective Action

(None).

Syslog Message

Ownership for disk %s (S/N %s) is being stolen from node "%s" (System ID: %u).

Parameters

diskname (STRING): Name of the disk whose ownership is being reassigned.
serialno (STRING): Serial number of the disk.
hostname (STRING): Name of the host that currently owns the disk.
systemid (INT): System ID of the host that currently owns the disk.
thread (STRING): Name of the thread that issued the ownership change request.
APIname (STRING): Name of the API that issued the ownership change request.

diskown.stealingdiskprevented events

diskown.StealingDiskPrevented

Severity

NOTICE

Description

This message occurs when a "storage disk assign" operation is performed on a disk that is owned and has a reservation from another system. The reservation prevents the disk ownership change from being completed.

Corrective Action

Perform the "storage disk assign" operation on the system that currently owns the disk.

Syslog Message

Ownership for disk %s (S/N %s) cannot be changed because node "%s" (System ID: %u) currently owns the persistent reservation.

Parameters

diskname (STRING): Name of the disk whose ownership is being assigned.
serialno (STRING): Serial number of the disk.
hostname (STRING): Name of the host that currently owns the disk.
systemid (INT): System ID of the host that currently owns the disk.
thread (STRING): Name of the thread that issued the ownership change request.
APIname (STRING): Name of the API that issued the ownership change request.

diskown.uprevversion events

diskown.UpRevVersion

Severity

NOTICE

Description

This message occurs when disk ownership information has been read and found to be from a version that is

higher (newer) than what the current version of Data ONTAP understands. New fields in the ownership information will be ignored.

Corrective Action

(None).

Syslog Message

(None).

Parameters

diskname (STRING): The name of the disk with the newer version.
serialno (STRING): The serial number of the disk.
foundversion (INT): The version of the disk ownership information found on the disk.
curversion (INT): The version of the disk ownership information that the current Data ONTAP uses.

diskown.waitingforreassign events

diskown.WaitingForReassign

Severity

NOTICE

Description

This message occurs when a giveback is occurring and the "storage disk reassign" is in progress. The giveback must wait until the reassign operation is complete.

Corrective Action

(None).

Syslog Message

Waiting for ownership of the partner disks to be updated as a result of a "storage disk reassign" command.

Parameters

(None).

diskshelf events

diskshelf.psu events

diskShelf.psu.added

Severity

NOTICE

Description

This message occurs when a power supply unit is added to the disk shelf.

Corrective Action

(None).

Syslog Message

%s power supply was added to %s.shelf%d

Parameters

location (STRING): Which power supply was added.
channelName (STRING): Channel connected to disk shelf.
shelfIdent (INT): ID number displayed on the disk shelf OPS panel.
serialNumber (STRING): Serial number of disk shelf.

diskShelf.psu.removed

Severity

ERROR

Description

This message occurs when a power supply unit is removed from the disk shelf.

Corrective Action

Insert a functional power supply unit into the disk shelf.

Syslog Message

%s power supply was removed from %s.shelf%d

Parameters

location (STRING): Which power supply was removed.
channelName (STRING): Channel connected to disk shelf.
shelfIdent (INT): ID number displayed on the disk shelf OPS panel.
serialNumber (STRING): Serial number of disk shelf.

diskshelf.support events

diskShelf.support.file

Severity

NOTICE

Description

This message occurs when a new disk shelf support file is detected. Current support level of existing shelves will be checked.

Corrective Action

(None).

Syslog Message

New disk shelf support file (DQP) detected.

Parameters

(None).

diskshelf.supported events

diskShelf.supported

Severity

NOTICE

Description

This message occurs when a newly supported disk shelf is detected.

Corrective Action

(None).

Syslog Message

Disk shelf %s (%s) is now supported.

Parameters

device (STRING): Device address of the disk shelf.
product_id (STRING): Product ID of the disk shelf.

diskshelf.unsupported events

diskShelf.unsupported

Severity

ALERT

Description

This message occurs when ONTAP® software detects an unsupported disk shelf.

Corrective Action

Verify that the disk shelf attached is supported by the version of ONTAP running on the storage controller. If the disk shelf is supported, replace the disk shelf module.

Syslog Message

Disk shelf %s (%s) is unsupported.

Parameters

device (STRING): Device address of the disk shelf.
product_id (STRING): Product ID of the disk shelf.

dlock events

dlock.release events

dlock.release.error

Severity

ERROR

Description

This message occurs when ONTAP® software reports an error while attempting to release an internal lock. This might impact services like Application-aware data management.

Corrective Action

Run the node local "dlock show" diag-level command to confirm whether the lock still exists. If the lock exists, run the node local "dlock release" diag-level command to clear the lock. If the lock does not exist, then the error was likely transient and can be ignored. Contact NetApp technical support for more information or assistance.

Syslog Message

Failed to release internal lock. Lock ID: "%s". Owner ID: "%s". Reason: %s.

Parameters

lockid (STRING): Lock ID.
ownerid (STRING): Owner ID.
error (STRING): Error that was encountered.

dm events

dm.cluster events

dm.cluster.rebaselinefailed

Severity

ERROR

Description

This message occurs when resynchronization of the cluster configuration failed in a MetroCluster(tm) configuration.

Corrective Action

Use the "metrocluster check config-cluster resync" command to resynchronize the cluster configuration.

Syslog Message

Cluster configuration resynchronization failed for cluster %s.

Parameters

cluster (STRING): Name of the cluster whose configuration is being replicated.

dm.vserver events

dm.vserver.mcc.rebaselinefailed

Severity

ERROR

Description

This message occurs when resynchronization of the Vserver configuration failed in a MetroCluster(tm) configuration.

Corrective Action

Use the "metrocluster vserver resync" command to resynchronize the Vserver configuration.

Syslog Message

Vserver configuration resynchronization failed for Vserver %s.

Parameters

vserver (STRING): Name of the Vserver whose configuration is being replicated.

dm.vserver.sm.rebaselinefailed

Severity

ERROR

Description

This message occurs when resynchronization of the Vserver configuration failed in a Vserver DR

relationship.

Corrective Action

Use the "snapmirror resync" command to resynchronize the Vserver configuration.

Syslog Message

Vserver configuration resynchronization failed for Vserver %s.

Parameters

vserver (STRING): Name of the Vserver whose configuration is being replicated.

dm.vserver.unlockfailed

Severity

ERROR

Description

This message occurs when unlocking the Vserver failed after resynchronization of the Vserver configuration in a MetroCluster(tm) configuration or Vserver DR setup. Management operations on this Vserver will fail, until an unlock operation is done by the admin manually.

Corrective Action

Use the "vserver unlock -force true" command at diagnostic privilege to manually unlock the Vserver.

Syslog Message

Vserver unlock failed for Vserver %s.

Parameters

vserver (STRING): Name of the Vserver whose unlock operation failed.

dml events

dml.drive events

dml.drive.offline.status

Severity

NOTICE

Description

This message occurs when drive offline completes.

Corrective Action

(None).

Syslog Message

Drive offline request for drive %s %s, (%d).

Parameters

drive_name (STRING): Drive name.
status_str (STRING): Drive offline status string.
status_code (INT): Drive offline status code.

dml.drive.online.status

Severity

NOTICE

Description

This message occurs when drive online completes.

Corrective Action

(None).

Syslog Message

Drive online request %s %s, (%d).

Parameters

drive_name (STRING): Drive name.
status_str (STRING): Drive online status string.
status_code (INT): Drive online status code.

dml.fae events

dml.fae.key.import.failed

Severity

ERROR

Description

This message occurs when the Device Management Layer fails to import key material.

Corrective Action

Verify whether aggregate keys are required. Retry the key transport operation.

Syslog Message

Key import failed. Reason: %s.

Parameters

reaon (STRING): Failure reason.

dml.init events

dml.init.fail

Severity

ERROR

Description

This message occurs when the Device Management Layer (DML) fails initialization.

Corrective Action

Retry the startup.

Syslog Message

Firestorm initialization failed with error code (%d).

Parameters

error_code (INT): Failure code.

dml.initialized events

dml.initialized

Severity

NOTICE

Description

This message occurs when the Device Management Layer (DML) is started.

Corrective Action

(None).

Syslog Message

DML initialized.

Parameters

(None).

dms events

dms.restserver events

dms.restserver.ssl.disabled

Severity

ERROR

Description

This message occurs when the system hits an error in enabling SSL authentication in the rest server.

Corrective Action

Check that the SSL certificates and keys given to the rest server are accessible and valid.

Syslog Message

Failed to set SSL authentication in DMAP rest server due to %s

Parameters

error (STRING): Text describing the error.

dns events

dns.disabled events

dns.disabled.configs.removed

Severity

NOTICE

Description

This message occurs when the last system to be upgraded in a cluster removes DNS configurations that were marked as disabled.

Corrective Action

(None).

Syslog Message

All DNS configurations with the "-state" parameter set to "disabled" were removed.

Parameters

(None).

dns.server events

dns.server.timed.out

Severity

ERROR

Description

This message occurs when the DNS server fails to respond to a query and timeout occurs.

Corrective Action

Make sure that the DNS server is up and running and that there are no networking issues preventing the Vserver from communicating with the DNS server.

Syslog Message

DNS server %s did not respond to vserver = %s within timeout interval.

Parameters

ipaddr (STRING): Ip address of the DNS server.
vsName (STRING): Name of the Vserver for which DNS response timed out.

download events

download.request events

download.request

Severity

NOTICE

Description

This event is generated when a user-initiated download is initiated.

Corrective Action

(None).

Syslog Message

Operator requested download initiated

Parameters

(None).

download.requestdone events

download.requestDone

Severity

NOTICE

Description

This event is generated when a user-initiated download has completed.

Corrective Action

(None).

Syslog Message

Operator requested download completed

Parameters

(None).

download.requestdoneerror events

download.requestDoneError

Severity

ERROR

Description

This event is generated when a user-initiated download did not complete successfully because of a problem. See console log for problem and corrective action.

Corrective Action

(None).

Syslog Message

Operator requested download failed.

Parameters

(None).

ds events

ds.sas events

ds.sas.config.warning

Severity

ERROR

Description

This message occurs when the system detects a configuration problem on the shelf I/O module.

Corrective Action

Reseat the disk shelf I/O module. If that does not fix the problem, replace the disk shelf I/O module.

Syslog Message

Configuration error on Serial Attached SCSI (SAS) I/O module %s channel %s shelf ID %lld - %s of %d expected %d

Parameters

module_id (STRING): Module (A or B) that is experiencing the problem.
channel (STRING): Channel of the shelf that is experiencing the problem.
shelfId (LONGINT): Shelf ID of the shelf that is experiencing the problem.
desc (STRING): Description of the parameter that is misconfigured.
actual (INT): Actual value for this configuration parameter on the shelf I/O module.
expected (INT): Expected value for this configuration parameter on the disk shelf I/O module.

ds.sas.drivephy.disableErr

Severity

ERROR

Description

This message occurs when a drive physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to one of the following reasons: manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold Transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; exceeded broadcast change threshold; or mirroring disabled on the other I/O module.

Corrective Action

Replace the disabled disk drive.

Syslog Message

Disk %s%s on channels %s shelf ID %lld %s bay %s %s.

Parameters

phy (STRING): Physical layer device (phy) that is being disabled.
disk_data (STRING): Disk data includes vendor name, model, firmware revision and the serial number of the disabled disk. If unable to access the disk then, this field is blank.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED

if unconnected.
shelfID (LONGINT): Shelf ID of the disk shelf reporting the error.
element (STRING): IOM (I/O module) designator (A or B).
bay (STRING): Bay in which the disk is installed.
reason (STRING): Reason the disk phy was disabled.

ds.sas.element.fault

Severity

ERROR

Description

This message occurs when a Serial Attached SCSI (SAS) module in a disk shelf reports an error.

Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

State of shelf module %s is %s on channels %s shelf ID %d

Parameters

element (STRING): Shelf module designator (A or B).
state (STRING): Current state of IOM.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.

ds.sas.element.xport.error

Severity

ERROR

Description

This message occurs when a Serial Attached SCSI (SAS) disk shelf module reports a transport error.

Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

Shelf module %s XPORT ERROR on channels %s shelf ID %d

Parameters

element (STRING): Shelf module designator (A or B).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.

ds.sas.hostphy.disableErr

Severity

ALERT

Description

This message occurs when a host physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to one of the following reasons: Invalid SAS2-SAS3 Transition; manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold; transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; exceeded broadcast change threshold; or mirroring disabled on the other I/O module.

Corrective Action

If the Host phys were disabled because of an invalid transition, remove the SAS cable on the disabled phys completely from both IOMs and then recable correctly. Removing the cable completely allows both IOMs to reset. For other disabled host phy conditions, replace the shelf module to which the affected host phy belongs.

Syslog Message

Port %s on channels %s shelf ID %lld %s %s.

Parameters

phy (STRING): Host port that is being disabled.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (LONGINT): Shelf ID of the shelf reporting the error.
element (STRING): I/O module designator (A or B).
reason (STRING): Reason the host phy was disabled.

ds.sas.id.conflict.cleared

Severity

NOTICE

Description

This message occurs when a shelf ID conflict on a channel reported earlier is resolved.

Corrective Action

(None).

Syslog Message

Shelf ID conflict on channel %s (shelf ID: %lld, S/N: %s) was cleared.

Parameters

channel (STRING): Channel that the shelf is attached to.
shelfId (LONGINT): Shelf ID.
SerialNumber (STRING): Shelf serial number.

ds.sas.id.conflict.detected

Severity

ERROR

Description

This message occurs when a SAS shelf ID conflict is detected on a channel.

Corrective Action

Ensure that all of the disk shelves in a high-availability pair have a unique shelf ID. For instructions, see "Changing the disk shelf ID" in the Disk Shelf Installation and Service Guide for the shelf model.

Syslog Message

SAS shelf on channel %s (shelf ID: %lld, S/N: %s) reported a shelf ID conflict.

Parameters

channel (STRING): Channel that the shelf is attached to.
shelfId (LONGINT): Shelf ID.
SerialNumber (STRING): Shelf serial number.

ds.sas.multPhys.disableErr

Severity

ALERT

Description

This message occurs when the system detects that multiple Physical Layer Devices (PHYs) are disabled on a SAS disk shelf.

Corrective Action

Check whether the problems on the PHYs are valid by looking for PHY errors in nearby events. If multiple PHYs are disabled at the same time in a particular disk shelf module, replace the disk shelf module.

Syslog Message

Multiple phys have been disabled on the disk shelf %d on Channels %s, %s.

Parameters

shelfID (INT): ID of the disk shelf reporting the error.
channels (STRING): Channels that have the error. "Channel" can be an adapter port, (for example, 0c), or PARTNER for high-availability partner, or UNUSED if unconnected.
element (STRING): Disk shelf module designator (A or B).

ds.sas.ses.disableErr

Severity

ALERT

Description

This message occurs when a virtual (SES) physical layer device (phy) on a Serial Attached SCSI (SAS) I/O module is disabled due to to one of the following reasons: manually bypassed; exceeded loss of double word synchronization threshold; exceeded running disparity threshold Transmitter fault; exceeded CRC error threshold; exceeded invalid double word threshold; exceeded phy reset problem threshold; or exceeded broadcast change threshold.

Corrective Action

Replace the shelf module.

Syslog Message

SES phy on channel %s shelf ID %lld module %s is disabled.

Parameters

channel (STRING): Channel that has the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (LONGINT): Shelf ID of the shelf reporting the error.
element (STRING): I/O module designator (A or B).

ds.sas.xfer.element.fault

Severity

ERROR

Description

This message occurs when an element had a fault during an I/O request. It might be due to a transient condition in link connectivity.

Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

I/O failure on shelf module %s on channels %s shelf id %d, status is %s.

Parameters

element (STRING): Shelf module designator (A or B).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.
state (STRING): Current state of IOM.

ds.sas.xfer.not.sent

Severity

ERROR

Description

This message occurs when an I/O transfer could not be sent. It might be due to a transient condition in link connectivity.

Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

Shelf module %s I/O failure NOT_SENT channels %s shelf ID %d

Parameters

element (STRING): Shelf module designator (A or B).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.

ds.sas.xfer.unknown.error

Severity

EMERGENCY

Description

This message occurs when an unknown error occurs during an I/O request.

Corrective Action

Ensure that the shelf module firmware and ONTAP® software are compatible versions. Find firmware versions at the NetApp technical support web site.

Syslog Message

Shelf module %s I/O failure UNKNOWN: %d channels %s shelf id %d

Parameters

element (STRING): Shelf module designator (A or B).
status (INT): Error status code.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.

ds.sas.xfer.xport.error

Severity

ERROR

Description

This message occurs when a transport error occurs during an I/O request. It might be due to a transient condition in link connectivity.

Corrective Action

Check cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

Shelf module %s I/O failure TRANSPORT_ERROR channels %s shelf ID %d.

Parameters

element (STRING): Shelf module designator (A or B).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Shelf ID (0-99) of the shelf reporting the error.

dump events

dump.bitmap events

dump.bitmap.fail

Severity

ERROR

Description

This event is generated during dump restarting and looking for the bitmap file and it is unable to locate

Corrective Action

(None).

Syslog Message

Missing bitmap files.

Parameters

(None).

dump.fail events

dump.fail.snapreserve

Severity

ERROR

Description

This event is generated while dump is trying to restart and there is no space left in the snap reserve

Corrective Action

Please increase the snap reserve space to avoid this error.

Syslog Message

Snapshots overflow reserved space.

Parameters

(None).

dump.file events

dump.file.has.security.label

Severity

NOTICE

Description

This message occurs when the dump engine encounters an NFS security label during any type of dump operation. The dump engine does not back up any NFS security labels but skips them and continues.

Corrective Action

(None).

Syslog Message

The dump engine encountered one or more inodes with NFS security labels. The dump engine will back up the inodes but will not back up the associated security labels.

Parameters

src_path (STRING): Path being backed up.

dump.inconsistent events

dump.inconsistent.acl_data

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in an ACL file in a Snapshot(tm) copy. Backup will abort.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d): WAFL ACL data inconsistent due to disk errors. Aborting the backup.

Parameters

src_path (STRING): Source path being backed up.
snap_id (INT): ID of the Snapshot copy where the disk error was encountered.

dump.inconsistent.file_data

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), inum (%u): WAFL data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort_on_disk_error option.

Parameters

> **src_path** (STRING): Source path being backed up.
> **snap_id** (INT): ID of the Snapshot copy where the disk error was encountered.
> **inum** (INT): Inode number of the file that encountered the disk error.

dump.inconsistent.ind_buf

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in indirect buffers of a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), inum (%u): WAFL metadata and data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort_on_disk_error option.

Parameters

> **src_path** (STRING): Source path being backed up.
> **snap_id** (INT): ID of the Snapshot copy where the disk error was encountered.
> **inum** (INT): Inode number of the file that encountered the disk error.

dump.inconsistent.stream_data

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in a stream associated with a file in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d), stream inum (%u), base inum(%u): WAFL data inconsistent due to disk errors. Aborting the backup as directed by ndmpd.abort_on_disk_error option.

Parameters

> **src_path** (STRING): Source path being backed up.
> **snap_id** (INT): ID of the Snapshot copy where the disk error was encountered.
> **sinum** (INT): Inode number of the stream that encountered the disk error.
> **inum** (INT): Inode number of the basefile whose associated stream encountered the disk error.

dump.inconsistent.wafl_metadata

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in either the inode file, a directory or a stream directory in a Snapshot(tm) copy. As a result of this error, the backup is aborted.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d): WAFL metadata inconsistent due to disk errors. Aborting the backup.

Parameters

src_path (STRING): Source path being backed up.
snap_id (INT): ID of the Snapshot copy where the disk error was encountered.

dump.inconsistent_streamdir_lunclone events

dump.inconsistent_streamdir_lunclone

Severity

ERROR

Description

This message occurs when the dump engine encounters a disk error in a stream directory of an inconsistent LUN clone in a Snapshot(tm) copy. Backup will abort because the user selected the option to abort on disk error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s), Snapshot copy ID (%d): WAFL metadata inconsistent due to disk errors. Aborting the backup.

Parameters

src_path (STRING): Source path being backed up.
snap_id (INT): ID of the Snapshot copy where the disk error was encountered.

dump.max events

dump.max.limit

Severity

ERROR

Description

This message occurs when new dump or restore sessions cannot be started because the limit for this platform has been reached.

Corrective Action

Dump/restore operation limit has been reached for this platform.

Syslog Message

Maximum limit of dump/restore sessions (%d) has been reached.

Parameters

max_limit (INT): Maximum dump and restore session limits.

dump.notify events

dump.notify.backward.ctime

Severity

ALERT

Description

This message occurs when the dump incremental backup might be incomplete. When setting ctime to past values is allowed, files copied to volumes through SMB/CIFS might have timestamps that are in the past compared to the time of copy. If an inode number is reused for the files with timestamps in the past that were copied into the volume after the last backup, the files will be missed in the incremental backup.

Corrective Action

Disable updates to ctime with past values by setting "bootarg.wafl.allow_ctime_backward" to "false", reboot the nodes, and then start a new backup chain from the baseline. For more information on the workaround, contact Technical Support.

Syslog Message

The incremental backup (Dump name = "%s", Snapshot copy ID = "%d") might be incomplete because setting ctime to past values is allowed on this node.

Parameters

dump_name (STRING): Dump name.
snap_id (INT): ID of the Snapshot copy being backed up.

dump.register events

dump.register.commit

Severity

ERROR

Description

This event is generated when a registry transaction failed to commit

Corrective Action

(None).

Syslog Message

Failed to flush backup table entry upgrade to registry: %s

Parameters

subject (STRING): Error description

dump.register.create

Severity

ERROR

Description

This event is generated when a registry creation is failed. Memory allocation failure

Corrective Action

(None).

Syslog Message

Failed to create a registry transaction for dump(%d).

Parameters

dump_id (INT): Dump ID

dump.register.set

Severity

ERROR

Description

This event is generated when a registry is tried to set and failed because a freed transaction is being tried to set

Corrective Action

(None).

Syslog Message

Failed to write context update information to registry.

Parameters

(None).

dump.snapshot events

dump.snapshot.fail

Severity

ERROR

Description

This event is generated during dump restarting and looking for the snapshot that was created by the dump while it was terminating last time and we are unable to locate the snapshot

Corrective Action

(None).

Syslog Message

Unable to locate snapshot needed by dump context ID (%d).

Parameters

dump_id (INT): Dump ID

dump.terminate events

dump.terminate

Severity

NOTICE

Description

This event is generated during dump termination, we see if we can retrieve the name of the dump. If we are unable to retrieve the name of the dump then dump id that is terminated is notified or else both dump id and name of the dump are notified

Corrective Action

(None).

Syslog Message

Terminating dump(%d)%s

Parameters

dump_id (INT): Dump ID
dump_name (STRING): Dump Name

dump.terminate.reserved

Severity

NOTICE

Description

This event is generated when we tried to terminate dump and have checked if dump is in the reserved state. This is just a notification message for dump termination and it is also restartable.

Corrective Action

(None).

Syslog Message

Terminating restartable dump(%d)

Parameters

dump_id (INT): Dump ID

dump.transit events

dump.transit.fail

Severity

ERROR

Description

This event is generated when the failover is still in transit while waiting for the dump to be initialized

Corrective Action

(None).

Syslog Message

Failover is still in transit.

Parameters

(None).

dump.volume events

dump.volume.memory

Severity

NOTICE

Description

This event is generated when we are trying to dump a volume which is full and we cannot write the offsetmap on to the disk and we are using memory instead of disk to do this.

Corrective Action

Please free up some of the disk space for this volume in order to avoid this memory consumption.

Syslog Message

DUMP using memory due to lack of disk space on /vol/%s.

Parameters

vol_name (STRING): Name of the volume that is full which needs to be freed

dump.xfercomplete events

dump.xfercomplete.inconsistent_data

Severity

ERROR

Description

This message occurs when the dump engine completes data backup with disk errors in user files.

Corrective Action

Contact NetApp technical support.

Syslog Message

Dump of source path (%s): One or more files in the backup encountered disk errors. Refer to /etc/log/backup for a list of files that encountered disk errors.

Parameters

src_path (STRING): Source path being backed up.

dyn events

dyn.auth events

dyn.auth.custom.comp.error

Severity

ERROR

Description

This message occurs when the custom trust score component of the Dynamic Authorization feature encounters an error. When an error occurs, the minimum score is assigned from the component for trust score calculations.

Corrective Action

Verify that the configured custom trust score component has a reachable uniform resource identifier (URI) provider, valid score field and returns a score between configured minimum and maximum values.

Syslog Message

Error encountered in the custom trust score component of the Dynamic Authorization feature. Reason: %s.

Parameters

reason (STRING): Reason for the error.

dyn.auth.history.comp.error

Severity

ERROR

Description

This message occurs when the authentication history trust score component of the Dynamic Authorization feature encounters an error with the data present in the authentication statistics table. When an error occurs, the minimum score is assigned from the component for trust score calculations.

Corrective Action

Use the "security dynamic-authorization user-trust-score reset" command to reset the trust score of the user for the Authentication History trust score component in a storage virtual machine (SVM).

Syslog Message

Error encountered in the authentication history trust score component of the Dynamic Authorization feature. Reason: %s.

Parameters

reason (STRING): Reason for the error.

ekmip events

ekmip.akv events

ekmip.akv.available

Severity

NOTICE

Description

This message occurs when a configured Azure Key Vault (AKV) that was previously reported unavailable for key operations is now available.

Corrective Action

(None).

Syslog Message

The AKV Key Management Service is now available. AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

Parameters

svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
configName (STRING): Name of the AKV configuration.
name (STRING): Uniform resource identifier (URI) of the AKV.

ekmip.akv.keyExpired

Severity

ERROR

Description

This message occurs when the current key version associated with the key identifier of the configured Azure Key Vault (AKV) has expired. The key version might be out of compliance. It is recommended that you update the key version to an active, non-expired key. ONTAP is still able to unwrap the top-level internal key protection key with the expired key version and there is no interruption to data availability.

Corrective Action

Update the key-ID to an active, non-expired key at the AKV portal.

Syslog Message

The AKV key version has expired. Key ID: "%s". AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

Parameters

keyId (STRING): Key ID.
svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
configName (STRING): Name of the AKV configuration.
name (STRING): Uniform resource identifier (URI) of the AKV.

ekmip.akv.keyVersionChanged

Severity

NOTICE

Description

This message occurs when the current key version associated with the key identifier of the configured Azure Key Vault (AKV), the AKV key-ID, changes. The key version might have been auto-rotated or manually changed at the AKV. Additionally, the top-level internal key protection key has been successfully re-wrapped with the current key version of the AKV key-ID.

Corrective Action

(None).

Syslog Message

The AKV key version has been changed. AKV configuration details, SVM "%s", configuration name "%s", AKV: "%s", previous key version: "%s", current key version: "%s".

Parameters

svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
configName (STRING): Name of the AKV configuration.
name (STRING): Uniform resource identifier (URI) of the AKV.
oldKeyVersion (STRING): Previous key version.
newKeyVersion (STRING): Current key version.

ekmip.akv.notAvailable

Severity

ALERT

Description

This message occurs when a check for the availability of the configured Azure Key Vault (AKV) for key operations fails. The AKV might be down or there might be a network-related problem preventing communication. Without access to the AKV, the node might not be able to restore authentication keys needed to unlock NetApp Storage Encryption (NSE) or SED drives, or encryption keys needed to mount encrypted volumes. If the AKV is unavailable the next time this node boots, then the failure to restore the keys might prevent the node from booting successfully or prevent the encrypted volumes hosted on this node from coming online.

Corrective Action

Ensure that the AKV configuration is correct by using the "security key-manager external azure show -vserver <vserver>" command and verifying that the cluster state is available. If it is not available, run the "security key-manager external azure restore" command to bring the cluster state to available. If the issue still persists, contact technical support.

Syslog Message

The AKV Key Management Service is not available. AKV configuration details, SVM: "%s", configuration name: "%s", AKV name: "%s".

Parameters

svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
configName (STRING): Name of the AKV configuration.

name (STRING): Uniform resource identifier (URI) of the AKV.

ekmip.akv.volOffline

Severity

ALERT

Description

This message occurs when the SVM has been blocked and any encrypted volumes belonging to the SVM have been taken offline due to errors received when attempting to access the key owned by the Azure Key Vault (AKV). Reasons for AKV key access errors include a disabled key, a key not being found and a key missing encryption and decryption privileges. ONTAP polls the AKV every 15 minutes to verify key accessibility. If, for 60 minutes, ONTAP does not receive a successful response to a poll, all encrypted volumes are taken offline and remain offline until the key access issues are resolved at the AKV. When ONTAP does receive a successful response, the volumes are brought back online automatically.

Corrective Action

Resolve the key access issues at the AKV portal. Ensure that the key is active and has the required encryption and decryption privileges.

Syslog Message

The SVM has been blocked and any encrypted volumes belonging to the SVM have been taken offline due to key access errors. AKV configuration details, SVM: "%s", configuration name "%s", key ID: "%s", AKV name: "%s".

Parameters

svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
keyId (STRING): Key ID.
name (STRING): Uniform resource identifier (URI) of the AKV.
configName (STRING): Name of the AKV configuration.

ekmip.akv.volOnline

Severity

NOTICE

Description

This message occurs when the volumes configured on the Azure Key Vault (AKV) that were unavailable due to key access issues are now back online.

Corrective Action

(None).

Syslog Message

Encrypted volumes belonging to the SVM are now back online. AKV configuration details, SVM: "%s", configuration name: "%s", key ID "%s", AKV name: "%s".

Parameters

svm (STRING): Name of the storage virtual machine (SVM) where the AKV is configured.
name (STRING): Uniform resource identifier (URI) of the AKV.
configName (STRING): Name of the AKV configuration.
keyId (STRING): Key ID.

ekmip.awskms events

ekmip.awskms.available

Severity

NOTICE

Description

This message occurs when a configured Amazon Web Services (AWS) Key Management Service (KMS) that was unavailable for key operations is now available.

Corrective Action

(None).

Syslog Message

The AWS KMS with region: "%s" and key ID: "%s" configured for Vserver "%s" is now available.

Parameters

region (STRING): AWS KMS region.
keyId (STRING): Key ID.
vserver (STRING): Name of the Vserver where the AWS KMS is configured.

ekmip.awskms.keyChg

Severity

NOTICE

Description

This message occurs when the key material associated with the key ID of the configured Amazon Web Services (AWS) Key Management Service (KMS) changes. The key material might have been auto-rotated or manually changed at the AWS KMS. Additionally, as a result of updated key material, the top-level internal key-protection key is successfully rewrapped with the current key material of the AWS KMS key ID.

Corrective Action

(None).

Syslog Message

The key material for key "%s" owned by AWS KMS region "%s" and configured for Vserver "%s" has changed.

Parameters

keyId (STRING): Key ID.
region (STRING): AWS KMS region.
vserver (STRING): Name of the Vserver where the AWS KMS is configured.

ekmip.awskms.keyVersionChg

Severity

NOTICE

Description

This message occurs when the key version associated with the key ID of the configured Amazon Web Services (AWS) Key Management Service (KMS) changes. Corrective Action

(None).

Syslog Message

The version of the key "%s" owned by AWS KMS region "%s", configured for Vserver "%s", is changed from "%s" to "%s".

Parameters

keyId (STRING): Key ID.
region (STRING): AWS KMS region.
vserver (STRING): Name of the Vserver where the AWS KMS is configured.
oldKeyVersion (STRING): Prior key version.
newKeyVersion (STRING): New key version.

ekmip.awskms.notAvailable

Severity

ALERT

Description

This message occurs when a check for the availability of the configured Amazon Web Services (AWS) Key Management Service (KMS) fails. The AWS KMS might be down or there might be a network-related problem preventing communication. Without access to the AWS KMS, the node might be unable to restore authentication keys needed to unlock NetApp Storage Encryption (NSE) drives or encryption keys needed to mount encrypted volumes. If the AWS KMS is unavailable, then the next time this node boots, the failure to restore the keys might prevent the node from booting successfully or the encrypted volumes hosted on this node from coming online.

Corrective Action

Verify that the AWS KMS configuration is correct by using the "security key-manager external aws show -vserver <vserver_name>" command, and verify that the AWS KMS cluster state is available. If the cluster state is unavailable, run the "security key-manager external aws restore" command to bring the cluster state to available. If the issue still persists, contact NetApp technical support.

Syslog Message

The AWS KMS with region: %s and key ID: %s configured for Vserver "%s" is not available.

Parameters

region (STRING): AWS KMS region.
keyId (STRING): Key ID.
vserver (STRING): Name of the Vserver where the AWS KMS is configured.

ekmip.awskms.volOffline

Severity

ALERT

Description

This message occurs when the Vserver has been blocked and any encrypted volumes belonging to the Vserver have been taken offline due to errors received when trying to access the key owned by the Amazon Web Services (AWS) Key Management Service (KMS). Reasons for AWS KMS key access errors include a disabled key, a destroyed key, key not found, or a user not having sufficient privileges to access the key. ONTAP polls the AWS KMS to verify key accessibility. If, after 60 minutes, ONTAP has not received a successful response to a poll, volumes are taken offline and remain offline until the key access issues are resolved at the AWS KMS. Subsequently, if ONTAP does receive a successful response, the volumes will be brought back online automatically.

Corrective Action

Resolve the key access issues at the AWS KMS portal. Ensure that the key is active and the user has the required privileges to access the key.

Syslog Message

The Vserver has been blocked and any encrypted volumes belonging to Vserver "%s" have been taken offline due to key access errors associated with key "%s" owned by AWS KMS region "%s".

Parameters

vserver (STRING): Name of the Vserver where the AWS KMS is configured.
keyId (STRING): Key ID.
region (STRING): AWS KMS region.

ekmip.awskms.volOnline

keyringName (STRING): Name of the key ring.

ekmip.ikpkms events

ekmip.ikpkms.200.missingField

Severity

ALERT

Description

This message occurs when trying to access the key owned by the IBM Key Protect (IKP) Key Management Service (KMS) and an "OK" response (code 200) is received but one field of the response is not populated. Reasons for IKP KMS key access errors include a disabled key, a destroyed key, key not found, or a user not having sufficient privileges to access the key. ONTAP polls the IKP KMS to verify key accessibility. The missing field is integral in determining the status of the key.

Corrective Action

The IKP KMS provided a response with a status of 200 (OK) that did not contain all of the expected fields. Contact technical support to resolve this issue.

Syslog Message

A 200 OK response was received from IKP KMS but the field "%s" was missing for Vserver "%s" with Keymanager Name "%s" associated with key "%s" owned by IKP KMS region "%s" with instance ID "%s".

Parameters

missingField (STRING): Name of the field that is not populated.
vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): The name of the IKP KMS.
keyId (STRING): The Key ID associated with this IKP KMS instance.
region (STRING): The region associated with this IKP KMS instance.
instanceId (STRING): IKP KMS Instance ID.

ekmip.ikpkms.available

Severity

NOTICE

Description

This message occurs when a configured IBM Key Protect (IKP) Key Management Service (KMS) that was unavailable for key operations is now available.

Corrective Action

(None).

Syslog Message

The IKP KMS with region: "%s", instance ID: "%s", and key ID: "%s" configured for Vserver "%s" with Keymanager Name "%s" is now available.

Parameters

region (STRING): The region associated with this IKP KMS instance.
instanceId (STRING): IKP KMS Instance ID.
keyId (STRING): The Key ID associated with this IKP KMS instance.
vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): The name of the IKP KMS.

ekmip.ikpkms.keyVersionChg

Severity

NOTICE

Description

This message occurs when the key version associated with the key ID of the configured IBM Key Protect (IKP) Key Management Service (KMS) changes. The key version might have been auto-rotated or manually changed at the IKP KMS. Additionally, as a result of updated key version, the top-level internal key-protection key has been successfully rewrapped with the current key version of the IKP KMS key ID.

Corrective Action

(None).

Syslog Message

The version of the key "%s" owned by IKP KMS region "%s" and instance ID "%s", configured for Vserver "%s" with Keymanager Name "%s", has been changed from "%s" to "%s".

Parameters

keyId (STRING): The Key ID associated with this IKP KMS instance.
region (STRING): The region associated with this IKP KMS instance.

instanceId (STRING): IKP KMS Instance ID.
vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): The name of the IKP KMS.
oldKeyVersion (STRING): Prior key version.
newKeyVersion (STRING): New key version.

ekmip.ikpkms.notAvailable

Severity

ALERT

Description

This message occurs when a check for the availability of the configured IBM Key Protect (IKP) Key Management Service (KMS) fails. The IKP KMS might be down or there might be a network-related problem preventing communication. Without access to the IKP KMS, the node might be unable to restore authentication keys needed to unlock NetApp Storage Encryption (NSE) drives or encryption keys needed to mount encrypted volumes. If the IKP KMS is unavailable, then the next time this node boots, the failure to restore the keys might prevent the node from booting successfully or the encrypted volumes hosted on this node from coming online.

Corrective Action

Verify that the IKP KMS configuration is correct by using the "security key-manager external ikp show -vserver <vserver_name>" command, and verify that the IKP KMS cluster state is available. If the cluster state is unavailable, run the "security key-manager external ikp restore" command to bring the cluster state to available. If the issue still persists, contact NetApp technical support.

Syslog Message

The IKP KMS with region: "%s", instance ID: "%s", and key ID: "%s" configured for Vserver "%s" with Keymanager Name "%s" is not available.

Parameters

region (STRING): The region associated with this IKP KMS instance.
instanceId (STRING): IKP KMS Instance ID.
keyId (STRING): The Key ID associated with this IKP KMS instance.
vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): The name of the IKP KMS.

ekmip.ikpkms.volOffline

Severity

ALERT

Description

This message occurs when the volumes belonging to the Vserver are taken offline due to errors received when trying to access the key owned by the IBM Key Protect (IKP) Key Management Service (KMS). Reasons for IKP KMS key access errors include a disabled key, a destroyed key, key not found, or a user not having sufficient privileges to access the key. ONTAP polls the IKP KMS to verify key accessibility. If, after 60 minutes, ONTAP has not received a successful response to a poll, volumes are taken offline and remain offline until the key access issues are resolved at the IKP KMS. Subsequently, if ONTAP does receive a successful response, the volumes will be brought back online automatically.

Corrective Action

Resolve the key access issues at the IKP KMS portal. Ensure that the key is active and the user has the required privileges to access the key.

Syslog Message

Encrypted volumes belonging to Vserver "%s" with Keymanager Name "%s" were taken offline due to key access errors associated with key "%s" owned by IKP KMS region "%s" and instance ID "%s".

Parameters

vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): The name of the IKP KMS.
keyId (STRING): The Key ID associated with this IKP KMS instance.
region (STRING): The region associated with this IKP KMS instance.
instanceId (STRING): IKP KMS Instance ID.

ekmip.ikpkms.volOnline

Severity

NOTICE

Description

This message occurs when the volumes configured on the IBM Key Protect (IKP) Key Management Service (KMS) that were unavailable due to key access issues are now back online.

Corrective Action

(None).

Syslog Message

Encrypted volumes belonging to Vserver "%s" with keymanager name "%s" associated with key-id "%s" owned by IBM Key Protect (IKP) KMS region "%s" and instance ID "%s" are now back online.

Parameters

vserver (STRING): Name of the Vserver where the IKP KMS is configured.
kmName (STRING): Name of the IKP KMS.
keyId (STRING): Key ID associated with this IKP KMS instance.
region (STRING): Region associated with this IKP KMS instance.
instanceId (STRING): IKP KMS Instance ID.

ems events

ems.asup events

ems.asup.noteto.transition

Severity

NOTICE

Description

This message occurs when the e-mail addresses for deprecated AutoSupport "noteto" messages are copied to EMS event notification destinations during an upgrade to Data ONTAP® 9.0 or later. This results in duplicate event notifications: one EMS notification and one AutoSupport short note message. Use the "event notification destination {show|modify}" command to view or modify deprecated "noteto" e-mail addresses to use new e-mail destinations. This copy action also creates an event notification that maps the "important-events" filter to all of the newly created destinations. Use the "event notification {show|modify}" command to view or modify the new event notification, as necessary. All events that match the "important-events" filter send notifications to the new destinations, including the AutoSupport triggers with "noteto" enabled.

Corrective Action

To remove event message duplication, remove the AutoSupport "noteto" addresses by entering the "system node autosupport modify -node * -noteto -" command.

Syslog Message

AutoSupport -noteto e-mail addresses have been copied and transitioned to EMS event notification destinations.

Parameters

(None).

ems.engine events

ems.engine.event.dnsLkupFail

Severity

ERROR

Description

This message occurs when the Event Management System (EMS) fails to send an event to a mail destination due to name resolution lookup failures for the mail server specified in EMS configuration options. Possible reasons for failure: DNS servers are not reachable, name services might not be configured correctly or, the configured mail server host name is no longer valid.

Corrective Action

Use the "vserver services name-service dns show" command to check the DNS configuration. If DNS is not configured correctly, use the "vserver services name-service dns modify" command to correct DNS server information, or the "vserver services name-service dns host modify" to correct static host name-to-IP address mapping information. Use the "event config {show|modify}" command to verify or change the configured mail server.

Syslog Message

Failed to send EMS event %s to mail server "%s" because the host name could not be resolved.

Parameters

emsId (STRING): EMS identifier of the event that was not sent to the mail destination.
mailserver (STRING): Mail server specified in EMS configuration options that could not be resolved.

ems.engine.event.undefinedEvent

Severity

NOTICE

Description

This message occurs when the Event Management System (EMS) receives an event that it does not recognize. The event cannot be processed.

Corrective Action

(None).

Syslog Message

(None).

Parameters

requestedEventName (STRING): EMS identifier of the event that was undefined.
requestedEventParams (STRING): List of parameters provided with the requested event.

ems.engine.event.unrecognizedEventVersion

Severity

NOTICE

Description

This message occurs when the Event Management System (EMS) receives an event name that it recognizes, but the event has unexpected parameters. This might occur naturally when the EMS tries to replay an event that occurred before an upgrade (or revert) and the event definition changed between versions.

Corrective Action

(None).

Syslog Message

(None).

Parameters

originalEventXml (STRING): Event name and parameters that were not recognized.

ems.engine.flush

Severity

INFORMATIONAL

Description

This message occurs when the event queues are flushed. Event queues are flushed on system shutdown and before some types of AutoSupport™ data collection.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

ems.snmp events

ems.snmp.parse.error

Severity

ERROR

Description

This message occurs when SNMP parsing of an input packet fails. It could fail for various reasons. The most common failures are due to invalid values for the integer and string fields in the Protocol Data Unit (PDU) and message overflows.

Corrective Action

An agent is incorrectly communicating with the system using SNMP. Find and disable or correct this agent. An Ethernet "sniffer" might be required to identify the client source that is sending the unsupported or incorrect SNMP request.

Syslog Message

%s

Parameters

errorMsg (STRING): Returned error message from the parsing of the input packet.

ems.test events

ems.test.notice

Severity

NOTICE

Description

This message occurs when the system generates a test EMS message of notice severity in response to a user test request.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

enc events

enc.operation events

enc.operation.aborted

Severity

ERROR

Description

This message occurs when either the rekeying of an encrypted flexible volume, or the conversion of the volume from unencrypted to encrypted, is aborted.

Corrective Action

For ASA r2, contact NetApp technical support for assistance to resume the encryption operation. For all other systems, determine the cause of the error by using either the "volume encryption rekey show -vserver <vserver-name> -volume <volume-name>" command or the "volume encryption conversion show -vserver <vserver-name> -volume <volume-name>" command. Correct the error. If the error is related to rekeying, continue the operation by using the "volume encryption rekey resume -vserver <vserver-name> -volume <volume-name>" command. If the error is related to conversion to encryption, continue the operation by using the "volume encryption conversion resume -vserver <vserver-name> -volume <volume-name>" command.

Syslog Message

%s scan is aborted in the volume "%s" (aggr "%s"). Reason: %s.

Parameters

op (STRING): Rekey or conversion operation.
volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.
status (STRING): Status of the scan.

enc.operation.completed

Severity

NOTICE

Description

This message occurs when rekey or conversion to encryption operation is completed in a flexible volume.

Corrective Action

(None).

Syslog Message

%s operation is completed in the volume '%s' (aggr '%s').

Parameters

op (STRING): Rekey or conversion operation.
volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.

enc.operation.disableAid

Severity

NOTICE

Description

This message occurs when the system automatically disables the Aggregate Inline Deduplication (AID) feature for a volume as it is converted from a non-encrypted volume to an encrypted volume because AID is not supported for an encrypted volume.

Corrective Action

(None).

Syslog Message

AID is disabled for volume %s within aggregate %s during conversion to encryption operation.

Parameters

volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.

enc.operation.failure

Severity

ERROR

Description

This message occurs when there is a failure in encryption operation. The operation description explains the nature of operation and reason for failure.

Corrective Action

Ensure that there is enough space in the aggregate, cluster is healthy, volume location database is online, and then retry the volume encryption operation.

Syslog Message

Failure in %s operation on volume '%s' (aggr '%s'). Reason '%s'.

Parameters

op (STRING): Rekey or conversion operation.
volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.
desc (STRING): Describes the reason for the failure of operation with arguments.

enc.operation.started

Severity

NOTICE

Description

This message occurs when rekey or conversion to encryption operation is started in a flexible volume.

Corrective Action

(None).

Syslog Message

%s operation is started in the volume '%s' (aggr '%s').

Parameters

op (STRING): Rekey or conversion operation.
volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.

encryption events

encryption.op events

encryption.op.completed

Severity

NOTICE

Description

This message occurs when a rekey or conversion to encryption operation is completed on a volume.

Corrective Action

(None).

Syslog Message

%s operation is completed on the volume '%s' in Vserver '%s'.

Parameters

op (STRING): Rekey or conversion operation.
volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.

encryption.op.paused.by.user

Severity

NOTICE

Description

This message occurs when a rekey or conversion to encryption operation is paused as a result of an operator request.

Corrective Action

(None).

Syslog Message

%s operation is paused by user on the volume '%s' in Vserver '%s'.

Parameters

op (STRING): Rekey or conversion operation.
volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.

encryption.op.paused.on.err

Severity

ERROR

Description

This message occurs when a rekey or conversion to encryption operation is paused as a result of an error. If it is a rekey operation, volume uses two encryption keys until the rekey operation is completed. New writes and rekeyed blocks use the new key, while the data written before the rekey start still use the old key in the read path. If it is a conversion to encryption operation, new writes and converted blocks use the key, while data written before conversion does not use any key in the read path. Data access continues to be possible, although performance might be degraded.

Corrective Action

For ASA r2, contact NetApp technical support for assistance to resume the encryption operation. For all other systems, determine the cause of the error by using either the "volume encryption rekey show -vserver <vserver-name> -volume <volume-name>" command or the "volume encryption conversion show -vserver <vserver-name> -volume <volume-name>" command. Correct the error. If the error is related to rekeying, continue the operation by using the "volume encryption rekey resume -vserver <vserver-name> -volume <volume-name>" command. If the error is related to conversion to encryption, continue by using the "volume encryption conversion resume -vserver < vserver-name> -volume <volume-name>" command.

Syslog Message

%s operation on volume "%s" in SVM "%s" is paused due to an error. Reason '%s'.

Parameters

op (STRING): Rekey or conversion operation.
volumename (STRING): Name of the volume.
vservername (STRING): Name of the storage virtual machine (SVM).
reason (STRING): Reason for the failure.

encryption.op.queued

Severity

NOTICE

Description

This message occurs when a plaintext volume is queued for encryption.

Corrective Action

(None).

Syslog Message

Volume %s in Vserver %s is queued for %s.

Parameters

volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.
op (STRING): Conversion operation.

encryption.op.started

Severity

NOTICE

Description

This message occurs when a rekey or conversion to encryption operation is started on a volume.

Corrective Action

(None).

Syslog Message

%s operation is started on the volume '%s' in Vserver '%s'.

Parameters

op (STRING): Rekey or conversion operation.
volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.

encryption.queue events

encryption.queue.op.failed

Severity

ERROR

Description

This message occurs when an operation on the volume in the encryption queue failed.

Corrective Action

Check the reason for the failure included in the message. Correct the issue and try the operation again.

Syslog Message

%s operation failed on the queued volume '%s' in Vserver '%s'. Reason: %s.

Parameters

op (STRING): Conversion operation.
volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.
reason (STRING): Reason for the failure.

esh events

esh.async events

esh.async.error

Severity

ERROR

Description

This message occurs when there is an error allocating memory for an asynchronous message during disk shelf discovery processing.

Corrective Action

If the error occurs upon addition of a disk shelf to a running system, disconnect the shelf and reattach it. If the error occurs during boot, reboot the controller.

Syslog Message

Could not allocate memory for an asynchronous message.

Parameters

(None).

esh.auto events

esh.auto.term.error

Severity

ERROR

Description

This message occurs when there is an error in autotermination. Major causes of this include: 1) Last disk shelf in the loop has the termination switch set improperly. 2) Communication is lost to some number of disk shelves in the loop due to an incorrect speed setting for DS14mk2 disk shelves, a bad cable connection, or unavailable power.

Corrective Action

Use the 'fcstat device_map' command to verify that all disk shelves in the loop are still accessible. If the disk shelf reporting the autotermination event is not the last disk shelf in the loop, a problem exists with some number of disk shelves in the loop. Check the speed, power, and cabling of all disk shelves in the loop after the disk shelf reporting the autotermination.

Syslog Message

AUTO TERMINATION ERROR: TERM switch set improperly on ESH %s on channels %s disk shelf ID %d.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.bypass events

esh.bypass.err.disk

Severity

ERROR

Description

This message occurs when there is a disk bypass event. It indicates that a disk is bypassed by the embedded switched hub (ESH) due to one of the following reasons: Manually bypassed; Transmitter fault; LIP F8; Data timeout; Receiver loss of signal; Comma loss of signal; Loop test before insert failure; Redundant port configuration; Exceeded stall threshold; Exceeded word error threshold; Exceeded CRC error threshold; or Exceeded clock delta error threshold.

Corrective Action

Replace the bypassed disk.

Syslog Message

Disk %s%son channels %s disk shelf ID %d %s%s%s.

Parameters

diskID (STRING): Disk that is being bypassed.
disk_data (STRING): disk data includes vendor name, model, firmware revision and the serial number of the disabled disk. If won't bw able to access the disk then this field will be blank.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.
element (STRING): ESH module designator (A is the upper module, B is the lower module).
bay (STRING): Bay in which the disk is installed.
reason (STRING): Reason the disk was bypassed.

esh.bypass.host.port

Severity

ALERT

Description

This message occurs when there is a host port bypass event. It indicates that a host port is bypassed by the embedded switched hub (ESH) due to one of the following reasons: Manually bypassed; Transmitter fault; LIP F8; Data timeout; Receiver loss of signal; Comma loss of signal; Loop test before insert failure; Redundant port configuration; Exceeded stall threshold; Exceeded word error threshold; Exceeded CRC error threshold; or Exceeded clock delta error threshold.

Corrective Action

Replace the disk shelf module to which the concerned host port belongs.

Syslog Message

%s on channels %s disk shelf ID %d %s%s.

Parameters

portID (STRING): Host port that is being bypassed.

channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.
element (STRING): ESH module designator (A is the upper module, B is the lower module).
reason (STRING): Reason the host port was bypassed.

esh.element events

esh.element.fault

Severity

ERROR

Description

This message occurs when the filer cannot communicate with the ESH module.

Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

Syslog Message

State of ESH module %s is %s on channels %s disk shelf id %d

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
state (STRING): Current state of ESH Module.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.element.xport.error

Severity

ERROR

Description

This message occurs when there is a transport error.

Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

Syslog Message

ESH %s XPORT ERROR on channels %s disk shelf ID %d.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).

channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.init events

esh.init.error

Severity

ERROR

Description

This message occurs when the system cannot allocate memory for a required service. The controller might not have sufficient memory to run the operating system, or installed memory is not functioning properly.

Corrective Action

Contact NetApp technical support.

Syslog Message

Could not allocate memory for ESH globals.

Parameters

(None).

esh.module events

esh.module.multiprob

Severity

ERROR

Description

This message occurs when the ESH might have failed because it is reporting multiple problems.

Corrective Action

Replace the ESH module if the reported multiple problems are not valid.

Syslog Message

channels %s disk shelf ID %d %s%s.

Parameters

channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.
element (STRING): ESH module designator (A is the upper module, B is the lower module).
reason (STRING): Reason the message is being sent.

esh.pctl events

esh.pctl.bpCPLDFailed

Severity

ERROR

Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the backplane CPLD (Complex Programmable Logic Device) is not operational.

Corrective Action

Power-cycle the disk shelf. If the problem persists, replace the disk shelf.

Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. Backplane CPLD (Complex Programmable Logic Device) in the disk shelf is not operational.

Parameters

loopID (INT): Loop ID of the disk for which the 'power control' command failed.
vendor (STRING): Vendor name of the disk.
model (STRING): Model name of the disk.
fwrev (STRING): Firmware revision of the disk.
serno (STRING): Serial number of the disk.
shelfID (INT): Disk shelf ID of the disk shelf that reported an error.
channelName (STRING): Name of the Fibre Channel adapter port.

esh.pctl.connFailed

Severity

ERROR

Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the CPLD (Complex Programmable Logic Device) serial link on the specified module has a problem.

Corrective Action

Replace the specified I/O module.

Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. The CPLD (Complex Programmable Logic Device) serial link on I/O module %s has a problem.

Parameters

loopID (INT): Loop ID of the disk for which the 'power control' command failed.
vendor (STRING): Vendor name of the disk.
model (STRING): Model name of the disk.
fwrev (STRING): Firmware revision of the disk.
serno (STRING): Serial number of the disk.
shelfID (INT): Disk shelf ID of the disk shelf that reported an error.
channelName (STRING): Name of the Fibre Channel adapter port.
module (STRING): Name of the module with a bad CPLD serial link.

esh.pctl.modCPLDFailed

Severity

ERROR

Description

This message occurs when a 'power control' command cannot be performed on the specified disk device because the CPLD (Complex Programmable Logic Device) on an I/O module is not operational.

Corrective Action

Replace the specifed I/O module.

Syslog Message

Cannot execute a 'power control' command on disk %d [%s:%s:%s] serial number [%s] in disk shelf %d on channel %s. The CPLD (Complex Programmable Logic Device) on I/O module %s is not operational.

Parameters

loopID (INT): Loop ID of the disk for which the 'power control' command failed.
vendor (STRING): Vendor name of the disk.
model (STRING): Model name of the disk.
fwrev (STRING): Firmware revision of the disk.
serno (STRING): Serial number of the disk.
shelfID (INT): Disk shelf ID of the disk shelf that reported an error.
channelName (STRING): Name of the Fibre Channel adapter port.
module (STRING): I/O module with the failed CPLD.

esh.speed events

esh.speed.error

Severity

ERROR

Description

This message occurs when there is an error in the link speed of the disk shelves that are attached to the node. Major causes of this include: 1) Last disk shelf in the loop has the termination switch set improperly. 2) Communication is lost to some number of disk shelves in the loop due to an incorrect speed setting for DS14mk2 disk shelves, a bad cable connection, or unavailable power.

Corrective Action

Use the 'fcstat device_map' command to verify that all disk shelves in the loop are still accessible. Check the speed, power, and cabling of all disk shelves in the loop after the disk shelf reporting the autotermination.

Syslog Message

Disk shelf previously connected to the OUT port of ESH %s on channels %s disk shelf ID %d is now inaccessible. (Check cables, speed selection.)

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED

if unconnected.

shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.term events

esh.term.error

Severity

ERROR

Description

This message occurs when there is an error related to loop termination.

Corrective Action

Set the termination switch to the OFF position on the ESH module that is reporting the error.

Syslog Message

FORCED TERMINATION ERROR: TERM switch set improperly on ESH %s on channels %s disk shelf ID %d. The disk shelf connected to the OUT port of this ESH module is inaccessible.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.unable events

esh.unable.add.shelf

Severity

ERROR

Description

This message occurs when a disk shelf cannot be added due to a memory allocation failure during disk shelf discovery processing.

Corrective Action

If the error occurs upon addition of a disk shelf to a running system, disconnect the shelf and reattach it. If the error occurs during boot, reboot the controller.

Syslog Message

Could not perform disk shelf add because of memory allocation failure (%s).

Parameters

name (STRING): Where in the disk shelf add path the error occurred.

esh.unexpected events

esh.unexpected.status

Severity

ALERT

Description

This message occurs when a disk shelf reports an unknown status.

Corrective Action

Ensure that the shelf module firmware and ONTAP® software are compatible versions. Find firmware versions at the NetApp technical support web site.

Syslog Message

Unexpected ESH status of: %d.

Parameters

status (INT): Unexpected/unknown status code that was received.

esh.xfer events

esh.xfer.element.fault

Severity

ERROR

Description

This message occurs when an element is unreachable during an I/O request. It might be due to a transient condition in loop connectivity.

Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

Syslog Message

I/O failure on ESH module %s on channels %s disk shelf id %d, status is %s.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.
state (STRING): State of ESH module.

esh.xfer.not.sent

Severity

ERROR

Description

This message occurs when an I/O transfer cannot be sent. It might be due to a transient condition in loop connectivity.

Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

Syslog Message

ESH %s I/O failure NOT_SENT channels %s disk shelf ID %d.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.xfer.pctl.error

Severity

ERROR

Description

This message occurs when an error is encountered while sending a disk 'power control' command to SCSI Enclosure Services (SES).

Corrective Action

Check the cabling to the disk shelf. Verify that the SES disk drives in slots 0 and 1 are properly seated. Check the status LEDs on the disk shelf and make sure that the fault LEDs are not lit. Clear any fault condition, if possible. See the quick reference cards beneath the fault disk shelf for information about interpreting the LEDs.

Syslog Message

Error sending disk 'power control' command to SCSI Enclosure Services (SES) in disk shelf %d on channel %s.

Parameters

shelfID (INT): Disk shelf ID of the disk shelf that reported an error.
channelName (STRING): Name of the Fibre Channel adapter port.

esh.xfer.unknown.error

Severity

ERROR

Description

This message occurs when there is an unknown error during an I/O request.

Corrective Action

Contact NetApp technical support.

Syslog Message

ESH %s I/O failure UNKNOWN: %d channels %s disk shelf ID %d.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
status (INT): Error status code.
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

esh.xfer.xport.error

Severity

ERROR

Description

This message occurs when there is a transport error during an I/O request. It might be due to a transient condition in loop connectivity.

Corrective Action

Check the cabling to the disk shelf. Verify that the SCSI Enclosure Services (SES) disk drives (0-1) are properly inserted. Check the status LED on the disk shelf, making sure that the fault LEDs are not lit. Clear any fault condition, if possible. Refer to the quick reference card beneath the disk shelf for information about the meanings of the LEDs.

Syslog Message

ESH %s I/O failure TRANSPORT_ERROR channels %s disk shelf ID %d.

Parameters

element (STRING): ESH module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID (1-7) of the disk shelf reporting the error.

exports events

exports.anon events

exports.anon.noCredForId

Severity

ERROR

Description

This message occurs when we cannot get UNIX credentials for a user id when evaluating the "-anon" portion of an export-policy rule.

Corrective Action

If "-anon" is a UID, ensure that a valid UID exists on the configured name servers. If "-anon" is a username, ensure that a mapping exists between the username and the UID on the configured name servers and the resulting UID is also present.

Syslog Message

Cannot retrieve credentials for UID "%u" present in the "-anon" entry for the export-policy rule for Vserver "%d".

Parameters

anonId (INT): UNIX UID for which we cannot acquire credentials.
vserver (INT): Identifier of the Vserver owning the export-policy.

exports.dns events

exports.dns.config

Severity

ERROR

Description

This message occurs when a name services lookup request finds that DNS is configured as an ns-switch source for hosts, but DNS is not configured for the Vserver. Name services lookups using DNS do not function.

Corrective Action

Check the ns-switch sources for hosts database configured for the Vserver using "vserver services name-service ns-switch show -database hosts" and the DNS configuration for the Vserver using "vserver services name-service dns show". Either remove DNS as an ns-switch source, or configure DNS using the "vserver services name-service dns create" command.

Syslog Message

DNS is configured as a ns-switch source for hosts, but the DNS configuration is not found for Vserver "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.

exports.dom events

exports.dom.notFound

Severity

ERROR

Description

This message occurs when the reverse lookup record mapping an IP address to its hostname cannot be found in the configured name servers. This record must be present to evaluate the export-policy rule that has a domain name in its clientmatch entry.

Corrective Action

The reverse mapping record might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

Syslog Message

IP address "%s" does not have a reverse mapping for its corresponding hostname in the configured name servers when evaluating the export-policy rule at index "%u" in policy-id "%llu" for Vserver "%s".

Parameters

ipaddr (STRING): IP address of the client that does not have the reverse lookup record.
ruleindex (INT): Index of the export-policy rule for which the problem is occurring.
policyid (LONGINT): Identifier for the export-policy owning the export-policy rule.
vserver (STRING): Name of the data Vserver for which the problem is occurring.

exports.dom.transient

Severity

ERROR

Description

This message occurs when reverse lookup of the IP address of a client using the configured name servers in a data Vserver is unsuccessful for an export-policy rule that uses the domain name in clientmatch.

Corrective Action

The name service might not be functioning correctly. Check the configuration with the appropriate tools for each name service.

Syslog Message

IP address "%s" could not be resolved to a hostname (error %d) when evaluating export-policy rule at index "%u" in policy-id "%llu" in Vserver "%s".

Parameters

ipaddr (STRING): IP address of the client encountering the reverse lookup error.
retcode (INT): Error code returned by the name service reverse lookup.
ruleindex (INT): Index of the export-policy rule for which the problem is occurring.
policyid (LONGINT): Identifier for the export-policy owning the export-policy rule.
vserver (STRING): Name of the data Vserver for which the problem is occurring.

exports.hostname events

exports.hostname.notFound

Severity

INFORMATIONAL

Description

This message occurs when the forward lookup record mapping a host name to its IP address is not found in the configured name servers in a Vserver. This record must be present to evaluate the export-policy rule that has a host name in its clientmatch entry.

Corrective Action

Ensure that the host has an interface configured for this address family, that the host name is correctly entered, that the host was not inadvertently removed from the name service, or that the host name was never entered at all. If the host should have an address for this address family, then check the configuration by using the appropriate tools for each name service.

Syslog Message

Hostname "%s" does not have a forward mapping for its corresponding %s address in the configured name servers when evaluating the export-policy rule at index "%u" in policy-id "%llu" for Vserver "%s".

Parameters

hostname (STRING): Name of the host that is not found.
addrfamily (STRING): Name of the address family for which the problem occurs.
ruleindex (INT): Index of the export-policy rule for which the problem occurs.
policyid (LONGINT): Identifier for the export-policy that owns the export-policy rule.
vserver (STRING): Name of the Vserver for which the problem occurs.

exports.hostname.transient

Severity

ERROR

Description

This message occurs when a host named in a clientmatch entry of an export-policy rule is not resolved to an IP address using the configured name servers in a data Vserver.

Corrective Action

Ensure that the name service is functioning correctly by checking the configuration by using the appropriate tools for each name service.

Syslog Message

Hostname "%s" could not be resolved to an %s address (error %d) when evaluating export-policy rule at index "%u" in policy-id "%llu" on Vserver "%s".

Parameters

hostname (STRING): Name of the host that is not resolved.
addrfamily (STRING): Name of the address family for which the problem occurs.
retcode (INT): Error code returned by the name service lookup.
ruleindex (INT): Index of the export-policy rule for which the problem occurs.

policyid (LONGINT): Identifier for the export-policy that owns the export-policy rule.
vserver (STRING): Name of the data Vserver for which the problem occurs.

exports.netgroup events

exports.netgroup.dnsNoPtrRec

Severity

ERROR

Description

This message occurs when the reverse lookup record mapping an IP address to its hostname cannot be found in the configured name servers. This record must be present to evaluate the membership of a hostname in the netgroup named in the clientmatch of an export-policy rule.

Corrective Action

The reverse mapping record might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

Syslog Message

IP address "%s" does not have a reverse mapping for its corresponding hostname in the configured name servers when evaluating the export-policy rules for netgroup "%s" on Vserver "%s".

Parameters

ipaddr (STRING): IP address of the client that does not have the reverse lookup record.
netgroup (STRING): Name of the netgroup that is being evaluated.
vserver (STRING): Name of the Vserver for which the problem is occurring.

exports.netgroup.notFound

Severity

ERROR

Description

This message occurs when a netgroup named in a clientmatch of an export-policy rule is not found in the configured name servers.

Corrective Action

The netgroup name might have been incorrectly entered, inadvertently removed from the name service, or never entered at all. Check the configuration with the appropriate tools for each name service.

Syslog Message

Netgroup "%s" cannot be found when evaluating export-policy rules on Vserver "%s".

Parameters

netgroup (STRING): Name of the netgroup that is not being found.
vserver (STRING): Name of the Vserver for which the problem is occurring.

exports.netgroup.partial

Severity

ERROR

Description

This message occurs when partial netgroup results are returned by the name services because of errors in the netgroup mapping.

Corrective Action

If the netgroup mapping is greater than 1024 characters for netgroups on Network Information Service (NIS) or 4096 for netgroups in a local file, consider creating a sub netgroup to divide it. If the nesting of the netgroup is too deep, consider reducing the depth by adding the entries directly to the netgroup instead of adding to sub netgroups. If the netgroup has a sub netgroup that is not available as a top level netgroup in the mapping, add an empty entry for the sub netgroup to resolve the error. Ensure the line length and nesting limits are not exceeded.

Syslog Message

Netgroup %s expansion failed with %s (error: %d) when evaluating export-policy rules on Vserver "%s".

Parameters

netgroup (STRING): Name of the netgroup that could not be expanded.
reason (STRING): Specific reason for the netgroup expansion failure.
error (INT): Error code returned during netgroup expansion.
vserver (STRING): Name of the Vserver in which the problem is occurring.

exports.ngbh events

exports.ngbh.allFailed

Severity

ERROR

Description

This message occurs when a netgroup by host request fails because all ns-switch sources for the netgroup database have returned connection errors and files are unusable as a source.

Corrective Action

There might be temporary connectivity issues with the Vserver's configured ns-switch sources for the netgroup database. Check connectivity to the name servers configured for netgroups.

Syslog Message

Connectivity issues encountered in all ns-switch sources when matching Client IP "%s" in Netgroup "%s" for Vserver "%s".

Parameters

client (STRING): IP address of the client for which the lookup failed.
netgroup (STRING): Name of the netgroup being evaluated.
vserver (STRING): Name of the Vserver where the problem is occurring.

exports.nsdb events

exports.nsdb.anonNameToId

Severity

ERROR

Description

This message occurs when a user string cannot be mapped to a user id when evaluating the "-anon" portion of an export-policy rule.

Corrective Action

If the "-anon" value is a name, ensure that a mapping from that name to a UID exists in the configured name services. For both a name and a UID entry in "-anon", ensure that the resulting UID exists in the configured name services.

Syslog Message

Cannot retrieve UID for UNIX username "%s" present in the "-anon" entry for the export-policy rule for Vserver "%d".

Parameters

anon (STRING): Anonymous string that cannot be mapped to a user id.
vserver (INT): Name of the Vserver owning the export-policy.

exports.policy events

exports.policy.empty

Severity

NOTICE

Description

This message occurs when an export policy with no rules is assigned to a volume or a qtree. Such an empty policy makes the volume or qtree inaccessible to NFS and CIFS protocol clients.

Corrective Action

If access is needed for the volume or qtree, then create an export policy rule using the "export-policy rule create" command.

Syslog Message

An export policy "%s" with no rules was assigned to a %s "%s" on the Vserver %s.

Parameters

policyName (STRING): Name of the export policy with no rules.
type (STRING): Type of object (volume or qtree).
typeName (STRING): Name of the volume or qtree.
vserver (STRING): Name of the Vserver with this issue.

exports.policy.last.rule

Severity

ERROR

Description

This message occurs when the last rule from the export policy assigned to a volume or qtree is deleted. An empty policy will make the volume or qtree inaccessible to clients using NFS or CIFS protocol.

Corrective Action

If access is needed for the volume or qtree, then create an export policy rule using the "export-policy rule create" command.

Syslog Message

The last rule from export policy "%s" was deleted on Vserver %s.

Parameters

policyName (STRING): Name of the export policy from which the rule is being deleted.
vserver (STRING): Name of the Vserver where the issue occurs.

exports.policy.rule.limit

Severity

ALERT

Description

This message occurs when the export-policy rule count is beyond the supported value.This can lead to ONTAP service disruption.

Corrective Action

There are two possible actions. Delete an existing export policy rule using the "vserver export-policy rule delete" command, then create the new policy rule again. Use an existing export policy rule that is configured the same way as the desired new rule. Modify the existing rule's "-clientmatch" property to include the client list/netgroups/netmask/domain needing to be added. See the "vserver export-policy rule modify" man page for more details.For more information, contactNetApp technical support.

Syslog Message

The cluster export policy rule limit (%s rules) has crossed the supported value.

Parameters

ruleLimit (STRING): Count of the export policy rule cluster limit.

extcache events

extcache.aggregate events

extCache.aggregate.invalidate

Severity

INFORMATIONAL

Description

This message provides diagnostic information about background work taking place in the WAFL® external cache subsystem.

Corrective Action

(None).

Syslog Message

WAFL external cache: %s

Parameters

detail (STRING): Specific diagnostic information related to the aggregate invalidation event.

extcache.configunsupported events

extCache.configUnsupported

Severity

ERROR

Description

This message occurs when the controller contains an external cache hardware configuration that cannot be supported on the controller.

Corrective Action

Consult the release documentation, check the Interoperability Matrix Tool (IMT) for a supported configuration, or contact Contact NetApp technical support. to understand and correct the hardware configuration.

Syslog Message

WAFL external cache hardware configuration is not supported: %s.

Parameters

description (STRING): String providing information about why the configuration is unsupported.

extcache.control events

extCache.control

Severity

NOTICE

Description

This message occurs when the external cache software cannot signal its administrative thread.

Corrective Action

(None).

Syslog Message

WAFL external cache: %s

Parameters

detail (STRING): Specific details of the event.

extcache.disabled events

extCache.disabled

Severity

NOTICE

Description

This message occurs when the external cache is administratively disabled.

Corrective Action

(None).

Syslog Message

WAFL external cache administratively disabled

Parameters

(None).

extcache.enabled events

extCache.enabled

Severity

NOTICE

Description

This message occurs when the external cache is administratively enabled.

Corrective Action

(None).

Syslog Message

WAFL external cache administratively enabled

Parameters

(None).

extcache.io events

extCache.io.BlockChecksumError

Severity

ERROR

Description

This message occurs when the external cache detects a block checksum verification error while performing a read operation. Checksum errors are infrequent. Some combinations of external cache hardware and software handle these errors automatically without the need for adminstrator action. If further action is required, other messages will be generated. The operation will be retried from persistent storage (RAID).

Corrective Action

(None).

Syslog Message

(None).

Parameters

block_num (INT): Block number that failed checksum verification.

extCache.io.extInfo

Severity

NOTICE

Description

This message accompanies read or write errors and prints out any relevant information about the failure.

Corrective Action

(None).

Syslog Message

%s: fbn: %lld, pvbn: %lld, vvbn: %lld, inum: %d, ecbn: %lld, vol: %s, aggr: %s.

Parameters

description (STRING): String providing information about the message.
fileBlockNum (LONGINT): fbn of the block that errored.
physBlockNum (LONGINT): pvbn of the block that errored.
volBlockNum (LONGINT): vvbn of the block that errored.
fileId (INT): Inode number of the file that owns the block.
ECblockNum (INT): The ecbn of the block.
volName (STRING): Name of the volume.
aggrName (STRING): Name of the aggregate.

extCache.io.readError

Severity

NOTICE

Description

This message occurs when the external cache detects an error on a read. Read errors are infrequent and are usually handled automatically by the external cache without the need for administrator action. The operation will be retried from persistent storage (RAID).

Corrective Action

(None).

Syslog Message

WAFL external cache I/O read error: %s, code %d.

Parameters

description (STRING): String providing information about why the operation failed.
detail (INT): Detailed error code about why the operation failed.

extCache.io.writeError

Severity

NOTICE

Description

This message occurs when the external cache detects an error on a write. Write errors are infrequent and are usually handled automatically by the external cache without the need for adminstrator action.

Corrective Action

(None).

Syslog Message

WAFL external cache I/O write error: %s, code %d.

Parameters

description (STRING): String providing information about why the operation failed.
detail (INT): Detailed error code about why the operation failed.

extcache.offline events

extCache.offline

Severity

ERROR

Description

This message occurs when the external cache is automatically taken offline. This can happen after an I/O error on the external cache and may result in degraded performance until the problem is corrected.

Corrective Action

(Call support).

Syslog Message

External cache has been taken offline on error (rc=%d). Check the EMS log for earlier errors.

Parameters

code (INT): A unique error code for this event.

extcache.qos events

extCache.QoS

Severity

INFORMATIONAL

Description

This message occurs when External Cache Quality of Service (QoS) monitoring is enabled/disabled.

Corrective Action

(None).

Syslog Message

External Cache QoS is: %s.

Parameters

description (STRING): State of External Cache QoS

extcache.restart events

extCache.restart

Severity

NOTICE

Description

This message occurs when the external cache encounters an internal consistency issue and triggers an automatic reset.

Corrective Action

(None).

Syslog Message

WAFL external cache reset: %s

Parameters

detail (STRING): String providing additional information about what triggered the reset.

extcache.rw events

extCache.rw.alloc

Severity

NOTICE

Description

This message occurs when an external cache cannot obtain sufficient system resources. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache could not allocate resources: %s.

Parameters

description (STRING): String identifying the specific resources that were not obtained.

extCache.rw.canceled

Severity

NOTICE

Description

This message occurs when the external cache cannot complete cache rewarming. This causes the external cache component to start with no data cached, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache reconstruct was canceled.

Parameters

(None).

extCache.rw.configChange

Severity

INFORMATIONAL

Description

This message occurs when the external cache warming logic detects a change in cache hardware configuration. This causes the external cache component to start with no data cached for any aggregates, which can cause a temporary performance impact. The problem should resolve itself at the next reboot.

Corrective Action

(None).

Syslog Message

WAFL external cache warming aborted due to hardware configuration change.

Parameters

(None).

extCache.rw.emptyCache

Severity

INFORMATIONAL

Description

This message occurs when the external cache warming process terminates due to a lack of active cache entries.

Corrective Action

(None).

Syslog Message

WAFL external cache warming canceled: cache is not in use.

Parameters

(None).

extCache.rw.entry

Severity

NOTICE

Description

This message occurs when the external cache cannot rebuild cache entries from stored data. This event is caused by an internal error and results in a small portion of the cache remaining empty during rewarming.

Corrective Action

(None).

Syslog Message

WAFL external cache experienced an internal error during reconstruct.

Parameters

(None).

extCache.rw.headerInvalid

Severity

NOTICE

Description

This message occurs when the external cache warming process encounters an invalid file header. This causes the external cache component to start with no data cached for one or all aggregates, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache warming encountered an invalid file header: %s.

Parameters

section (STRING): String identifying the header section in question.

extCache.rw.io.readLimit

Severity

NOTICE

Description

This message occurs when the external cache exceeds the allowable threshold for I/O errors on reads. This causes the external cache component to start with no data cached for any aggregates and might result in temporarily degraded performance.

Corrective Action

(None).

Syslog Message

WAFL external cache warming encountered too many read errors: %s (%d).

Parameters

description (STRING): String providing information about the operation.
number (INT): Number of unsuccessful reads detected.

extCache.rw.io.write

Severity

INFORMATIONAL

Description

This message occurs when the external cache detects an I/O error on a write. This causes the external cache component to be unable to reconstruct portions of the cache and might result in slightly degraded performance.

Corrective Action

(None).

Syslog Message

WAFL external cache I/O write: %s, code %d.

Parameters

description (STRING): String providing information about the operation.
detail (INT): Detailed error code about the operation.

extCache.rw.io.writeLimit

Severity

NOTICE

Description

This message occurs when the external cache exceeds the allowable threshold for I/O errors on writes. This causes the external cache component to start with no cached data for any aggregates and might result in temporarily degraded performance.

Corrective Action

(None).

Syslog Message

WAFL external cache warming encountered too many write errors: %s (%d).

Parameters

description (STRING): String providing information about the operation.
number (INT): Number of unsuccessful writes detected.

extCache.rw.log.bufLoad

Severity

NOTICE

Description

This message occurs when the external cache invalidation log cannot load a WAFL® buffer. This causes the external cache component to be unable to rewarm the aggregate in question after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache invalidation log buf could not be loaded: aggregate %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.

extCache.rw.log.disabled

Severity

NOTICE

Description

This message occurs when external cache invalidation logging is disabled for an aggregate. This causes the external cache component to be unable to rewarm that aggregate after a reboot, which might cause a

temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache invalidation log disabled: aggregate %s: %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
reason (STRING): String indicating the cause of the problem.

extCache.rw.log.freeSpace

Severity

NOTICE

Description

This message occurs when an external cache log file cannot be written due to lack of free space. This causes the external cache component to be unable to rewarm a specific aggregate or the entire cache after a reboot, which might cause a temporary performance impact.

Corrective Action

Make sufficient space available on the aggregate.

Syslog Message

WAFL external cache log out of space on aggregate %s (needs %d bytes).

Parameters

aggregate (STRING): String identifying the aggregate that experienced the failure.
bytes (INT): Number of free bytes needed to successfully open the log file.

extCache.rw.log.maxSize

Severity

NOTICE

Description

This message occurs when an external cache log file reaches its maximum size. This causes the external cache component to be unable to rewarm a specific aggregate or the entire cache after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache log reached maximum size: aggregate %s, log %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
logtype (STRING): String identifying the log file that reached the maximum size.

extCache.rw.log.open

Severity

NOTICE

Description

This message occurs when the external cache cannot open a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache log could not be opened: aggregate %s, log %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
logtype (STRING): String identifying the type of log file that could not be opened.

extCache.rw.log.range

Severity

NOTICE

Description

This message occurs when the external cache invalidation log has a block address that is not within an aggregate's address range. This causes the external cache component to be unable to rewarm the aggregate in question after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache invalidation log block out of range: aggregate %s block %lld.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the failure.
block (LONGINT): Block encountered in the invalidation log.

extCache.rw.log.read

Severity

NOTICE

Description

This message occurs when the external cache cannot read from a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates during a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache log could not be read: aggregate %s, log %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
logtype (STRING): String identifying the log file that could not be read.

extCache.rw.log.seek

Severity

NOTICE

Description

This message occurs when the external cache cannot manipulate a log file. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache log could not be read: aggregate %s, log %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
logtype (STRING): String identifying the log file that could not be read.

extCache.rw.log.write

Severity

NOTICE

Description

This message occurs when the external cache cannot write to a log file. This causes the external cache component to be unable to rewarm some or all of the cached aggregates after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache log could not be written: aggregate %s, log %s.

Parameters

aggregate (STRING): String identifying the aggregate that experienced the problem.
logtype (STRING): String identifying the log file that could not be written.

extCache.rw.replay.canceled

Severity

NOTICE

Description

This message occurs when the external cache cannot successfully process the invalidation logs for an individual aggregate. This causes the external cache component to start with no data cached for the aggregate, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache replay canceled for aggregate %s: %s.

Parameters

aggregate (STRING): String identifying the aggregate in question.
description (STRING): String providing information about the operation.

extCache.rw.replay.complete

Severity

INFORMATIONAL

Description

This message occurs when the external cache finishes processing the invalidation logs for an individual aggregate.

Corrective Action

(None).

Syslog Message

WAFL external cache warming replay complete for aggregate %s with invalidation log %d%% full.

Parameters

aggregate (STRING): String identifying the aggregate in question.
percent (INT): Percentage of ilog that is full.

extCache.rw.replay.start

Severity

INFORMATIONAL

Description

This message occurs when the external cache begins processing the invalidation logs for an individual aggregate.

Corrective Action

(None).

Syslog Message

WAFL external cache warming replay has begun for aggregate %s.

Parameters

aggregate (STRING): String identifying the aggregate in question.

extCache.rw.replay.timeout

Severity

NOTICE

Description

This message occurs when the external cache timed out waiting for an aggregate to come online and purged old cache entries for it. This causes the external cache component to start with no data cached for the aggregate, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache replay timed out for aggregate %s.

Parameters

aggregate (STRING): String identifying the aggregate in question.

extCache.rw.snap.canceled

Severity

NOTICE

Description

This message occurs when the external cache cannot save a warming snapshot copy. This causes the external cache component to be unable to rewarm after a reboot, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache snapshot copy canceled: %s.

Parameters

description (STRING): String providing information about why the operation was canceled.

extCache.rw.terminated

Severity

NOTICE

Description

This message occurs when the external cache warming process is terminated. This causes the external cache component to start with no data cached for any aggregates, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache warming process terminated.

Parameters

(None).

extCache.rw.timeout

Severity

NOTICE

Description

This message occurs when the external cache warming process terminates after exceeding its allowed time. This causes the external cache component to start with a subset of cached data, which might cause a temporary performance impact.

Corrective Action

(None).

Syslog Message

WAFL external cache warming process exceeded its maximum allowable time and was aborted.

Parameters

(None).

extcache.unallowed events

extCache.unallowed.option

Severity

NOTICE

Description

This message occurs when an external cache bootarg or setflag is set without the required privilege. The default value is used instead.

Corrective Action

(None).

Syslog Message

WAFL external cache %s %s is set without the required privilege; using the default value.

Parameters

    type (STRING): Whether the option set is a bootarg or a setflag.
    option (STRING): Option name.

fabric events

fabric.mgmt events

fabric.mgmt.interface

Severity

NOTICE

Description

This message occurs when the system fails to establish a management interface on the fabric.

Corrective Action

(None).

Syslog Message

Cannot establish a management (Status/Control/Maintenance) interface on fabric %s.

Parameters

fabName (STRING): Fabric name.

fabric.sdm events

fabric.sdm.mem.alloc

Severity

NOTICE

Description

This message occurs when the system fails to allocate a message for storage device monitor (SDM) notification.

Corrective Action

(None).

Syslog Message

Failed to allocate a message for SDM notification to fabric_man.

Parameters

(None).

fabriclink events

fabriclink.retry events

fabriclink.retry.delay

Severity

NOTICE

Description

This message occurs when object replication encounters an error when attempting to contact a remote object store. The attempt will be retried after a short delay.

Corrective Action

(None).

Syslog Message

Link L%u (%s) encountered OSC error %s; will retry in %u seconds.

Parameters

linkid (INT): Link ID that encountered an error.
objstore (STRING): Object store UUID that encountered an error.
error (STRING): Error that was encountered.
delay (INT): Delay (seconds) before the attempt will be retried.

fabricpool events

fabricpool.cloud events

fabricpool.cloud.subscription.added

Severity

NOTICE

Description

This message occurs when a cloud subscription license for FabricPools has been added.

Corrective Action

(None).

Syslog Message

A cloud subscription license for FabricPools has been added for license type %s. Cluster id: %s.

Parameters

license_type (STRING): The type of license that the subscription is added for.
cluster_uuid (STRING): UUID of the cluster.

fabricpool.cloud.subscription.removed

Severity

NOTICE

Description

This message occurs when a cloud subscription license for FabricPools has been removed.

Corrective Action

(None).

Syslog Message

A cloud subscription license for FabricPools has been removed for license type %s. Cluster id: %s.

Parameters

license_type (STRING): The type of license that the subscription was removed for.
cluster_uuid (STRING): UUID of the cluster.

fabricpool.full events

fabricpool.full

Severity

ERROR

Description

This message occurs when the total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has reached the license limit.

Corrective Action

To find the percentage of the licensed capacity used by each FabricPool, use the "storage aggregate object-store show-space" command. To create more space, delete snapshots from volumes with the tiering policy "snapshot" or "backup" by using the "volume snapshot delete" command. To increase the licensed capacity, install a new license on the cluster.

Syslog Message

Total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has reached the licensed limit. Cluster ID: %s. Current usage: %s, licensed capacity: %s.

Parameters

cluster_uuid (STRING): UUID of the cluster.
used_capacity (STRING): Total usage of capacity-licensed object stores.
licensed_capacity (STRING): FabricPool licensed capacity.

fabricpool.lost events

fabricpool.lost.contact.scu

Severity

ALERT

Description

This message occurs when ONTAP has lost contact with the Service Control Unit used with cloud subscription licenses.

Corrective Action

Ensure that the Service Control Unit is running and Ontap should have connectivity to it.

Syslog Message

ONTAP has lost contact with the service control unit for the license of type %s. Cluster ID: %s.

Parameters

license_type (STRING): The type of license which has lost contact with the Service Control Unit.
cluster_uuid (STRING): UUID of the cluster.

fabricpool.nearly events

fabricpool.nearly.full

Severity

ERROR

Description

This message occurs when the total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has nearly reached the license limit.

Corrective Action

To find the percentage of the licensed capacity used by each FabricPool, use the "storage aggregate object-store show-space" command. To create more space, delete snapshots from volumes with the tiering policy "snapshot" or "backup" by using the "volume snapshot delete" command. To increase the licensed capacity, install a new license on the cluster.

Syslog Message

Total, cluster-wide FabricPool space usage of object stores from capacity-licensed providers has nearly reached the licensed limit. Cluster id: %s. Current usage: %s, licensed capacity: %s.

Parameters

cluster_uuid (STRING): UUID of the cluster.
used_capacity (STRING): Total usage of capacity-licensed object stores.
licensed_capacity (STRING): FabricPool licensed capacity.

fabricpool.scu events

fabricpool.scu.contacted

Severity

NOTICE

Description

This message occurs when contact has resumed between ONTAP and the Service Control Unit that is used with cloud subscription licenses.

Corrective Action

(None).

Syslog Message

Contact has resumed between ONTAP and the service control unit for the license of type %s. Cluster ID: %s.

Parameters

license_type (STRING): The type of license which has resumed contact with the Service Control Unit.
cluster_uuid (STRING): UUID of the cluster.

fabricpool.tiering events

fabricpool.tiering.stopped.no.scu

Severity

ALERT

Description

This message occurs when ONTAP has stopped tiering data to the cloud tier because it has lost contact with the Service Control Unit used for one or more cloud subscription licenses.

Corrective Action

Ensure that the Service Control Unit is running and ONTAP should have connectivity to it.

Syslog Message

Ontap has stopped tiering data to the cloud tier because it lost contact with the Service Control Unit for the license of type %s. Cluster ID: %s.

Parameters

license_type (STRING): The type of license which has lost contact with the Service Control Unit.
cluster_uuid (STRING): UUID of the cluster.

fal_nvme events

fal_nvme.init events

fal_nvme.init.failed

Severity

ERROR

Description

This message occurs when the Flash Adaptation Layer (FAL) NVMe subsystem fails to initialize.

Corrective Action

Reboot the node. If the problem persists, contact technical support for assistance.

Syslog Message

FAL NVMe subsystem initialization failed. Reason: %s.

Parameters

reason (STRING): Reason for failure.

fal_nvme.online events

fal_nvme.online.succ

Severity

INFORMATIONAL

Description

This message occurs when the Flash Adaptation Layer (FAL) NVMe subsystem successfully brings online all resources in a caching module.

Corrective Action

(None).

Syslog Message

Successfully brought online %lu GB of the caching module.

Parameters

capacity (LONGINT): Total capacity.

fal_nvme.partition events

fal_nvme.partition.status

Severity

NOTICE

Description

This message occurs when a partition status in the Flash Adaptation Layer (FAL) changes.

Corrective Action

(None).

Syslog Message

Partition %lx-%lu with capacity %lu GiB status: %s.

Parameters

id (LONGINTHEX): Unique identifier for the partition.
ns (LONGINTHEX): Index of the namespace.
capacity (LONGINT): Partition capacity.
state (STRING): Partition state.

fc events

fc.bridge events

fc.bridge.fc.port.alert

Severity

ALERT

Description

This message occurs when an FC port goes offline.

Corrective Action

Check cables, SFPs, and connected devices. If the port is intentionally unused, use the Fibre Channel bridge CLI to disable it.

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s FC Port FC_PORT%d offline. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.fc.port.notice

Severity

NOTICE

Description

This message occurs when an FC port on the identified bridge comes online.

Corrective Action

(None).

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s FC Port FC_PORT%d connected. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.power.alert

Severity

ALERT

Description

This message occurs when an FC-to-SAS bridge power supply fails.

Corrective Action

Check input power and cable. If the problem persists, replace the power supply.

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s Power Supply %s has failed. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePowerSupply (STRING): Power supply reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.power.notice

Severity

NOTICE

Description

This message occurs when an FC-to-SAS bridge power supply returns to normal operation.

Corrective Action

(None).

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s Power supply %s operating normally. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePowerSupply (STRING): Port reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.sas.phy.alert

Severity

ALERT

Description

This message occurs when a SAS port PHY goes offline.

Corrective Action

Check Mini-SAS HD connector, cables, and connected equipment.

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port %d Phy %d offline. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
bridgePhy (INT): SAS port Phy reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.sas.phy.notice

Severity

NOTICE

Description

This message occurs when a SAS port PHY on a bridge comes online.

Corrective Action

(None).

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS port %d Phy %d online. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
bridgePhy (INT): Phy reported by the FC—to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.sas.port.alert

Severity

ALERT

Description

This message occurs when an SAS port goes offline.

Corrective Action

Check cables, SFPs, and connected devices. If the port is intentionally unused, use the Fibre Channel bridge CLI to disable it.

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port SAS_PORT%d offline. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.sas.port.notice

Severity

NOTICE

Description

This message occurs when an SAS port on the identified bridge comes online.

Corrective Action

(None).

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s SAS Port SAS_PORT%d connected. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgePort (INT): Port reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.temp.alert

Severity

ALERT

Description

This message occurs when an FC-to-SAS bridge reaches a elevated temperature threshold. The bridge will continue to operate, but action should be taken to reduce the temperature.

Corrective Action

The bridge is experiencing an elevated temperature, which indicates a loss of cooling airflow. Check cooling airflow, fan operation, and ambient temperature, and take action to reduce the FC-to-SAS bridge operating temperature. If this is not done and the temperature continues to rise, the FC-to-SAS bridge will shut down when the critical temperature threshold is reached.

Syslog Message

FC-to-SAS %s bridge with name: %s S/N: %s WWN: %s is operating at elevated temperature (%d C). %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgeTemp (INT): Temperature reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.temp.emergency

Severity

EMERGENCY

Description

This message occurs when an FC-to-SAS bridge reaches a critical temperature threshold. The bridge will shut down to protect the hardware.

Corrective Action

Take immediate action to reduce the operating temperature of the FC-to-SAS bridge to avoid hardware damage. Check cooling airflow, fan operation, and ambient temperature. The FC-to-SAS bridge will shut down when this condition is reached, and will not operate until the temperature is reduced.

Syslog Message

FC-to-SAS %s bridge with name: %s S/N: %s WWN:%s has reached critical temperature (%d C) and will soon shut down. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgeTemp (INT): Temperature reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.temp.notice

Severity

NOTICE

Description

This message occurs when an FC-to-SAS bridge returns to a normal operating temperature. No action needs to be taken, because the FC-to-SAS bridge temperature has returned to normal levels.

Corrective Action

(None).

Syslog Message

FC-to-SAS %s bridge %s S/N: %s WWN: %s temperature has returned to normal (%d C). %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.

bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
bridgeTemp (INT): Temperature reported by the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.throughput.alert

Severity

ALERT

Description

This message occurs when an FC-to-SAS bridge experiences degraded throughput.

Corrective Action

Contact NetApp technical support.

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s is experiencing degraded throughput. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fc.bridge.throughput.notice

Severity

NOTICE

Description

This message occurs when an FC-to-SAS bridge recovers from degraded throughput.

Corrective Action

(None).

Syslog Message

Fibre Channel %s Bridge %s S/N: %s WWN: %s throughput is normal. %s

Parameters

bridgeType (STRING): Type of the FC-to-SAS bridge.
bridgeName (STRING): Name of the FC-to-SAS bridge.
bridgeSerialNum (STRING): Serial number of the FC-to-SAS bridge.
bridgeWWN (STRING): World-Wide Name (WWN) of the FC-to-SAS bridge.
addlInfo (STRING): Additional information about the alert being generated, if available.

fcadmin events

fcadmin.bridge events

fcadmin.bridge.prog.disk

Severity

INFORMATIONAL

Description

This event reports the WWN written to a device.

Corrective Action

(None).

Syslog Message

Programming Disk %s LUN=%d on Path=0x%0x with WWN %02x:%02x:%02x:%02x:%02x:%02x:%02x:%02x.

Parameters

diskName (STRING): Name of the disk.
LUNid (INT): Logical Unit Number identifier.
pathAddress (INTHEX): Device address.
WWNbyte0 (INTHEX): 0th byte of World Wide Name.
WWNbyte1 (INTHEX): 1st byte of World Wide Name.
WWNbyte2 (INTHEX): 2nd byte of World Wide Name.
WWNbyte3 (INTHEX): 3rd byte of World Wide Name.
WWNbyte4 (INTHEX): 4th byte of World Wide Name.
WWNbyte5 (INTHEX): 5th byte of World Wide Name.
WWNbyte6 (INTHEX): 6th byte of World Wide Name.
WWNbyte7 (INTHEX): 7th byte of World Wide Name.

fcadmin.bridge.prog.done

Severity

INFORMATIONAL

Description

This message indicates that WWN programming has been successfully completed on a disk.

Corrective Action

(None).

Syslog Message

Disk %s LUN=%d on path=0x%0x successfully programmed. Reboot the drive to see the updated WWN.

Parameters

diskName (STRING): Name of the disk.
LUNid (INT): Logical Unit Number identifier.
pathAddress (INTHEX): Device address.

fcadmin.bridge.prog.fault

Severity

ERROR

Description

This message indicates that the attempt to write the WWN to the disk has failed.

Corrective Action

Retry the command after sometime, error might be transient.

Syslog Message

Error programming disk %s LUN=%d on path=0x%0x. Error status=0x%0x.

Parameters

diskName (STRING): Name of the disk.
LUNid (INT): Logical Unit Number identifier.
pathAddress (INTHEX): Device address.
commandStatus (INTHEX): Returned SCSI error code.

fcadmin.bridge.progWWN

Severity

INFORMATIONAL

Description

This message reports the statistics of the operation to write the World Wide Name (WWN) to the drives.

Corrective Action

(None).

Syslog Message

Total LUNs/drives reported = %d. Total LUNs/drives programmed = %d.

Parameters

reportedLUNs (INT): Total number of LUN instances reported for entire session.
programmedLUNs (INT): Total number of LUN instances programmed for entire session.

fcadmin.bridge.retrieve.fail

Severity

ERROR

Description

This event is generated when the drive is not qualified for DDB (Disk Drive Behavior) update while programming the WWNs.

Corrective Action

(None).

Syslog Message

Error retrieving DDB data for disk=%s on path=0x%0x. Drives on the current path could not be programmed with WWN.

Parameters

diskName (STRING): Name of the disk.
pathAddress (INTHEX): Device address.

fcadmin.bridge.rprt.fault

Severity

ERROR

Description

This message is generated when the Report LUNs response completed with some error.

Corrective Action

Retry the command after sometime, error might be transient.

Syslog Message

Error reported for Report LUN command on disk %s on path 0x%0x, error=0x%0x.

Parameters

diskName (STRING): Name of the disk.
pathAddress (INTHEX): Device address.
commandStatus (INTHEX): Returned SCSI error code.

fcadmin.bridge.rprtcmd.fail

Severity

ERROR

Description

This event is generated when insufficient SCSI command blocks are available for Report LUN command.

Corrective Action

Retry the command after sometime. As command blocks may have become available.

Syslog Message

Memory allocation failed for Report LUN command. No LUN instances are programmed.

Parameters

(None).

fcadmin.bridge.rprtdata.fail

Severity

ERROR

Description

This event is generated when insufficient SCSI command blocks are available for Report LUN command.

Corrective Action

Retry the command after sometime. As command blocks may have become available.

Syslog Message

Memory allocation failed for Report LUN data command, bytes Requested=%d Disk %s on Path=0x%0x.

Parameters

requestedMemory (INT): Requested memory for Report LUN data command.
diskName (STRING): Name of the disk
deviceAddress (INTHEX): Device address.

fcadmin.bridge.WWN.prog.stat

Severity

INFORMATIONAL

Description

This event is generated when the programming of the WWNs into the reported LUNs is complete. An error in programming is indicated when the number of reported LUNs is different from the number programmed.

Corrective Action

(None).

Syslog Message

WWN update completed on disk %s path 0x%0x, total %d LUNS reported, total %d LUNS programmed.

Parameters

diskName (STRING): Name of the disk.
pathAddress (INTHEX): Device address.
LUNsReported (INT): Number of LUNs reported.
LUNsProgrammed (INT): Number of LUNs programmed.

fci events

fci.adapter events

fci.adapter.bootarg.option

Severity

INFORMATIONAL

Description

This message occurs when the the Fibre Channel adapter driver is setting an option based on the setting of a bootarg variable.

Corrective Action

(None).

Syslog Message

Bootarg option "%s" configured for Fibre Channel adapter %s.

Parameters

option (STRING): Option being modified.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter (HBA).

fci.adapter.dump.saved

Severity

NOTICE

Description

This message occurs when an unexpected event or invalid condition is detected by the Fibre Channel(FC) initiator driver and the contents of the FC initiator memory is saved. Dump files are stored in a directory on the system's root volume at /etc/log, with the following directory name format: slifc_[adapterName]*[YYYYMMDD]*[HHMMSS]

Corrective Action

Send the dump file to technical support for analysis.

Syslog Message

A dump for adapter %s was stored in %s.

Parameters

adapterName (STRING): Name of the associated FC host bus adapter.
filename (STRING): Name of the file containing the dump.

fci.adapter.error

Severity

NOTICE

Description

This message occurs when the Fibre Channel adapter driver encounters an error with the adapter. The adapter will be reset to recover.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter driver encountered error "%s" on adapter %s.

Parameters

error (STRING): Type of error that occurred.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.fabric.login.failed

Severity

ERROR

Description

This message occurs when the Fibre Channel adapter cannot log in with the fabric management server.

Corrective Action

The driver will attempt to recover from this error, but if this error keeps occurring, make sure that the switch is configured correctly and then try disconnecting and then reconnecting the adapter to the switch.

Syslog Message

Fibre Channel adapter %s cannot log in with the fabric management server for reason 0x%x.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
status (INTHEX): Status returned from the adapter.

fci.adapter.fabric.ns.login.failed

Severity

ERROR

Description

This message occurs when the Fibre Channel adapter cannot log in with the fabric name server.

Corrective Action

The driver will attempt to recover from this error but if this error keeps occurring make sure that the switch is configured correctly, and then try disconnecting and then reconnecting the adapter to the switch.

Syslog Message

Fibre Channel adapter %s was unable to log in with the fabric name server for reason 0x%x.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
status (INTHEX): Status returned from the adapter.

fci.adapter.fabric.request.failed

Severity

ERROR

Description

This message occurs when the Fibre Channel adapter returns an unexpected status for a fabric query.

Corrective Action

The driver will attempt to recoverf rom this error but if this error keeps occurring make sure that the switch is configured correctly, and then try disconnecting and then reconnecting the adapter to the switch.

Syslog Message

Fibre Channel adapter %s returned unexpected status 0x%x for a fabric query.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
status (INTHEX): Status returned from the adapter.

fci.adapter.failed

Severity

ALERT

Description

This message occurs when the Fibre Channel adapter driver cannot recover the adapter after resetting it multiple times. The adapter will be put offline.

Corrective Action

If the adapter is in use check the cabling, and if it is connected to disk shelves check the seating of the LRC/ESH cards and disks. If the problem keeps occurring try replacing the adapter. If the issue is still not resolved, contact NetApp technical support for assistance in diagnosing a Fibre Channel issue.

Syslog Message

Failed to recover Fibre Channel HBA %s after multiple resets. Taking the adapter offline.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
reason (STRING): Diagnostic information.

fci.adapter.firmware.fault

Severity

NOTICE

Description

This message occurs when a firmware fault is detected on the Fibre Channel adapter and it is being reset to recover.

Corrective Action

(None).

Syslog Message

Detected firmware fault 0x%x on Fibre Channel adapter %s.

Parameters

faultCode (INTHEX): Firmware fault code.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.firmware.pause

Severity

NOTICE

Description

This message occurs when a firmware fault is detected on the Fibre Channel adapter and it is being reset to recover.

Corrective Action

(None).

Syslog Message

Detected firmware fault 0x%x on Fibre Channel adapter %s.

Parameters

faultCode (INTHEX): Firmware fault code.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.link.online

Severity

INFORMATIONAL

Description

This message occurs when a Fibre Channel adapter reports online link status, usually after the adapter is reset successfully.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter %s link online.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.notification

Severity

NOTICE

Description

This message occurs following a management request from the Fibre Channel(FC) driver to the host bus adapter.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter driver notification: "%s" on adapter %s.

Parameters

info (STRING): Description of the outcome.
adapterName (STRING): Name of the associated FC host bus adapter.

fci.adapter.nvram.invalid

Severity

ALERT

Description

This message occurs when ONTAP® software cannot read the NVRAM content of a Fibre Channel adapter. This might cause ONTAP to load an incorrect driver, which could cause the adapter not to work as intended. In addition, the World Wide Node Name (WWNN) and the World Wide Port Name (WWPN) will be incorrect and temporary ones will be assigned. This might cause fabric zoning not to work correctly and might cause problems with anything that depends on consistent WWNNs and WWPNs.

Corrective Action

Reboot the appliance. If the problem still exists, replace the adapter.

Syslog Message

Cannot read NVRAM content of Fibre Channel adapter %s.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.offline

Severity

INFORMATIONAL

Description

This message occurs when the system takes a Fibre Channel adapter offline.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter %s is now offline.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.offlining

Severity

INFORMATIONAL

Description

This message occurs when the system takes a Fibre Channel adapter offline after all outstanding I/O requests have finished.

Corrective Action

(None).

Syslog Message

Taking Fibre Channel adapter %s offline.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.online

Severity

INFORMATIONAL

Description

This message occurs when the system brings a Fibre Channel adapter online.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter %s is now online.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.online.failed

Severity

ERROR

Description

This message occurs when a Fibre Channel adapter fails to come online.

Corrective Action

If the adapter is in use check the cabling, and if it connected to disk shelves check the seating of the LRC/ESH cards.

Syslog Message

Fibre Channel adapter %s failed to come online.

Parameters

    adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.onlining

Severity

    INFORMATIONAL

Description

    This message occurs when the Fibre Channel adapter begins the process of going online.

Corrective Action

    (None).

Syslog Message

    Onlining Fibre Channel adapter %s.

Parameters

    adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.adapter.speed

Severity

    INFORMATIONAL

Description

    This message occurs when speed auto- negotiation for the Fibre Channel port is disabled because the administrator used either the 'ispfc-force-XG-only?' or the 'mptfc-force-XG-only?' boot argument in conjunction with the 'fc-force-XG-ports' boot argument to force a particular speed. For example, setting 'ispfc-force-2G-only?' to 'true' and setting 'fc-force-2G-ports' to '0a,0c' would force ports 0a and 0c to operate at a rate of 2 Gigabits per second.

Corrective Action

    (None).

Syslog Message

    The speed of Fibre Channel adapter port %s was forced to %u Gbps by link speed related boot arguments.

Parameters

    port (STRING): Name of the adapter port.
    speed (INT): Speed the adapter port was assigned.

fci.adapter.topology

Severity

    INFORMATIONAL

Description

    This message occurs when topology auto- negotiation for the Fibre Channel port is disabled because the administrator used either the 'fc-force-ptp-ports' or the 'fc-force-loop-ports' boot argument to force a particular topology.

Corrective Action

(None).

Syslog Message

Fibre Channel adapter port %s was forced to negotiate its topology as %s by topology-related boot arguments.

Parameters

port (STRING): Name of the adapter port.
topo (STRING): Topology the adapter port was assigned.

fci.config events

fci.config.autoReboot

Severity

NOTICE

Description

This message occurs when the system reboots automatically to enable correct adapter operation after changing the state of a reconfigurable adapter.

Corrective Action

No user action is required. The system is rebooting to enable the new adapter configuration.

Syslog Message

Rebooting for Fibre Channel adapter %s to become available.

Parameters

adapters (STRING): Affected adapters.

fci.config.error

Severity

ERROR

Description

This message occurs when there is an error during the Fibre Channel adapter auto-reconfiguration process. The specified adapters will be unavailable until the problem is fixed.

Corrective Action

Contact NetApp technical support.

Syslog Message

Auto-reconfiguration for Fibre channel %s adapter(s) %s has failed.

Parameters

type (STRING): Adapter type.
adapters (STRING): Affected adapter(s).

fci.config.missing

Severity

ERROR

Description

This message occurs when the system cannot find Fibre Channel adapter configuration stored on disk, but the adapter is configured in the boot environment. The boot environment information will be used, but you should update the on-disk configuration to be consistent and to prevent the adapter from getting into an unexpected state if the boot environment settings are lost.

Corrective Action

Use the 'fcadmin config' command to reapply the on-disk configuration to match the setting in the boot environment. If the on-disk configuration is not saved and the boot environment is lost, recovery of this adapter's port personality is not possible. No action is taken automatically to correct the problem.

Syslog Message

Fibre Channel adapter %s is configured in the boot environment but the on-disk configuration information is missing.

Parameters

adapter (STRING): Name of the affected Fibre Channel adapter.

fci.config.needsReboot

Severity

ERROR

Description

This message occurs when the state of a reconfigurable adapter is changed, but the system must be rebooted to place the adapter into service.

Corrective Action

Reboot the system to enable the new adapter configuration.

Syslog Message

Reboot the system for Fibre channel %s adapter %s to become available.

Parameters

type (STRING): Adapter type.
adapters (STRING): Affected adapter(s).

fci.config.offline

Severity

NOTICE

Description

This message occurs when a configurable Fibre Channel adapter cannot be brought online because the configured adapter type needs to be changed.

Corrective Action

Use the 'fcadmin config' utility to change the adapter configuration state and/or reboot the system to allow the PENDING adapter state change to take effect before bringing the adapter online.

Syslog Message

Fibre Channel adapter %s is offline because it is in the %s state.

Parameters

adapter (STRING): Name of the associated Fibre Channel adapter.
state (STRING): Configured adapter state.

fci.config.state

Severity

NOTICE

Description

This message occurs when the state of a configurable Fibre Channel adapter changes.

Corrective Action

(None).

Syslog Message

Fibre Channel %s adapter %s is in the %s state.

Parameters

type (STRING): Current adapter type.
adapter (STRING): Name of the associated Fibre Channel adapter.
state (STRING): Configured adapter state.

fci.device events

fci.device.general.reject

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel port transmits a frame that is rejected. The reject frame contains a reason code that can help diagnose the problem. In some cases, this might lead to a solution.

Corrective Action

(None).

Syslog Message

The frame transmitted by port %s was rejected by port_id 0x%x with reason code 0x%x '%s', explanation code 0x%x '%s'.

Parameters

port (STRING): Name of the adapter port that transmitted the rejected frame.
identifier (INTHEX): Destination port identifier of the rejected frame.

reasonCode (INTHEX): Reason code byte provided for the exchange failure.
reasonString (STRING): Reason code string provided for the exchange failure.
explanationCode (INTHEX): Explanation code byte provided for the exchange failure.
explanationString (STRING): Explanation code string provided for the exchange failure.

fci.device.invalidate.soft.address

Severity

ERROR

Description

This message occurs when a Fibre Channel disk drive takes a soft-assigned address and is being invalidated because soft-assigned addresses are not allowed.

Corrective Action

Disk drives can take a soft-assigned address if the shelf IDs conflict. Make sure that all of the shelves in the loop have unique shelf IDs, and if different shelf types are being mixed, be sure to follow the documentation guidelines for mixing shelves on the same loop. After setting the shelves correctly, power-cycle the shelves so that the drives acquire the correct hard-assigned address.

Syslog Message

Fibre Channel adapter %s is invalidating disk drive %s, which appears to have taken a soft address. Expected hard address %d (0x%x), assigned soft address %d (0x%x).

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
deviceName (STRING): Name of the associated Fibre Channel device.
hardLoopId (INT): Hard loop ID that the device attempted to acquire.
hardALPA (INTHEX): Hard AL_PA that the device attempted to acquire.
softLoopId (INT): Soft loop ID that the device acquired.
softALPA (INTHEX): Soft AL_PA that the device acquired.

fci.device.login.failure

Severity

ERROR

Description

This message occurs when the Fibre Channel port login fails during the PLOGI or PRLI frame exchange. This can happen due to the reception of a Reject or Logout frame coming from the target, or due to a timeout.

Corrective Action

Power-cycling the device might allow it to recover from this problem.

Syslog Message

A login failure has occurred between Fibre Channel adapter %s and %s device %s, with error subcode %s.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
deviceType (STRING): Type of device.
deviceName (STRING): Name of the device.

code (STRING): Error subcode provided by the firmware for the login failure, "N/A" if not provided.

fci.device.login.reject

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel port transmits a PLOGI frame that is rejected. The reject frame contains a reason code that can help diagnose the problem. In some cases, this might lead to a solution.

Corrective Action

None.

Syslog Message

The PLOGI transmitted by port %s was rejected by port_id 0x%x with reason code 0x%x '%s', explanation code 0x%x '%s'.

Parameters

port (STRING): Name of the adapter port that transmitted the PLOGI frame.
identifier (INTHEX): Destination port identifier of the PLOGI frame.
reasonCode (INTHEX): Reason code byte provided for the login failure.
reasonString (STRING): Reason code string provided for the login failure.
explanationCode (INTHEX): Explanation code byte provided for the login failure.
explanationString (STRING): Explanation code string provided for the login failure.

fci.device.loop.recovery

Severity

ERROR

Description

This message occurs when a device reports a break in the Fibre Channel loop, which could be due to a bad or unstable connection.

Corrective Action

Check the cabling and verify that the disk drives and the shelf Fibre Channel modules on the loop are fully inserted. The problem is being caused by a connection in the loop upstream from the device.

Syslog Message

Loop recovery event caused by the device upstream from %s device %s.

Parameters

deviceType (STRING): Type of device.
deviceName (STRING): Name of the device.

fci.discovery events

fci.discovery.timeout

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel adapter driver cannot complete device discovery within the specified time. The driver allows ONTAP® software to continue booting and continues the discovery process in the background.

Corrective Action

(None).

Syslog Message

Device discovery timeout after %d seconds on adapter %s.

Parameters

time (INT): Amount of time, in seconds, spent waiting for device discovery to be completed.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.fabric events

fci.fabric.max.ports

Severity

ERROR

Description

This message occurs when a switch in the fabric attached to the Fibre Channel adapter exceeds the maximum number of ports allowed on a switch. Any devices on this switch will not be seen by the Fibre Channel adapter.

Corrective Action

Any devices on this switch will not be seen by the Fibre Channel adapter. If that is okay then this error can be ignored. If the devices need to be seen by the Fibre Channel adapter then they need to be connected to a switch that does not exceed the maximum number of ports supported per switch.

Syslog Message

Switch with WWN %s on Fibre Channel adapter %s exceeded the maximum number of ports supported: Maximum ports supported is %d and this switch has %d ports.

Parameters

switchWWN (STRING): World-Wide Name (WWN) of the switch that has exceeded the maximum number of supported ports.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
numMaxSwitches (INT): Maximum number of ports supported per switch.
numFabricSwitches (INT): Number of ports on this switch.

fci.fabric.max.switches

Severity

ERROR

Description

This message occurs when the fabric attached to the Fibre Channel adapter exceeds the maximum number of allowed switches. This configuration is not supported and will not work.

Corrective Action

Reduce the number of switches in the fabric.

Syslog Message

Invalid Fabric configuration detected on Fibre Channel adapter %s: Maximum switches supported is %d and this fabric contains %d switches.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
numMaxSwitches (INT): Maximum number of switches supported in a fabric.
numFabricSwitches (INT): Number of switches in the fabric.

fci.flash events

fci.flash.preload.failed

Severity

ERROR

Description

This message occurs when there is a failure updating the Fibre Channel adapter flash preload table. If the preload table cannot be updated, the adapter might not have the best configuration settings for the PCI Express link.

Corrective Action

In most cases the adapter will still function normally. However, if you see PCI Express correctable errors on this adapter, you should replace the adapter.

Syslog Message

Failed to update flash preload table on Fibre Channel adapter %s with error %d.

Parameters

port (STRING): Name of the adapter port.
errorCode (INT): Update error code.

fci.flash.preload.reboot

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel adapter flash preload table has been updated and the controller is rebooting for the new settings to take effect.

Corrective Action

(None).

Syslog Message

Rebooting for updated Fibre Channel flash preload table to take effect.

Parameters

(None).

fci.flash.preload.updated

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel adapter flash preload table is updated. The preload table contains configuration settings for the adapter.

Corrective Action

(None).

Syslog Message

Updated flash preload table on Fibre Channel adapter %s to version %s.

Parameters

port (STRING): Name of the adapter port.
version (STRING): Preload table version.

fci.fwupdate events

fci.fwupdate.AutoBoot

Severity

NOTICE

Description

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver successfully updates the firmware of the host bus adapter (HBA).

Corrective Action

None; the controller is rebooted automatically to enable the new HBA firmware.

Syslog Message

FC Initiator HBA %s firmware updated from version %s to %s. The adapter will be reset automatically to enable the new HBA firmware.

Parameters

hba (STRING): HBA where the firmware version update occurred.
currentversion (STRING): Firmware version the HBA is running.
bundleversion (STRING): Firmware version bundled with ONTAP® software.

fci.fwupdate.NeedBoot

Severity

NOTICE

Description

This message occurs when the Service Level Interface Fibre Channel (SLIFC) Initiator driver successfully updates the firmware version of the host bus adapter (HBA), and requires a reboot of the controller to complete the process.

Corrective Action

(None).

Syslog Message

FC Initiator HBA %s firmware updated from version %s to %s. Reboot the controller to enable the new HBA firmware.

Parameters

hba (STRING): HBA where the firmware update occurred.
currentversion (STRING): Firmware version the HBA is running.
bundleversion (STRING): Firmware version bundled with ONTAP® software.

fci.fwupdate.UpdDone

Severity

NOTICE

Description

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver successfully updates the firmware of the host bus adapter (HBA).

Corrective Action

(None).

Syslog Message

FC Inititator HBA %s firmware updated successfully from version %s to %s.

Parameters

hba (STRING): HBA where the firmware update occurred.
currentversion (STRING): Firmware version the HBA was running.
bundleversion (STRING): Firmware version bundled with ONTAP® software.

fci.fwupdate.UpdErr

Severity

ERROR

Description

This message occurs when the Service Level Initiator Fibre Channel (SLIFC) Initiator driver encounters an error while updating the firmware of the host bus adapter (HBA).

Corrective Action

Contact NetApp technical support for further analysis.

Syslog Message

FC Initator HBA %s failed to update the firmware from version %s to %s with the status of %d.

Parameters

hba (STRING): HBA where the firmware update failure occurred.
currentversion (STRING): Firmware version the HBA is running.
bundleversion (STRING): Firmware version bundled with ONTAP® software.
status (INT): Status code of the firmware update process.

fci.link events

fci.link.break

Severity

ERROR

Description

This message occurs when the Fibre Channel adapter detects a break in the link.

Corrective Action

If the adapter is in use, check the cabling.

Syslog Message

Link break detected on Fibre Channel adapter %s.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.link.break.shelf.fw.update

Severity

INFORMATIONAL

Description

This message occurs when the Fibre Channel adapter detects a break in the link due to a shelf firmware update being performed.

Corrective Action

No corrective action is required. This is expected behavior when firmware is being downloaded to a shelf.

Syslog Message

Link break detected on Fibre Channel adapter %s while downloading shelf firmware.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.link.error

Severity

NOTICE

Description

This message occurs when the Fibre Channel adapter cannot recover the link and the link is going offline.

Corrective Action

(None).

Syslog Message

Could not recover link on Fibre Channel adapter %s after %d seconds. Taking the adapter offline.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
downTime (INT): Amount of time that the link is down.

fci.loop events

fci.loop.stability

Severity

ERROR

Description

This message occurs when the Fibre Channel loop generates too many loop initialization events. This can be a sign of unstable hardware.

Corrective Action

If the adapter is in use check cabling, and if it is connected to disk shelves check the seating of the LRC/ESH cards and disks. If this does not resolve the issue, contact NetApp technical support for assistance in diagnosing a Fibre Channel issue.

Syslog Message

Fibre Channel adapter %s has a loop stability problem. %d loop-initialization events seen in %d seconds.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
numLips (INT): Number of loop-initialization events that occurred.
numSeconds (INT): Time interval that these loop-initialization events were seen.

fci.mserr events

fci.mserr.general

Severity

ERROR

Description

This message occurs when the Fibre Channel fabric cannot successfully complete a request to the Management Server to retrieve configuration information. This query request is issued when the specified adapter is connected to a Fibre Channel fabric. Included in the event is the specific Management Server query along with text describing the reason and explanation codes returned by the fabric.

Corrective Action

If the system happens to issue a Management Server query while the fabric is processing one or more configuration changes, the fabric might not successfully complete the request. After the fabric stabilizes, the Management Server can resume processing requests and the system automatically recovers from the error. This error is expected on McData switches that do not have the OSMS license installed, and devices on those switches cannot be seen by the Fibre Channel adapter. This error might also take place if the configuration has not been cabled properly, particularly if the explanation code translates into something like 'Invalid name for interconnect element or port'. If this error continues to occur after the fabric has stabilized and it is not happening on a McData switch without the OSMS license installed, check cabling, and contact NetApp technical support.

Syslog Message

The Fibre Channel fabric Management Server request (%s) sent from adapter %s for WWN (%s) failed with reason code 0x%x (%s), explanation code 0x%x (%s), and response code 0x%x.

Parameters

msRequest (STRING): Name of the failing Fibre Channel Management Server request.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter (HBA).
queryWWN (STRING): World Wide Name that was used for the query.
reasonCode (INTHEX): Reason code provided by the fabric for failure of the Management Server request.
reason (STRING): Reason text provided by the fabric for failure of the Management Server request.
explanationCode (INTHEX): Explanation code provided by the fabric qualifying the stated reason.
explanation (STRING): Explanation text provided by the fabric qualifying the stated reason.
responseCode (INTHEX): Response code provided by the fabric for failure of the specified Management Server request.

fci.nserr events

fci.nserr.general

Severity

ERROR

Description

This message occurs when the Fibre Channel fabric cannot successfully complete a Name Server query issued to obtain configuration and device information when an adapter is connected to the Fibre Channel fabric. Included in the event are the specific Name Server query and text describing the reason and explanation codes returned by the fabric.

Corrective Action

If the system happens to issue a Name Server query while the fabric is processing one or more configuration changes, the fabric might not successfully complete the request. After the fabric stabilizes, the Name Server can resume processing requests and the system automatically recovers from the error. If this error continues to occur after the fabric has stabilized, contact NetApp technical support.

The Fibre Channel fabric Name Server request (%s) sent from adapter %s failed with reason code 0x%x (%s), explanation code 0x%x (%s) and response code 0x%x.

Parameters

nsRequest (STRING): Name of the failing Fibre Channel Name Server request.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
reasonCode (INTHEX): Reason code provided by the fabric for failure of the Name Server request.
reason (STRING): Reason text provided by the fabric for failure of the Name Server request.
explanationCode (INTHEX): Explanation code provided by the fabric qualifying the stated reason.
explanation (STRING): Explanation text provided by the fabric qualifying the stated reason.
responseCode (INTHEX): Response code provided by the fabric for failure of the specified Name Server request.

fci.nserr.noDevices

Severity

ERROR

Description

This message occurs when the fabric to which the specified adapter is attached reports that no Fibre Channel devices are present.

Corrective Action

Check the fabric to ensure that all expected devices appear in the Name Server. If they appear in the Name Server but have not been reported to the specified adapter, review fabric zoning (if zoning is in use) to ensure that devices are present in the zone containing the adapter. If all expected devices are not present in the Name Server, verify the devices are powered-on, in an operational state, and switch connections/ports are operational.

Syslog Message

The Fibre Channel fabric attached to adapter %s reports the presence of no Fibre Channel devices.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.nserr.peerWWN

Severity

ERROR

Description

This message occurs when the fabric connected to the specified adapter is zoned such that the adapter (or switch port if port zoning is in use) is not included in a fabric zone.

Corrective Action

Check the fabric to ensure that the specified adapter is included in a fabric zone. If port zoning is in use, make sure that the switch port to which the adapter is attached is included in the active zone configuration. If WWN zoning is in use, ensure that the WWN of the specified adapter is included in the active zone configuration. Also make sure that the associated switch port is in an operational state.

Syslog Message

Adapter %s is not in a fabric zone.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.

fci.set events

fci.set.wwn

Severity

INFORMATIONAL

Description

This message occurs when the World-Wide Name (WWN) for this adapter is set to the value in the fci-wwn-"adapter_name" bootarg.

Corrective Action

(None).

Syslog Message

Setting WWN for adapter %s to %s.

Parameters

adapterName (STRING): Name of the associated Fibre Channel host bus adapter.
wwn (STRING): WWN that will be used by the adapter.

fci.sfp events

fci.sfp.invalid

Severity

ERROR

Description

This message occurs when an invalid Small Form-factor Pluggable (SFP) is inserted into the adapter. For example, a 10-GB SFP was inserted into an 8-GB FC adapter.

Corrective Action

Replace the SFP with one that supports the proper speed.

Syslog Message

The SFP in FC adapter %s is not valid. (%s)

Parameters

port (STRING): Name of the adapter port.
reason (STRING): Reason for Invalid SFP.

fci.wrong events

fci.wrong.speed

Severity

NOTICE

Description

This message occurs when the fixed speed level requested by the fc-force-XG-ports bootarg is out of range for the corresponding FC port.

Corrective Action

If another fixed speed is desired, adjust accordingly. Otherwise, the port will autonegotiate.

Syslog Message

Fibre Channel adapter port %s does not support a speed setting of %u Gbps, which does not fall within port range %x.

Parameters

port (STRING): Name of the adapter port.
speed (INT): Speed the adapter port was assigned.
range (INTHEX): Range of speeds the adapter port is capable of using.

fcmon events

fcmon.status events

fcmon.status

Deprecated

Deprecated as of Data ONTAP 9.2 because FCMON process has been removed.

Severity

INFORMATIONAL

Description

This message occurs when FCMON starts up, halts or is requested to print it's current state.

Corrective Action

None.

Syslog Message

FCMON is %s

Parameters

status (STRING): The status of FCMON (initializing|running|sleeping|halted)

fcp events

fcp.service events

fcp.service.shutdown

Severity

INFORMATIONAL

Description

The Fibre Channel Protocol (FCP) service has been shutdown.

Corrective Action

(None).

Syslog Message

FCP service shutdown

Parameters

(None).

fcp.service.startup

Severity

INFORMATIONAL

Description

The Fibre Channel Protocol (FCP) service has been started.

Corrective Action

(None).

Syslog Message

FCP service startup

Parameters

(None).

fcvi events

fcvi.attr events

fcvi.attr.changed

Severity

NOTICE

Description

This message occurs when any of the FCVI attributes changes.

Corrective Action

(None).

Syslog Message

FC-VI adapter: %s changed on port %s. %s

Parameters

attr_type (STRING): Attribute type.
port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.cm events

fcvi.cm.timedout

Severity

NOTICE

Description

This message occurs when connection requests times out.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Connection request timedout on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.cross events

fcvi.cross.connect.detected

Severity

ERROR

Description

This message occurs when the fcvi driver detects a cross connection

Corrective Action

Check the FCVI interconnect cabling at the local and remote nodes. FCVI adapter ports fcvi_device_0s and fcvi_device_1s should not be connected to the same fabric. Contact NetApp technical support if the problem persists.

Syslog Message

FC-VI adapter: Cross Connection detected between local port %s and remote port %s. Local System ID = %llu, Remote System ID = %llu.

Parameters

lname (STRING): Local node's port name.
rname (STRING): Remote node's port name.
lsid (LONGINT): Local node's system id.
rsid (LONGINT): Remote node's system id.

fcvi.disabled events

fcvi.disabled

Severity

ALERT

Description

This message occurs when the HA interconnect card is disabled by the ic-type environment variable.

Corrective Action

Either remove the HA interconnect card from the controller or change the ic-type environment variable.

Syslog Message

FC-VI adapter: Port %s has been disabled because of the ic-type environment variable.

Parameters

port (STRING): FCVI Interconnect NIC.

fcvi.fcrenabled events

fcvi.fcrEnabled

Severity

NOTICE

Description

This message occurs if Fiber Channel Routing (FCR) functionality is enabled on the system.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Fiber Channel Routing (FCR) is enabled.

Parameters

(None).

fcvi.initfailed events

fcvi.initFailed

Severity

ERROR

Description

This message occurs when the driver fails to initialize a FC-VI port.

Corrective Action

Reboot the controller. Contact NetApp technical support if the problem persists.

Syslog Message

FC-VI adapter: %s failed for port %s.

Parameters

operation (STRING): Type of operation
port (STRING): FCVI Interconnect NIC.

fcvi.invalid events

fcvi.invalid.advertisement

Severity

ERROR

Description

This message occurs when FCVI driver receives invalid advertisement.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid advertisement. %s

Parameters

port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.invalid.sfp

Severity

ERROR

Description

This message occurs when the SFP (Small Form-Factor Pluggable) module of the Fibre Channel Virtual Interface (FC-VI) is invalid or incompatible.

Corrective Action

Replace the SFP with a compatible one.

Syslog Message

FC-VI adapter: Invalid SFP - Reason: %s on port %s.

Parameters

reason (STRING): Reason for the incompatibility.
port (STRING): Interconnect NIC.

fcvi.link events

fcvi.link.down

Severity

NOTICE

Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter goes down.

Corrective Action

1. Ensure that the FC-VI link has not been tampered with. 2. Verify that the physical status of the FC-VI adapter is "Up" by using the command "metrocluster interconnect adapter show". 3. If the configuration includes fabric switches, ensure that they are properly cabled and configured.

Syslog Message

(None).

Parameters

alertId (STRING): Alert ID.
alertingResource (STRING): Alerting resource unique name.
alertingResourceName (STRING): Alerting resource name.
possibleEffect (STRING): Possible effect for link transition.
probableCause (STRING): Probable cause of the event.

probableCauseDescription (STRING): Probable cause description of the event.
additionalInfo (STRING): Any additional information for the event.

fcvi.link.up

Severity

NOTICE

Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter comes up.

Corrective Action

(None).

Syslog Message

(None).

Parameters

alertId (STRING): Alert ID.
alertingResource (STRING): Alerting resource unique name.

fcvi.qlgc events

fcvi.qlgc.async.event.overflow

Severity

ERROR

Description

This message occurs when total number of async events are overflowed.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s async event overflowed. Resetting the adapter.

Parameters

port (STRING): FCVI Interconnect NIC.

fcvi.qlgc.connErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter detects a connection error. The FC-VI driver will attempt to retry the connection.

Corrective Action

If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s detects connection error. FC-VI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
opcode_str (STRING): FCVI opcode.
opcode (INTHEX): FCVI opcode.
qpname (STRING): QP name.
qpnum (INT): QP number.
systemID (LONGINT): Remote node's system ID.
info (STRING): Additional info.

fcvi.qlgc.cpr.reset.cancelled

Severity

ERROR

Description

This message occurs when the CPR reset initiated by the FC-VI port got cancelled.

Corrective Action

Reboot the filer. If issue still persists then replace the FCVI adapter.

Syslog Message

FC-VI adapter: CPR reset initiated by port %s got cancelled. Offlining the port.

Parameters

port (STRING): FCVI Interconnect adapter.

fcvi.qlgc.cpr.reset.failed

Severity

ERROR

Description

This message occurs when the CPR reset initiated by the FC-VI port fails.

Corrective Action

Reboot the filer. If issue still persists then replace the FCVI adapter.

Syslog Message

FC-VI adapter: CPR reset initiated by port %s failed.

Parameters

port (STRING): FCVI Interconnect adapter.

fcvi.qlgc.cpr.reset.unsupported

Severity

ERROR

Description

This message occurs when the CPR reset is not supported by the adapter.

Corrective Action

Reboot the filer. If issue still persists then replace the FCVI adapter.

Syslog Message

FC-VI adapter: CPR reset is not supported by port %s.

Parameters

port (STRING): FCVI Interconnect adapter.

fcvi.qlgc.FrameDiscardErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter firmware discards a received frame because of a receive frame error.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Discarded a received frame because of a receive frame error. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.hard.reset.failed

Severity

ERROR

Description

This message occurs when an FC-VI port's soft reset fails.

Corrective Action

If CPR reset is not supported in the platform, then reboot the filer to recover from this issue. If issue persists then replace the FCVI adapter.

Syslog Message

FC-VI adapter: Hard reset failed at port %s.

Parameters

port (STRING): FCVI Interconnect adapter.

fcvi.qlgc.invalid.data

Severity

ERROR

Description

This message occurs when FCVI driver receives invalid data from firmware.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid data. QP index = %d, completion status = %s(status code = %d), opcode = %s(%d), remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpnum (INT): QP index.
status (STRING): Completion status.
status_code (INT): Completion status code.
opcode_str (STRING): FCVI opcode in string.
opcode (INT): FCVI opcode.
systemID (LONGINT): Remote node's system Id.
info (STRING): Additional info.

fcvi.qlgc.invalid.exch.address

Severity

ERROR

Description

This message occurs when FCVI driver receives a response with invalid exchange address.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid exchange address for %s. QP name = %s, QP index = %d, expected exchange address = 0x%x, received exchange address = 0x%x. %s

Parameters

> **port** (STRING): FCVI Interconnect NIC.
> **resp_type** (STRING): Response type.
> **qpname** (STRING): QP name.
> **qpnum** (INT): QP number.
> **exp_oxid** (INTHEX): Expected exchange address.
> **rcvd_oxid** (INTHEX): Received exchange address.
> **info** (STRING): Additional info.

fcvi.qlgc.invalid.qp

Severity

> ERROR

Description

> This message occurs when FCVI driver receives invalid QP index from firmware.

Corrective Action

> (None).

Syslog Message

> FC-VI adapter: Port %s received invalid QP. Received QP index = %d, completion status = %s(status code = %d), entry type = %s(entry code = %d). %s

Parameters

> **port** (STRING): FCVI Interconnect NIC.
> **qpnum** (INT): QP index.
> **status** (STRING): Completion status.
> **status_code** (INT): Completion status code.
> **entry_type** (STRING): Request/Response entry type.
> **entry_code** (INT): Request/Response entry code.
> **info** (STRING): Additional info.

fcvi.qlgc.invalid.response

Severity

> ERROR

Description

> This message occurs when FCVI driver receives invalid response from firmware.

Corrective Action

> (None).

Syslog Message

> FC-VI adapter: Port %s received invalid response. %s. %s

Parameters

> **port** (STRING): FCVI Interconnect NIC.
> **error_type** (STRING): Type of error.
> **info** (STRING): Additional info.

fcvi.qlgc.ioErr

Severity

ERROR

Description

This message occurs when the FC-VI driver receives some IO error.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: FCVI driver on port %s received IO error. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): FCVI opcode in string.
opcode (INTHEX): FCVI opcode.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system ID.

fcvi.qlgc.login.timedout

Severity

NOTICE

Description

This message occurs when port login request times out.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Remote port login timedout on port %s. Remote port id = 0x%x, Remote port handle = %d. %s

Parameters

port (STRING): FCVI Interconnect NIC.
portid (INTHEX): Remote port identifier.
porthandle (INT): Remote port handle.
info (STRING): Additional info.

fcvi.qlgc.ls.reject

Severity

ERROR

Description

This message occurs when the FCVI firmware rejects a link service.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link service = %s(code = %d), rejected on port %s. %s

Parameters

ls (STRING): Link service name.
ls_code (INT): Link service code.
port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.mbox.cmd.pending

Severity

ERROR

Description

This message occurs when a mailbox command is pending for a long time.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Mailbox command '%s(code = 0x%x)' pending on port %s. %s

Parameters

cmd (STRING): Mailbox command.
cmd_code (INTHEX): Mailbox command code.
port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.mbox.cmd.timedout

Severity

ERROR

Description

This message occurs when a mailbox command times out.

Corrective Action

(None).

FC-VI adapter: Mailbox command '%s(code = 0x%x)' timedout on port %s. %s

Parameters

cmd (STRING): Mailbox command.
cmd_code (INTHEX): Mailbox command code.
port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.no.iu.buffer

Severity

ERROR

Description

This message occurs when the FCVI firmware identifies no more incoming IU buffers in the free pool.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s doesn't have free IU buffer. %s

Parameters

port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.no.recv.buffer

Severity

ERROR

Description

This message occurs when the FCVI firmware identifies no more receive buffers available for the incoming receive frames.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s doesn't have free receive buffer. QP name = %s, QP index = %d, Message ID = 0x%x. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
msg_id (INTHEX): Message id of the incoming message.
info (STRING): Additional info.

fcvi.qlgc.oodErr

Severity

ERROR

Description

This message occurs when the FC-VI driver receives out of order completions.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: FCVI driver on port %s receives out of order completions. FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
opcode_str (STRING): FCVI opcode in string.
opcode (INTHEX): FCVI opcode.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system ID.

fcvi.qlgc.PCIErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter firmware encounters a PCI error because it cannot write a frame to host memory.

Corrective Action

(None).

Syslog Message

FC-VI adapter: PCI error while writing a frame to host memory. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.port.reset

Severity

ERROR

Description

This message occurs when a FCVI port resets.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Resetting the port %s. %s

Parameters

port (STRING): FCVI Interconnect NIC.
reason (STRING): Reason for port reset.

fcvi.qlgc.qp.create.err

Severity

ERROR

Description

This message occurs when QP creation fails.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Failed to create QP on port %s. Requested QP index = %d, completion status = %s(status code = %d). %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpnum (INT): QP index.
status (STRING): Completion status.
status_code (INT): Completion status code.
info (STRING): Additional info.

fcvi.qlgc.qp.destroy.failed

Severity

ERROR

Description

This message occurs when the QP destroy request failed.

Corrective Action

(None).

Syslog Message

FC-VI adapter: QP destroy failed on port %s. QP index = %d. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpnum (INT): QP index.
info (STRING): Additional info.

fcvi.qlgc.qpErr

Severity

ERROR

Description

This message occurs when the FC-VI driver receives a QP error from the Firmware. The FC-VI driver will attempt to retry the connection.

Corrective Action

If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: FCVI driver on port %s received QP Error. QP name = %s, QP index = 0x%x, VI state = %s(state code = 0x%x), sub-error = %s(error code = 0x%x). Remote node's system id = %llu. This error has occurred %d times. %s

Parameters

port (STRING): Interconnect Adapter.
qpname (STRING): QP name.
qpnum (INTHEX): QP number.
state_str (STRING): QP state.
state (INTHEX): QP state code.
suberror (STRING): Sub-error.
code (INTHEX): Sub-error code.
system_id (LONGINT): Remote node's system ID.
errcnt (INT): Number of times QP async error was encountered.
info (STRING): Additional info.

fcvi.qlgc.rcvd.invalid.iu.buffer

Severity

ERROR

Description

This message occurs when the FC-VI adapter receives invalid information unit buffer.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

FC-VI adapter: Port %s received invalid IU buffer. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): FCVI opcode in string.
opcode (INTHEX): FCVI opcode.
qpname (STRING): QP name.
qpnum (INT): QP number.
bufhdl (INT): Buffer handle.
systemID (LONGINT): Remote node's system ID.
info (STRING): Additional info.

fcvi.qlgc.receive.error

Severity

ERROR

Description

This message occurs when the FCVI firmware detects an error in the received frame.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Received bad frame on port %s. Mailbox-1 = %d, Mailbox-2 = %d. %s

Parameters

port (STRING): FCVI Interconnect NIC.
mbox1 (INT): Content of mailbox-1.
mbox2 (INT): Content of mailbox-2.
info (STRING): Additional info.

fcvi.qlgc.received.disconnect

Severity

NOTICE

Description

This message occurs when FCVI driver receives disconnect request from partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Disconnect request received on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.received.reject

Severity

NOTICE

Description

This message occurs when FCVI driver receives connection reject from partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Connect request rejected on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.recvIUErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter receives some error in received information unit.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s received IU error. Status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): FCVI opcode in string.
opcode (INTHEX): FCVI opcode.

qpname (STRING): QP name.
qpnum (INT): QP number.
bufhdl (INT): Buffer handle.
systemID (LONGINT): Remote node's system ID.

fcvi.qlgc.regDumped

Severity

NOTICE

Description

This message occurs when the FCVI driver saves a diagnostic dump in a file.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Diagnostic dump for port %s saved to file %s.

Parameters

port (STRING): FCVI Interconnect NIC.
filename (STRING): File to which the diagnostic dump was saved.

fcvi.qlgc.RespFrameErr

Severity

ERROR

Description

This message occurs when the adapter firmware sends a response frame with the error bit set.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Firmware sent a response with the error bit set. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.risc.paused

Severity

ERROR

Description

This message occurs when FCVI RISC is paused.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s detected a RISC pause error. %s

Parameters

port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.rmt.link.down

Severity

NOTICE

Description

This message occurs when FCVI driver lost link to partner port.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link to partner node over port %s is down. Partner port id = 0x%x, partner node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
port_id (INTHEX): Partner port id.
system_id (LONGINT): Partner node's system id.
info (STRING): Additional info.

fcvi.qlgc.rmt.link.up

Severity

NOTICE

Description

This message occurs when FCVI driver gets link to partner port.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link to partner node over port %s is up. Partner port id = 0x%x, partner node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
port_id (INTHEX): Partner port id.
system_id (LONGINT): Partner node's system id.
info (STRING): Additional info.

fcvi.qlgc.sendIUError

Severity

ERROR

Description

This message occurs when the FC-VI adapter fails to send an information unit.

Corrective Action

No corrective action is required. The driver internally retries. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s sendIU status = %s(status code = 0x%x), FCVI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code in hex.
opcode_str (STRING): FCVI opcode in string.
opcode (INTHEX): FCVI opcode in hex.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.sent.disconnect

Severity

NOTICE

Description

This message occurs when FCVI driver sends disconnect request to remote partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Disconnect request sent on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.

system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.soft.reset.failed

Severity

ERROR

Description

This message occurs when an FC-VI port's soft reset fails.

Corrective Action

None.

Syslog Message

FC-VI adapter: Soft reset failed at port %s.

Parameters

port (STRING): FCVI Interconnect adapter.

fcvi.qlgc.system.error

Severity

ERROR

Description

This message occurs when FCVI driver receives system error from FCVI firmware.

Corrective Action

No corrective action is required. The driver internally resets the adapter. However, if you see this message frequently, there might be an issue with the adapter/firmware. Contact NetApp technical support.

Syslog Message

FC-VI adapter: System Error on port %s. %s

Parameters

port (STRING): FCVI Interconnect NIC.
info (STRING): Additional info.

fcvi.qlgc.TimeOutErr

Severity

ERROR

Description

This message occurs when the adapter firmware cannot send a request.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Firmware could not send a request. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): FCVI Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

fcvi.qlgc.transfer.error

Severity

ERROR

Description

This message occurs when the FCVI firmware detects a transfer error.

Corrective Action

(None).

Syslog Message

FC-VI adapter: %s transfer error on port %s. Affected queue number = %d. %s

Parameters

trans_type (STRING): Transfer type.
port (STRING): FCVI Interconnect NIC.
queue_num (INT): Queue number.
info (STRING): Additional info.

fcvi.qlgc_regdumpfailed events

fcvi.qlgc_regDumpFailed

Severity

NOTICE

Description

This message occurs when the HA interconnect driver could not save a diagnostic dump.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Failed to save diagnostic dump for port %s. %s.

Parameters

    port (STRING): FCVI Interconnect NIC.
    reason (STRING): Reason for the failure.

fcvi.unsupported events

fcvi.unsupported.config

Severity

    ERROR

Description

    This message occurs when a network adapter port behavior type is set to use FC-VI on a platform that has not been validated for its use and is therefore unsupported.

Corrective Action

    Change the port behavior type to a value other than "FC-VI". Use the "system hardware unified-connect show" command to view network adaptor port information, including the current behavior type. Use the "system hardware unified-connect modify" command to change the network adapter port behavior type.

Syslog Message

    FC-VI port behavior type not supported on network adapter port %s.

Parameters

    port (STRING): The network adapter port whose behavior type is set to use FC-VI.

fcvi.update events

fcvi.update.link.state

Severity

    NOTICE

Description

    This message occurs when there is a change in physical link state of the Fibre Channel Virtual Interface (FC-VI) adapter.

Corrective Action

    (None).

Syslog Message

    FC-VI adapter: Physical link is %s on port %s.

Parameters

    link_state (STRING): New link state.
    port (STRING): Interconnect NIC.

ffm events

ffrespmon events

fg events

fg.admin events

fg.admin.wait.long

Severity

NOTICE

Description

This message occurs when the data component takes longer than 15 seconds to update its view of the FlexGroup volume after an admin operation.

Corrective Action

(None).

Syslog Message

FlexGroup volume "%s" (MSID "%lu") in Vserver "%s" took %lu seconds to update the "%s" property during the "%s" operation.

Parameters

volumeName (STRING): Name of the FlexGroup volume.
volumeMsid (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.
numSeconds (LONGINT): Number of seconds that the data component took to update.
property (STRING): Volume property being updated.
operation (STRING): Admin operation performed before the data component update.

fg.aggr events

fg.aggr.mixed.types.error

Severity

ERROR

Description

This message occurs when the constituents of a FlexGroup volume are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates) for more than one week. It is reported once per week if a FlexGroup volume remains in this state. Leaving a FlexGroup volume in a mixed-aggregate state might lead to unbalanced data placement and unexpected performance issues.

Corrective Action

Move all the constituents of the FlexGroup volume to the same aggregate type, i.e., either FabricPool-enabled aggregates or non-FabricPool-enabled aggregates, using the 'volume move start' command with the 'allow-mixed-aggr-types' option set to true.

Syslog Message

The constituents of FlexGroup volume '%s' with UUID '%s' have been located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates) for more than one

week.

Parameters

vol (STRING): Name of the FlexGroup volume.
uuid (STRING): UUID of the FlexGroup volume.

fg.aggr.mixed.types.notice

Severity

NOTICE

Description

This message occurs when the constituents of a FlexGroup volume are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates). It is reported once per hour. Leaving a FlexGroup volume in a mixed-aggregate state might lead to unbalanced data placement and unexpected performance issues.

Corrective Action

Move all the constituents of the FlexGroup volume to the same aggregate type, i.e., either FabricPool-enabled aggregates or non-FabricPool-enabled aggregates, using the 'volume move start' command with the 'allow-mixed-aggr-types' option set to true.

Syslog Message

The constituents of FlexGroup volume '%s' with UUID '%s' are located on different types of aggregates (FabricPool-enabled aggregates and non-FabricPool-enabled aggregates).

Parameters

vol (STRING): Name of the FlexGroup volume.
uuid (STRING): UUID of the FlexGroup volume.

fg.convert events

fg.convert.critical.fail

Severity

ALERT

Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup fails. The FlexVol volume is inoperable, and can no longer serve data.

Corrective Action

(Call support).

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s.The FlexVol can no longer serve data. Reason: %s.

Parameters

volumeName (STRING): Name of the volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.

reason (STRING): Reason the conversion failed.
rollbackFailedReason (STRING): Reason the conversion could not roll back after failing to convert.

fg.convert.fail

Severity

ERROR

Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup fails. The FlexVol volume is still operable.

Corrective Action

Ensure that the FlexVol volume is a valid candidate for the convert operation, and then retry the command. If the error persists, contact NetApp technical support.

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s

Parameters

volumeName (STRING): Name of volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.
reason (STRING): Reason why the conversion failed.

fg.convert.ksmf.timeout

Severity

NOTICE

Description

This message occurs when the operation to convert a FlexVol® volume into a FlexGroup times out when updating the volume's RAID label. The system retries the conversion automatically.

Corrective Action

(None).

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu has timed out while updating the volume's RAID label.

Parameters

volumeName (STRING): Name of the volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.

fg.convert.start

Severity

NOTICE

Description

This message occurs when the conversion of a FlexVol® volume to a FlexGroup begins.

Corrective Action

(None).

Syslog Message

Starting conversion of FlexVol volume %s to new FlexGroup with MSID %llu, UUID %s.

Parameters

volumeName (STRING): Name of volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.
flexgroupUuid (STRING): UUID of the new FlexGroup.

fg.convert.success

Severity

NOTICE

Description

This message occurs when the conversion of a FlexVol® volume into a FlexGroup succeeds.

Corrective Action

(None).

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu successful.

Parameters

volumeName (STRING): Name of volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.

fg.create events

fg.create.workflow.non.auto

Severity

NOTICE

Description

This message occurs when a user creates a FlexGroup volume that has a workflow with a type that is not "auto".

Corrective Action

(None).

Syslog Message

FlexGroup volume "%s" in Vserver "%s" was created with workflow type "%s"

Parameters

volumeName (STRING): Name of the FlexGroup volume.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.
workflow (STRING): The type of workflow for the FlexGroup volume.

fg.inactive events

fg.inactive.dc.only.delete

Severity

NOTICE

Description

This message occurs when the system automatically deletes an inactive FlexGroup constituent that existed only in the data component.

Corrective Action

(None).

Syslog Message

Constituent with DSID "%lu" of FlexGroup volume "%s" (MSID "%lu") in Vserver "%s", which exists only in the data component and is inactive, has been automatically deleted.

Parameters

constituentDsid (LONGINT): Data Set ID (DSID) of the deleted constituent.
volumeName (STRING): Name of the FlexGroup volume owning the deleted constituent.
volumeMsid (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume owning the deleted constituent.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.

fg.inactive.delete

Severity

NOTICE

Description

This message occurs when the system automatically deletes an inactive FlexGroup constituent.

Corrective Action

(None).

Syslog Message

Constituent "%lu" (DSID "%lu") of FlexGroup volume "%s" (MSID "%lu") in Vserver "%s" is inactive and has been automatically deleted.

Parameters

flexgroupIndex (LONGINT): FlexGroup index of the deleted constituent.
constituentDsid (LONGINT): Data Set ID (DSID) of the deleted constituent.
volumeName (STRING): Name of the FlexGroup volume owning the deleted constituent.
volumeMsid (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume owning the deleted constituent.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.

NOTICE

Description

This message occurs when conditions that led to previous "fg.inodes.member.nearlyFull" and "fg.inodes.member.full" events no longer apply for any constituent in this FlexGroup. All constituents within this FlexGroup have sufficient inodes for normal operation.

Corrective Action

(None).

Syslog Message

All constituents in FlexGroup %s (fg-uuid %s) have sufficient inodes for normal operation.

Parameters

object_name (STRING): Human-readable name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.

fg.inodes.member.full

Severity

ALERT

Description

This message occurs when a constituent with a FlexGroup has run out of inodes. New files cannot be created on this constituent. This might lead to an overall imbalanced distribution of content across the FlexGroup.

Corrective Action

Adding capacity to the FlexGroup by using the "volume modify -files +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup may work, but it is difficult to determine which files have landed on which constituent.

Syslog Message

Constituent %llu in FlexGroup %s (fg-uuid %s) is out of inodes.

Parameters

constituent_dsid (LONGINT): DSID of the constituent that is out of inodes.
object_name (STRING): Human-readable name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.

fg.inodes.member.nearlyFull

Severity

ALERT

Description

This message occurs when a constituent within a FlexGroup is almost out of inodes. This constituent will receive far fewer new create requests than average, which might impact the FlexGroup's overall performance, because those requests are routed to constituents with more inodes.

Corrective Action

Adding capacity to the FlexGroup by using the "volume modify -files +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup might work, although it can be difficult to determine which files have landed on which constituent.

Syslog Message

Constituent %llu in FlexGroup %s (fg-uuid %s) is nearly out of inodes.

Parameters

constituent_dsid (LONGINT): DSID of the constituent that is almost out of inodes.
object_name (STRING): Human-readable name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.

fg.member events

fg.member.below.threshold

Severity

ALERT

Description

This message occurs when a members available space is below the threshold. ONTAP will be reporting zero space for the entire flexgroup.

Corrective Action

Correct the problem based on the reason specified. If the error persists, contact NetApp technical support for further assistance.

Syslog Message

FlexGroup volume "%s" (Size: "%lu", Usage: "%lu"%%) has member volume "%s" (Size: "%lu", Usage: "%lu"%%) that is at or below the free space threshold of "%lu" blocks.

Parameters

flexgroupName (STRING): Name of the FlexGroup volume.
flexgroupSize (LONGINT): Size in blocks of the FlexGroup volume.
flexgroupUsage (LONGINT): Usage percentage of the FlexGroup volume.
memberName (STRING): Name of the FlexGroup member volume.
memberSize (LONGINT): Size in blocks of the FlexGroup member volume.
memberUsage (LONGINT): Usage percentage of the FlexGroup member volume.
thresholdSize (LONGINT): Size of threshold that has been reached.

fg.member.elastic.sizing

Severity

NOTICE

Description

This message occurs when a constituent volume in a FlexGroup volume undergoes elastic sizing either to restore balance among constituent volumes or to resize them to accommodate space needs.

Corrective Action

(None).

Syslog Message

Constituent volume "%u" in FlexGroup volume "%s" was resized from %lu blocks to %lu blocks. This constituent volume (%s) %s by resizing the constituent volume "%s" (dsid "%u"). This constituent volume is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

Parameters

constituent_dsid (INT): DSID of the constituent volume undergoing elastic sizing.
object_name (STRING): Name of the FlexGroup volume.
current_size (LONGINT): Original block size of the constituent volume.
new_size (LONGINT): New block size of the constituent volume.
constituent_name (STRING): Name of the constituent volume.
operation (STRING): Indicates whether the constituent volume is being grown or shrunk.
partner_name (STRING): Name of the constituent volume's partner.
partner_dsid (INT): DSID of the constituent volume's partner.
size (LONGINT): Size in bytes of the constituent volume.
used (LONGINT): Size in bytes of the used space of the constituent volume.
percent_full (INT): Percentage of filled space in the constituent volume.
flexgroup_size (LONGINT): Size in bytes of the FlexGroup volume.
flexgroup_used (LONGINT): Size in bytes of the used space in the FlexGroup volume.
flexgroup_percent_full (INT): Percentage of filled space in the FlexGroup volume.
event_time (LONGINT): When the event occurred, shown in system time.

fg.member.invalidated

Severity

NOTICE

Description

This message occurs when a FlexGroup volume has been invalidated by an operation that was performed directly on a constituent volume instead of on the overall FlexGroup. For example, a constituent volume was directly deleted or had an operation performed on it such as snapshot restore.

Corrective Action

(None).

Syslog Message

FlexGroup volume MSID "%lu" in Vserver "%s", has been been invalidated by an operation performed on constituent "%s" (DSID "%lu").

Parameters

volumeMsid (LONGINT): Master Data Set ID (MSID) of the FlexGroup volume owning the invalidated constituent.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.
constituentName (STRING): Name of the invalidated constituent.

constituentDsid (LONGINT): Data Set ID (DSID) of the invalidated constituent.

fg.modify events

fg.modify.workflow

Severity

NOTICE

Description

This message occurs when a user modifies the workflow type of a FlexGroup volume.

Corrective Action

(None).

Syslog Message

The workflow type for FlexGroup volume "%s" in Vserver "%s" was modified from "%s" to "%s".

Parameters

volumeName (STRING): Name of the FlexGroup volume.
vserverName (STRING): Name of the Vserver on which the FlexGroup volume resides.
oldWorkflow (STRING): The old workflow type of the FlexGroup volume.
newWorkflow (STRING): The new workflow type for the FlexGroup volume.

fg.move events

fg.move.unmirrored.aggr

Severity

NOTICE

Description

This message occurs when a user moves a FlexGroup constituent to an unmirrored aggregate on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

Corrective Action

(None).

Syslog Message

FlexGroup constituent %s was moved to unmirrored aggregate %s on Vserver %s.

Parameters

volumeName (STRING): Name of the FlexGroup constituent moved to the unmirrored aggregate.
aggregateName (STRING): Name of the unmirrored aggregate.
vserverName (STRING): Name of the Vserver on which the FlexGroup constituent resides.

fg.multidelete events

fg.multidelete.inval.snapid

Severity

NOTICE

Description

This message occurs when a Snapshot copy in an invalid state is deleted from a FlexGroup volume. For example, if a Snapshot copy creation fails on some constituent volumes of a FlexGroup volume, but succeeds on others, it is deemed invalid and deleted by ONTAP.

Corrective Action

(None).

Syslog Message

Invalid Snapshot copy ID "%u" on FlexGroup volume "%s" is being deleted (UUID: %s, MSID: %llx).

Parameters

snapid (INT): ID of the invalid Snapshot copy to be deleted.
flexgroup_name (STRING): Name of the FlexGroup volume.
flexgroup_uuid (STRING): UUID of the FlexGroup volume.
flexgroup_msid (LONGINTHEX): Master Data Set ID (MSID) of the FlexGroup volume.

fg.plex events

fg.plex.del.unmirror.aggr

Severity

NOTICE

Description

This message occurs when a user unmirrors an aggregate (plex delete) that contains a FlexGroup constituent on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

Corrective Action

(None).

Syslog Message

Aggregate %s, which contains a FlexGroup constituent, was unmirrored.

Parameters

aggregateName (STRING): Name of the aggregate that is unmirrored.

fg.provision events

fg.provision.unmirrored.aggr

Severity

NOTICE

Description

This message occurs when a user provisions a FlexGroup on unmirrored aggregates on nodes in a MetroCluster(tm) configuration. However, unmirrored aggregates, as a rule, do not have synchronous disaster protection.

Corrective Action

(None).

Syslog Message

FlexGroup %s was provisioned on unmirrored aggregates on Vserver %s.

Parameters

volumeName (STRING): Name of the FlexGroup created on the unmirrored aggregates.
vserverName (STRING): Name of the Vserver on which the FlexGroup resides.

fg.quota events

fg.quota.cannot.enforce

Severity

NOTICE

Description

This message occurs when a FlexGroup cannot enforce its quota as expected.

Corrective Action

(None).

Syslog Message

FlexGroup %s (fg-uuid %s) cannot enforce quota due to %s.

Parameters

object_name (STRING): Name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.
reason (STRING): Reason for lack of quota enforcement.

fg.quota.enforcement.on

Severity

NOTICE

Description

This message occurs when a file operation discovers that the quota enforcement state of a FlexGroup has changed to "on".

Corrective Action

(None).

Syslog Message

FlexGroup %s (fg-uuid %s) quota enforcement state is on.

Parameters

object_name (STRING): Name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.

fg.quota.on.failed

Severity

ERROR

Description

This message occurs when enabling quotas (quota on an operation) on a FlexGroup constituent fails.

Corrective Action

Correct the problem based on the reason specified. If the error persists, contact technical support.

Syslog Message

Failed to execute the quota on operation on FlexGroup constituent %s in Vserver %s. Reason: %s.

Parameters

volumeName (STRING): Name of the constituent.
vserverName (STRING): Name of the Vserver.
reason (STRING): Reason for the failure.

fg.quota.usermapping.result

Severity

NOTICE

Description

This message occurs when the quota mapper decides whether to map the Windows quota record and the UNIX quota record of a user into a single multiuser record.

Corrective Action

(None).

Syslog Message

%s (uuid %s) tid %d: %s.

Parameters

constituent_name (STRING): Name of the FlexGroup constituent.
object_uuid (STRING): UUID of the FlexGroup constituent.
qtree (LONGINT): Qtree identifier (tid).
result (STRING): User mapping result.

fg.recover events

fg.recover.fail

Severity

ERROR

Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® fails. The FlexGroup volume is still operable.

Corrective Action

Ensure that the FlexGroup volume is a valid candidate for the recovery operation, and then retry the command. If the error persists, contact NetApp technical support.

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu failed. Reason: %s

Parameters

volumeName (STRING): Name of volume being recovered back into a FlexVol.
flexgroupMsid (LONGINTHEX): MSID of the recovered FlexVol.
reason (STRING): Reason why the recovery failed.

fg.recover.start

Severity

NOTICE

Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® begins.

Corrective Action

(None).

Syslog Message

Starting recovery of FlexGroup volume %s back into a FlexVol® with MSID %llu.

Parameters

volumeName (STRING): Name of volume being recovered back into a FlexVol.
volMsid (LONGINTHEX): MSID of the recovered FlexVol.

fg.recover.success

Severity

NOTICE

Description

This message occurs when the recovery of a FlexGroup volume back into a FlexVol® succeeds.

Corrective Action

(None).

Syslog Message

Conversion of FlexVol volume %s to FlexGroup with MSID %llu successful.

Parameters

volumeName (STRING): Name of volume being recovered back into a FlexVol.
volMsid (LONGINTHEX): MSID of the recovered FlexVol.

fg.space events

fg.space.member.allOK

Severity

NOTICE

Description

This message occurs when conditions that led to previous "fg.space.member.nearlyFull" and "fg.space.member.full" events no longer apply. All constituents within this FlexGroup have sufficient space for normal operation.

Corrective Action

(None).

Syslog Message

The FlexGroup %s (fg-uuid %s) no longer has any full constituents.

Parameters

object_name (STRING): Human-readable name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.

fg.space.member.full

Severity

ALERT

Description

This message occurs when a constituent volume within a FlexGroup volume is now full. Although new files can still be created within the FlexGroup volume and some files can still be expanded, none of the files that are stored on this constituent volume can be modified. The user might see random out-of-space errors as a consequence when trying to perform write operations on this FlexGroup volume.

Corrective Action

Adding capacity to the FlexGroup volume by using the "volume modify -size +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup volume might work, but it is difficult to determine which files have landed on which constituent volume.

Syslog Message

Constituent volume "%llu" in FlexGroup volume "%s" (fg-uuid "%s") is out of space. This constituent volume ("%s") is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

Parameters

constituent_dsid (LONGINT): DSID of the constituent volume that is out of space.
object_name (STRING): Human-readable name of the FlexGroup volume.
object_uuid (STRING): UUID of the FlexGroup volume.
constituent_name (STRING): Name of the constituent volume.
size (LONGINT): Size in bytes of the constituent volume.
used (LONGINT): Size in bytes of the used space of the constituent volume.
percent_full (INT): Percentage of filled space in the constituent volume.

flexgroup_size (LONGINT): Size in bytes of the FlexGroup volume.
flexgroup_used (LONGINT): Size used in bytes of the FlexGroup volume.
flexgroup_percent_full (INT): Percentage of filled space in the FlexGroup volume.
event_time (LONGINT): When the event occurred, shown in system time.

fg.space.member.nearlyFull

Severity

ALERT

Description

This message occurs when a constituent volume within a FlexGroup volume is nearly out of space. Although files can be created and expanded, if the constituent volume runs out of space, the user's ability to append to and modify those files that reside on this constituent volume will be impeded.

Corrective Action

Adding capacity to the FlexGroup volume by using the "volume modify -size +X" command is the best way to solve this problem. Alternatively, deleting files from the FlexGroup volume might work, but it is difficult to determine which files have landed on which constituent volume.

Syslog Message

Constituent volume "%llu" in FlexGroup volume "%s" (fg-uuid "%s") is nearly out of space. This constituent volume ("%s") is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

Parameters

constituent_dsid (LONGINT): DSID of the constituent volume that is nearly out of space.
object_name (STRING): Human-readable name of the FlexGroup volume.
object_uuid (STRING): UUID of the FlexGroup volume.
constituent_name (STRING): Name of the constituent volume.
size (LONGINT): Size in bytes of the constituent volume.
used (LONGINT): Size in bytes of the used space of the constituent volume.
percent_full (INT): Percentage of filled space in the constituent volume.
flexgroup_size (LONGINT): Size in bytes of the FlexGroup volume.
flexgroup_used (LONGINT): Size used in bytes of the FlexGroup volume.
flexgroup_percent_full (INT): Percentage of filled space in the FlexGroup volume.
event_time (LONGINT): When the event occurred, shown in system time.

fg.space.resize.failed

Severity

NOTICE

Description

This message occurs when a resize of a FlexGroup member was blocked. This can occur due to issues with the FlexGroup configuration, current state, or internal issues such as memory allocation failures. This message gives information that can help correct the issue.

Corrective Action

Monitor the constituent. If its space usage continues to grow and the filer is unable to add space, then writes to the constituent may start to fail. Evaluate the error reason identified in the event and determine if it can be corrected. If it's not clear how to correct the error, contact Support.

Syslog Message

Constituent volume "%s" in FlexGroup volume "%s" (fg-uuid "%s") has had a resize failure of type "%s" with error: "%s". This constituent volume is %llu bytes in size with %llu bytes used (%u percent full). The FlexGroup volume is %llu bytes in size with %llu bytes used (%u percent full).

Parameters

constituent_name (STRING): Name of the constituent volume.
object_name (STRING): Human-readable name of the FlexGroup volume.
object_uuid (STRING): UUID of the FlexGroup volume.
resize_type (STRING): The type of resize that was attempted.
resize_error (STRING): The resize error that occurred.
size (LONGINT): Size in bytes of the constituent volume.
used (LONGINT): Size in bytes of the used space of the constituent volume.
percent_full (INT): Percentage of filled space in the constituent volume.
flexgroup_size (LONGINT): Size in bytes of the FlexGroup volume.
flexgroup_used (LONGINT): Size used in bytes of the FlexGroup volume.
flexgroup_percent_full (INT): Percentage of filled space in the FlexGroup volume.
event_time (LONGINT): When the event occurred, shown in system time.

fg.statechange events

fg.stateChange

Severity

NOTICE

Description

This message occurs when the FlexGroup has transitioned from one state to another. This message might not occur immediately after the state transition occurred.

Corrective Action

(None).

Syslog Message

FlexGroup %s (fg-uuid %s) has changed state from %s to %s.

Parameters

object_name (STRING): Human-readable name of the FlexGroup.
object_uuid (STRING): UUID of the FlexGroup.
old_state (STRING): State that the FlexGroup was in before the EMS event.
new_state (STRING): State that the FlexGroup was in at the time of the EMS event.

fg.svmdr events

fg.svmdr.qos.wklds.insuff

Severity

NOTICE

Description

This message occurs during FlexGroup volume replication in an SVM DR setup when the available QoS workloads are insufficient on the secondary cluster.

Corrective Action

Contact NetApp technical support.

Syslog Message

Available QoS workloads are insufficient to support replicated FlexGroup "%s" in Vserver "%s".

Parameters

volume (STRING): FlexGroup name.
vserver (STRING): Vserver name.

fg.unconfig events

fg.unconfig.consts.exist

Severity

ERROR

Description

This message occurs when a FlexGroup detects constituents that are not properly configured and have not been removed after a sufficient timeout. This usually means that a failed attempt to expand the volume also failed to delete constituents.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

FlexGroup %s has had constituents that are not properly configured for longer than %d seconds.

Parameters

object_name (STRING): Name of the FlexGroup.
seconds (INT): Timeout period in seconds.

fg.unconvert events

fg.unconvert.critical.fail

Severity

ALERT

Description

This message occurs when a member of a FlexGroup fails to be converted into an independent FlexVol® volume. The original state of this member could not be restored, so the FlexGroup itself is inoperable, and requires repair.

Corrective Action

Contact NetApp technical support.

Syslog Message

FlexGroup member #%u of %u in FlexGroup %s failed to be converted into an independent FlexVol volume. The FlexGroup is inoperable. Reason: %s

Parameters

fgindex (INT): FlexGroup index of the volume being converted to a FlexVol volume.
fgmembers (INT): Total number of members in this FlexGroup.
fgname (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.
reason (STRING): Reason why the conversion failed.

fg.unconvert.fail

Severity

ERROR

Description

This message occurs when a member of a FlexGroup has fails to be converted into an independent FlexVol® volume. The FlexGroup is still functional.

Corrective Action

Ensure that the FlexGroup is a valid candidate for the unconvert operation, and then retry the command. If the error persists, contact NetApp technical support.

Syslog Message

FlexGroup member #%u of %u in FlexGroup %s failed to be converted into an independent FlexVol volume. Reason: %s

Parameters

fgindex (INT): FlexGroup index of the volume being converted to a FlexVol volume.
fgmembers (INT): Total number of members in this FlexGroup.
fgname (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.
reason (STRING): Reason why the conversion failed.

fg.unconvert.start

Severity

NOTICE

Description

This message occurs when a member of a FlexGroup, usually the root constituent, is being converted to an independent FlexVol® volume.

Corrective Action

(None).

Syslog Message

Starting conversion of FlexGroup member #%u of %u in FlexGroup %s into an independent FlexVol volume.

Parameters

> **fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.
> **fgmembers** (INT): Total number of members in this FlexGroup.
> **fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

fg.unconvert.success

Severity

> NOTICE

Description

> This message occurs when a member of a FlexGroup is successfully converted to an independent FlexVol® volume.

Corrective Action

> (None).

Syslog Message

> FlexGroup member #%u of %u in FlexGroup %s was successfully converted into an independent FlexVol volume.

Parameters

> **fgindex** (INT): FlexGroup index of the volume being converted to a FlexVol volume.
> **fgmembers** (INT): Total number of members in this FlexGroup.
> **fgname** (STRING): Name of the FlexGroup containing the member being converted to a FlexVol volume.

fg.writeback events

fg.writeback.delta.checker

Severity

> NOTICE

Description

> This message occurs when an inconsistency is discovered during a writeback. The writeback is ignored, so that the inconsistency does not get transferred to the cache origin.

Corrective Action

> (None).

Syslog Message

> Writeback operation failed for %s at line %d (%s).

Parameters

> **fh** (STRING): File handle of the affected inode.
> **source** (INT): Location of the failing writeback validation test.
> **state** (STRING): Description of the inconsistency.

fgr events

fgr.metadata events

fgr.metadata.repaired

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the volume capacity rebalancing metadata. As a consequence, the inconsistent metadata is deleted and new metadata will be repopulated according to latest volume capacity rebalancing state.

Corrective Action

None.

Syslog Message

The system detected an inconsistency in the volume capacity rebalancing metadata associated with volume %s:%s.

Parameters

vserveruuid (STRING): Universal unique identifier (UUID) of the volume's Vserver.
volname (STRING): Volume name.

fips events

fips.post events

fips.post.failure

Severity

ERROR

Description

This message occurs when an unrecoverable error prevents initialization of the cryptographic subsystem into FIPS mode. No SSL communication will be possible with the storage system in this state. Other ONTAP features may also be affected by the lack of cryptographic operations.

Corrective Action

To operate in non FIPS cryptographic mode, turn off FIPS mode for the SSL interface using command "security config modify -interface SSL -is-fips-enabled false" and restart the system. For more information or assistance, contact NetApp technical support.

Syslog Message

SSL interface disabled due to failure of FIPS mode cryptographic services.

Parameters

(None).

firmware events

firmware.file events

firmware.file.invalid

Severity

ERROR

Description

This message occurs when the system detects an invalid disk or shelf firmware file. This file cannot be used to update firmware on any disk or shelf device. This message repeats every 24 hours as long as the invalid file is present. There might be other invalid files on the system, and messages for those files are suppressed if they are detected within 24 hours of this event.

Corrective Action

Check your support provider for more information about obtaining the latest disk and shelf firmware. If the problem persists, contact NetApp technical support.

Syslog Message

%s %s failed verification due to: %s.

Parameters

fwFileType (STRING): Type of the firmware file, for example disk or shelf firmware file.
fwFileName (STRING): Name of the firmware file.
reason (STRING): Reason for mismatch.

flexcache events

flexcache.attrib events

flexcache.attrib.sync.failed

Severity

ALERT

Description

This message occurs when when syncing properties between an origin of a FlexCache volume and its FlexCache volume fails, and due to which FlexCache volume may not be able to proceed with accurate data.

Corrective Action

Use the "volume flexcache sync-properties" command on the cluster hosting the FlexCache volume to sync the origin volume properties with the FlexCache volume.

Syslog Message

Failed to sync the FlexCache configuration for cluster %s in Vserver %s hosting FlexCache volume %s.

Parameters

cacheCluster (STRING): Name of the cluster hosting the FlexCache volume.
cacheVserver (STRING): Name of the Vserver hosting the FlexCache volume.
cacheVolName (STRING): Name of FlexCache volume for which sync failed.

flexcache.attrib.sync.passed

Severity

NOTICE

Description

This message occurs when origin of a FlexCache volume properties sync succeeds for all connected FlexCache volumes.

Corrective Action

(None).

Syslog Message

Sync of origin of a FlexCache volume %s in Vserver %s succeeded for all connected FlexCache volumes.

Parameters

originVolName (STRING): Origin of a FlexCache volume.
originVserver (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

flexcache.attrib.sync.warn

Severity

NOTICE

Description

This message occurs when syncing properties between an origin of a FlexCache volume and its FlexCache volume fails, and the sync operation will be retried.

Corrective Action

Use the "volume flexcache sync-properties" command on the cluster hosting the FlexCache volume to sync the origin volume properties with the FlexCache volume.

Syslog Message

Failed to sync the FlexCache configuration for cluster %s in Vserver %s hosting FlexCache volume %s. Operation will be retried.

Parameters

cacheCluster (STRING): Name of the cluster hosting the FlexCache volume.
cacheVserver (STRING): Name of the Vserver hosting the FlexCache volume.
cacheVolName (STRING): Name of FlexCache volume for which sync failed.

flexcache.autogrow events

flexcache.autogrow.fail

Severity

ERROR

Description

This message occurs when automatically growing a FlexCache volume fails because the total cluster-wide FlexCache provisioned space has exceeded the licensed limit.

Corrective Action

To increase the licensed capacity, install a new license in the cluster.

Syslog Message

Autosize of FlexCache volume '%s%s%s' failed because the total cluster-wide FlexCache provisioned space has exceeded the licensed limit in the cluster %s.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
cluster_uuid (STRING): UUID of the Cluster.

flexcache.cacheconnected events

flexcache.cacheConnected

Severity

INFORMATIONAL

Description

This message occurs when a FlexCache® origin volume establishes communication with its cache volume.

Corrective Action

No action required.

Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s is connected with FlexCache volume with Vserver UUID %s and MSID %lu.

Parameters

originVolumeName (STRING): Origin Volume name.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.
originVserverName (STRING): Vserver name of the origin volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.

flexcache.cachedisconnected events

flexcache.cacheDisconnected

Severity

EMERGENCY

Description

This message occurs when a FlexCache® origin volume cannot communicate with its cache volume. The cache volume might therefore present stale data to its clients until the connection is reestablished.

Corrective Action

Verify that the origin volume can connect with the FlexCache volume. If both volumes are within the same cluster, check the health of the owning nodes by using the "system node show" command. If the volumes are on different clusters, ensure that the intercluster LIFs on each cluster can connect by using the "network ping" command.

Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s is disconnected from FlexCache volume with Vserver UUID %s and MSID %lu.

Parameters

originVolumeName (STRING): Origin Volume name.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.
originVserverName (STRING): Vserver name of the origin volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.

flexcache.capacity events

flexcache.capacity.exceeded

Severity

ERROR

Description

This message occurs when the total cluster-wide FlexCache provisioned space has exceeded the licensed limit.

Corrective Action

To increase the licensed capacity, install a new license in the cluster.

Syslog Message

The total cluster-wide FlexCache provisioned space has exceeded the licensed limit. Cluster id: %s, Current usage: %s, Licensed capacity: %s.

Parameters

cluster_uuid (STRING): UUID of the Cluster.
used_capacity (STRING): Total FlexCache provisioned space in the cluster.
licensed_capacity (STRING): FlexCache licensed capacity.

flexcache.conf events

flexcache.conf.refreshFailed

Severity

ALERT

Description

This message occurs when FlexCache configuration refresh fails. If this event happens, FlexCache will not be able to reach to its origin which will cause FlexCache to serve only cached data. This message occurs at most once every 30 minutes.

Corrective Action

Use the "volume flexcache config-refresh" command on the cluster hosting the FlexCache volume to refresh the origin volume configuration on FlexCache volume.

Syslog Message

Failed to refresh FlexCache configuration for peer vserver UUID %s and peer volume MSID %lu. isPeerOrigin : %u.

Parameters

peerVserverUuid (STRING): Peer vserver UUID in string format for which refresh failed.
peerVolMsid (LONGINT): Peer volume MSID for which refresh failed.
isPeerOrigin (INT): Origin peer volume or cache peer volume for which refresh failed.

flexcache.config events

flexcache.config.sync.failed

Severity

ERROR

Description

This message occurs when the FlexCache volume expand operation fails to synchronize the FlexCache configuration information between the newly created constituent volume and the origin cluster.

Corrective Action

Use the "volume flexcache config-refresh" command on the origin cluster to update the FlexCache configuration.

Syslog Message

Volume expand failed to create the cache configuration for FlexCache volume "%s" in Vserver "%s" on the origin of the FlexCache cluster. Error: %s.

Parameters

cacheVolName (STRING): Name of the FlexCache volume.
cacheVserver (STRING): Name of the Vserver hosting the FlexCache volume.
errorString (STRING): Error string.

flexcache.encryption events

flexcache.encryption.mismatch.with.origin

Severity

ALERT

Description

This message occurs when a plaintext FlexCache volume has been created for an encrypted origin volume.

Corrective Action

(None).

Syslog Message

A plaintext FlexCache volume "%s" in Vserver "%s" has been created for origin volume "%s" in Vserver "%s".

Parameters

originVolumeName (STRING): Origin Volume Name.
cacheVolumeName (STRING): Cache Volume Name.
cacheVserverName (STRING): Cache Vserver Name.
originVserverName (STRING): Origin Vserver Name.

flexcache.featuredisabled events

flexcache.featureDisabled

Severity

ERROR

Description

This message occurs when an attempt is made to mount a FlexCache volume. FlexCache is no longer supported, please remove any remaining FlexCache volumes left over from upgrading the cluster.

Corrective Action

Delete all FlexCache volumes in the cluster. They can be displayed by using the "volume flexcache show" command.

Syslog Message

(None).

Parameters

volume (STRING): FlexCache volume involved.

flexcache.mcc events

flexcache.mcc.refresh.failed

Severity

ERROR

Description

This message occurs when a FlexCache® configuration refresh operation fails during MetroCluster(tm) switchover and switchback. Data access through FlexCache volumes might be impacted as a result.

Corrective Action

First, verify that the two Vservers in question are peered by using the "vserver peer show" command. Next, enter the "flexcache config-refresh -peer-server <peer-vserver> -peer-volume <peer-volume> -peer -endpoint-type <peer-endpoint-type>" command on a node within the cluster that directly manages the peer endpoint.

Syslog Message

FlexCache configuration refresh failed on peer Vserver %s for peer volume %s and peer endpoint %s on cluster %s.

Parameters

peeredVserverUuid (STRING): UUID of the peered Vserver.
peerVolumeName (STRING): Name of the peer volume.
peerEndPointType (STRING): Peer endpoint type.
clusterUuid (STRING): UUID of the cluster with the peer endpoint.
localVserverUuid (STRING): UUID of the local Vserver.

flexcache.name events

flexcache.name.sync.failed

Severity

ERROR

Description

This message occurs when the FlexCache® volume rename operation fails to synchronize the FlexCache name information to the origin cluster. Because of this failure, the "volume flexcache origin show-caches" command shows the old FlexCache volume name for the origin relationship.

Corrective Action

Use the "volume flexcache sync-properties" command on the FlexCache cluster to update the FlexCache name on the origin cluster. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

Syslog Message

Volume rename failed to update the new FlexCache volume "%s" on Vserver "%s" to the origin of the FlexCache cluster. Error: %s.

Parameters

cacheVolName (STRING): Name of the FlexCache volume.
cacheVserver (STRING): Name of the Vserver hosting the FlexCache volume.
errorString (STRING): Error string.

flexcache.nearly events

flexcache.nearly.full

Severity

ERROR

Description

This message occurs when the total cluster-wide FlexCache provisioned space has nearly reached the licensed limit.

Corrective Action

To increase the licensed capacity, install a new license in the cluster.

Syslog Message

The total cluster-wide FlexCache provisioned space has nearly reached the licensed limit. Cluster id: %s, Current usage: %s, Licensed capacity: %s.

Parameters

cluster_uuid (STRING): UUID of the Cluster.
used_capacity (STRING): Total FlexCache provisioned space in the cluster.
licensed_capacity (STRING): FlexCache licensed capacity.

flexcache.origin events

flexcache.origin.config.sync.failed

Severity

ERROR

Description

This message occurs when the origin of the FlexCache volume expand operation fails to synchronize the configuration information between the newly created constituent volume and the cache cluster.

Corrective Action

Use the "volume flexcache config-refresh" command on the cache cluster to update the origin of the FlexCache configuration.

Syslog Message

Volume expand failed to create the origin configuration for the origin of the FlexCache volume "%s" in Vserver "%s" on the FlexCache cluster. Error: %s.

Parameters

originVolName (STRING): Name of the origin of the FlexCache volume.
cacheVserver (STRING): Name of the Vserver hosting the origin of the FlexCache volume.
errorString (STRING): Error string.

flexcache.origin.size.sync.failed.disconnected.mode

Severity

ERROR

Description

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails because the cluster containing the FlexCache volume is not reachable.

Corrective Action

Make sure that the cluster containing the FlexCache volume is reachable. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

Syslog Message

Failed to sync origin size property for FlexCache Cluster "%s". Error: %s

Parameters

originClusterUuid (STRING): Cache Cluster UUID.
errorString (STRING): Error string.

flexcache.origin.size.sync.failed.for.cache.cluster

Severity

ERROR

Description

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails because we encountered some error on the cluster containing the FlexCache volume.

Corrective Action

Look for an EMS on the cache cluster and take the corrective action needed. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

Syslog Message

Failed to sync origin size property for Cache Cluster "%s".

Parameters

cacheClusterUuid (STRING): Cache Cluster UUID.

flexcache.origin.size.sync.failed.for.cache.volume

Severity

ERROR

Description

This message occurs when syncing the size property of the origin volume between an origin of a FlexCache volume and its FlexCache volume fails, and the sync operation will be retried.

Corrective Action

Take the appropriate action depending on the error message. Make sure that the FlexCache cluster and the origin of the FlexCache cluster are running on the same ONTAP® build.

Syslog Message

Failed to sync origin size property for FlexCache volume "%s" in Vserver "%s". Error: %s.

Parameters

volumeName (STRING): Cache Volume Name.
vserverName (STRING): Cache Vserver Name.
errorString (STRING): Error string.

flexcache.origincleanup events

flexcache.origincleanup.fail

Severity

ERROR

Description

This message occurs when the origin of a FlexCache® volume cleanup job fails to clean up the origin volume. All future FlexCache operations on the origin volume will fail.

Corrective Action

Use the "volume flexcache origin cleanup-cache-relationship -force-retry true" command on the origin cluster to cleanup origin of a FlexCache volume. If the problem persists then contact technical support for assistance.

Syslog Message

Origin volume cleanup job failed to clean up the origin volume of the FlexCache volume %s in Vserver %s.

Parameters

originVolName (STRING): Name of the origin volume of the FlexCache volume.
originVserver (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

flexcache.origincleanup.retry

Severity

ERROR

Description

This message occurs when the RAL cleanup at the origin volume of a FlexCache® volume fails due to timeout. All future FlexCache operations on the origin volume will fail.

Corrective Action

Use the "volume flexcache origin cleanup-cache-relationship -force-retry true" command on the origin cluster to cleanup origin of a FlexCache volume. If the problem persists then contact technical support for assistance.

Syslog Message

RAL cleanup incomplete for the origin volume of the FlexCache volume %s in Vserver %s.

Parameters

originVolName (STRING): Name of the origin volume of the FlexCache volume.
originVserver (STRING): Name of the Vserver hosting the origin of a FlexCache volume.

flexcache.originconnected events

flexcache.originConnected

Severity

INFORMATIONAL

Description

This message occurs when a FlexCache® volume establishes communication with its origin volume.

Corrective Action

No action required.

Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s is connected with its origin volume with Vserver UUID %s and MSID %lu.

Parameters

cacheVolumeName (STRING): Volume Name of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.
cacheVserverName (STRING): Vserver Name of the FlexCache volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.

flexcache.origindisconnected events

flexcache.originDisconnected

Severity

EMERGENCY

Description

This message occurs when a FlexCache® volume cannot communicate with its origin volume. The cache volume might therefore present stale data to its clients. Client I/O to the cache volume might also not appear to respond if the client is requesting data that has not been cached.

Corrective Action

Verify that the FlexCache volume can connect with its origin volume. If both volumes are within the same cluster, check the health of the owning nodes by using the "system node show" command. If the volumes are on different clusters, ensure that the intercluster LIFs on each cluster can connect by using the "network ping" command.

Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s is disconnected from its origin volume with Vserver UUID %s and MSID %lu.

Parameters

cacheVolumeName (STRING): Volume Name of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.
cacheVserverName (STRING): Vserver Name of the FlexCache volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.

flexcache.originfull events

flexcache.originFull

Severity

ALERT

Description

This message occurs when a FlexCache® origin volume cannot serve data to cache volume because origin volume is full. The cache volume might therefore not be able to serve data to its clients until the origin has free space.

Corrective Action

Ensure that the origin volume has free space.

Syslog Message

FlexCache origin volume with Name %s MSID %lu on Vserver Name %s UUID %s may not be able to serve data to FlexCache volume with Vserver UUID %s and MSID %lu because origin volume is full.

Parameters

originVolumeName (STRING): Origin Volume name.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.
originVserverName (STRING): Vserver name of the origin volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.

flexcache.originfull_1 events

flexcache.originFull_1

Severity

ALERT

Description

This message occurs when a FlexCache® volume cannot retrieve data from its origin volume because origin volume is full. Client I/O to the cache volume might not appear to respond if the client is requesting data that has not been cached.

Corrective Action

Ensure that the origin volume has free space.

Syslog Message

FlexCache volume with Name %s MSID %lu on Vserver Name %s UUID %s may not be able to retrieve data from its origin volume with Vserver UUID %s and MSID %lu because origin volume is full.

Parameters

cacheVolumeName (STRING): Volume Name of the FlexCache volume.
cacheMsid (LONGINT): MSID of the FlexCache volume.
cacheVserverName (STRING): Vserver Name of the FlexCache volume.
cacheVserverUuid (STRING): Vserver UUID of the FlexCache volume.
originVserverUuid (STRING): Vserver UUID of the origin volume.
originMsid (LONGINT): Master data set identifier (MSID) of the origin volume.

flexcache.softevict events

flexcache.softEvict.failed

Severity

ERROR

Description

This message occurs when soft evicting a cache volume fails. The cache volume might therefore present stale data to its clients.

Corrective Action

(None).

Syslog Message

Soft eviction of constituent DSID %lu failed.

Parameters

constituentDsid (LONGINT): Constituent's DSID.

flexcache.softEvict.success

Severity

INFORMATIONAL

Description

This message occurs on successfully soft evicting the cache volume.

Corrective Action

No Action Required.

Syslog Message

Constituent DSID %lu is successfully soft evicted.

Parameters

constituentDsid (LONGINT): Constituent's DSID.

fli events

fli.lun events

fli.lun.import.checkpoint

Severity

ERROR

Description

This message occurs when a checkpoint record delete fails. Checkpoint is metadata information stored with the NetApp LUN attribute stream for tracking import progress. An attempt is made to delete this metadata during import stop or delete operations.

Corrective Action

This record can remain in the LUN attribute stream without any harm. It could occupy ~100-200 bytes of space in the LUN attribute stream. If that is an issue, a support personnel could be contacted to delete this record.

Syslog Message

Import checkpoint record could not be deleted for LUN %s - Reason:%s

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fli.lun.import.complete

Severity

INFORMATIONAL

Description

This message occurs when a foreign LUN import is complete.

Corrective Action

(None).

Syslog Message

Import of foreign LUN %s of size %lld bytes from array model %s belonging to vendor %s is successfully completed. Destination NetApp LUN is %s.

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
Size (LONGINT): Size of the foreign LUN.
ForeignArrayModelID (STRING): Foreign array model ID.
ForeignArrayVendor (STRING): Foreign array vendor name.
LUNSerialNumber (STRING): Serial number of the LUN.

fli.lun.import.failed

Severity

ERROR

Description

This message occurs when a foreign LUN import goes into failed state. 1. Data could not be read from the source(foreign LUN). 2. Data could not be written to the destination(NetApp LUN). 3. This is an Internal/metadata related error.

Corrective Action

1. Verify the connectivity to the foreign disk. 2. Verify that the destination volume is online and has enough space by using "volume show" command. 3. Run the "lun import pause" command followed by a "lun import resume" command. In certain cases, the import might need to be restarted (Use "lun import stop" command followed by "lun import start" command). The ultimate recovery is to delete this relationship (with -force option) and create it again.

Syslog Message

Import of foreign LUN %s to LUN %s failed - Reason:%s

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fli.lun.import.failed.r2

Severity

ERROR

Description

This message occurs when a foreign LUN import goes into a failed state due to one of the following reasons: 1. Data could not be read from the source foreign LUN. 2. Data could not be written to the destination LUN. 3. This is an internal error or a metadata related error.

Corrective Action

1. Verify the connectivity to the foreign disk. 2. Verify that the destination LUN has enough space by using the "lun show -fields physical-used, physical-used-by-snapshots, se-ratio" command. 3. Run the "lun import pause" command followed by the "lun import resume" command. In certain cases, the import might need to be restarted. (Use "lun import stop" command followed by "lun import start" command). The ultimate solution is to delete this relationship (with -force option) and create it again. 4. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Import of foreign LUN %s to LUN %s failed - Reason:%s

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fli.lun.import.inconsistent

Severity

ERROR

Description

This message occurs when the import inconsistent flag cannot be unset. The import inconsistent flag is a system attribute for the NetApp LUN that is set during import progress, to indicate inconsistent data in the destination LUN. This is to discourage restore operations on LUN Snapshot(tm) copies created during import. A best effort is done to unset this flag after the import is complete, and also during import stop and delete operations. It is safe to perform restore operations if data in the destination LUN is known to be successfully verified.

Corrective Action

(None).

Syslog Message

Import inconsistent flag could not be unset for LUN %s - Reason:%s

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fli.lun.verify.complete

Severity

INFORMATIONAL

Description

This message occurs when a foreign LUN import verify is complete.

Corrective Action

(None).

Syslog Message

Import verify of foreign LUN %s of size %lld bytes from array model %s belonging to vendor %s with NetApp LUN %s is successfully completed.

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
Size (LONGINT): Size of the foreign LUN.
ForeignArrayModelID (STRING): Foreign array model ID.
ForeignArrayVendor (STRING): Foreign array name.
LUNSerialNumber (STRING): Serial number of the LUN.

fli.lun.verify.failed

Severity

ERROR

Description

This message occurs when a foreign LUN import verify fails. 1. Data could not be read from the source(foreign LUN). 2. Data could not be written to the destination(NetApp LUN). 3. There was a data mismatch during the verify operation. 4. There was an internal error.

Corrective Action

1. For a data mismatch, start the import operation again. 2. Verify the connectivity to the foreign disk. 3. Verify that destination volume is in a healthy state. In certain cases, the verify operation might need to be restarted (Use "lun import verify stop" command followed by "lun import verify start" command). The ultimate recovery is to delete this relationship (with -force option) and create it again.

Syslog Message

Import verify of foreign LUN %s and NetApp LUN %s failed - Reason:%s

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fli.lun.verify.failed.r2

Severity

ERROR

Description

This message occurs when a foreign LUN import verify fails. 1. Data could not be read from the source foreign LUN. 2. Data could not be written to the destination LUN. 3. There was a data mismatch during the verify operation. 4. There was an internal error.

Corrective Action

1. For a data mismatch, start the import operation again. 2. Verify the connectivity to the foreign disk. 3. In certain cases, the verify operation might need to be restarted. (Use "lun import verify stop" command followed by "lun import verify start" command). If necessary, delete this relationship (with -force option) and create it again.

Syslog Message

Import verify of foreign LUN %s and destination LUN %s failed - Reason:%s.

Parameters

DiskSerialNumber (STRING): Foreign disk serial number.
LUNSerialNumber (STRING): Serial number of the LUN.
FailureReason (STRING): Internal error reason.

fm events

fm.cpuutilduringarl events

fm.cpuUtilDuringARL

Deprecated

Deprecated as of version 9.0.

Severity

NOTICE

Description

This message occurs at the start of an aggregate relocation (ARL) and at the completion of an ARL. It records the maximum, minimum, and average CPU and disk utilization on the node executing the ARL.

Corrective Action

(None).

Syslog Message

CPU and disk utilization during the %d seconds %s: cpu_util_high: %lld; cpu_util_low: %lld; cpu_util_avg: %lld; disk_util_high: %lld; disk_util_low: %lld; disk_util_avg: %lld

Parameters

window_sz (INT): Duration, in seconds, over which CPU and disk utilization are tracked.
when (STRING): Event during which CPU and disk utilization are tracked.
cpu_util_high (LONGINT): Maximum CPU utilization.
cpu_util_low (LONGINT): Minimum CPU utilization.
cpu_util_avg (LONGINT): Average CPU utilization.
disk_util_high (LONGINT): Maximum disk utilization.
disk_util_low (LONGINT): Minimum disk utilization.
disk_util_avg (LONGINT): Average disk utilization.

fm.cpuutilduringtransition events

fm.cpuUtilDuringTransition

Severity

NOTICE

Description

This message occurs during various failover and aggregate mobility events, including start of a takeover, end of a successful takeover, start of a CFO giveback, after completion of SFO giveback and completion of an aggregate relocation. This message records the maximum, minimum, and average CPU and disk utilization on the node executing the failover or aggregate mobility operation.

Corrective Action

(None).

Syslog Message

CPU and disk utilization during the %d seconds %s: cpu_util_high: %lld; cpu_util_low: %lld; cpu_util_avg: %lld; disk_util_high: %lld; disk_util_low: %lld; disk_util_avg: %lld

Parameters

window_sz (INT): Duration, in seconds, over which CPU and disk utilization are tracked.
when (STRING): Event during which CPU and disk utilization are tracked.
cpu_util_high (LONGINT): Maximum CPU utilization.
cpu_util_low (LONGINT): Minimum CPU utilization.
cpu_util_avg (LONGINT): Average CPU utilization.
disk_util_high (LONGINT): Maximum disk utilization.
disk_util_low (LONGINT): Minimum disk utilization.
disk_util_avg (LONGINT): Average disk utilization.

fm.overridembxuncertain events

fm.overrideMbxUncertain

Severity

NOTICE

Description

This message occurs when the user has chosen to override a mailbox uncertain state using the CTRL_O option. The node could have gotten into the mailbox uncertain state if, while booting up, it finds that one or more disks are missing and it does not have the requisite number of mailbox disks to boot up. If the override was successful, at least half of the online disks were also present in the mailbox hints bootarg and the node will boot up. If the override was unsuccessful, the node continues to remain in an uncertain mailbox state and will not boot up completely.

Corrective Action

(None).

Syslog Message

HA mailbox uncertain state overridden.

Parameters

(None).

fmmb events

fmmb.add events

fmmb.add.problem

Severity

ERROR

Description

This event is issued when the HA mailbox is attempting to add a mailbox disk and a problem occurred.

Corrective Action

(None).

Syslog Message

Error attempting to add disk %s as a %s HA mailbox disk.

Parameters

disk (STRING): The name of the disk. If the disk name is not available, a ?.? will be used.
host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.blobnotfound events

fmmb.BlobNotFound

Severity

ALERT

Description

This message occurs when a mailbox 'blob' is not read from the on-disk mailbox data structure. A 'blob' is a piece of data which has been stored for a non-High Availability (HA) Data ONTAP® subsystem in the mailbox.

Corrective Action

If the blob id is "3" and this is a 2-node cluster, use the 'cluster ha modify -configure' command to unconfigure ha and then reconfigure it.

Syslog Message

(None).

Parameters

blob_id (INT): 'blob' ID.
owner (STRING): Owner of the blob, either PARTNER or LOCAL.
reason (STRING): Reason for the problem.

fmmb.blobnotwritten events

fmmb.BlobNotWritten

Deprecated

Deprecated as of version 9.2.

Severity

ALERT

Description

This message occurs when a mailbox 'blob' write operation to the on-disk mailbox data structure fails. A 'blob' is a piece of data that has been stored for a non-high availability (HA) Data ONTAP® subsystem in the HA mailbox.

Corrective Action

If the blob ID is "3" and this is a two-node cluster, use the 'cluster ha modify -configure' command to unconfigure HA and then reconfigure it.

Syslog Message

(None).

Parameters

blob_id (INT): 'blob' ID.
owner (STRING): Owner of the blob, either PARTNER or LOCAL.
reason (STRING): Reason for the problem.

fmmb.blobwritten events

fmmb.BlobWritten

Severity

INFORMATIONAL

Description

This message occurs when a mailbox 'blob' write to the on-disk mailbox data structure succeeds. A 'blob' is a piece of data that has been stored for a non-high availability (HA) Data ONTAP® subsystem in the HA mailbox.

Corrective Action

(None).

Syslog Message

Blob %d: bytes written %d: data: %llx.

Parameters

blob_id (INT): 'blob' ID.
blob_data_len (INT): Total number of bytes of data written.
data (LONGINTHEX): First eight bytes of the data written.

fmmb.current events

fmmb.current.lock.disk

Severity

INFORMATIONAL

Description

This event is issued when HA mailbox disks are discovered or allocated.

Corrective Action

(None).

Syslog Message

Disk %s is a %s HA mailbox disk.

Parameters

disk (STRING): The name of the disk. If the disk name is not available, the name ?.? will be used.
host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.destroy events

fmmb.destroy.mbx

Severity

INFORMATIONAL

Description

This event is issued when the high-availability (HA) Mailbox contents are cleared, typically by the 'mailbox destroy' command.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_name (STRING): Disk name on which the mailbox was cleared.

fmmb.destroy.mbx.fail

Severity

NOTICE

Description

This event is issued when an attempt is made to destroy the mailbox contents on the disk and this fails.
Data ONTAP to a 7.0 or later version.

Corrective Action

(None).

Syslog Message

Failed to clear mailbox on disk:%s, error:%s.

Parameters

disk_name (STRING): disk name on which we are trying to clear the mailbox.
error (STRING): The reason why mailbox clear failed.

fmmb.disk events

fmmb.disk.IDchange

Severity

INFORMATIONAL

Description

This event is issued when the unique identifier of one of the disks used by the HA mailbox has changed.

Corrective Action

(None).

Syslog Message

Disk %s has changed its unique identifier.

Parameters

disk (STRING): The name of the disk whose identifier has changed.

fmmb.disk.notAccsble

Severity

NOTICE

Description

This message occurs when mailbox disks of the specified host are not accessible.

Corrective Action

(None).

Syslog Message

All %s mailbox disks are inaccessible.

Parameters

host (STRING): Host string, which is either local or partner.

fmmb.exthdr events

fmmb.exthdr.null

Severity

ERROR

Description

This event is issued when the HA Mailbox extension header is invalid. The extension header is an on-disk structure which describes the opaque client blocks and major reset structures.

Corrective Action

(None).

Syslog Message

HA Mailbox extension header is null.

Parameters

host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.inststat events

fmmb.instStat.change

Severity

INFORMATIONAL

Description

This message occurs whenever the mailbox instance state changes.

Corrective Action

(None).

Syslog Message

%s on %s side.

Parameters

buff (STRING): Instance state string.
host (STRING): Host string, which is either local or partner.

fmmb.lock events

fmmb.lock.disk.remove

Severity

INFORMATIONAL

Description

This event is issued when a disk is removed from the HA mailbox disk lock set.

Corrective Action

(None).

Syslog Message

Disk %s removed from %s mailbox set.

Parameters

disk (STRING): The name of the disk. If the disk name is not available, a ?.? will be used.
host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.major events

fmmb.major.reset.invalid

Severity

ALERT

Description

This event is issued when the HA Mailbox major reset data should exist and it doesn't. The major reset data in the mailbox is created and used when there is a major change of information kept in the HA mailbox records.

Corrective Action

(None).

Syslog Message

HA %s Mailbox major reset header information is invalid.

Parameters

host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.mediator events

fmmb.mediator.lckdiskSuggest

Severity

INFORMATIONAL

Description

This message occurs when a mailbox disk from the mediator site is selected to be included in the mailbox disk list.

Corrective Action

(None).

Syslog Message

(None).

Parameters

side (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

uuid (STRING): Disk unique ID of the mailbox disk on mediator site.

fmmb.mediator.noLckdisk

Severity

INFORMATIONAL

Description

This message occurs when there is no mediator mailbox detected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

side (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

fmmb.mediator.nullLckdiskSuggest

Severity

INFORMATIONAL

Description

This message occurs when there is null mediator mailbox detected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

side (INT): The mailbox instance side. The value of 0 for local mailbox and the value of 1 for partner mailbox.

fmmb.mmr events

fmmb.MMR.payload.bad

Severity

ALERT

Description

This event is issued when the outbound FM payload area is found to be corrupted and the master mailbox record is missing.

Corrective Action

(None).

Syslog Message

%s outbound FM payload area is invalid and the master mailbox record is missing.

Parameters

host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.newdisksuggestion events

fmmb.NewDiskSuggestion

Severity

INFORMATIONAL

Description

This message occurs when RAID sends to the high-availability (HA) mailbox code a list of disks to use for HA mailbox disks.

Corrective Action

(None).

Syslog Message

(None).

Parameters

count (INT): Number of suggested disks.
new (STRING): List of suggested disks.
old (STRING): Current list of HA mailbox disks.

fmmb.oldformatcleared events

fmmb.oldFormatCleared

Severity

INFORMATIONAL

Description

This event is issued when the older format HA mailboxes (special area of disk used for bookkeeping) are cleared on an upgrade from a pre 7.0 version of Data ONTAP to a 7.0 or later version.

Corrective Action

(None).

Syslog Message

Clearing content of %s old format HA mailboxes (special area of disk used for bookkeeping).

Parameters

whichone (STRING): Either local or partner to indicate which set of HA mailboxes are being cleared.

fmmb.opaque events

fmmb.opaque.hdr.invalid

Severity

ALERT

Description

This event is issued when the HA Mailbox opaque header is invalid. The opaque area in the HA Mailbox is used by HA mailbox clients, like RAID, to store persistent information.

Corrective Action

(None).

Syslog Message

HA %s Mailbox opaque header is invalid.

Parameters

host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.

fmmb.payload events

fmmb.payload.outbound.bad

Severity

ALERT

Description

This event is issued when the outbound FM payload area is found to be corrupted. The invalid fm state information is logged. As a result of this condition the payload is zeroed and HA mailbox re-initialization is done.

Corrective Action

(None).

Syslog Message

%s outbound FM payload area is invalid with fmState of %d.

Parameters

host (STRING): The node which owns the HA mailbox disk. The node can be either local or partner.
fmState (INT): The invalid FM state information.

fmmb.revert events

fmmb.revert.opaque

Severity

ERROR

Description

This event is issued when the HA Mailbox opaque recieves a write request for the opaque area and a revert_to command is in progress. The write request is rejected. The opaque area in the HA Mailbox is used by non HA mailbox clients, like RAID, to store persistent information.

Corrective Action

(None).

Syslog Message

HA Mailbox RAID write request rejected during revert.

Parameters

(None).

fp events

fp.est events

fp.est.scan.catalog.failed

Severity

ERROR

Description

This message occurs when the volume footprint estimator scan fails to update the catalog file. This can cause footprint data reduction to be unreported post volume remount until the next scan updates the file.

Corrective Action

Check if there is atleast 4K worth of space available for the catalog metafile in the volume. Use "df <vol-name>" command to see available space details.

Syslog Message

Volume footprint estimator scan catalog update fails on "%s" - %s.

Parameters

vol (STRING): Volume name.
fail_message (STRING): Update failure reason.

fp.est.scan.catalog.updated

Severity

NOTICE

Description

This message occurs when related information of the volume footprint estimator scan is updated on the catalog file.

Corrective Action

(None).

Syslog Message

Volume footprint estimator scan catalog updated on '%s' (SE ratio local: %s, SE ratio migrate: %s, Incompressible: %d%%, Hot data: %llu%%, Mode: %d, SE ratio cold migrate: %s).

Parameters

vol (STRING): Volume name.
se_ratio_local (STRING): Storage efficiency ratio for local reporting.
se_ratio_migrate (STRING): Storage efficiency ratio for migrate reporting.
incomp_data_pct (INT): Incompressible data percentage.
hot_data_pct (LONGINT): Hot data percentage.
scan_mode (INT): Scan mode.
se_ratio_cold_migrate (STRING): Storage efficiency ratio for cold migrate reporting.

fp.est.scan.start.failed

Severity

ERROR

Description

This message occurs when the volume footprint estimator scan fails to start. This might cause footprint data reduction reporting to be inaccurate. But the scan is expected to be triggered again in the next cycle which is likely to be the next day.

Corrective Action

Scan will be triggered again in the next cycle which is likely to be the next day.

Syslog Message

Volume footprint estimator scan fails to start on "%s" - %s.

Parameters

vol (STRING): Volume name.
fail_message (STRING): Scan failure reason.

fpolicy events

fpolicy.eagain events

fpolicy.eagain.disconnect

Severity

ALERT

Description

This message occurs when the TCP connection to the FPolicy server is broken four times in a two minute interval due to EAGAIN error. ONTAP will not establish a new connection and FPolicy notifications will not be sent to the server.

Corrective Action

Persistent EAGAIN errors indicate slow network or slow/unresponsive FPolicy server. Check the connection between the FPolicy server and the node or contact the FPolicy application's vendor support to address the slow/unresponsive server.

Syslog Message

Connection to the FPolicy server "%s" of policy "%s" is broken for Vserver %s (reason: "%s").

Parameters

fpserver (STRING): IP address of the FPolicy server.
policy (STRING): Name of the policy.
vserver (STRING): Vserver Name.
reason (STRING): Reason for disconnection.

fpolicy.eagain.on.write

Severity

NOTICE

Description

This message occurs when there is no space in the send buffer for sending a message to the FPolicy server. The FPolicy server is apparently slow in reading notifications.

Corrective Action

Occasional EAGAIN (resource temporarily unavailable) errors can occur for transient network issues. If this message occurs frequently, check the connection between the FPolicy server and the node. If the errors persist, contact the FPolicy application's vendor support.

Syslog Message

Write returned EAGAIN while sending notification to the FPolicy server "%s" for Vserver %s with UUID %s.

Parameters

fpserver (STRING): IP address of the FPolicy server.
vserver (STRING): Vserver Name.
Vserver_UUID (STRING): Vserver UUID.

fpolicy.fgconversion events

fpolicy.fgconversion.warning

Severity

NOTICE

Description

This message occurs when a FlexVol® unmount notification is not sent to the FPolicy(tm) server during a FlexGroup conversion.

Corrective Action

(None).

Syslog Message

Failed to send FPolicy unmount notification for FlexVol %s of Vserver %s. FlexGroup MSID: %llu.

Parameters

vserverName (STRING): Name of the Vserver.
volumeName (STRING): Name of the volume being converted to a FlexGroup.
flexgroupMsid (LONGINTHEX): MSID of the new FlexGroup.

fpolicy.memory events

fpolicy.memory.pressure

Severity

ALERT

Description

This message occurs when either the FPolicy Service Manager (FSM) receives too many requests to process immediately, or when the number of requests is accumulating due to server connectivity issues. FSM processing time might degrade as a result.

Corrective Action

Check the connection between the node and the FPolicy server by using the "vserver fpolicy show-engine" command. Verify that FPolicy is only monitoring file operations that are recommended by the FPolicy server vendor. Verify that FPolicy is using filters recommended by the server vendor for common file operations, for example, close, read, write and open.

Syslog Message

FSM is experiencing memory pressure.

Parameters

(None).

fpolicy.outage events

---

fpolicy.outage.file.invalid

Severity

ERROR

Description

This message occurs when file creation fails under the configured resiliency directory path.

Corrective Action

Check the configured resiliency directory path. To find the configured resiliency directory path by using the "vserver fpolicy policy external-engine show" command.

Syslog Message

Failed to create file under configured resiliency directory path of FPolicy external engine "%s" for policy "%s". Reason: %s.

Parameters

engine (STRING): FPolicy external engine.
policy (STRING): FPolicy policy.
reason (STRING): Reason for the failure.

fpolicy.outage.msg.lost

Severity

ERROR

Description

This message occurs when the send operation fails for the network outage notification.

Corrective Action

Find the file in the configured resiliency directory path.

Syslog Message

Failed to send outage notification message to any FPolicy server for policy "%s" and path "%s".

Parameters

policy (STRING): FPolicy policy.
path (STRING): File path.

fpolicy.outage.msg.success

Severity

NOTICE

Description

This message occurs when a network outage notification is successfully sent.

Corrective Action

(None).

Syslog Message

Outage notification message sent to at least one FPolicy server for policy "%s" and file path "%s".

Parameters

policy (STRING): FPolicy policy.
path (STRING): File path.

fpolicy.outage.over

Severity

NOTICE

Description

This message occurs when the FPolicy external engine, acting asynchronously and with resiliency support enabled, is reconnected after a network outage.

Corrective Action

(None).

Syslog Message

The network outage (duration: "%llu" sec) is over. At least one FPolicy server is now connected successfully for FPolicy external engine "%s" of policy "%s".

Parameters

Duration (LONGINT): Network outage duration in seconds.
engine (STRING): Asynchronous FPolicy external engine.
policy (STRING): FPolicy policy.

fpolicy.outage.start

Severity

NOTICE

Description

This message occurs when the FPolicy external engine, acting asynchronously and with resiliency support enabled, is disconnected due to a network outage.

Corrective Action

(None).

Syslog Message

Network outage for FPolicy external engine "%s" of policy "%s".

Parameters

engine (STRING): Asynchronous FPolicy external engine.
policy (STRING): FPolicy policy.

fpolicy.outage.timeout

Severity

NOTICE

Description

This message occurs when the maximum notification retention duration for the FPolicy external engine expires, and the engine is configured to operate asynchronously with resiliency support enabled. The storage controller stores no more notifications.

Corrective Action

(None).

Syslog Message

Maximum notification retention time has expired for FPolicy external engine "%s" of policy "%s".

Parameters

engine (STRING): Asynchronous FPolicy external engine.
policy (STRING): FPolicy policy.

fpolicy.outage.write

Severity

NOTICE

Description

This message occurs when FPolicy cannot store file notifications using the configured resiliency directory path.

Corrective Action

(None).

Syslog Message

Failed to store notifications in configured resiliency directory path of FPolicy external engine "%s" for policy "%s". Reason: %s.

Parameters

engine (STRING): FPolicy external engine.
policy (STRING): FPolicy policy.
reason (STRING): Reason for the failure.

fpolicy.outage.writes.lost

Severity

ERROR

Description

This message occurs when FPolicy fails multiple consecutive times to store file notifications using the configured resiliency directory path.

Corrective Action

Check the configured resiliency directory path. To find the configured resiliency directory path by using the "vserver fpolicy policy external-engine show" command.

Syslog Message

Unable to store notifications in configured resiliency directory path of FPolicy external engine "%s" for policy "%s".

Parameters

engine (STRING): FPolicy external engine.
policy (STRING): FPolicy policy.

fpolicy.pspath events

fpolicy.pspath.failed

Severity

ERROR

Description

This message occurs when the creation of the FPolicy persistent store active or backlog directories fails. This disrupts the persistent store workflow in FPolicy.

Corrective Action

Check the space availability and permission on volume and recreate the PS config.

Syslog Message

Failed to create FPolicy persistent store path "%s" in SVM "%s".

Parameters

path (STRING): The directory path name that failed while it's creation.
vserverName (STRING): Name of the Vserver.

fpolicy.server events

fpolicy.server.bkPressApply

Severity

INFORMATIONAL

Description

This message occurs when the FPolicy server has applied backpressure which means that the server is busy and does not want to receive requests until it removes backpressure.

Corrective Action

(None).

Syslog Message

FPolicy server "%s" has applied backpressure.

Parameters

fpserver (STRING): IP Address of the FPolicy server.

fpolicy.server.bkPressRemove

Severity

INFORMATIONAL

Description

This message occurs when the FPolicy server removes backpressure, which it has previously applied. The FPolicy server removes backpressure when it is ready to receive requests.

Corrective Action

(None).

Syslog Message

FPolicy server "%s" has removed backpressure.

Parameters

fpserver (STRING): IP Address of the FPolicy server.

fpolicy.server.connect

Severity

NOTICE

Description

This message occurs when a control channel is established between the node and the FPolicy server.

Corrective Action

(None).

Syslog Message

Control channel with the FPolicy server "%s" of policy "%s" is established for Vserver %s.

Parameters

fpserver (STRING): IP Address of the FPolicy server.
policy (STRING): Name of the policy.
vserver (STRING): Vserver Name.

fpolicy.server.connectError

Severity

ERROR

Description

This message occurs when the node fails to establish a control channel with the FPolicy server. The control channel is used for communication between the node and the FPolicy server. The error could be because of a failure in establishing TCP connection, SSL failure, FPolicy handshake failure, or some internal error.

Corrective Action

Depending on the failure reason, check the following: On the node, check whether the correct IP and port entries are specified in the policy configuration. Also, the FPolicy server should be running and listening on the port specified in the policy configuration. Run the command "network interface show" to determine that at least one data logical interface (LIF) is configured to the Vserver on the node. Run the command

"routing-groups route show" to verify that the network route exists to the FPolicy server. Run the command "network ping" to verify that the FPolicy server is reachable from the node. For any other reason, see the Cluster-Mode documentation.

Syslog Message

Node failed to establish a connection with the FPolicy server "%s" of policy "%s" for Vserver %s (reason: "%s").

Parameters

fpserver (STRING): IP address of the FPolicy server.
policy (STRING): Name of the policy.
vserver (STRING): Vserver Name.
reason (STRING): Reason for failure.

fpolicy.server.disconnect

Severity

ERROR

Description

This message occurs when the TCP connection to the FPolicy(tm) server is broken.

Corrective Action

Reestablish the connection by using "vserver fpolicy engine-connect" command.

Syslog Message

Connection to the FPolicy server "%s" of policy "%s" is broken for Vserver %s (reason: "%s").

Parameters

fpserver (STRING): IP address of the FPolicy server.
policy (STRING): Name of the policy.
vserver (STRING): Vserver Name.
reason (STRING): Reason for disconnection.

fpolicy.server.maxPendingReq

Severity

INFORMATIONAL

Description

This message occurs when the maximum outstanding requests for a FPolicy server from a node has reached. The value is configurable through CLI.

Corrective Action

If you want to increase the maximum pending request modify the "-max-server-reqs" option using command "fpolicy policy external-engine modify" from CLI.

Syslog Message

Maximum outstanding requests for the FPolicy server "%s" has reached.

fpserver (STRING): IP Address of the FPolicy server.

fpolicy.unsupportedpathlen events

fpolicy.unsupportedPathLen

Severity

NOTICE

Description

This message occurs when an FPolicy screen request has a path name longer than 4k bytes. The associated file operation will not be screened by FPolicy.

Corrective Action

If possible remove the volume generating long path notification from FPolicy screening.

Syslog Message

FPolicy notification has path names with unsupported length of "%lld". Max supported path length is %lld. The associated file operation will not be screened by FPolicy.

Parameters

currentPathLen (LONGINT): Length of the file or directory path from root of volume.
allowedPathLen (LONGINT): Maximum supported path length.

fsm events

fsm.low events

fsm.low.memory

Severity

ERROR

Description

This message occurs when Fpolicy Service Manager (FSM) fails to send outage, alert, handshake, cancel or volume operation notification to the FPolicy server due to memory allocation error.

Corrective Action

Check the connection between ONTAP and FPolicy server. Slow connection may result in accumulation of notifications in FSM. Make sure that the FPolicy is monitoring file operation which are recommended by FPolicy server vendor. Also use vendor recommended filter for operation like close, read, write and open.

Syslog Message

Failed to allocate memory for %s notification.

Parameters

reqType (STRING): Type of the message.

gb events

gb.cfo events

gb.cfo.abort.raid.fm

Severity

ERROR

Description

This message occurs when a high-availability (HA) controller failover (CFO) giveback is canceled due to RAID activity on a partner aggregate.

Corrective Action

Reissue the "storage failover giveback" command to initiate giveback to the partner after the pending or in-progress operation on the partner volume or aggregate is complete. Use the "storage aggregate status -r" command to view the state of the aggregate. If a plex is offline, use the "storage aggregate plex online" command to bring the plex online. If unmirrored aggregates are not supported on this configuration, use the "storage aggregate mirror" command to mirror this aggregate.

Syslog Message

%s %s%s is %s; canceling giveback.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Current owner of the aggregate.
vol (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing CFO giveback.

gb.cfo.veto.asup.generalNopart

Severity

NOTICE

Description

This message occurs when AutoSupport vetoes a controller failover (CFO) giveback request because an AutoSupport message for the down partner node was not collected prior to the giveback request.

Corrective Action

Typically, an AutoSupport message for the partner node is collected shortly after takeover is complete. If the CFO giveback was attempted and vetoed within 20 minutes of the takeover, retry the operation later. If time does not permit waiting, use the 'cf giveback -f' command to force a giveback.

Syslog Message

AutoSupport vetoed giveback because an AutoSupport message for the down partner node was not yet collected.

Parameters

(None).

gb.cfo.veto.coredump.pardump

Severity

> NOTICE

Description

> This message occurs when the partner node is still dumping core, and cannot yet resume serving data. The giveback attempt has been canceled.

Corrective Action

> Either let the dumpcore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

Syslog Message

> Giveback canceled because partner is still dumping core

Parameters

> (None).

gb.cfo.veto.coredump.parsave

Severity

> NOTICE

Description

> This message occurs when savecore is currently saving the partner coredump. This work will be lost if a giveback is done at this time, so the giveback has been canceled.

Corrective Action

> Either let the savecore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

Syslog Message

> Giveback canceled because savecore is running. %d%% - %d of %d blocks saved

Parameters

> **percent** (INT): Percentage of core that has been saved
> **completed** (INT): Number of blocks that have been saved
> **total** (INT): Total number of blocks in the core

gb.cfo.veto.coredump.savinit

Severity

> NOTICE

Description

> This message occurs when savecore is getting ready to start saving the partner coredump. The giveback attempt has been canceled.

Corrective Action

> Either let the savecore operation finish, or use the "-override-vetoes true" parameter to force a giveback.

Syslog Message

Giveback canceled because savecore is initializing

Parameters

(None).

gb.cfo.veto.lmgr.nonCA.broke

Severity

NOTICE

Description

This message occurs when a giveback is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in controller failover (CFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

(None).

Syslog Message

Dropped non-CA locks on volume %s%s%s%s on CFO aggregate %s due to forced giveback.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

gb.cfo.veto.lmgr.nonCA.locks

Severity

ERROR

Description

This message occurs when a giveback has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in controller failover (CFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate list" -continuously-available No' command. "aggregate list" is a list of aggregates that are sent home as a result of the giveback operation. If lock state disruption for all existing non-CA locks is acceptable, retry the giveback operation by using the '-override-vetoes true' option.

Could not complete giveback because of non-CA locks on volume %s%s%s%s CFO aggregate %s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

gb.cfo.veto.nvsave.fail

Severity

ERROR

Description

This message occurs when the system cannot perform a giveback due to WAFL® NVSave file replay activity, and must abort the giveback.

Corrective Action

Retry the giveback operation after completion of NVSave files replay. Replay completion is indicated by the EMS message 'wafl.nvsave.replaying.pass' or 'wafl.nvsave.replaying.fail'.

Syslog Message

%s %s%s%s%s has WAFL NVSave file replay activity underway; canceling giveback.

Parameters

type (STRING): Object type (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

gb.cfo.veto.repl

Severity

NOTICE

Description

This message occurs when a cluster failover(CFO) giveback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

Corrective Action

Either abort the replication transfer that is preventing the giveback from being completed, retry the 'storage failover giveback' command with the '-override-vetoes true' option, or wait for the transfer to finish.

Syslog Message

Could not complete giveback because a replication transfer with UUID %s is in progress.

Parameters

transferId (STRING): UUID of the SnapMirror® replication transfer that vetoed the giveback.

gb.cfo.veto.sanown.ReassignInProgress

Severity

ERROR

Description

This message occurs when a controller disallows a giveback attempt because the partner's disk ownership is being reassigned. Typically, ownership reassignment is done after a controller replacement.

Corrective Action

Reissue the giveback request after disk ownership assignment is completed.

Syslog Message

Giveback was vetoed because the disk ownership reassignment in progress on the partner cannot be interrupted.

Parameters

(None).

gb.cfo.veto.snap.fail

Severity

NOTICE

Description

This message occurs when the system cannot perform a giveback due to snapshot activity, and must abort the giveback.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s has snapshot activity underway; canceling giveback.

Parameters

type (STRING): Object type (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the the volume name itself is insufficient.

gb.cfo.veto.snap.warning

Severity

NOTICE

Description

This message occurs when the system detects snapshot activity during giveback.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s has snapshot activity underway.

Parameters

type (STRING): Object type (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the the volume name itself is insufficient.

gb.cfo.veto.storageDiskBrkn

Severity

ERROR

Description

This message occurs when a giveback is aborted because a failed disk is present.

Corrective Action

Remove all failed disks and retry the giveback.

Syslog Message

Failed disk %s should be removed before the giveback command is invoked.

Parameters

diskName (STRING): Name of the device.

gb.cfo.veto.storageDiskByp

Severity

ERROR

Description

This message occurs when a giveback is aborted because one or more bypassed disks are present.

Corrective Action

Remove all bypassed disks and retry the giveback.

Syslog Message

All bypassed disks should be removed before a giveback command is entered.

Parameters

(None).

gb.cfo.veto.storageDiskSanit

Severity

ERROR

Description

This message occurs when a giveback is aborted because disk sanitization is in progress.

Corrective Action

Retry the giveback after sanitization is completed.

Syslog Message

Disk sanitization is in the process of formatting a disk. This operation should not be interrupted by a giveback.

Parameters

(None).

gb.cfo.veto.vservermigrate

Severity

ERROR

Description

This message occurs when the vserver migrate cutover operation vetoes cfo aggregate giveback because vserver migration cannot be aborted during that time.

Corrective Action

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the vserver migrate cutover operation is completed.

Syslog Message

Vserver migration in progress prevents giveback.

Parameters

(None).

gb.netra events

gb.netra.ca.check.failed

Severity

ERROR

Description

This message occurs during the migration of an aggregate as a part of storage failover (SFO) giveback, when the destination node cannot reach the object stores.

Corrective Action

Verify that your intercluster LIF is online and functional by using the 'network interface show' command. Also, check network connectivity to the object store server by using the 'ping' command over the destination node intercluster LIF. Additionally, verify that the configuration of your object store has not changed and that login and connectivity information is still accurate by using the 'aggregate object-store config show'

command. It is possible to override this error by specifying false for the "require-partner-waiting" parameter of the giveback command. For more information or assistance, contact NetApp technical support.

Syslog Message

Giveback of aggregate '%s' (uuid: %s) failed due to %s preventing object store access on the destination node.

Parameters

vol (STRING): Name of the aggregate.
aggr_uuid (STRING): UUID of the aggregate.
reason (STRING): Activity that is preventing the aggregate giveback operation.

gb.sfo events

gb.sfo.abort.raid.fm

Severity

ERROR

Description

This message occurs when a high-availability (HA) storage failover (SFO) giveback is canceled due to RAID activity on a partner aggregate.

Corrective Action

Reissue the "storage failover giveback" command to initiate giveback to the partner after the pending or in-progress operation on the partner volume or aggregate is complete. Use the "storage aggregate status -r" command to view the state of the aggregate. If a plex is offline, use the "storage aggregate plex online" command to bring the plex online. If unmirrored aggregates are not supported on this configuration, use the "storage aggregate mirror" command to mirror this aggregate.

Syslog Message

%s %s%s is %s; canceling giveback.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Current owner of the aggregate.
vol (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing SFO giveback.

gb.sfo.netra.ha.dskChkFailed

Severity

ERROR

Description

This message occurs when giveback of the partner's storage failover (SFO) aggregate fails because the high-availability (HA) partner cannot see all disks belonging to the aggregate.

Corrective Action

Use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the disks and to determine the latest ownership. If the disk inventory mismatch is not resolved, check the

cabling for loose connections or a bad cable on the partner node.

Syslog Message

Giveback of aggregate %s failed because the partner cannot see all disks belonging to the aggregate.

Parameters

aggr (STRING): Name of the aggregate that was not given back.

gb.sfo.netra.raid.failed

Severity

ERROR

Description

This message occurs during migration of an aggregate as part of storage failover (SFO) giveback, when one of the aggregate checks on the destination node fails, including duplicate aggregate name or duplicate Universally Unique Identifier (UUID).

Corrective Action

1. If checks fail due to duplicate aggregate name or UUID, delete the duplicate aggregate created from previous "storage failover giveback" or "storage aggregate relocation" operations. Contact NetApp technical support for assistance with deletion of the unwanted duplicate aggregate.

Syslog Message

Aggregate '%s' (UUID = %s, type = %s, home_owner_id = %llu, dr_home_owner_id = %llu): RAID aggregate migration checks failed on destination node %s.

Parameters

vol (STRING): Name of the aggregate.
aggregate_uuid (STRING): UUID of the aggregate.
raid_type (STRING): RAID type of the volume.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
dr_home_owner_id (LONGINT): NVRAM system ID of the aggregate's disaster recovery (DR) home owner.
reason (STRING): Activity that is preventing the aggregate relocation or giveback operation.

gb.sfo.netra.wafl.mcc.veto

Severity

ERROR

Description

This message occurs during migration of an aggregate as part of storage failover (SFO) giveback, when one or more online left-behind disaster recovery(DR) aggregates are found on the destination node and the "node-object-limit" option is set to off.

Corrective Action

Check whether there exists any online left-behind DR aggregates on the destination node from a previous switchover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner, and then retry the operation. If you cannot perform the corrective action, then use the "override-vetoes" option in the "giveback" command to force the giveback.

Syslog Message

Aggregate '%s': One or more online left-behind DR aggregates were found on the destination node and the "node-object-limit" option is set to off.

Parameters

vol (STRING): Name of the aggregate.

gb.sfo.precmt.lmgr.resynabrt

Severity

NOTICE

Description

This message occurs during giveback, when automatic lock resynchronization with the node's high-availability (HA) partner for files on this aggregate was aborted.

Corrective Action

(None).

Syslog Message

Automatic lock resynchronization was aborted for aggregate %s on forced giveback.

Parameters

aggr (STRING): Name of the aggregate for which resynchronization was aborted.

gb.sfo.precmt.lmgr.resyncing

Severity

ERROR

Description

This message occurs during giveback, when automatic lock resynchronization with the node's high-availability (HA) partner is in progress for files on this aggregate.

Corrective Action

Retry the giveback after verifying that lock synchronization is complete using the 'debug locks auto-resync-status -aggregate <aggregate>' diagnostic privilege command. If lock state disruption for all CA locks on the aggregate is acceptable, retry the giveback with the '-override-vetoes true' option.

Syslog Message

Could not give back aggregate %s because automatic lock resynchronization was in progress.

Parameters

aggr (STRING): Name of the aggregate with locks not yet in sync.

gb.sfo.precmt.repl

Severity

NOTICE

Description

This message occurs when all replication transfers are aborted because of storage failover (SFO) giveback.

Corrective Action

(None).

Syslog Message

Replication transfers aborted due to SFO giveback.

Parameters

(None).

gb.sfo.precmt.vdom.lowMem

Severity

ERROR

Description

This message occurs when giveback of the partner's storage failover (SFO) aggregate fails due to the unavailability of Data ONTAP® memory on the source node.

Corrective Action

Free some memory and retry the giveback.

Syslog Message

Giveback of aggregate %s failed due to unavailability of Data ONTAP® memory on the source node.

Parameters

aggr (STRING): Name of the aggregate that was not given back.

gb.sfo.precmt.wafl.volconversion

Severity

ERROR

Description

This message occurs when an active volume conversion is running on one or more volumes on the source aggregate. Pre-commit is aborted.

Corrective Action

When volume conversion is complete, re-run the 'storage failover giveback' command.

Syslog Message

SFO giveback is blocked as Volume Conversion is in progress on one of the volumes on aggregate %s.

Parameters

aggregate_name (STRING): The name of the aggregate containing the volume on which conversion is in progress.

gb.sfo.veto.asup.generalNopart

Severity

NOTICE

Description

This message occurs when AutoSupport vetoes a storage failover (SFO) giveback (sendhome) request because an AutoSupport message for the down partner node was not collected prior to the giveback request.

Corrective Action

Typically, an AutoSupport message for the partner node is collected shortly after takeover is complete. If an SFO giveback was attempted and vetoed within 20 minutes of the takeover, retry the operation later. If time does not permit waiting, use the 'storage failover giveback -override-vetoes true' command to force a giveback.

Syslog Message

AutoSupport vetoed giveback because an AutoSupport message for the down partner node was not yet collected.

Parameters

(None).

gb.sfo.veto.dump

Severity

ERROR

Description

This message occurs when dump/restore is aborted during storage failover/ aggregate relocation.

Corrective Action

(None).

Syslog Message

Dump/restore operations were aborted because %s is in progress.

Parameters

arl_or_sendhome (STRING): Describes whether ARL or SFO

gb.sfo.veto.kmgr.keysmissing

Severity

ERROR

Description

This message occurs when a giveback of the partner's storage failover (SFO) aggregate fails due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the partner node.

Corrective Action

Wait a few minutes, and then try the giveback of the partner's SFO aggregate again. If the problem persists, run the "security key-manager external restore" command for an external key manager, the "security key-

manager external azure restore" command for an AKV configuration, the "security key-manager external aws restore" command for an AWSKMS configuration, the "security key-manager external gcp restore" command for a GCPKMS configuration, the "security key-manager external ikp restore" command for an IKPKMS configuration, or the "security key-manager onboard sync" command for the Onboard Key Manager. These commands retrieve the encryption keys for the encrypted volumes of the aggregate from the key manager. After running the appropriate command, then try the giveback of the partner's SFO aggregate again.

Syslog Message

Giveback of aggregate "%s" failed due to the unavailability of the volume encryption keys for the encrypted volumes of the aggregate on partner node "%s". Details: %s.

Parameters

aggr (STRING): Name of the aggregate that was not given back.
node (STRING): Name of the node that is missing encryption keys.
details (STRING): Detailed reason for failure.

gb.sfo.veto.lmgr.nonCA.broke

Severity

NOTICE

Description

This message occurs when a giveback is forced that causes non-continuously available (non-CA) locks on the volume to be dropped. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

(None).

Syslog Message

Dropped non-CA locks on volume %s%s%s%s on SFO aggregate %s due to forced giveback.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

gb.sfo.veto.lmgr.nonCA.locks

Severity

ERROR

Description

This message occurs when a giveback has started but cannot proceed because non-continuously available (non-CA) locks are present on the volume. CA locks are established by opens through CIFS CA shares for regular files on read-write volumes that reside in storage failover (SFO) aggregates. These locks are mirrored to the node's high-availability (HA) partner to support the nondisruptive property of CA shares. The

rest of the locks are classified as non-CA locks and are not mirrored to the node's HA partner.

Corrective Action

Based on how resilient they are to failures, applications must either gracefully close sessions over which non-CA locks are established or accept lock state disruption. To determine the open files that have these sessions established, run the 'vserver cifs session file show -hosting-aggregate "aggregate list" -continuously-available No' command. "aggregate list" is a list of aggregates that are sent home as a result of the giveback operation. If lock state disruption for all existing non-CA locks is acceptable, retry the giveback operation by using the '-override-vetoes true' option.

Syslog Message

Could not complete giveback because of non-CA locks on volume %s%s%s%s SFO aggregate %s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
aggrname (STRING): Aggregate name.

gb.sfo.veto.lmgr.recons.left

Severity

ERROR

Description

This message occurs when a storage failover giveback has started, but cannot proceed because reconstruction of client file locks from mirrored lock information is not yet complete.

Corrective Action

Retry the giveback after checking the status of reconstruction using the 'debug locks reconstruction show' diagnostic privilege command. If the locks reconstruction operation is not completed, restart the giveback and override the veto using the '-override-vetoes true' option.

Syslog Message

Could not perform giveback because lock reconstruction on node %s is in progress.

Parameters

node (STRING): Name of the node reconstructing locks.

gb.sfo.veto.lmgr.syncing

Severity

ERROR

Description

This message occurs when a storage failover giveback has started but cannot proceed because synchronization of client file locks ("locks sync") with the partner is not yet complete.

Corrective Action

Retry the giveback after verifying that lock synchronization is completed, by using the 'debug locks lock-sync show' diagnostic privilege command.

Could not perform giveback because locks sync from node %s to its partner node %s is in progress.

Parameters

node (STRING): Name of the node performing locks sync with its partner.
partner (STRING): Name of the partner node with which locks sync is being performed.

gb.sfo.veto.repl

Severity

NOTICE

Description

This message occurs when a storage failover(SFO) giveback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

Corrective Action

Either abort the replication transfer that is preventing the giveback from being completed, retry the 'storage failover giveback' command with the '-override-vetoes true' option, or wait for the transfer to finish.

Syslog Message

Could not complete giveback because a replication transfer with UUID %s involving the aggregate %s is in progress.

Parameters

transferId (STRING): UUID of the SnapMirror® replication transfer that vetoed the giveback.
aggr (STRING): Name of the aggregate.

gb.sfo.veto.snaprestore

Severity

ERROR

Description

This message occurs when the system cannot perform a giveback because a volume snaprestore operation is active. The giveback is aborted.

Corrective Action

Retry giveback after the snaprestore operation is finished.

Syslog Message

%s %s%s%s%s is running snaprestore. Canceling giveback.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

gb.sfo.veto.volmove

Severity

ERROR

Description

This message occurs when the volume move operation vetoes a giveback because volume move can not be aborted during that time.

Corrective Action

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the volume move is completed. Or use the '-override-vetoes true' option to abort the volume move.

Syslog Message

Volume move in progress for volume %s with DSID %llu prevents giveback.

Parameters

vol_name (STRING): Name of the source or destination volume.
volume_dsid (LONGINT): Source or destination volume data set identifier (DSID).

gb.sfo.veto.vservermigrate

Severity

ERROR

Description

This message occurs when the vserver migrate cutover operation vetoes data aggregate giveback because vserver migration cannot be aborted during that time.

Corrective Action

Reissue the 'storage failover giveback' command to initiate giveback to the partner when the vserver migrate cutover operation is completed.

Syslog Message

Vserver migration in progress prevents giveback.

Parameters

(None).

gb.sfo.veto.wafl.volconversion

Severity

ERROR

Description

This message occurs when an active volume conversion against one or more of the volumes on the source aggregate vetoed giveback.

Corrective Action

When volume conversion is complete, re-run the 'storage failover giveback' command.

Syslog Message

SFO giveback is vetoed as Volume Conversion is in progress on one of the volumes on aggregate %s.

Parameters

aggregate_name (STRING): The name of the aggregate containing the volume on which conversion is in progress.

geom events

geom.ontap events

geom.ontap.orphan.removing

Severity

NOTICE

Description

This message occurs when the geometry layer (geom) detects a device to be detached from the system.

Corrective Action

(None).

Syslog Message

Removing unit %d type %d.

Parameters

unit (INT): Unit number.
disk_type (INT): Disk type.

gpo events

gpo.cap events

gpo.CAP.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) central access policy (CAP) settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied CAP settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.CAP.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) central access policy (CAP) settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply CAP settings to Vserver %s failed, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.frmwork events

gpo.frmwork.RSoPApplied

Severity

NOTICE

Description

This event occurs after the resultant set of Group Policy (GPO) is calculated and applied to the Replicated Database (RDB) successfully.

Corrective Action

(None).

Syslog Message

GPO policy applied into RDB successfully.

Parameters

vserver (STRING): Vserver name.

gpo.frmwork.secJobFailed

Severity

ERROR

Description

This message occurs when starting or restarting the GPO Security Apply job fails.

Corrective Action

Address the specific reason for the issue, and then start the job by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to start a GPO Security Apply job run for Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.frmwork.updateFailed

Severity

ERROR

Description

This message occurs when updating group policy object (GPO) tables fails.

Corrective Action

Address the specific reason for the issue, and then update the tables by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

GPO tables update failed for Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.frmwork.updateRSoPFailed

Severity

ERROR

Description

This message occurs when updating group policy object (GPO) RSoP (Resultant Set of Policy) settings fails.

Corrective Action

Address the specific reason for the issue, and then update the settings by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

GPO RSoP update failed for Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.job events

gpo.job.mainUpdateFailed

Severity

ERROR

Description

This message occurs when the Group Policy Object (GPO) Main Update job run fails. Consequently, the policies won't be applied to the CIFS server, requiring a rerun of the update job.

Corrective Action

Make sure Group Policy Object is enabled by running the "vserver cifs group-policy show -vserver <vserver-name>" command, CIFS admin state is up by running the "vserver cifs show -vserver <vserver-name>" and there are no connectivity issues with Active Directory by running "vserver cifs check -vserver <vserver-name>" command, and then run the job again by running the "vserver cifs group-policy update -force -reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

GPO Main Update job (%s) run failed for Vserver %s, reason: %s.

Parameters

jobid (STRING): GPO job ID.
vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.job.mainUpdateSuccess

Severity

INFORMATIONAL

Description

This message occurs when the GPO Main Update job run succeeds.

Corrective Action

(None).

Syslog Message

Successfully completed a GPO Main Update job (%s) run for Vserver %s.

Parameters

jobid (STRING): GPO job ID.
vserver (STRING): Vserver name.

gpo.job.outOfMemory

Severity

ERROR

Description

This event occurs when the system has not enough memory to perform the GPO (Group Policy Object) job.

Corrective Action

Ensure there is enough memory available to perform the GPO job.

Syslog Message

GPO job %s failure: Out of memory.

Parameters

jobid (STRING): The GPO job ID.

gpo.job.securityApplyFailed

Severity

ERROR

Description

This message occurs when the Group Policy Object (GPO) Security Apply job run fails. Consequently, the security policies are not applied to the CIFS server, requiring a rerun of the apply job.

Corrective Action

Make sure we are able to check the CIFS configuration by running the "vserver cifs show -vserver <vserver-name>" command and the "vserver cifs check -vserver <vserver-name>" command. Run the job again using the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

GPO Security Apply job (%s) run failed for Vserver %s, reason: %s.

Parameters

jobid (STRING): GPO job ID.
vserver (STRING): Storage virtual machine (SVM) name.

reason (STRING): Reason for the failure.

gpo.job.securityApplySuccess

Severity

INFORMATIONAL

Description

This message occurs when the GPO Security Apply job run succeeds.

Corrective Action

(None).

Syslog Message

Successfully completed a GPO Security Apply job (%s) run for Vserver %s.

Parameters

jobid (STRING): GPO job ID.
vserver (STRING): Vserver name.

gpo.reg events

gpo.reg.applied

Severity

INFORMATIONAL

Description

This message occurs when the group policy object (GPO) registry policy settings are applied.

Corrective Action

(None).

Syslog Message

Successfully applied GPO registry settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.reg.bCache.applied

Severity

INFORMATIONAL

Description

This message occurs when the group policy object (GPO) BranchCache settings are applied.

Corrective Action

(None).

Syslog Message

Successfully applied BranchCache settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.reg.bCache.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) registry BranchCache policy settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply BranchCache settings for Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.reg.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) registry policy settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply GPO registry settings for Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec events

gpo.sec.EvtAdt.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) event audit policy settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied event audit and log settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.sec.EvtAdt.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) event audit policy settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply event audit and log settings to Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.fsec.applied

Severity

INFORMATIONAL

Description

This message occurs when the group policy object (GPO) file security settings are applied.

Corrective Action

(None).

Syslog Message

Successfully applied file security settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.sec.fsec.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) file security setings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply file security settings to Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.fsec.notAppliedFor

Severity

NOTICE

Description

This message occurs when applying a group policy object (GPO) security descriptor to a given file fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply file security settings to path %s in Vserver %s, reason: %s.

Parameters

path (STRING): File and directory path to which a security descriptor is to be applied.
vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.kerb.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) Kerberos settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied Kerberos settings to Vserver %s.

Parameters

    vserver (STRING): Vserver name.

gpo.sec.kerb.notApplied

Severity

    ERROR

Description

    This message occurs when applying group policy object (GPO) Kerberos settings fails.

Corrective Action

    Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

    Failed to apply Kerberos settings to Vserver %s, reason: %s.

Parameters

    vserver (STRING): Vserver name.
    reason (STRING): Reason for the failure.

gpo.sec.privR.applied

Severity

    INFORMATIONAL

Description

    This message occurs when applying group policy object (GPO) privilege-rights settings succeeds.

Corrective Action

    (None).

Syslog Message

    Successfully applied privilege rights settings to Vserver %s.

Parameters

    vserver (STRING): Vserver name.

gpo.sec.privR.notApplied

Severity

    ERROR

Description

    This message occurs when applying group policy object (GPO) privilege-rights settings fails.

Corrective Action

    Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply privilege-rights settings to Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.privR.notAppliedFor

Severity

NOTICE

Description

This message occurs when applying group policy object (GPO) privilege-rights fails for a supported setting.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply privilege-rights %s setting to Vserver %s, reason: %s.

Parameters

setting (STRING): Name of the setting: Take ownership, Security privilege, or Bypass traverse.
vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.reg.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) security registry settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied security registry settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.sec.reg.notAppliedFor

Severity

ERROR

Description

This message occurs when applying a group policy object (GPO) security registry setting fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply security registry %s setting to Vserver %s, reason: %s.

Parameters

setting (STRING): Name of the setting: SMB signing.
vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.resAno.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) security restrict anonymous settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied restrict anonymous settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.sec.resAno.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) security restrict anonymous settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply restrict anonymous settings to Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.resGrp.applied

Severity

INFORMATIONAL

Description

This message occurs when applying group policy object (GPO) restricted-groups settings succeeds.

Corrective Action

(None).

Syslog Message

Successfully applied restricted group settings to Vserver %s.

Parameters

vserver (STRING): Vserver name.

gpo.sec.resGrp.notApplied

Severity

ERROR

Description

This message occurs when applying group policy object (GPO) restricted-groups settings fails.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply restricted-groups settings to Vserver %s, reason: %s.

Parameters

vserver (STRING): Vserver name.
reason (STRING): Reason for the failure.

gpo.sec.resGrp.notAppliedFor

Severity

NOTICE

Description

This message occurs when applying group policy object (GPO) restricted-groups settings fails for a given group.

Corrective Action

Address the specific reason for the issue, and then apply the settings again by entering the "vserver cifs group-policy update -force-reapply-all-settings true -vserver <vserver-name>" command.

Syslog Message

Failed to apply restricted-groups settings for group %s in Vserver %s, reason: %s.

Parameters

    group (STRING): Group name.
    vserver (STRING): Vserver name.
    reason (STRING): Reason for the failure.

gpo.security events

gpo.security.unrecogFileForm

Severity

    ERROR

Description

    This event occurs when the GptTmpl.inf file is not in UNICODE (16 bit)format.

Corrective Action

    Ensure the security file GptTmpl.inf is in UNICODE 16bit format.

Syslog Message

    Security file is not unicoded.

Parameters

    filename (STRING): The security filename.

gpo.security.unrecogTemplate

Severity

    ERROR

Description

    This event occurs when the system fails to recognize the security template.

Corrective Action

    Ensure the security file GptTmpl.inf has the correct header.

Syslog Message

    Unable to recognize the security template.

Parameters

    (None).

ha events

ha.aggrmigrduration events

ha.aggrMigrDuration

Severity

NOTICE

Description

This message occurs every 60 seconds during an aggregate migration operation. It indicates the current phase of the aggregate migration, the high-availability (HA) operation that triggered the aggregate migration, and the elapsed time since the start of the current phase of the aggregate migration.

Corrective Action

(None).

Syslog Message

As part of the current %s operation, the aggregate migration phase %s has been ongoing for %lld msecs. Aggregate undergoing migration: %s.

Parameters

aggr_migr_op_name (STRING): Name of the HA operation that triggered the aggregate migration.
aggr_migr_phase (STRING): Current phase of the aggregate migration.
elapsed_time (LONGINT): Elapsed time since the start of the current phase of the aggregate migration.
aggr_name (STRING): Name of the aggregate undergoing migration.

ha.bdfu events

ha.bdfu.notEnabledOnDest

Severity

INFORMATIONAL

Description

This message occurs during storage failover (SFO) giveback or aggregate relocation when the source node cannot reenable background disk firmware update (BDFU) on the destination node. BDFU will be reenabled automatically on the destination node after all the aggregates have been given back.

Corrective Action

(None).

Syslog Message

(None).

Parameters

nodename (STRING): Destination node.

ha.disasterbootinitiated events

ha.disasterBootInitiated

Severity

NOTICE

Description

This message occurs when an HA disaster recovery boot is initiated. Such a boot occurs when the HA partner of a failing node also experiences a failure, and one from which it cannot recover.

Corrective Action

(None).

Syslog Message

HA disaster recovery boot initiated.

Parameters

(None).

ha.fm events

ha.fm.platformTypeChanged

Severity

NOTICE

Description

This message occurs when the Failover Monitor (FM) platform type changes in response to changes in the cluster configuration.

Corrective Action

(None).

Syslog Message

FM platform type changed from %s to %s.

Parameters

from (STRING): Previous FM platform type.
to (STRING): New FM platform type.

ha.gb events

ha.gb.mbxAccessErr

Severity

ALERT

Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback.

Corrective Action

Verify the mailbox disk physical locations and mailbox disk counts by using the "storage failover mailbox-disk show -node node-id" advanced command. If all mailbox disks are present for the indicated physical location, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If none of the mailbox disks for the indicated physical location are shown, wait a few minutes, and then retry the show command to see whether all mailbox disks are present. If all mailbox disks are present, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If some but not all mailbox disks are present for the indicated physical location, then set the "-override-vetoes" field to "true" for either the "storage failover giveback" command or sf-send-home-initiate ZAPI, and then retry the giveback.

Syslog Message

Problem accessing %s mailbox disks prior to giveback. Found %d disks, expected %d disks. Override vetoes option: %s; Internal error code: %d status: %d.

Parameters

physical_location (STRING): Identifies the physical location of the mailbox disks. Values are Local Node, Partner Node, Mediator, or a node name.
mailbox_disk_count (INT): Current count of mailbox disks having the physical location specified by the physical_location parameter.
expected_count (INT): Expected count of mailbox disks having the physical location specified by the physical_location parameter.
override_vetoes (STRING): Value of the "-override-vetoes" field in the "storage failover giveback" command or sf-send-home-initiate ZAPI.
error_code (INT): Disk I/O or other error code.
error_status (INT): Additional internal status related to the error code.

ha.gb.mbxCountMismatch

Severity

NOTICE

Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback, but giveback is allowed to proceed because the "override-vetoes" field is set to "true" for the "storage failover giveback" command or the sf-send-home-initiate ZAPI.

Corrective Action

(None).

Syslog Message

Problem accessing %s mailbox disks during giveback. Found %d disks, expected %d disks. Override vetoes option: %s; Internal result code: %d status: %d"

Parameters

physical_location (STRING): Identifies the physical location of the mailbox disks. Values are Local Node, Partner Node, Mediator, or a node name.
mailbox_disk_count (INT): Current count of mailbox disks having the physical location specified by the physical_location parameter.
expected_count (INT): Expected count of mailbox disks having the physical location specified by the physical_location parameter.

override_vetoes (STRING): Value of the "-override-vetoes" field in the "storage failover giveback" command or sf-send-home-initiate ZAPI.
result_code (INT): Disk I/O or other result code.
result_status (INT): Additional internal status related to the result code.

ha.gb.mbxNotFound

Severity

ALERT

Description

This message occurs when a mailbox disk cannot be accessed prior to a giveback.

Corrective Action

Verify the mailbox disk physical locations and mailbox disk counts by using the "storage failover mailbox-disk show -node node-id" advanced command. If all mailbox disks are present, retry the "storage failover giveback" command or the sf-send-home-initiate ZAPI. If none of the mailbox disks for the indicated mailbox owner are shown, wait a few minutes, and then retry the show command to see whether all mailbox disks are present. If all mailbox disks are present, retry the "storage failover giveback" command or sf-send-home-initiate ZAPI. If some but not all mailbox disks are present for the indicated mailbox owner, verify whether all nodes in the cluster are healthy and accessible by using the "cluster show" command, and check whether disks are healthy by using the "disk show" command.

Syslog Message

Problem accessing %s mailbox disks prior to giveback. Found %d disks. Override vetoes option: %s; Internal error code: %d status: %d.

Parameters

mailbox_owner (STRING): Identifies the node in the high-availability (HA) pair that owns the missing mailbox disk.
mailbox_disk_count (INT): Number of mailbox disks found. These disks are owned by the node specified by the mailbox_owner parameter.
override_vetoes (STRING): Value of the "-override-vetoes" parameter passed to the "storage failover giveback" command or the sf-send-home-initiate ZAPI.
error_code (INT): Disk I/O or other error code.
error_status (INT): Additional internal status related to the error code.

ha.gettakoverlockstatus events

ha.getTakoverLockStatus

Severity

NOTICE

Description

This message occurs when the HA subsystem attempts to acquire takeover lock as part of the takeover operation.

Corrective Action

(None).

Syslog Message

Attempting to acquire takeover lock. Status: %s.

Parameters

status (STRING): Status of the attempt to acquire the lock.

ha.giveback events

ha.giveback.aggrOnlineFailed

Severity

INFORMATIONAL

Description

This message occurs when the RAID or WAFL® subsystem fails to bring online the aggregate or its containing volumes after giveback.

Corrective Action

Check the EMS logs for messages from the RAID and WAFL subsystems to determine the exact cause of the failure and corrective action.

Syslog Message

Bringing online of aggregate %s or its volumes failed after giveback with error %d.

Parameters

aggrName (STRING): Name of the aggregate that was given back.
error (INT): Error that occurred while bringing online the aggregate or its volumes after giveback.

ha.giveback.aggrOnlineTimeout

Severity

ERROR

Description

This message occurs when a node fails to bring online the aggregate and its containing volumes within the specified time after giveback.

Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online.

Syslog Message

Node did not bring online the aggregate %s and its volumes after the giveback for %llu milliseconds.

Parameters

aggrUUID (STRING): UUID of the aggregate that was given back.
time (LONGINT): Timeout, in milliseconds, to bring online the aggregate and its volumes after the giveback.

ha.giveback.aggrPartnerTimeout

Severity

INFORMATIONAL

Description

This message occurs during a giveback operation, when a node does not receive notification from its high-availability (HA) partner within the specified time that the aggregate is online.

Corrective Action

Use the "storage aggregate show" command to verify that the aggregate and its volumes are online on the partner node.

Syslog Message

Node did not receive notification from its partner in %llu milliseconds that aggregate %s is online after the giveback.

Parameters

time (LONGINT): Timeout, in milliseconds, for notification from the partner node that an aggregate is online after giveback.
aggrName (STRING): Name of the aggregate that was given back.

ha.giveback.commWithPartnerFailed

Severity

ERROR

Description

This message occurs when the local node cannot communicate over the cluster network with the d-blade of its high-availability (HA) partner while giving back an aggregate.

Corrective Action

1. Verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local and the partner node are up. 3. If the preceding checks pass, then run the "storage failover giveback" command to initiate giveback. To force giveback, use the "storage failover giveback -require-partner-waiting false" command.

Syslog Message

Failed to communicate with the partner %s over the cluster network while giving back aggregate %s.

Parameters

partnerName (STRING): Name of the partner node.
aggrName (STRING): Name of the aggregate being given back.

ha.giveback.connectToPartnerFailed

Severity

ERROR

Description

This message occurs when the local node cannot connect over the cluster network to the d-blade of its high-availability (HA) partner while giving back an aggregate.

Corrective Action

1. Verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local node and the partner node are up. 3. If the preceding checks pass, then run the "storage failover giveback" command to initiate giveback. To force giveback, use the "storage failover giveback -require-partner-waiting false" command.

Syslog Message

Failed to connect with the partner node %s (d-blade ID: %s) over the cluster network while giving back aggregate %s.

Parameters

partnerName (STRING): Name of the partner node.
partnerDbladeid (STRING): D-blade ID of the partner node.
aggrName (STRING): Name of the aggregate being given back.

ha.giveback.emptyAggr

Severity

ERROR

Description

This message occurs when the local node does not find any disks in the aggregate being given back.

Corrective Action

1. Use the "storage disk show -aggregate aggrName" command to verify that the aggregate has disks. 2. If the preceding check passes, then run the "storage failover giveback" command to initiate giveback.

Syslog Message

Aggregate %s does not have any disks.

Parameters

aggrName (STRING): Name of the aggregate being given back.

ha.giveback.sysCommit

Severity

INFORMATIONAL

Description

This message occurs during the commit phase of the giveback of an aggregate to indicate the time taken by the specified subsystem to commit.

Corrective Action

(None).

Syslog Message

Subsystem %s took %llu msecs to commit giveback of aggregate '%s'.

Parameters

subsys (STRING): Name of the subsystem performing the commit.
time (LONGINT): Time taken by the subsystem to commit the giveback.

aggr (STRING): Name of the aggregate being given back.

ha.giveback.sysVetoChk

Severity

INFORMATIONAL

Description

This message occurs during the veto phase of the giveback of an aggregate to indicate the time taken by the specified subsystem to check whether giveback should be aborted.

Corrective Action

(None).

Syslog Message

Subsystem %s took %llu msecs to check whether to veto giveback of aggregate '%s'.

Parameters

subsys (STRING): Name of the subsystem performing the veto check.
time (LONGINT): Time taken by the subsystem to check whether giveback should be aborted.
aggr (STRING): Name of the aggregate being given back.

ha.giveback.totalCommit

Severity

INFORMATIONAL

Description

This message occurs during the giveback of an aggregate to indicate the total time taken by the commit phase.

Corrective Action

(None).

Syslog Message

Total time taken to commit the giveback of aggregate '%s' was %llu msecs.

Parameters

aggr (STRING): Name of the aggregate being given back.
time (LONGINT): Total time taken to commit the giveback.

ha.giveback.usingHAInterconnect

Severity

INFORMATIONAL

Description

This message occurs when the local node uses the high-availability (HA) interconnect instead of the preferred cluster network to communicate with its HA partner during giveback.

Corrective Action

(None).

Syslog Message

Local node used the HA interconnect to communicate with the partner during giveback of aggregate %s.

Parameters

aggrName (STRING): Name of the aggregate being given back.

ha.localnodeshutdown events

ha.localNodeShutDown

Severity

NOTICE

Description

This message occurs when shutdown of the local node is initiated.

Corrective Action

(None).

Syslog Message

Shutdown of the local node has been initiated with inhibit_takeover set to %s.

Parameters

inhibit_takeover (STRING): Specifies whether takeover by the partner node is inhibited on shutdown of the local node.

ha.mbxresvreleasedelay events

ha.mbxResvReleaseDelay

Severity

NOTICE

Description

This message occurs when the takeover node cannot release a disk reservation for a mailbox disk in preparation for a giveback event. The mailbox reservation release will be automatically retried after a few minutes.

Corrective Action

The mailbox reservation release will be automatically retried after a few minutes. If this problem persists and "storage failover giveback" is not run automatically or cannot be run manually, release the mailbox disks reservations manually using maintenance mode.

Syslog Message

Problem releasing reservation for mailbox disk attached to node with System ID %d. Disk name %s, disk owner %s, disk UUID: %s, status: %d.

Parameters

physical_location (LONGINT): System ID of the node directly attached to the mailbox disk on which the reservation release failure occurred.
disk_name (STRING): Name of the disk for which the reservation release failed.
mbx_disk_owner (STRING): Owner of the mailbox disk where the reservation release failed. Values are Local Node or Partner Node.
disk_uid (STRING): Unique identifier of the disk where the reservation release failed.
status (INT): Reservation release status code.

ha.netpartition events

ha.netPartition

Severity

NOTICE

Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, but cannot take over the partner node or allow the partner to take over because both takeover-of-partner and takeover-by-partner are both disabled. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

Corrective Action

(None).

Syslog Message

Network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

Parameters

error_code (INT): Internal error code.
error_status (INTHEX): Additional internal status bits related to error_code.
req_id (INT): Internal request ID.
duration (LONGINT): Elapsed time in msecs spent resolving the reported error.

ha.netPartition.reboot

Severity

NOTICE

Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, and reboots the local node due to the network partition. The reboot occurs only if `takeover-by-partner is enabled on the local node. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

Corrective Action

(None).

Syslog Message

Rebooting the local node due to a network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

Parameters

error_code (INT): Internal error code.
error_status (INTHEX): Additional internal status bits related to error_code.
req_id (INT): Internal request ID.
duration (LONGINT): Elapsed time in msecs spent resolving the reported error.

ha.netPartition.takeover

Severity

NOTICE

Description

This message occurs when a Data ONTAP® subsystem detects an error potentially due to network partitioning, and initiates a takeover of the partner node due to the partition. Network partitioning is indicated by concurrent errors on more than one of a node's interfaces, if a halt, reboot, takeover or similar action affecting connectivity is not already in progress.

Corrective Action

(None).

Syslog Message

Taking over the partner node due to a network partition error. Internal error code %d; status: 0x%x; internal request ID: %d.

Parameters

error_code (INT): Internal error code.
error_status (INTHEX): Additional internal status bits related to error_code.
req_id (INT): Internal request ID.
duration (LONGINT): Elapsed time in msecs spent resolving the reported error.

ha.netparttodisabled events

ha.netPartToDisabled

Severity

NOTICE

Description

This message occurs when takeovers due to network partitioning are disabled because of the number of previous, consecutive, network-partiion takeovers that occurred within a preceding detection period. Subsequent takeovers due to network partitioning are automatically reenabled after the disable time limit is reached or after a takeover is initiated for a different reason.

Corrective Action

(None).

Syslog Message

Network partitioning takeovers are disabled due to %d network-related takeovers in the preceding %d minutes. Takeovers by local node %d; partner node %d. Takeovers will be be re-enabled in %d minutes or when another type of takeover occurs.

Parameters

takeovers_initiated (INT): Consecutive takeovers initiated from either node within the detection period that were due to network partitioning.

detection_period (INT): Number of minutes over which the network partition takeover attempts were monitored and counted.

local_node_initiated (INT): Number of takeovers due to network partitioning occurring within the detection period that were initiated by the local node. This number is included in the takeover_initiated number.

partner_node_initiated (INT): Number of takeovers due to network partitioning occurring within the detection period that were initiated by the partner node. This number is included in the takeover_initiated number.

minutes_until_reenable (INT): Minutes until takeover due to network partitioning is reenabled.

ha.netra events

ha.netra.dskChkNoContDsk

Severity

ERROR

Description

This message occurs during an aggregate migration, when the destination node either cannot determine whether at least one disk in the aggregate is a disk partition, or the associated container disk is not visible to the destination node. The aggregate migration operation is aborted.

Corrective Action

Use the (privilege: advanced) "storage disk refresh-ownership" command to rescan the disks and update ownership information. After refreshing the disk ownership info, use the "storage show disk" command to view the ownership of all disks, and the "storage show disk -container-type shared" command to view container-disk ownership. If any disks are incorrectly owned, update the disk ownership information. If the problem persists, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to check whether there are any disks that are not visible to a subset of the nodes. Use the "storage failover show" command to check whether the high-availability (HA) partner's information is known. If HA partner information is missing, verify the HA Interconnect between both nodes is installed and functioning correctly. If not, fix the HA Interconnect cabling issues to resolve the connectivity problems. Use the "storage disk show" command to check whether there are any failed disks. If failed disks are present, remove or replace them. If there are no failed disks, check the cabling for loose connections or a bad cable on the node where the disk is not visible. If the problem persists, contact NetApp technical support.

Syslog Message

Disk with UUID %s is not visible to node %s, which is the destination of an aggregate migration operation. As a result, the aggregate migration was aborted. Check the event log of the destination node to determine the name of the aggregate whose migration was aborted.

Parameters

disk_uuid (STRING): Universal unique identifier (UUID) of the disk that is not visible to the destination node.

node_name (STRING): Name of the destination node.

ha.nomediatormbx events

ha.noMediatorMbx

Severity

ERROR

Description

This message occurs when the non-local mailbox disks of a node are not accessible. The system will not be able to perform a takeover and can potentially prevent a takeover by the partner as well.

Corrective Action

Use the "storage failover show -fields local-mailbox-disks" command to verify that all nodes in the cluster can access their respective mailbox disks. Use the (privilege: advanced) "storage iscsi-initiator show" command to verify that all iSCSI connections are up and healthy. If not healthy, use the "storage iscsi-initiator add-target" and "storage iscsi-initiator connect" commands to add and connect any missing or misconnected iSCSI targets.

Syslog Message

Takeover not possible because non-local mailbox disks owned by node "%s" cannot be accessed.

Parameters

mailbox_owner (STRING): Node that owns the non-local mailbox disks that could not be accessed.

ha.noprogrammaticto events

ha.noProgrammaticTO

Severity

NOTICE

Description

This message occurs when a takeover is initiated programmatically by Data ONTAP® and the takeover request fails because giveback or aggregate relocation cleanup is still in progress.

Corrective Action

(None).

Syslog Message

Failover monitor: Programmatic takeover failed due to giveback or aggregate relocation post-processing cleanup not yet complete.

Parameters

(None).

ha.panicinfonotsent events

ha.panicInfoNotSent

Severity

NOTICE

Description

This message occurs when a node cannot send panic information to its high-availability (HA) partner over the HA interconnect. The HA partner might still initiate takeover if it detects that the partner is down by other means, and takeover of the panicking node is allowed.

Corrective Action

(None).

Syslog Message

Local node cannot send a panic information message to the HA partner over the HA interconnect due to error: %s. Partner name: %s. Partner system ID: %llu.

Parameters

error (STRING): Reason the node cannot send panic information to its HA partner.
partner_name (STRING): Name of the HA partner.
partner_systemid (LONGINT): System ID of the HA partner.

ha.panicinfonotsentic events

ha.panicInfoNotSentIC

Severity

NOTICE

Description

This message occurs when a node cannot send panic information to its high-availability (HA) partner over the HA interconnect due to an HA interconnect error. The HA partner might still initiate takeover if it detects that the partner is down by other means, and takeover of the panicking node is allowed.

Corrective Action

(None).

Syslog Message

Local node cannot send a panic information message to its HA partner due to an HA interconnect error: %s (error code: %d). Partner name: %s. Partner system ID: %llu.

Parameters

error (STRING): Reason the node cannot send panic information to its HA partner.
error_code (INT): Specific error generated by the HA Interconnect. Example error codes: 1 (ERR_ICDOWN): Interconnect is down 4 (ERR_SYSERROR): System error 5 (ERR_ICERROR): Interconnect error 6 (ERR_OUTOFMEMORY): Out of memory 11 (ERR_SENDSIZE): Send size is too large 19 (ERR_CKSUM): Checksum error
partner_name (STRING): Name of the HA partner.
partner_systemid (LONGINT): System ID of the HA partner.

ha.panicinforcvbadvrsn events

ha.panicInfoRcvBadVrsn

Severity

NOTICE

Description

This message occurs when the version of the panic information received from the high-availability (HA) partner is not equal to the expected version. The receiving node will discard this panic information message. A takeover might still occur if the local node detects that its HA partner is down by other means, and takeover of the panicking node is allowed.

Corrective Action

(None).

Syslog Message

Panic information message received from the HA partner is the wrong version. Expected version: %u. Received version: %u. Partner name: %s. Partner system ID: %llu.

Parameters

expected_version (LONGINT): Expected version of the panic information.
received_version (LONGINT): Received version of the panic information.
partner_name (STRING): Name of the HA partner.
partner_systemid (LONGINT): System ID of the HA partner.

ha.panicinfosent events

ha.panicInfoSent

Severity

NOTICE

Description

This message occurs when a node successfully sends panic information to its high-availability (HA) partner over the HA interconnect.

Corrective Action

(None).

Syslog Message

Node successfully sent a panic information message to its HA partner. Partner name: %s. Partner system ID: %llu.

Parameters

local_hostname (STRING): Name of the node that panicked and sent panic information over the HA interconnect.
local_systemid (LONGINT): System ID of the node that panicked and sent panic information over the HA interconnect.

ha.panicinfosznotok events

ha.panicInfoSzNotOk

Severity

NOTICE

Description

This message occurs when the size of the panic information received from the high-availability (HA) partner is not equal to the expected panic information size. The receiving node will discard this panic information message. A takeover might still occur if the local node detects that its HA partner is down by other means, and takeover of the panicking node is allowed.

Corrective Action

(None).

Syslog Message

Panic information message received from the HA partner is the wrong size. Expected size: %u. Received size: %u. Partner name: %s. Partner system ID: %llu.

Parameters

expected_size (LONGINT): Expected size of the panic information.
received_size (LONGINT): Received size of the panic information.
partner_name (STRING): Name of the HA partner.
partner_systemid (LONGINT): System ID of the HA partner.

ha.partner events

ha.partner.discovered

Severity

NOTICE

Description

This message occurs when a controller in an High Availability Configuration discovers its HA partner.

Corrective Action

(None).

Syslog Message

Discovered HA partner with system ID %d, port %d.

Parameters

sysid (INT): System ID of the HA partner.
port (INT): Port number of the HA partner.

ha.resvconflicthalt events

ha.resvConflictHalt

Severity

NOTICE

Description

This message occurs when the node halts itself after it finds disks with reservation conflicts. Reservations are placed on disks as part of a node taking over its partner. This disk reservation conflict is due to this node being taken over by its partner.

Corrective Action

(None).

Syslog Message

A disk reservation conflict was detected on disk %s at %-20s. Typically, this only occurs when the node was taken over by its partner.

Parameters

disk_name (STRING): Name of the disk.
time (STRING): Time when the disk reservation was detected.
last_update (INT): Time passed since last rescan, in milliseconds.

ha.resvmediatormbxstatus events

ha.ResvMediatorMbxStatus

Severity

NOTICE

Description

This message occurs when the local node attempts to reserve a mailbox disk while trying to acquire the takeover lock as part of the takeover operation.

Corrective Action

(None).

Syslog Message

Attempting to reserve mailbox disk %s (UUID: %s) on node "%s" as part of takeover lock. Status: %d.

Parameters

mailbox_disk_name (STRING): Name of the disk being reserved.
mailbox_disk_uid (STRING): UUID of the mailbox disk on which a reservation was attempted.
mailbox_host (STRING): Name of the node that owns the mailbox disk.
mailbox_op_status (INT): Result of the disk reservation attempt on the mailbox disk.

ha.takeover events

ha.takeover.bypOptimChange

Severity

INFORMATIONAL

Description

This message occurs when the value of the 'bypass-takeover-optimization' parameter of the "storage failover" command is changed on a node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

node_name (STRING): Name of the node.
new_value (STRING): New value of the 'bypass-takeover-optimization' parameter.

ha.takeover.checkEnd

Severity

ALERT

Description

This message occurs when a node is simulating a takeover. This marks the end of a simulated takeover on the local node.

Corrective Action

(None).

Syslog Message

This node is testing the takeover workflow. This test is a simulation only. The simulation has ended on the local node.

Parameters

(None).

ha.takeover.checkError

Severity

ALERT

Description

This message occurs when a takeover with the check-only flag detects an error that would prevent takeover.

Corrective Action

Use the "storage failover check-takeover" command to identify the failures that occured along the takeover path. Perform corrective action based on error information shown by the command.

Syslog Message

This node is testing the takeover workflow. This test is a simulation only. The simulation has encountered

and error that would disrupt takeover.

Parameters

(None).

ha.takeover.checkStart

Severity

ALERT

Description

This message occurs when a node is simulating a takeover. This marks the start of a simulated takeover on the local node.

Corrective Action

(None).

Syslog Message

This node is testing the takeover workflow. This test is a simulation only. The simulation has started on the local node.

Parameters

(None).

ha.takeover.stateDuration

Severity

NOTICE

Description

This message occurs when a node has been in the takeover state for a set time period of 1 hour and every hour thereafter the node continues to be in that state.

Corrective Action

(None).

Syslog Message

Node (%s) in takeover for %d days and %d hours.

Parameters

host (STRING): Name of the host
days_in_TO (INT): Number of days in takeover
hours_in_TO (INT): Number of hours in takeover

ha.takeoverimpdegraded events

ha.takeoverImpDegraded

Severity

ALERT

Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover because the partner mailbox disks are not available.

Corrective Action

Check connectivity to the partner disks. Identify the mailbox disks on the partner node by using the "storage failover show -instance" command. Verify that this node has connectivity to the partner mailbox disks by using the "storage disk show -instance" command. Resolve any connectivity issues by fixing cabling or shelf issues.

Syslog Message

Takeover of the partner node is impossible due to lack of connectivity to the partner mailbox disks.

Parameters

(None).

ha.takeoverimphotshelf events

ha.takeoverImpHotShelf

Severity

EMERGENCY

Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover due to disk shelves that are overheating.

Corrective Action

Check cooling for the disk shelves.

Syslog Message

Takeover of the partner node is impossible due to disk shelves that are overheating.

Parameters

(None).

ha.takeoverimpic events

ha.takeoverImpIC

Severity

ALERT

Description

This message occurs when the partner node is down and the local node cannot perform a takeover because of interconnect errors.

Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if

applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

Syslog Message

Takeover of the partner node is not possible due to interconnect errors.

Parameters

(None).

ha.takeoverimplowmem events

ha.takeoverImpLowMem

Severity

ERROR

Description

This message occurs when the partner node is down; however, due to this node being low on memory, it is currently impossible to perform a takeover.

Corrective Action

Contact NetApp technical support.

Syslog Message

Takeover of the partner node is impossible due to a low memory situation.

Parameters

(None).

ha.takeoverimpnotdef events

ha.takeoverImpNotDef

Severity

ERROR

Description

This message occurs when the partner node is down and it is currently impossible to perform a takeover.

Corrective Action

Check the reason string and repair the problem reported.

Syslog Message

Takeover of the partner node is impossible due to reason %s.

Parameters

reason (STRING): Reason the takeover is currently impossible.

ha.takeoverimpunsync events

ha.takeoverImpUnsync

Severity

    ALERT

Description

    This message occurs when the partner node is down and it is currently impossible to perform a takeover because the takeover node does not have partner NVRAM data.

Corrective Action

    Verify that the interconnect cables are correctly connected between the nodes. Boot the partner node to reestablish the interconnect if it was shut down. If necessary, force a takeover with the '[run node] cf forcetakeover' command. This action might cause data loss if there is NVRAM data on the partner node not written to disk.

Syslog Message

    Takeover of the partner node is impossible due to lack of partner NVRAM data.

Parameters

    (None).

ha.takeoverimpversion events

ha.takeoverImpVersion

Severity

    ALERT

Description

    This message occurs when the partner node is down; however, due to a version mismatch, it is currently impossible to perform a takeover.

Corrective Action

    Upgrade the downrev node, so that both nodes are on the same release of Data ONTAP®. If a revert is being performed, downgrade the uprev node to the same release as the partner node.

Syslog Message

    Takeover of the partner node is impossible due to version mismatch.

Parameters

    (None).

ha.tkover events

ha.tkover.waitARLabort

Severity

INFORMATIONAL

Description

This message occurs when a pending takeover is waiting for an in-progress aggregate relocation (ARL) operation to complete or abort before proceeding with the takeover.

Corrective Action

(None).

Syslog Message

Node %s has been waiting for an ongoing ARL for %d seconds. It will proceed with takeover when the ARL operation has been completed or aborted.

Parameters

node_name (STRING): Name of the node doing the takeover.
wait_time (LONGINT): Amount of time spent waiting for the ongoing ARL operation to be completed or aborted.

ha.tkover.waitGBabort

Severity

INFORMATIONAL

Description

This message occurs when a pending takeover is waiting for an in-progress SFO giveback operation to complete or abort before proceeding with the takeover.

Corrective Action

(None).

Syslog Message

Node %s has been waiting for an ongoing SFO giveback for %d seconds. It will proceed with takeover when the SFO giveback operation has been completed or aborted.

Parameters

node_name (STRING): Name of the node doing the takeover.
wait_time (LONGINT): Amount of time spent waiting for the ongoing SFO giveback operation to be completed or aborted.

ha.tkoverabortednomediatormbx events

ha.tkoverAbortedNoMediatorMbx

Severity

NOTICE

Description

This message occurs when a planned failover is aborted because the mediator mailbox disks were not detected.

Corrective Action

Run the "storage failover show -fields local-mailbox-disks partner-mailbox-disks" and "storage failover show -instance" commands to check whether the mediator mailbox disks are missing. If the mediator mailbox disks are not present, rescan the disks on both nodes in the HA pair to determine the latest ownership by using the "storage disk refresh-ownership" command. If the rescan does not work, contact NetApp technical support.

Syslog Message

(None).

Parameters

(None).

ha.toafterrcvpanicinfo events

ha.toAfterRcvPanicInfo

Severity

NOTICE

Description

This message occurs when the local node initiates a takeover of its high-availability (HA) partner after detecting a panic of the HA partner node.

Corrective Action

(None).

Syslog Message

Local node initiated takeover after receiving a panic information message from its HA partner. Partner name: %s. Partner system ID: %llu.

Parameters

hostname (STRING): Host name of the node being taken over.
systemid (LONGINT): System ID of the node being taken over.

ha.tp events

ha.tp.testPointHit

Severity

NOTICE

Description

This message occurs when the testpoint is encountered or hit.

Corrective Action

(None).

Syslog Message

Testpoint hit: '%s' [%s, %s], [%s:%d], count %d ⇒ '%s'.

Parameters

message (STRING): Test message.
tpModuleName (STRING): Testpoint module name.
tpId (STRING): ID of the testpoint within the module.
fileName (STRING): File name.
lineNo (INT): Line number.
tpCount (INT): Number of times the testpoint triggers before being disabled.
tpType (STRING): Type of testpoint.

Severity

ERROR

Description

This message occurs when a disk inventory check cannot be sent to the local node's high-availability (HA) partner because the disk check request could not be correctly constructed.

Corrective Action

Retry the operation. If the problem persists, use the "storage failover show -fields local-missing-disks, partner-missing-disks" command to rescan the disks and to determine the latest ownership. If the disk inventory mismatch is not resolved, check the cabling for either loose connections or for a bad cable on the partner node.

Syslog Message

A disk inventory check cannot be sent to the local node's HA partner. Failure reason: %s.

Parameters

failure_reason (STRING): The reason that the disk inventory check request could not be properly constructed.

haosc events

haosc.config events

haosc.config.unknown.cf

Severity

ALERT

Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memories (FRU PROMs) have inconsistent data.

Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Exercise extreme caution. Setting the wrong configuration might lead to data loss. For ASA r2, set the configuration to HA.

Syslog Message

Cannot determine whether configuration should be stand-alone or HA. Chassis is in %s configuration, and controller is in %s configuration.

Parameters

cha_config (STRING): Chassis FRU PROM HA configuration string.
cont_config (STRING): Controller FRU PROM HA configuration string.

haosc.config.unknown.ls

Severity

ALERT

Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memory (FRU PROM) configurations conflict with the HA mode.

Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. For ASA r2, set the configuration to HA. If you need assistance, contact NetApp technical support.

Syslog Message

Cannot determine whether the configuration should be stand-alone or HA. Chassis is in %s configuration, controller is in %s configuration, and the HA mode is %s.

Parameters

cha_config (STRING): Chassis FRU PROM HA configuration string.
cont_config (STRING): Controller FRU PROM HA configuration string.
mode (STRING): HA mode string.

haosc.config.unknown.nv

Severity

ALERT

Description

This message occurs when the chassis and controller field-replaceable unit programmable read-only memories (FRU PROMs) have factory default configurations and the nonvolatile memory is dirty.

Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. For ASA r2, set the configuration to HA. If you need assistance, contact NetApp technical support.

Syslog Message

Cannot determine whether configuration should be stand-alone or HA. Chassis is in %s configuration, controller is in %s configuration, and the nonvolatile memory is dirty.

Parameters

cha_config (STRING): Chassis FRU PROM HA configuration string.
cont_config (STRING): Controller FRU PROM HA configuration string.

haosc.fru events

haosc.fru.op.failed

Severity

ALERT

Description

This message occurs when the chassis or controller field-replaceable unit programmable read-only memory (FRU PROM) read/write fails.

Corrective Action

Replace the system chassis or controller, and contact NetApp technical support for assistance.

Syslog Message

%s FRU PROM %s operation failed.

Parameters

fru (STRING): Chassis/controller string.
op (STRING): Read/write operation string.

haosc.invalid events

haosc.invalid.config

Severity

EMERGENCY

Description

This message occurs when the chassis or controller field-replaceable unit programmable read-only memory (FRU PROM) returns an invalid configuration.

Corrective Action

Boot into Maintenance mode and run the 'ha-config modify' command to set the controller and chassis configuration to stand-alone or HA, as appropriate. Setting the wrong configuration might lead to data loss. For ASA r2, set the configuration to HA. If you need assistance, contact NetApp technical support.

Syslog Message

%s FRU PROM returns an invalid configuration.

Parameters

fru (STRING): Chassis/controller string.

haosc.sa events

haosc.sa.config

Severity

ERROR

Description

This message occurs when nonvolatile memory on a stand-alone system is configured for a high-availability system. Only half of the available nonvolatile memory will be used and system performance will be affected.

Corrective Action

Reboot the system to use all of the nonvolatile memory.

Syslog Message

Only half of the available nonvolatile memory is in use. This will affect system performance.

Parameters

(None).

hashd events

hashd.maxstore events

hashd.maxstore.oversize

Severity

NOTICE

Description

This message occurs when the size of hashes in the hash store is greater than the maximum size configured.

Corrective Action

If the hash files are not being retained for a long enough duration, consider resizing the maximum size of the hash store by issuing the 'vserver cifs branchcache modify -hash-store-max-size' command.

Syslog Message

Size of the hashes in the hash store exceeded maximum size configured for Vserver %s.%s

Parameters

vserver_name (STRING): Name of the Vserver where the problem is occuring.
oldestKept_timestamp (STRING): Timestamp of the oldest kept hash file.

hm events

hm.alert events

hm.alert.cleared

Severity

NOTICE

Description

This message occurs when a system health monitor alert is successfully cleared. Because health monitors evaluate the conditions dynamically, they might determine that the alerting condition is no longer valid. The alert is then removed from the system and this message is generated.

Corrective Action

(None).

Syslog Message

%s cleared by monitor %s

Parameters

detailed_info (STRING): Specific information for the deleted alert.
monitor (STRING): Health monitor hm_type value for this alert.
alert_id (STRING): Alert ID for the alert.
alerting_resource (STRING): Alert resource related to this alert.

hm.alert.raised

Severity

ALERT

Description

This message occurs when a system health monitor alert is detected. Based on predefined policies, alerts are created dynamically as and when conditions are evaluated. The alert is then populated with the actual names of the resources causing it.

Corrective Action

Run the "system health alert show" command to see the alert that was created with this event. Follow the suggested actions listed in the "Corrective Actions" field of the alert.

Syslog Message

%s raised by monitor %s

Parameters

detailed_info (STRING): Specific information for the created alert.
monitor (STRING): Health monitor hm_type value for this alert.
alert_id (STRING): Alert ID for the alert.
alerting_resource (STRING): Alert resource related to this alert.
probable_cause_description (STRING): Description of what could have caused the alert.
alert_corrective_action (STRING): Instructions to correct the alerting condition.

possible_effect (STRING): Possible effect on the system if the alert is not addressed.
additional_info (STRING): Additional information related to the alert.
tags (STRING): Tags to categorize the alert.
acknowledge (INT): True indicates the alert has been acknowledged.
acknowledger (STRING): Text describing the user that acknowledged the alert.
suppress (INT): True indicated the alert has been suppressed.
suppressor (STRING): Text describing the user that suppressed the alert.
asup_enable (INT): True indicates that this alert will trigger an AutoSupport® message.

host events

host.app events

host.app.component.error

Severity

ERROR

Description

This message occurs when a host encounters an error specific to an application component.

Corrective Action

For more information or assistance, contact NetApp technical support.

Syslog Message

Application component %s (UUID: %s) belonging to application %s (UUID: %s) on host %s running %s reported error %d: %s.

Parameters

app_name (STRING): Name of the application.
app_uuid (STRING): UUID of the application.
component_name (STRING): Name of the application component.
app_component_uuid (STRING): UUID of the application component.
host_name (STRING): Fully qualified domain name (FQDN) of the host.
software_product (STRING): Name of the software product running on the host.
host_error_num (INT): Number of the error on the host.
host_error_string (STRING): Description of the error on the host.

host.app.error

Severity

ERROR

Description

This message occurs when a host encounters an error specific to an application.

Corrective Action

For more information or assistance, contact NetApp technical support.

Syslog Message

Application %s (UUID: %s) on host %s running %s reported error %d: %s.

Parameters

app_name (STRING): Name of the application.
app_uuid (STRING): UUID of the application.
host_name (STRING): Fully qualified domain name (FQDN) of the host.
software_product (STRING): Name of the software product running on the host.
host_error_num (INT): Number of the error on the host.
host_error_string (STRING): Description of the error on the host.

host.error events

host.error

Severity

ERROR

Description

This message occurs when the host software encounters an error.

Corrective Action

For more information or assistance, contact NetApp technical support.

Syslog Message

Host %s running %s reported error %d: %s.

Parameters

host_name (STRING): Fully qualified domain name (FQDN) of the host.
software_product (STRING): Name of the software product running on the host.
host_error_num (INT): Number of the error on the host.
host_error_string (STRING): Description of the error on the host.

hotplug events

hotplug.generic events

hotplug.generic.busy_not_ready

Severity

ERROR

Description

This message occurs when a module replacement or removal command fails because the driver or system is busy. Hot plug functionality is not available at this time.

Corrective Action

Try the command again after a few minutes. If the system remains busy, it is an internal error. Contact NetApp technical support for assistance.

Syslog Message

%s command failed for module %s in slot %s of node %s because the driver or system is busy.

Parameters

command (STRING): Name of the command.
card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert events

hotplug.insert.badCard.type

Severity

ERROR

Description

This message occurs when the module type does not match the system's record for this slot.

Corrective Action

Use a replacement module of the same type.

Syslog Message

%s module insertion failed in slot %s of node %s because the module type does not match the system's record for this slot.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert.badCard.ver

Severity

ERROR

Description

This message occurs when the module revision does not match the system's record for this slot.

Corrective Action

Use a replacement module of the same board revision.

Syslog Message

%s module insertion failed in slot %s of node %s because the module revision does not match the system's record for this slot.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert.illegal_card

Severity

NOTICE

Description

This message occurs when the module inserted is not supported.

Corrective Action

Use vendor-approved modules.

Syslog Message

%s module insertion failed in slot %s of node %s because the module is not supported.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert.link_not_up

Severity

ALERT

Description

This message occurs when link on module fails to initialize after module is powered on.

Corrective Action

Reinsert the module and try command again. If problem persists, contact NetApp technical support for assistance.

Syslog Message

%s module insertion failed in slot %s of node %s because the link on module failed to initialize.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert.no_power_up

Severity

ALERT

Description

This message occurs when a module does not initialize after it is powered on.

Corrective Action

Reinsert the module and try the command again. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

%s module insertion failed in slot %s of node %s because module failed to initialize.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.insert.success

Severity

NOTICE

Description

This message occurs when module insertion is successful.

Corrective Action

(None).

Syslog Message

%s module insertion is successful in slot %s of node %s.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.remove events

hotplug.remove.success

Severity

NOTICE

Description

This message occurs when module removal is successful.

Corrective Action

(None).

Syslog Message

%s module removal is successful in slot %s of node %s.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

hotplug.replace events

hotplug.replace.success

Severity

NOTICE

Description

This message occurs when module replacement is successful.

Corrective Action

(None).

Syslog Message

%s module replacement is successful in slot %s of node %s.

Parameters

card (STRING): Name of the module.
slot (STRING): Number of the slot.
node (STRING): Name of the node.

http events

http.cfg events

http.cfg.csrf.max.tokens

Severity

NOTICE

Description

This message occurs when the maximum number of Cross-Site Request Forgery (CSRF) tokens has been reached. Web applications served from ONTAP®, such as ONTAP System Manager, use CSRF tokens to prevent unauthorized modifications to the cluster. When the token limit has been reached, new connections to these applications will not be able to make changes to the cluster configuration.

Corrective Action

You can fix the issue in a few different ways. You can disable CSRF protection by using the "system services web modify -csrf-protection-enabled false" command. You can increase the maximum number of tokens by using the "system services web modify -csrf-token-concurrent-limit <number>" command. You can wait until existing CSRF tokens expire. You can view and modify CSRF token settings by using the "system services web show" command.

Syslog Message

Maximum number of CSRF tokens (%d) has been reached.

Parameters

limit (INT): Maximum number of CSRF tokens that can exist at any given time.

httpd events

httpd.api events

httpd.api.expired.session.limit

Severity

ERROR

Description

This message occurs when a Manage ONTAP® API request to an internal server expires due to configured session limits.

Corrective Action

Inspect the last error contained in the message to determine why the API request exceeded the configured session limits. The "security session show -interface ontapi" command may be used to display all active and pending API requests across the cluster. Run "security session limit show -interface ontapi" to verify the currently configured session limits.

Syslog Message

A Manage ONTAP® API request (%s) has expired after %lu seconds. Last error: %s

Parameters

api_name (STRING): The name of the API.
elapsed_time (LONGINT): The age of the API request (in seconds).
last_error (STRING): Reason for the warning, indicating the limit category that was exceeded.
purge_time (LONGINT): The purge time (in seconds) for outstanding API requests.
trace_tag (LONGINTHEX): The generated trace tag associated with the API request.

hwaccel events

hwaccel.init events

hwaccel.init.failed

Severity

ALERT

Description

This message occurs when initialization of a hardware accelerator fails due to an unexpected software error. The system falls back to software acceleration and continues to function normally, but expect reduced performance.

Corrective Action

Rebooting the system might clear the problem. The problem might be caused by a software bug, but is likely indicative of a hardware failure. If the problem persists, contact NetApp technical support.

Syslog Message

Initialization of hardware accelerator %s fails due to unexpected software error %s:%d.

Parameters

devName (STRING): Name of the acceleration device; for example, "qat0".
module (STRING): Name of the software module or driver.
error (INT): Module-specific error code.

hwaccel.reset events

hwaccel.reset

Severity

NOTICE

Description

This message occurs when a hardware accelerator is reset using software.

Corrective Action

(None).

Syslog Message

Hardware accelerator %s reset by %s.

Parameters

devName (STRING): Name of the acceleration device; for example, "qat0".
module (STRING): Name of the software module or driver.

hya events

hya.dup_vbn_lookup events

hya.dup_vbn_lookup

Severity

ERROR

Description

This event is generated if we detect redundant lookups of a PVBN without an intervening suspend.

Corrective Action

(None).

Syslog Message

%s %s %s %s %s %s %s %s %s %s %s

Parameters

f2 (STRING): Third frame of backtrace.
f3 (STRING): Fourth frame of backtrace.
f4 (STRING): Fifth frame of backtrace.
f5 (STRING): Sixth frame of backtrace.
f6 (STRING): Seventh frame of backtrace.
f7 (STRING): Eighth frame of backtrace.
f8 (STRING): Ninth frame of backtrace.
f9 (STRING): Tenth frame of backtrace.
f10 (STRING): Eleventh frame of backtrace.
f11 (STRING): Twelfth frame of backtrace.
f12 (STRING): Thirteenth frame of backtrace.

hya.dup_vbn_lookup.detail

Severity

ERROR

Description

This event is generated if we detect redundant lookups of a PVBN without an intervening suspend.

Corrective Action

(None).

Syslog Message

%s %s

Parameters

description (STRING): Description of failure.
buffers (STRING): Details of buffers that were predirtied.

hybaggrcopy events

hybaggrcopy.dstgeommismatch events

hybAggrCopy.dstGeomMismatch

Severity

ERROR

Description

This message occurs when there is a mismatch between the disk geometries of source and destination hybrid aggregates.

Corrective Action

Satisfy the following conditions: Both aggregates are hybrid. The destination aggregate has at least the same number of HDD and SSD disks as the source aggregate. The disk size and type of each disk of the source aggregate matches those of the destination aggregate.

Syslog Message

Aggregate %s cannot be copied. Source and destination hybrid aggregate geometries do not match.

Parameters

srcaggr (STRING): Aggr copy source aggregate.

hybaggrcopy.srcgeommismatch events

hybAggrCopy.srcGeomMismatch

Severity

ERROR

Description

This message occurs when an aggregate cannot be copied. The issue is either that the source is a hybrid aggregate and the destination is not, or there is a mismatch between the disk geometries of the source and destination hybrid aggregates.

Corrective Action

Verify that the source and destination are both hybrid aggregates. Verify that the destination aggregate has at least the same number each of hard disk drives (HDDs) and solid state drives (SSDs) as the source aggregate. Verify that the disk size and type of each disk of the source aggregate matches those of the destination aggregate.

Syslog Message

Aggregate %s cannot be copied. Either the source is a hybrid aggregate but the destination is not, or the source and destination hybrid aggregate geometries do not match.

Parameters

srcaggr (STRING): Name of the source aggregate.

ic events

ic.hainterconnectdown events

ic.HAInterconnectDown

Severity

ERROR

Description

This message occurs every hour when the high-availability (HA) interconnect is down.

Corrective Action

Base the corrective action on the number and type of HA interconnect links supported by the platform and the reason for which the interconnect is down. If links are down: Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If links are disabled: Enable the links by using the "system ha interconnect link on" command. If a peer is not connected: Disable and reenable the links one at a time by using the "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

Syslog Message

HA interconnect: Interconnect down for %d minutes: %s

Parameters

ic_downtime (INT): Amount of time (in minutes) the connection has been down.
reason (STRING): Reason that the HA interconnect is down, which might be due to links being down, links being disabled, or an unconnected peer.

ic.hainterconnectlinkdown events

ic.HAInterconnectLinkDown

Severity

ERROR

Description

This message occurs every hour when one of the high-availability (HA) interconnect links is down.

Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

Syslog Message

HA interconnect: %s link #%d has been down for %d minutes.

Parameters

link_type (STRING): Type of link that is down. Possible values are external and backplane.
link_num (INT): Number that identifies which link is down.
link_downtime (INT): Amount of time (in minutes) the link has been down.

ic.linkspeeddegraded events

ic.linkSpeedDegraded

Severity

ERROR

Description

This message occurs when the high-availability (HA) interconnect detects a degraded link speed.

Corrective Action

For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

Syslog Message

HA interconnect: Link speed of link #%d degraded. Current: %s, expected: %s.

Parameters

link_num (INT): Number that identifies the link.
link_speed (STRING): Current link speed.
expected_speed (STRING): Link speed expected for the HA interconnect device.

ic.linkstatuschange events

ic.linkStatusChange

Severity

INFORMATIONAL

Description

This message occurs when the link status changes for a high-availability (HA) interconnect port.

Corrective Action

Verify that both controllers in the HA pair are operational. For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. When one link is down on platforms with two available links, HA link redundancy is lost. However, HA services are still working and enabled on the secondary link.

Syslog Message

HA interconnect: Port %s link is %s.

Parameters

port_name (STRING): Name of the port for which link status changed.
link_status (STRING): Link status string: "up" or "down".

ic.linkwidthdegraded events

ic.linkWidthDegraded

Severity

ERROR

Description

This message occurs when the high-availability (HA) interconnect detects a degraded link width. This can affect the write performance of the system.

Corrective Action

For externally connected links, make sure that the interconnect cables are connected properly and that small form-factor pluggable (SFP) modules, if applicable, are seated properly on both controllers. For internally connected links, disable and reenable the links one at a time by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands. If the problem persists, contact NetApp technical support.

Syslog Message

HA interconnect: Link width of link #%d degraded. Current: %dX, expected: %dX.

Parameters

link_num (INT): Number that identifies the link.
link_width (INT): Current link width.
expected_width (INT): Link width expected for the HA interconnect type.

ic.unsupportcable events

ic.unsupportCable

Severity

ERROR

Description

This message occurs when an unsupported cable is detected on the high-availability interconnect port. An unsupported cable might cause the interconnect to be unstable, resulting in unsynchronized logs.

Corrective Action

Unplug the unsupported cable, and then plug in a supported cable. Search the support site "Hardware Universe" for information about supported high-availability cables for this platform.

Syslog Message

Detected unsupported %s cable with part number %s.

Parameters

> **cable_type** (STRING): Cable type.
> **cable_part** (STRING): Cable part number.

ic.viif events

ic.viif.initFailed

Severity

> ERROR

Description

> This message occurs when the driver fails to create a virtual interface.

Corrective Action

> Reboot the controller. Contact NetApp technical support if the problem persists.

Syslog Message

> HA interconnect: Virtual interface initialization failure.

Parameters

> (None).

iclink events

iclink.init events

iclink.init.error

Severity

ALERT

Description

This message occurs when the HA interconnect fails to initialize.

Corrective Action

Reboot the system. If the problem persists, run diagnostics on the memory in the node.

Syslog Message

(None).

Parameters

errorCode (INT): The internal error code.

iclink.probe events

iclink.probe.error

Severity

ALERT

Description

This message occurs when the system cannot detect a High Availability (HA) interconnect card, making HA communication inoperable.

Corrective Action

Verify that the High Availability interconnect card is present and operational on the system. If this message persists, disable and reenable the link by using the (privilege: advanced) "system ha interconnect link off" and "system ha interconnect link on" commands.

Syslog Message

(None).

Parameters

errorCode (INT): Internal error code.

icmp events

icmp.ping events

icmp.ping.throttle

Severity

NOTICE

Description

This message occurs when the system receives a burst of ICMP ping packet within a one-second interval. The packets are dropped by the system because these packets could be due to an ICMP attack.

Corrective Action

If the condition persists, determine the network source of the ICMP ping traffic and then block it by using a firewall rule. For assistance in determining the source, contact your network administrator.

Syslog Message

icmp_input: The system dropped %d ping packets after limiting the packets to %d per second.

Parameters

pingDropped (INT): ICMP_ECHO packets dropped due to throttling since the last time this message was generated.
icmpLimit (INT): Maximum number of ICMP packets per second.

image events

image.copy events

image.copy.bypass.ds.chk

Severity

ALERT

Description

This message occurs when ONTAP software installation was performed via the boot menu, which does not verify the digital signature of the software image.

Corrective Action

Corrective action is not required if the software was installed by authorized personnel. Corrective action might be required if the software was installed by unauthorized personnel because the specified image might not be authorized or digitally signed.

Syslog Message

ONTAP software image %s was installed without digital signature verification.

Parameters

cfcard_image (STRING): Software image name that was installed.

image.install events

image.install.bypass.ds.chk

Severity

ALERT

Description

This message occurs when ONTAP software installation was performed via the boot menu, which does not verify the digital signature of the software image. Since boot_recovery or netboot was used, the boot device is formatted and both primary and backup software images are installed.

Corrective Action

Corrective action is not required if the software was installed by authorized personnel. Corrective action might be required if the software was installed by unauthorized personnel because it might not be authorized or digitally signed.

Syslog Message

The installed primary and backup ONTAP software images were not digitally verified.

Parameters

(None).

image.install.fail.aggregate

Severity

ERROR

Description

This message occurs when a software image installation fails, because one or more aggregates or volumes are not online.

Corrective Action

Ensure that aggregates and volumes are all online by using the "storage aggregate show -state !online" command and the "volume show -state !online -state !restricted" command.

Syslog Message

Image installation fail: One or more aggregates are not online.

Parameters

(None).

image.install.fail.mcluster

Severity

ERROR

Description

This message occurs when a software image installation fails because a MetroCluster(tm) switchover operation is in progress or already switched over.

Corrective Action

Use the "metrocluster show" command to verify that both the local and remote clusters are neither performing switchover nor in switchover mode.

Syslog Message

MetroCluster switchover operation is in progress or already switched over.

Parameters

(None).

image.install.fail.sfostate

Severity

ERROR

Description

This message occurs when a software image installation fails because the node is in takeover state.

Corrective Action

Ensure that all storage failover operations have been completed and that no nodes remain taken over by using the "storage failover show-giveback" command, and then try the installation again.

Syslog Message

The node is taken over, cannot set to new image.

Parameters

(None).

image.install.fail.sign

Severity

ALERT

Description

This message occurs when the software installation process cannot verify the digital signature of the intended image.

Corrective Action

Replace the image, and then try the command again.

Syslog Message

Image installation fail: Image digital signature check failed.

Parameters

(None).

ipfw events

ipfw.reachedmaxstates events

ipfw.ReachedMaxStates

Severity

NOTICE

Description

This message occurs when the ipfw firewall fails to create a new dynamic state entry for a "keep-state" rule because the number of dynamic state entries has reached the maximum allowed value of 32768. The "keep-state" rule is used by the firewall to keep track of whether a connection is established. States are maintained by firewall for TCP, UDP, BGP, and ESP packets. This message occurs at most once every 60 seconds; it lists the most recent connections to reach the limit.

Corrective Action

(None).

Syslog Message

The ipfw firewall failed to create dynamic "keep-state" entry. Reason: %s, current # of entries: %d. Recent connections reaching this limit: %s

Parameters

message (STRING): Information about the failed ipfw dynamic state creation.
current_states_held (INT): Current total number of ipfw dynamic "keep state" entries held.
cnn_message (STRING): Information about recent connections that reached the limit.

ipmultipath events

ipmultipath.init events

ipmultipath.init.badChksumType

Severity

ERROR

Description

This message occurs during IP Multipath session initialization, when an INIT packet with an unknown checksum type is received.

Corrective Action

The two end points are possibly running incompatible versions of ONTAP. Run identical/compatible versions of ONTAP on the two end points and try again.

Syslog Message

Unknown checksum type (%d) in IP Multipath INIT packet.

Parameters

chksum_type (INT): Checksum type received.

ipmultipath.init.badVersion

Severity

ERROR

Description

This message occurs during IP Multipath session initialization, when an INIT packet with an unknown version number is received.

Corrective Action

The two end points are possibly running incompatible versions of ONTAP. Run identical/compatible versions of ONTAP on the two end points and try again.

Syslog Message

Unknown version (%d) in IP Multipath INIT packet.

Parameters

version (INT): Version number received.

ipmultipath.session events

ipmultipath.session.noMemory

Severity

ERROR

Description

This message occurs when an IP Multipath session is dropped due to failure to allocate memory.

Corrective Action

The system is out of memory. Try to reduce load on the system. When memory becomes available, IP Multipath automatically reestablishes the session.

Syslog Message

IP Multipath aborting session due to failure to allocate memory.

Parameters

(None).

ipmultipath.setup events

ipmultipath.setup.bindFailed

Severity

ERROR

Description

This message occurs during IP Multipath connection setup, when the IP Multipath listener process cannot bind to any IP address of the source.

Corrective Action

The source host information provided to IP Multipath is probably incorrect. Correct the configuration information and retry.

Syslog Message

IP Multipath failed to bind to %s.

Parameters

src (STRING): Host name on which the failure occurred.

ipmultipath.setup.connFailed

Severity

ERROR

Description

This message occurs during IP Multipath connection setup, when it cannot connect to the remote end point.

Corrective Action

The destination host information provided to IP Multipath is incorrect or the remote host is unreachable. Correct configuration information and retry. If the remote host is unreachable, IP Multipath automatically establishes the connection after the problem is corrected.

Syslog Message

IP Multipath failed to connect to %s.

Parameters

    dst (STRING): Host name of the remote host.

ipsec events

ipsec.ib events

ipsec.ib.bad.encrypt

Severity

ALERT

Description

This message occurs when an inbound IPsec packet cannot be successfully decrypted. Corrupt data is received.

Corrective Action

The IPsec SA database could be out of sync to cause this decryption failure. Use the "security ipsec policy modify -is-enabled" command to disable and then reenable the affected policy matching the source and destination IP address.

Syslog Message

IPsec: %s packet cannot be successfully decrypted.

Parameters

sa2str (STRING): IPsec Security Association (SA) in string format SA (Security Parameter Index, source IP address, destination IP address).

ipsec.ib.no.lookup

Severity

NOTICE

Description

This message occurs when an inbound IPsec packet cannot able to locate the IPsec Security Association (SA) from the SA database. The remote side is using an SA which does not exist in the local SA database.

Corrective Action

The IPsec SA database is out of sync. Use the "security ipsec policy modify -is-enabled" command to disable and then reenable the affected policy matching the source and destination IP address.

Syslog Message

IPsec: SA not found. SPI: %s Src IP: %s Dst IP: %s.

Parameters

spi (STRING): IPsec SA Security Parameter Index (SPI).
srcAddr (STRING): Source IP address.
dstAddr (STRING): Destination IP address.

ipsec.ib.no.replay

Severity

NOTICE

Description

This message occurs when an inbound IPsec Security Association (SA) encounters a replay check failure. Number of out-of-order and retransmitted IPsec packet received. Possible causes include a denial-of-service (DoS) attack or traffic congestion.

Corrective Action

Possible traffic congestion or DoS attack.

Syslog Message

IPsec: %s replay packets detected. Possible DoS attack or traffic congestion.

Parameters

sa2str (STRING): IPsec SA in string format SA (Security Parameter Index, source IP address, destination IP address).

ipsec.ib.policy.violation

Severity

ALERT

Description

This message occurs when an inbound IPsec packet is found to violate the security policy. It is either not IPsec protected or it is protected in a different way than the policy specifies.

Corrective Action

check the IPsec policy configuration on both ends to make sure that they match each other.

Syslog Message

IPsec: Inbound %s packet %s =⇒ %s security policy violation.

Parameters

protocol (STRING): Packet protocol.
srcAddr (STRING): Source IP address.
dstAddr (STRING): Destination IP address.

ipsec.ob events

ipsec.ob.no.acquire

Severity

NOTICE

Description

This message occurs when the kernel cannot acquire an IPsec Security Association (SA) to protect an outbound packet.

Corrective Action

Double check the IPsec policy configuration on both ends to make sure that they match each other.

Syslog Message

IPsec: Could not acquire SA for packet %s =⇒ %s.

Parameters

srcAddr (STRING): Source IP address.
dstAddr (STRING): Destination IP address.

iscsi events

iscsi.loginfailure events

iscsi.loginFailure

Severity

NOTICE

Description

This event is issued when an initiator fails an iSCSI login attempt.

Corrective Action

Attempt to configure the iSCSI text keys on the initiator such that the iSCSI login succeeds. If the event occurs occasionally but does not affect stability or performance, no corrective action is needed but the event should be monitored. If the event persists and/or iSCSI application performance degrades, starting and stopping the iSCSI service and restarting any iSCSI applications may help clear the condition. Contact NetApp technical support.

Syslog Message

ISCSI: iSCSI login failure, '%s'

Parameters

m (STRING): A more detailed message describing the iSCSI login failure.

iscsi.loginipnotauthorized events

iscsi.loginIpNotAuthorized

Severity

NOTICE

Description

This message occurs when the system rejects an iSCSI login attempt because it originates from an unauthorized IP address.

Corrective Action

Run 'iscsi security show -address-ranges' to see if the initiator IP address has been added to the list of permitted IP addresses from where iSCSI logins are allowed.

Syslog Message

iSCSI login authorization failure. Initiator %s attempted to log in on Vserver %s, LIF %s from IP address %s

Parameters

initiator_name (STRING): Name of the initiator that attempted to login.
vserver (STRING): Name of the vserver to which the unauthorized login attempt is made.
lif (STRING): Name of the LIF where the login was attempted.
initiator_ip_address (STRING): Source IP address of the initiator that attempted to login.

iscsi.notice events

iscsi.notice

Severity

NOTICE

Description

This event is issued when a loggable, non-error event occurs within the iSCSI subsystem.

Corrective Action

(None).

Syslog Message

ISCSI: %s

Parameters

m (STRING): A more specific message describing the event.

iscsi.session events

iscsi.session.stateChanged

Severity

NOTICE

Description

This message occurs when iSCSI session status is changed.

Corrective Action

If the identified iSCSI session is experiencing unexpected events (disconnecting, reconnecting, or connected), examine the link for excessive errors or latency.

Syslog Message

iSCSI session state is changed to %s for the target %s (type: %s, address: %s). %s

Parameters

iscsi_session_state (STRING): New iSCSI session state.
iscsi_target (STRING): iSCSI target name.
iscsi_target_type (STRING): iSCSI target type.
iscsi_target_address (STRING): iSCSI target address.
iscsi_session_state_change_reason (STRING): Reason for the iSCSI session state change.
iscsi_timeout_value (INT): iSCSI timeout value.

iscsi.warning events

iscsi.warning

Severity

NOTICE

Description

This event is issued if the iSCSI subsystem detects an abnormal state.

Corrective Action

(None).

Syslog Message

ISCSI: %s

Parameters

m (STRING): A more specific message describing the state.

isns events

isns.enqueue events

isns.enqueue.failed

Severity

ERROR

Description

This message occurs when the Internet Storage Name Service (iSNS) is not able to enqueue a new operation to the iSNS subsystem.

Corrective Action

The iSNS failed to enqueue an action into the work queue. This may be due to an overloaded system. Please consider moving the Vserver's Management LIF to another node for that Vserver in the cluster with a lighter work-load.

Syslog Message

The iSNS cannot enqueue an operation %s for Vserver %s.

Parameters

event (STRING): Event/Operation that was no enqueued.
vserver (STRING): Name of the Vserver

isns.portal events

isns.portal.info.unavailable

Severity

ERROR

Description

This message occurs when the Internet Storage Name Service (iSNS) is not able to retrieve the portal information required for iSNS registration.

Corrective Action

Ensure that at least one node hosting a IP data LIF for SAN is successfully loaded and operating correctly.

Syslog Message

The iSNS cannot retrieve the portal information for %s: %s.

Parameters

vserver (STRING): Name of the Vserver
err_msg (STRING): Reported error.

isns.reg events

isns.reg.info.unavailable

Severity

ERROR

Description

This message occurs when the Internet Storage Name Service (iSNS) registration information is not valid or not available.

Corrective Action

Check the Data ONTAP® iSNS configuration to ensure that all configuration information is present. Also check the cluster health for the impacted node to ensure that it is online.

Syslog Message

The iSNS registration information for %s was not valid or not available: %s.

Parameters

vserver (STRING): Name of the Vserver
err_msg (STRING): Reported error.

isns.reg.pdu.oversized

Severity

ALERT

Description

This message occurs when the the Internet Storage Name Service (iSNS) registration query packet data unit (PDU) length is larger than the supported maximum value. iSNS will not function properly until the problem is resolved.

Corrective Action

Reconfigure the networking interfaces to reduce the portals until the iSNS registration query PDU is within its maximum value.

Syslog Message

The iSNS registration query for %s failed due to the oversized iSNS query PDU length. Reduce the networking interface portals.

Parameters

vserver (STRING): Name of the Vserver

isns.reg.period.too_small

Severity

INFORMATIONAL

Description

This message occurs when the Internet Storage Name Service (iSNS) requests a registration period that is too small. When this happens, the iSNS client service will be automatically disabled.

Corrective Action

Reconfigure the server to increase the registration period.

Syslog Message

The iSNS registration period for %s was too small (%d); increase the registration period.

Parameters

vserver (STRING): Name of the Vserver
period (INT): Registration period received from the iSNS server

isns.socket events

isns.socket.conn.failed

Severity

ERROR

Description

This message occurs when the TCP socket connection in the Internet Storage Name Service (iSNS) fails to connect to the iSNS server.

Corrective Action

The iSNS failed to create a socket for communicating with the iSNS server. Check the Data ONTAP® network configuration to ensure that the address for the iSNS server is in the routing group for all Vserver Management LIFs for the Vserver and that they are reachable via the clustered Data ONTAP "network ping" command.

Syslog Message

The iSNS TCP socket connection failed for %s to %s: %s

Parameters

vserver (STRING): Name of the Vserver
ip_address (STRING): IP address for the iSNS server.
err_msg (STRING): Reported network error.

isns.socket.setup.failed

Severity

ERROR

Description

This message occurs when the Internet Storage Name Service (iSNS) fails to create a socket for communicating with the iSNS server.

Corrective Action

Check the Data ONTAP® network configuration to ensure that the address for the iSNS server is in the routing group for all Vserver Management LIFs for the Vserver and that they are reachable via the clustered Data ONTAP "network ping" command.

Syslog Message

The iSNS for %s failed to create a socket to %s; check the Data ONTAP network configuration.

Parameters

vserver (STRING): Name of the Vserver
ip_address (STRING): IP address for the iSNS server.

kern events

kern.cron events

kern.cron.dstError

Severity

ERROR

Description

This event is issued when the kernel cron daemon is unable to reschedule an internal process due to an error in handling of daylight savings time.

Corrective Action

(None).

Syslog Message

Daylight Saving Time change caused %s to be scheduled at an invalid time could not reschedule it, deleting further scheduling

Parameters

owner (STRING): The name of the process that was supposed to be scheduled

kern.cron.reschedDst

Severity

NOTICE

Description

This event is issued when the kernel cron daemon reschedules an event to run at a newly scheduled time as a result of a daylight savings time change.

Corrective Action

(None).

Syslog Message

Daylight Savings Time change: rescheduling %s to run at %s

Parameters

owner (STRING): The name of the process that was scheduled
time (STRING): The text version of the time string at which the event was scheduled

kern.log events

kern.log.rotate

Severity

NOTICE

Description

This event is issued when the system messages log is rotated to a new name. This event will be the first event in the new message file. When in takeover mode, this event is also issued for the partner node.

Corrective Action

(None).

Syslog Message

System %s (ID %s) is running %s

Parameters

hostname (STRING): The host name of the appliance.
serialno (STRING): The serial number of the host.
short_version (STRING): The short version string of the OnTap kernel, in the form 'NetApp Release NNNN'.

kern.rc events

kern.rc.errorMsg

Severity

NOTICE

Description

This event is issued when an error printf is issued by the kernel in the context of executing the /etc/rc file.

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The text of the message

kern.rc.msg

Severity

NOTICE

Description

This event is issued when a printf is issued by the kernel in the context of executing the /etc/rc file.

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The text of the message

kern.shutdown events

kern.shutdown

Severity

NOTICE

Description

This event is issued to indicate a pending shutdown is underway.

Corrective Action

(None).

Syslog Message

System shut down because : "%s".

Parameters

type (STRING): The type of shutdown (halt or reboot) that is underway.

kern.shutdown.cantDeleteEntry

Severity

ERROR

Description

This event is issued when we detect that a halt or reboot is about to occur but a registry entry cannot be deleted

Corrective Action

(None).

Syslog Message

(None).

Parameters

key (STRING): The registry key

kern.syslog events

kern.syslog.drops

Severity

ERROR

Description

This event is generated when we detect that syslog messages were dropped before being logged. Syslog messages may be dropped if one or more Data ONTAP subsystems are generating many syslog messages

over short period of time. That can be an indicator that those subsystems are experiencing problems that need to be resolved.

Corrective Action

Look in the syslog messages file at the messages prior to this message. If they all seem to be coming from a common subsystem, it may indicate that there is a problem with that subsystem. Attempt to resolve the problem with that subsystem.

Syslog Message

Dropped %d syslog messages starting at %s due to lack of internal log buffers

Parameters

numDrops (INT): The number of messages that have been dropped.
timestamp (STRING): A timestamp that indicates the time when the syslog messages started being dropped.

kern.syslog.msg

Severity

NOTICE

Description

This event is generated when a kernel syslog message is detected.

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The text of the message
vfilerName (STRING): The name of the vfiler that generated the message

kern.syslogd events

kern.syslogd.error

Severity

ERROR

Description

This message occurs when an event is generated to log errors from the syslog daemon.

Corrective Action

(None).

Syslog Message

syslog daemon error %s.

Parameters

ErrMsg (STRING): Specific error generated by the syslog daemon.

kern.timezone events

kern.timezone.change

Severity

NOTICE

Description

This message occurs when the configured time zone changes.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_tz (STRING): Previous time zone.
old_tz_offset (INT): Seconds east of UTC of the previous time zone.
new_tz (STRING): New time zone.
new_tz_offset (INT): Seconds east of UTC of the new time zone.

kern.uptime events

kern.uptime.filer

Severity

NOTICE

Description

This message occurs to display the uptime status of the controller. Typically, this message is generated once per hour.

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): Text message describing the current status of the controller.
secs (LONGINT): Number of seconds since the controller was booted.
nfsOps (LONGINT): Number of NFS operations that have been performed.
cifsOps (LONGINT): Number of CIFS operations that have been performed.
httpOps (LONGINT): Number of HTTP operations that have been performed.
fcpOps (LONGINT): Number of FCP operations that have been performed.
iscsiOps (LONGINT): Number of iSCSI operations that have been performed.

nvmeFcOps (LONGINT): Number of NVMe/FC operations that have been performed.
nvmeTcpOps (LONGINT): Number of NVMe/TCP operations that have been performed.
nvmeRoceOps (LONGINT): Number of NVMe/RDMA over Converged Ethernet(RoCE) operations that have been performed.

kern.version events

kern.version.change

Severity

NOTICE

Description

This message occurs when you reboot your system with a version of the Data ONTAP® kernel that is different from the one you ran previously.

Corrective Action

(None).

Syslog Message

Data ONTAP kernel version was changed from %s to %s.

Parameters

oldver (STRING): Previous version of the Data ONTAP kernel.
newver (STRING): Current version of the Data ONTAP kernel.

kern.vm events

kern.vm.mmap.return

Severity

NOTICE

Description

This message occurs when an attempt to create a new mapping in the virtual address space of a process has failed.

Corrective Action

(None).

Syslog Message

mmap(2) by %s (pid %d) for size %ld failed: %s, limit %ld, error %d.

Parameters

process_name (STRING): Name of the process with the failed attempt.
process_id (INT): ID of the process with the failed attempt.
size (LONGINT): Size in bytes of the memory map attempt.
message (STRING): Details about the failed memory map attempt.
limit (LONGINT): Size in bytes of the process's virtual memory limit.
errno (INT): The error code returned to the process.

km events

km.cluster events

km.cluster.okm.hierarchy.bad

Severity

ALERT

Description

This message occurs in a MetroCluster(tm) configuration, when one or both clusters have been configured with the Onboard Key Manager, but one or both of the Onboard Key Manager key hierarchies are corrupted. Specifically, the 'hashed_pass' object does not match the 'hashed_pass_l' object in at least one cluster.

Corrective Action

Reboot each of the nodes in the MetroCluster configuration.

Syslog Message

This cluster is part of a MetroCluster configuration. The Onboard Key Manager key hierarchy on one or both of the clusters is corrupted. Specifically, the 'hashed_pass' object does not match the 'hashed_pass_l' object, part of the 'cluster_kdb' table, in either cluster.

Parameters

(None).

km.cmek events

km.cmek.gckms.available

Severity

NOTICE

Description

This message occurs when a configured Google Cloud Key Management Service (GCKMS) that was previously reported as unavailable for key operations is now available.

Corrective Action

(None).

Syslog Message

The GCKMS with project ID: "%s", key ring location: "%s", key ring: "%s" and key name: "%s" configured is now available.

Parameters

projectId (STRING): Project ID.
keyringLocation (STRING): Location of the key ring.
keyringName (STRING): Name of the key ring.
keyName (STRING): Name of the key.

km.cmek.gckms.keyVersionChg

Severity

NOTICE

Description

This message occurs when a change is made to the current key version associated with the key name of the configured Google Cloud Key Management Service (GCKMS). The key version might have been auto-rotated or manually changed at the GCKMS. Additionally, the top-level internal key protection key is successfully re-wrapped with the current key version of the GCKMS key name.

Corrective Action

(None).

Syslog Message

The version of the key "%s" owned by GCKMS project ID "%s", with key ring "%s" at "%s", has been changed from "%s" to "%s".

Parameters

keyName (STRING): Name of the key.
projectId (STRING): Project ID of the GCKMS.
keyringName (STRING): Name of the key ring.
keyringLocation (STRING): Location of the key ring.
oldKeyVersion (STRING): Prior key version.
newKeyVersion (STRING): New key version.

km.cmek.gckms.notAvailable

Severity

ALERT

Description

This message occurs when a check for the availability of the configured Google Cloud Key Management Service (GCKMS) fails. The GCKMS might be down or there might be a network-related problem preventing communication. Without access to the GCKMS, the system might not be able to restore encryption keys needed to mount encrypted volumes. If the GCKMS is not available, then the next time this system boots, the failure to restore the keys might prevent the system from booting successfully or the encrypted volumes hosted on this system from coming online.

Corrective Action

Verify that the GCKMS configuration is correct and verify the permissions and connectivity are correct. If the issue still persists, contact technical support.

Syslog Message

The GCKMS with project ID: "%s", key ring location: "%s", key ring: "%s" and key name: "%s" is not available.

Parameters

projectId (STRING): Project ID.
keyringLocation (STRING): Location of the key ring.
keyringName (STRING): Name of the key ring.
keyName (STRING): Name of the key.

km.cmek.init.failed

Severity

ALERT

Description

This message occurs when the system fails to initialize the key hierarchy required for volume encryption and that is protected by the Customer Managed Encryption Key (CMEK). Reasons for failure include failure to create the key hierarchy, incorrect CMEK configuration, identity, networking or permission issues in communicating with the CMEK hosted service and failure to store the CMEK wrapped key hierarchy in an external store like etcd.

Corrective Action

Ensure that the configuration, identity, networking and permissions required to communicate with the CMEK hosted service are configured correctly. If the issue persists, contact technical support.

Syslog Message

Initialization of the CMEK protected key hierarchy fails. Reason: "%s".

Parameters

reason (STRING): Reason for failure.

km.cmek.init.success

Severity

NOTICE

Description

This message occurs when the system successfully initializes and protects the key hierarchy with a Customer Managed Encryption Key (CMEK). The system is ready to support encrypted volumes.

Corrective Action

(None).

Syslog Message

CMEK protected key hierarchy initialization successfully completed.

Parameters

(None).

km.extkeysvr events

km.extkeysvr.details

Severity

NOTICE

Description

This message occurs when a key is retrieved or restored from an external KMIP server. This is an informational message that describes the external KMIP server where the key is stored.

Corrective Action

(None).

Syslog Message

Key ID "%s" restored/retrieved from external key server "%s".

Parameters

keyId (STRING): Key ID of the key being restored or retrieved.
hostPort (STRING): Host port details of the external KMIP server.

km.keyretrieve events

km.keyretrieve.failed

Severity

ALERT

Description

This message occurs when a node fails to retrieve a complete set of encryption keys from the configured key servers by the time the management process comes online. Should this node take ownership of an encrypted volume associated with a missing key before the key becomes available, the encrypted volume cannot come online.

Corrective Action

Use the "security key-manager external restore -node <node> -vserver <vserver>" command to manually restore the keys.

Syslog Message

Key auto-retrieve failed on node %s for Vserver %s (ID %u, UUID %s).

Parameters

node (STRING): Name of the node whose management process goes online.
vserver (STRING): Name of the Vserver that could not retrieve all of the keys.
vserverId (INT): Vserver ID of the Vserver.
vserverUuid (STRING): UUID of the related Vserver.

km.keyserver events

km.keyserver.available

Severity

NOTICE

Description

This message occurs when a check by the key manager for connectivity with a configured key management server indicates that the key management server that was previously unavailable is now available.

Corrective Action

(None).

Syslog Message

The external key management server "%s" is now available for Vserver "%s".

Parameters

address (STRING): IP address of the key management server.
vserver (STRING): Name of the Vserver where the key management server is configured.

km.keyserver.notavailable

Severity

ALERT

Description

This message occurs when a check by the key manager for connectivity with a configured key management server indicates that the key management server is not available. The key management server might be down, there might be a network-related problem preventing communication with the key server, or the security certificates used to authenticate with the key management server might have expired. Without access to the key management server, the node might not be able to restore authentication keys needed to unlock NSE drives or encryption keys needed to mount encrypted volumes. If the key management server is not available the next time this node boots, then the failure to restore the keys might prevent the node from booting successfully or prevent the encrypted volumes hosted on this node from coming online.

Corrective Action

Ensure that the key management server is online using the server's management interface. If the server is online, use the "network ping -lif <lif> -vserver <vserver> -destination <address>" command to verify that the node can communicate with the server. If this command indicates that the server is available, use the "security key-manager external show -vserver <vserver>" command to get the certificate names, and then check whether they are expired with the "security certificate show-user-installed -vserver <vserver> -cert -name <cert>" command. If so, install the updated certificates with the "security certificate install" and "security key-manager external modify" commands.

Syslog Message

The external key management server "%s" is not available for Vserver "%s", status: "%s".

Parameters

address (STRING): IP address of the key management server.
vserver (STRING): Name of the Vserver where the key management server is configured.
keyserver_status (STRING): Status of the key management server.

km.mcc events

km.mcc.okm.hierarchy.bad

Severity

ALERT

Description

This message occurs in a MetroCluster(tm) configuration, when one or both clusters have been configured with the Onboard Key Manager, but one or both of the Onboard Key Manager key hierarchies are corrupted. Specifically, the 'hashed_pass' object does not contain the same value in each Onboard Key Manager key hierarchy.

Corrective Action

Reboot each of the nodes in the MetroCluster configuration.

Syslog Message

This cluster is part of a MetroCluster configuration. The Onboard Key Manager key hierarchy on one or both of the clusters is corrupted. The replication subsystem has failed to update the 'hashed_pass' field in the 'cluster_kdb' table.

Parameters

(None).

km.mcc.okmkey.mismatch

Severity

ALERT

Description

This message occurs in a NetApp MetroCluster configuration, where both peer clusters are configured with Onboard Key Manager (OKM) and the lists of OKM hierarchy keys on the peer clusters are not consistent. A mismatch in the OKM hierarchy keys can lead to a failure during a reboot or future switchover/switchback event.

Corrective Action

Contact NetApp technical support.

Syslog Message

This cluster is part of a MetroCluster configuration. The list of OKM hierarchy keys on one or both of the clusters is potentially corrupted.

Parameters

(None).

km.mcc.svmkek.missing.local

Severity

ALERT

Description

This message occurs in a NetApp MetroCluster configuration, where both peer clusters are configured with Onboard Key Manager (OKM) and an SVM key encryption key is created on the remote peer, but due to various conditions, is not replicated to the local cluster. Creation of a new SVM key encryption key (KEK) on the local cluster is prevented to avoid failure during a reboot or future switchover/switchback event.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

This cluster is part of a MetroCluster configuration. An SVM key encryption key created on the remote cluster has not been replicated to the local cluster.

Parameters

(None).

km.okmdb events

km.okmdb.read.failed

Severity

ALERT

Description

This message occurs when a read of the Onboard Key Manager's database file fails. This may occur when the Onboard Key Manager has been configured to use a USB based mount-point and the USB device has not been mounted on the node.

Corrective Action

Check that the USB device is attached to the node.

Syslog Message

The system is not able to read from the Onboard Key Manager's database file.

Parameters

(None).

km.okmdb.write.failed

Severity

ALERT

Description

This message occurs when a write to the Onboard Key Manager's database file fails. This may occur when the Onboard Key Manager has been configured to use a USB based mount-point and the USB device has either not been mounted on the node or the USB device is write-protected.

Corrective Action

Check that the USB device is attached to the node and that it is not write-protected.

Syslog Message

The system is not able to write to the Onboard Key Manager's database file.

Parameters

(None).

km.onboard events

km.onboard.ccmode.wrongpass

Severity

NOTICE

Description

This message occurs when a cluster administrator supplies the wrong Onboard Key Manager cluster-wide passphrase more than three times in a row while attempting to enable Common Criteria (CC) mode.

Corrective Action

(None).

Syslog Message

The Onboard Key Manager cluster-wide passphrase has been entered incorrectly %s times by user "%s" while attempting to enable Common Criteria mode.

Parameters

username (STRING): Name of the user who issued the command to enable CC mode.
failure_count (STRING): Number of sequential times that the cluster-wide passphrase has been entered incorrectly.

km.restore events

km.restore.invalid.key

Severity

ALERT

Description

This message occurs when the key manager attempts to restore a key which has an invalid length.

Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

Syslog Message

ONTAP has attempted to restore an %s key which has an invalid key length. Vserver: %s, Key ID: %s, Key server: %s.

Parameters

keyType (STRING): Key type (NSE, AES, XTS) that has invalid length.
vserverName (STRING): Vserver name.
keyId (STRING): Key ID of the key being restored.
keyServer (STRING): Key server from which the key is being restored.

km.run events

km.run.external.setup

Severity

ERROR

Description

This message occurs when a node successfully performs a join operation to join a cluster, but the other nodes in the cluster have the External Key Manager configured and the new node does not. The new node cannot perform External Key Manager-related tasks, such as creating encrypted volumes, until it has the

External Key Manager configured.

Corrective Action

Set up the External Key Manager on the new node by using the "security key-manager setup" command.

Syslog Message

External Key Manager setup required after the cluster "%s" operation for node "%s", serial "%s".

Parameters

operation_type (STRING): Type of cluster operation.
node (STRING): Name of the node that successfully joined the cluster.
serial (STRING): System serial number of the node that successfully joined the cluster.

km.run.extrnl.enable.needed

Severity

ALERT

Description

This message occurs when a cluster in a MetroCluster(tm) configuration has configured external key management via the "security key-manager external enable -key-servers <ip_address:port> -client-cert <client_cert_name> -server-ca-certs <server_ca_cert_name>" command. This is an alert that the external key management configuration on the two clusters is not consistent, and that the "security key-manager external enable -key-servers <ip_address:port> -client-cert <client_cert_name> -server-ca-certs <server_ca_cert_name>" command" should be run on the local cluster or peer cluster, specifying the same set of key servers. Otherwise, encrypted volumes and NSE drives will not come online after a future switchover or switchback event. This message will be generated on both the local cluster and the peer cluster.

Corrective Action

Run the "security key-manager external enable" command on the local cluster or the peer cluster (identified in the "cluster" parameter), specifying the same set of configured key servers, to make the external key management consistent.

Syslog Message

The external key management configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

Parameters

cluster (STRING): Local cluster or peer cluster on which to run the command.

km.run.extrnl.setup.needed

Severity

ALERT

Description

This message occurs when a cluster in a MetroCluster(tm) configuration has configured external key management via the "security key-manager setup" command. This is an alert that the external key management configuration on the two clusters is not consistent, and that the "security key-manager setup" command should be run on the local cluster or peer cluster. Otherwise, encrypted volumes and NSE drives

will not come online after a future switchover or switchback event. This message will be generated on both the local cluster and the peer cluster.

Corrective Action

Run the "security key-manager setup" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the external key management configurations consistent.

Syslog Message

The external key management configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

Parameters

cluster (STRING): Local cluster or peer cluster on which to run the command.

km.run.onboard.setup

Severity

ERROR

Description

This message occurs when a node successfully performs a join operation to join a cluster, but the other nodes in the cluster have the Onboard Key Manager configured and the new node does not. The new node cannot perform the Onboard Key Manager-related tasks, such as creating encrypted volumes, until it has the Onboard Key Manager configured.

Corrective Action

Set up the Onboard Key Manager on the new node by using the "security key-manager setup" command.

Syslog Message

The Onboard Key Manager setup required after the cluster "%s" operation for node "%s", serial "%s".

Parameters

operation_type (STRING): Type of cluster operation.
node (STRING): Name of the node that successfully joined the cluster.
serial (STRING): System serial number of the node that successfully joined the cluster.

km.run.onboard.setup.needed

Severity

ALERT

Description

This message occurs when a cluster in a MetroCluster(tm) configuration has either configured the Onboard Key Manager via the "security key-manager setup" command or has reconfigured the cluster passphrase via the "security key-manager update-passphrase" command. This is an alert that the onboard key hierarchies on the two clusters are not consistent, and that the "security key-manager setup -sync -metrocluster-config yes" command should be run on the local cluster or peer cluster. Otherwise, a future switchover or switchback event could fail. This message will be generated on both the local cluster and the peer cluster.

Corrective Action

Run the "security key-manager setup -sync-metrocluster-config yes" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the two onboard key hierarchies consistent.

Syslog Message

The Onboard Key Manager configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

Parameters

cluster (STRING): Local cluster or peer cluster on which to run the command.

km.run.onboard.sync.needed

Severity

ALERT

Description

This message occurs when a cluster in a MetroCluster(tm) configuration has either configured the Onboard Key Manager via the "security key-manager onboard enable" command or has reconfigured the cluster passphrase via the "security key-manager onboard update-passphrase" command. This is an alert that the onboard key hierarchies on the two clusters are not consistent, and that the "security key-manager onboard sync" command should be run on the local cluster or peer cluster. Otherwise, a future switchover or switchback event could fail. This message will be generated on both the local cluster and the peer cluster.

Corrective Action

Run the "security key-manager onboard sync" command on the local cluster or the peer cluster (identified in the "cluster" parameter) to make the two onboard key hierarchies consistent.

Syslog Message

The Onboard Key Manager configuration is not consistent between the local cluster and the peer cluster of the MetroCluster configuration. This can lead to a failure during a future switchover or switchback event. Synchronize the configuration on the %s cluster.

Parameters

cluster (STRING): Local cluster or peer cluster on which to run the command.

km.volume events

km.volume.mount.fail

Severity

ALERT

Description

This message occurs during the recovery of the key manager when a volume is placed online, but fails to mount. Volumes need to be mounted manually.

Corrective Action

The volume needs to be mounted manually with the provided junction using the "volume mount" command.

Syslog Message

Vserver "%s" failed to mount volume: "%s" to junction path: "%s" during key manager recovery.

Parameters

vserver (STRING): Name of the Vserver that owns the volumes being placed online.
volume (STRING): Name of the the volume being placed online.
junction (STRING): Name of the junction path to mount.

km.volume.mount.mismatch

Severity

ALERT

Description

This message occurs during recovery of the key manager when a junction path cannot identify the volume to mount. Pair the supplied junction with its volume and mount manually.

Corrective Action

The volumes are online but need to be mounted manually using the "volume mount" command.

Syslog Message

During health monitor recovery of the key manager on Vserver "%s", the junction path "%s" cannot be associated with the volume to mount.

Parameters

vserver (STRING): Name of the Vserver that owns the volume that could not be mounted.
junction (STRING): Name of the junction path to mount.

kmip2 events

kmip2.cannot events

kmip2.cannot.import.MROOTAK

Severity

ALERT

Description

This message occurs when the KMIP2 client cannot import the MROOT-AK key from a Key Management Interoperability Protocol (KMIP) key server. A key was retrieved from a KMIP key server, but an error occurred when trying to add the key to ONTAP®. The node fails the boot up process when this happens.

Corrective Action

Reboot the node. If the issue persists, contact NetApp technical support for assistance.

Syslog Message

KMIP2 client fails to import MROOT-AK from KMIP key server. Error: %d.

Parameters

err (INT): Error code from system call to sysctlbyname().

kmip2.cannot.import.NSE.key

Severity

ALERT

Description

This message occurs when the KMIP2 client cannot import an NSE key from a KMIP key server. A key was retrieved from a KMIP key server, but an error occurred when trying to add the key to an ONTAP® data structure.

Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

Syslog Message

KMIP2 client failed to import NSE key from KMIP key server, error: %d

Parameters

err (INT): Error code from system call to sysctlbyname().

kmip2.cannot.import.NVE.key

Severity

ALERT

Description

This message occurs when the KMIP2 client cannot import an NVE key from a KMIP key server. A key was retrieved from a KMIP key server, but an error occurred when trying to add the key to an ONTAP® data

structure.

Corrective Action

Run the "security key-manager restore" command to restore keys from external key servers.

Syslog Message

KMIP2 client failed to import NVE key from KMIP key server, error: %d

Parameters

err (INT): Error code from system call to sysctlbyname().

kmip2.cannot.read.client.cert

Severity

ALERT

Description

This message occurs when the client certificate cannot be read. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

Corrective Action

Examine the KMIP client certificate and ensure that the certificate has been created properly.

Syslog Message

KMIP Failed to read client certificate with error: %s

Parameters

err (STRING): KMIP error code.

kmip2.cannot.read.private.key

Severity

ALERT

Description

This message occurs when the client private key certificate can't be read. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

Corrective Action

Examine the KMIP client private certificate and ensure that the certificate has been created properly.

Syslog Message

KMIP Failed to read client private certificate with error: %s

Parameters

err (STRING): KMIP error code.

kmip2.invalid events

kmip2.invalid.key.length

Severity

ALERT

Description

This message occurs when ONTAP cannot push a key to a KMIP key server because the key has an invalid length.

Corrective Action

(None).

Syslog Message

ONTAP failed to push an %s key to a KMIP key server due to invalid key length. Vserver Name: %s, Key ID: %s.

Parameters

keyType (STRING): Key type (NSE, AES, XTS) that has invalid length.
vserverName (STRING): Vserver name.
keyID (STRING): Key ID of key being pushed to key server.

kmip2.ssl events

kmip2.ssl.cannot.connect

Severity

ALERT

Description

This message occurs when a KMIP SSL/TLS connection error is detected in either a Cloud ONTAP system with encrypted aggregates or a NSE system. On a Cloud ONTAP® system, this message indicates one of the following: 1) A request to create an encrypted aggregate will not succeed because the key cannot be sent to the external KMIP server, or 2) The request to retrieve a key from the external KMIP server will fail. In this case, the encrypted aggregate will not be able to be mounted. On a NSE system, this message indicates one of the following: 1) A request to re-key a NSE drive will not succeed because the key cannot be sent to the external KMIP server, or 2) The ability to read/write data to/from a NSE drive might be impacted if power to the drive or to the disk shelf is lost.

Corrective Action

Examine the KMIP certificates and ensure that the certificates have been created properly.

Syslog Message

Unable to make SSL/TLS connection to KMIP server. Error: %s

Parameters

err (STRING): KMIP error code with details.

krb events

krb.config events

krb.config.updateFail

Severity

ERROR

Description

The CIFS server's security settings could not be written to the configuration file on this node.

Corrective Action

Modify any of the 'vserver cifs security' fields using the 'vserver cifs security modify' command, which will attempt to write to the configuration file again on every node. Change the setting back to its original value if desired. Afterward, verify that the event log does not contain any new instances of this error.

Syslog Message

The CIFS server's security settings could not be written to the configuration file on this node.

Parameters

(None).

ktls events

ktls.badauth events

ktls.badAuth

Severity

NOTICE

Description

This message occurs when the system receives a TLS message with bad 'authentication' data. The connection is closed. It might indicate that this system is under attack.

Corrective Action

ONTAP software automatically closes the connection from which this incorrect authentication information was received. If this message is repeatedly generated from the same internet address, it might indicate that this system is under attack.

Syslog Message

ONTAP received a TLS message with incorrect authentication at local address %s local port %d from remote address %s remote port %d via IPspace %d.

Parameters

localAddr (STRING): Full internet address of the local end of this session.
localPort (INT): Local port number that was being reached.
remoteAddr (STRING): Full internet address of the remote end of this session.
remotePort (INT): Remote port number that sent the erroneous data.
IPspace (INT): IPspace in which the remote address was reached.

ktls.cnxnhandshakelimit events

ktls.cnxnHandshakeLimit

Severity

NOTICE

Description

This message occurs when the concurrent TLS connection handshake limit is reached. Any new TLS connection request will fail and an error status will be returned.

Corrective Action

Reduce the encrypted connection load on ONTAP to avoid reaching the maximum concurrent TLS handshake limit.

Syslog Message

ONTAP reached the maximum limit of %d concurrent TLS connection handshakes. If this limit is reached, subsequent TLS connections will fail.

Parameters

    maxTLSConnHandles (INT): Maximum number of concurrent TLS connection handshakes.

ktls.failed events

ktls.failed

Severity

    NOTICE

Description

    This message occurs when several successive Transport Layer Security (TLS) connections with a remote system have failed.

Corrective Action

    Corrective actions will necessarily depend on what condition is being reported.

Syslog Message

    "The TLS connections have failed several times with remote host '%s' in IPspace '%s', for which the latest reason given is: %s."

Parameters

    peer (STRING): Network address of the remote peer.
    ipsname (STRING): IPspace within which the network address is defined.
    reason (STRING): Reason for failure.

ktls.health events

ktls.health.actionQGrowing

Severity

    NOTICE

Description

    This message occurs when the depth of the action queue in the ktlsd subsystem is increasing in the majority of time intervals. It is a potential indication of back-pressure accumulating within ktlsd or the kernel.

Corrective Action

    (None).

Syslog Message

    "The depth of the action queue in the ktlsd subsystem has trended upward over the last "%d" intervals of" %d" seconds."

Parameters

    intervalQuantity (INT): Number of intervals over which the problem was observed.
    intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.actionQHigh

Severity

NOTICE

Description

This message occurs when the depth of the action queue in the ktlsd subsystem accounts for a significant percentage of our total available handshake slots. It is a potential indication of back-pressure accumulating within ktlsd or the kernel.

Corrective Action

(None).

Syslog Message

"The depth of the action queue in the ktlsd subsystem has been at an elevated level over the last %d intervals of %d seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.backoffGrowing

Severity

NOTICE

Description

This message occurs when the number of backoffs in the ktlsd subsystem is increasing in the majority of time intervals. It is most likely an indication that handshake timeouts are occurring frequently.

Corrective Action

(None).

Syslog Message

"The number of self-imposed backoffs in the ktlsd subsystem has trended upward over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.highStress

Severity

ALERT

Description

This message occurs when a combination of indicators suggest high stress within the Kernel Transport Layer Security (KTLS) subsystem. This subsystem does not perform adequately as a consequence.

Corrective Action

There might be a variety of potential corrective actions. The first course of action should be to check for other ktls.health.* events around the same time. These might have their own guidance. In general it is likely that the resolution involves reducing the inbound load on KTLS, which requires different steps depending on the feature.

Syslog Message

"The KTLS subsystem is exhibiting signs of high stress."

Parameters

(None).

ktls.health.inactiveGrowing

Severity

NOTICE

Description

This message occurs when the total length of time handshakes spend in an active state has been increasing in the majority of time intervals.

Corrective Action

(None).

Syslog Message

"The inactive period for TLS handshakes has trended upward over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.latencyGrowing

Severity

NOTICE

Description

This message occurs when the latency of handshakes has been increasing in the majority of time intervals.

Corrective Action

(None).

Syslog Message

"The latency of TLS handshakes has trended upward over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.lowCompletion

Severity

ERROR

Description

This message occurs when a significant percentage of handshakes initiated in the ktlsd subsystem over an interval of time do not succeed.

Corrective Action

There might be a variety of potential corrective actions. Any ktls.failed events generated around the same time contain a "reason" parameter which provides a good starting point for probable causes of this condition.

Syslog Message

"A high percentage of handshakes initiated in the ktlsd subsystem over the last "%d" intervals of "%d" seconds have not completed successfully."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.startLatencyHigh

Severity

NOTICE

Description

This message occurs when the amount of time handshakes are spending in the start queue in the ktlsd subsystem is at an elevated level over some time intervals. It is a potential indication of back-pressure accumulating within ktlsd.

Corrective Action

(None).

Syslog Message

"The amount of time handshakes have spent in the start queue of the ktlsd subsystem has been at an elevated level over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.startQGrowing

Severity

NOTICE

Description

This message occurs when the depth of the start queue in the ktlsd subsystem is increasing in the majority of time intervals. It is a potential indication of back-pressure accumulating within ktlsd.

Corrective Action

(None).

Syslog Message

"The depth of the start queue in the ktlsd subsystem has trended upward over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.startQHigh

Severity

NOTICE

Description

This message occurs when the depth of the start queue in the ktlsd subsystem accounts for a significant percentage of total available handshake slots. It is a potential indication of back-pressure accumulating within ktlsd.

Corrective Action

(None).

Syslog Message

"The depth of the start queue in the ktlsd subsystem has been at an elevated level over the last "%d" intervals of "%d" seconds."

Parameters

intervalQuantity (INT): Number of intervals over which the problem was observed.
intervalLength (INT): Length of the observation intervals for this problem, in seconds.

ktls.health.stress

Severity

ERROR

Description

This message occurs when a combination of indicators suggest moderate stress within the Kernel Transport Layer Security (KTLS) subsystem.

Corrective Action

There might be a variety of potential corrective actions. The first course of action should be to check for other ktls.health.* events around the same time. These might have their own guidance. In general it is likely that the resolution involves reducing the inbound load on KTLS, which requires different steps depending on the feature.

Syslog Message

"The KTLS subsystem is exhibiting signs of moderate stress."

Parameters

(None).

largevol events

largevol.remount events

largevol.remount.nfsclient

Severity

NOTICE

Description

This message occurs when the "is-large-size-enabled" property is set on a FlexVol volume or Flexgroup volume, which is NFS mounted for client access. Setting this field enables volumes to support large files, from 16TB to 128TB. If the volume has already been mounted via NFS, then the NFS client caches the older maximum file size, which is 16TB. For support of files up to 128TB to take effect, the NFS client needs to remount the volume. This issue does not occur if automount has been configured on NFS client to mount the volumes.

Corrective Action

To support 128TB as the maximum file size on the NFS client, stop the applications using the NFS mount, remount the FlexVol volume in the NFS client and then restart the applications. If the issue still persists, Contact NetApp technical support.

Syslog Message

Remount the volume on the NFS client.

Parameters

vvolname (STRING): Volume name.
vserver (STRING): Vserver name.

ldap events

ldap.false events

ldap.false.configs.removed

Severity

NOTICE

Description

This message occurs when the last system to be upgraded in a cluster removes LDAP configurations that were marked as disabled.

Corrective Action

(None).

Syslog Message

All LDAP configurations with the "-client-enabled" parameter set to "false" were removed.

Parameters

(None).

lib events

lib.nvtrace events

lib.nvtrace.syslog.relog.alert

Deprecated

This event is deprecated as of ONTAP 9.1.

Severity

ALERT

Description

This message occurs when the system sorts the syslog messages when syslog is not yet initialized, and the panic messages are relogged.

Corrective Action

(None).

Syslog Message

Relog syslog %s.

Parameters

data (STRING): Syslog data in NVRAM(Non Volatile RAM).

lic events

lic.cappool events

lic.cappool.reassign.abort

Severity

NOTICE

Description

This message occurs when the system aborts an operation of reassigning nodes to a different capacity pool license, because another reassignment operation to a different capacity pool license in the same request has failed.

Corrective Action

Look for the "lic.cappool.failed" event that occurred about the same time, which caused the reassignment operation to abort.

Syslog Message

"Capacity pool license reassignment is aborted for nodes ("%s") to serial number "%s" due to failure to reassign other nodes to serial number "%s"."

Parameters

aborted_node_names (STRING): Aborted list of node names.
aborted_pool_serial (STRING): Aborted capacity pool license serial number.
failed_pool_serial (STRING): Another reassignment operation to this capacity pool serial number has failed.

lic.cappool.reassign.done

Severity

NOTICE

Description

This message occurs when the system successfully completes an operation of reassigning nodes to a different capacity pool license.

Corrective Action

(None).

Syslog Message

"Capacity pool license reassignment successfully completed for nodes ("%s") to license serial number "%s"."

Parameters

node_names (STRING): List of node names that are reassigned to the new capacity pool license.
new_pool_serial (STRING): Capacity pool license serial number to which the nodes are reassigned.

lic.cappool.reassign.done.info

Severity

NOTICE

Description

This message occurs when the system successfully completes an operation of reassigning nodes to a different capacity pool license with with a non-critical error, which does not affect the outcome of the ultimate operation.

Corrective Action

(None).

Syslog Message

"Capacity pool license reassignment successfully completed for nodes ("%s") to license serial number "%s" with non-critical error "%s"."

Parameters

node_names (STRING): List of node names that are reassigned to the new capacity pool license.
new_pool_serial (STRING): Capacity pool license serial number to which the nodes are reassigned.
non_critical_error (STRING): Information about the non-critical error encountered during the reassignment operation.

lic.cappool.reassign.failed

Severity

ERROR

Description

This message occurs when operation of reassigning nodes to a different capacity pool license fails.

Corrective Action

Resolve the error, which should clearly indicate why the operation has failed. Follow the instructions shown on the ONTAP Select Deploy utility from which the operation was initiated.

Syslog Message

"Capacity pool license reassignemnt to license serial number "%s" failed for nodes ("%s") with error: %s"

Parameters

failed_pool_serial (STRING): Capacity pool license serial number to which the nodes failed to be reassigned.
failed_node_names (STRING): List of node names that failed to be reassigned to the new capacity pool license.
error (STRING): Reason for failure.

lic.cappool.reassign.start

Severity

NOTICE

Description

This message occurs when the system starts an operation of reassigning nodes to a different capacity pool license.

Corrective Action

(None).

Syslog Message

"Capacity pool license reassignment started for nodes ("%s") to license serial number "%s"."

Parameters

node_names (STRING): List of node names that are reassigned to the new capacity pool license.
new_pool_serial (STRING): Capacity pool license serial number to which the nodes are reassigned.

lic.lm events

lic.lm.server.not.configured

Severity

ALERT

Description

This message occurs when ONTAP® software is running in the capacity pools licensing model and there is no License Manager configuration available. Without the License Manager configuration, the system cannot create or expand an aggregate.

Corrective Action

Find the IP address of the ONTAP Select Deploy instance from which this ONTAP system was created. Use that IP address to manually configure the License Manager by using the "system license license-manager modify -host ip_address_of_license_manager" command. Verify that the correct License Manager is configured by using the "system license license-manger show" command. Use the "system license license-manager check" command to determine whether the License Manager is accessible. These commands are accessible through diagnostic privileges.

Syslog Message

"License Manager has not been configured for capacity pools."

Parameters

(None).

license events

license.capac events

license.capac.enforce

Severity

ALERT

Description

This message occurs when the total storage capacity of all disks currently assigned to your system exceeds the limits of your capacity license. The system will shut down within the next 72 hours.

Corrective Action

To avoid disruption, either contact your sales representative immediately to obtain a license with a larger maximum capacity, or reduce the storage capacity of the system.

Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB. Forced system shutdown is imminent."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
max_capacity (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

license.capac.eval

Severity

ALERT

Description

This message occurs when a capacity license intended only for evaluation purposes is approaching its end date. This expiration might result in the forced shutdown of the system.

Corrective Action

To avoid any disruption, copy the contents of the volumes of this system to a new location. Contact your sales representative to purchase a version of the system.

Syslog Message

"The system have %llu GB installed. Evaluation license ends on %s."

Parameters

current_capacity (LONGINT): Current storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.eval.ending

Severity

ERROR

Description

This message occurs when a capacity license intended only for evaluation purposes is approaching its end date. It will soon not be possible to either create data aggregates, expand them, mirror them, or bring them online.

Corrective Action

To avoid any disruption, copy the contents of the volumes of this system to a new location. Contact your sales representative to purchase a version of the system.

Syslog Message

"The system is using %llu GB. Evaluation license ends on %s."

Parameters

current_capacity (LONGINT): Current storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.eval.enforce

Severity

ALERT

Description

This message occurs when the evaluation period has expired. Creating aggregates, extending them, mirroring them, and bringing them online will be prohibited. However, if the effective version of the cluster precedes the version of ONTAP® software on this node, any node with this condition might shut down within the next 72 hours.

Corrective Action

To avoid any disruption, move or copy volumes as needed from this system. Contact your sales representative immediately to purchase a version of this system.

Syslog Message

"Evaluation version of capacity license expired. Capacity at %llu GB. Certain aggregate operations are not allowed after %s."

Parameters

current_capacity (LONGINT): Current storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.eval.shutdown

Severity

EMERGENCY

Description

This message occurs when the evaluation period has expired. The system will be shut down within the next 10 minutes.

Corrective Action

Contact your sales representative immediately to purchase a version of this system. Restart the system as needed to move or copy volumes.

Syslog Message

"Storage capacity is at %llu GB. Evaluation license ends on %s. Forced system shutdown is imminent."

Parameters

current_capacity (LONGINT): Current storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.invalidated

Severity

ERROR

Description

This message occurs when the system determines that its existing capacity license does not cover its current used capacity during an attempted upgrade. To allow the upgrade to proceed, the system has deleted the license.

Corrective Action

Either delete enough data aggregates to bring the system into compliance with the existing capacity license, or contact your sales representative immediately to obtain a new license with a sufficient capacity value. In either case, apply the license after the upgrade is successfully completed.

Syslog Message

"Storage capacity now %llu GB, max allowed is %llu GB. Capacity license removed for upgrade."

Parameters

current_capacity (LONGINT): Current capacity of the system, in gigabytes.
max_capacity (LONGINT): Maximum usable storage capacity supported under the current license, in gigabytes.

license.capac.promo.failed

Severity

ERROR

Description

This message occurs when an evaluation version of ONTAP® Select has failed to be promoted to production.

Corrective Action

Remove the license used during promotion by using the "system license clean-up -unused true" command, and then retry promotion.

Syslog Message

"ONTAP Select promotion from evaluation to production was unsuccessful. Failure reason: %s."

Parameters

reason (STRING): Reason for promotion failure.

license.capac.promo.incomp

Severity

ALERT

Description

This message occurs when an evaluation version of ONTAP® Select has fails to automatically reboot to complete promotion.

Corrective Action

Manually reboot the node to complete the evaluation to production promotion process.

Syslog Message

"ONTAP Select promotion from evaluation to production failed to automatically reboot node to complete promotion. Node will use license (serial number: %s) after the node is manually rebooted."

Parameters

license_serial_number (STRING): License serial number of the license intended to be used by the node after promotion.

license.capac.promo.partial

Severity

ALERT

Description

This message occurs when an evaluation version of ONTAP® Select has partially completed the promotion process.

Corrective Action

Manually reboot the node to complete the evaluation to production promotion process.

Syslog Message

"ONTAP Select promotion from evaluation to production is incomplete. Node will use license (serial number: %s) after the node reboots."

Parameters

license_serial_number (STRING): License serial number of the license intended to be used by the node after promotion.

license.capac.promoted

Severity

NOTICE

Description

This message occurs when an evaluation version of ONTAP® Select has been successfully promoted to production.

Corrective Action

(None).

Syslog Message

"ONTAP Select promotion from evaluation to production was successful with a license (serial number: %s)"

Parameters

license_serial_number (STRING): License serial number being used by the promoted node.

license.capac.shutdown

Severity

EMERGENCY

Description

This message occurs when the total storage capacity of all disks currently assigned to your system has exceeded the limits of your capacity license. The system will shut down within the next 10 minutes.

Corrective Action

Contact your sales representative immediately to obtain your capacity license. Restart the system as needed to complete the license installation.

Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB. Forced system shutdown is imminent."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
max_capacity (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

license.capac.unl.ending

Severity

ERROR

Description

This message occurs when a valid capacity license has not been installed. As a result, data aggregates cannot be created, expanded, mirrored, or brought online.

Corrective Action

Contact your sales representative immediately to obtain your capacity license, to avoid any disruption.

Syslog Message

"Now using %llu GB of storage capacity. Certain aggregate operations are prohibited after %s. The grace period for installing a valid capacity license is ending soon."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
end_date (STRING): Date by which a valid license must be installed.

license.capac.unl.enforce

Severity

ALERT

Description

This message occurs when a valid capacity license has not been installed. The system will not permit the creation, expansion, or mirroring of aggregates, or bringing aggregates online. However, if the effective version of the cluster precedes the version of ONTAP® on this node, any node with this condition may forcibly shut down.

Corrective Action

Contact your sales representative immediately to obtain your capacity license, to avoid any disruption.

Syslog Message

"The grace period for installing a valid capacity license has ended. Storage capacity is at %llu GB. Certain aggregate operations are prohibited as of %s."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.unl.shutdown

Severity

EMERGENCY

Description

This message occurs when a valid capacity license has not been installed. The system will shut down within the next 10 minutes.

Corrective Action

Contact your sales representative immediately to obtain your capacity license. Restart the system as needed to complete the license installation.

Syslog Message

"Storage capacity is at %llu GB. License ends on %s. Forced system shutdown is imminent."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
end_date (STRING): Evaluation period end date.

license.capac.unlicensed

Severity

ALERT

Description

This message occurs when the system first detects that a valid capacity license has not been installed. As a result, data aggregates can be created, expanded, mirrored, and brought online only during the initial grace period. However, if the effective version of the cluster precedes the version of ONTAP® on this node, any node with this condition may be forcibly shut down after this grace period.

Corrective Action

To avoid any disruption, contact your sales representative immediately to obtain your capacity license.

Syslog Message

"No capacity license for system with %llu GB used. Certain aggregate operations are prohibited after %s."

Parameters

current_capacity (LONGINT): Current storage capacity of the system, in gigabytes.
end_date (STRING): Unlicensed grace period end date.

license.capac.valid

Severity

NOTICE

Description

This message occurs when a valid capacity license has been installed on your system.

Corrective Action

(None).

Syslog Message

"Capacity license allows %llu GB, you have %llu GB installed."

Parameters

max_capacity (LONGINT): Maximum storage capacity allowed under current license, in gigabytes.
current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.

license.capac.warning

Severity

NOTICE

Description

This message occurs when the total storage capacity of all disks currently assigned to your system is in danger of exceeding the limits of your current license. Exceeding this capacity limit might result in the forced shutdown of the system.

Corrective Action

To avoid disruption, either contact your sales representative immediately to obtain a license with a larger maximum capacity, or reduce the storage capacity of the system.

Syslog Message

"Storage capacity is at %llu GB, max allowed is %llu GB."

Parameters

current_capacity (LONGINT): Currently used storage capacity of the system, in gigabytes.
max_capacity (LONGINT): Maximum storage capacity supported under the current license, in gigabytes.

license.cappool events

license.cappool.aggr.noncomp

Severity

ALERT

Description

This message occurs when an aggregate does not comply with the current Capacity Pool entitlement, as determined by the Licensing Manager. In an HA configuration, noncompliant aggregates are prevented from being sent home during an HA takeover/giveback situation. In a non-HA configuration, these aggregates cannot be brought online if they are already offline.

Corrective Action

Use the "system license license-manager check" command to determine whether the License Manager is accessible. Use the "system license show-aggregates -compliant false" command to find all aggregates that do not comply. From the web interface of the ONTAP® Select Deploy® instance, check the Capacity Pool licensing status, and ensure that sufficient capacity remains within the capacity pool used by this instance of ONTAP. If the capacity is insufficient, reduce the usage by instances of ONTAP that use the pool (for example, by deleting aggregates). If no reduction is possible, Contact NetApp technical support..

Syslog Message

Aggregate %s (UUID: %s) is not compliant with current Capacity Pool entitlement.

Parameters

aggr_name (STRING): Name of the aggregate.
aggr_uuid (STRING): UUID of the aggregate.

license.cert events

license.cert.expired

Severity

ALERT

Description

This message occurs when the license validation certificate is expired. No new license can be validated.

Corrective Action

Contact your sales representative or reseller about renewing your license validation certificate.

Syslog Message

No new license can be validated. Certificate expired on %s.

Parameters

exp_date (STRING): Expiration date.

license.cert.expired.check

Severity

NOTICE

Description

This message occurs when the license validation certificate is near its expiration date. After the certificate expires, no new license can be validated.

Corrective Action

Contact your sales representative or reseller about renewing your license validation certificate.

Syslog Message

Certificate to validate licenses will expire on %s.

Parameters

exp_date (STRING): Expiration date.

license.check events

license.check.expired

Severity

ERROR

Description

This message occurs when the license checker determines that the Base license has expired. If this is the case, you cannot add nodes to the cluster

Corrective Action

Install a permanent Base license on this cluster.

Syslog Message

License Checking: Expired Base license (%s)

Parameters

error (STRING): Interpreted error string from the license validation check.

license.check.failed

Severity

ERROR

Description

This message occurs when the license checker has run and has been unable to validate the Base license due to an internal error. If there is not a valid Base license, then no additional nodes can be added to the cluster.

Corrective Action

Install a valid Base license on this cluster.

Syslog Message

License Checking: internal error validating Base license (%s)

Parameters

> **error** (STRING): Interpreted error string from the license validation check.

license.check.invalid

Severity

> ERROR

Description

> This message occurs when the license checker determines that the Base license is incorrect in some way. If Base license is invalid, you cannot add nodes to the cluster.

Corrective Action

> Install a valid Base license on this cluster.

Syslog Message

> License Checking: The Base license is invalid (%s)

Parameters

> **error** (STRING): Interpreted error string from the license validation check.

license.check.mirror

Severity

> ERROR

Description

> This message occurs when the license checker has run and has determined that at least one volume is being mirrored but there isn't a valid Mirror license installed.

Corrective Action

> Install a valid Mirror license on this cluster.

Syslog Message

> License Checking: Mirror License failure: (%s)

Parameters

> **volume** (STRING): The first volume detected that requires a Mirror license

license.check.missing

Severity

> ERROR

Description

> This message occurs when the license checker deterimines that the Base license is missing. If this is the case, you cannot add nodes to the cluster.

Corrective Action

> Reinstall the Base license.

Syslog Message

License Checking: Missing Base license

Parameters

(None).

license.check.nodes

Severity

ERROR

Description

This message occurs when the license checker determines that the number of nodes in the cluster exceeds the number of nodes allowed by the Base license

Corrective Action

Install a Base license with the correct node count, or remove nodes from the cluster using the unjoin command until the number of total nodes is equal to, or less than, the specified node count limit.

Syslog Message

License Checking: Current node count (%d) exceeds the licensed node limit (%d)

Parameters

nodecount (INT): Number of nodes detected in the cluster
nodelimit (INT): Number of nodes allowed by the Base license

license.check.nonodes

Severity

ERROR

Description

This message occurs when the license checker determines that it cannot retrieve the number of nodes in the cluster to compare against the Base license node count. If this is the case, then you cannot add nodes to the cluster.

Corrective Action

Re-install the Base license so that the node count is correctly reflected. If that fails to fix the problem please contact Customer Support.

Syslog Message

License Checking: Cannot to retrieve the number of nodes in the cluster.

Parameters

(None).

license.check.warn.expired

Severity

ERROR

Description

This message occurs when the license checker determines that a license has expired.

Corrective Action

Install a permanent license on this cluster.

Syslog Message

The license for package "%s" expired on %s.

Parameters

package (STRING): Name of the license package.
expiration (STRING): Expiration date.

license.check.warn.expiring

Severity

ERROR

Description

This message occurs when the license checker determines that a license is within a week of its expiration date.

Corrective Action

Install a permanent license on this cluster.

Syslog Message

The license for package "%s" expires on %s.

Parameters

package (STRING): Name of the license package.
expiration (STRING): Expiration date.

license.feat events

license.feat.delete.failed

Severity

ERROR

Description

This message occurs when the system cannot successfully delete a license for a feature. (This message is currently used only for FlexCache® licenses.)

Corrective Action

The feature might be vetoing deletion for specific, valid reasons (e.g., it is still in use), or it might be in a state that is inconsistent with deletion. Examine the error condition for more information. Contact NetApp technical support.

Syslog Message

License for feature %s and serial %s not deleted: %s.

Parameters

feature (STRING): Name of the feature.
serial (STRING): Serial number associated with the license.
reason (STRING): Error condition encountered.

license.feat.deleted

Severity

NOTICE

Description

This message occurs when the system deletes a license for a feature. (This message is currently used only for FlexCache® licenses.)

Corrective Action

(None).

Syslog Message

License deleted: feature %s, serial %s.

Parameters

feature (STRING): Name of the feature.
serial (STRING): Serial number associated with the license.

license.feat.install.failed

Severity

ERROR

Description

This message occurs when the system cannot successfully install a license for a feature. (This message is currently used only for FlexCache® licenses.)

Corrective Action

Check whether the feature is supported by the target instance of ONTAP® software. Check whether the target instance supports the change in the entitlements as specified by the license. Contact NetApp technical support.

Syslog Message

License for feature %s and serial %s not installed: %s.

Parameters

feature (STRING): Name of the feature.
serial (STRING): Serial number associated with the license.
reason (STRING): Error condition encountered.

license.feat.installed

Severity

NOTICE

Description

This message occurs when the system successfully installs a license for a feature. (This message is currently used only for FlexCache® licenses.)

Corrective Action

(None).

Syslog Message

License installed for feature %s: serial: %s, %s.

Parameters

feature (STRING): Name of the feature.
serial (STRING): Serial number associated with the license.
attrs (STRING): Attributes of interest for this license, listed as a colon-separated key-value pairs.

license.fpool events

license.fpool.changed

Severity

NOTICE

Description

This message occurs when the maximum storage capacity limit for FabricPool is changed.

Corrective Action

(None).

Syslog Message

"FabricPool entitlement: maximum capacity limit now allows %u TB."

Parameters

max_capacity (LONGINT): Current maximum limit supported under the current entitlement, in TB.

license.fpool.denied

Severity

NOTICE

Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied by FabricPool.

Corrective Action

(None).

Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u from %u TB."

Parameters

requested_max_capacity (LONGINT): Requested maximum capacity supported, in TB.
current_max_capacity (LONGINT): Current maximum capacity limit supported under the current entitlement, in TB.

license.fpool.no.cloud

Severity

NOTICE

Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied, because there is no support for licensing FabricPool directly on instances of Cloud ONTAP(tm).

Corrective Action

(None).

Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB - licensing FabricPool directly on instances of Cloud ONTAP not supported."

Parameters

requested_max_capacity (LONGINT): Requested maximum capacity supported, in TB.

license.fpool.removed

Severity

NOTICE

Description

This message occurs when the license for FabricPool usage is deleted.

Corrective Action

(None).

Syslog Message

"FabricPool entitlement deleted."

Parameters

(None).

license.fpool.unsupported

Severity

NOTICE

Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is denied, because FabricPool is not supported on this instance of ONTAP(tm).

Corrective Action

(None).

Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB - feature is not supported."

Parameters

requested_max_capacity (LONGINT): Requested maximum capacity supported, in TB.

license.fpool.wrong.cluster

Severity

ERROR

Description

This message occurs when an attempt to alter the maximum storage capacity limit for FabricPool is rejected. The license used in the attempt contains an incompatible cluster ID.

Corrective Action

Determine the ID of the cluster by using the "cluster identity show" command. Within the license itself, determine the value of the "HostID" field. If the field exists, compare its value to the cluster ID. Confirm that these values match. If not, then the cluster is not the intended target of this license. Apply the license to the correct cluster if possible. For all other scenarios, contact NetApp technical support.

Syslog Message

"FabricPool entitlement: maximum capacity limit not changed to %u TB; license applies to cluster with ID %s."

Parameters

requested_max_capacity (LONGINT): Requested maximum capacity supported, in TB.
cluster_ID (STRING): Cluster ID as specified in license.

license.ontapi events

license.ontapi.eval

Severity

NOTICE

Description

This message occurs when ONTAPI enablement evaluation license is installed successfully.

Corrective Action

Contact your sales representative to get a license if you wish to continue using ONTAPI past this expiration date.

Syslog Message

ONTAPI enablement evaluation license installed. Expiration: "%s".

Parameters

expiration_date (STRING): Expiration date of ONTAPI enablement evaluation license.

license.ontapi.valid

Severity

NOTICE

Description

This message occurs when a valid ONTAPI enablement license has been installed on your system.

Corrective Action

(None).

Syslog Message

ONTAPI enablement license installed. Expiration: "%s".

Parameters

expiration_date (STRING): Expiration date of ONTAPI enablement license.

license.pool events

license.pool.sfo.gb.veto

Severity

ERROR

Description

This message occurs when a storage failover giveback is vetoed because the aggregate has no valid capacity lease from the capacity pool. This might be because the capacity pool license has expired, because there is not sufficient capacity in the pool, or because the License Manager is not accessible.

Corrective Action

If the node could not check the compliance status of an aggregate, check that the License Manager is accessible by using the "system license license-manager check" command. If the License Manager is not accessible, verify that it is up and running in ONTAP Select Deploy, and that there are no network connectivity issues. If an aggregate has been found to be out of compliance, verify on ONTAP Select Deploy that the capacity pool license has not expired, and that there is enough capacity remaining for the aggregate. For all other reasons, Contact NetApp technical support.

Syslog Message

SFO giveback vetoed. %s.

Parameters

reason (STRING): Explanation for the veto.

license.sfo events

license.sfo.gb.veto

Severity

ERROR

Description

This message occurs when a storage failover giveback is vetoed because a select capacity license has not been installed and the license installation grace period has ended.

Corrective Action

Install a valid select capacity license, and then reissue the "storage failover giveback" command. Use the "system license show-status" command to determine which node is missing the capacity license.

Syslog Message

SFO giveback vetoed. Missing select capacity license.

Parameters

(None).

license.sfo.gb.veto.eval

Severity

ERROR

Description

This message occurs when a storage failover giveback is vetoed because the evaluation period for the ONTAP ® instance has ended.

Corrective Action

Contact your sales representative for further assistance.

Syslog Message

SFO giveback vetoed. Evaluation period ended.

Parameters

(None).

license.subscription events

license.subscription.enforcement

Severity

EMERGENCY

Description

This message occurs when your Cloud ONTAP® license subscription has expired but may still be renewed.

Corrective Action

Contact your sales representative to have your subscription reactivated.

Syslog Message

    %s

Parameters

    expiration_msg (STRING): Expiration message.

license.subscription.reminder

Severity

    NOTICE

Description

    This message occurs when your Cloud ONTAP® license subscription is going to expire soon.

Corrective Action

    Contact your sales representative to renew your subscription as soon as possible.

Syslog Message

    %s

Parameters

    reminder_msg (STRING): Reminder message.

license.subscription.warning

Severity

    ALERT

Description

    This message occurs when your Cloud ONTAP® license subscription is nearly expired.

Corrective Action

    Contact your sales representative to renew your subscription immediately, to avoid any disruption.

Syslog Message

    %s

Parameters

    warning_msg (STRING): Warning message.

license.term events

license.term.enforcement

Severity

    ALERT

Description

    This message occurs when your feature license has expired. The feature might no longer function.

Corrective Action

Contact your sales representative to have your feature license reactivated.

Syslog Message

%s

Parameters

enforcement_msg (STRING): Enforcement message.

license.term.reminder

Severity

NOTICE

Description

This message occurs when your feature license is going to expire soon.

Corrective Action

Contact your sales representative to renew your feature license as soon as possible.

Syslog Message

%s

Parameters

reminder_msg (STRING): Reminder message.

license.term.warning

Severity

ERROR

Description

This message occurs when your feature license has expired. The feature might stop working soon.

Corrective Action

Contact your sales representative to renew your feature license immediately to avoid any disruption.

Syslog Message

%s

Parameters

warning_msg (STRING): Warning message.

lifp events

lifp.net events

lifp.net.bdmismatch

Severity

ERROR

Description

This message occurs while assigning network ports to broadcast domains, when LIF Placement subnet discovery finds a port that is assigned to a broadcast domain that is different from the broadcast domain to which other ports in the same physical broadcast domain are assigned.

Corrective Action

Ports assigned to broadcast-domains need to be corrected by the admin. The ports in one physical broadcast domain must be assigned to a single broadcast-domain.

Syslog Message

In IPspace %s, other ports in the same physical broadcast domain are assigned to broadcast-domain %s but %s is assigned to broadcast-domain %s.

Parameters

ipspacename (STRING): IPspace name.
broadcastdomainOnOtherPorts (STRING): Broadcast-domain name.
port (STRING): Port name.
broadcastdomainOnCurrentPort (STRING): Broadcast-domain name.

lldp events

lldp.receive events

lldp.receive.maximum.entries

Severity

NOTICE

Description

This message occurs when the LLDP (Link Layer Discovery Protocol) daemon running on the storage controller receives more unique neighbor advertisements than it can cache. The storage controller can cache 64 unique entries and accommodates new entries after that by removing the oldest entries first. This event is typically observed when connected to Ethernet networks that do not support LLDP broadcasts.

Corrective Action

If the storage system is connected to an Ethernet network that is forwarding LLDP advertisements, disable LLDP on the storage system or disable forwarding LLDP advertisements on the switch.

Syslog Message

LLDP maximum entries exceeded, oldest record replaced by new record received on port %s.

Parameters

port_name (STRING): The network port that received the LLDP advertisement.

lmgr events

lmgr.aggr events

lmgr.aggr.CA.locks.dropped

Severity

EMERGENCY

Description

This message occurs when locks established through CIFS Continuously Available (CA) shares on an aggregate are dropped after takeover, giveback, or aggregate relocation. This causes clients to see a service disruption on the aggregate.

Corrective Action

Confirm that the aggregate is online by using the 'aggr show -aggregate [name of the aggregate] -fields state' command. Then reopen files to reestablish CA locks. For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "lmgr.aggr.CA.locks.dropped" keyword.

Syslog Message

Continuously Available (CA) locks were dropped on aggregate %s because %s.

Parameters

aggregate (STRING): Name of the aggregate where CA locks were dropped.
reason (STRING): Reason for dropping CA locks, such as "remote lock synchronization is in progress".

lmgr.badstructure events

lmgr.badStructure.found

Severity

ERROR

Description

This event is issued whenever the multi-protocol lock manager finds a bad file pointer and turns off the logging of lock manipulation to preserve trace information. This information can be of use during core analysis.

Corrective Action

(None).

Syslog Message

bad file pointer found, preserving trace information

Parameters

(None).

lmgr.ca events

lmgr.CA.recons.mcc.veto

Severity

ALERT

Description

This message occurs when the system vetoes MetroCluster(tm) switchback or negotiated switchover because one of the volumes affected by the switch has CIFS Continuously Available (CA) locks that are still being reconstructed.

Corrective Action

Retry the switchback or negotiated switchover after verifying that lock reconstruction is complete by using the 'debug locks reconstruction show' diagnostic privilege command.

Syslog Message

Vetoed MetroCluster switchback or negotiated switchover because CA lock reconstruction is in progress.

Parameters

(None).

lmgr.cb events

lmgr.cb.waiting.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager waiting lock callback object cannot be allocated due to reaching the limit for waiting lock callback objects in the associated pool. It is possible there are too many clients holding locks on files where other clients want locks. Clients will have problems accessing or locking files through NAS protocols while at or above the waiting lock callback object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of waiting callback objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u locks %u/%u owners %u/%u

Parameters

cb_waiting_total (INT): Number of allocated waiting callback objects in the pool.
cb_waiting_limit (INT): Allocated callback waiting objects limit for the pool.
pool_name (STRING): Name of the limit pool.

files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.
owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.

lmgr.delegations events

lmgr.delegations.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager WAN FlexCache® delegation object cannot be allocated due to reaching the limit for WAN FlexCache delegation objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols using a FlexCache over a WAN to an origin volume on the node generating this message while at or above the WAN FlexCache delegation object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of WAN FlexCache delegation objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u locks %u/%u owners %u/%u

Parameters

delegations_total (INT): Number of allocated WAN FlexCache delegation objects in the pool.
delegations_limit (INT): Allocated WAN FlexCache delegation objects limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.
owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.

lmgr.enable events

lmgr.enable.remote.lock.space.error

Severity

NOTICE

Description

This message occurs when the enabling of the remote lock functionality is unsuccessful due to insufficient storage space.

Corrective Action

Run "lmgr enable_remote_lock <DSID> -multipart true" command from the diagnostic privilege level for enabling remote lock functionality manually.

Syslog Message

Remote lock functionality could not be enabled on volume '%s%s%s' (DSID %llu) due to insufficient storage space. Please consider freeing up some space and then attempt to enable it manually.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
volDsid (LONGINT): Data set identifier (DSID) of the volume.

lmgr.files events

lmgr.files.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager file object cannot be allocated due to reaching the limit for file objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the file object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of file objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: hosts %u/%u locks %u/%u owners %u/%u.

Parameters

    files_total (INT): Number of allocated files in the pool.

    files_limit (INT): Allocated files limit for the pool.

    pool_name (STRING): Name of the limit pool.

    hosts_total (INT): Number of allocated hosts in the pool.

    hosts_limit (INT): Allocated hosts limit for the pool.

    locks_total (INT): Number of allocated locks in the pool.

    locks_limit (INT): Allocated locks limit for the pool.

    owners_total (INT): Number of allocated owners in the pool.

    owners_limit (INT): Allocated owners limit for the pool.

lmgr.gb events

lmgr.gb.CA.locks.lost

Severity

    NOTICE

Description

    This message occurs when giveback veto is overridden. Locks established through CIFS continuously available (CA) shares on the aggregate being given back are dropped because the giveback occurs before lock sync completion.

Corrective Action

    (None).

Syslog Message

    Dropping partner aggregate locks during lock sync on aggregate %s.

Parameters

    aggr (STRING): Name of the aggregate for which CA locks are lost.

lmgr.gb.CA.locks.may.lost

Severity

    ALERT

Description

    This message occurs when giveback veto is overridden. Locks established using CIFS continuously available (CA) shares on the aggregate being given back might be dropped, because giveback commit occurs simultaneously with lock sync completion.

Corrective Action

    (None).

Syslog Message

    Continuously Available (CA) locks may be lost on aggregate %s due to forced giveback commit occurring simultaneously with lock sync completion.

Parameters

aggr (STRING): Name of the aggregate for which CA locks might be lost.

lmgr.hostfile events

lmgr.hostfile.cleared

Severity

INFORMATIONAL

Description

This message occurs when the volume lock manager hosts file is unusable. In such cases, the hosts files are cleared and reinitialized.

Corrective Action

None.

Syslog Message

Clearing lock manager file %s on volume %s due to error: %s.

Parameters

file_name (STRING): Name of the file that is being cleared.
vol (STRING): Name of the volume.
error (STRING): Error code.

lmgr.hostfile.create.abort

Severity

ERROR

Description

This message occurs when the volume lock manager fails to create the hosts file.

Corrective Action

None.

Syslog Message

Creating lock manager file %s on volume %s failed due to error: %s.

Parameters

aggr (STRING): The name of the volume.
file_name (STRING): The name of the file that was being cleared.
error (STRING): Error code.

lmgr.hostfile.init.failed

Severity

ERROR

Description

This message occurs when the volume lock manager hosts file initialization fails.

Corrective Action

None.

Syslog Message

Initializing lock manager file %s on volume %s failed due to error: %s.

Parameters

aggr (STRING): The name of the volume.
file_name (STRING): The name of the file that is being initialized.
error (STRING): Error code.

lmgr.hosts events

lmgr.hosts.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager host object cannot be allocated due to reaching the limit for host objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the host object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of host objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u locks %u/%u owners %u/%u.

Parameters

hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.
owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.

lmgr.lock events

lmgr.lock.reclaim.aborted

Severity

ERROR

Description

This message occurs when the system aborts the volume lock reclaim process. A volume attempts to reclaim file locks when you bring the volume online after a reboot or after a takeover or giveback event. This error is usually caused by the volumes going offline during the initialization process.

Corrective Action

None;When the volumes come back online the reclaim process will be restarted.

Syslog Message

Aborting Lock manager grace period initialization on volume %s due to error: %s.

Parameters

aggr (STRING): The name of the aggregate.
error (STRING): Error code.

lmgr.lock.type.counts

Severity

NOTICE

Description

This message provides additional information about the current count of lock manager objects when a lock manager pool limit is reached. The combination of the counts from a message indicating a limit has been reached and this message provide context for investigating and resolving the limit issues.

Corrective Action

(None).

Syslog Message

The number of lock manager object types in pool %s are: share locks %u byte locks %u waiting locks %u callback waiting %u pfs (clustered Data ONTAP FlexCache delegations) %u cached locks %u WAN FlexCache delegations %u

Parameters

pool_name (STRING): Name of the limit pool.
share (INT): Number of allocated share locks in the pool.
byte (INT): Number of allocated byte locks in the pool.
waiting (INT): Number of allocated waiting locks in the pool.
cb_waiting (INT): Number of allocated cb_waiting locks in the pool.
pfs (INT): Number of allocated clustered Data ONTAP® FlexCache® delegations in the pool.
cached (INT): Number of allocated clustered Data ONTAP FlexCache cached locks in the pool.
delegations (INT): Number of allocated WAN FlexCache delegations in the pool.

lmgr.locks events

lmgr.locks.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager lock object cannot be allocated due to reaching the limit for lock objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the lock object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of lock objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u owners %u/%u.

Parameters

locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.

lmgr.locks.sync.complete

Severity

NOTICE

Description

This message occurs when synchronization of client file locks ("locks sync") with the partner node completes over the aggregates noted in the previous "lmgr.locks.sync.start" message. Lock sync occurs for locks that were established using CIFS continuously available (CA) shares.

Corrective Action

(None).

Syslog Message

Lock sync completed on %s.

Parameters

aggr (STRING): Lock sync occurs in two cases: 1. Aggregate relocation 2. Giveback In the case of aggregate relocation, the aggregate name is provided. In the case of giveback, "aggr" indicates that lock sync is occuring over all aggregates on the node.

lmgr.locks.sync.start

Severity

NOTICE

Description

This message occurs when synchronization of client file locks ("locks sync") with the partner node starts over one or more aggregates. Lock sync occurs for locks that were established using CIFS continuously available (CA) shares.

Corrective Action

(None).

Syslog Message

Lock sync started on %s.

Parameters

aggr (STRING): Lock sync occurs in two cases: 1. Aggregate relocation 2. Giveback In the case of aggregate relocation, the aggregate name is provided. In the case of giveback, "aggr" indicates that lock sync is occuring over all aggregates on the node.

lmgr.locks.threshold.hit

Severity

ERROR

Description

This message occurs when lock manager lock object has reached the threshold limit for lock objects in the associated pool. The system might become overloaded. Clients will have problems accessing files through NAS protocols while at or above the lock object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The current number of lock objects %u, with maximum limit of %u has reached the threshold limit percentage of %u for pool "%s". The current number/limit of other lock manager objects are: files %u/%u, hosts %u/%u and owners %u/%u.

Parameters

locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.

threshold_percentage (INT): Threshold locks limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.

lmgr.lockstate events

lmgr.lockstate.cleanup.fail

Severity

ERROR

Description

This message occurs when the system cannot clean up the lock state associated with the active file system. The stale lock state can lead to problems accessing files through NAS protocols.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Lock state cleanup failed for '%s' during '%s' on volume '%s%s%s' (DSID %llu) with error %d.

Parameters

lock_type (STRING): Type of locks being cleaned up.
cleanup_reason (STRING): Reason to clean up locks.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
code (INT): Error code returned while trying to clean up lock state.

lmgr.mcc events

lmgr.mcc.oplock.recall.fail

Severity

ERROR

Description

This message occurs when the system vetoes MetroCluster™ switchback or negotiated switchover because CIFS oplock recall fails. Some oplocks could not be recalled because of CPU overload, slow CIFS client response, or a large number of open files.

Corrective Action

Recall oplocks for Vservers participating in negotiated switchover or switchback operations by using the command 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' for volumes or qtrees with oplocks enabled. Then retry the MetroCluster operation,

and reenable oplocks after the operation is complete. If the error persists, then contact NetApp technical support for assistance.

Syslog Message

Vetoed MetroCluster switchback or negotiated switchover because CIFS oplock recall failed with internal error (%d).

Parameters

error (INT): Error number.

lmgr.meta events

lmgr.meta.corrupted

Severity

ERROR

Description

This event occurs when the system detects that the lock manager host metafile is corrupted.

Corrective Action

It is possibile that the corruption affected other parts of the file system. Run wafliron on the volume to verify file system consistency.

Syslog Message

Corrupted lock state file in volume %s: reinitializing.

Parameters

path (STRING): Volume name.

lmgr.mismatch events

lmgr.mismatch.file.objects

Severity

NOTICE

Description

This message occurs when the current file object of a lock does not match the file object found through the file handle. This might be caused by a SnapMirror® promote operation where the Master Data Set ID (MSID) is remapped.

Corrective Action

None.

Syslog Message

(None).

Parameters

volume (STRING): Name of the volume, based on the file handle.

lockid (STRING): Lock Universal Unique Identifier (UUID) of the sharelock.
caller (STRING): WAFL® spinnp operation that encountered this event.

lmgr.move events

lmgr.move.dump.lock.counts

Severity

NOTICE

Description

This message occurs when a volume move operation fails the cutover phase, due to volume quiesce timer expiration, and not all locks were transferred before the failure.

Corrective Action

Run the "vserver locks show -vserver <vserver> -volume <volume>" command to check the locks and the client IP addresses they are associated with. For NFS v4 locks, run instead the "vserver locks nfsv4 show -fields client-name" command in all nodes to get the same information. Reduce locks so that the number of locks remaining in this volume is fewer than the number scanned, and then attempt the volume move cutover again.

Syslog Message

The volume move of volume with DSID %llu did not cut over due to volume quiesce timer expiration. The volume move has scanned %d out of %d locks in the volume.

Parameters

volDsid (LONGINT): Data set identifier (DSID) of the volume.
scanned_locks (INT): Number of locks in the volume that were scanned before the failure.
total_locks (INT): Total number of locks in the volume.

lmgr.notify events

lmgr.notify.host.skip.write

Severity

INFORMATIONAL

Description

This message occurs when the volume lock manager cannot write to the notify hosts file due to an error, for example, insufficient space. In such cases, writing to the notify hosts file is skipped.

Corrective Action

(None).

Syslog Message

Skipped writing to notify hosts file %s on volume %s due to error: %s.

Parameters

file_name (STRING): Name of the file that writing was skipped on.
vol (STRING): Name of the volume.
error (STRING): Error code.

lmgr.owners events

lmgr.owners.limit.hit

Severity

ERROR

Description

This message occurs when a lock manager owner object cannot be allocated due to reaching the limit for owner objects in the associated pool. It is possible that the system is overloaded. Clients will have problems accessing files through NAS protocols while at or above the owner object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The number of owner objects %u has reached the limit %u for the pool %s. The current number/limit of other lock manager objects are: files %u/%u hosts %u/%u, locks %u/%u.

Parameters

owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.

lmgr.owners.threshold.hit

Severity

ERROR

Description

This message occurs when a lock manager owner object has reached the threshold limit for owner objects in the associated pool.The system might become overloaded. Clients will have problems accessing files through NAS protocols while at or above the owner object limit.

Corrective Action

Move volumes to a node with a lower utilization of lock manager resources. Lock manager statistics can be displayed from the diagnostic privilege level. Use the "statistics show -raw true -object lmgr_ng" command for displaying all lock manager resource counters. Use the "statistics show -raw true -object lmgr_ng -instance <node-name>" command for displaying the lock manager statistics for a node's limit pool. Use the "statistics show -raw true -object lmgr_ng -node <node-name>" command for displaying all lock manager statistics on the specified node.

Syslog Message

The current number of owner objects %u with maximum limit of %u has reached the threshold limit percentage of %u for pool "%s". The current number/limit of other lock manager objects are: files %u/%u, hosts %u/%u and locks %u/%u.

Parameters

owners_total (INT): Number of allocated owners in the pool.
owners_limit (INT): Allocated owners limit for the pool.
thresold_percentage (INT): Threshold locks limit for the pool.
pool_name (STRING): Name of the limit pool.
files_total (INT): Number of allocated files in the pool.
files_limit (INT): Allocated files limit for the pool.
hosts_total (INT): Number of allocated hosts in the pool.
hosts_limit (INT): Allocated hosts limit for the pool.
locks_total (INT): Number of allocated locks in the pool.
locks_limit (INT): Allocated locks limit for the pool.

lmgr.partner events

lmgr.partner.locks.outOfSync

Severity

ERROR

Description

This message occurs when a partner node's mirrored lock state goes out of sync with the actual lock state.

Corrective Action

Under normal conditions, no action is necessary. There is an automatic synchronize process that will attempt to resynchronize the lock state. You can wait for this process to synchronize the lock state, or you can manually resynchronize the lock state by running the 'debug locks mirrored sync' command in diag mode, with the Vserver, volume, and file ID supplied in this message.

Syslog Message

Mirrored lock state is out of sync for %s%s/%s (DSID %08x) for file %d Snapshot copy %d (mirroring status %d communication status %d)

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.
dsid (LONGINT): Data set identifier.
fileid (INT): File identifier.
snapid (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.
mirroring_status (INT): Error status from the mirroring operation.
csm_status (INT): Communication status from the mirroring operation.

lmgr.partner.locks.resynched

Severity

INFORMATIONAL

Description

This message occurs when a partner node's mirrored lock state is resynchronized with the actual lock state after having been out of sync previously.

Corrective Action

The mirrored lock state is now synchronized between the partner nodes. You can verify the mirror state of the locks by running the 'debug locks mirrored show' command in diag mode, with the Vserver, volume, and file ID supplied in this message.

Syslog Message

Mirrored lock state is now in sync for %s/%s (DSID %08x) for file %d Snapshot copy %d.

Parameters

vol (STRING): Volume name.
volident (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.
dsid (LONGINT): Data set identifier.
fileid (INT): File identifier.
snapid (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.

lmgr.persistent events

lmgr.persistent.file.open.limit.hit

Severity

NOTICE

Description

This message is triggered when the persistent open lock count for a single file reaches its maximum supported limit.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. From the diagnostic privilege level, execute "lmgr test show_ca_locks_count <file_path>" to inspect the persistent open lock count for the file. If necessary, close unused opens to reduce the count to the maximum limit of persistent open locks per file.

Syslog Message

The file with id %u on volume '%s' (DSID %llu) has hit its maximum persistent open lock count, fully utilizing the supported limit of %u.

Parameters

file_id (INT): File inode number.
vol_name (STRING): Name of the volume.
vol_dsid (LONGINT): Data set identifier (DSID) of the volume.
locks_limit (INT): Maximum supported persistent open locks count for a file.

lmgr.persistent.file.open.limit.warn

Severity

NOTICE

Description

This message is triggered when the persistent open lock count for a single file reaches 80% its maximum supported limit.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. From the diagnostic privilege level, execute "lmgr test show_ca_locks_count <file_path>" to inspect the persistent open lock count for the file. If necessary, close unused opens to reduce the count to the maximum limit of persistent open locks per file.

Syslog Message

The persistent open lock count for file with id %u on volume '%s' (DSID %llu) has reached %u, constituting 80 percent of its maximum supported limit of %u.

Parameters

file_id (INT): File inode number.
vol_name (STRING): Name of the volume.
vol_dsid (LONGINT): Data set identifier (DSID) of the volume.
locks_total (INT): Number of persistent open lock count for file.
locks_limit (INT): Maximum supported persistent open locks count for a file.

lmgr.persistent.open.limit.hit

Severity

NOTICE

Description

This message occurs when the number of persistent open lock count reaches the maximum supported limit.

Corrective Action

Run the "vserver locks show-mirrored-open-count -detailed" command to check the persisted open lock count and try closing the unused files to bring this count down to the currently supported maximum persistent open locks.

Syslog Message

The number of persisted open locks count %u has reached the limit %u.

Parameters

locks_total (INT): Number of persisted open locks.
locks_limit (INT): Maximum supported persisted open locks.

lmgr.precommit events

lmgr.precommit.oplock.recall.fail

Severity

ALERT

Description

This message occurs when the system fails aggregate giveback or relocation because SMB oplock or NFSv4 delegation recall fails. Giveback or relocation cannot proceed until all oplocks are recalled successfully or the lock manager pre-commit phase is forced, in which case cached writes in clients might be lost.

Corrective Action

There are two options for allowing aggregate giveback or relocation to proceed: (1) Force the sendhome pre-commit phase. For aggregate relocation, this can be done by specifying the '-override-destination-checks true' option. For giveback, this can be done by specifying the '-require-partner-waiting false' option. (2) Recall oplocks for Vservers on aggregates participating in the operation by using the 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' command for volumes or qtrees with oplocks enabled. Then retry the operation, and reenable oplocks after the operation is complete. If the error persists, contact NetApp technical support for assistance.

Syslog Message

Aggregate "%s" failed giveback or relocation because lock manager oplock recall failed. Error: %s.

Parameters

aggrname (STRING): Aggregate name.
error (STRING): Error details.

lmgr.precommit.oplock.recall.forced

Severity

NOTICE

Description

This message occurs when the lock manager oplock recall fails during aggregate giveback or relocation, but the pre-commit phase has been forced to proceed. It is possible that cached writes in clients might have been lost as a result.

Corrective Action

(None).

Syslog Message

Lock manager oplock recall failed for aggregate "%s" during giveback or relocation. The failure abort was overridden. Error: %s.

Parameters

aggrname (STRING): Aggregate name.
error (STRING): Error details.

lmgr.precommit.oplock.recall.timeout

Severity

ALERT

Description

This message occurs when the lock manager oplock recall fails during aggregate giveback or relocation because the recalls could not be completed within the internal timeout window. The timeout typically can expire due to CPU overload, slow client response, or a large number of open files.

Corrective Action

The timeout can can be ignored by specifying the '-override-vetoes true' option in the giveback or relocation command.

Syslog Message

Lock manager oplock recall failed to be completed for aggregate "%s" within %d seconds.

Parameters

aggrname (STRING): Aggregate name.
timeout (INT): Timeout value.

lmgr.pruning events

lmgr.pruning.delayed

Severity

NOTICE

Description

This message occurs when there is a delay in pruning and removing unused entries in the volume lock manager hosts file. The current hosts file contents remain; unused entries were not removed.

Corrective Action

(None).

Syslog Message

Pruning lock manager on volume %s for file %s delayed due to error: %s.

Parameters

volume (STRING): Name of the volume.
file_name (STRING): Name of the host file being pruned.
error (STRING): Error description.

lmgr.recons events

lmgr.recons.CA.lock.dropped

Severity

ERROR

Description

This message occurs when locks established through CIFS Continuously Available (CA) shares are dropped after a takeover, giveback, or aggregate relocation. This is because the multi-protocol lock manager finds bad mirrored lock state for CA locks and skips reconstructing them. This causes a client to see a service disruption on the file to which the CA locks belong.

Corrective Action

Reopen the file to reestablish CA locks.

Syslog Message

A Continuously Available (CA) lock for volume %s%s/%s (DSID %08x) file %d snapshot copy %d reconnect key %d is dropped because of %s.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.
dsid (LONGINT): Data set identifier.
fileid (INT): File identifier.
snapid (INT): Snapshot(tm) copy in which the file exists, 0 for the active file system.
reconnect_key (INT): Open identifier to uniquely identify a durable or persistent open on a volume
reason (STRING): Description of the reason for dropping a CA lock.

lmgr.scrub events

lmgr.scrub.lock.space.error

Severity

NOTICE

Description

This message occurs when the internal scrubbing of Remote Lock Entry Metafile (RLEM) fails due to insufficient storage space.

Corrective Action

Run "lmgr scrub_remote_lock <DSID> -multipart true" command from the diagnostic privilege level for scrubbing the Remote Lock Entry Metafile (RLEM) manually.

Syslog Message

The system was unable to scrub the Remote Lock Entry Metafile (RLEM) automatically on volume '%s%s%s' (DSID %llu). Please scrub it manually.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name alone is insufficient.
volDsid (LONGINT): Data set identifier (DSID) of the volume.

lmgr.sendhome events

lmgr.sendhome.veto.bootarg.override

Severity

NOTICE

Description

This message occurs during an SFO aggregate giveback or relocation. It implies that the automated nondisruptive update procedure will override any veto by the lock-manager, due to the presence of a bootarg.

Corrective Action

(None).

Syslog Message

Because bootarg.gb.override.lmgr.veto is set to true, the ANDU procedure will override any lock-manager veto regarding the giveback of the "%s" aggregate.

Parameters

aggregate (STRING): Name of the aggregate.

lmgr.session events

lmgr.session.failed

Severity

INFORMATIONAL

Description

This event occurs when a SpinNP session has failed, which causes session-scoped (e.g. CIFS) locks on the D-blade to be dropped. Only affects locks acquired using the failed session. This will cause clients to see a service disruption until they re-connect to the server.

Corrective Action

None — clients will automatically try to reconnect to the server, re-locking files as necessary.

Syslog Message

Dropped session-scoped locks from session %s:%s:%s due to failed session.

Parameters

initiator (STRING): The blade ID of the initiator.
uniquifier (STRING): The session uniquifier.
target (STRING): The blade ID of the target.

lmgr.sf events

lmgr.sf.up.ready

Severity

NOTICE

Description

This message occurs when the lock manager non-disruption subsystem for CIFS continuously available (CA) shares notifies the high-availability (HA) module that transition into the up state is allowed. After the lock manager has sent this notification, the HA module will allow certain failover options to proceed such as aggregate relocation and giveback.

Corrective Action

(None).

Syslog Message

Lock manager allowed high availability module to transition to the up state for the following reason: %s.

Parameters

reason (STRING): Reason for allowing transition to occur. Valid reasons include: 1. Lock-sync complete 2. Lock-sync timed out 3. CSM Invalid 4. Partner down 5. Mirroring disabled from bootarg 6. SMB3 disabled

lmgr.sh events

lmgr.sh.oplock.recall.fail

Deprecated

This EMS was replaced by the new "lmgr.precommit.oplock.recall.*" variants below and is no longer needed.

Severity

ALERT

Description

This message occurs when the system vetoes aggregate giveback or relocation because CIFS oplock recall fails. Some oplocks could not be recalled because of CPU overload, slow CIFS client response, or a large number of open files. Giveback or relocation cannot proceed until all oplocks are recalled successfully or the veto is overridden, in which case cached writes in clients might be lost.

Corrective Action

Recall oplocks for Vservers on aggregates participating in the operation by using the command 'volume qtree oplocks -volume <vol-name> -qtree <qtree-name> -vserver <vserver-name> -oplock-mode disable' for volumes or qtrees with oplocks enabled. Then retry the operation, and reenable oplocks after the operation is complete. If the error persists, contact NetApp technical support for assistance.

Syslog Message

Aggregate "%s" vetoed giveback or relocation because CIFS oplock recall failed. Internal error: %s.

Parameters

aggrname (STRING): Aggregate name.
error (STRING): Error details.

lmgr.vol events

lmgr.vol.lock.reclaim.partial

Severity

NOTICE

Description

This message occurs when a volume cannot reclaim certain file locks when the system attempts to bring it online. This can occur after a reboot, a takeover, a giveback or an MCC event.

Corrective Action

(None).

Syslog Message

Lock reclaims for volume %s are partial due to the following error: %s.

Parameters

vol (STRING): The name of the volume.
error (STRING): Error code.

logger events

logger.usr events

logger.usr

Severity

NOTICE

Description

This event is issued when the user runs the 'logger' command. The parameter indicates the message that is sought to be notified and is derived from the string passed in to the logger command.

Corrective Action

(None).

Syslog Message

%s

Parameters

message (STRING): Message passed by the user to the logger command.

login events

login.auth events

login.auth.loginDenied

Severity

NOTICE

Description

This event is issued when a login attempt is refused due to authentication failure.

Corrective Action

Use a valid username/password combination to login.

Syslog Message

(None).

Parameters

message (STRING): Details about the failed login attempt.

lsm events

lsm.merge events

lsm.merge.alog.problem

Severity

NOTICE

Description

This message occurs when a block store encounters an error while merging an append log. Normally these merges should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

Corrective Action

(None).

Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while merging an append log: "%u : %s"

Parameters

lsm_id (INT): LSM identifier.
lsm_level (INT): LSM level.
keyspace_id (INT): Keyspace identifier.
volume_name (STRING): Volume name.
error_code (INT): Error code.
error_string (STRING): Error string.

lsm.merge.slog.problem

Severity

NOTICE

Description

This message occurs when a block store encounters an error while merging a sorted log. Normally these merges should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

Corrective Action

(None).

Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while merging a sorted log: "%u : %s"

Parameters

lsm_id (INT): LSM identifier.
lsm_level (INT): LSM level.
keyspace_id (INT): Keyspace identifier.

volume_name (STRING): Volume name.
error_code (INT): Error code.
error_string (STRING): Error string.

lsm.pal events

lsm.pal.problem

Severity

NOTICE

Description

This message occurs when a block store PAL operation encounters an error. Normally these PAL operations should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

Corrective Action

(None).

Syslog Message

Block store PAL has encountered the following error while processing operation "%s": "%u"

Parameters

pal_op (STRING): PAL operation being done.
error_code (INT): WAFL error code.

lsm.rangedelete events

lsm.rangeDelete.problem

Severity

NOTICE

Description

This message occurs when a block store encounters an error while performing a range delete operation. Normally these deletes should recover, but it is important to keep track of exactly when and where the problem happened to help with performance tuning and recovery options.

Corrective Action

(None).

Syslog Message

Block store LSM "%u" (level %u) of keyspace "%u" on volume "%s" has encountered the following error while performing a range delete operation: "%u : %s"

Parameters

lsm_id (INT): LSM identifier.
lsm_level (INT): LSM level.
keyspace_id (INT): Keyspace identifier.
volume_name (STRING): Volume name.
error_code (INT): Error code.

error_string (STRING): Error string.

lun events

lun.clone events

LUN.clone.log.full

Severity

NOTICE

Description

This message occurs when lun clone creation fails because the limit on the maximum number of supported clone log entries (32705) is exceeded.

Corrective Action

Retry upon the completion of the pending clone operations for this volume.

Syslog Message

Logging the LUN clone creation has failed because the limit on the maximum number of supported clone log entries in the volume %s (DSID %llu) has been exceeded.

Parameters

volume_name (STRING): Name of the volume for which the LUN clone creation has failed.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the LUN clone creation has failed.

LUN.clone.snapshot.deleted

Severity

NOTICE

Description

This message occurs when the snapshot used to clone a LUN is deleted before the completion of the cloning process. Data may be inaccessible for this LUN, depending on how much of the data was copied before the snapshot was deleted.

Corrective Action

The LUN should be destroyed to prevent I/O errors from occurring.

Syslog Message

A snapshot containing a file or LUN used to create the LUN clone %s (Inode number %d) in volume %s (DSID %llu) was deleted before the completion of the cloning process.

Parameters

lun_path (STRING): Path for the LUN clone for which the snapshot was deleted.
lun_inode_num (INT): Inode number of the LUN clone for which the snapshot was deleted.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.copy events

LUN.copy.dstPresent

Severity

INFORMATIONAL

Description

This message occurs when a LUN appears in the public namespace of the destination volume during a LUN copy operation.

Corrective Action

(None).

Syslog Message

LUN copy job with UUID %s created destination LUN (%s) successfully.

Parameters

job_uuid (STRING): UUID of the LUN copy job.
dst_path (STRING): Destination path of the LUN copy job.

LUN.copy.started

Severity

INFORMATIONAL

Description

This message occurs when a LUN copy operation is successfully started.

Corrective Action

(None).

Syslog Message

LUN copy started from (DSID:%llu)%s to (DSID:%llu)%s with job-uuid %s.

Parameters

src_vol_dsid (LONGINT): Source volume Data Set ID (DSID).
src_lun (STRING): Source LUN.
dst_vol_dsid (LONGINT): Destination volume Data Set ID (DSID).
dst_lun (STRING): Destination LUN.
UUID (STRING): UUID identifying the copy operation.

lun.create events

LUN.create.nvfailed.volume

Severity

ERROR

Description

This message occurs when a LUN is created in a volume that is in the nvfailed state.

Corrective Action

Clear the nvfailed state of the containing volume, take the appropriate nvfail recovery action to recover from the possible data loss, and bring the LUN online. Note that the actual recovery steps vary based on the application and the host.

Syslog Message

LUN %s was created in a volume %s (DSID %llu) that is in the nvfailed state. It is offline and in the nvfailed state.

Parameters

lun_path (STRING): Path for the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

LUN.create.resized.base

Severity

NOTICE

Description

This message occurs when creating a LUN from a base file causes a permanent size change to that base file.

Corrective Action

(None).

Syslog Message

The base file of the LUN at path %s in volume %s (DSID %llu) has been resized.

Parameters

lun_path (STRING): Path for the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

lun.data events

LUN.data.unavailable

Severity

ERROR

Description

This message occurs when data is unable to be read from a capacity tier.

Corrective Action

Troubleshoot capacity tier connectivity problems.

Unavailable error was received for the object at path %s (fileid:%u) in volume %s (DSID %llu).

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace.
file_id (INT): Identifying number for the suspect inode.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.destroy events

LUN.destroy

Severity

NOTICE

Description

This message occurs when a LUN is destroyed.

Corrective Action

(None).

Syslog Message

LUN %s, vol %s (DSID %llu) destroyed (UUID: %s).

Parameters

lun_path (STRING): Path for the LUN that was destroyed.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the LUN or a hyphen (-) if the UUID cannot be determined.
object_type (STRING): Type of object under notification.

lun.inaccessible events

LUN.inaccessible.restore

Severity

NOTICE

Description

This message occurs when a LUN or NVMe namespace that is inaccessible due to restore is found in a volume. Such an object can contain inconsistent data and will not be accessible for I/O or management operations.

Corrective Action

The object can be destroyed using the option force-fenced for the command 'lun destroy'. It can also be restored from a snapshot or backup.

The LUN or NVMe namespace %s in volume %s (DSID %llu) is inaccessible due to restore.

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.inconsistent events

LUN.inconsistent.blocks

Severity

ERROR

Description

This message occurs when the block containing a LUN or NVMe namespace's attributes is found to be inconsistent.

Corrective Action

Recover the LUN or NVMe namespace from a good backup. If the unrecoverable RAID is in a Snapshot(tm) copy, delete the Snapshot copy. Contact NetApp technical support for more options.

Syslog Message

RAID error was received for the attributes of the object at path %s (fileid:%u) in volume %s (DSID %llu).

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace.
file_id (INT): Identifying number for the suspect inode.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

LUN.inconsistent.filesystem

Severity

EMERGENCY

Description

This message occurs when a LUN or NVMe namespace is found whose on-disk structure is inconsistent in the WAFL® file system. Such a LUN or NVMe namespace is not accessible for I/O or management operations.

Corrective Action

Run wafliron on the containing aggregate, and then recover the LUN from a backup. Contact NetApp technical support for more options.

Syslog Message

The on-disk structure of the object at path %s in volume %s (DSID %llu) is inconsistent in the WAFL file system.

Parameters

> **lun_path** (STRING): Path for the LUN or NVMe namespace.
> **volume_name** (STRING): Name of the containing volume.
> **volume_dsid** (LONGINT): Data set ID (DSID) of the containing volume.

lun.inplace events

LUN.inplace.dmpRstrLUNonNS

Severity

> ERROR

Description

> This message occurs when an in-place restore from a dump fails and creates a metadata inconsistency because the source object type does not match the existing destination object. A LUN has been restored over an existing NVMe namespace at the same path.

Corrective Action

> Unmap the NVMe namespace for which the mismatched restore has created a metadata inconsistency by using the "subsystem map remove" command. Remove the NVMe namespace for which the mismatched restore has created a metadata inconsistency by using the "force-fenced" option for the "lun delete" command. Retry the dump restore. If the original restore location was chosen in error, recover that deleted NVMe namespace.

Syslog Message

> An in-place restore from dump to an existing destination at path %s in volume %s (DSID %llu) failed due to a vdisk type mismatch.

Parameters

> **lun_path** (STRING): Path of the existing destination for which the restore failed.
> **volume_name** (STRING): Name of the destination volume.
> **volume_dsid** (LONGINT): Data set ID (DSID) of the destination volume.

LUN.inplace.dmpRstrNSonLUN

Severity

> ERROR

Description

> This message occurs when an in-place restore from a dump fails and creates a metadata inconsistency because the source object type does not match the existing destination object. An NVMe namespace has been restored over an existing LUN at the same path.

Corrective Action

> Unmap the LUN for which the mismatched restore has created a metadata inconsistency by using the "lun unmap" command. Remove the object for which the mismatched restore has created a metadata inconsistency by using the "force-fenced" option for the "lun delete" command. Retry the dump restore. If the original restore location was chosen in error, recover that deleted LUN.

Syslog Message

An in-place restore from dump to an existing destination at path %s in volume %s (DSID %llu) failed due to a vdisk type mismatch.

Parameters

lun_path (STRING): Path of the existing destination for which restore failed.
volume_name (STRING): Name of the destination volume.
volume_dsid (LONGINT): Data set ID (DSID) of the destination volume.

LUN.inplace.dumpRestoreFail

Severity

ERROR

Description

This message occurs when an in-place restore of a LUN from a dump fails because the source LUN is of a higher version than this Data ONTAP® release supports.

Corrective Action

To recover the source LUN's data from the dump, first restore the LUN to a new path on the destination volume where it will be restored as a regular file with the entire source data intact. Then create a new and unmapped LUN from this file using the 'lun create -f' command. The original destination LUN is inaccessible for I/O or management operations and can be deleted using the 'force-fenced' option for the command 'lun destroy'.

Syslog Message

An in-place restore from dump to an existing destination LUN at path %s in volume %s (DSID %llu) failed.

Parameters

lun_path (STRING): Path of the existing destination LUN for which restore failed.
volume_name (STRING): Name of the destination volume.
volume_dsid (LONGINT): Data set ID (DSID) of the destination volume.

LUN.inplace.restore.failed

Severity

ERROR

Description

This message occurs when an in-place SFSR (Single File SnapRestore®) operation fails and might have left a LUN or NVMe namespace in an inconsistent state.

Corrective Action

To recover the LUN, restore it to a new path. After the LUN is restored it needs to be mapped and hosts need to discover the new device. The LUN in the original path can be deleted.

Syslog Message

An in-place SFSR (Single File SnapRestore®) failed at path %s in volume %s (DSID %llu) and might have left the LUN in an inconsistent state.

Parameters

lun_path (STRING): Path of the LUN or NVMe namespace for which the restore operation failed.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.metadb events

LUN.metadb.version.mismatch

Severity

ERROR

Description

This message occurs when a version mismatch is detected for the metafile containing LUN metadata.

Corrective Action

Rebuild the LUN metadata metafile for the volume by running the 'lun rescan -build-oovc' command.

Syslog Message

A version mismatch was detected for the metafile containing LUN metadata metafile in volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which a version mismatch of the metafile containing LUN metadata was detected.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the metafile containing LUN metadata was detected.

lun.metafile events

lun.metafile.dirCreateFailed

Severity

ERROR

Description

lun metafile directory creation failed

Corrective Action

Check available space on the volume and make sure that the volume is not full or close to full.

Syslog Message

Couldn't create vdisk metafile directory %s.

Parameters

path (STRING): path for the metafile directory that Data ONTAP failed to create

lun.metafile.OOVC.corrupt

Severity

ERROR

Description

This message occurs when inconsistent blocks are read while reading or writing to the Out Of Volume Container (OOVC) metafile. The OOVC metafile contains certain LUN and NVMe namespace configuration and metadata for the objects in a given volume. SAN management operations might be impaired while the OOVC is in this state.

Corrective Action

Use the 'lun rescan -build-oovc' command to rebuild the OOVC metafiles for the affected volume.

Syslog Message

RAID error inconsistency was received for the OOVC metafile in volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which the OOVC metafile was found to be inconsistent.
volume_dsid (LONGINT): Data set ID (DSID) of the volume for which the OOVC metafile was found to be inconsistent.

lun.metafile.VTOC.corrupt

Severity

ERROR

Description

This message occurs when inconsistent blocks are read while reading or writing to the Vdisk Table of Contents (VTOC) metafile. The VTOC metafile contains the inventory of LUNs and NVMe namespaces in a given volume. SAN management operations might be impaired while the VTOC is in this state.

Corrective Action

Use the 'lun rescan -build-vtoc' command to rebuild the VTOC metafile for the affected volume.

Syslog Message

RAID error inconsistency was received for the VTOC metafile in volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which the VTOC metafile was found to be inconsistent.
volume_dsid (LONGINT): Data set ID (DSID) of the volume for which the VTOC metafile was found to be inconsistent.

lun.move events

LUN.move.dstPresent

Severity

INFORMATIONAL

Description

This message occurs when a LUN appears in the public namespace of the destination volume during a LUN move operation.

Corrective Action

(None).

Syslog Message

LUN move job with UUID %s created destination LUN (%s) successfully.

Parameters

job_uuid (STRING): UUID of the LUN move job.
dst_path (STRING): Destination path of the LUN move job.

LUN.move.started

Severity

INFORMATIONAL

Description

This message occurs when a LUN move operation is successfully started.

Corrective Action

(None).

Syslog Message

LUN move started from (DSID:%llu)%s to (DSID:%llu)%s with job-uuid %s.

Parameters

src_vol_dsid (LONGINT): Source volume Data Set ID (DSID).
src_lun (STRING): Source LUN.
dst_vol_dsid (LONGINT): Destination volume Data Set ID (DSID).
dst_lun (STRING): Destination LUN.
UUID (STRING): UUID identifying the move operation.

lun.no events

LUN.no.memory.available

Severity

NOTICE

Description

This message occurs when an operation on LUNs or NVMe namespaces on the node owning the given volume fails due to the unavailability of Data ONTAP® memory.

Corrective Action

Retry the operation.

Syslog Message

An operation on LUNs or NVMe namespaces on the node owning the volume %s (DSID %llu) failed due to unavailability of Data ONTAP® memory.

Parameters

volume_name (STRING): Name of the volume for which the operation has failed.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the operation has failed.

lun.nvfail events

LUN.nvfail.option.on

Severity

NOTICE

Description

This message occurs when the nvfail option for the named volume is turned on. The volume contains LUNs or NVMe namespaces and it is recommended that you keep this option on for such volumes.

Corrective Action

(None).

Syslog Message

The nvfail option for the volume %s (DSID %llu) has been turned on. The volume contains LUNs or NVMe namespaces and it is recommended that this option be kept on for such volumes.

Parameters

volume_name (STRING): Name of the volume for which the nvfail option was turned on.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the nvfail option has been turned on.

LUN.nvfail.vol.proc.complete

Severity

ERROR

Description

This message occurs when an inconsistency is detected in the nvlog during boot or takeover, resulting in the initiation of nvfail processing and the LUNs in the volume being brought offline. This behavior is expected and is intended to prevent any FC/iSCSI data access to LUNs in a volume that might have lost the last few updates to the nvlog. Platform specifics: ASA r2: In addition to LUNs, NVMe namespaces will be brought offline when an inconsistency is dectected in the nvlog during boot or takeover. This behavior is expected and is intended to prevent any NVMf data access to NVMe namespaces in a volume that might have lost the last few updates to the nvlog.

Corrective Action

Verify that the LUN maps are valid. After the LUNs are mapped properly, use the 'lun online' command to bring the LUNs online to make then available to hosts. Host side recovery actions may be required to check the consistency of the data in the LUNs. Platform specifics: ASA r2: Use the 'nvme namespace modify -state online' command to bring the NVMe namespace online. Host side recovery actions may be required to check to consistency of the data in the NVMe namespace.

Syslog Message

LUNs or NVMe namespaces in volume %s (DSID %llu) have been brought offline because an inconsistency was detected in the nvlog during boot or takeover.

Parameters

> **volume_name** (STRING): Name of the volume for which nvfail processing was completed.
> **volume_dsid** (LONGINT): Data Set ID (DSID) of the volume for which nvfail processing was completed.

LUN.nvfail.vol.proc.failed

Severity

> EMERGENCY

Description

> This message occurs when nvfail processing for LUNs in a volume fails to complete. Some of the LUNs in the volume might not be offline. FC/iSCSI data access to the LUNs in the volume is prevented until the nvfail state of the volume is cleared. Platform specifics: ASA r2: In addition to LUNs, Some NVMe namespaces might not be offline when nvfail processing fails to complete. NVMf data access to NVMe namespaces is prevented until the nvfail state of the volume is cleared.

Corrective Action

> For any LUNs that are offline, use the 'lun online' command to bring them online and make them available to hosts. Host side recovery actions might be required to check the consistency of the data in the LUNs. Platform specifics: ASA r2: For any NVMe namespaces that are offline, use the 'nvme namespace modify -state online' command to bring them online and make them available to hosts. Host side recovery actions might be required to check the consistency of the data in the NVMe namespaces.

Syslog Message

> An inconsistency was detected in the nvlog during boot or takeover, and some or all LUNs or NVMe namespaces in volume %s (DSID %llu) might not have been brought offline.

Parameters

> **volume_name** (STRING): Name of the volume for which nvfail processing failed.
> **volume_dsid** (LONGINT): Data Set ID (DSID) of the volume for which nvfail processing failed.

LUN.nvfail.vol.proc.started

Severity

> ERROR

Description

> This message occurs when an inconsistency is detected in the nvlog during boot or takeover, resulting in the initiation of nvfail processing and the LUNs in the volume being brought offline. This behavior is expected and is intended to prevent any FC/iSCSI data access to LUNs in a volume that might have lost the last few updates to the nvlog. Platform specifics: ASA r2: In addition to LUNs, NVMe namespaces will be brought offline when an inconsistency is dectected in the nvlog during boot or takeover. This behavior is expected and is intended to prevent any NVMf data access to NVMe namespaces in a volume that might have lost the last few updates to the nvlog.

Corrective Action

> Verify that the LUN maps are valid. After the LUNs are mapped properly, use the 'lun online' command to bring the LUNs online to make then available to hosts. Host side recovery actions may be required to check the consistency of the data in the LUNs. Platform specifics: ASA r2: Use the 'nvme namespace modify -state online' command to bring the NVMe namespace online. Host side recovery actions may be required to check to consistency of the data in the NVMe namespace.

Syslog Message

LUNs or NVMe namespaces in volume %s (DSID %llu) have been brought offline because an inconsistency was detected in the nvlog during boot or takeover.

Parameters

volume_name (STRING): Name of the volume for which nvfail processing was initiated.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which nvfail processing was initiated.

lun.offline events

LUN.offline

Severity

NOTICE

Description

This message occurs when a LUN is brought offline manually.

Corrective Action

(None).

Syslog Message

LUN %s, vol %s (DSID %llu) was brought offline (UUID: %s).

Parameters

lun_path (STRING): Path for the LUN that was brought offline.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the LUN.
object_type (STRING): Type of object under notification.

lun.online events

LUN.online

Severity

NOTICE

Description

This message occurs when a LUN is brought online manually.

Corrective Action

(None).

Syslog Message

LUN %s, vol %s (DSID %llu) was brought online (UUID: %s).

Parameters

lun_path (STRING): Path for the LUN that was brought online.
volume_name (STRING): Name of the containing volume.

volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the LUN.
object_type (STRING): Type of object under notification.

lun.oovc events

LUN.oovc.rebuild.done

Severity

NOTICE

Description

This message occurs when the rebuilding of the Out Of Volume Container (OOVC) file is complete.

Corrective Action

(None).

Syslog Message

The OOVC has been rebuilt for the volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which the OOVC file was rebuilt.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the OOVC file was rebuilt.

LUN.oovc.version.mismatch

Severity

ERROR

Description

This message occurs when a version mismatch is detected for the Out Of Volume Container (OOVC) metafile.

Corrective Action

Rebuild the OOVC metafile for the volume by running the 'lun rescan -build-oovc' command.

Syslog Message

A version mismatch has been detected for the OOVC metafile in volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which a version mismatch of the OOVC metafile has been detected.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the OOVC metafile has been detected.

lun.op events

LUN.op.nvfail.offline

Severity

ERROR

Description

This message occurs when a LUN is restored or a LUN clone is created in a volume that is currently in the nvfailed state. It can also occur if the source LUN for the operation is in the nvfailed state.

Corrective Action

If the containing volume is in the nvfailed state, clear the nvfailed state and bring the LUN online. Host side recovery actions might be required to check the consistency of the data in the LUN before the LUN is brought online. Note that the actual recovery steps vary based on the application and the host.

Syslog Message

LUN %s in volume %s (DSID %llu) is offline and in the nvfailed state.

Parameters

lun_path (STRING): Path for the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

lun.out events

LUN.out.of.space

Severity

EMERGENCY

Description

This message occurs when a LUN is brought offline by the SCSI layer because of a write failure due to lack of space.

Corrective Action

Add space to the volume, and then bring the LUN online using the "lun online" command.

Syslog Message

LUN %s, vol %s (DSID %llu) is out of space (UUID: %s).

Parameters

lun_path (STRING): Path for the LUN that was brought offline.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the LUN.
object_type (STRING): Type of object under notification.

lun.outplace events

LUN.outplace.dumpRestoreFail

Severity

ERROR

Description

This message occurs when an out-of-place restore of a LUN from dump fails because the source LUN is of a higher version than this Data ONTAP® release supports.

Corrective Action

Restore creates a regular file at the destination path, with the same data as in the source LUN. To recover the source LUN's data from the dump, you can create a new and unmapped LUN from this file using the 'lun create -f' command.

Syslog Message

An out-of-place restore of a LUN from dump for the destination path %s in volume %s (DSID %llu) failed.

Parameters

lun_path (STRING): Destination path for the failed LUN restore.
volume_name (STRING): Name of the destination volume.
volume_dsid (LONGINT): Data set ID (DSID) of the destination volume.

lun.provisioning events

LUN.provisioning.failed

Severity

ERROR

Description

This message occurs during the creation of a LUN or NVME namespace when the provisioning for its metadata fails due to insufficient space in the aggregate. Attempts to map or bind the object will fail until the aggregate has sufficient free space for the metadata.

Corrective Action

Add more space to the aggregate. Use the command 'lun map' or 'lun bind' to allow provisioning of the LUN's metadata to be completed.

Syslog Message

LUN or NVMe namespace %s in volume %s (DSID %llu) was created, but provisioning of its metadata failed due to insufficient space in the aggregate.

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace for which metadata provisioning failed.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.restore events

LUN.restore.complete

Severity

INFORMATIONAL

Description

This message occurs when the SFSR (Single File SnapRestore®) for a LUN or NVMe namespace is complete.

Corrective Action

(None).

Syslog Message

LUN or NVMe namespace was restored at path %s in volume %s (DSID %llu).

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace that was restored.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

lun.scsi events

LUN.SCSI.reservation.removal.failed

Severity

ALERT

Description

This message occurs when the SCSI reservation for one or more LUNs in the secondary or primary Vserver cannot be deleted during a Vserver disaster recovery(DR) resynchronize operation. This might result in the host accessing stale SCSI reservation entries for the LUN during a subsequent Vserver DR activate operation.

Corrective Action

Use the "lun persistent-reservation clear" command to remove the LUN's SCSI reservation.

Syslog Message

SCSI reservation for LUN %s in volume %s (DSID %llu) could not be deleted.

Parameters

lun_path (STRING): Path for the LUN whose SCSI reservation could not be removed.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

lun.serial events

lun.serial.timeWentBack

Severity

INFORMATIONAL

Description

This event occurs when the system clock has been set back in time. It prints the current LUN serial number counter.

Corrective Action

(None).

Syslog Message

(None).

Parameters

counter (LONGINT): Current value of LUN serial number counter.

lun.space events

LUN.space.resv.not.honored

Severity

NOTICE

Description

This message occurs when the space reservation settings for the named volume are not honored in its containing aggregate.

Corrective Action

Make sure that the space guarantee settings for the volume are set to 'file' or 'volume'. If the volume guarantee is disabled, make sure that there is enough free space in the aggregate to enable the volume guarantee.

Syslog Message

Space reservations in volume %s (DSID %llu) are not honored, either because the volume space guarantee is set to 'none' or it is disabled due to lack of space in its containing aggregate.

Parameters

volume_name (STRING): Name of the volume for which reservations are not honored.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which reservations are not honored.

lun.transition events

LUN.transition.fail.no.i2p

Severity

ERROR

Description

This message occurs when the transition of a 7-Mode LUN to clustered Data ONTAP® fails because the i2p database for the destination volume is not fully built.

Corrective Action

Wait a few seconds and then issue the 'lun transition start' command to retry the transition of LUNs in the volume.

Syslog Message

LUNs in volume %s (DSID %llu) could not be transitioned because the i2p database for the volume has not been fully built.

Parameters

volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

LUN.transition.fail.no.space

Severity

ERROR

Description

This message occurs when the transition of a 7-Mode LUN to clustered Data ONTAP® fails due to lack of space in the destination volume or containing aggregate.

Corrective Action

Set the 'filesys-size-fixed' option to false for the volume, add 1MB space for each LUN in the volume, and then issue the 'lun transition start' command to retry the transition.

Syslog Message

LUN %s in volume %s (DSID %llu) could not be transitioned due to lack of space in the volume.

Parameters

lun_path (STRING): Path for the LUN that could not be transitioned.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

LUN.transition.failed

Severity

ERROR

Description

This message occurs when the transition of a LUN to clustered Data ONTAP® fails.

Corrective Action

Determine the cause of failure and the specific corrective action by looking at other events issued for LUNs. Use the "lun transition start" command to retry the transition.

Syslog Message

LUN %s in volume %s (DSID %llu) could not be transitioned.

Parameters

lun_path (STRING): Path for the LUN that could not be transitioned.
volume_name (STRING): Name of the containing volume.

volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

LUN.transition.incons.attrs

Severity

ERROR

Description

This message occurs when a LUN is found whose 7-Mode on-disk structure is inconsistent in the WAFL® file system. This LUN cannot be transitioned and is not accessible for management.

Corrective Action

If the volume was being transitioned, destroy the LUN by using the "lun transition 7-mode delete" advanced-privilege command in clustered Data ONTAP®. Issue the command "lun transition 7-mode start" to retry transition on the volume.

Syslog Message

The 7-mode on-disk structure of the LUN at path %s in volume %s (DSID %llu) is inconsistent in the WAFL file system.

Parameters

lun_path (STRING): Path for the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

LUN.transition.no.type

Severity

NOTICE

Description

This message occurs when Data ONTAP® encounters a LUN that is scheduled for transition and for which the multiprotocol type of the LUN cannot be determined. Data ONTAP substitutes a default value of "linux" for the type and calculates geometry values to match.

Corrective Action

(None).

Syslog Message

Multiprotocol type for LUN "%s" in volume "%s" (DSID: %llu) could not be determined. Once transitioned, this LUN will be assigned the default type "linux".

Parameters

lun_path (STRING): Path of the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

LUN.transition.unsupp.clone

Severity

ERROR

Description

This message occurs when transition of a LUN to clustered Data ONTAP® fails because the LUN is a Snapshot® copy-backed LUN clone. This LUN cannot be transitioned and is not accessible for management.

Corrective Action

Destroy the LUN by using the "lun transition 7-mode delete" advanced-privilege command in clustered Data ONTAP. To make your original LUN a supported candidate for transition, split your Snapshot copy-backed LUN clone prior to transition.

Syslog Message

LUN %s in volume %s (DSID %llu) could not be transitioned.

Parameters

lun_path (STRING): Path for the LUN that cannot be transitioned.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.

LUN.transition.unsupp.geom

Severity

NOTICE

Description

This message occurs when Data ONTAP® encounters a 7-Mode LUN that is scheduled for transition and for which the extent size or cylinder size is absent or unsupported. Data ONTAP substitutes reasonable geometry values upon transition.

Corrective Action

(None).

Syslog Message

LUN "%s" in volume "%s" (DSID: %llu) has a geometry that is not supported in clustered Data ONTAP. Once transitioned, this LUN will be assigned reasonable geometry values.

Parameters

lun_path (STRING): Path of the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

LUN.transition.unsupported.type

Severity

NOTICE

Description

This message occurs when Data ONTAP® encounters a 7-Mode LUN that is scheduled for transition and for which the multiprotocol type is unsupported in clustered Data ONTAP. Data ONTAP substitutes a default value of "linux" for the type upon transition and calculates geometry values to match.

Corrective Action

(None).

Syslog Message

LUN "%s" in volume "%s" (DSID: %llu) has a multiprotocol type that is not supported in clustered Data ONTAP. Once transitioned, this LUN will be assigned the default type of "linux".

Parameters

lun_path (STRING): Path of the LUN.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

lun.vdisk events

LUN.vdisk.cnt.exceeded

Severity

ERROR

Description

This message occurs when a volume contains more than the supported limit of LUNs in the volume. Performance degradation in volume management operations may occur as a result and it will not be possible to create more LUNs in this volume.

Corrective Action

It is recommended that LUNs be moved to other volumes.

Syslog Message

Volume %s (DSID %llu) contains more than the supported limit for LUNs (%d).

Parameters

volume_name (STRING): Name of the volume which contains more than the supported limit of LUNs.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume which contains more than the supported limit of LUNs.
max_create_limit (INT): The maximum number of LUNs that can be created in a volume.

LUN.vdisk.prov.cnt.exceeded

Severity

ERROR

Description

This message occurs when provisioning of metadata for some LUNs fails because the limit for provisioning LUNs in the volume has been exceeded.

Corrective Action

It is recommended that LUNs be moved to other volumes and then mapped using the 'lun map' command.

Syslog Message

Provisioning of metadata for some LUNs failed because the limit on the maximum supported LUNs in the volume %s (DSID %llu) has been exceeded. These LUNs cannot be discovered by hosts and will not be

accessible for I/O. Metadata cannot be provisioned for more than %d LUNs.

Parameters

volume_name (STRING): Name of the volume for which the LUN provisioning failed.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the LUN provisioning failed.
max_prov_limit (INT): Maximum number of LUNs for which metadata can be provisioned in a volume.

lun.vol events

LUN.vol.no.space

Severity

ERROR

Description

This message occurs when an operation on a LUN or NVMe namespace fails due to insufficient space in the volume.

Corrective Action

Add space to the volume and retry the operation.

Syslog Message

An operation on %s in volume %s (DSID %llu) failed due to lack of space in the volume.

Parameters

lun_path (STRING): Path for the LUN or NVMe namespace.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data Set ID (DSID) of the containing volume.

LUN.vol.proc.fail.no.space

Severity

ERROR

Description

This message occurs when the processing for LUNs or NVMe namespaces in the volume has failed due to lack of space in the volume or containing aggregate.

Corrective Action

Platform specifics: Unified ONTAP: Check accompanying event messages to determine whether the volume or containing aggregate lacks space. Add space to the volume or aggregate containing the volume as necessary before retrying the operation. If the volume was being transitioned, issue the command 'lun transition start' to retry; otherwise issue the command 'lun rescan -sync' to complete processing of LUNs in the volume. ASA r2: Contact NetApp technical support for assistance.

Syslog Message

Processing for LUNs or NVMe namespaces in volume %s (DSID %llu) failed due to lack of space.

Parameters

volume_name (STRING): Name of the volume for which the processing failed.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the processing failed.

lun.vtoc events

LUN.vtoc.rebuild.done

Severity

NOTICE

Description

This message occurs when the rebuilding of the Vdisk Table of Contents (VTOC) file is complete.

Corrective Action

(None).

Syslog Message

The VTOC has been rebuilt for the volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which the VTOC file was rebuilt.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which the VTOC file was rebuilt.

LUN.vtoc.version.mismatch

Severity

ERROR

Description

This message occurs when a version mismatch is detected for the Vdisk Table of Contents (VTOC) metafile.

Corrective Action

Rebuild the VTOC metafile for the volume by running the 'lun rescan -build-vtoc' command.

Syslog Message

A version mismatch has been detected for the VTOC metafile in volume %s (DSID %llu).

Parameters

volume_name (STRING): Name of the volume for which a version mismatch of the VTOC metafile has been detected.
volume_dsid (LONGINT): Data Set ID (DSID) of the volume for which a version mismatch of the VTOC metafile has been detected.

malloc events

malloc.failure events

malloc.failure

Severity

    ERROR

Description

    This event is generated if malloc is called unsafely.

Corrective Action

    (None).

Syslog Message

    %s %s %s %s %s %s %s %s %s %s %s

Parameters

    f2 (STRING): Third frame of backtrace.
    f3 (STRING): Fourth frame of backtrace.
    f4 (STRING): Fifth frame of backtrace.
    f5 (STRING): Sixth frame of backtrace.
    f6 (STRING): Seventh frame of backtrace.
    f7 (STRING): Eighth frame of backtrace.
    f8 (STRING): Ninth frame of backtrace.
    f9 (STRING): Tenth frame of backtrace.
    f10 (STRING): Eleventh frame of backtrace.
    f11 (STRING): Twelfth frame of backtrace.
    f12 (STRING): Thirteenth frame of backtrace.

malloc.failure.detail

Severity

    ERROR

Description

    This event is generated if malloc is called unsafely.

Corrective Action

    (None).

Syslog Message

    %s %s

Parameters

    description (STRING): Description of failure.
    buffers (STRING): Details of buffers that were predirtied.

master events

mav events

mav.disabled events

mav.disabled.used.console

Severity

ALERT

Description

This message occurs when multi-admin verification (MAV) is enabled, the bootarg "bootarg.multi_admin.enable" is set to false, and an operation that normally requires MAV approval is executed via the console. This results in an MAV request, executed from the console only, without requiring approval for the operation.

Corrective Action

Set the bootarg "bootarg.multi_admin.enable" to true or to unset as soon as it's no longer needed.

Syslog Message

The multi-admin verification (MAV) feature is disabled by a bootarg. An MAV rule is being triggered by the execution of "%s" command by "%s" user. Allow execution from the console.

Parameters

command (STRING): Command that was executed.
user (STRING): User that executed the command.

max events

max.fsa events

max.fsa.init.scan.limit

Severity

NOTICE

Description

This message occurs when the File System Analytics initialization scan cannot be started because the maximum number of concurrent initialization scans are already running on the cluster. File System Analytics cannot currently be enabled on the volume.

Corrective Action

Use the "volume analytics show" command to check for volumes with the File System Analytics state of "initializing" or "initialization_paused". Wait for a File System Analytics initialization scan to complete, and then try enabling File System Analytics again.

Syslog Message

Enabling File System Analytics on volume "%s" in SVM "%s" fails because the maximum number of concurrent initialization scans are already running on the cluster.

Parameters

volumeName (STRING): Name of the volume on which File System Analytics enable request fails.
vserverName (STRING): Name of the storage virtual machine (SVM) on which the volume resides.

maxcid events

maxcid.limit events

maxCID.limit.exceeded

Severity

ALERT

Description

This message occurs when system exceeds the maximum number of open network data connections on the node.

Corrective Action

Balance the network load across all nodes within the cluster in order to avoid disruptions in service. Contact NetApp technical support.

Syslog Message

Number of active data connections is %d and system limit is %d.

Parameters

activeCID (INT): Number of open data connections on the node.
maxCID (INT): Maximum allowed limit of data connections per node.

maxcid.threshold events

maxCID.threshold.exceeded

Severity

ERROR

Description

This message occurs when the system is approaching the maximum number of open data connections supported on the node.

Corrective Action

Balance the network load across all nodes within the cluster.

Syslog Message

Number of active data connections is %d and maximum supported threshold is %d.

Parameters

activeCID (INT): Number of open data connections on the node.
maxCIDThreshold (INT): Maximum threshold of data connections supported per node.

mc events

mc.channel events

mc.channel.create.failed

Severity

NOTICE

Description

This message occurs on failure in new channel creation in Mirror Cache.

Corrective Action

(None).

Syslog Message

Failure in Mirror Cache on new channel — Name: %s

Parameters

channel (STRING): Channel name

mc.post events

mc.post.replay.stats

Severity

NOTICE

Description

This message occurs post replay and conveys information regarding bdatas inserted, rejected, duplicate, hits and misses.

Corrective Action

(None).

Syslog Message

Mirror Cache post replay stats — Name: %s Inserted: %llu Rejected: %llu Duplicate: %llu Hits: %llu Misses: %llu.

Parameters

name (STRING): Aggr name
inserted (LONGINT): Bdatas inserted
rejected (LONGINT): Bdatas rejected
duplicate (LONGINT): Duplicate bdatas
hits (LONGINT): Bdata hits
misses (LONGINT): Bdatas misses

mcc events

mcc.auso events

mcc.auso.trigFailed

Severity

EMERGENCY

Description

This message occurs when a trigger for automatic unplanned switchover fails to issue the operation.

Corrective Action

Verify the health of each node and that automatic unplanned switchover is enabled on both by using the "metrocluster node show" command. Use the "metrocluster switchover -forced-on-disaster true" command to switch over the DR-site storage manually.

Syslog Message

A trigger for Automatic Unplanned Switchover failed to issue the operation. Reason: %s.

Parameters

probableCauseDescription (STRING): Further description of the probable cause.
alertId (STRING): Identifier for this condition.
alertingResource (STRING): Unique name of the resource responsible for this condition.
alertingResourceName (STRING): Name of the resource responsible for this condition.
possibleEffect (STRING): Possible effect of the failure.
probableCause (STRING): Probable cause of the failure.
additionalInfo (STRING): Additional information about this failure.

mcc.auso.triggered

Severity

NOTICE

Description

This message occurs when the node triggers an automatic unplanned switchover on detection of a failure of the DR partner node.

Corrective Action

(None).

Syslog Message

The node has triggered an Automatic Unplanned Switchover of the DR partner. Reason: %s. If Automatic Unplanned Switchover was triggered because of heartbeat loss, any ongoing dump on the partner may be aborted.

Parameters

cause (STRING): Cause for triggering automatic unplanned switchover.

mcc.check events

mcc.check.failed

Severity

ERROR

Description

This message occurs when the MetroCluster (tm) check job has failed to complete all checks for the system.

Corrective Action

Run "metrocluster operation history show" command to check the reason for this failure. Make sure that all nodes in each of the clusters are healthy, and both clusters are in normal mode using the "metrocluster node show" and "metrocluster show" commands. Then retry the operation using the command "metrocluster check run". If the problem persists, contact NetApp technical support.

Syslog Message

The MetroCluster (tm) check job has failed to complete all checks for the system in cluster %s.

Parameters

Cluster (STRING): Cluster where the check was running.

mcc.config events

mcc.config.assignConfigFail

Severity

ERROR

Description

This message occurs when the MetroCluster(tm) local node configuration assignment to persistent storage failed.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

(None).

Parameters

error (STRING): Description of assign config error.
nodeID (STRING): Node UUID.
dbladeID (STRING): Dblade UUID.

mcc.config.auso.enableIgnore

Severity

ALERT

Description

This message occurs when an attempt to enable automatic unplanned switchover fails because the capability has been manually disabled by the user or disabled because of a failed switchover or switchback operation.

Corrective Action

If you want to keep automatic switchover enabled, enable it using the advanced mode command "metrocluster modify -automatic-switchover-onfailure true".

Syslog Message

Failed to enable Automatic Unplanned Switchover because the capability has been manually disabled by the user or disabled because of a failed Switchover or Switchback operation.

Parameters

(None).

mcc.config.auso.stDisabled

Severity

ERROR

Description

This message occurs when automatic unplanned switchover capability is disabled.

Corrective Action

Run the "metrocluster modify -node-name <nodename> -automatic-switchover-onfailure true" command for each node in the cluster to enable automatic switchover.

Syslog Message

The state of Automatic Unplanned Switchover capability has been disabled.

Parameters

alertId (STRING): Identifier for this condition.
alertingResource (STRING): Unique name of the resource responsible for this condition.
alertingResourceName (STRING): Display name of the resource responsible for this condition.
possibleEffect (STRING): Possible effect of the event.
probableCause (STRING): Probable cause of the event.
probableCauseDescription (STRING): Further description of the probable cause.
additionalInfo (STRING): Additional information about this event.

mcc.config.auso.stEnabled

Severity

NOTICE

Description

This message occurs when automatic unplanned switchover capability is enabled.

Corrective Action

(None).

The state of Automatic Unplanned Switchover capability has been enabled.

Parameters

alertId (STRING): Identifier for this condition.
alertingResource (STRING): Unique name of the resource responsible for this condition.

mcc.config.bootConfigNotRead

Severity

ALERT

Description

This message occurs when the MetroCluster(tm) configuration cannot be read from persistent storage. This could be because the partner has active reservations on the disk, the root aggregate is not assimilated, or the configuration has not been performed on the system yet. The system will try to retrieve or set the configuration try to retrieve or set the configuration automatically later during boot.

Corrective Action

If the problem persists, contact NetApp technical support for assistance in resolving this issue.

Syslog Message

Configuration could not be read from persistent storage due to internal error %s. The system will try to retrieve or set the configuration automatically later, during boot.

Parameters

error (STRING): Actual error that caused configuration read to fail.

mcc.config.checkPartnerError

Severity

ERROR

Description

This message occurs when an error is found during a MetroCluster(tm) configuration check. The checks include partner operational status and valid disaster recovery (DR) group configurations.

Corrective Action

Make sure that all of the nodes are online and healthy by running the "cluster show" command and verifying that the "Health" and "Eligibility" fields displayed as true. Check the switch and controller configuration and make sure that all of the controllers in the DR group and HA/DR Interconnect ports are properly connected for DR group communication.

Syslog Message

(None).

Parameters

partner_names (STRING): List of disaster recovery partner names.
error (STRING): Description of the error that occurred.

mcc.config.disableDrMirror

Severity

INFORMATIONAL

Description

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets disabled persistently in a MetroCluster(tm) configuration.

Corrective Action

(None).

Syslog Message

(None).

Parameters

reason (STRING): Reason the disaster recovery (DR) NVlog mirroring is disabled persistently.

mcc.config.disableMirrorMem

Severity

INFORMATIONAL

Description

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets disabled in a MetroCluster(tm) configuration.

Corrective Action

(None).

Syslog Message

(None).

Parameters

reason (STRING): Reason the DR NVlog mirroring is disabled in memory.

mcc.config.drPartner.mbxFail

Severity

ALERT

Description

This message occurs when a node in a 2-node MetroCluster(tm) configuration fails to access it's DR partner's mailbox. This may impact automatic unplanned switchover.

Corrective Action

(None).

Syslog Message

Read of DR partner's mailbox failed with error (%d).

Parameters

err (INT): Error returned from mailbox access.

mcc.config.drPartner.mbxRead

Severity

INFORMATIONAL

Description

This message occurs when a node in 2-node MetroCluster(tm) configuration is successfully able to access it's DR partner's mailbox.

Corrective Action

(None).

Syslog Message

Read of DR partner's mailbox successful.

Parameters

(None).

mcc.config.enableDrMirror

Severity

INFORMATIONAL

Description

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets persistently enabled in a MetroCluster(tm) configuration.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mcc.config.enableMirrorMem

Severity

INFORMATIONAL

Description

This message occurs when NVlog mirroring to the disaster recovery(DR) partners gets enabled in a MetroCluster(tm) configuration.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mcc.config.headswapComplete

Severity

NOTICE

Description

This message occurs when headswap update completes successfully on a node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mcc.config.headswapMsgSent

Severity

NOTICE

Description

This message occurs when a headswap HA message is successfully sent to a partner node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

role (INT): Role of the node.

mcc.config.headswapNoNotify

Severity

ERROR

Description

This message occurs when the MetroCluster(tm) node cannot communicate with one or more of its partners after a headswap. In a MetroCluster configuration, partners need to be informed of the old and new system ID of the local node through an HA message, so that they use the correct partner system ID during disaster recovery(DR) operations. Data ONTAP® takes appropriate recovery actions.

Corrective Action

Other than making sure that all of the partners are online, there is no explicit user intervention required; the node automatically retries the operation at regularly scheduled intervals (every 30 seconds).

Syslog Message

Local node system ID changed from %d to %d. Local node could not inform its HA or DR partner node of this change due to error %s.

Parameters

old_system_id (INT): Old system ID of the node.
new_system_id (INT): New system ID of the node.
error (STRING): Internal error description identifying the reason for the failure.

mcc.config.headswapPartnerEr

Severity

ERROR

Description

This message occurs when the partner returns a failure during a MetroCluster(tm) headswap configuration update. This can be due to configuration mismatches on the remote partner, disk ownership reassignment failure, or persistent storage write failure.

Corrective Action

This could potentially be because the partner that failed was not fully functional or was operating in a degraded state. Make sure that the partner is online by issuing the "metrocluster show" and the "metrocluster node show" command. The partner configuration update will be retried at regular intervals automatically. In case of other configuration mismatch failure, check the relevant subsystem cited in the error and run the "disk show" command to examine the disk state. If the problem persists, contact NetApp technical support.

Syslog Message

Partner %s failed to update configuration due to error %s.

Parameters

partner (STRING): Name of the partner node.
error (STRING): Error description returned by the partner.

mcc.config.headswapRevert

Severity

NOTICE

Description

This message occurs when the receiver of a headswap HA message detects that the old head was brought back in before headswap processing completed. The receiver will undo any nvram id update it had processed earlier.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_sys_id (INT): Old system id received from the HA message
new_sys_id (INT): New system id received from the HA message

mcc.config.locHeadswapDetect

Severity

NOTICE

Description

This message occurs when a headswap is detected on the local node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

old_system_id (INT): Old system ID of the node.
new_system_id (INT): New system ID of the node.

mcc.config.restoreFailure

Severity

NOTICE

Description

Error returned while recovering the Configuration.

Corrective Action

(None).

Syslog Message

MetroCluster configuration was not restored from persistent source because of reason :%d.

Parameters

err (INT): Error returned while recovering the mailbox.

mcc.config.restoreSuccessful

Severity

INFORMATIONAL

Description

This message occurs when the MetroCluster(tm) configuration is successfully restored from an alternate persistent configuration source.

Corrective Action

(None).

Syslog Message

MetroCluster configuration was successfully restored from persistent source %s.

Parameters

source (STRING): Source from which the MetroCluster configuration was retrieved.

mcc.config.selfNodeInvalid

Severity

ERROR

Description

This message occurs when the local node UUID and the node UUID returned by the Connectivity, Liveness, Availability Monitor (CLAM) do not match. This is a configuration error and can result in failures during disaster recovery operations.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Configuration error: Local node UUID and the node UUID reported by CLAM do not match.

Parameters

local_node_uuid (STRING): Local node UUID.
clam_node_uuid (STRING): Node UUID returned by the CLAM.

mcc.config.sysidNoNotify

Severity

ERROR

Description

This message occurs when the local node is unable to notify its HA or DR partners of its system ID after a reboot.

Corrective Action

Verify that the HA or DR partner node is healthy and can be reached over the intercluster network.

Syslog Message

The node could not notify its nvram system id to partner %s. Error: %s.

Parameters

partner (STRING): Name of the partner node.
error (STRING): Error description.

mcc.config.teardown

Severity

INFORMATIONAL

Description

This message is generated whenever CTRL connections to MetroCluster(tm) partners are torn down.

Corrective Action

(None).

Syslog Message

(None).

Parameters

reason (STRING): Reason for tearing down the CTRL connections.

mcc.config.update.role

Severity

INFORMATIONAL

Description

This message is generated whenever the roles of CTRL connections to MetroCluster(tm) partners are updated.

Corrective Action

(None).

Syslog Message

(None).

Parameters

reason (STRING): Reason for updating the role of the CTRL connections.

mcc.config.vso.disabled

Severity

NOTICE

Description

This message occurs when the "vserver configuration override" command is disabled for MetroCluster over IP after controller replacement operations are completed.

Corrective Action

(None).

Syslog Message

MetroCluster over IP Vserver configuration override is disabled.

Parameters

(None).

mcc.config.vso.enabled

Severity

NOTICE

Description

This message occurs when the "vserver configuration override" command is enabled for MetroCluster over IP controller replacement operations.

Corrective Action

(None).

Syslog Message

MetroCluster over IP Vserver configuration override is enabled.

Parameters

(None).

mcc.ctlbe events

mcc.ctlbe.IODelayed

Severity

INFORMATIONAL

Description

SCSI IO for RSM is delayed significantly in the iSCSI stack.

Corrective Action

(None).

Syslog Message

(None).

Parameters

devSerial (STRING): Device Serial Number
lunId (INT): The LUN ID.
cdb (STRING): A string containing the opcode byte of the CDB.
delay (LONGINT): The delay in milliseconds experienced by this IO in the software iSCSI stack.

mcc.ctlbe.IOResponseDelayed

Severity

INFORMATIONAL

Description

SCSI IO for RSM is delayed significantly in the storage stack.

Corrective Action

(None).

(None).

Parameters

devSerial (STRING): Device Serial Number
lunId (INT): The LUN ID.
cdb (STRING): A string containing the opcode byte of the CDB.
delay (LONGINT): The delay in milliseconds experienced by this IO in the D-blade storage stack.

mcc.drdom events

mcc.drdom.diskOwnerChange

Severity

INFORMATIONAL

Description

This message occurs when disk ownership changes are made by the disaster recovery disk ownership manager (DRDOM).

Corrective Action

(None).

Syslog Message

(%d) disks belonging to DR partner (%ld) underwent ownership change due to (%s).

Parameters

disk_count (INT): Number of disks that underwent ownership change.
dr_partner_system_id (LONGINT): System ID of the DR partner whose disks underwent ownership change.
reason (STRING): Reason for the disk ownership change.

mcc.drdom.diskReserveFail

Severity

ERROR

Description

This message occurs when one or more disks fails a disk reservation request from the disaster recovery disk ownership manager (DRDOM).

Corrective Action

Make sure that none of the available DR partner disks are not in a failed or inconsistent state. Contact NetApp technical support if failed or misbehaving disks cannot be identified.

Syslog Message

%d/%d DR disks failed disk reservation request from DRDOM, %d local disks.

Parameters

error_count (INT): Number of disks that failed disk reservation.
disk_num (INT): Number of disks that have DR ownership.

local_disks (INT): Number of disks that have local ownership.

mcc.drdom.disksAssignFail

Severity

ERROR

Description

This message occurs when the disaster recovery disk ownership manager (DRDOM) fails to assign the ownership of one or more disks in the disk list enrolled in this operation to be reassigned.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

DRDOM failed to assign the ownership of one or more disks in the disk list involved in disk ownership reassign request message during %s.

Parameters

operation (STRING): The MetroCluster(tm) DR operation that issued the "assign disks" request.
disks_in_request (INT): Total number of disks for which the disk ownership change is requested.
disks_failed_request (INT): Total number of disks for which the disk ownership change request failed.
error_code (INT): Internal error code for the failure.

mcc.drdom.hsAssignFail

Severity

ERROR

Description

This message occurs when the node fails to change disk ownership for disaster recovery (DR) partner disks after a headswap. This can occur if the node is in switchover or it has disks that are left behind from previous DR operations.

Corrective Action

Make sure that the DR partner disks with current-owner as local node are online and not in failed state or inconsistent state. Contact NetApp technical support if the failed or misbehaving disks cannot be identified.

Syslog Message

Node failed to change disk ownership for DR partner disks after a headswap.

Parameters

disks_in_request (INT): Total number of disks for which the disk ownership change is requested.
disks_failed_request (INT): Total number of disks for which the disk ownership change request failed.
error_code (INT): Internal error code for the failure.

mcc.drgroup events

mcc.drgroup.fetch.failed

Severity

INFORMATIONAL

Description

This message occurs when MCC DR group information cannot be retrieved from RDB tables.

Corrective Action

(None).

Syslog Message

Unable to fetch DR-group information from RDB, error: %s.

Parameters

reason (STRING): Reason why RDB operation failed to fetch DR-group information.

mcc.drmsg events

mcc.drmsg.received

Severity

INFORMATIONAL

Description

This message occurs when a DR message is successfully received from a DR partner node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

version (INT): Version of the DR message.
type (STRING): Type of message sent.
request (STRING): Type of request being sent.
seq_num (LONGINT): Sequence number of the message.
recv_sysid (LONGINT): System ID of receiving Node
sysid (LONGINT): System ID of sending node.
recv_time (LONGINT): Time when message was sent.
send_time (LONGINT): Time when message was sent.
status (STRING): Status of the DR message.
fsm_state (STRING): FSM state of the responding node.
sb_reason (STRING): SB reason if any specified.
dr_op_state (INT): DR operation state of the responding node.
ha_fw_state (STRING): HA firmware state of the responding node.

mcc.drmsg.sent

Severity

INFORMATIONAL

Description

This message occurs when a DR message is successfully sent to a partner node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

version (INT): Version of the DR message.
type (STRING): Type of message sent.
request (STRING): Type of request being sent.
seq_num (LONGINT): Sequence number of the message.
sysid (LONGINT): System ID of sending Node.
send_time (LONGINT): Time when message was sent.

mcc.drsom events

mcc.drsom.disk.filter.fail

Severity

INFORMATIONAL

Description

This message occurs when it cannot be determined whether a disk belongs to a root aggregate.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk (STRING): Name of the disk.
op (STRING): Operation during which this check failed.
status (INT): Status of the check that failed.

mcc.drsom.disk.skipped

Severity

INFORMATIONAL

Description

This message occurs when disaster recovery switchover manager determines that a disk needs to be skipped from an assign request.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk (STRING): Name of the disk.
op (STRING): Operation during which this check failed.
reason (STRING): Reason why the disk was skipped.

mcc.drsom.fsm.execute

Severity

INFORMATIONAL

Description

This message occurs when the disaster recovery Switchover Monitor(DRSOM) FSM (Finite State Machine) starts processing an event.

Corrective Action

(None).

Syslog Message

DRSOM FSM state is (%s) and it will process the event (%s). Whether this event will be processed for the DR auxiliary partner: (%s)

Parameters

fsm_state (STRING): Current state of the DRSOM FSM.
fsm_event (STRING): Event to be processed by the DRSOM FSM.
DR_aux (STRING): Indication of whether the event will be processed for the DR auxiliary partner.

mcc.drsom.fsm.invalid.state

Severity

ALERT

Description

This message occurs when the disaster recovery (DR) Switchover Monitor (DRSOM) FSM (Finite State Machine) reaches an invalid state.

Corrective Action

If this problem is seen persistently, contact NetApp technical support for assistance in resolving this issue.

Syslog Message

MCC DRSOM FSM state saw an invalid transition from %s to %s.

Parameters

prev_st (STRING): Previous DRSOM FSM state.
st (STRING): Current DRSOM FSM state.

mcc.drsom.fsm.invalidState

Severity

ERROR

Description

This message occurs when an unexpected disaster recovery Switchover Monitor(DRSOM) FSM (Finite State Machine) event is generated.

Corrective Action

This can happen in cases where a new DR operation was issued before the previous one could finish and it might require a forced-recovery operation. Contact NetApp technical support for assistance in resolving this issue.

Syslog Message

DRSOM FSM event (%s) generated in state (%s) will cause an invalid FSM state transition.

Parameters

fsm_event (STRING): DRSOM FSM event.
fsm_state (STRING): DRSOM FSM state in which the event is generated.

mcc.drsom.fsm.sb.rec.pending

Severity

ALERT

Description

This message occurs when the disaster recovery switchover monitor (DRSOM) transitions to a switchback recovery pending state.

Corrective Action

If this node is booting up for the first time after a disaster, no action is required. If not, please check the states of all the nodes and contact NetApp technical support if they are incorrect.

Syslog Message

This node has entered the Switchback Recovery Pending State.

Parameters

(None).

mcc.drsom.fsmState.EarlySb

Severity

INFORMATIONAL

Description

This message occurs when the disaster recovery switchover monitor (DRSOM) recovers from unexpected error conditions by transitioning to perform an early switchback. An early switchback is performed in the following three cases: a node panics while processing a switchover; a node panics or reboots while retrying a switchover operation; or a node either encounters a subsystem failure, panics, or reboots while aborting a switchover operation. The switchover was reverted and the DRSOM state on all nodes is 'normal'.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mcc.drsom.mbxRecovery

Severity

INFORMATIONAL

Description

This message occurs when the disaster recover Switchover Monitor(DRSOM) FSM (Finite State Machine) state stored persistently in the mailbox is inconsistent with the DRC (DR Coordinator) and has been recovered.

Corrective Action

(None).

Syslog Message

DRSOM FSM state stored in the mailbox is inconsistent with the DRC. It has been recovered and intialized to %s.

Parameters

next_fsm_state (STRING): State to which the DRSOM FSM will be initialized.

mcc.drsom.process.op.fail

Severity

ALERT

Description

This message occurs when the disaster recovery (DR) Switchover Monitor (DRSOM) cannot perform the DR operation.

Corrective Action

If this problem is seen persistently, contact NetApp technical support for assistance in resolving this issue.

Syslog Message

MCC state machine received invalid operation %s while it was in state %s.

Parameters

op (STRING): DR operation issued.
st (STRING): Current FSM (Finite State Machine) state.

mcc.drsom.sbRecSt.change

Severity

INFORMATIONAL

Description

This message occurs when there is a change in the disaster recovery Switchover Monitor(DRSOM) switchback recovery state.

Corrective Action

(None).

Syslog Message

Switchback recovery state changed from (%d) to (%d) due to (%s).

Parameters

old_state (INT): Previous switchback recovery state.
new_state (INT): New switchback recovery state.
reason (STRING): Reason for change of state.

mcc.drsom.sstbl.configErr

Severity

ERROR

Description

This message occurs during switchback processing, when the disaster recovery(DR) partner cannot be contacted to confirm that it is in a valid MetroCluster(tm) configuration state.

Corrective Action

Make sure that the DR partner is online and accessible by this node.

Syslog Message

(None).

Parameters

partner (STRING): Name of the failed partner.

mcc.drsom.sstbl.sanownCompEr

Severity

ERROR

Description

This message occurs during switchback processing, when the disaster recover(DR) partner cannot be contacted to enable or suspend a sanown completion event.

Corrective Action

Make sure that the DR partner is online and accessible by this node.

Syslog Message

(None).

Parameters

operation (STRING): Disable or enable completion event.
partner (STRING): Name of the failed partner.

mcc.drsom.sstblRunFailure

Severity

ERROR

Description

This message occurs when a particular subsystem cannot proceed with the disaster recovery (DR) operation.

Corrective Action

Refer to the subsystem-specific error that would have been logged before this message.

Syslog Message

(None).

Parameters

dr_operation (STRING): DR operation.
sub_system (STRING): Name of the subsystem that encountered the failure.

mcc.drsom.watch.conflict

Severity

INFORMATIONAL

Description

This message shows drsom watchdog information on conflicting operations

Corrective Action

(None).

Syslog Message

(None).

Parameters

enabled (INT): Current state of watchdog.
extended (INT): Current extended state of watchdog.
last_update_time (LONGINT): Last update time.
current_time (LONGINT): Current time.
last_update_count (LONGINT): Last update count.
last_thread (LONGINT): ID of last thread to update.
last_thread_info (STRING): Text describing last udpate.
curr_thread_info (STRING): Text describing current update.

mcc.encryption events

mcc.encryption.disabled

Severity

NOTICE

Description

This message occurs when the encryption for NVLog and storage data in a MetroCluster (tm) configuration is disabled.

Corrective Action

(None).

Syslog Message

The MetroCluster encryption feature has been disabled.

Parameters

(None).

mcc.fabricpool events

mcc.fabricpool.license.absent

Severity

ERROR

Description

This message occurs when a FabricPool license exists on only one of the two sites of a MetroCluster(tm) configuration.

Corrective Action

Install a FabricPool license on the cluster that is missing the license.

Syslog Message

The FabricPool license is installed on only one site of this MetroCluster configuration. The license is missing on cluster %s (ID: %s).

Parameters

cluster_name (STRING): Name of the cluster which is missing the license.
cluster_uuid (STRING): UUID of the cluster.

mcc.fabricpool.license.diff

Severity

ERROR

Description

This message occurs when the FabricPool license capacity or term limits are different for the two sites of a MetroCluster(tm) configuration.

Corrective Action

Install a new license on one of the clusters so that the license limits match.

Syslog Message

The FabricPool license limits are different for the two sites of this MetroCluster configuration. The license limits are %s and %s on site %s and %s and %s on site %s.

Parameters

local_license_limit (STRING): License capacity limit from the local cluster.
local_term_limit (STRING): License term limit from the local cluster.
local_cluster_name (STRING): Name of the local cluster.
remote_license_limit (STRING): License capacity limit from the remote cluster.
remote_term_limit (STRING): License term limit from the remote cluster.
remote_cluster_name (STRING): Name of the remote cluster.

mcc.fabricpool.mirror.missing

Severity

ALERT

Description

This message occurs when a FabricPool in a MetroCluster configuration does not have a mirror object store attached.

Corrective Action

Use the "storage aggregate object-store mirror" command to add a mirror object store to the FabricPool.

Syslog Message

FabricPool: "%s" UUID: "%s" in a MetroCluster configuration does not have synchronous data protection enabled because the mirror object store is missing.

Parameters

aggr (STRING): Name of the FabricPool.
UUID (STRING): UUID of the FabricPool.

mcc.forced events

mcc.forced.auso.issued

Severity

NOTICE

Description

This message occurs when the node triggers a forced automatic unplanned switchover because the "allow-auto-forced-switchover" option is true.

Corrective Action

(None).

Syslog Message

The node has triggered a forced automatic unplanned switchover of the DR partner. Reason: "%s".

Parameters

reason (STRING): Reason for triggering a forced automatic unplanned switchover with "allow-auto-forced-switchover" option.

mcc.hwassist events

mcc.hwassist.trap.AUSO

Severity

NOTICE

Description

This message occurs when a HW assist trap is received from the Service Processor of the DR-partner and is used to trigger an Automatic SwitchOver.

Corrective Action

(None).

Syslog Message

HW assist trap of type=%s, severity=%s received for event=%s from sysid=%s.

Parameters

type (STRING): Type of event, such as system_down.
severity (STRING): Severity of the event, such as alert.
event (STRING): Specific event, such as power_loss.
sysid (STRING): System-id of the node generating the event.

mcc.ic events

mcc.ic.process.node.adv

Severity

INFORMATIONAL

Description

This message occurs when the MetroCluster(tm) config module receives a node advertisement from any of its partners.

Corrective Action

(None).

Syslog Message

(None).

Parameters

sys_id (LONGINT): System id of the node sending the advertisements.
is_local_node_assigned (INT): Boolean specifying whether the local node has joined the cluster.

is_partner_assigned (INT): Boolean specifying whether the node sending advertisements has joined the cluster.

mcc.ipspace events

mcc.ipspace.not.found

Severity

ERROR

Description

This message occurs when the IPspace is not found in a MetroCluster(tm) configuration while replicating the object store configuration. Until this is resolved, some MetroCluster and FabricPool operations will fail.

Corrective Action

Create the missing MetroCluster IPspace. The configuration replication task will be completed automatically.

Syslog Message

Object store "%s" configuration replication failed because IPspace "%s" was not found in cluster "%s".

Parameters

object_store_name (STRING): Name of the object store.
ipspace_name (STRING): Name of the IPspace.
cluster_name (STRING): Name of the cluster.

mcc.kill events

mcc.kill.received

Severity

INFORMATIONAL

Description

This message occurs when the node is halting because it received a "kill" message from the disaster recovery (DR) partner.

Corrective Action

(None).

Syslog Message

Node is halting because a kill message with reason %s has been received from the DR partner with system ID %ld.

Parameters

reason (STRING): Reason for halting the node.
sender_sysid (LONGINT): System ID of the sender.

mcc.lunmgr events

mcc.lunmgr.lunid_alloc_failure

Severity

ERROR

Description

This message occurs when failing to allocate a CTL Target LUN ID to a target disk

Corrective Action

This indicates an internal error during the discovery of Target LUN devices.

Syslog Message

Device S/N %s - Failed to allocate a LUN ID

Parameters

device_serial_number (STRING): Device serial number

mcc.network events

mcc.network.congestion

Severity

NOTICE

Description

This message occurs when a MetroCluster over IP configuration detects network congestion over the inter-cluster links (ISL) that connect sites and an action is taken to reduce further network congestion.

Corrective Action

Verify that network between MetroCluster sites is following minimum SLA requirements and fix any such violations if needed. If the issue persists, contact NetApp technical support.

Syslog Message

Network congestion detected. Action taken: %s.

Parameters

action_taken (STRING): Action taken to reduce network congestion.

mcc.notify events

mcc.notify.auto_heal_queue_failure

Severity

ERROR

Description

Failed to queue the "MetroCluster Auto Heal" job

Corrective Action

Manually complete the healing phase using the command "metrocluster heal aggregates" and "metrocluster heal root-aggregates"

Syslog Message

(None).

Parameters

retries_attempted (INT): Number of retries attempted

mcc.nso events

mcc.nso.abort.dump

Severity

NOTICE

Description

This message occurs when dump/restore is aborted during a MetroCluster switch-over operation.

Corrective Action

(None).

Syslog Message

Dump/restore operations were aborted because %s is in progress.

Parameters

nso (STRING): Describes whether a MetroCluster switch-over operation is progress.

mcc.nso.veto.repl

Severity

NOTICE

Description

This message occurs when an MetroCluster(tm) switch-over is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

Corrective Action

Either abort the replication transfer that is preventing the MetroCluster switch-over from being completed, retry the MetroCluster switch-over operation with the '-override-vetoes true' option, or wait for the transfer to finish.

Syslog Message

Could not complete switch-over because a replication transfer with UUID %s is in progress.

Parameters

transferId (STRING): UUID of the SnapMirror® replication transfer that vetoed MetroCluster switch-over.

mcc.nvmeof events

mcc.nvmeof.port.modify

Severity

NOTICE

Description

This message occurs when the mode of an NVMe-oF port is changed.

Corrective Action

(None).

Syslog Message

Changing NVMe-oF port %s to %s mode.

Parameters

port (STRING): Name of port being configured.
mode (STRING): Mode in which to configure port: network or storage.

mcc.nvmeof.rdma.disconnect.event

Deprecated

Deprecated as of version 9.13.1.

Severity

NOTICE

Description

This message occurs when the NVMe-oF driver detects an RDMA disconnect. There might be a decrease in performance while reconnecting.

Corrective Action

(None).

Syslog Message

NVMe-oF RDMA disconnect on subnqn %s, controller ID %d, qpair ID %d.

Parameters

subnqn (STRING): Subsystem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.

mcc.nvmeof.rdma.disconnect.status

Deprecated

Deprecated as of version 9.13.1.

Severity

NOTICE

Description

This message occurs when the NVMeoF driver detects a command that finishes with a disconnect status. There might be a decrease in performance while reconnecting.

Corrective Action

(None).

Syslog Message

NVMe-oF disconnect on subnqn %s, controller ID %d, qpair ID %d.

Parameters

subnqn (STRING): Subsystem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.

mcc.nvmeof.subsystem.add

Severity

NOTICE

Description

This message occurs when an NVMe-oF subsystem is added.

Corrective Action

(None).

Syslog Message

NVMe-oF subsystem added at address %s.

Parameters

address (STRING): IP address of susbsystem.

mcc.nvmeof.subsystem.delete

Severity

NOTICE

Description

This message occurs when an NVMe-oF subsystem is deleted.

Corrective Action

(None).

Syslog Message

NVMe-oF subsystem deleted at address %s.

Parameters

address (STRING): IP address of susbsystem.

mcc.nvmeof.timeout

Severity

NOTICE

Description

This message occurs when the NVMeoF driver detects a timeout on a request. There might be a decrease in performance while retrying.

Corrective Action

(None).

Syslog Message

Timeout on subnqn %s, controller ID %d, qpair ID %d, sequence number %d.

Parameters

subnqn (STRING): Subsytem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.
cid (INT): NVMe-oF CID.

mcc.sb events

mcc.sb.abort.dump

Severity

NOTICE

Description

This message occurs when dump/restore is aborted during a MetroCluster switchback operation.

Corrective Action

(None).

Syslog Message

Dump/restore operations were aborted because %s is in progress.

Parameters

sb (STRING): Describes whether a MetroCluster switchback operation is progress.

mcc.sb.veto.repl

Severity

NOTICE

Description

This message occurs when an MetroCluster(tm) switchback is vetoed by a critical replication transfer (for example, volume move in the cutover phase).

Corrective Action

Either abort the replication transfer that is preventing the MetroCluster switchback from being completed, retry the MetroCluster switchback operation with the '-override-vetoes true' option, or wait for the transfer to finish.

Syslog Message

Could not complete switchback because a replication transfer with UUID %s is in progress.

Parameters

transferId (STRING): UUID of the SnapMirror® replication transfer that vetoed the MetroCluster switchback.

mcc.sbca events

mcc.sbca.mdvNotAvailable

Severity

ERROR

Description

This message occurs when a MetroCluster (tm) system metadata volume that provides storage for the configuration replication services is not available.

Corrective Action

Contact technical support for assistance.

Syslog Message

A MetroCluster (tm) system metadata volume is not available in cluster %s.

Parameters

Cluster (STRING): Cluster attempting to use the volume.

mcc.scsipd events

mcc.scsipd.iScsiSessionReconnectDestroySim

Severity

NOTICE

Description

iSCSI session maintenance thread was signaled to reconnect and destroy SIM paths.

Corrective Action

(None).

Syslog Message

(None).

Parameters

> **watchdogIdx** (INT): The watchdog thread index for the mcc_scsipd driver.
> **watchdogTimeLimit** (INT): The time limit in seconds that the watchdog thread waits before signaling the iSCSI session maintenace thread.

mcc.so events

mcc.so.nodeObjectLmt.chkFail

Severity

> ALERT

Description

> This message occurs when a MetroCluster(tm) switchover operation cannot be performed on this node because it is in the takeover state and one of the nodes in its disaster recovery(DR) group has the "node-object-limit" MetroCluster configuration option set to off.

Corrective Action

> Use the "storage failover giveback" command to take this node out of takeover state.

Syslog Message

> Switchover operation cannot be performed on this node because it is in the takeover state and one of the nodes in its DR group has the "node-object-limit" MetroCluster configuration option set to off.

Parameters

> (None).

mcc.switchover events

mcc.switchover.mdvInNvfailedState

Severity

> ERROR

Description

> This message occurs when a MetroCluster switchover operation finds a system metadata volume, used by config replication applications, in the nvfailed state.

Corrective Action

> Verify the configuration.

Syslog Message

> The 'in-nvfailed-state' was cleared on MetroCluster system metadata volume '%s'. The system will attempt to replicate all recent configuration updates (if any) to the local cluster. After the process completes, verify the configuration.

Parameters

> **Volume** (STRING): Volume

mcc.toomany events

mcc.toomany.vols.per.aggr

Severity

ALERT

Description

This message occurs when a volume is added to an aggregate in which the recommended maximum number of volumes for an aggregate in a MetroCluster setup is exceeded. An excessive number of volumes in a MetroCluster aggregate can result in high failover times, which may disrupt data availability from the affected node.

Corrective Action

Re-distribute the volumes among the aggregates to comply with the volume limit per aggregate in a MetroCluster setup. The number of volumes in an aggregate can be found by using the "aggregate show -fields volcount" command. Volumes can be moved between aggregates by using the "volume move start -vserver <vserver_name> -volume <vol_name> -destination-aggregate <destination_aggregate>" command.

Syslog Message

MetroCluster protected aggregate %s has volume count %d, which exceeds the recommended maximum %d.

Parameters

aggregate (STRING): Name of the aggregate.
current_volume (INT): Current number of volumes on the aggregate.
volume_limit (INT): Recommended maximum number of volumes per aggregate.

mct events

mct.channel events

mct.channel.destroy

Severity

NOTICE

Description

This message occurs when the Mirror Cache Transport layer destroys a communication channel between two nodes.

Corrective Action

(None).

Syslog Message

Mirror Cache transport destroyed channel '%s'.

Parameters

channel (STRING): Name of the data channel.

mct.control events

mct.control.error

Severity

NOTICE

Description

This message occurs when the Mirror Cache Transport layer encounters an error in its control group.

Corrective Action

(None).

Syslog Message

Mirror Cache transport control error: '%s'.

Parameters

error_message (STRING): Details for the encountered error.

mdb events

mdb.exit events

mdb.exit

Severity

EMERGENCY

Description

This message occurs when the management process exits to recover from a database error.

Corrective Action

If the problem persists, contact NetApp technical support for assistance.

Syslog Message

MDB %s process exit due to "%s". Error code: %d (%s).

Parameters

name (STRING): Name of the M-Host process using the management database.
table_or_operation (STRING): Database table name or operation that encountered the error.
error_code (INT): Numeric error code reported by the management database.
error_msg (STRING): Error message reported by the management database.

mes_dimm events

mes_dimm.error events

mes_dimm.error

Severity

ALERT

Description

This message appears when an error is encountered by MES (Memory Error Statistics).

Corrective Action

DIMM error reported. Please contact NetApp technical support for further assistance.

Syslog Message

DIMM error - %s.

Parameters

error (STRING): Error message from Data ONTAP.

mgmt events

mgmt.aba events

mgmt.aba.abortCloneParent

Severity

INFORMATIONAL

Description

This message occurs when Auto Balance Aggregate initiates a move of a volume that was then changed to a FlexClone® parent.

Corrective Action

(None).

Syslog Message

The Auto Balance Aggregate initiated move of volume %s from aggregate %s to aggregate %s was aborted when the move job detected that the volume was now a FlexClone parent.

Parameters

volume (STRING): Name of the volume.
srcAggregate (STRING): Name of the source aggregate.
dstAggregate (STRING): Name of the destination aggregate.

mgmt.aba.abortMirrorMove

Severity

INFORMATIONAL

Description

This message occurs when Auto Balance Aggregate initiates a move of a volume that was then changed to be part of a SnapMirror® relationship".

Corrective Action

(None).

Syslog Message

The Auto Balance Aggregate initiated move of volume %s from aggregate %s to aggregate %s was aborted when the move job detected that the volume was now part of a SnapMirror relationship.

Parameters

volume (STRING): Name of the volume.
srcAggregate (STRING): Name of the source aggregate.
dstAggregate (STRING): Name of the destination aggregate.

mgmt.aba.move.unbalanced

Severity

INFORMATIONAL

Description

This message occurs when Auto Balance Aggregate is running in auto mode and identifies an aggregate in which the used space has exceeded the high-water mark. Auto Balance Aggregate attempts to trigger moves to lower the aggregate's usage below the threshold.

Corrective Action

Use the "volume move show" command to monitor active moves.

Syslog Message

Auto Balance Aggregate has detected that aggregate %s has exceeded the threshold of %jd. The aggregate currently shows a usage of %jd.

Parameters

aggr (STRING): Name of the aggregate.
usedSpace (LONGINT): Aggregate's used space.
threshold (LONGINT): Configured high-water mark.

mgmt.aba.moveVolume

Severity

INFORMATIONAL

Description

This message occurs when Auto Balance Aggregate identifies a volume that can be moved to alleviate a low-space condition with an aggregate. The move will be initiated by Auto Balance Aggregate and can be monitored by using the "volume move show" command.

Corrective Action

(None).

Syslog Message

Auto Balance Aggregate is moving volume %s in Vserver %s from aggregate %s to aggregate %s. Upon completion of the move, the source aggregate is projected to be %d percent full and the destination aggregate is projected to be %d percent full.

Parameters

volume (STRING): Volume that will be moved.
vserver (STRING): Vserver hosting the volume.
srcAggr (STRING): Aggregate the volume will be moved from.
dstAggr (STRING): Aggregate the volume will be moved to.
afterSourceSpace (INT): Projected percentage of used space in the source aggregate after the move is performed.
afterDestSpace (INT): Projected percentage of used space in the destination aggregate after the move is performed.

mgmt.aba.noMovableVols

Severity

ERROR

Description

This message occurs when Auto Balance Aggregate identifies an aggregate that is unbalanced but cannot identify a volume to move from that aggregate. Some of the more common reasons this can occur for an aggregate are that its volumes are being heavily accessed, its volumes have been recently moved, or Auto Balance Aggregate cannot identify an aggregate to move to.

Corrective Action

Manually inspect the aggregate to determine whether any volumes can be moved.

Syslog Message

Auto Balance Aggregate could not find any volumes to move from aggregate %s. The aggregate's calculated space is %jd and the threshold is %jd.

Parameters

aggregate (STRING): Name of the aggregate.
usedSize (LONGINT): Recorded used size.
threshold (LONGINT): Configured threshold.

mgmt.aba.rcmd.unbalanced

Severity

ERROR

Description

This message occurs when Auto Balance Aggregate is running in recommend mode and identifies an aggregate in which the used space has exceeded the high-water mark.

Corrective Action

Use the "volume move recommend show" command to see the list of recommended actions.

Syslog Message

Auto Balance Aggregate has detected that aggregate %s has exceeded the threshold of %jd. The aggregate currently shows a usage of %jd.

Parameters

aggr (STRING): Name of the aggregate.
usedSpace (LONGINT): Aggregate's used space.
threshold (LONGINT): Configured high-water mark.

mgmt.aba.recommendMove

Severity

INFORMATIONAL

Description

This message occurs when Auto Balance Aggregate identifies a volume that can be moved to alleviate a low-space condition with an aggregate. The move will not be initiated, but will be listed with other recommendations listed by running the "volume move recommend show" command.

Corrective Action

If desired, initiate the recommended move by using the "volume move start" command.

Syslog Message

Auto Balance Aggregate is recommending that volume %s in Vserver %s be moved from aggregate %s to aggregate %s. Upon completion of the move, the source aggregate is projected to be %d percent full and the destination aggregate is projected to be %d percent full.

Parameters

volume (STRING): Volume identified as a candidate to move.
vserver (STRING): Vserver hosting the volume.
srcAggr (STRING): Aggregate the volume should be moved from.
dstAggr (STRING): Aggregate the volume should be moved to.
afterSourceSpace (INT): Projected percentage of used space in the source aggregate if the move is performed.
afterDestSpace (INT): Projected percentage of used space in the destination aggregate if the move is performed.

mgmt.abv events

mgmt.abv.service.filling

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when the percentage of data used on one or more data constituents in a storage service of a managed Infinite Volume exceeds the full watermark. Constituents that have exceeded the full watermark will receive no new content.

Corrective Action

Either increase the size of this Infinite Volume by entering the "volume modify -size" command, or enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents within this storage service.

Syslog Message

(None).

Parameters

vserver (STRING): Vserver that hosts the constituent.
storageService (STRING): Storage service that holds the constituents.
fullCount (INT): Number of constituents that are full.
totalCount (INT): Total number of constituents within this storage service.

mgmt.abv.service.full

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ALERT

Description

This message occurs when the percentage of data used for all of the data constituents within an Infinite Volume's storage service have exceeded the Infinite Volume's full watermark. As a result, users cannot write any more data to this Infinite Volume that would be stored in this storage service by the create-time policy, and the post-ingest policy cannot move files to this storage service while all of its data constituents are in excess of the full watermark.

Corrective Action

This storage service requires more capacity. Either increase the size of one or more of its data constituents, or add one or more new data constituents to it. After adding more capacity, it is strongly recommended that you enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents in this storage service.

Syslog Message

The percentage of data used for all of the data constituents within an Infinite Volume's storage service has exceeded the Infinite Volume's full watermark. Vserver: %s, storage service: %s.

Parameters

vserver (STRING): Vserver that hosts these constituents.
storageService (STRING): Storage service that holds the constituents.

mgmt.abv.volume.filling

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when the percentage of data used on one or more data constituents in this Infinite Volume exceeds the full watermark. Constituents that have exceeded the full watermark will receive no new content.

Corrective Action

Either increase the size of this Infinite Volume by entering the "volume modify -size" command, or enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents.

Syslog Message

(None).

Parameters

vserver (STRING): Vserver that hosts the constituent.
fullCount (INT): Number of full data constituents within this Infinite Volume.
totalCount (INT): Total number of data constituents within this Infinite Volume.

mgmt.abv.volume.full

Deprecated
Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity
ALERT

Description
This message occurs when all of the data constituents within an Infinite Volume have exceeded the Infinite Volume's full watermark. Users cannot write any more data to this Infinite Volume.

Corrective Action
Expand this Infinite Volume by entering the "volume modify -size" command. After expanding the Infinite Volume, it is strongly recommended that you enter the "autobalance volume start" command to equalize the percentage of data used across all data constituents.

Syslog Message
(None).

Parameters
vserver (STRING): Vserver that hosts the constituents.

mgmt.cifsserver events

mgmt.cifsserver.failure

Severity
ERROR

Description
This message occurs when a CIFS server fails to be configured and, therefore, CIFS access might not be available.

Corrective Action
Check the reason for the error and take action accordingly. For further assistance, contact techinal support.

Syslog Message
Failed to configure CIFS server. Error: %s.

Parameters
reason (STRING): Reason for the failure.
vservername (STRING): Name of the vserver.
cifsservername (STRING): Name of the cifs server.

mgmt.cifsserver.success

Severity
INFORMATIONAL

Description

This message occurs when a CIFS server is successfully configured after a failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vservername (STRING): Name of the vserver.
cifsservername (STRING): Name of the cifs server.

mgmt.cifsshare events

mgmt.cifsshare.duplicatesid

Severity

NOTICE

Description

This message occurs when a network client attempts to set a CIFS share's discretionary access control list (DACL) to a list where any security descriptor (SID) appears in more than one access control entry (ACE). The operation is failed and no changes are made to the share's DACL.

Corrective Action

(None).

Syslog Message

Duplicate SID not supported in CIFS share DACL %s

Parameters

vservername (STRING): Name of the Vserver.
cifssharename (STRING): Name of the CIFS share.
sid (STRING): Textual SID.

mgmt.cifsshare.failure

Severity

ERROR

Description

This message occurs when configuration of a CIFS share fails; CIFS access to the share might not be available.

Corrective Action

Check the reason for the error and take action accordingly.

Syslog Message

Failed to configure CIFS share. Error: %s.

Parameters

> **reason** (STRING): Reason for the failure.
> **vservername** (STRING): Name of the vserver.
> **cifsservername** (STRING): Name of the cifs server.
> **cifssharename** (STRING): Name of the cifs share.

mgmt.cifsshare.success

Severity

> INFORMATIONAL

Description

> This message occurs when a CIFS share is successfully configured after a failure.

Corrective Action

> (None).

Syslog Message

> (None).

Parameters

> **vservername** (STRING): Name of the vserver.
> **cifssharename** (STRING): Name of the cifs share.

mgmt.cifssuperuser events

mgmt.cifssuperuser.failure

Severity

> ERROR

Description

> This message occurs when configuration of a CIFS super-user fails; CIFS access through this acccount may not grant full super-user privileges.

Corrective Action

> Check the reason for the error and take action accordingly.

Syslog Message

> Failed to configure CIFS superuser. Error: %s.

Parameters

> **reason** (STRING): Reason for the failure.
> **vservername** (STRING): Name of the vserver.
> **cifsservername** (STRING): Name of the cifs server.
> **cifsdomainname** (STRING): Name of the cifs domain.
> **accountname** (STRING): Name of the superuser account.

mgmt.cifssuperuser.success

Severity

INFORMATIONAL

Description

This message occurs when a CIFS super-user is successfully configured after a failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vservername (STRING): Name of the vserver.
cifsservername (STRING): Name of the cifs server.
cifsdomainname (STRING): Name of the cifs domain.
accountname (STRING): Name of the superuser account.

mgmt.cifssymlink events

mgmt.cifssymlink.failure

Severity

ERROR

Description

This message occurs when configuration of a CIFS symbolic link fails; the symbolic link might not be available through CIFS.

Corrective Action

Check the reason for the error and take action accordingly.

Syslog Message

Failed to configure CIFS symlink. Error: %s.

Parameters

reason (STRING): Reason for the failure.
vservername (STRING): Name of the vserver.
unix_path (STRING): The UNIX path.

mgmt.cifssymlink.success

Severity

INFORMATIONAL

Description

This message occurs when a CIFS symbolic link is successfully configured after a failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vservername (STRING): Name of the vserver.
unix_path (STRING): The UNIX path.

mgmt.cr events

mgmt.cr.constituent.added

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when a constituent volume is added to the Infinite Volume.

Corrective Action

(None).

Syslog Message

Constituent volume "%s" has been added to Infinite Volume "%s" in Vserver "%s". Its size is %ld bytes.

Parameters

constituentName (STRING): Name of the added volume.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.
size (LONGINT): Size of the added volume.

mgmt.cr.constituent.deleted

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when a constituent volume is deleted from the Infinite Volume.

Corrective Action

(None).

Syslog Message

Constituent volume "%s" has been deleted from the Infinite Volume "%s" in Vserver "%s".

Parameters

constituentName (STRING): Name of the deleted volume.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.

mgmt.cr.constituent.failure

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when an Infinite Volume operation that operates on the constituent volumes succeeds, but fails on an individual constituent.

Corrective Action

Fix the cause of the failure listed in the error, and then run the command again.

Syslog Message

Repository job "%s" run on Infinite Volume "%s" in Vserver "%s" failed for constituent volume "%s": %s

Parameters

jobName (STRING): Name of the repository job.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.
constituentName (STRING): Name of the constituent volume.
reason (STRING): Reason for the failure.

mgmt.cr.constituent.resized

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when an Infinite Volume constituent volume is resized.

Corrective Action

(None).

Syslog Message

Constituent volume "%s" of Infinite Volume "%s" in Vserver "%s" has been resized to %ld bytes.

Parameters

constituentName (STRING): Name of the resized volume.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.
size (LONGINT): New size of the volume.

mgmt.cr.job.failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when a repository job fails.

Corrective Action

Fix the cause of the failure, listed in the error, and run the command again.

Syslog Message

Repository job "%s" has failed for Infinite Volume "%s" in Vserver "%s": %s

Parameters

jobName (STRING): Name of the repository job.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.
reason (STRING): Reason for the failure.

mgmt.cr.job.succeeded

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when a repository job is completed successfully.

Corrective Action

(None).

Syslog Message

Repository job "%s" has succeeded for Infinite Volume "%s" in Vserver "%s": %s

Parameters

jobName (STRING): Name of the repository job.
repositoryName (STRING): Name of the Infinite Volume.
vserverName (STRING): Name of the Vserver.
reason (STRING): Success message of the job.

mgmt.cr.missing.footprint

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when Data ONTAP® is attempting to create or expand an Infinite Volume and cannot retrieve volume footprint information about a volume. The footprint information for all volumes on aggregates used by an Infinite Volume, even those in other Vservers, must be known to safely create or expand an Infinite Volume.

Corrective Action

Ensure that the volume is healthy and online, and then retry the operation.

Syslog Message

Unable to get footprint information about volume "%s" in Vserver "%s".;

Parameters

constituentName (STRING): Name of the volume for which footprint information could not be retrieved.
vserverName (STRING): Name of the Vserver the volume belongs to.

mgmt.exovol events

mgmt.exovol.transfer.failed

Severity

ERROR

Description

This message occurs when the replication engine fails to transfer exo-volume data.

Corrective Action

If problem persists, Contact NetApp technical support.

Syslog Message

The replication for volume dsid %jd, transfer-id %s failed to transfer %s exo-volume data, error: %d, failure reason: %s, extended failure reason: %s.

Parameters

volDsid (LONGINT): Data set identifier of the volume.
transferId (STRING): Replication transfer id.
streamType (STRING): Type of data being transferred.
error (INT): Transfer failure error code.
failureReason (STRING): Basic reason for the failure.
extendendFailureReason (STRING): Detailed reason for the failure.

mgmt.exovol.xfer.dest.no.space

Severity

ERROR

Description

This message occurs when there is no free space left on the destination aggregate.

Corrective Action

Please increase the amount of free space available on the destination aggregate.

Syslog Message

The replication for volume dsid %jd, transfer-id %s failed to transfer %s exo-volume data because there is no free space left on the destination aggregate.

Parameters

volDsid (LONGINT): Data set identifier of the volume.
transferId (STRING): Replication transfer id.
streamType (STRING): Type of data being transferred.

mgmt.fpolicy events

mgmt.fpolicy.policy.disabled

Severity

INFORMATIONAL

Description

This message occurs when a Vserver administrator disables an FPolicy® policy. No subsequent client requests will be processed and no notifications will be sent to FPolicy servers attached with this policy.

Corrective Action

(None).

Syslog Message

FPolicy policy %s is disabled on Vserver %s.

Parameters

policyname (STRING): Name of the policy.
vservername (STRING): Name of the Vserver.

mgmt.fpolicy.policy.enabled

Severity

INFORMATIONAL

Description

This message occurs when a Vserver administrator enables an FPolicy® policy. Based on the event configuration, subsequent client requests will be processed, notifications will be generated, and notifications might be sent (based on the policy configuration) to FPolicy servers attached with this policy.

Corrective Action

(None).

Syslog Message

FPolicy policy %s is enabled on Vserver %s.

Parameters

policyname (STRING): Name of the policy.
vservername (STRING): Name of the Vserver.

mgmt.fpolicy.priv.failed

Severity

ERROR

Description

This message occurs when the creation of privileged share ONTAP_ADMIN$ fails. Attempted connections to ONTAP_ADMIN$ share by the FPolicy servers will fail.

Corrective Action

Check the reason for failure and take action accordingly. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Failed to create privileged share ONTAP_ADMIN$ for Vserver "%s". Reason: "%s".

Parameters

vserverName (STRING): Name of the Vserver.
reason (STRING): Reason for failure.

mgmt.fpolicy.replay.failed

Severity

ERROR

Description

This message occurs when an FPolicy® configuration replication mechanism fails after a maximum number of retries. FPolicy Service Manager (FSM) process will restart to resync configuration.

Corrective Action

If the error persists, contact NetApp technical support for assistance.

Syslog Message

FPolicy configuration replication process failed.

Parameters

(None).

mgmt.fsecurity events

mgmt.fsecurity.failure

Severity

ERROR

Description

This message occurs when applying configuration of fsecurity fails.

Corrective Action

Wait for a while and reapply using the "vserver security file-directory apply" command. See the "vserver security file-directory" man pages for information, or if the problem persists, contact NetApp technical support.

Syslog Message

Failed to apply file security policy. Error: %s.

Parameters

reason (STRING): Reason for the failure.
vservername (STRING): Name of the vserver.

mgmt.fsecurity.success

Severity

INFORMATIONAL

Description

This message occurs when a file security policy was applied successfully after a previous failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vservername (STRING): Name of the Vserver.

mgmt.keymgr events

mgmt.keymgr.keyid.noDelete

Severity

ERROR

Description

This message occurs when the system cannot delete the key ID associated with the encrypted aggregate from the key management server.

Corrective Action

Manually delete the key ID associated with the encrypted aggregate from the key management server.

Syslog Message

Encrypted aggregate "%s" with UUID "%s" has been deleted. The key ID "%s" was associated with this aggregate and must be manually deleted from the key management server.

Parameters

name (STRING): Aggregate name.
uuid (STRING): Unique identifier of the aggregate when the aggregate name by itself is insufficient.
key_id (STRING): Unique key ID used by the encrypted aggregate.

mgmt.mcc events

mgmt.mcc.fsecurity.cfig.err

Severity

ERROR

Description

This message occurs when MetroCluster(tm) switchback or switchover happens while applying a file security (fsecurity) policy on the MetroCluster partner. The policy was not applied to the partner.

Corrective Action

Reapply the policy by using the "vserver security file-directory apply" command. See the "vserver security file-directory" man pages for information. If the problem persists, contact NetApp technical support.

Syslog Message

Failed to apply file security policy "%s" on Vserver "%s".

Parameters

policy (STRING): Fsecurity policy name.
vservername (STRING): Name of the Vserver.

mgmt.nfslisteners events

mgmt.nfslisteners.failure

Severity

ERROR

Description

This message occurs when the listener for the NFS service is not configured. If the problem persists, NFS access is not available.

Corrective Action

This problem might be resolved by subsequent automatic retries of the NFS request. If NFS service is not available, check the NFS configuration of the service and the external services it uses. To verify NFS configuration of the service, use the "nfs server show -vserver <vserver name> [-fields <field name>]" command. If the problem persists after you check the NFS configuration, delete the NFS Vserver, and then

re-create it. See the NFS man page guide for information about deleting and re-creating the NFS Vserver, or contact NetApp technical support.

Syslog Message

Failed to configure NFS listener. Error: %s.

Parameters

reason (STRING): Message provided by the NFS service when a listener configuration does not succeed.

mgmt.nfslisteners.success

Severity

INFORMATIONAL

Description

This message occurs when the listener for the NFS service is configured after a failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgmt.nfsserver events

mgmt.nfsserver.failure

Severity

ERROR

Description

This message occurs when a NFS server fails to be configured and, therefore, NFS access might not be available.

Corrective Action

Check the reason for the error and take action accordingly. For further assistance, contact techinal support.

Syslog Message

Failed to configure NFS server. Error: %s.

Parameters

reason (STRING): Reason for the failure.
vservername (STRING): Name of the vserver.

mgmt.nfsserver.success

Severity

INFORMATIONAL

Description

This message occurs when a NFS server is successfully configured after a failure.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vservername (STRING): Name of the nfs server.

mgmt.rst events

mgmt.rst.fail.dst.compressed

Severity

ERROR

Description

This message occurs when the SnapMirror® 'restore' command fails because compression is enabled on the destination volume.

Corrective Action

Force a cleanup of the failed operation by reissuing the 'restore' command with the parameter 'clean-up-failure', disable compression on the destination volume, create a Snapshot(tm) copy, and then reissue the 'restore' command.

Syslog Message

SnapMirror restore from source volume '%s' to destination volume '%s' failed with error: %s.

Parameters

srcpath (STRING): Path name of the source volume for restore.
dstpath (STRING): Path name of the destination volume for restore.
error (STRING): Error message.

mgmt.s3 events

mgmt.s3.sm.license.near.limit

Severity

NOTICE

Description

This message occurs when the total cluster-wide logical used size for S3 Snapmirror external object store relationships is near the license capacity limit but does not exceed the limit.

Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

Syslog Message

%s.

Parameters

message (STRING): Capacity warning message for users

mgmt.s3.sm.license.over.limit

Severity

ERROR

Description

This message occurs when the total cluster-wide bucket used size for S3 Snapmirror external object store relationships is over the license capacity limit.

Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

Syslog Message

%s.

Parameters

message (STRING): Capacity warning message for users

mgmt.sm events

mgmt.sm.cant.clear.autoInit

Severity

NOTICE

Description

This message occurs when a SnapMirror® protect operation fails because the source volume is already protected with a SnapMirror relationship in the specified destination Vserver with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix and auto-initialize parameter set to true. The auto-initialize parameter cannot be cleared on a SnapMirror relationship once it is set to true.

Corrective Action

(None).

Syslog Message

Job ID %lld failed to disable auto-initialize for SnapMirror relationship on volume %s, destination vserver %s. This operation is not permitted.

Parameters

> **jobID** (LONGINT): Job ID.
> **srcpath** (STRING): Path name of the source volume to be protected.
> **dstvserver** (STRING): Destination Vserver name.

mgmt.sm.cg.force.delete

Severity

> ERROR

Description

> This message occurs when a sync granular consistency group relationship is deleted with the force option. Consistency Group relationship will be the deleted, however the items of the Consistency Group might not be made read-write or deletable after the operation.

Corrective Action

> For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Perform a volume offline and online on the destination volume to trigger the cleanup of any remaining relationship information on the volume.

Syslog Message

> Sync granular consistency group relationship with source path %s. Destination path %s has been force deleted and items of the consistency group on the destination volume might not be read-write or deletable.

Parameters

> **src_path** (STRING): Source path of the sync granular consistency group relationship that was force deleted.
> **dst_path** (STRING): Destination path of the sync granular consistency group relationship that was force deleted.

mgmt.sm.cgRel.limit

Severity

> ALERT

Description

> This message occurs when either Consistency Group relationships or FlexGroups relationships exceeds the cluster-wide limit.

Corrective Action

> To delete the excess relationships. Alternatively, not to create any more additional relationship in the cluster.

Syslog Message

> Number of Consistency Group SnapMirror and/or FlexGroup relationships exceeds supported limit. Number of relationships supported on this cluster "%d". Current Number of relationships "%lu"

Parameters

> **max_count** (INT): Maximum number of relationships supported on cluster.
> **cur_count** (LONGINT): Current count of relationships on cluster.

mgmt.sm.cgVolRel.limit

Severity

ALERT

Description

This message occurs when either Consistency Group item relationships or FlexGroups item relationships exceeds the cluster-wide limit.

Corrective Action

To delete the excess item relationships. Alternatively, not to create any more additional relationship in the cluster.

Syslog Message

Number of Consistency Group item SnapMirror and/or FlexGroup item relationships exceeds supported limit. Number of item relationships supported on this cluster "%d". Current Number of relationships "%lu"

Parameters

max_count (INT): Maximum number of item relationships supported on cluster.
cur_count (LONGINT): Current count of item relationships on cluster.

mgmt.sm.dp.depr.msg

Severity

NOTICE

Description

SnapMirror relationships of type DP are deprecated. From the previous release, users were no longer able to initialize new relationships of type DP. From this release, relationships of type DP will no longer function.

Corrective Action

Use SnapMirror relationships of type XDP instead of type DP.

Syslog Message

SnapMirror relationships of type DP are deprecated in this ONTAP release.

Parameters

(None).

mgmt.sm.ep.cant.clr.autoInit

Severity

NOTICE

Description

This message occurs when a SnapMirror® protect operation fails because the source is already protected with a SnapMirror relationship that has the specified destination endpoint type and the same "-destination-volume-prefix" and "-destination-volume-suffix" parameter values, with the "-auto-initialize" parameter set to "true". The "-auto-initialize" parameter cannot be cleared on a SnapMirror relationship after it is set to "true".

Corrective Action

To change the auto-initialize behavior, delete and release the existing SnapMirror relationship by using the "snapmirror delete" command and the "snapmirror release" command, and then establish another relationship without auto-initialize.

Syslog Message

Job ID %lld: Failed to disable auto-initialize for SnapMirror relationship from source %s to destination endpoint type %s. This operation is not permitted.

Parameters

jobID (LONGINT): Job ID.
srcpath (STRING): Path name of the source to be protected.
dsteptype (STRING): Destination endpoint type.

mgmt.sm.expand.overprovision

Severity

ERROR

Description

This message occurs when a volume expand job starts for the source of a SnapMirror® relationship and the provisioning check finds that there isn't enough free space on the aggregates for destination volume. The source volume expand job is not impacted, but auto-expand will fail for the destination FlexGroup after the source FlexGroup is expanded.

Corrective Action

Increase the size of the aggregates for the destination Flexgroup volume.

Syslog Message

The aggregates on the cluster hosting destination FlexGroup volume '%s' do not have enough free space to be used for expanding the FlexGroup volume. Expansion of the destination will fail until the size of enough aggregates is increased to provide enough space.

Parameters

dstVolume (STRING): Destination volume name of the SnapMirror® relationship.

mgmt.sm.keymgr.not.setup

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation on an encrypted source volume fails because the Key Manager is not set up on the destination node. A SnapMirror relationship with the destination in the specified destination Vserver to protect the source volume will not be created until this condition is corrected.

Corrective Action

Set up the Key Manager by using the "security key-manager setup" command on the destination.

Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because the Key Manager was not set up on the destination cluster. Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
dstvserver (STRING): Destination Vserver name.
jobID (LONGINT): Job ID.

mgmt.sm.license.near.limit

Severity

NOTICE

Description

This message occurs when the total cluster-wide virtual used size for object store relationships is near the license capacity limit but does not exceed the limit.

Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

Syslog Message

%s.

Parameters

message (STRING): Capacity warning message for users

mgmt.sm.license.not.found

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation of a source volume fails because a required license on the destination cluster is missing. The error message contains the information about the missing license. A SnapMirror relationship with the destination in the specified destination Vserver to protect the source volume will not be created until this condition is corrected.

Corrective Action

Install the license that is missing on the destination cluster. The error message contains information about the missing license.

Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because there was a license missing on the destination cluster. Error: %s, Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
dstvserver (STRING): Destination Vserver name.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.sm.license.over.limit

Severity

ERROR

Description

This message occurs when the total cluster-wide virtual used size for object store relationships is over the license capacity limit.

Corrective Action

To increase the license capacity, install a new license on the cluster. Alternatively, remove some data you are managing.

Syslog Message

%s.

Parameters

message (STRING): Capacity warning message for users

mgmt.sm.obj.fanout.unsupp

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because the source is already protected with a SnapMirror relationship with an object store destination. Creation of multiple SnapMirror relationships from a source endpoint to object store destinations is unsupported.

Corrective Action

View the existing SnapMirror relationship using the "snapmirror show" command, and correct as necessary.

Syslog Message

Source endpoint "%s" is already protected in an object store. Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
jobID (LONGINT): Job ID.

mgmt.sm.protect.internal.err

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because of an unexpected internal error.

Corrective Action

Retry the command after some time. If the problem persists, contact NetApp technical support.

Syslog Message

SnapMirror protect failed because of an unexpected internal error. Error: %s, Job ID: %llu.

Parameters

error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.sm.rel.exists

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because the source volume is already protected with a SnapMirror relationship in the specified destination storage virtual machine (SVM) with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Protect the volume again by carrying out the following three steps: 1. Use a different destination volume suffix or destination volume prefix. 2. Use a different schedule or policy. 3. Use the "volume create" command to create a destination volume with a user defined name and then the "snapmirror create" command to create another SnapMirror relationship for the same source volume.

Syslog Message

SnapMirror protect operation of source volume "%s" fails to destination SVM "%s" because the source volume is already protected with a SnapMirror relationship in the specified destination SVM with the same policy, schedule, relationship type, destination volume prefix, and destination volume suffix. Error: %s, Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
dstvserver (STRING): Destination SVM name.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.sm.rename.ndu.error

Severity

ERROR

Description

This message occurs when the renaming of a SnapMirror® volume in another cluster fails, due to the lack of support for this operation in that cluster's effective version of ONTAP® software.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to update Volume name "%s" in remote cluster "%s".

Parameters

volume (STRING): Volume for which the rename operation failed.
clusName (STRING): Remote cluster name.

mgmt.sm.restore.fail

Severity

ERROR

Description

This message occurs when the SnapMirror® 'restore' command fails.

Corrective Action

To retry the restore, reissue the command. Alternatively, force a cleanup of the failed operation without starting another restore by including the parameter 'clean-up-failure' when reissuing the 'restore' command.

Syslog Message

SnapMirror restore from source volume '%s' to destination volume '%s' failed with error: %s.

Parameters

srcpath (STRING): Path name of the source volume for restore.
dstpath (STRING): Path name of the destination volume for restore.
error (STRING): Error message.

mgmt.sm.schd.invalid

Severity

ERROR

Description

This message occurs when the SnapMirror® protect operation fails to find the specified schedule name or the schedule has not been specified. A SnapMirror relationship with the destination will be created and initialized, if auto-initialize is enabled, but subsequent periodic backup operations will not be initiated.

Corrective Action

Add a valid schedule.

Syslog Message

The schedule "%s" is not valid or has not been specified.

Parameters

schd_name (STRING): Name of the schedule that is invalid.

mgmt.sm.schd.unavailable

Severity

ERROR

Description

This message occurs when a schedule is not available on the secondary site for configuration replication of a SnapMirror® relationship of -type Load Sharing (LS) in a MetroCluster(tm) configuration.

Corrective Action

Create a job schedule on the secondary site that is identical to that on the primary site by using the 'job schedule cron create' command.

Syslog Message

Configuration replication of SnapMirror relationship of -type Load Sharing for destination path "%s" has failed because the schedule "%s" is not available.

Parameters

dstpath (STRING): Destination path name of the SnapMirror relationship.
schd_name (STRING): Name of the schedule that is unavailable on the secondary site.

mgmt.sm.snap.create.fail

Severity

ALERT

Description

This message occurs when a SnapMirror® "snapshot create" command fails on the destination volume, after successfully converting a FlexVol® volume to a FlexGroup volume. Future SnapMirror transfers will be unsuccessful.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Create the baseline Snapshot copy on destination volume "%s" using the "volume conversion create-destination-snapshot" command, and then re-create the SnapMirror relationship using the "snapmirror create -destination-path %s -source-path %s -policy %s -throttle %d -schedule %s" command.

Syslog Message

Create the baseline Snapshot copy on destination volume "%s" using the "volume conversion create-destination-snapshot" command, and then re-create the SnapMirror relationship using the "snapmirror create -destination-path %s -source-path %s -policy %s -throttle %s -schedule %s" command.

Parameters

volume (STRING): Volume converted to a FlexGroup volume.
dstPath (STRING): Destination path for SnapMirror create.
srcPath (STRING): Source path for SnapMirror create.
policy (STRING): Policy for SnapMirror create.
throttle (STRING): Throttle for SnapMirror create.
schedule (STRING): Schedule for SnapMirror create.

mgmt.sm.src.policy.creat

Severity

ALERT

Description

This message occurs when a reverse resync operation was performed from System Manager and the SnapMirror policy associated with an intercluster SnapMirror relationship was replicated to the source from the destination, but the retention period in the policy was not replicated. This will happen only if the source cluster ONTAP® version is earlier than ONTAP 9.13.1. Because the retention period was not associated

with the Snapshot copies, the Snapshot copies are prone to deletion, which might lead to data protection issues.

Corrective Action

Add the retention period to the appropriate rules of the SnapMirror policy in the source cluster using the command "snapmirror policy modify-rule -vserver <storage_VM_name> -policy <policy_name> -snapmirror -label <snapmirror_label_name> -retention-period <retention_period>".

Syslog Message

The retention period setting in the destination SnapMirror policy "%s" has not been replicated to the source during a reverse resync, and it might need to be updated manually.

Parameters

policyName (STRING): Name of the policy associated with the SnapMirror relationship that was replicated from the destination to source.

mgmt.sm.src.vol.not.found

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because the source volume was not found.

Corrective Action

Check whether the source path is correct, and then retry the operation with the correct path.

Syslog Message

SnapMirror protect of source volume "%s" failed to destination Vserver "%s" because the source volume was not found. Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
dstvserver (STRING): Destination Vserver name.
jobID (LONGINT): Job ID.

mgmt.sm.sync.break.dp.error

Severity

ERROR

Description

This message occurs when a SnapMirror® break operation fails on a synchronous SnapMirror destination volume, because the destination is either in the "broken-off" state, or another state that is inconsistent with the operation.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror break operation failed for sync SnapMirror relationship with destination volume "%s" because the destination volume is either in the broken-off state or the volume state is inconsistent.

Parameters

dstpath (STRING): Path name of the destination volume.

mgmt.sm.v2.upgrade.chk

Severity

ERROR

Description

This message occurs after booting, when there is a Data Protection relationship created in a Data ONTAP® release prior to 8.2.

Corrective Action

Establish Vserver peering so that the system can convert the pre-8.2 relationships to 8.2 and later relationships. Vserver peering can only be established if both endpoints are running Data ONTAP 8.2 or later on all nodes in the cluster. To check whether the source cluster supports Data ONTAP 8.2 SnapMirror® relationships, run the "capability show -node * -capability volume.snapmirror_v2" command. If the capability is "true" on all nodes, create a Vserver peer relationship between the source and destination endpoint Vservers by by issuing the "vserver peer create" command. If the capability is "false" on any node in the source cluster, upgrade and configure the source cluster by following instructions in the Upgrade and Revert/Downgrade Guide.

Syslog Message

SnapMirror relationships from a pre-8.2 installation are present on this cluster but no Vserver peer relationships were found between the source and destination Vservers.

Parameters

(None).

mgmt.sm.vol.place.create.err

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails to find an aggregate with sufficient free space for a destination volume or fails to create the volume. A SnapMirror relationship with the destination in the specified destination storage virtual machine (SVM) to protect the source volume will not be created until this condition is corrected.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Use the "vserver show -vserver <vserver-name> -fields aggr-list" command to check whether there is a list of aggregates assigned to the destination SVM. If there are aggregates listed, check the status of and the space left in the storage aggregates belonging to that SVM. If there are no aggregates listed, then check the status of and the space left in all of the non-root, non-taken-over and non-SnapLock aggregates. To check whether storage aggregates are non-root, non-taken-over and non-SnapLock, run the "storage aggregate show -fields root, is-home, snaplock-type" command. To check the status of and the

space left in a storage aggregate, run the "storage aggregate show -aggregate <aggr-name>" command for a particular aggregate or the "storage aggregate show" command for all storage aggregates on the cluster. If storage aggregates are offline, use "storage aggregate online -aggregate <aggr-name>" command to bring the storage aggregates online. If there is no space in the storage aggregates: 1) Use the "vserver add-aggregates -vserver <vserver-name> -aggregates <aggr-name>" command to add more storage aggregates to the destination SVM. 2) If needed, use the "storage aggregate create -aggregate <aggr-name> -diskcount <number-of-disks> -node <node-name>" command to create new storage aggregates on available nodes. 3) Use the "storage aggregate add-disks -aggregate <aggr-name> -diskcount <number-of-disks>" command to add space to the storage aggregate. Even if there is free space on storage aggregates, it is possible that the maximum number of volumes already exist on a node. If so, additional volumes cannot be created on that node. If this is the case, add more aggregate space on other nodes. You can determine the number of volumes on a node by using the "volume show -node <node-name>" command. Note the entry count at the end of the show output. To check the overall status of the SnapMirror protect operation, use the "job show <jobID> -instance" or "job history show -id <jobID> -instance" commands. If the problem persists, contact NetApp technical support.

Syslog Message

SnapMirror protect of source volume "%s" failed on destination SVM "%s". Error: %s, Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
dstvserver (STRING): Destination SVM name.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.sm.vol.style.unsupp

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because the source volume style is unsupported. The "SnapMirror" protect command only supports FlexVol® volumes. FlexGroup volumes, FlexGroup constituents, Infinite Volumes, and Infinite Volume constituents are unsupported. Temporary volumes are also not unsupported.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: If you want to protect Infinite Volumes or FlexGroup volumes, use the individual commands: 1. "volume create" for the destination volume 2. "snapmirror create" for the relationship 3. "snapmirror initialize" for the relationship Creating individual SnapMirror relationships on FlexGroup volumes or Infinite Volume constituents is unsupported.

Syslog Message

SnapMirror protect of source volume "%s" fails because the volume is not a FlexVol volume. Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
jobID (LONGINT): Job ID.

mgmt.sm.vsrs.not.peered

Severity

ERROR

Description

This message occurs when a SnapMirror® protect operation fails because either the source or destination Vservers do not exist or the source and destination Vservers are not peered. A SnapMirror relationship with the specified destination Vserver will not be created, and the source volume will not be protected, until this condition is corrected.

Corrective Action

Use the 'vserver show' and 'vserver peer' commands to verify that the source and destination Vservers exist and are named uniquely. Also make sure that the 'snapmirror protect' operation targets the intended Vservers. See the man pages of these commands for further information.

Syslog Message

SnapMirror protect operation of source volume "%s" failed because destination Vserver "%s" and source Vserver %s are not peered. Job ID: %llu.

Parameters

srcpath (STRING): Path name of the source volume to be protected.
srcvserver (STRING): Source Vserver name.
dstvserver (STRING): Destination Vserver name.
jobID (LONGINT): Job ID.

mgmt.smbc events

mgmt.smbc.config.not.repl

Severity

NOTICE

Description

This message occurs when the system fails to replicate the configuration of Report Target Group Port(RTPG) and Inter-Cluster(IC) LIF information.

Corrective Action

(None).

Syslog Message

Failure in configuration replication of RTPG, IC LIF information with relationship UUID "%s".

Parameters

srcpath (STRING): Path name of the source group of the SnapMirror® active sync relationship.
dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.
relationship_id (STRING): Relationship UUID.

mgmt.smbc.proxy.create.fail

Severity

ERROR

Description

This message occurs when there is a failure to create proxy I/O path channel between the SnapMirror®
active sync peer clusters.

Corrective Action

Check the network connection between the source and destination volumes by using the "net interface
show -role intercluster -status-admin up" command.

Syslog Message

Failure in proxy initiator %s and target %s creation.

Parameters

proxy_initiator (STRING): Path name of the proxy initiator.
proxy_target (STRING): Path name of the proxy target.
relationship_id (STRING): Relationship UUID.
error_msg (STRING): Description of the failure.

mgmt.snapmir events

mgmt.snapmir.dst.invalidType

Severity

ERROR

Description

This message occurs when the destination volume of a SnapMirror® relationship is not a Data Protection
(DP) or Load Sharing (LS) type, and a SnapMirror initialize operation is attempted. A volume must be a DP
or LS type to accept a SnapMirror initialize operation.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all
other systems: Use a DP or LS type of volume, or use the "volume create" command to create a new
volume with a DP or LS type to use as a destination of the SnapMirror relationship. You cannot modify the
type of a volume using the "volume modify" command.

Syslog Message

Destination volume "%s" of a SnapMirror relationship is not a DP or LS type. Job ID %llu.

Parameters

dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
jobID (LONGINT): Job ID.

mgmt.snapmir.fl.bkt.del.fail

Severity

ERROR

Description

This message occurs when a bucket could not be deleted during a cleanup of a SnapMirror restore or create operation. Because the operation did not complete successfully, the bucket might be left in an inconsistent state.

Corrective Action

Use the "object-store-server bucket delete" command to delete the bucket.

Syslog Message

Bucket "%s" could not be deleted as part of the clean up of a SnapMirror create or restore operation.

Parameters

bucket (STRING): Name of the bucket in the SnapMirror relationship.

mgmt.snapmir.fl.crt.cleanup

Severity

ERROR

Description

This message occurs when the cleanup of a link failed when it encountered an error during a SnapMirror create operation. Because the link could not be cleaned up properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

Corrective Action

1. Run the "snapmirror delete" command to delete the link.

Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s".

Parameters

sourceBucket (STRING): Name of the source bucket in the SnapMirror relationship.
destBucket (STRING): Name of the destination bucket in the SnapMirror relationship.
error (STRING): Error that was encountered.

mgmt.snapmir.fl.failover.rmt

Severity

ERROR

Description

This message occurs when the remote bucket was not demoted during a failover operation. This could allow the remote bucket to still accept the traffic even though it is no longer permitted to so. Use the "demote bucket" command to avoid this situation.

Corrective Action

Use the "fabriclink demote-bucket" command in the cluster where remote bucket "%s" is located.

Syslog Message

Failover failed for remote bucket "%s".

Parameters

remoteBucket (STRING): Name of the remote bucket for which the failover operation failed.

mgmt.snapmir.fl.mod.rmt.fail

Severity

NOTICE

Description

This message occurs when the links on a remote cluster could not be modified during the execution of the "snapmirror modify" command. Even though the SnapMirror policy was modified, some of the links on the remote cluster could not be updated with new rpo/ throttle values. There is no detectable impact until a failover is performed. Only when a failover is performed would the reverse link be used, and it would still be functional even if the links on the remote cluster were not updated previously. They would just be using old rpo/throttle values.

Corrective Action

(None).

Syslog Message

Links on remote cluster "%s" were not modified.

Parameters

clusterUuid (STRING): Cluster UUID of the cluster where the links were not updated.

mgmt.snapmir.fl.rstr.bkt.cln

Severity

ERROR

Description

This message occurs when objects in a restore bucket were not deleted during the cleanup of a SnapMirror restore operation. The restore bucket has objects in it even though the restore relationship no longer exists.

Corrective Action

Delete the objects in bucket "%s".

Syslog Message

Objects in bucket "%s" were not deleted during a restore failure cleanup.

Parameters

restoreBucket (STRING): Name of the restore bucket in the SnapMirror relationship.

mgmt.snapmir.fl.rstr.cln.all

Severity

ERROR

Description

This message occurs when the deletion of objects and the cleanup of link failed when the operations encountered an error during a SnapMirror restore operation. Because the link could not be cleaned up

properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

Corrective Action

1. Run the "snapmirror delete" command to delete the link. 2. Delete the objects in the restore bucket.

Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s" and the objects in the restore bucket could not be deleted.

Parameters

sourceBucket (STRING): Name of the source bucket in the SnapMirror relationship.
destBucket (STRING): Name of the destination bucket in the SnapMirror relationship.
error (STRING): Error that was encountered.

mgmt.snapmir.fl.rstr.lnk.cln

Severity

ERROR

Description

This message occurs when the cleanup of a link failed when it encountered an error during a SnapMirror restore operation. Because the link could not be cleaned up properly, the bucket could be in an inconsistent state and might not be able to accept any traffic. Also, if the links are not cleaned up, a new SnapMirror relationship cannot be established with these two buckets.

Corrective Action

Run the "snapmirror delete" command to delete the link.

Syslog Message

Cleanup of the link between buckets "%s" and "%s" failed with error "%s".

Parameters

sourceBucket (STRING): Name of the source bucket in the SnapMirror relationship.
destBucket (STRING): Name of the destination bucket in the SnapMirror relationship.
error (STRING): Error that was encountered.

mgmt.snapmir.init.fail

Severity

ERROR

Description

This message occurs when a SnapMirror® 'initialize' or 'initialize-ls-set' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Initialize from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpaths (STRING): Path names of the destination volumes to which the initialize failed.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.snapmir.ls.catchup.fail

Severity

ALERT

Description

This message occurs when a catch-up update for a lagging member in a load-sharing set fails.

Corrective Action

Check the reason for the error and take action accordingly.

Syslog Message

Load-share catch-up update transfer from source volume '%s' to destination volume '%s' failed with error '%s'. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror® relationship.
dstpath (STRING): Path name of the destination volume to which the catch-up update transfer failed.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.snapmir.resync.fail

Severity

ALERT

Description

This message occurs when a SnapMirror® 'resync' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Resync from source volume '%s' to destination volume '%s' failed with error '%s'. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the resync failed.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.snapmir.schd.trans.fail

Severity

ALERT

Description

This message occurs when a scheduled SnapMirror® transfer fails and no automatic retry will be attempted until the next scheduled transfer.

Corrective Action

Check the reason for the error and take action accordingly.

Syslog Message

Scheduled transfer from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpaths (STRING): Path names of the destination volumes to which the scheduled transfer failed.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.snapmir.schd.trans.overrun

Severity

ERROR

Description

This message occurs when a scheduled SnapMirror® transfer overruns the schedule window.

Corrective Action

Check the reason for the schedule overrun and take action accordingly.

Syslog Message

Scheduled transfer from source volume '%s' to destination volume(s) '%s' is taking longer than the schedule window. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpaths (STRING): Path names of the destination volumes of the scheduled transfer.
jobID (LONGINT): Job ID.

mgmt.snapmir.unexpected.err

Severity

ERROR

Description

This message occurs when a SnapMirror operation encounters an unexpected error. JobID might be zero if the job ID could not be determined at the time the error was generated.

Corrective Action

If the problem persists, contact NetApp technical support.

Syslog Message

SnapMirror unexpected error '%s'. Job ID %llu.

Parameters

error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.snapmir.update.fail

Severity

ALERT

Description

This message occurs when a SnapMirror® 'update' or 'update-ls-set' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Update from source volume '%s' to destination volume(s) '%s' failed with error '%s'. Job ID %llu.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpaths (STRING): Path names of the destination volumes to which the update failed.
error (STRING): Error message.
jobID (LONGINT): Job ID.

mgmt.vdr events

mgmt.vdr.fsecurity.cfig.err

Severity

ERROR

Description

This message occurs when a "snapmirror break" operation is executed while a file security job is running and the previous "snapmirror update" operation only partially transfers the changes made to the file system by the file security job. This results in the policy being applied only partially to the partner; that is, ACLs on the files are applied partially.

Corrective Action

Verify that the file security job has been successfully applied on the Vserver DR partner by using the "job show" command on the source; it should display the "complete" status. Then resync the SnapMirror® relationship by using the "snapmirror resync -source-vserver <source-vserver-name> -destination-vserver <destination-vserver-name>" command. Alternatively, you can break the SnapMirror relationship, and then reapply the job on the destination by using the "vserver security file-directory apply -vserver <vserver-name> -policy-name <policy-name>" command. See the "vserver security file-directory" man pages for more information. If the problem persists, contact NetApp technical support.

Parameters

policy (STRING): Fsecurity policy name.
vservername (STRING): Name of the Vserver.

mgmt.vopl events

mgmt.vopl.cleanup.failed

Severity

ALERT

Description

This message occurs when the system encounters an error trying to clean up after a failed 'volume move' operation.

Corrective Action

Contact NetApp technical support..

Syslog Message

'volume move' cleanup operation with job ID '%jd' failed in step (%s) with the error (%s) for volume '%s' in Vserver '%s'.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
step (STRING): Phase during cleanup where the error occurred.
error (STRING): Error recorded during the cleanup phase.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.del.staleLunMaps

Severity

ERROR

Description

This message occurs when a 'volume delete' operation cannot delete LUN initiator group maps for the LUNs in the volume, resulting in stale LUN initiator group maps. Any attempt to delete these initiator groups that are mapped to nonexistent LUNs (provided that they are not mapped to any other LUNs) fails. 'lun mapped show -igroup <igroup name>' does not list any maps, but 'igroup delete -igroup <igroup name>' fails with an error, suggesting that the initiator group cannot be deleted because it is mapped to LUNs.

Corrective Action

Contact NetApp technical support.

Syslog Message

Could not delete LUN initiator group maps for the volume with MSID '%llu' on Vserver '%s'. Error: %s.

Parameters

voldMsid (LONGINT): Master data set ID of the volume being deleted.
vserver (STRING): Vserver hosting the volume.
error (STRING): Internal software error.

mgmt.vopl.fail.rstart.nosvol

Severity

ALERT

Description

This message occurs when a 'volume move' operation fails in the restart phase because the source volume is not found. The system repeatedly attempts the phase until the restart can be completed. In the time between the first failure and when the restart can be completed, there might be disruption to client traffic for the volume being moved.

Corrective Action

Verify that the job restart is completed by running the "volume move show -vserver <vservername> -volume <volName%gt;" command. If the restart phase continues to fail, contact NetApp technical support.

Syslog Message

'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' failed in the restart phase when attempting to retrieve the source volume.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.fail.status.entry

Severity

ALERT

Description

This message occurs when a 'volume move' operation fails to make an entry in the VLDB table for the 'volume move show' command. The system repeatedly attempts this operation until it exhausts the number of retries. Until an entry is made, the 'volume move show' command might return stale entries use 'job show -id' to show the status of the current volume move operation.

Corrective Action

Use the 'job show -id' command to show the status of the current 'volume move' operation. Retry the 'volume move' operation. If the problem persists, contact NetApp technical support.

Syslog Message

The 'volume move' operation with ID '%jd' for volume name '%s' in Vserver '%s' failed while attempting to make an entry in the VLDB table for the 'volume move show' command. Use 'job show -id' command to show the current status of the job.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.

vserverName (STRING): Name of the source Vserver.

mgmt.vopl.fail.status.modify

Severity
ALERT

Description
This message occurs when a 'volume move' operation fails to modify the VLDB table for the 'volume move show' command. The system repeatedly attempts this phase. Until the modification succeeds, the 'volume move show' command might return stale information about the current 'volume move' operation.

Corrective Action
If the problem persists, contact NetApp technical support.

Syslog Message
The 'volume move' operation for volume '%s' with job ID '%jd' in Vserver '%s' cannot modify an entry in the VLDB table.

Parameters
volName (STRING): Name of the source volume.
jobId (LONGINT): Job ID of the 'volume move' operation.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.made.status.entry

Severity
INFORMATIONAL

Description
This message occurs when a 'volume move' operation makes an entry for the 'volume move show' command because the entry did not exist in the VLDB table.

Corrective Action
(None).

Syslog Message
Use the 'volume move show -vserver %s -volume %s' command to show the status of this 'volume move' operation.

Parameters
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.badDstVol

Severity
ERROR

Description
This message occurs when a 'volume move' operation cannot access the specified destination volume.

Corrective Action

Verify that the destination volume exists and is online.

Syslog Message

The move operation could not access the specified destination volume '%s'.

Parameters

dstVol (STRING): Name of the temporary destination volume for move operation.

mgmt.vopl.move.badSourceVol

Severity

ERROR

Description

This message occurs when a 'volume move' operation cannot access the specified source volume.

Corrective Action

Verify that the source volume exists and is online.

Syslog Message

The move operation could not access the specified source volume '%s' in Vserver '%s' for job ID '%jd'.

Parameters

srcVol (STRING): Name of the volume to be moved.
vserverName (STRING): Name of the Vserver.
jobID (LONGINT): Job ID of the volume move operation.

mgmt.vopl.move.bytesLeft

Severity

INFORMATIONAL

Description

This message occurs when a 'volume move' operation is in data copy phase and we want to know the bytes left.

Corrective Action

(None).

Syslog Message

The 'volume move' operation for volume '%s' in Vserver '%s' and job ID '%jd' is in data copy phase. We want to know the number of bytes left to transfer.

Parameters

volpath (STRING): Name of the source volume of the move job.
vserverName (STRING): Name of the source Vserver.
jobID (LONGINT): Job ID of the 'volume move' operation.

mgmt.vopl.move.cantCrtDstVol

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the destination volume cannot be created.

Corrective Action

Check for space on the destination aggregate. Execute the "volume move" command with the "-perform-validation-only" parameter. If it succeeds, contact NetApp technical support. If it does not succeed, increase space on the destination aggregate, then try the "volume move" command again.

Syslog Message

Volume move job failed because destination volume "%s" could not be created.

Parameters

volpath (STRING): Name of the destination volume of the move.

mgmt.vopl.move.cantCrtSrcSnp

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because creation of a snapshot on the source volume failed.

Corrective Action

Use the "volume show" to check if the volume has enough space for the snapshot. Use the "snapshot show" command to check if the number of snapshots have reached the maximum count. If the issue persists, contact Contact NetApp technical support..

Syslog Message

Volume move job failed because creation of a snapshot on source volume "%s" failed.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.cantDstCncld

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot conclude a transfer on the destination volume.

Corrective Action

Contact NetApp technical support.

'volume move' job could not conclude a transfer on the destination volume '%s'.

Parameters

volpath (STRING): Name of the destination volume of the move job.

mgmt.vopl.move.cantReadCfg

Severity

ERROR

Description

This message occurs when the 'volume move' job cannot read the configuration information.

Corrective Action

Check whether the replicated database is online.

Syslog Message

The job configuration information for 'volume move' operation with job ID '%jd' could not be read.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.

mgmt.vopl.move.cantSaveToRdb

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot save information to the replicated database. The 'volume move' job attempts to retry the operation.

Corrective Action

The "volume move" job is retried automatically. Check the satus of database with "cluster ring show" advanced command. If the problem persists, contact NetApp technical support.

Syslog Message

The volume move job '%jd' for volume '%s' in Vserver '%s' could not save the information to the replicated database.

Parameters

jobId (LONGINT): ID of the 'volume move' job.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.cantSrcCncld

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot conclude a transfer on the source volume.

Corrective Action

Verify that the source volume exists, is readable, and is not currently locked exclusively by another process. If the problem persists, contact NetApp technical support.

Syslog Message

'volume move' job could not conclude the transfer on the source volume '%s'.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.ClnupFldDlVol

Severity

ERROR

Description

This message occurs when a cleanup operation cannot delete the destination volume after a 'volume move' job fails.

Corrective Action

Delete the destination volume by using the 'volume delete' command.

Syslog Message

Could not delete destination volume '%s' following a failed 'volume move'.

Parameters

volpath (STRING): Name of the destination volume that could not be deleted.

mgmt.vopl.move.cntRdDstDAttr

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot read the attributes of the destination volume from disk. The 'volume move' job attempts to retry the operation.

Corrective Action

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

Syslog Message

The 'volume move' job could not fetch attributes of destination volume '%s' from the disk.

Parameters

volpath (STRING): Name of the destination volume involved in the move operation.

mgmt.vopl.move.cntRdPostCutoverSrcDAttr

Severity

ERROR

Description

This message occurs when a 'volume move' operation cannot access the specified source volume after cutover to propagate final volume attributes. The attributes were set to values that were either obtained immediately before the cutover occurred, or were set to default values.

Corrective Action

Verify that the attributes on the destination volume are correct. Specifically, check the value for the attribute "filesys-size-fixed".

Syslog Message

The move operation could not read post-cutover attributes from the specified temporary source volume '%s' in Vserver '%s' for job ID '%jd'.

Parameters

dstVol (STRING): Name of the temporary source volume for the move operation.
vserverName (STRING): Name of the Vserver.
jobID (LONGINT): Job ID of the volume move operation.

mgmt.vopl.move.cntRdSrcDAttr

Severity

NOTICE

Description

This message occurs when the volume move operation cannot read the attributes of the source volume from disk. The volume move operation will attempt to retry the operation.

Corrective Action

(None).

Syslog Message

The volume move operation could not fetch the attributes of source volume '%s' from the disk.

Parameters

volpath (STRING): Name of the source volume involved in the move operation.

mgmt.vopl.move.cut.entryFail

Severity

ERROR

Description

This message occurs when the volume move operation cannot enter the cutover phase. The original source volume is functional. After a short delay, the volume move operation will reattempt cutover entry.

Corrective Action

If the problem persists, reduce client traffic on the volume being moved and reduce the general load on the destination node.

Syslog Message

The volume move operation of volume '%s' in Vserver '%s' to destination aggregate '%s' did not enter the cutover phase. The system provided the additional explanation: '%s'. After a short delay, the volume move operation will reattempt cutover entry. The job ID for the volume move job is '%jd'.

Parameters

volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
aggrName (STRING): Name of the destination aggregate.
reasonforFailure (STRING): Reason for the failure.
jobID (LONGINT): Job ID of the volume move operation.

mgmt.vopl.move.cutover.deferred

Severity

ALERT

Description

This message occurs when the volume move job cannot be completed because the cutover phase has been deferred.

Corrective Action

Address the reason for the cutover deferral, and then use the 'volume move trigger-cutover' command to reattempt the cutover phase for this volume move operation.

Syslog Message

Cutover phase has been deferred for the volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s', because of '%s'. Space savings from efficiency could be lost.

Parameters

jobID (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
aggrName (STRING): Name of the destination aggregate.
reasonforDefer (STRING): Reason for deferred cutover.

mgmt.vopl.move.cutover.deferred.wait

Severity

INFORMATIONAL

Description

This message occurs when the volume move job cannot be completed because the cutover phase has been deferred due to the user specifying the cutover action as 'wait'.

Corrective Action

Use the 'volume move trigger-cutover' command to attempt the cutover phase for this volume move operation.

Syslog Message

Cutover phase has been deferred for the volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s', because of '%s'. Space savings from efficiency could be lost.

Parameters

jobID (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
aggrName (STRING): Name of the destination aggregate.
reasonforDefer (STRING): Reason for the deferred cutover.

mgmt.vopl.move.cutover.failed

Severity

ERROR

Description

This message occurs when the volume move job attempts to cut over and is unsuccessful. The system continues to retry the operation until it exhausts the number of cutover attempts allowed.

Corrective Action

Reduce client traffic on the volume, that is scheduled to be moved.

Syslog Message

The volume move operation with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s' did not cut over because: '%s'. The volume move operation has tried to cut over '%d' out of '%d' times, %d forced.

Parameters

jobID (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
aggrName (STRING): Name of the aggregate.
reasonforFailure (STRING): Reason for cutover failure.
actualcutoverAttempt (INT): Number of actual cutover attempts made.
cutoverAttempt (INT): Number of cutover attempts.
forcedCutoverAttempt (INT): Number of forced cutover attempts.

mgmt.vopl.move.cutoverMod

Severity

INFORMATIONAL

Description

This message occurs when a 'volume move' operation is in cutover and one of the modifiable parameters used by the 'move' job has been modified with the 'volume move modify' command. These modified values will be used for next cutover attempt.

Corrective Action

(None).

Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' is performing a cutover. Values modified with the 'volume move modify' command will not be used until the next cutover attempt.

Parameters

jobId (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.done

Severity

NOTICE

Description

This message occurs when the volume move job succeeds.

Corrective Action

(None).

Syslog Message

The volume move job with ID '%jd' on volume '%s' on Vserver '%s' to destination aggregate '%s' succeeded.

Parameters

jobID (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
aggrName (STRING): Name of the destination aggregate.

mgmt.vopl.move.dstPrepareFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the destination volume cannot be prepared for a transfer.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job failed because the destination volume '%s' could not be prepared for a transfer.

Parameters

volpath (STRING): Name of the destination volume of the move job.

mgmt.vopl.move.findSnpDltFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the call to calculate the delta between a snapshot and the active file system failed.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job failed because the call to calculate the delta between a snapshot and the active file system on the source volume '%s' failed.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.getNxtSnapFld

Severity

ERROR

Description

This message occurs when the 'volume move' job cannot look up the snapshot next in age to the currently referenced snapshot. The 'volume move' job attempts to retry the operation.

Corrective Action

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

Syslog Message

The 'volume move' job could not to look up the snapshot next in age to the currently referenced snapshot on the source volume '%s'.

Parameters

volpath (STRING): Name of the source volume involved in the move operation.

mgmt.vopl.move.gtDstSSLstFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because a snapshot list cannot be obtained from the destination volume.

Corrective Action

Check whether the destination volume is online. If the problem persists, contact NetApp technical support.

Syslog Message

Volume move job failed because a snapshot list could not be obtained from the destination volume '%s'.

Parameters

    volpath (STRING): Name of the destination volume of the move job.

mgmt.vopl.move.gtSnpTgSrcFld

Severity

    ERROR

Description

    This message occurs when the volume move job cannot be completed because a snapshot tag cannot be read from the source volume.

Corrective Action

    Check whether the source volume is online. If the problem persists, contact NetApp technical support.

Syslog Message

    Volume move job failed because a snapshot tag could not be read from the source volume '%s'.

Parameters

    volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.gtSrcSSLstFld

Severity

    ERROR

Description

    This message occurs when the volume move job cannot be completed because a snapshot list cannot be obtained from the source volume.

Corrective Action

    Check whether the source volume is online. If the problem persists, contact NetApp technical support.

Syslog Message

    Volume move job failed because a snapshot list could not be obtained from the source volume '%s'.

Parameters

    volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.gtSSTgsDstFld

Severity

    ERROR

Description

    This message occurs when the volume move job cannot be completed because the snapshot tags on the destination volume cannot be read.

Corrective Action

    Retry the volume move job. If the problem persists, this indicates a system level problem. Contact NetApp technical support.

Syslog Message

Volume move job failed because snapshot tags on the destination volume '%s' in vserver '%s' for the volume move of source volume '%s' in vserver '%s' could not be read.

Parameters

dstVol (STRING): Name of the destination volume of the move job.
srcVol (STRING): Name of the source volume of the move job.
dstVserverName (STRING): Name of destination vserver.
srcVserverName (STRING): Name of source vserver.

mgmt.vopl.move.has.clones

Severity

ERROR

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot delete the original volume instance on the source aggregate. This is because the original volume instance has volume clones.

Corrective Action

The system usually reaps these types of volume after all clones have been deleted or split automatically. If space occupied by source needs to be freed immediately, then delete the original volume instance using the 'volume delete' command after all the volume clones have been deleted or split.

Syslog Message

The 'volume move' operation with ID '%jd' could not delete the original volume %s in Vserver %s on %s aggregate following a successful volume move because the original volume instance has volume clones.

Parameters

jobId (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume instance that could not be deleted.
vserverName (STRING): Name of the volume's Vserver.
aggrName (STRING): Name of the source aggregate.

mgmt.vopl.move.invldXfrState

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because a transfer is in an invalid state.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job with job ID '%jd' for volume '%s' in Vserver '%s' failed because a transfer was in an invalid state.

Parameters

jobID (LONGINT): ID of the 'volume move' job.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.jobIgnoreQuit

Severity

ERROR

Description

This message occurs when a volume move job fails to stop when you issue a 'volume move abort' or 'job stop' command. If the command is not repeated, the volume move job might continue to run to completion.

Corrective Action

Retry the 'volume move abort' or 'job stop' command before the volume move job is complete.

Syslog Message

Volume move job '%jd' for volume '%s' in Vserver '%s' could not be stopped at this time. Retry the 'volume move abort' or 'job stop' command.

Parameters

jobID (LONGINT): ID of the volume move job.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.jobQuit

Severity

INFORMATIONAL

Description

This message occurs when a 'volume move' job is not completed because a 'volume move abort' or 'job stop' command was issued.

Corrective Action

Verify the status of the move job through the 'volume move show' command.

Syslog Message

'volume move' job with ID '%jd' for volume '%s' in Vserver '%s' was not completed because a 'volume move abort' or 'job stop' command was issued.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.last.upd.fail

Severity

ERROR

Description

This message occurs when a 'volume move' operation fails to update attributes on the destination volume after the cutover has been completed.

Corrective Action

Contact NetApp technical support.

Syslog Message

'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' failed to update the attributes on the destination volume after the cutover has been completed.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.mark.source.reapable.failed

Severity

ERROR

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot mark the original volume instance on the source aggregate for deletion. The original volume instance cannot be deleted immediately because it has volume clones.

Corrective Action

Delete the original volume instance using the 'volume delete' command after all the volume clones have been deleted or split.

Syslog Message

The 'volume move' operation with ID '%jd' could not mark the Volume %s containing volume clones in Vserver %s on %s aggregate for later deletion after a successful volume move.

Parameters

jobId (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume instance that could not be marked for later deletion.
vserverName (STRING): Name of the volume's Vserver.
aggrName (STRING): Name of the destination aggregate.

mgmt.vopl.move.memAllocFld

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot allocate memory. The 'volume move' job attempts to retry the operation.

Corrective Action

Use the 'volume move show' command to get the status of the current move operation. If the problem persists, contact NetApp technical support.

Syslog Message

The 'volume move' job ID '%jd' for volume '%s' in Vserver '%s' could not allocate memory.

Parameters

jobId (LONGINT): ID of the 'volume move' job.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.moveModlgr

Severity

INFORMATIONAL

Description

This message occurs when modifiable parameters of the 'move' job have been modified by 'volume move modify' command, but the 'volume move' operation finished with older values and did not use the newly modified values.

Corrective Action

Use 'volume move show' command to verify the parameters used during cutover phase and the final state of the volume move operation.

Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' has completed. Parameters modified during last cutover attempt through 'volume move modify' command have been ignored or 'volume move' operation failed on job restart before refreshing parameters from the VLDB.

Parameters

jobId (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.nosnapspace

Severity

ERROR

Description

This message occurs when a 'volume move' operation fails to create a snapshot on source volume because the number of snapshots in the volume exceeds the maximum limit or there is insufficient disk space in the volume.

Corrective Action

Make sure that the snapshot limit is not reached for the volume. The current Data ONTAP version allows a maximum of 255 snapshots per volume. If required, delete old snapshots of the volumes on the aggregate by running the 'volume snapshot delete' command.

The 'volume move' operation with job ID '%jd' for volume '%s' present on Vserver '%s' cannot proceed (Reason: Cannot create a snapshot on the volume).

Parameters

jobId (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.nospace

Severity

ERROR

Description

This message occurs when there is not enough space on the volume or aggregate for a 'volume move' operation to proceed. It could be on the source or the destination node.

Corrective Action

Reduce the amount of used space on the volume or aggregate, or increase the size of the volume or aggregate. To increase the size of the volume, run the 'volume modify' command. To create space on an aggregate, take one of the following actions: a. To free up more space on a volume, delete old snapshots of the volumes on the aggregate by running the 'volume snapshot delete' command. b. To increase the size of a volume or an aggregate, add disks to the aggregate by running the 'storage aggregate add-disks' command.

Syslog Message

The 'volume move' operation with ID '%jd' for volume '%s' present on Vserver '%s' cannot proceed (Reason: Not enough space in the volume or aggregate).

Parameters

jobId (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.parent.online

Severity

NOTICE

Description

This message occurs when a "volume move" operation fails to take offline the quiesced volume remaining after moving a clone parent, because wafliron is running.

Corrective Action

No action is required, because the system removes the quiesced clone parent automatically. To free some of the resources used by the volume, you can manually take it offline by using the "volume offline" command after the wafliron operation has completed.

Syslog Message

The "volume move" operation for the volume %s on vserver %s with job-id %jd could not offline the quiesced clone parent volume left behind.

Parameters

volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
jobId (LONGINT): Job ID of the "volume move" operation.

mgmt.vopl.move.queryDstFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because a query of the destination for transfer status failed.

Corrective Action

Its a system level problem. Contact Contact NetApp technical support. for further investigation.

Syslog Message

Volume move job failed because a query for transfer status of the destination volume '%s' in vserver '%s' failed.

Parameters

volpath (STRING): Name of the destination volume of the move job.
vserverName (STRING): Name of destination vserver.

mgmt.vopl.move.querySrcFld

Severity

NOTICE

Description

This message occurs when the 'volume move' job cannot be completed because a query of the source for transfer status failed. The 'volume move' job attempts to retry the operation.

Corrective Action

Use the 'volume move show' command to get the status of the move operation. If the problem persists, contact NetApp technical support.

Syslog Message

The 'volume move' job could not query the source '%s' for transfer status.

Parameters

volpath (STRING): Name of the source volume involved in the move operation.

mgmt.vopl.move.refVldbFld

Severity

NOTICE

Description

This message occurs when a 'volume move' operation fails to refresh modifiable parameters used by the 'move' job from the Volume Location Database (VLDB). Volume move operation will use current parameters until a refresh attempt succeeds.

Corrective Action

(None).

Syslog Message

The 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' could not refresh the modifiable parameters used by the 'move' job from the VLDB. Volume move operation will use current parameters until a refresh attempt succeeds.

Parameters

jobId (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.restart.failed

Severity

ERROR

Description

This message occurs when a volume move job encounters conditions that prevent it from restarting; for example, required snapshots have been deleted. This might result in loss of client access to the volume, stale temporary volumes and stale metadata.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job ID '%jd' could not restart correctly and might have left a stale temporary volume and stale persistent volume move data. Client access to the data stored on the source volume might be blocked. Reason: %s, error %d. Move job was started for volume '%s' in Vserver '%s'.

Parameters

jobID (LONGINT): Job ID of the volume move job.
reason (STRING): Reason for restart failure.
error (INT): Error code for the restart failure.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.snpNtDeletd

Severity

ERROR

Description

This message occurs when a 'volume move' operation cannot delete a reference snapshot created by the move job.

Corrective Action

Use the 'snapshot show' command to verify that the snapshot exists and is not locked by another process. Use the 'snapshot delete' command to delete the snapshot manually.

Syslog Message

snapshot for 'volume move' job ID %jd could not be deleted: name: %s; Vserver ID: %d; volume name: %s.

Parameters

jobId (LONGINT): ID of the volume move job.
snapName (STRING): Name of the snapshot.
vserverId (INT): Destination Vserver ID.
volName (STRING): Name of the parent volume of the snapshot.

mgmt.vopl.move.source.cleanup.failed

Severity

ERROR

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination aggregate but cannot delete the original volume instance on the source aggregate.

Corrective Action

Delete the original volume instance using the 'volume delete' command after offlining the volume.

Syslog Message

The 'volume move' operation with ID '%jd' could not delete the Volume %s in Vserver %s on %s aggregate after a successful volume move.

Parameters

jobId (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the volume instance that could not be deleted
vserverName (STRING): Name of the volume's Vserver.
aggrName (STRING): Name of the destination aggregate.

mgmt.vopl.move.srcVAttrGtFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the Volume Location Database (VLDB) attributes for the source volume cannot be read.

Corrective Action

To check whether the VLDB process is up and running, run the (privilege: advanced) "cluster ring show -unitname vldb" command. Contact NetApp technical support.

Syslog Message

Volume move job failed because the VLDB attributes for source volume "%s" could not be read.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.srcVolInconst

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the source volume is inconsistent.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job failed because the source volume '%s' is inconsistent.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.srcVolOffln

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the source volume is offline.

Corrective Action

Bring the source volume online and retry the move job.

Syslog Message

Volume move job failed because the source volume '%s' is offline.

Parameters

volpath (STRING): Name of the source volume of the move.

mgmt.vopl.move.srcVolRstrctd

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because the source volume is restricted.

Corrective Action

If the source volume is of type DP and a "snapmirror initialize" operation is running on it, wait for the operation to finish, then retry "volume move" operation. If the problem persists, contact NetApp technical

support.

Syslog Message

Volume move job failed because the source volume "%s" is restricted.

Parameters

volpath (STRING): Name of the source volume of the move job.

mgmt.vopl.move.srcVolTemp

Severity

ALERT

Description

This message occurs when a 'volume move' operation cannot start because the source volume is marked as temporary.

Corrective Action

Verify that the source volume exists.

Syslog Message

'volume move' operation with job ID '%jd' for source volume name '%s' and Vserver name '%s' failed because the source volume is marked as temporary.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.move.stSnpTgDstFld

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because a snapshot tag cannot be written to the destination volume.

Corrective Action

Check whether the destination volume is online. If the problem persists, contact NetApp technical support.

Syslog Message

Volume move job failed because a snapshot tag could not be written to the destination volume '%s'.

Parameters

volpath (STRING): Name of the destination volume of the move job.

mgmt.vopl.move.voplIntrnlErr

Severity

ERROR

Description

This message occurs when the volume move job cannot be completed because of an internal error in the Volume Operations Library used by the job management code.

Corrective Action

Contact NetApp technical support.

Syslog Message

Volume move job ID '%jd' for volume '%s' in Vserver '%s' failed because of an internal error in Volume Operations Library used by the job management code.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.move.XferNotFound

Severity

ERROR

Description

This message occurs when the 'volume move' job cannot find the specified transfer.

Corrective Action

Contact NetApp technical support.

Syslog Message

Transfer not found for 'volume move' job with '%jd' for volume '%s' in Vserver '%s'.

Parameters

jobId (LONGINT): ID of the 'volume move' job.
volName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmt.vopl.rehost.failed

Severity

ERROR

Description

This message occurs when a volume rehost job attempts to rehost a volume from one Vserver to another and is unsuccessful. This might happen if the target volume is being accessed by some other Data ONTAP® operations (for example, volume move); if the target volume is in a relationship, such as a SnapMirror DP relationship; or if the aggregate hosting the volume is undergoing a wafliron process. The system makes its best effort to revert the rehost procedure and make the volume available under the source Vserver. Subsequent attempts to rehost this volume might be successful; if the volume rehost revert procedure still fails, use the command "debug vreport" to fix volume discrepancies.

Corrective Action

Follow the instructions provided as part of the volume rehost error and retry the operation after some time. If the volume rehost revert procedure fails and there are volume discrepancies, use command "debug

vreport" in diagnostic mode to fix volume discrepancies.

Syslog Message

The volume rehost operation on volume '%s [%s]' on Vserver '%s' to destination Vserver '%s' by administrator '%s' failed with reason: '%s'. The volume rehost operation can be retried after sometime.

Parameters

volName (STRING): Name of the target volume.
volUuid (STRING): Target volume UUID.
vserverName (STRING): Name of the source Vserver.
destinationVserverName (STRING): Name of the destination Vserver.
adminName (STRING): Name of the administrator attemting the volume rehost operation.
reasonforFailure (STRING): Reason for volume rehost failure.

mgmt.vopl.rehost.succeeded

Severity

INFORMATIONAL

Description

This message occurs when a volume rehost job is successful in rehosting a volume from one Vserver to another.

Corrective Action

(None).

Syslog Message

The volume rehost operation on volume '%s [%s]' on Vserver '%s' to destination Vserver '%s' by administrator '%s' is successful.

Parameters

volName (STRING): Name of the target volume.
volUuid (STRING): Target volume UUID.
vserverName (STRING): Name of the source Vserver.
destinationVserverName (STRING): Name of the destination Vserver.
adminName (STRING): Name of the administrator attemting the volume rehost operation.

mgmt.vopl.rstart.fail.jstate

Severity

NOTICE

Description

This message occurs when a volume move operation encounters an error during the restart phase because it cannot retrieve the state information from the job manager. The system repeatedly attempts the restart process until it can be completed.

Corrective Action

Verify that the restart phase is completed by running the "volume move show -vserver <vservername> -volume <volName%gt;" command. If the restart phase continues to fail, contact NetApp technical support.

volume move operation with job ID '%jd' for volume '%s' in Vserver '%s' encountered an error in the restart phase when attempting to retrieve the job state information.

Parameters

jobID (LONGINT): Job ID of the volume move operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.rstart.retry.fail

Severity

ALERT

Description

This message occurs when an attempt to restart an interrupted 'volume move' operation repeatedly encounters an error and cannot proceed any further. The 'volume move' job will transition to a failed state without cleanup being attempted.

Corrective Action

Check the job status for the ID listed in the event message, and look for errors involving the source and destination nodes and aggregates, and then contact NetApp technical support.

Syslog Message

The attempt to restart the 'volume move' operation with job ID '%jd' for volume '%s' in Vserver '%s' failed.

Parameters

jobID (LONGINT): Job ID of the 'volume move' operation.
volName (STRING): Name of the source volume.
vserverName (STRING): Name of the source Vserver.

mgmt.vopl.vmsi.fail.no.entry

Severity

ALERT

Description

This message occurs when a "volume move" operation cannot update the VLDB table, because the system cannot find any record of the operation within the table. This failure prevents the operation from being displayed in by the "volume move show" command.

Corrective Action

Use the "job show -id" command to display the current status of the "volume move" operation.

Syslog Message

The "volume move" operation for the volume %s with job-id %jd could not modify the entry in the VLDB table for the "volume move show" command. Use the "job show -id" command to track the status of this move operation.

Parameters

volName (STRING): Name of the volume.

jobId (LONGINT): Job ID of the "volume move" operation.

mgmtgwd events

mgmtgwd.certificate events

mgmtgwd.certificate.expired

Severity

ERROR

Description

This message occurs when a digital certificate for a Vserver expires. Client-server communication is not secure.

Corrective Action

Install a new digital certificate on the system using the 'security certificate create' or 'security certificate install' command.

Syslog Message

A digital certificate with Fully Qualified Domain Name (FQDN) %s, Serial Number %s, Certificate Authority '%s' and type %s for Vserver %s has expired.

Parameters

common_name (STRING): Name of the Fully Qualified Domain Name(FQDN) whose digital certificate expired.
serial_number (STRING): Serial Number of the digital certificate.
certificate_authority (STRING): Name of the Certificate Authority.
type (STRING): Type of the digital certificate.
vserver (STRING): Name of the Vserver.

mgmtgwd.certificate.expiring

Severity

ERROR

Description

This message occurs when a digital certificate for a Vserver is about to expire. Client-server communication will not be secure if the certificate expires.

Corrective Action

Install a new digital certificate on the system using the 'security certificate create' or 'security certificate install' command.

Syslog Message

A digital certificate with Fully Qualified Domain Name (FQDN) %s, Serial Number %s, Certificate Authority '%s' and type %s for Vserver %s will expire in the next %d day(s).

Parameters

common_name (STRING): Name of the Fully Qualified Domain Name(FQDN) whose digital certificate is about to expire.
serial_number (STRING): Serial Number of the digital certificate.
certificate_authority (STRING): Name of the Certificate Authority whose digital certificate is about to

expire.

type (STRING): Type of the digital certificate.

vserver (STRING): Name of the Vserver.

days (LONGINT): Number of days remaining until the certificate expires.

mgmtgwd.certificate.switch

Severity

ALERT

Description

This message occurs when the user installed certificates of the service processor API service become invalid and are subsequently replaced with internal certificates.

Corrective Action

Install new digital certificates on the system using the "security certificate create" or "security certificate install" command and enable them using "system service-processor api-service enable-installed-certificates" command.

Syslog Message

User installed certificates of the service processor API service are replaced with internal certificates.

Parameters

(None).

mgmtgwd.configbr events

mgmtgwd.configbr.backupCompleted

Deprecated

This event was replaced by configbr.backupCompleted.

Severity

NOTICE

Description

This message occurs when a scheduled configuration backup is successfully created.

Corrective Action

(None).

Syslog Message

Scheduled configuration backup %s was created successfully.

Parameters

backup (STRING): Backup file.

mgmtgwd.configbr.backupFailed

Deprecated

This event was replaced by configbr.backupFailed.

Severity

ERROR

Description

This message occurs when when the configuration backup cannot be created.

Corrective Action

If the reason is about the root volume file system, ensure that it is available and has enough space to create a backup. If the reason is that a scheduled backup file could not be created, create the backup file manually and upload it to the remote URL.

Syslog Message

The %s configuration backup %s cannot be created. Error: '%s'.

Parameters

type (STRING): Type of backup, either cluster or local.
backup (STRING): Backup file.
reason (STRING): Reason for the error.

mgmtgwd.configbr.deleteFailed

Deprecated

This event was replaced by configbr.deleteFailed.

Severity

ERROR

Description

This message occurs when an old configuration backup cannot be deleted.

Corrective Action

Ensure that the node is accessible and healthy. If necessary, delete the backup manually.

Syslog Message

The %s configuration backup %s on node %s cannot be deleted. Error: '%s'.

Parameters

type (STRING): Type of backup, either cluster or local.
backup (STRING): Backup file.
node (STRING): Node on which the backup file exists.
reason (STRING): Reason for the error.

mgmtgwd.configbr.distributeFailed

Deprecated

This event was replaced by configbr.distributeFailed.

Severity

ERROR

Description

This message occurs when a configuration backup cannot be distributed to another node in the cluster.

Corrective Action

Ensure that the destination node is accessible and healthy. If necessary, upload the backup file to the remote URL to increase the availability of the backup file.

Syslog Message

Configuration backup %s cannot be distributed to node %s. Error: '%s'.

Parameters

backup (STRING): Backup file.
destination_node (STRING): Destination node to which the backup file failed to be distributed.
reason (STRING): Reason for the error.

mgmtgwd.configbr.initFailed

Deprecated

This event was replaced by configbr.initFailed.

Severity

ERROR

Description

This message occurs when when the configuration backup and restore feature cannot initialize the necessary software components.

Corrective Action

If the reason is about the backup directory under the root volume, ensure that the root volume is available and has enough free space. If the reason is about populating replicated database entries, wait five minutes and then use the advanced mode of the command-line interface to access the "Backup Settings" menu to ensure that backup schedules are listed. If the reason is about creating backup jobs, wait five minutes and then run the 'job show' command to ensure that backup jobs are displayed for each schedule.

Syslog Message

Configuration backup and restore feature could not be initialized. Error: '%s'.

Parameters

reason (STRING): Reason for the initialization failure.

mgmtgwd.configbr.intError

Deprecated

This event was replaced by configbr.intError.

Severity

ERROR

Description

This message occurs when an attempt to create a configuration backup file encountered an internal software error.

Corrective Action

Create the configuration backup file manually by using the "system configuration backup create" command.

Syslog Message

Configuration backup and restore detected an internal software error. Error: '%s'.

Parameters

error (STRING): Internal software error.

mgmtgwd.configbr.noDestURL

Deprecated

This event was replaced by configbr.noDestURL.

Severity

ERROR

Description

This message occurs when the cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

Corrective Action

Configure an offsite configuration backup destination URL as soon as possible, using the commands "system configuration backup settings modify -destination <destination-url> -username <username-on-destination-url>" and "system configuration backup settings set-password".

Syslog Message

Cluster backup is saved on only one node and no offsite configuration backup destination URL is configured.

Parameters

(None).

mgmtgwd.configbr.snapshotDeleteFailed

Deprecated

This event was replaced by configbr.snapshotDelFailed.

Severity

ERROR

Description

This message occurs when a Snapshot(tm) copy on the root volume cannot be deleted. The Snapshot copy was created during a configuration backup.

Corrective Action

Ensure that the root volume file system is available.

Syslog Message

Snapshot copy %s on the root volume cannot be deleted on node %s. Error: '%s'.

Parameters

name (STRING): Name of the Snapshot copy.
node (STRING): Node on which the Snapshot copy was created.
reason (STRING): Reason for the error.

mgmtgwd.configbr.unpubFailed

Deprecated

This event was replaced by configbr.unpubFailed.

Severity

ERROR

Description

This message occurs when the configuration backup and restore feature fails to unpublish a package by using the file replication service. The configuration backup process creates file packages and registers them with the file replication service, which stores the package in the root file system. When the configuration backup process is complete, it cleans up these files by unpublishing the package by using the file replication service. When unpublishing fails, these files are not be cleaned up and remain in the root file system. This message does not indicate a failure in the configuration backup process, which continues despite the event. You can monitor the status of an ongoing configuration backup process by using the "job show" command. The completed configuration backup files are visible when you run the "system configuration backup show" command.

Corrective Action

Obtain diagnostic privilege and view the file replication packages by using the "system services replication show" command. Unpublish the file replication packages by issuing the "system services replication unpublish" command, for which you also need diagnostic privilege. Check the "cluster ring show" command to ensure that the node is in quorum; management quorum is required for the unpublish command to succeed. Do not take these actions while an active configuration backup process is running.

Syslog Message

Configuration backup and restore failed to unpublish package %s; Error: '%s'.

Parameters

package_name (STRING): Name of the package.
reason (STRING): Reason for the unpublishing failure.

mgmtgwd.configbr.uploadFailed

Deprecated

This event was replaced by configbr.uploadFailed.

Severity

ERROR

Description

This message occurs when the configuration backup cannot be uploaded to the destination URL.

Corrective Action

Ensure that the destination URL is reachable, the protocol in the URL is supported, and the user credentials are valid.

Syslog Message

Configuration backup file %s cannot be uploaded to the destination URL %s. Error: '%s'.

Parameters

backup (STRING): Backup file.
destination (STRING): Destination URL.
reason (STRING): Reason for the upload failure.

mgmtgwd.fg events

mgmtgwd.fg.32bit.nfs3ids

Severity

ERROR

Description

This message occurs when the user creates a FlexGroup on a Vserver that has NFSv3 enabled, but uses 32-bit identifiers, which could cause file ID collisions.

Corrective Action

To prevent file ID collisions within the FlexGroup, enable NFSv3 64-bit FSIDs and file IDs on the Vserver. For more information or assistance, contact NetApp technical support.

Syslog Message

FlexGroup %s was created on Vserver %s which uses 32-bit NFSv3 FSIDs and File IDs. File ID collisions may occur.

Parameters

volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmtgwd.fg.32bit.nfs4ids

Severity

ERROR

Description

This message occurs when the user creates a FlexGroup on a Vserver that has NFSv4.x enabled, but uses 32-bit identifiers, which could cause file ID collisions.

Corrective Action

To prevent file ID collisions within the FlexGroup, enable NFSv4.x 64-bit FSIDs and file IDs on the Vserver. For more information or assistance, contact NetApp technical support.

Syslog Message

FlexGroup %s was created on Vserver %s which uses 32-bit NFSv4.x FSIDs and File IDs. File ID collisions may occur.

Parameters

    volumeName (STRING): Name of the volume.
    vserverName (STRING): Name of the Vserver.

mgmtgwd.fg.modify.constituent.fail

Severity

    ERROR

Description

    This message occurs when modification of a FlexGroup constituent's state fails during the operation to modify the state of the FlexGroup. The FlexGroup will be in the 'mixed' state and constituents that are still online will be able to serve data. Constituents that are offline will not be able to serve data. All management operations will be unavailable on the FlexGroup until it is brought completely online.

Corrective Action

    Correct the problem based on the reason specified. If the error persists, contact NetApp technical support.

Syslog Message

    Failed to modify the state of FlexGroup constituent %s in Vserver %s. Reason: %s.

Parameters

    volumeName (STRING): Name of the constituent.
    vserverName (STRING): Name of the Vserver.
    reason (STRING): Reason for the failure.

mgmtgwd.fg.modify.rlbk.fail

Severity

    ERROR

Description

    This message occurs after a series of failures. First, the FlexGroup resize fails. To recover, we try to rollback the FlexGroup constituents to their original sizes. If we fail to rollback any of these constituents, this message will occur.

Corrective Action

    Correct the problem based on the reason specified. If the error persists, contact NetApp technical support.

Syslog Message

    Failed to rollback the size of FlexGroup constituent %s in Vserver %s Reason: %s.

Parameters

    volumeName (STRING): Name of the constituent.
    vserverName (STRING): Name of the Vserver.
    reason (STRING): Reason for the failure.

mgmtgwd.fg.sis.op.constituent.fail

Severity

ERROR

Description

This message occurs when the execution of the efficiency operation on a FlexGroup constituent fails.

Corrective Action

Correct the problem based on the reason specified. If the error persists, contact Netapp technical support for further assistance.

Syslog Message

Failed to execute the efficiency operation on FlexGroup constituent %s in Vserver %s. Operation: %s. Reason: %s.

Parameters

volumeName (STRING): Name of the constituent.
vserverName (STRING): Name of the Vserver.
operationType (STRING): Type of the efficiency operation.
reason (STRING): Reason for the failure.

mgmtgwd.filereplication events

mgmtgwd.filereplication.failverify

Severity

ERROR

Description

This message occurs when the startup scan of the file replication publishing root directory fails to verify packages. This might be due to file corruption or a mixed-version issue.

Corrective Action

Contact NetApp technical support.

Syslog Message

The startup scan of the file replication publishing directory failed to verify one or more packages.

Parameters

(None).

mgmtgwd.filereplication.forbidden

Severity

ERROR

Description

This message occurs when the file replication service receives a request on an unsecure network interface.

Corrective Action

Use the "network interface show" command to verify that the source IP address of the request is from an internal, authorized source. This could be a security breach attempt. File replication never attempts to

communicate over nonclustered interfaces.

Syslog Message

The file replication service denied an incoming request that came from '%s' through the virtual interface address '%s'.

Parameters

client_ip (STRING): IP address of the client.
server_ip (STRING): IP address of the server interface.

mgmtgwd.filereplication.nopubroot

Severity

ERROR

Description

This message occurs when the file replication service cannot find or initialize the publishing root directory.

Corrective Action

Contact NetApp technical support.

Syslog Message

The publishing root directory at '%s' could not be initialized. Error: '%s'.

Parameters

dir (STRING): Location of the publishing root directory.
reason (STRING): Reason the directory cannot be used.

mgmtgwd.filereplication.noserver

Severity

ERROR

Description

This message occurs when the file replication module cannot initialize the local server process.

Corrective Action

Ensure that the local replication network port is not in use ("network port show" and "network port broadcast-domain show") and that system resources are not limited.

Syslog Message

The file replication service could not initialize its server process. Error: '%s'.

Parameters

description (STRING): Reason for the failure.

mgmtgwd.filereplication.nostart

Severity

ERROR

Description

This message occurs when the file replication service cannot be started.

Corrective Action

Contact NetApp technical support.

Syslog Message

The file replication service could not be started.

Parameters

(None).

mgmtgwd.fips events

mgmtgwd.fips.post.failure

Severity

ERROR

Description

This message occurs when an unrecoverable error prevents initialization of the cryptographic subsystem into FIPS mode. No SSL communication will be possible with the storage system in this state. Other ONTAP features may also be affected by the lack of cryptographic operations.

Corrective Action

To operate in non FIPS cryptographic mode, turn off FIPS mode for the SSL interface using command "security config modify -interface SSL -is-fips-enabled false" and restart the system. For more information or assistance, contact NetApp technical support.

Syslog Message

SSL interface disabled due to failure of FIPS mode cryptographic services.

Parameters

(None).

mgmtgwd.jobmgr events

mgmtgwd.jobmgr.fetcherr

Severity

ERROR

Description

This message occurs when the system cannot locate the configuration for a specific Vserver.

Corrective Action

Disable and reenable the auditing function of the affected Vserver using the 'vserver audit disable' and 'vserver audit enable' commands to attempt to retrieve the missing configuration information. If the audit enable command fails, contact the system administrator for assistance.

Syslog Message

Job '%s' [jobid %d, name "%s", UUID %s] failed on Vserver '%s'.

Parameters

name (STRING): Name of the job.
jobid (INT): ID of the job.
description (STRING): Description of the job.
jobuuid (STRING): UUID of the job.
vservername (STRING): Vserver name linked with the job.

mgmtgwd.jobmgr.high.jobs

Severity

ERROR

Description

This message occurs when the total number of queued jobs, including both the cluster-wide jobs and the node-local jobs, exceeds a configured threshold.

Corrective Action

Allow the backlog of jobs to run to completion before adding more jobs. Halt external tools from issuing frequent commands that result in jobs. You can view the job queue thresholds with the diag privilege command "job queue config show". The command "job show" displays cluster-wide jobs. The command "job private show" displays node-local jobs. The command "job history show" displays job history. The command "job queue show" displays the job queues.

Syslog Message

High number of jobs: there are %d jobs queued on this node. New jobs will not be accepted by this node when the total number of jobs exceeds %d.

Parameters

jobs (LONGINT): Number of jobs queued.
max (LONGINT): Maximum number of jobs accepted.

mgmtgwd.jobmgr.high.jobtype

Severity

ERROR

Description

This message occurs when the total number of queued jobs of any type, including both the cluster-wide jobs and the node-local jobs, exceeds a configured threshold.

Corrective Action

Allow the backlog of jobs to run to completion before adding more jobs. Halt external tools from issuing frequent commands that result in jobs. You can view the job queue thresholds with the diag privilege command "job queue config show". The command "job show" displays cluster-wide jobs. The command "job private show" displays node-local jobs. The command "job history show" displays job history. The command "job queue show" displays the job queues.

Syslog Message

High number of "%s" jobs: there are %d of this job type queued on this node. New jobs will not be accepted by this node when the total number of jobs of this type exceeds %d.

Parameters

type (STRING): Job type.
jobs (LONGINT): Number of jobs queued of this type.
max (LONGINT): Maximum number of jobs accepted of this type.

mgmtgwd.jobmgr.init.err

Severity

ERROR

Description

This message occurs when the Job manager cannot load a private job.

Corrective Action

Look into the private job history by using the job_id. If necessary, restart the activity by using the applicable command. Example Command: job private show-completed -node node-01 -id 10

Syslog Message

"Unable to load private job. Job UUID = %s and ID= %ul. Reason: %s"

Parameters

job_uuid (STRING): UUID of the private job.
job_id (LONGINT): Human-readable ID of the private job.
failure_reason (STRING): Reason for failure to load.

mgmtgwd.jobmgr.jobcomplete.failure

Severity

INFORMATIONAL

Description

This message occurs when the Job Manager completes a job unsuccessfully.

Corrective Action

(None).

Syslog Message

Job "%s" [id %d] (%s) completed unsuccessfully: %s (%llu).

Parameters

name (STRING): Name of the job.
jobid (INT): ID of the job.
description (STRING): Description of the job.
completion (STRING): Completion string for the job.
code (LONGINT): Completion code for the job.
jobuuid (STRING): UUID of the job.

mgmtgwd.jobmgr.jobrestart

Severity

INFORMATIONAL

Description

This message occurs when the Job Manager restarts a job.

Corrective Action

(None).

Syslog Message

Restarted job "%s" [id %d]: %s.

Parameters

name (STRING): Name of the job.
jobid (INT): ID of the job.
description (STRING): Description of the job.
jobuuid (STRING): UUID of the job.

mgmtgwd.jobmgr.private.jobcomplete.failure

Severity

INFORMATIONAL

Description

This message occurs when the Job Manager completes a private job unsuccessfully.

Corrective Action

(None).

Syslog Message

Private job "%s" [id %d] (%s) completed unsuccessfully: %s (%llu).

Parameters

name (STRING): Name of the job.
jobid (INT): ID of the job.
description (STRING): Description of the job.
completion (STRING): Completion string for the job.
code (LONGINT): Completion code for the job.
jobuuid (STRING): UUID of the job.

mgmtgwd.jobmgr.sched.peer.update

Severity

ERROR

Description

This message occurs when a job schedule is updated on the peer cluster and might need to be updated on this cluster.

Corrective Action

Update the schedule on this cluster to match the peer cluster.

Syslog Message

"Schedule "%s" was %s on peer cluster and must also be updated on this cluster. Command on peer cluster: %s."

Parameters

schedule (STRING): Schedule name.
operation (STRING): Operation performed on schedule: "created," "modified," or "deleted."
command (STRING): Job schedule command that was executed on the peer cluster.

mgmtgwd.jobmgr.sched.type

Severity

ERROR

Description

This message occurs when a job schedule is created with the same name as a schedule from the MetroCluster(tm) partner cluster, but with a different schedule type.

Corrective Action

Create a replacement schedule with a different name, and then delete one of the same-named schedules.

Syslog Message

Schedule "%s" was created with the same name as an existing schedule, but with a different schedule type.

Parameters

schedule (STRING): Schedule name.

mgmtgwd.jobmgr.sched.update

Deprecated

Deprecated as of version 9.6. Job schedules are automatically replicated to the peer cluster.

Severity

ERROR

Description

This message occurs when a job schedule is updated on this cluster and might need to be updated on the peer cluster.

Corrective Action

On the peer cluster, update the schedule to match this cluster.

Syslog Message

"Schedule "%s" was %s and must also be updated on the peer cluster. Command: %s."

Parameters

schedule (STRING): Schedule name.
operation (STRING): Operation performed on schedule: "created," "modified," or "deleted."

command (STRING): Job schedule command that was executed.

mgmtgwd.mixed events

mgmtgwd.mixed.version

Severity

ALERT

Description

This message occurs when not all nodes are running the same version of ONTAP. Not all features of a software version are available to the cluster unless all nodes are at the same version. This message can occur when upgrade or revert is in progress or has not completed successfully.

Corrective Action

Use "version" to check the current cluster version and use "version -node *" to check the version on individual nodes.

Syslog Message

Not all nodes are at the same ONTAP version. Cluster is operating in version %s. One or more nodes are at %s.

Parameters

ClusterVersion (STRING): Current cluster version.
HighestVersion (STRING): Highest version in the cluster.

mgmtgwd.replace events

mgmtgwd.replace.node.mgmt.lif

Severity

ERROR

Description

This message occurs when the temporary node management LIF, which is normally deleted automatically, has not been replaced. It should be replaced to free the DHCP address.

Corrective Action

Create a new node management LIF by using the 'network interface create' command, and then delete the temporary node management LIF by using the 'network interface delete' command.

Syslog Message

Temporary node management LIF '%s' should be replaced with a new node management LIF.

Parameters

lif (STRING): Temporary node management LIF.

mgmtgwd.repos events

mgmtgwd.repos.conflictingOps

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when an Infinite Volume operation cannot be started because another Infinite Volume operation is already in progress.

Corrective Action

Check whether another Infinite Volume operation is currently in progress by running the 'job show' command. After the current operation is complete, try the new operation again. If the error persists, contact NetApp technical support.

Syslog Message

Infinite Volume operation '%s' could not be started on volume '%s' on Vserver '%s', because operation '%s' is already in progress.

Parameters

attemptedOperation (STRING): Name of the Infinite Volume operation that could not be started.
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
existingOperation (STRING): Name of the Infinite Volume operation already running.

mgmtgwd.revertto events

mgmtgwd.revertTo.forceErrors

Deprecated

This event was replaced by revertTo.force.

Severity

NOTICE

Description

This message occurs when a revert to process is being initiated with the "force" flag, and configuration errors have been detected.

Corrective Action

(None).

Syslog Message

Forcing revert in spite of detected configuration errors.

Parameters

(None).

mgmtgwd.rootvol events

mgmtgwd.rootvol.recovery.changed

Severity

EMERGENCY

Description

This message occurs when the system detects that a root volume might have changed, causing the local management databases to be out of sync with the replicated databases. The node is not fully operational. Data lifs might have failed over within the cluster, so NFS and CIFS access is limited on this node. There also might have been a loss of stored data. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Contact technical support to obtain the root volume recovery procedures.

Syslog Message

The contents of the root volume might have changed and the local management databases might be out of sync with the replicated databases. This node is not fully operational. Contact technical support to obtain the root volume recovery procedures.

Parameters

(None).

mgmtgwd.rootvol.recovery.different

Severity

EMERGENCY

Description

This message occurs when the system detects a different root volume than it has used previously. The node is not fully operational. Data lifs might have failed over within the cluster, so NFS and CIFS access is limited on this node. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Contact technical support to obtain the root volume recovery procedures.

Syslog Message

The root volume is different than the one previously used by this node. This node is not fully operational. Contact technical support to obtain the root volume recovery procedures.

Parameters

(None).

mgmtgwd.rootvol.recovery.new

Severity

EMERGENCY

Description

This message occurs when the system detects a new root volume. The node is not fully operational. Data lifs might have failed over within the cluster, so NFS and CIFS access is limited on this node. There also might be a loss of stored data. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Contact technical support to obtain the root volume recovery procedures.

Syslog Message

A new root volume was detected. This node is not fully operational. Contact technical support to obtain the root volume recovery procedures.

Parameters

(None).

mgmtgwd.rootvol.recovery.takeover.changed

Severity

EMERGENCY

Description

This message occurs when the system detects that a root volume might have changed, causing the local management databases to be out of sync with the replicated databases. This occurred due to corruption of the Non-Volatile RAM log (NVLOG) during takeover. The node is not fully operational. Data logical interfaces (LIFs) might have failed over within the cluster, so NFS and CIFS access is limited on this node. There also might have been a loss of stored data. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Contact technical support to obtain the root volume recovery procedures.

Syslog Message

The contents of the root volume might have changed and the local management databases might be out of sync with the replicated databases due to corruption of NVLOG data during takeover. This node is not fully operational. Contact technical support to obtain the root volume recovery procedures.

Parameters

(None).

mgmtgwd.rootvolrec events

mgmtgwd.rootvolrec.low.space

Severity

EMERGENCY

Description

This message occurs when the system detects that the root volume is dangerously low on space. The node is not fully operational. Data logical interfaces (LIFs) might have failed over within the cluster, so NFS and CIFS access is limited on this node. Administrative capability is limited to local recovery procedures for this node to make space available on the root volume.

Corrective Action

Contact NetApp technical support for assistance to make space available on the root volume by deleting old Snapshot® copies, deleting unnecessary files, or expanding the root volume capacity. After space is available, controller needs to be rebooted.

Syslog Message

The root volume on node "%s" is dangerously low on space. Less than %d MB of free space remaining.

Parameters

node (STRING): Node on which the root volume is low on space.
threshold_in_mb (INT): Threshold, in MB, that is being used to compare against the root volume's available space.

mgmtgwd.schedsnap events

mgmtgwd.schedSnap.createFail

Severity

ERROR

Description

This message occurs when the system fails to create a Snapshot(tm) copy for the given volume.

Corrective Action

Correct the problem based on the reason specified. If the error persists, contact NetApp technical support.

Syslog Message

Skipping creation of scheduled Snapshot copy '%s' on volume '%s' on vserver '%s' for schedule '%s' prefix '%s' (reason: %s)

Parameters

snapshotName (STRING): Name of the Snapshot copy.
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the virtual server.
scheduleName (STRING): Name of the Snapshot policy schedule.
prefixName (STRING): Name of the prefix associated with the Snapshot policy schedule.
reason (STRING): Reason for the failure.

mgmtgwd.schedSnap.createSkip

Severity

ERROR

Description

This message occurs when a scheduled Snapshot(tm) copy for a volume is skipped because there is a conflicting operation being performed on the volume.

Corrective Action

Correct the problem based on the reason specified. If the error persists, contact NetApp technical support.

Syslog Message

Skipping creation of scheduled Snapshot copy for volume "%s" on Vserver "%s" using policy "%s". Reason: %s.

Parameters

volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
snapshotPolicy (STRING): Name of the Snapshot policy.
reason (STRING): Reason that the scheduled Snapshot copy was skipped.
appUuid (STRING): UUID of the Application.

mgmtgwd.sign events

mgmtgwd.sign.cert.expired

Severity

ERROR

Description

This message occurs when a digital certificate for a Vserver expires. Client-server communication is not secure.

Corrective Action

Sign a new digital certificate on the system using the 'security certificate sign' command.

Syslog Message

A digital certificate with Fully Qualified Domain Name (FQDN) %s, Serial Number %s, Certificate Authority '%s' and Certificate Authority Serial Number %s for Vserver %s has expired.

Parameters

common_name (STRING): Name of the Fully Qualified Domain Name(FQDN) whose digital certificate expired.
serial_number (STRING): Serial Number of the digital certificate.
certificate_authority (STRING): Name of the Certificate Authority.
ca_serial_number (STRING): Serial Number of the Certificate Authority(CA) that signed the digital certificate.
vserver (STRING): Name of the Vserver.

mgmtgwd.sign.cert.expiring

Severity

ERROR

Description

This message occurs when a digital certificate for a Vserver is about to expire. Client-server communication will not be secure if the certificate expires.

Corrective Action

Sign a new digital certificate on the system using the 'security certificate sign' command.

Syslog Message

A digital certificate with Fully Qualified Domain Name (FQDN) %s, Serial Number %s, Certificate Authority '%s' and Certificate Authority Serial Number %s for Vserver %s will expire in %d day(s).

Parameters

common_name (STRING): Name of the Fully Qualified Domain Name(FQDN) whose digital certificate is about to expire.
serial_number (STRING): Serial Number of the digital certificate.
certificate_authority (STRING): Name of the Certificate Authority whose digital certificate that is about to expire.
ca_serial_number (STRING): Serial Number of Certificate Authority(CA) that signed the digital certificate.
vserver (STRING): Name of the Vserver.
days (INT): Number of days remaining until the certificate expires.

mgmtgwd.snapshot events

mgmtgwd.snapshot.deleteWarn

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when a snapshot cannot be deleted from an Infinite Volume.

Corrective Action

Delete one or more older snapshots associated with this schedule by using the "volume snapshot delete" command.

Syslog Message

Skipping deletion of scheduled snapshot "%s" on volume "%s" on Vserver "%s" for schedule "%s" prefix "%s" (reason: %s).

Parameters

snapshotName (STRING): Name of the snapshot.
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
scheduleName (STRING): Name of the snapshot policy schedule.
prefixName (STRING): Name of the prefix associated with the snapshot policy schedule.
reason (STRING): Reason for the failure.

mgmtgwd.snapshot.frcRestore

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when a snapshot is restored on an Infinite Volume using the 'force' option.

Corrective Action

(None).

Syslog Message

Volume '%s' on Vserver '%s' was restored to snapshot '%s' using the 'force' option.

Parameters

volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
snapshotName (STRING): Name of the snapshot.

mgmtgwd.snapshot.partCreate

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when a snapshot copy is partially created on an Infinite Volume. Residual snapshots might remain on one or more Infinite Volume constituent volumes. These snapshots might consume the snapshot reserve on the constituent volumes.

Corrective Action

Contact NetApp technical support.

Syslog Message

Scheduled snapshot '%s' of volume '%s' on Vserver '%s' for schedule '%s' prefix '%s' was partially created and cleanup failed on one or more constituent volumes.

Parameters

snapshotName (STRING): Name of the snapshot.
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.
scheduleName (STRING): Name of the snapshot policy schedule.
prefixName (STRING): Name of the prefix associated with the snapshot policy schedule.
constituentMsidList (STRING): List of master data set IDs (MSIDs) of Infinite Volume constituent volumes that might have residual snapshots.

mgmtgwd.snapshot.tooManySnap

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when a snapshot cannot be created on an Infinite Volume because too many snapshots exist for the associated schedule.

Corrective Action

Delete an older snapshot associated with this schedule using the 'volume snapshot delete' command.

Syslog Message

Scheduled snapshot '%s' of volume '%s' on Vserver '%s' could not be created because too many snapshots exist for the associated schedule.

Parameters

snapshotName (STRING): Name of the snapshot.
volumeName (STRING): Name of the volume.
vserverName (STRING): Name of the Vserver.

mgmtgwd.upgrade events

mgmtgwd.upgrade.aborted

Severity

ALERT

Description

This message occurs when an upgrade task is aborted. The node will not be fully operational.

Corrective Action

(Call support).

Syslog Message

(None).

Parameters

(None).

mgmtgwd.upgrade.failed

Severity

ALERT

Description

This message occurs when one or more upgrade tasks fails. The node will not be fully operational.

Corrective Action

(Call support).

Syslog Message

(None).

Parameters

(None).

mgmtgwd.upgrade.started

Severity

INFORMATIONAL

Description

This message occurs when an upgrade is started.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgmtgwd.upgrade.success

Severity

INFORMATIONAL

Description

This message occurs when an upgrade is completed successfully.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgmtgwd.var events

mgmtgwd.var.recovery

Severity

EMERGENCY

Description

This message occurs when the system detects a missing or corrupted /var root directory. The node is not fully operational. Data LIFs might have failed over within the cluster, so NFS and CIFS access is limited on this node. There also might be a loss of stored data. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Contact NetApp technical support to obtain the recovery procedures.

Syslog Message

Part of the /var boot directory is missing. This node is not fully operational. Contact technical support to obtain the recovery procedures.

Parameters

(None).

mgmtgwd.volcreatedrestricted events

mgmtgwd.volcreatedrestricted

Severity

NOTICE

Description

This message occurs when a volume is created in the restricted state. This message is used to update the status of the health dashboard.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver (STRING): The vserver that owns the volume.
volume (STRING): The name of the volume.

mgmtgwd.volmove events

mgmtgwd.volmove.notoptimized

Severity

NOTICE

Description

This message occurs when a volume move operation does not take the optimized path to avoid read requests from a cloud-based tier.

Corrective Action

(None).

Syslog Message

Volume move operation from source aggregate "%s" to destination aggregate "%s" of volume "%s" on Vserver "%s" might need to copy data from existing objects in the capacity tier.

Parameters

    sourceAggregate (STRING): Name of the source aggregate.
    destinationAggregate (STRING): Name of the destination aggregate.
    volume (STRING): Name of the volume.
    Vserver (STRING): Vserver that owns the volume.
    errMsg (STRING): Error reason why volume move operation did not avoid reads from the cloud.

mgmtgwd.volmove.optimized

Severity

    NOTICE

Description

    This message occurs when a volume move operation avoids a read request from a cloud-based tier.

Corrective Action

    (None).

Syslog Message

    Volume move operation from source aggregate "%s" to destination aggregate "%s" of volume "%s" on Vserver "%s" avoided copying data from existing objects in the capacity tier.

Parameters

    sourceAggregate (STRING): Name of the source aggregate.
    destinationAggregate (STRING): Name of the destination aggregate.
    volume (STRING): Name of the volume.
    Vserver (STRING): Vserver that owns the volume.

mgmtgwd.vreport events

mgmtgwd.vreport.nodesUnreachable

Severity

    ERROR

Description

    This message occurs when the 'debug vreport' command found that some nodes were unreachable. Such nodes may contain WAFL-VLDB discrepancies which will not get reported.

Corrective Action

    The file mgwd.log logs the list of unavailable nodes. Ensure all these nodes are reachable from the node where the 'debug vreport' is run.

Syslog Message

    Vreport encountered some unreachable nodes. The report may be incomplete.

Parameters

    (None).

mgmtgwd.wafl events

mgmtgwd.wafl.rdb.autorecover

Severity

NOTICE

Description

This message occurs when the system will automatically enter RDB recovery because the system has detected that a root volume might have changed, possibly causing the local management databases to be out of sync with the replicated databases . This occurred due to corruption of the Non-Volatile RAM log (NVLOG) during takeover. The node is not fully operational. Data logical interfaces (LIFs) might have failed over within the cluster, so NFS and CIFS access is limited on this node. There also might have been a loss of stored data. Administrative capability is limited to local recovery procedures for this node.

Corrective Action

Use the command 'event log show' to monitor for RDB recovery completion. On successful RDB recovery completion, the event 'rdb.recovery.succeeded' will be generated. Should RDB recovery fail, the event 'rdb.recovery.failed' will be generated. Failure will also generate a 'callhome.root.vol.recovery.reqd' event.

Syslog Message

The system will automatically enter RDB recovery because the system has detected that a root volume might have changed, possibly causing the local management databases to be out of sync with the replicated databases.

Parameters

(None).

mgr events

mgr.avail events

mgr.avail.stat.reset

Severity

> NOTICE

Description

> This message is emitted when statistics is reset

Corrective Action

> (None).

Syslog Message

> Availability statistics reset

Parameters

> (None).

mgr.boot events

mgr.boot.bios_backup_flash

Severity

> ERROR

Description

> This message occurs when the system boots from its backup BIOS image because either it failed to boot
> from its primary BIOS image within the expected timeframe or the image is corrupted.

Corrective Action

> Power-cycle the system. If the system still does not boot from the primary BIOS image, contact technical
> support for assistance.

Syslog Message

> System boot from the primary BIOS flash image failed. system booted from the backup BIOS flash image.

Parameters

> (None).

mgr.boot.disk_done

Severity

> INFORMATIONAL

Description

> This message is sent when a system completes disk boot.

Corrective Action

(None).

Syslog Message

%s boot complete. Last disk update written at %s

Parameters

ver (STRING): (long) version of the OS which just booted
last_write_time (STRING): time at which the previous OS last wrote to disk

mgr.boot.floppy_25_7

Severity

NOTICE

Description

This message is sent when a system completes a 25/7 boot.

Corrective Action

(None).

Syslog Message

%s floppy boot complete (after 25/7).

Parameters

ver (STRING): (long) version of the OS which just booted

mgr.boot.floppy_done

Severity

INFORMATIONAL

Description

This message is sent when a system completes a plain old floppy boot.

Corrective Action

(None).

Syslog Message

%s floppy boot complete.

Parameters

ver (STRING): (long) version of the OS which just booted

mgr.boot.floppy_media

Severity

EMERGENCY

Description

This message is sent when a system completes a bypass_media boot.

Corrective Action

(None).

Syslog Message

%s floppy boot complete (with disk media errors bypassed).

Parameters

ver (STRING): (long) version of the OS which just booted

mgr.boot.floppy_prev_cp

Severity

INFORMATIONAL

Description

This message is sent when a system completes a prev_cp boot.

Corrective Action

(None).

Syslog Message

%s floppy boot complete (after prev_cp).

Parameters

ver (STRING): (long) version of the OS which just booted

mgr.boot.mroot.done

Severity

INFORMATIONAL

Description

This event marks the end of populating the mroot during the boot sequence; this event is generated immediately after the process of populating the mroot has completed.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgr.boot.mroot.start

Severity

INFORMATIONAL

Description

This event marks the start of populating the mroot during the boot sequence; this event is generated immediately before the process of populating the mroot begins.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgr.boot.new_OS2

Severity

NOTICE

Description

This message is sent when a system boots with a different OS version from before, and the previous version is known.

Corrective Action

(None).

Syslog Message

This system is running a new version of %s (was %s, now %s)

Parameters

osName (STRING): The flavor of operating system (Data ONTAP or NetCache)
oldOsVersion (STRING): The previous OS version
newOsVersion (STRING): The new OS version

mgr.boot.node.unstable

Severity

ALERT

Description

This message occurs when a node does not reach a stable state within 5 minutes after system boot. The system will continue booting while waiting for a stable state. Under a takeover scenario, the node has to be stable for giveback to be completed.

Corrective Action

Run the "storage failover show" command for takeover status. If the issue persists, contact NetApp technical support for assistance.

Syslog Message

The node has not reached a stable state within 5 minutes after system boot. Retries are in progress.

Parameters

(None).

mgr.boot.oldOFW

Severity

ERROR

Description

This message occurs when the system firmware is determined to be too old.

Corrective Action

For more information about upgrading your system firmware, check your support provider's web site or knowledgebase.

Syslog Message

The current system firmware version %s is too old. Upgrade to the minimum version %s or later.

Parameters

currentFW (STRING): Current system firmware version.
newFW (STRING): Desired system firmware version.

mgr.boot.pmroot.done

Severity

INFORMATIONAL

Description

This event marks the end of populating the pmroot during the boot sequence; this event is generated immediately after the process of populating the pmroot has completed.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgr.boot.pmroot.start

Severity

INFORMATIONAL

Description

This event marks the start of populating the pmroot during the boot sequence; this event is generated immediately before the process of populating the pmroot begins.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

mgr.boot.process.hung

Deprecated

Deprecated as of ONTAP 9.1. Last used in 9.0x.

Severity

ALERT

Description

This message occurs when a system detects an un-responsive process during system boot. The system will continue booting while waiting for the process to respond.

Corrective Action

Contact NetApp technical support to diagnose the issue further.

Syslog Message

The %s process is not responding. Error: %s

Parameters

process (STRING): The process that is hung.
error (STRING): An error message about the problem.

mgr.boot.reason_abnormal

Severity

EMERGENCY

Description

This message is sent when a system boots for abnormal reasons (panic, watchdog, etc). The message contains the reboot reason.

Corrective Action

(None).

Syslog Message

%s

Parameters

reboot_reason (STRING): reboot reason

mgr.boot.reason_ok

Severity

NOTICE

Description

This message is sent when a system boots for normal reasons (halt/reboot command, etc). The message contains the reboot reason.

Corrective Action

(None).

Syslog Message

%s

Parameters

reboot_reason (STRING): reboot reason

mgr.boot.unequalDist

Severity

ERROR

Description

This message occurs during system initialization when the local system finds that the number of disks that it can use to create a partitioned root aggregate is different than on the partner node.

Corrective Action

To create a system with an equal number of automatically partitioned disks on the local and partner systems: 1. Make sure that any failed disks in the internal shelf are replaced. 2. Remove ownership from all disks. The system automatically assigns one half of the disks to the local system and the other half to the partner node. To remove disk ownership, boot into maintenance mode and manually remove ownership by using the "disk remove_ownership" command.

Syslog Message

Warning: Unequal number of disks will be used for auto-partitioning of the root aggregate on the local system and HA partner. The local system will use %d disks but the HA partner will use %d disks. To correct this situation, boot both controllers into maintenance mode and remove the ownership of all disks.

Parameters

n_local (INT): Number of partitionable disks that are used by the local system.
n_partner (INT): Number of partitionable disks that are used by the partner system.

mgr.module events

mgr.module.address

Severity

NOTICE

Description

This occurs to inform you of where kernel modules were loaded in memory. This information helps NetApp technical support interpret the data in any mgr.stack.frameaddr events.

Corrective Action

(None).

Syslog Message

Module %s loaded from 0x%llx - 0x%llx.

Parameters

module_name (STRING): Name of the module.
module_start (PTR): Starting address of the module.
module_end (PTR): Ending address of the module.

mgr.partner events

mgr.partner.stack.saved

Severity

NOTICE

Description

This event is generated after a successful cluster takeover caused by a partner panic, and indicates partner stack trace information was collected from the time of the panic. Partner stack trace information is saved in the node status area of the cluster mailbox disk

Corrective Action

Generally when a panic occurs, if autosupport is configured a NetApp case is automatically created, case E-mail notifications are sent, and a point of contact at your site is contacted by NetApp technical support. If autosupport is not configured or if you are not sure a case was automatically created, contact NetApp technical support.

Syslog Message

Cluster takeover has saved partner panic stack trace information for logging.

Parameters

(None).

mgr.stack events

mgr.stack.at

Severity

NOTICE

Description

This message contains the panic string.

Corrective Action

(None).

Syslog Message

Panic occurred at: %s

Parameters

time (STRING): The time string

mgr.stack.checkpoint

Severity

NOTICE

Description

Logs the last checkpoint dumpcore crossed before failing.

Corrective Action

(None).

Syslog Message

Dumpcore failure: At checkpoint %d

Parameters

checkpoint (INT): (None).

mgr.stack.frame

Severity

NOTICE

Description

The stack frame: frame number, functionname, base, offset.

Corrective Action

(None).

Syslog Message

Stack frame %2d: %s(0x%llx) + 0x%x

Parameters

frame (INT): The frame number
sym (STRING): The symbolic name
base (PTR): The base address
offset (INTHEX): The offset

mgr.stack.frameaddr

Severity

NOTICE

Description

The stack frame: frame number, (no function name), base, offset.

Corrective Action

(None).

Syslog Message

Stack frame %2d: 0x%llx + 0x%x

Parameters

frame (INT): The frame number
base (PTR): The base address
offset (INTHEX): The offset

mgr.stack.framebase

Severity

NOTICE

Description

The stack frame: frame number, base address.

Corrective Action

(None).

Syslog Message

Stack frame %2d: 0x%llx

Parameters

frame (INT): The frame number
base (PTR): The base address

mgr.stack.longrun.proc

Severity

NOTICE

Description

The name of the process that hogged the cpu too long.

Corrective Action

(None).

Syslog Message

Long running process: %s

Parameters

name (STRING): The name of the process

mgr.stack.noFrames

Severity

NOTICE

Description

This message is emitted when no stack frames are available. This is normal on platforms which do not support stack tracing, or when the prior release did not support stack trace.

Corrective Action

(None).

Syslog Message

No stack frames available

Parameters

(None).

mgr.stack.proc

Severity

NOTICE

Description

The name of the process that we took the panic in.

Corrective Action

(None).

Syslog Message

Panic in process: %s

Parameters

name (STRING): The name of the process

mgr.stack.saved

Severity

NOTICE

Description

This message indicates that we've saved panic information in the NV RAM.

Corrective Action

(None).

Syslog Message

Reboot with saved panic information in log file

Parameters

(None).

mgr.stack.string

Severity

NOTICE

Description

This message contains the panic string.

Corrective Action

(None).

Syslog Message

Panic string: %s

Parameters

string (STRING): The panic string

mgwd events

mgwd.cluscheck events

mgwd.cluscheck.rmtDevRepair

Severity

NOTICE

Description

This message occurs when the system changes the cluster LIFs used for internal replicated database (RDB) operations, ensuring they are connected to different cluster switches for optimal cluster resiliency.

Corrective Action

(None).

Syslog Message

Cluster LIF "%s" with IP address %s connected to cluster switch "%s" is being replaced with cluster LIF "%s" with IP address %s connected to cluster switch "%s" in the RDB.

Parameters

existinglif (STRING): Cluster LIF being replaced.
existingaddress (STRING): IP address of the cluster LIF that is being replaced.
existingremotedevice (STRING): Cluster switch connected to the home port of the IP address being replaced.
replacementlif (STRING): Cluster LIF being added.
replacementaddress (STRING): IP address of the cluster LIF that is being added.
replacementremotedevice (STRING): Cluster switch connected to the home port of the IP address being added.

mgwd.notify events

mgwd.notify.halt.result

Severity

INFORMATIONAL

Description

This message reports the result of the Management Gateway process notification attempt to the Connectivity, Liveliness, Availability Monitor (CLAM) instance on its high-availability (HA) partner node that this node is undergoing a planned shutdown.

Corrective Action

(None).

Syslog Message

MGWD %s to notify CLAM on its HA partner node that this node is undergoing a planned shutdown (reason: %s). Error: %s

Parameters

    result (STRING): Result of the notify attempt.
    reason (STRING): Reason for the partner beginning the halt process.
    error (STRING): Error encountered in the notify attempt (if any).

mhost events

mhost.ca events

mhost.ca.connect.cert.error

Severity

ERROR

Description

This message occurs when the client connection has failed due to certificate error.

Corrective Action

Ensure that a valid certificate is loaded onto the remote service to which ONTAP® is attempting to connect and the corresponding CA certificate is loaded in ONTAP Use "security certificate show" CLI command to ensure a valid CA certificate is installed for the destination service. Use "security certificate install" CLI command to install a valid CA certificate.

Syslog Message

Cluster agent connection: %s has failed due to certificate error. Error: %s.

Parameters

client_name (STRING): Name of the client connection whose connection has an error.
error_msg (STRING): Error that has been reported for client connection.

mhost.ca.connect.delete

Severity

NOTICE

Description

This message occurs when the cluster agent connection is deleted upon user request.

Corrective Action

(None).

Syslog Message

Cluster agent connection to the client: %s is deleted upon user request.

Parameters

client_name (STRING): Name of the client connection whose connection is deleted.

mhost.ca.connect.failure

Severity

ERROR

Description

This message occurs when the cluster agent connection is not in a connected state. Reconnect attempt to establish a connection will be initiated automatically.

Corrective Action

Verify that the connection path to the destination is in healthy state and network security polices are configured as needed to permit connectivity. If this behavior persists, contact NetApp technical support.

Syslog Message

Cluster agent connection of the client: %s is not healthy. Attempting to reconnect. Error: %s.

Parameters

client_name (STRING): Name of the client connection whose connection has failed and reconnection is being attempted.
error_msg (STRING): Error that has been reported for client connection.

mhost.ca.connect.success

Severity

NOTICE

Description

This message occurs when the cluster agent connection is successfully established.

Corrective Action

(None).

Syslog Message

Cluster agent connection succeeded to the client: %s.

Parameters

client_name (STRING): Name of the client connection to which connection is established.

mhost.ca.msg.delivery.fail

Severity

ERROR

Description

This message occurs when the client is not able to deliver the message even when the client connection is in a connected state.

Corrective Action

For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "mhost.ca.msg.delivery.fail" keyword. If issue is not resolved, contact Contact NetApp technical support. for assistance.

Syslog Message

Cluster agent connection: %s is not able to send messages to remote service. Error: %s.

Parameters

client_name (STRING): Name of the client connection whose message delivery failed.
error_case (STRING): Use case which caused this error.

mhost.ca.node.offline

Severity

NOTICE

Description

This message occurs when the node that is hosting the cluster agent connection is offline. ONTAP® will automatically attempt to migrate the connection to an available healthy node.

Corrective Action

(None).

Syslog Message

Node "%s" hosting cluster agent connection "%s", is offline. ONTAP is attempting to migrate the connection to an available healthy node.

Parameters

node (STRING): Name of the node which is offline.
client_name (STRING): Name of the client connection whose connection will be rehosted.

mhost.ca.rehost.success

Severity

NOTICE

Description

This message occurs when the cluster agent connection of the client is rehosted successfully on a healthy node.

Corrective Action

(None).

Syslog Message

Cluster agent connection "%s" has migrated to node "%s".

Parameters

client_name (STRING): Name of the client connection that will be rehosted.
node (STRING): Name of the node to which the connection has migrated.

migrate events

migrate.root events

migrate.root.completed

Severity

NOTICE

Description

This message occurs when the migration of a root aggregate has completed successfully.

Corrective Action

(None).

Syslog Message

Root aggregate migration completed successfully on node %s.

Parameters

node (STRING): Name of the node that completed the migration.

migrate.root.failed

Severity

ERROR

Description

This message occurs when the migration of a root aggregate has failed.

Corrective Action

Run the "system node run -node nodename -command aggr status" command to determine if the target aggregate named "new_root" has been created. If not, address the error condition and attempt the "system node migrate-root" command again. If the new aggregate exists, contact technical support to complete the operation.

Syslog Message

Root aggregate migration failed on node %s. Reason: %s.

Parameters

node (STRING): Name of the node that failed to complete the migration.
reason (STRING): Reason that the migrate operation failed.

migrate.root.started

Severity

NOTICE

Description

This message occurs when the user initiates an attempt to move the root aggregate to a different set of disks on a node.

Corrective Action

(None).

Syslog Message

Root aggregate migration started on node %s.

Parameters

node (STRING): Name of the node.

misconfig events

misconfig.lif events

misconfig.lif.info.lost

Severity

NOTICE

Description

This message occurs when the record for the incorrectly placed LIF is lost during MetroCluster™ switchover or switchback. As a result, the "metrocluster check lif show" command will not be able to fetch the incorrectly placed LIF on the surviving cluster after executing "metrocluster switchover" and on the disaster cluster after executing "metrocluster switchback". Also, the incorrectly placed LIF cannot be placed correctly with the "metrocluster check lif repair-placement" command.

Corrective Action

The LIF is incorrectly placed and needs to be manually corrected. For an incorrectly placed LIF on HA partners, correct the "home-node" by using the "network interface modify -vserver <vserver_name> -lif <lif_name> -home-node <new_home_node>" command. For a LIF with a wrong port assignment, correct the "home-port" by using the "network interface modify -vserver <vserver_name> -lif <lif_name> -home-port <new_home_port>" command. For a SAN LIF, use the "network interface modify -vserver <vserver_name> -lif <lif_name> -status-admin down" command to bring down status-admin of the LIF, before modifying the "home-node" or the "home-port" of the LIF.

Syslog Message

LIF "%s" in Vserver "%s" incorrectly placed needs manual recovery. Reason: "%s".

Parameters

lif (STRING): LIF name.
vserver_name (STRING): Vserver name.
error (STRING): Reason for misconfigured LIF.

mlm events

mlm.arr events

mlm.arr.affinity.not.queued

Severity

NOTICE

Description

This message occurs when the current processing of an error event prevents the Asymmetric Logical Unit Access (ALUA) handler from queuing an affinity switch event.

Corrective Action

(None).

Syslog Message

Affinity event %s not queued for LUN %s.

Parameters

event (STRING): Affinity event for asymmetric array.
serialno (STRING): Serial number of the array LUN.

mlm.arr.many.affinity.error

Severity

ERROR

Description

This message occurs when the Asymmetric Logical Unit Access (ALUA) handler encounters too many affinity errors, which might lead to reduced I/O throughput.

Corrective Action

Evaluate the back-end array connectivity for optimal LUN balance across array controllers. Also check for failures reported by the back-end array with regards to ALUA target port group settings. Verify that FlexArray connectivity is done as per best-practice guide.

Syslog Message

Failing cmd %s for LUN %s due to too many affinity errors.

Parameters

cdb (STRING): String containing the opcode byte of the command descriptor block (CDB) that was sent to the device.
serialno (STRING): Serial number of the array LUN.

mlm.array events

mlm.array.aluaSupported

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array. Defines whether the array supports ALUA(asymmetric logical unit access) or not.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

Unsupported array: [Vendor '%s' Product '%s'] ALUA Support for array %s.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
alua (STRING): Whether the array supports ALUA or not.

mlm.array.apf.cancel

Severity

NOTICE

Description

This message occurs when any one of the path to an Array comes back online when the last path failure to an Array is extended.

Corrective Action

(None).

Syslog Message

Delay on last path to Array '%s' is cancelled as target port: WWNN: %s, WWPN: %s seen from initiator '%s' is up.

Parameters

arrayName (STRING): Name of the Array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
adapterName (STRING): Name of the Fibre Channel adapter accessing the array target port.

mlm.array.apf.enter

Severity

ALERT

Description

This message occurs when the all-path-fail-delay option for an Array is set to a non-zero value and when last path to an Array goes down. This allows Data ONTAP to suspend I/O operations for a longer period of time before declaring a data access disruption, allowing for I/O operations to resume if any path comes

back online within the specified duration.

Corrective Action

In such cases, you should evaluate the specified device for possible replacement. Sometimes the problem results from the partial failure of a component involved in the Fibre Channel. Common things to check include properly secured cable connections, and crimped or otherwise damaged cables. If the adapter is in use check cabling.

Syslog Message

Last path to Array '%s' target port: WWNN: %s, WWPN: %s seen from initiator '%s' is down. Failing this path will be extended for %d seconds.

Parameters

arrayName (STRING): Name of the Array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
adapterName (STRING): Name of the Fibre Channel adapter accessing the array target port.
delay (INT): All Path Fail delay in seconds.

mlm.array.apf.exit

Severity

NOTICE

Description

This message occurs when all path to an Array goes down and the Array remains inaccessible even after the extended duration is set by all-path-fail-delay option.

Corrective Action

(None).

Syslog Message

No path to Array '%s' came back online when last path failure is extended to %d seconds.

Parameters

arrayName (STRING): Name of the Array.
delay (INT): All Path Fail delay in seconds.

mlm.array.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new array.

Corrective Action

(None).

Syslog Message

A new array (%s) was connected to this node.

Parameters

arrayName (STRING): Name of the array.

mlm.array.inquiryPage80

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

Array LUN %s [S/N '%s' vendor '%s' product '%s'] Inquiry page 80: devtype '%d' page_code '%d' reserved '%d' page_len '%d' data '%s' hex_dump '%s'

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
dev_type (INT): Device type of the array LUN.
page_code (INT): Page code of the array LUN.
reserved (INT): Reserved fields in inquiry page 80.
page_len (INT): Inquiry page 80 length.
data (STRING): Serial number from inquiry page 80.
P_80_hex (STRING): Inquiry page 80 hexadecimal dump.

mlm.array.inquiryPage83

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

[Vendor '%s' Product '%s'] Inquiry page 83: devtype '%d' page_code '%d' reserved '%d' page_len '%d' code_set '%d' association_id '%d' reserved_msb '%d' id_len '%d' hex_dump '%s'.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
dev_type (INT): Device type of the array LUN.
page_code (INT): Page code of the array LUN.

reserved (INT): Reserved fields in inquiry page 83.
page_len (INT): Inquiry page 83 length.
code_set (INT): Inquiry page 83 code set.
association_id (INT): Inquiry page 83 association ID.
reserved_msb (INT): Most significant byte of page_len in SPC3 spec.
id_len (INT): Inquiry page 83 ID length.
P_83_hex (STRING): Inquiry page 83 hexadecimal dump.

mlm.array.inquiryStd

Severity
ERROR

Description
This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action
Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message
[S/N '%s' vendor '%s' product '%s'] STD inquiry : devtype '%d' dev_modifier '%d' support_level '%d' dev_mode '%d' revision '%s' hex_dump '%s'

Parameters
serialno (STRING): Serial number of the array LUN.
vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
dev_type (INT): Device type of the array LUN.
dev_modifier (INT): Device modifier of the array LUN.
support_level (INT): Support level.
dev_mode (INT): Development mode.
revision (STRING): Product revision level(product firmware release number).
inquiry_hex (STRING): Inquiry hexadecimal dump.

mlm.array.lun.discovery

Severity
INFORMATIONAL

Description
This message occurs when the system discovers a new array LUN.

Corrective Action
(None).

Syslog Message
New array LUN %s (S/N: %s) was discovered on initiator port %s at array target port WWNN: %s, WWPN: %s.

Parameters

> **diskName** (STRING): Name of the array LUN.
> **serialno** (STRING): Serial number of the array LUN.
> **adapter** (STRING): Name of the initiator port discovering the array LUN.
> **wwnn** (STRING): World Wide Node Name of the array target port exporting the new array LUN.
> **wwpn** (STRING): World Wide Port Name of the array target port exporting the new array LUN.

mlm.array.lun.forceResume

Severity

> ERROR

Description

> This message occurs when the system is forced to resume I/O to a previously quiesced array LUN path when no other viable non-quiesced paths remain. For arrays with asymmetric logical unit access a forced resume will also happen when there are no other viable non-quiesced paths on the current target port group.

Corrective Action

> Verify the configuration and check why array lun is usable through only one path.

Syslog Message

> Array LUN '%s' (%s) has had I/O resumed on the path from initiator %s to %s's target port: WWNN: %s, WWPN: %s to ensure LUN access through atleast one path. User settings are preempted.

Parameters

> **diskName** (STRING): Name of the array LUN.
> **serialno** (STRING): Serial number of the array LUN.
> **adapterName** (STRING): Name of the initiator port used to access the array LUN.
> **arrayName** (STRING): Name of the array.
> **wwnn** (STRING): World Wide Node Name of the array's target port.
> **wwpn** (STRING): World Wide Port Name of the array's target port.

mlm.array.lun.hiddenDMXVCMDB

Severity

> ERROR

Description

> This message occurs when the system determines that a Symmetrix LUN is write protected.

Corrective Action

> Either write enable the LUN or, if this is the Symmetrix VCMDB control device, consider unmapping the LUN to Data ONTAP.

Syslog Message

> Symmetrix LUN (%s, %s) is write protected and will be ignored. This logical unit may be the VCMDB control device.

Parameters

> **diskName** (STRING): Name of the LUN.
> **serialno** (STRING): Serial number of the LUN.

mlm.array.lun.multipleIDs

Severity

ALERT

Description

This message occurs when a logical device (LDEV) on an array has more than one LUN ID.

Corrective Action

Verify the LUN configuration and make sure that the LUN ID is the same on all array target ports.

Syslog Message

Array LUN '%s' (%s): Multiple LUN IDs are associated with the same LDEV on array %s. An LDEV can only have one LUN ID associated with it across all array target ports.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
arrayName (STRING): Name of the array.

mlm.array.lun.OnePath

Severity

ERROR

Description

This message occurs when an array LUN has only one path.

Corrective Action

Verify the configuration and make sure that there are at least two paths to this array LUN.

Syslog Message

Array LUN '%s' is connected using only one path. To avoid the potential for data loss caused by the remaining path's failure, all array LUNs should have at least two paths.

Parameters

diskName (STRING): Name of the array LUN.

mlm.array.lun.PathAdded

Severity

INFORMATIONAL

Description

This message occurs when a new path is added for an array LUN.

Corrective Action

(None).

Syslog Message

Array LUN '%s' (%s) is now connected on initiator port %s through %s's target port: WWNN: %s, WWPN:

%s at LUN ID: %d.

Parameters

diskName (STRING): Name of the array LUN
serialno (STRING): Serial number of the array LUN.
adapterName (STRING): Name of the Fibre Channel adapter used to access the array LUN.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
LUNID (INT): LUN ID to which a path was added.

mlm.array.lun.PathFO

Severity

NOTICE

Description

This message occurs when an array LUN path becomes inaccessible and after a user-configurable delay, a path failover begins if the path remains inaccessible. The delay time can be modified using the "storage array modify -name array_name -path-failover-time delay_time" command.

Corrective Action

(None).

Syslog Message

Path via adapter %s and device "%s" to array "%s" is currently offline, but path failover is delayed for %d seconds. After this delay, if the path is back online, I/O will resume on this same path. Otherwise, I/O will fail over to an alternate path.

Parameters

adapterName (STRING): Name of the adapter involved in the path offline operation.
deviceName (STRING): Name of the Fibre Channel device.
arrayName (STRING): Name of the array.
delay (INT): Path failover delay, in seconds.

mlm.array.lun.PathRemoved

Severity

INFORMATIONAL

Description

This message occurs when a path to this array LUN is removed.

Corrective Action

(None).

Syslog Message

Array LUN '%s' (%s) is no longer available on initiator port %s through %s's target port: WWNN: %s, WWPN: %s.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
adapterName (STRING): Name of the Fibre Channel adapter used to access the array LUN.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.

mlm.array.lun.quiesced

Severity

INFORMATIONAL

Description

This message occurs when I/O is quiesced on an array LUN.

Corrective Action

(None).

Syslog Message

Array LUN '%s' (%s) has had I/O quiesced on the path from initiator %s to %s's target port: WWNN: %s, WWPN: %s.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
adapterName (STRING): Name of the Fibre Channel adapter used to access the array LUN.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.

mlm.array.lun.removed

Severity

NOTICE

Description

This message occurs when the last path to an array LUN is removed.

Corrective Action

(None).

Syslog Message

Array LUN '%s' (%s) is no longer being presented to this node.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.

mlm.array.lun.resumed

Severity

INFORMATIONAL

Description

This message occurs when I/O is resumed on an array LUN that was quiesced.

Corrective Action

(None).

Syslog Message

Array LUN '%s' (%s) has had I/O resumed on the path from initiator %s to %s's target port: WWNN: %s, WWPN: %s.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
adapterName (STRING): Name of the Fibre Channel adapter used to access the array LUN.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.

mlm.array.lun.type.control

Severity

ERROR

Description

This message occurs when the array LUN is a control LUN on the array. A control LUN cannot be used as a data LUN.

Corrective Action

Disable or mask off control LUNs.

Syslog Message

Array LUN '%s' is a control LUN and is not usable for data storage. Disable it or mask it off.

Parameters

diskName (STRING): Name of the array LUN.

mlm.array.mixedFailoverMode

Severity

ALERT

Description

This message occurs when Data ONTAP® determines that the set of paths to a storage device is configured with more than one failover mode policy.

Corrective Action

Reconfigure the storage array so that each target port reports the same failover mode policy. When the reconfiguration is complete, reboot the system node that detected the error.

Syslog Message

Fibre Channel host bus adapter %s detects that storage array %s reports a failover mode policy (%s) on target port WWNN: %s, WWPN: %s that doesn't match the policy (%s) currently in effect. The failover mode policy must be consistent on each path presented.

Parameters

adapterName (STRING): Name of the Fibre Channel adapter detecting the failover mode conflict.
arrayName (STRING): Name of the array.
policy1 (STRING): Inconsistent failover mode policy detected.
wwnn (STRING): World Wide Node Name of the array target port reporting the inconsistent failover mode policy.
wwpn (STRING): World Wide Port Name of the array target port reporting the inconsistent failover mode policy.
policy2 (STRING): Failover mode policy currently in effect.

mlm.array.ndu.complete

Severity

INFORMATIONAL

Description

This message occurs when you set the is-upgrade-pending flag status for the array to "false".

Corrective Action

(None).

Syslog Message

Array '%s' has the is-upgrade-pending flag status set to "false".

Parameters

arrayName (STRING): Name of the array.

mlm.array.ndu.doneTgtPort

Severity

INFORMATIONAL

Description

This message occurs when you set the is-upgrade-pending flag status for the array to "false". This message is logged for every array target port seen by the initiators from this node.

Corrective Action

(None).

Syslog Message

Array '%s' has the is-upgrade-pending flag status set to "false" for the path from initiator '%s' to the target port: WWNN: %s, WWPN: %s.

Parameters

arrayName (STRING): Name of the array.
adapterName (STRING): Name of the Fibre Channel adapter accessing the array target port.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.

mlm.array.ndu.pending

Severity

INFORMATIONAL

Description

This message occurs when you set the is-upgrade-pending flag status to "true" for a specific array, to indicate that the array will undergo a firmware upgrade in the near future. After the upgrade is complete, you must manually set the is-upgrade-pending flag status back to "false" to maintain optimal path failover detection.

Corrective Action

(None).

Syslog Message

Array '%s' has its is-upgrade-pending flag status set to "true". Path failover performance will be degraded during the array firmware upgrade. After the upgrade is complete, set the is-upgrade-pending flag status for this array to "false".

Parameters

arrayName (STRING): Name of the array.

mlm.array.ndu.pendingTgtPort

Severity

INFORMATIONAL

Description

This message occurs when you set the is-upgrade-pending flag status for the array to "true". This message is logged for every array target port seen by the initiators from this node.

Corrective Action

(None).

Syslog Message

Array '%s' has the is-upgrade-pending flag status set to "true" for the path from initiator %s to the target port: WWNN: %s, WWPN: %s.

Parameters

arrayName (STRING): Name of the array.
adapterName (STRING): Name of the Fibre Channel adapter accessing the array target port.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.

mlm.array.ndu.portsDown

Severity

NOTICE

Description

This message occurs when the array target port does not come back online after 80 seconds. This message is logged for every array target port seen by the initiators of this node that does not come back online after the array firmware upgrade.

Corrective Action

(None).

Syslog Message

Array '%s' target port: WWNN: %s, WWPN: %s seen from initiator '%s' is down.

Parameters

arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
adapterName (STRING): Name of the Fibre Channel adapter accessing the array target port.

mlm.array.ndu.portsOffline

Severity

INFORMATIONAL

Description

This message occurs when all array ports for a specific array go offline while the array has its is-upgrade-pending flag status set to "true".

Corrective Action

(None).

Syslog Message

Array '%s' has target ports changed to offline state while its is-upgrade-pending status flag is set to "true".

Parameters

arrayName (STRING): Name of the array.

mlm.array.ndu.portsOnline

Severity

INFORMATIONAL

Description

This message occurs when the first array target port is detected back online after a firmware upgrade where the array is marked with the is-upgrade-pending flag status set to "true".

Corrective Action

(None).

Array '%s' has target ports changed to online state during a firmware upgrade.

Parameters

arrayName (STRING): Name of the array.

mlm.array.ndu.stillPending

Severity

ERROR

Description

This message occurs once every 60 minutes while the is-upgrade-pending flag status is set to "true" on an array. You should set the is-upgrade-pending flag status to "false" after the array firmware upgrade is complete to avoid path failover performance issues.

Corrective Action

After the array firmware upgrade is complete, set the is-upgrade-pending flag status for the array to "false".

Syslog Message

Array '%s' has the is-upgrade-pending flag status set to "true". After the array's firmware update is complete, set the is-upgrade-pending flag status for this array to "false".

Parameters

arrayName (STRING): Name of the array.

mlm.array.path.autoQuiesced

Severity

NOTICE

Description

This message occurs when the path to the array is quiesced,auto path quiesce happens when the number of path failures reached path_failure count in the given duration(in mins).

Corrective Action

(None).

Syslog Message

Path from initiator %s to array %s target_port:WWNN:%s,WWPN:%s has quiesced as path-failure has reached %d in %d mins duration.

Parameters

adapterName (STRING): Name of the Fibre Channel adapter used to access the path.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.
path_failure (INT): Number of failures occured in the specified path.
duration (INT): Duration in minutes to monitor the path failures.

mlm.array.path.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new path to an array.

Corrective Action

(None).

Syslog Message

A new path was discovered: initiator port %s is now connected to array %s's target port: WWNN: %s, WWPN: %s. There are %d array LUNs visible on this target port.

Parameters

adapter (STRING): Initiator port on which a new path to the array was discovered.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's newly discovered target port.
wwpn (STRING): World Wide Port Name of the array's newly discovered target port.
count (INT): Number of array LUNs visible on this target port.

mlm.array.path.forceResume

Severity

NOTICE

Description

This message occurs when the path to the array is resumed forcefully when no other path except the quiesced path available for I/O in the node.

Corrective Action

(None).

Syslog Message

Path from initiator %s to array %s target_port:WWNN:%s,WWPN:%s has resumed forcefully as it is the last available path for the I/O. User settings are preempted.

Parameters

adapterName (STRING): Name of the Fibre Channel adapter used to access the path.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.

mlm.array.path.quiesced

Severity

INFORMATIONAL

Description

This message occurs when the path to the array is quiesced when user request the particular path to be quiesced.

Corrective Action

(None).

Syslog Message

Path from initiator %s to array %s target_port:WWNN:%s,WWPN:%s has quiesced.

Parameters

adapterName (STRING): Name of the Fibre Channel adapter used to access the path.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.

mlm.array.path.resumed

Severity

INFORMATIONAL

Description

This message occurs when the path to the array is resumed.

Corrective Action

(None).

Syslog Message

Path from initiator %s to array %s target_port:WWNN:%s,WWPN:%s has resumed.

Parameters

adapterName (STRING): Name of the Fibre Channel adapter used to access the path.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port.
wwpn (STRING): World Wide Port Name of the array's target port.

mlm.array.port.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new target port for an array.

Corrective Action

(None).

Syslog Message

A new array target port was discovered on array %s: WWNN: %s, WWPN: %s.

Parameters

arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the new array target port.
wwpn (STRING): World Wide Port Name of the new array target port.

mlm.array.portDuplicateID

Severity

ALERT

Description

This message occurs when more than one logical device (LDEV) has the same LUN ID on the same array. The error is set on these logical devices and these devices will not function until the error is resolved.

Corrective Action

Ensure that each LDEV has a different LUN ID.

Syslog Message

%s: %d appears more than once on %s's target port: WWNN: %s, WWPN: %s. LUN ID reuse on an array target port is not supported, even in different host groups.

Parameters

diskName (STRING): Name of the array LUN.
lunid (INT): LUN ID that represents more than one LDEV.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port that is presenting this LUN ID.
wwpn (STRING): World Wide Port Name of the array's target port that is presenting this LUN ID.

mlm.array.portEmpty.direct

Severity

INFORMATIONAL

Description

This message occurs when a host group on an array is empty.

Corrective Action

(None).

Syslog Message

Fibre Channel host bus adapter %s reports no LUNs presented by storage array %s, target port WWNN: %s WWPN: %s.

Parameters

adapterName (STRING): Name of the initiator port detecting the empty host group.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.

mlm.array.portEmpty.switch

Severity

INFORMATIONAL

Description

This message occurs when a host group on an array is empty.

Corrective Action

(None).

Syslog Message

Fibre Channel host bus adapter %s reports no LUNs presented by storage array %s, target port WWNN: %s WWPN: %s, switch:port %s.

Parameters

adapterName (STRING): Name of the initiator port detecting the empty host group.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
switchPort (STRING): Name of the switch and port connected to the storage array.

mlm.array.portMixedAddress

Severity

EMERGENCY

Description

This message occurs when a back-end array is set to Volume Set Addressing mode on one port but not on another. This results in LUN IDs that do not match in value or format. The error is set on these logical devices and these devices will not function until the error is resolved.

Corrective Action

Consult the back-end array documentation to disable Volume Set Addressing mode on all ports.

Syslog Message

Array %s is using inconsistent LUN addressing schemes. Check LUN addressing settings on port WWNN: %s, WWPN %s.

Parameters

arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array's target port that is reporting Volume Set Addressing Enabled.
wwpn (STRING): World Wide Port Name of the array's target port that is reporting Volume Set Addressing Enabled.

mlm.array.portOneController

Severity

ERROR

Description

This message occurs when all paths for an array LUN are connected to the same controller on the array. This configuration results in a single point of failure at the array.

Corrective Action

Reconfigure your back-end SAN so that array LUNs are presented from controllers in different fault domains on the target array.

Syslog Message

All paths for array LUN %s are connected to the same controller on array %s. This configuration is a single point of failure. Ensure that array LUNs are accessible through controllers in different fault domains.

Parameters

diskName (STRING): Name of the array LUN.
arrayName (STRING): Name of the array.

mlm.array.prCapabilities

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

[Vendor '%s' Product '%s'] PR_CAP : sip_c : %x, atp_c : %x, res_c : %x, ptpl_c : %x.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
sip_c (INTHEX): Specify initiator ports capable bit.
atp_c (INTHEX): All target ports capable bit.
res_c (INTHEX): Reserved bit.
ptpl_c (INTHEX): Persist through power loss capable bit.

mlm.array.prReadReservation

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

[Vendor '%s' Product '%s'] Data_key : '0x%llx' Reservation : generation '%u' length '%u' resv_key '0x%llx' scope_address '%u' scope_type '0x%x' extent_len '%d' hex_dump '%s'.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
resv_key (LONGINTHEX): SCSI persistent reservation key.

generation (INT): SCSI persistent reserve data generation value.
len (INT): SCSI persistent reserve data header generation length.
read_in_resv_key (LONGINTHEX): SCSI persistent reserve data reservation key.
scope_address (INT): SCSI persistent reserve data scope address.
scope_type (INTHEX): SCSI persistent reserve data scope.
extent_length (INT): SCSI persistent reserve data extent length.
pr_reservation_hex (STRING): SCSI persistent reservation hexadecimal dump.

mlm.array.reportluns

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

Unsupported array: [Vendor '%s' Product '%s'] Report LUNs: lun_count '%d' reserved field '%d'.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
lun_count (INT): Total number of LUNs visible.
reserved (INT): Report luns reserved field.

mlm.array.rptpgs

Severity

ERROR

Description

This message occurs when the system detects an array LUN from an unsupported array.

Corrective Action

Detach the unsupported array. See the NetApp Support Site Interoperability Matrix Tool for further information about supported arrays.

Syslog Message

Unsupported array: [Vendor '%s' Product '%s'] ASS : %d , Access flag : %d.

Parameters

vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.
aas (INT): Asymmetric Access State.
flags (INT): Access state flags.

mlm.array.setPortTPQD

Severity

INFORMATIONAL

Description

This message occurs when you set the target port queue depth for a specific target port of an array.

Corrective Action

(None).

Syslog Message

Array '%s' target port: WWNN: %s, WWPN: %s has a target port queue depth value set to %d.

Parameters

arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name of the array target port.
wwpn (STRING): World Wide Port Name of the array target port.
tpqd (INT): Target port queue depth value set for the specified target port of an array.

mlm.array.setTPQD

Severity

INFORMATIONAL

Description

This message occurs when you set the target port queue depth for an array.

Corrective Action

(None).

Syslog Message

Target ports on the array '%s' have a target port queue depth value set to %d.

Parameters

arrayName (STRING): Name of the array.
tpqd (INT): Target port queue depth value set for the target ports of the array.

mlm.array.unknown

Severity

ERROR

Description

This message occurs when an array LUN is detected from an unknown array that is not supported in this version of Data ONTAP®.

Corrective Action

Remove the array from the system.

Syslog Message

Array LUN %s [S/N '%s' vendor '%s' product '%s'] is unknown and is not supported in this version of Data ONTAP.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.

mlm.array.unsupported

Severity

NOTICE

Description

This message occurs when an array LUN is detected from an unsupported array.

Corrective Action

(None).

Syslog Message

Array LUN %s [S/N '%s' vendor '%s' product '%s'] is not supported in this version of Data ONTAP.

Parameters

diskName (STRING): Name of the array LUN.
serialno (STRING): Serial number of the array LUN.
vendor (STRING): Vendor ID of the array LUN.
product (STRING): Product ID of the array LUN.

mlm.arraylun events

mlm.arrayLUN.limit.exceeded

Severity

ALERT

Description

This message occurs when Data ONTAP® cannot install one or more discovered array LUNs since the disk device count is at full capacity.

Corrective Action

If possible, remove an existing disk or array LUN so that array LUN installation can proceed. If the failure persists, contact NetApp technical support.

Syslog Message

Unable to install one or more array LUNs [vendor '%s' product '%s'] discovered on initiator port %s, array target port WWNN: %s, WWPN: %s. The disk device limit (%d) has been reached.

Parameters

vendor (STRING): Vendor ID of the storage array.
product (STRING): Product ID of the storage array.
adapter (STRING): Name of the initiator port discovering the array LUN(s).
wwnn (STRING): World Wide Node Name of the array target port exporting the array LUN(s).
wwpn (STRING): World Wide Port Name of the array target port exporting the array LUN(s).
limit (INT): Disk device maximum count.

mlm.bad events

mlm.bad.topology.data

Severity

ERROR

Description

This message occurs when a device reports invalid data for "REPORT LUNS" command. The invalid data may include one or more instances of duplicate LUN IDs and/or the "list length value" from the "REPORT LUNS" command may not match the amount of data received.

Corrective Action

Repair or replace the faulty hardware associated with the wwnn and wwpn

Syslog Message

The device with wwnn %s and wwpn %s is reporting inconsistent "REPORT LUNS" data.

Parameters

wwnn (STRING): World Wide Node Name(wwnn) of the Device.
wwpn (STRING): World Wide Port Name(wwpn) of the Device.

mlm.excessive events

mlm.excessive.TPlatency

Severity

NOTICE

Description

This message occurs when ONTAP® detects that the average SCSI I/O command latency on the target port of the array exceeds the set threshold. This message indicates a degradation of I/O throughput for the target port of the array.

Corrective Action

Reduce the I/O load on the device, increase the number of array target ports available for I/O, and/or alleviate the cause for the excessive latency on the device.

Syslog Message

Average latency of %dus on target port %s, has exceeded %dus

Parameters

> **avg_latency** (INT): Current average latency of commands for the array target port in microseconds.
> **wwpn** (STRING): World Wide Port Name of the array target port on which the excessive latency was detected.
> **threshold** (INT): Threshold value for excessive average latency in microseconds.

mlm.non events

mlm.non.optimized.TPusage

Severity

> ERROR

Description

> This message occurs when Data ONTAP® detects non-optimized usage of an array's target port. This message indicates degradation of I/O throughput for the indicated array's target port and the cause should be corrected.

Corrective Action

> Increase the target port queue depth for the array's target port and/or increase the number of array target ports available for I/O to alleviate the SCSI I/O command load for the array's target port. For example, to increase the maximum allowed I/O commands for an array's target port, the following command can be run: storage array port modify -name ARRAY_NAME_1 -wwnn 50014380025d1500 -wwpn 50014380025d1508 -max-queue-depth 750

Syslog Message

> Detected non-optimized usage of a array's target port. WWPN: %s, average service time: %dus, average latency: %dus

Parameters

> **wwpn** (STRING): World Wide Port Name of the array's target port which the non-optimized usage was detected on.
> **avg_service** (INT): Current average service time of I/O commands for the array's target port in microseconds.
> **avg_latency** (INT): Current average latency of I/O commands for the array's target port in microseconds.

mlm.prregistration events

mlm.PRregistration.failed

Severity

> ERROR

Description

> This message occurs when the registration of a SCSI persistent reservation key fails. A number of conditions can cause this SCSI command to fail and most are transitory in nature. If there is not a subsequent EMS_mlm_PRregistration_succeeded message, it is indicative of a persistent hardware fault.

Corrective Action

> A SCSI persistent registration failure normally indicates an error at the device during execution of the requested command. Such cases are often the result of an intermittent device hardware that is

automatically handled by the Data ONTAP® drivers through retries. In cases of repeated events, the specified device should be evaluated for proper operation and possible repair or replacement.

Syslog Message

A SCSI persistent registration command failed on device %s on initiator port %s, target port World Wide Node Name %s, target port World Wide Port Name %s with a ha status of 0x%x, target status of 0x%x, sense key of 0x%x, additional sense code of 0x%x, additional sense code qualifier of 0x%x.

Parameters

device_name (STRING): Electrical path name of the device on which the error occurred.
ha_name (STRING): Name of the initiator port.
wwnn (STRING): World Wide Node Name of the target port.
wwpn (STRING): World Wide Port Name of the target port.
ha_status (INTHEX): Integer value of the hardware adapter status for the failed command.
target_status (INTHEX): Integer value of the target status for the failed command.
sense_key (INTHEX): Integer value of the sense key for the failed command.
asc (INTHEX): Integer value of the additional sense code for the failed command.
asq (INTHEX): Integer value of the additional sense code qualifier for the failed command.

mlm.PRregistration.succeeded

Severity

INFORMATIONAL

Description

This message occurs when a successful registration of a SCSI persistent reservation key occurs that had previously failed.

Corrective Action

(None).

Syslog Message

A SCSI persistent reservation command succeeded on device %s on initiator port %s, target port World Wide Node Name %s, target port World Wide Port Name %s where it had previously failed.

Parameters

device_name (STRING): Electrical path name of the device on which the registration succeeded.
ha_name (STRING): Name of the initiator port.
wwnn (STRING): World Wide Node Name of the target port.
wwpn (STRING): World Wide Port Name of the target port.

mlm.scsi events

mlm.SCSI.supportLvl.bad

Severity

ALERT

Description

This message occurs when an array target port contains SCSI INQUIRY data with an incorrect support level. To prevent a possible data corruption scenario, the target port is not used.

Corrective Action

Verify that the SPC-2 bit in the array's host group is set.

Syslog Message

The target port containing SCSI INQUIRY DATA %s:%s with a (WWPN) of %s, has an incorrect SCSI support level; it will not be available.

Parameters

vendorId (STRING): Vendor ID from the SCSI INQUIRY data.
productId (STRING): Product ID from the SCSI INQUIRY data.
wwpn (STRING): World Wide Port Name (WWPN) of the target port that has the incorrect SCSI support level.

mlm.SCSI.supportLvl.good

Severity

NOTICE

Description

This message occurs when an array target port that previously contained SCSI INQUIRY data with an incorrect support level has been corrected.

Corrective Action

(None).

Syslog Message

The target port containing SCSI INQUIRY DATA %s:%s with a (WWPN) of %s, now has a correct SCSI support level.

Parameters

vendorId (STRING): Vendor ID from the SCSI INQUIRY data.
productId (STRING): Product ID from the SCSI INQUIRY data.
wwpn (STRING): World Wide Port Name (WWPN) of the target port that now has the correct SCSI support level.

mlm.tapemc events

mlm.tapemc.lun.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new tape or media changer logical unit (Tape/MC LUN) reported by a tape library.

Corrective Action

(None).

Syslog Message

New %s LUN %s (S/N: %s) was discovered on initiator port %s at tape library target port WWNN: %s, WWPN: %s.

Parameters

deviceType (STRING): Type of LUN device.
deviceName (STRING): Name of the Tape/MC LUN.
serialno (STRING): Serial number of the LUN.
adapterName (STRING): Name of the initiator port discovering the LUN.
wwnn (STRING): World Wide Node Name(WWNN) of the library target port exporting the new LUN.
wwpn (STRING): World Wide Port Name(WWPN) of the library target port exporting the new LUN.

mlm.tapemc.lun.noInit

Severity

ERROR

Description

This message occurs when the initialization sequence for a tape or media changer logical unit (LUN) fails.

Corrective Action

An expected LUN might be missing from the configuration. Information about the path to the LUN might be unknown but the product information in the log may help identify the missing LUN. Check the device LUN configuration settings.

Syslog Message

%s device %sL%d failed LUN initialization sequence at phase %s.

Parameters

deviceType (STRING): Type of LUN device.
deviceName (STRING): Name of the device on which the LUN initialization fails.
lunid (INT): LUN ID of the device on which LUN initialization fails.
lunInitPhase (STRING): Failing LUN initialization phase.

mlm.tapemc.lun.PathAdded

Severity

INFORMATIONAL

Description

This message occurs when a new path is added for a tape or media changer logical unit (Tape/MC LUN).

Corrective Action

(None).

Syslog Message

%s LUN '%s' (S/N: %s) is now connected on initiator port %s through %s's target port: WWNN: %s, WWPN: %s at LUN ID: %d.

Parameters

deviceType (STRING): Type of LUN device.

deviceName (STRING): Name of the Tape/MC LUN.
serialno (STRING): Serial number of the LUN.
adapterName (STRING): Name of the adapter used to access the LUN.
libraryName (STRING): Name of the library.
wwnn (STRING): World Wide Node Name(WWNN) of the library target port.
wwpn (STRING): World Wide Port Name(WWPN) of the library target port.
LUNID (INT): LUN ID to which a path was added.

mlm.tapemc.lun.PathRemoved

Severity

INFORMATIONAL

Description

This message occurs when a path to this tape or media changer logical unit (Tape/MC LUN) is removed.

Corrective Action

(None).

Syslog Message

The %s LUN '%s' (S/N: %s) is no longer available on initiator port %s through %s's target port: WWNN: %s, WWPN: %s.

Parameters

deviceType (STRING): Type of LUN device.
deviceName (STRING): Name of the Tape/MC LUN.
serialno (STRING): Serial number of the LUN.
adapterName (STRING): Name of the adapter used to access the LUN.
libraryName (STRING): Name of the library.
wwnn (STRING): World Wide Node Name(WWNN) of the library target port.
wwpn (STRING): World Wide Port Name(WWPN) of the library target port.

mlm.tapemc.lun.removed

Severity

NOTICE

Description

This message occurs when the last path to a tape or media changer logical unit (Tape/MC LUN) is removed.

Corrective Action

(None).

Syslog Message

The %s LUN '%s' (S/N: %s) is no longer visible to this node.

Parameters

deviceType (STRING): Type of LUN device.
deviceName (STRING): Name of the Tape/MC LUN.
serialno (STRING): Serial number of the LUN.

mlm.tapemc.path.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new tape or media changer logical unit (Tape/MC LUN) path.

Corrective Action

(None).

Syslog Message

A new Tape/MC path was discovered: initiator port %s is now connected to tape library %s's target port: WWNN: %s, WWPN: %s. There are %d LUNs visible on this target port.

Parameters

adapterName (STRING): Name of the initiator port discovering the Tape/MC LUN.
libraryName (STRING): Name of the tape library.
wwnn (STRING): World Wide Node Name(WWNN) of the library target port exporting the new LUN.
wwpn (STRING): World Wide Port Name(WWPN) of the library target port exporting the new LUN.
count (INT): Number of LUNs visible on this port.

mlm.tpqd events

mlm.TPQD.TPutilization

Severity

ERROR

Description

This message occurs when Data ONTAP® has lowered the number of I/O commands that are allowed to be active by at least 25 percent for an array's target port. This message indicates degradation of I/O throughput for the indicated array's target port and the cause should be corrected.

Corrective Action

Analyze the EMS logs for EMS_fci_device_timeout, EMS_scsi_cmd_adapterResources or EMS_scsi_cmd_targetStatus indicating of "Busy" or "Queue Full" events associated to the array's target port and correct any hardware faults. Reduce the shared load on the device and/or reduce the maximum allowed I/O commands for the array's target port. For example, to reduce the maximum allowed I/O commands for an array's target port, the following command can be run: storage array port modify -name ARRAY_NAME_1 -wwnn 50014380025d1500 -wwpn 50014380025d1508 -max-queue-depth 256

Syslog Message

Array target port of %s has had its dynamic target port queue depth lowered to %d which is 25%% or lower of its maximum allowed value of %d.

Parameters

wwpn (STRING): World Wide Port Name of the array's target port which has its queue depth decreased by 25% or more.
current_qdepth (INT): Current number of allowed active I/O commands for the array's target port.
max_qdepth (INT): Maximum allowed value of the array's target port queue depth.

mlm.vmdisk events

mlm.vmdisk.discovery

Severity

INFORMATIONAL

Description

This message occurs when the system discovers a new virtual disk in a virtual machine (VM).

Corrective Action

(None).

Syslog Message

A new virtual disk with virtual device ID %d was discovered on initiator port %s on array %s with target port WWNN %s and WWPN: %s.

Parameters

VirtualDeviceID (INT): Virtual device ID of the virtual disk.
adapterName (STRING): Name of the initiator port discovering the virtual disk.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name (WWNN) of the array target port exporting the new virtual disk.
wwpn (STRING): World Wide Port Name (WWPN) of the array target port exporting the new virtual disk.

mlm.vmdisk.PathAdded

Severity

INFORMATIONAL

Description

This message occurs when a new path is added for a virtual disk in a virtual machine (VM).

Corrective Action

(None).

Syslog Message

Virtual disk '%s' (%s) is now connected on initiator port %s through %s's target port: WWNN: %s, WWPN: %s at virtual device ID: %d.

Parameters

diskName (STRING): Name of the virtual disk
serialno (STRING): Serial number of the virtual disk.
adapterName (STRING): Name of the initiator port discovering the virtual disk path.
arrayName (STRING): Name of the array.
wwnn (STRING): World Wide Node Name (WWNN) of the array target port.
wwpn (STRING): World Wide Port Name (WWPN) of the array target port.
VirtualDeviceID (INT): Virtual device ID of the virtual disk.

monitor events

monitor.brokendisk events

monitor.brokenDisk.notice

Severity

NOTICE

Description

This message occurs when a node is in a degraded state because of a broken disk. The timeout values indicate how long the system will run after each boot before shutting down because of this condition. Shutdown is to encourage you to replace broken disks. * The timeout[123] values are duplicated as a convenience for the Syslog message, which prints out the value three times.

Corrective Action

Consult other logged messages to determine the identity of broken disks, or use the "storage disk show -broken" command. Replace any broken disks. The %d hour timeout can be increased by altering the "raid.timeout" value using the "storage raid-options modify" command.

Syslog Message

%s, the system shuts down automatically every %d hours to encourage you to replace the disk. If you reboot the system, it will run for another %d hours before shutting down.

Parameters

type (STRING): Type of degradation.
timeout1 (INT): Timeout value.
timeout2 (INT): Timeout value.
timeout3 (INT): Timeout value.

monitor.chassisfan events

monitor.chassisFan.degraded

Severity

ALERT

Description

This message occurs when a chassis fan is degraded.

Corrective Action

Replace the fan unit.

Syslog Message

Chassis fan is degraded: %s

Parameters

fan_name (STRING): Name of the fan.

monitor.chassisFan.ok

Severity

NOTICE

Description

This message occurs when the chassis fans are OK.

Corrective Action

(None).

Syslog Message

Chassis fan %s is ok.

Parameters

fru_name (STRING): Name of the field-replaceable unit (FRU) containing the fan.

monitor.chassisFan.removed

Severity

ALERT

Description

This message occurs when a chassis fan is removed This is a warning message.

Corrective Action

Reinsert the FRU.

Syslog Message

Chassis fan %s is removed

Parameters

fan_name (STRING): Name of the field-replaceable unit (FRU) containing the fan.

monitor.chassisFan.stop

Severity

ERROR

Description

This message occurs when a chassis fan is stopped. This is a warning message.

Corrective Action

Reseat the FRU. If the FRU is an I/O module, schedule unit downtime and power off the unit before reseating the FRU. If the error persists, replace the FRU.

Syslog Message

Chassis fan contains at least one stopped fan: %s

Parameters

fru_name (STRING): Name of the field-replaceable unit (FRU) containing the fan.

monitor.chassisFan.warning

Severity

ALERT

Description

This message occurs when a chassis fan is spinning either too slowly or too fast. This is a warning message.

Corrective Action

Replace the FRU.

Syslog Message

Chassis fan is in warning state: %s

Parameters

fru_name (STRING): Name of the field-replaceable unit (FRU) containing the fan.

monitor.chassisfanfail events

monitor.chassisFanFail.xMinShutdown

Severity

EMERGENCY

Description

This message occurs when multiple chassis fans have failed, and the system will shut down in a few minutes unless corrected.

Corrective Action

Reseat the chassis fans. If they do not restart, replace them.

Syslog Message

Multiple Chassis Fan failure: System will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system will shut down.

monitor.chassispower events

monitor.chassisPower.degraded

Severity

ALERT

Description

This message occurs when a power supply is degraded.

Corrective Action

Degraded power might be caused by bad power supplies, bad wall power, or bad components on the motherboard. If spare power supplies are available, try exchanging them to see if that alleviates the problem. Otherwise contact NetApp technical support for further direction.

Syslog Message

Chassis power is degraded: %s

Parameters

reasonText (STRING): Description of the degradation.

monitor.chassisPower.ok

Severity

NOTICE

Description

This message occurs when the motherboard power is OK.

Corrective Action

(None).

Syslog Message

Chassis power is OK.

Parameters

(None).

monitor.chassispowersupplies events

monitor.chassisPowerSupplies.ok

Severity

INFORMATIONAL

Description

This message occurs when all power supplies are OK.

Corrective Action

(None).

Syslog Message

Chassis power supplies OK.

Parameters

(None).

monitor.chassispowersupply events

monitor.chassisPowerSupply.degraded

Severity

NOTICE

Description

This message occurs when a power supply is degraded.

Corrective Action

A replacement power supply might be required. Contact NetApp technical support for further direction.

Syslog Message

Chassis power supply %d is degraded: %s

Parameters

ps_number (INT): Power supply number.
reasonText (STRING): Description of the degradation.

monitor.chassisPowerSupply.notPresent

Severity

NOTICE

Description

This message occurs when an expected a power supply is not present.

Corrective Action

Add a power supply to the controller chassis.

Syslog Message

Chassis power supply %d is not present.

Parameters

ps_number (INT): Power supply number.

monitor.chassisPowerSupply.off

Severity

NOTICE

Description

This message occurs when a power supply is off.

Corrective Action

Turn on the power supply.

Syslog Message

Chassis power supply %d off.

Parameters

ps_number (INT): Power supply number.

monitor.chassisPowerSupply.ok

Severity

INFORMATIONAL

Description

This message occurs when the power supply is OK.

Corrective Action

(None).

Syslog Message

Chassis power supply %d is OK.

Parameters

ps_number (INT): Power supply number.

monitor.chassistemperature events

monitor.chassisTemperature.cool

Severity

ALERT

Description

This message occurs when the chassis temperature is too cool. This is a warning message.

Corrective Action

The appliance cannot function in an environment that is too cold; find ways to warm the appliance.

Syslog Message

Chassis temperature is too cool: %s

Parameters

describe_toocool (STRING): Description of the condition.

monitor.chassisTemperature.ok

Severity

NOTICE

Description

This message occurs when the chassis temperature is normal.

Corrective Action

(None).

Syslog Message

Chassis temperature is ok.

Parameters

(None).

monitor.chassisTemperature.state.unknown

Severity

ALERT

Description

This message occurs when the system cannot read multiple chassis temperature sensors. The condition can be caused by software, firmware, or hardware problems.

Corrective Action

Arrange to AC power-cycle the unit to address possible software and firmware issues. If the condition persists, contact NetApp technical support for assistance with Processor Control Module (PCM) replacement.

Syslog Message

Chassis temperature state is unknown: %s.

Parameters

reasonText (STRING): Description of the temperature sensor issue.

monitor.chassisTemperature.warm

Severity

ALERT

Description

This message occurs when the chassis temperature is too warm. This is a warning message. If the condition persists, the system will shut down automatically.

Corrective Action

Ensure that sufficient cooling air is being supplied to the chassis and that the air inlets and outlets of the unit are not blocked. If you cannot resolve the situation, shut down all clients that are attached to the storage appliance, and then shut down the system.

Syslog Message

Chassis temperature is too warm: %s

Parameters

describe_toowarm (STRING): Description of the condition.

monitor.completed events

monitor.completed.iron

Severity
ERROR

Description
This message occurs when wafliron in the optional commit mode has finished on the aggregate but changes have not been committed or rejected. Either commit or reject the changes.

Corrective Action
Run the "aggr waflrion commit VOL" command to commit the changes or the "aggr wafliron reject VOL" command to reject the changes.

Syslog Message
Wafliron in the optional commit mode has completed on aggregate '%s' but the changes have not been committed or rejected. Either commit or reject the changes.

Parameters
volname (STRING): Volume name

monitor.cpu events

monitor.cpu.ok

Severity
INFORMATIONAL

Description
This message occurs when the CPU busy situation is corrected.

Corrective Action
(None).

Syslog Message
%s

Parameters
report (STRING): Description of the current CPU usage.

monitor.cpu.tooBusy

Severity
NOTICE

Description
This message occurs when the CPU is too busy.

Corrective Action
(None).

Syslog Message

Warning: %s

Parameters

report (STRING): Description of the problem.

monitor.disklabelcheckfailed events

monitor.diskLabelCheckFailed

Severity

NOTICE

Description

This message occurs when the system detects that a file system disk has an invalid or a missing RAID label. The system corrects the situation during the next label update.

Corrective Action

No user action is required.

Syslog Message

Periodic check of RAID %s has failed. The system will correct the problem.

Parameters

disk_info (STRING): Formatted information of the disk object.
label_block_num (INT): Label block number code.
label_state (INT): Label state code.
label_read_error (INT): Label read error code.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk in RPM.

monitor.downrevdisks events

monitor.downRevDisks

Severity

ERROR

Description

This message occurs when ONTAP® detects that downrev disks are still present in the system.

Corrective Action

Download the latest disk firmware on each node and ensure that automatic background firmware update is enabled. If necessary, use the (advanced privilege) "storage disk firmware update" command to manually

update disk firmware. Consult the man page for cautions.

Syslog Message

Downrev disks still present!!

Parameters

(None).

monitor.extcache events

monitor.extCache.failed

Severity

NOTICE

Description

This message occurs when the monitor detects the WAFL® external cache subsystem (FlexScale) has failed and is no longer available for use.

Corrective Action

Consult the system logs to determine the original cause of the error.

Syslog Message

FlexScale WAFL external cache is unavailable due to an earlier fatal error.

Parameters

(None).

monitor.fan events

monitor.fan.critical

Severity

EMERGENCY

Description

This message occurs when one or more main unit fans have failed. The system cannot continue to operate.

Corrective Action

Replace the failed fans.

Syslog Message

%s

Parameters

report (STRING): Report indicating the critical state.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

monitor.fan.failed

Severity

ALERT

Description

This message occurs when one or more main unit fans have failed. The system remains operational. If the condition persists too long, an automatic shutdown for overtemperature might occur.

Corrective Action

Reseat the failed fans. If the error persists, replace them.

Syslog Message

%s

Parameters

report (STRING): Report indicating the failed fans.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

monitor.fan.ok

Severity

NOTICE

Description

This message occurs when a previously failed main unit fan has been restarted.

Corrective Action

(None).

Syslog Message

%s

Parameters

report (STRING): Report indicating that the failed fans have restarted.

monitor.fan.warning

Severity

NOTICE

Description

This message occurs when one or more fans are in a warning state.

Corrective Action

Replace the indicated fans to avoid overheating.

Syslog Message

%s

Parameters

report (STRING): Report indicating the warning level.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

monitor.fru events

monitor.fru.info.readable

Severity

INFORMATIONAL

Description

This message occurs when the inventory information about a field-replaceable unit (FRU) that was previously unreadable becomes readable.

Corrective Action

(None).

Syslog Message

The inventory information of FRU %s is readable.

Parameters

fru_name (STRING): FRU name.

monitor.fru.info.unreadable

Severity

ERROR

Description

This message occurs when the inventory information of a field-replaceable unit (FRU) is not readable.

Corrective Action

See the system hardware guide for the replacement of the FRU. At the earliest convenient time, remove and reinsert the FRU to reseat it, and then resume normal system operation. If the error persists, replace the FRU according to the hardware guide directions.

Syslog Message

The inventory information of FRU %s is not readable.

Parameters

fru_name (STRING): FRU name.

monitor.globalstatus events

monitor.globalStatus.critical

Severity

EMERGENCY

Description

This message occurs when the system's global health is critical; for example, if a fan failed.

Corrective Action

Check the event log for other conditions that can cause this global status message. Follow the corrective actions in those messages.

Syslog Message

%s

Parameters

problem (STRING): System problem description.

monitor.globalStatus.nonCritical

Severity

ERROR

Description

This message occurs when the system's global health is degraded; for example, if a file system is nearly full.

Corrective Action

Check the event log for other conditions that can cause this global status message. Follow the corrective actions in those messages.

Syslog Message

%s

Parameters

problem (STRING): System problem description.

monitor.globalStatus.nonRecoverable

Severity

EMERGENCY

Description

This message occurs when the system's global health is non-recoverable, and the system is shutting down. There are currently no examples of this failure.

Corrective Action

Check the event log for other conditions that can cause this global status message. Follow the corrective actions in those messages.

Syslog Message

%s

Parameters

problem (STRING): System problem description.

monitor.globalStatus.ok

Severity

NOTICE

Description

This message occurs when the system's global health returns to normal.

Corrective Action

(None).

Syslog Message

%s

Parameters

problem (STRING): Description of the system's normal condition.

monitor.iocard events

monitor.ioCard.degraded

Severity

ALERT

Description

This message indicates that an I/O card is degraded.

Corrective Action

Exchange or replace the card with a known good card in the same I/O slot. If the problem persists, contact NetApp technical support for replacement assistance.

Syslog Message

IO card is degraded: %s

Parameters

reasonText (STRING): Slot number of the card and the reason the card is degraded.

monitor.ioCard.ok

Severity

NOTICE

Description

This message indicates that an I/O card is operating properly.

Corrective Action

None.

Syslog Message

IO card on slot %d is OK

Parameters

slot_number (INT): Slot number of the card.

monitor.ioexpansionpower events

monitor.ioexpansionPower.degraded

Severity

NOTICE

Description

This message indicates that power on the I/O expansion module is degraded.

Corrective Action

Degraded power might be caused by bad power supplies, bad wall power, or bad components on the motherboard. If spare power supplies are available, try exchanging them to see whether the problem is resolved. Otherwise, contact NetApp technical support.

Syslog Message

Power on I/O expansion module is degraded: %s

Parameters

reasonText (STRING): Reading and state of voltage sensors on the I/O expansion module.

monitor.ioexpansionPower.ok

Severity

NOTICE

Description

This messages indicates that power on the I/O expansion module is OK.

Corrective Action

No corrective action is needed.

Syslog Message

Power on the I/O expansion module is OK.

Parameters

(None).

monitor.ioexpansiontemperature events

monitor.ioexpansionTemperature.cool

Severity

EMERGENCY

Description

This warning message occurs when the I/O expansion module is too cold.

Corrective Action

The system cannot function in an environment that is too cold; find ways to warm the system.

Syslog Message

I/O expansion module is too cold: %s

Parameters

describe_toocool (STRING): Reading and state of the temperature sensors on the I/O expansion module.

monitor.ioexpansionTemperature.ok

Severity

NOTICE

Description

This message occurs when the temperature of the I/O expansion module is normal. It can occur for the following two cases: 1) LOG_NOTICE to show that a bad condition has reverted to normal. 2) LOG_INFO for hourly to indicate that the temperature is OK.

Corrective Action

No corrective action is needed.

Syslog Message

Temperature of the I/O expansion module is OK.

Parameters

(None).

monitor.ioexpansionTemperature.warm

Deprecated

Deprecated as of version 9.2.0 to address the EMS ID length violation.

Severity

ALERT

Description

This warning message occurs when the I/O expansion module is too warm.

Corrective Action

Evaluate the environment in which the system is functioning: are air conditioning units needed or is the current air conditioning not functioning properly?

Syslog Message

I/O expansion module is too warm: %s

Parameters

> **describe_toowarm** (STRING): Reading and state of the temperature sensors on the I/O expansion module.

monitor.ioxmtemp events

monitor.ioxmTemp.warm

Severity

> ALERT

Description

> This message occurs when the I/O module is above the recommended operating temperature.

Corrective Action

> Evaluate the environment in which the system is functioning for proper air flow and temperature control.

Syslog Message

> I/O expansion module is too warm: %s

Parameters

> **describe_toowarm** (STRING): Reading and state of the temperature sensors on the I/O expansion module.

monitor.mismatch events

monitor.mismatch.hourly

Severity

> ALERT

Description

> This message occurs when the version of ONTAP® is not supported on this hardware. You cannot run a version of ONTAP produced by one vendor on hardware supplied by another. The system will shut down if you do not install a correctly branded version of ONTAP.

Corrective Action

> Install a correctly branded version of ONTAP before the timer expires.

Syslog Message

> ONTAP detected a branding mismatch. The hardware is branded by %s and ONTAP is branded by %s. There are %d hour(s) left before shutdown. Install a version of ONTAP branded by your hardware vendor.

Parameters

> **hardware** (STRING): Vendor brand associated with the hardware.
> **software** (STRING): Vendor brand associated with the version of ONTAP.
> **hours** (INT): Number of hours before shutdown.

monitor.mismatch.shutdown

Severity

EMERGENCY

Description

This message occurs when the system shuts down because the hardware brand does not match the ONTAP® version brand.

Corrective Action

Install a correctly branded version of ONTAP to prevent subsequent shutdowns for brand mismatch. Monitor the EMS_monitor_mismatch_hourly message to determine when the next shutdown will occur because of the brand mismatch.

Syslog Message

Shutting down because of a software branding mismatch. The hardware is branded by %s and ONTAP is branded by %s.

Parameters

hardware (STRING): Vendor brand associated with the hardware.
software (STRING): Vendor brand associated with the version. of ONTAP.

monitor.nvmembattery events

monitor.nvmembattery.warninglow

Severity

ALERT

Description

This message occurs when the nonvolatile memory (NVMEM) battery charge is low.

Corrective Action

Replace the NVMEM battery as soon as possible.

Syslog Message

NVMEM battery is low on power and should be replaced as soon as possible.

Parameters

(None).

monitor.nvramlowbatteries events

monitor.nvramLowBatteries

Severity

EMERGENCY

Description

This message occurs when the NVRAM batteries are at a dangerously low power level.

Corrective Action

Replace the NVRAM batteries.

Syslog Message

NVRAM batteries are dangerously low.

Parameters

(None).

monitor.nvramLowBatteries.notice

Severity

NOTICE

Description

This message occurs when a low batteries situation exists. The timeout[123] values are duplicated as a convenience for the Syslog message, which prints out the value three times.

Corrective Action

Replace the NVRAM batteries.

Syslog Message

If the NVRAM batteries are dangerously low, the system shuts down automatically every %d hours to encourage you to replace them. If you reboot the system it will run for another %d hours before shutting down.

Parameters

timeout1 (INT): Timeout value.
timeout2 (INT): Timeout value.
timeout3 (INT): Timeout value.

monitor.nvramlowbattery events

monitor.nvramLowBattery

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery is at a dangerously low power level.

Corrective Action

Replace the NVRAM battery.

Syslog Message

NVRAM battery is dangerously low.

Parameters

(None).

monitor.nvramLowBattery.notice

Severity

NOTICE

Description

This message occurs when a low battery situation exists. The timeout[123] values are duplicated as a convenience for the Syslog message, which prints out the value three times.

Corrective Action

Replace the NVRAM battery.

Syslog Message

If the NVRAM battery is dangerously low, the system shuts down automatically every %d hours to encourage you to replace it. If you reboot the system it will run for another %d hours before shutting down.

Parameters

timeout1 (INT): Timeout value.
timeout2 (INT): Timeout value.
timeout3 (INT): Timeout value.

monitor.partnercontroller events

monitor.partnerController.notPresent

Severity

ALERT

Description

This message occurs when both controllers are configured as an HA (high-availability) pair, but the partner controller is not present. The system fan will run at a higher speed to prevent overheating due to the non-optimum air flow with only one controller in place.

Corrective Action

Put the partner controller back into the HA configuration; otherwise, the system fan will run at a higher speed to prevent overheating due to the non-optimum air flow with only one controller in place.

Syslog Message

Both controllers are configured as an HA (high-availability) pair, but the partner controller is not present. The system fan will run at a higher speed to prevent possible overheating.

Parameters

(None).

monitor.power events

monitor.power.degraded

Deprecated

Deprecated as of version 9.2. Last used in 7.3.6 on Tin and Dell one-PSU systems. It is the last user of

snmp trap 43.

Severity

EMERGENCY

Description

This message occurs when the main unit power supply is in a degraded mode.

Corrective Action

(Call support).

Syslog Message

Power supply is in degraded mode: %s

Parameters

report (STRING): Description of the problem.

monitor.power.normal

Severity

INFORMATIONAL

Description

This message occurs when the system has sufficient power (220V) to power up both controllers.

Corrective Action

(None).

Syslog Message

The power provided to the system is sufficient.

Parameters

(None).

monitor.power.not.sufficient

Severity

ALERT

Description

This message occurs when a storage system in a low-line (110V) power configuration does not have sufficient power to support both controllers. The built-in hardware logic prevents the controller in the bottom slot from powering up.

Corrective Action

A high-line (220V) power configuration is needed to power up both controllers. Power off the system, connect the power supply unit (PSU) with 220V power, and then power up the system.

Syslog Message

The bottom controller is not powered up due to insufficient power.

Parameters

(None).

monitor.power.unreadable

Severity

ERROR

Description

This message occurs when a power sensor in the controller module is not readable.

Corrective Action

Shut down the system and power-cycle the controller module. If the sensor is still not readable, replace the controller module.

Syslog Message

A power sensor %s in the controller module is not readable.

Parameters

sensor_name (STRING): Sensor name.

monitor.raid events

monitor.raid.brokenDisk

Severity

ERROR

Description

This message occurs when the monitor detects a broken disk.

Corrective Action

Replace the disk.

Syslog Message

%s in RAID group "%s" %s broken.

Parameters

type (STRING): Type of disk.
rgname (STRING): Name of the RAID group.
verb (STRING): Description of the broken state.

monitor.raid.reconstruct

Severity

NOTICE

Description

This message occurs when a RAID reconstruct is initiated.

Corrective Action

No user action is required for the reconstruct operation to succeed. Refrain from removing disks from the affected RAID group until reconstruction is completed.

Syslog Message

Reconstructing broken %s in RAID group "%s".

Parameters

type (STRING): Type of disk.
rgname (STRING): RAID group name.

monitor.raid.reconstruct.susp

Severity

ERROR

Description

This message occurs when a RAID reconstruction needs to be performed on a RAID group, but reconstruction is suspended or disabled.

Corrective Action

Contact NetApp technical support for assistance with reenabling RAID reconstruction.

Syslog Message

Reconstruction needs to be performed on RAID group "%s", but RAID reconstruction is suspended or disabled.

Parameters

rgname (STRING): RAID group name.

monitor.raiddp events

monitor.raiddp.vol.singleDegraded

Severity

ERROR

Description

This message occurs as part of an hourly system check when a double parity volume is in single degraded mode. This happens when there is a disk failure in the double parity volume and the RAID subsystem cannot find a suitable replacement disk to start reconstruction.

Corrective Action

Add a spare disk suitable to reconstruction.

Syslog Message

%s in RAID group "%s" is broken.

Parameters

type (STRING): Type of disk: data, parity or dparity disk.
rgname (STRING): RAID group name.

monitor.raidtec events

monitor.raidtec.dblDegraded

Severity

ERROR

Description

This message occurs as part of an hourly system check, when a RAID-TEC aggregate is in double degraded mode. This happens when there are two disk failures in any RAID group in the RAID-TEC aggregate and the RAID subsystem cannot find suitable replacement disks to start reconstruction. One more disk failure in the same RAID group leads to the aggregate being in its worst degraded state.

Corrective Action

Replace the failed disks, which are identifiable by lighted fault LED lights, to start reconstruction. After reconstruction is complete, the output of the "aggr show" command shows that the aggregate is back to normal state.

Syslog Message

%s in RAID group "%s" are broken.

Parameters

type (STRING): Type of disks: data, parity, dparity, or tparity disk.
rgname (STRING): RAID group name.

monitor.rtchighpower events

monitor.rtcHighPower

Severity

ERROR

Description

This message occurs when the real-time clock (RTC) battery voltage is above normal level.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the real-time clock battery voltage is still above normal 60 minutes after environmental problems have been corrected, replace it at the next available maintenance window.

Syslog Message

Real-time clock battery voltage is above normal (%s).

Parameters

reading (STRING): Battery voltage reading (mV).

monitor.rtclowpower events

monitor.rtcLowPower

Severity

ERROR

Description

This message occurs when the real-time clock (RTC) battery is at a dangerously low power level.

Corrective Action

Replace the real-time clock battery.

Syslog Message

Real-time clock battery is dangerously low. Replace it at the next available maintenance window.

Parameters

(None).

monitor.rtcnormal events

monitor.rtcNormal

Severity

NOTICE

Description

This message occurs when the real-time clock (RTC) battery voltage is normal. Previously occurred fault is now cleared.

Corrective Action

(None).

Syslog Message

Real-time clock battery voltage is normal.

Parameters

(None).

monitor.rtcwarnlowpower events

monitor.rtcWarnLowPower

Severity

ERROR

Description

This message occurs when the real-time clock (RTC) battery is at a "warning low" voltage level.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the real-time clock battery voltage is still below normal 60 minutes after environmental problems have been corrected, replace it at the

next available maintenance window.

Syslog Message

Real-time clock battery voltage is below normal (%s).

Parameters

reading (STRING): Battery voltage reading (mV).

monitor.shelf events

monitor.shelf.accessError

Severity

ALERT

Description

This message occurs when the monitor detects that a disk shelf access error has occurred. The message is also an hourly reminder that the error has not been corrected. Enclosure Services is unable to monitor or control one or more disk shelves on a particular Fibre Channel loop or Serial SCSI Attach (SAS) domain because it cannot communicate with the enclosure services processes in those shelves.

Corrective Action

Check the corrective actions of enclosure services error messages that might precede this error in the log. Ensure that all loop or domain connections are latched and secured properly. Correct any error conditions indicated by LEDs on any of the shelves or shelf I/O modules. This might require power-cycling of shelves or replacement of modules, as is appropriate to the particular shelf type.

Syslog Message

Enclosure services has detected an error in access to shelves on channel %s.

Parameters

channel (STRING): Adapter slot or switch port that has detected the fault; for example, "7a" or "myswitch:5".

monitor.shelf.accessError.ok

Severity

NOTICE

Description

This message occurs when the monitor detects that a previously detected shelf access error has been corrected.

Corrective Action

(None).

Syslog Message

Enclosure services-detected shelf access error has been corrected on channel %s.

Parameters

channel (STRING): Adapter slot or switch port where the error was corrected.

monitor.shelf.configError

Severity

ALERT

Description

This message occurs when the Enclosure Services process notifes the monitor of a disk shelf configuration error. The message is also an houly reminder that the error has not been corrected. Configuration errors might cause Enclosure Services to be unable to monitor a disk shelf, or might indicate shelf configuration or interconnect problems; for example, too few power supplies in a disk shelf, or improper mixing of modules in a shelf or on a loop.

Corrective Action

See the EMS message concerning disk shelf configuration errors that preceded the first instance of this message, and follow the corrective actions therein.

Syslog Message

Enclosure services has detected an error in access to shelves or shelf configuration on channel %s.

Parameters

channel (STRING): Adapter slot or switch port that has detected the fault; for example, "7a" or "myswitch:5".

monitor.shelf.configError.ok

Severity

NOTICE

Description

This message occurs when the monitor detects that a previously detected shelf configuration error has been corrected.

Corrective Action

(None).

Syslog Message

Enclosure services-detected configuration error has been corrected on channel %s.

Parameters

channel (STRING): Adapter slot or switch port where the fault existed.

monitor.shelf.fault

Severity

ALERT

Description

This message occurs when the system detects a critical disk shelf fault. It is also an hourly reminder that the condition has not been corrected.

Corrective Action

Check the event log for more specific shelf error messages, and follow the corrective actions there. Use the "storage shelf show" and "storage shelf show -errors" commands to display the current shelf status.

Syslog Message

Critical fault reported on disk storage shelf attached to channel %s. Check fans, power supplies, disks, and temperature sensors.

Parameters

channel (STRING): Adapter slot or switch port that has detected the fault; for example, "7a" or "myswitch:5".

monitor.shelf.fault.ok

Severity

NOTICE

Description

This message occurs when the monitor detects that a previously detected shelf fault has been corrected.

Corrective Action

(None).

Syslog Message

Fault previously reported on disk storage shelf attached to channel %s has been corrected.

Parameters

channel (STRING): Adapter slot or switch port where the error has been corrected; for example,"7a" or "myswitch:5".

monitor.shelf.warning

Severity

ERROR

Description

This message occurs when the system detects a disk shelf warning. It is also an hourly reminder that the condition has not been corrected.

Corrective Action

Check the messages log for more specific shelf error messages, and follow the corrective actions there.

Syslog Message

Fault reported on disk storage shelf attached to channel %s. Check fans, power supplies, disks, and temperature sensors.

Parameters

channel (STRING): Adapter slot or switch port that has detected the fault; for example, "7a" or "myswitch:5".

monitor.shutdown events

monitor.shutdown.brokenDisk

Severity

EMERGENCY

Description

This message occurs when an automatic shutdown sequence is initiated due to a degraded RAID group that cannot be reconstructed because there are insufficient appropriate spare disks. The timeout period is specified by the "raid.timeout" option, which must be set by user to a nonzero value in order for the system to shutdown on expiry of the timeout period. If the option is not set or is set to zero, then system will not shut down due to a degraded RAID group.

Corrective Action

To recover from the shutdown, boot the system. Ensure that there are sufficient spare disks of the appropriate type so that the degraded RAID group can be reconstructed.

Syslog Message

%s in RAID group "%s" %s broken. Halting system now.

Parameters

type (STRING): Type of disk.
rgname (STRING): RAID group name.
verb (STRING): Description of the broken state.

monitor.shutdown.brokenDisk.pending

Severity

NOTICE

Description

This message occurs when an automatic shutdown sequence has been postponed due to RAID reconstruction.

Corrective Action

(None).

Syslog Message

%s in RAID group "%s" %s broken. Halting system in %d hour%s.

Parameters

type (STRING): Type of disk.
rgname (STRING): RAID group name.
verb (STRING): Description of the broken state.
countdown (INT): Number of hours remaining to shutdown.
plural (STRING): Plural character.

monitor.shutdown.cancel

Severity

NOTICE

Description

This message occurs when an automatic shutdown sequence is canceled.

Corrective Action

(None).

Syslog Message

Automatic shutdown sequence canceled.

Parameters

(None).

monitor.shutdown.cancel.brokenDisk

Severity

NOTICE

Description

This message occurs when an automatic shutdown sequence has been postponed due to RAID reconstruction

Corrective Action

(None).

Syslog Message

%s in RAID group "%s" %s broken. Halt delayed until %s finishes.

Parameters

type (STRING): Type of disk.
rgname (STRING): RAID group name.
verb (STRING): Description of the broken state.
reason (STRING): Reason that the shutdown was postponed. Possible reasons are "RAID reconstruction" and "parity recomputation".

monitor.shutdown.cancel.nvramLowBatteries

Severity

NOTICE

Description

This message occurs when an automatic shutdown sequence has been postponed due to RAID reconstruction.

Corrective Action

(None).

Syslog Message

NVRAM batteries are dangerously low. Halt delayed until %s finishes.

Parameters

reason (STRING): Reason that the shutdown was postponed. Possible reasons are "RAID reconstruct" and "parity recomputation".

monitor.shutdown.cancel.nvramLowBattery

Severity

NOTICE

Description

This message occurs when an automatic shutdown sequence has been postponed due to RAID reconstruction

Corrective Action

(None).

Syslog Message

NVRAM battery is dangerously low. Halt delayed until %s finishes.

Parameters

reason (STRING): Reason that the shutdown was postponed. Possible reasons are "RAID reconstruct" and "parity recomputation".

monitor.shutdown.chassisOverTemp

Severity

EMERGENCY

Description

This message occurs when the chassis temperature is too hot. This is sent just before shutdown.

Corrective Action

Ensure that sufficient cooling air is being supplied to the chassis and that the air inlets and outlets of the unit are not blocked.

Syslog Message

Chassis temperature is too hot: %s

Parameters

describe_toohot (STRING): Description of the condition.

monitor.shutdown.chassisUnderTemp

Severity

ERROR

Description

This message occurs when the system is shutting down because chassis temperature is too cold.

Corrective Action

The appliance is in an environment that is too cold. Find a way to warm the environment around the appliance.

Syslog Message

Chassis temperature is too cold: %s

Parameters

describe_toocold (STRING): Description of the condition.

monitor.shutdown.emergency

Severity

EMERGENCY

Description

This message occurs when ONTAP® initiates an emergency shutdown.

Corrective Action

Correct the condition noted in the reason field.

Syslog Message

Emergency shutdown: %s

Parameters

reason (STRING): Reason for the shutdown.

monitor.shutdown.ioexpansionOverTemp

Severity

EMERGENCY

Description

This message occurs when the I/O expansion module is too hot. This message is sent just before shutdown.

Corrective Action

The system environment is too hot; cool the environment.

Syslog Message

I/O expansion module is too hot: %s

Parameters

describe_toohot (STRING): Reading and state of the temperature sensors on the I/O expansion module.

monitor.shutdown.ioexpansionUnderTemp

Severity

EMERGENCY

Description

This message occurs when the I/O expansion module is too cold. This message is sent just before shutdown.

Corrective Action

The system environment is too cold; warm the environment.

Syslog Message

I/O expansion module is too cold: %s

Parameters

describe_toocold (STRING): Reading and state of the temperature sensors on the I/O expansion module.

monitor.shutdown.nvramLowBatteries

Severity

EMERGENCY

Description

This message occurs when the NVRAM power in a controller with multiple NVRAM batteries is dangerously low, and ONTAP® initiates a shutdown to protect user data.

Corrective Action

Replace the controller NVRAM batteries.

Syslog Message

Emergency shutdown: NVRAM batteries dangerously low in degraded mode. Replace the batteries immediately!

Parameters

(None).

monitor.shutdown.nvramLowBatteries.pending

Severity

ALERT

Description

This message occurs when an automatic shutdown sequence is pending because of low NVRAM batteries voltage.

Corrective Action

Replace the controller NVRAM batteries.

Syslog Message

NVRAM batteries are dangerously low. Halting system in %d hour%s. Replace the batteries immediately!

Parameters

countdown (INT): Hours remaining until shutdown.
plural (STRING): Grammatical number.

monitor.shutdown.nvramLowBattery

Severity

EMERGENCY

Description

This message occurs when the controller NVRAM voltage is dangerously low, and ONTAP® initiates a shutdown to protect user data.

Corrective Action

Replace the controller NVRAM battery.

Syslog Message

Emergency shutdown: NVRAM battery dangerously low in degraded mode. Replace the battery immediately!

Parameters

(None).

monitor.shutdown.nvramLowBattery.pending

Severity

ALERT

Description

This message occurs when an automatic shutdown sequence is pending because of low NVRAM battery voltage.

Corrective Action

Replace the controller NVRAM battery.

Syslog Message

NVRAM battery is dangerously low. Halting system in %d hour%s. Replace the battery immediately!

Parameters

countdown (INT): Hours remaining until shutdown.
plural (STRING): Grammatical number.

monitor.sparelabelcheckfailed events

monitor.spareLabelCheckFailed

Severity

NOTICE

Description

This message occurs when the system detects that a hot spare disk has an invalid or a missing label. The system corrects the situation by rewriting the label.

Corrective Action

No user action is required.

Syslog Message

Periodic check of hot spare %s has failed. The system will correct the problem.

Parameters

disk_info (STRING): Formatted information of the disk object.
label_block_num (INT): Label block number code.
label_state (INT): Label state code.
label_read_error (INT): Label read error code.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk in RPM.

monitor.temp events

monitor.temp.unreadable

Severity

ERROR

Description

This message occurs when the controller module temperature is not readable. In this condition, the system does not automatically shut down if it becomes too hot for reliable operation.

Corrective Action

Shut down the system and power-cycle the controller module. If the temperature is still not readable, replace the controller module.

Syslog Message

The controller temperature (%s) is not readable.

Parameters

sensor_name (STRING): Sensor name.

monitor.unknown events

monitor.unknown.message

Severity

ERROR

Description

This message occurs when the status monitor receives an unexpected message type. This is an internal

---

error.

Corrective Action

(None).

Syslog Message

Internal error: status monitor received message type %d, expected type %d

Parameters

msgType (INT): (None).
expectedType (INT): (None).

monitor.vol events

monitor.vol.full.inc.sav

Severity

ALERT

Description

This message occurs when one or more file systems are full, typically indicating at least 98% full. Space usage is computed based on the active file system size as well as all of the space saved by storage efficiency features. This value is computed by subtracting the value of the "Snapshot Reserve" field, and is equivalent to the "logical-used" field of the "volume show-space" command. The volume can be over 100% full due to space used or including savings by storage efficiency features or reserved by metadata. A value greater than 100% can cause the volume to become logically overallocated. See the "vol.log.overalloc.inc.sav" event message for more information.

Corrective Action

Create space by increasing the volume size, deleting data, or deleting snapshots. To increase volume size, use the "volume size" command. To delete snapshots, use the "volume snapshot delete" command.

Syslog Message

%s %s%s%s (UUID %s) is full (reserved or using %d%% of space including savings and %d%% of inodes).

Parameters

object_type (STRING): Identifier for the type of object to which this event applies. This event should be applicable only to volumes with logical space enforcement enabled.
name (STRING): Name of this object.
app (STRING): Application Universally Unique ID (UUID).
vserver_uuid (STRING): UUID of the object's or volume's Vserver.
object_uuid (STRING): UUID of the object or volume.
percent_full_blocks (INT): Used capacity of the space of the object, as a percentage.
percent_full_inodes (INT): Used capacity of inodes of the object, as a percent.

monitor.vol.nearFull.inc.sav

Severity

ALERT

Description

This message occurs when one or more file systems are nearly full, typically indicating at least 95% full. Space usage is based on the active file system size as well as all of the space saved by storage efficiency features. This value is computed by subtracting the value of the "Snapshot Reserve" field, and is equivalent to the "logical-used" field of the "volume show-space" command.

Corrective Action

Create space by increasing the volume size, deleting data, or deleting snapshots. To increase volume size, use the "volume size" command. To delete snapshots, use the "volume snapshot delete" command.

Syslog Message

%s %s%s%s (UUID %s) is nearly full (reserved or using %d%% of space including savings and %d%% of inodes).

Parameters

object_type (STRING): Identifier for the type of object to which this event applies. This event should be applicable only to volumes with logical space enforcement enabled.
name (STRING): Name of this object.
app (STRING): Application Universally Unique ID (UUID).
vserver_uuid (STRING): UUID of the object's or volume's Vserver.
object_uuid (STRING): UUID of the object or volume.
percent_full_blocks (INT): Used capacity of the space of the object, including space saved by the storage efficiency features, as a percentage.
percent_full_inodes (INT): Used capacity of inodes of the object, as a percentage.

monitor.volume events

monitor.volume.full

Severity

ALERT

Description

This message occurs when one or more file systems are full, typically indicating at least 98% full. The space usage is computed based on the active file system size and is computed by subtracting the value of the "Snapshot Reserve" field from the value of the "Used" field of the "volume show-space" command. Either a volume or an aggregate can be over 100% full due to space used or reserved by metadata. A value greater than 100% might cause Snapshot copy space to become unavailable or cause a volume to become logically overallocated. See the "vol.log.overalloc" EMS message for more information.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume or aggregate size, or by deleting data or deleting Snapshot copies. To increase a volume's size, use the "volume size" command. To delete a volume's Snapshot copy, use the "volume snapshot delete" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate Snapshot copies are deleted automatically when the aggregate is full. For ASA r2 platforms, create space in the volume or aggregate. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

%s "%s%s%s" is full (using or reserving %s%% of space and %s%% of inodes).

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
name (STRING): Name of this object.
app (STRING): Application universal unique identifier (UUID)
vserver_uuid (STRING): UUID of the object's storage virtual machine (SVM), if the object is a volume. Otherwise, this string is empty.
percent_full_blocks (STRING): Used capacity of the space of the object, as a percentage.
percent_full_inodes (STRING): Used capacity of inodes of the object, as a percentage.

monitor.volume.nearlyFull

Severity

ERROR

Description

This message occurs when one or more file systems are nearly full, typically indicating at least 95% full. The space usage is computed based on the active file system size and is computed by subtracting the value of the "Snapshot Reserve" field from the value of the "Used" field of the "volume show-space" command.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume or aggregate sizes, or by deleting data or deleting Snapshot copies. To increase a volume's size, use the "volume size" command. To delete a volume's Snapshot copies, use the "volume snapshot delete" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate Snapshot copies are deleted automatically when the aggregate is full. For ASA r2 platforms, create space in the volume or aggregate. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

%s %s%s%s is nearly full (using or reserving %s%% of space and %s%% of inodes).

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
name (STRING): Name of this object.
app (STRING): Application universal unique identifier(UUID).
vserver_uuid (STRING): UUID of the object's storage virtual machine (SVM), if the object is a volume. Otherwise, this string is empty.
percent_full_blocks (STRING): Used capacity of the space of the object, as a percent.
percent_full_inodes (STRING): Used capacity of inodes of the object, as a percent.

monitor.weeklystatsasup events

monitor.weeklyStatsASUP.off

Severity

ERROR

Description

This message occurs when weekly performance AutoSupport(tm) is disabled.

Corrective Action

Enable the weekly performance AutoSupport by entering the "options stats.autosupport.weekly.enable on" command. You must have the correct privilege to run this command.

Syslog Message

Weekly performance AutoSupport has been disabled.

Parameters

(None).

moveagent events

moveagent.abort events

moveagent.abort.cutover

Severity

INFORMATIONAL

Description

This event is issued during volume move when cutover is aborted because the volume took too long to replicate. The volume is unquiesced.

Corrective Action

The move job can be in process of retry. User can try '-force-cutover true' to force cutover.

Syslog Message

Cutover abort due to volume quiesce timer expiration: volume dsid %llu.

Parameters

volume_dsid (LONGINT): The source volume data set identifier (dsid)

moveagent.cleanup events

moveagent.cleanup.dest

Severity

ERROR

Description

This message occurs when a volume move operation running on the partner cluster is interrupted by a disaster recovery event (such as switchover or switchback) in the MetroCluster(tm) configuration before the operation reaches the cutover phase. This leaves the temporary destination volume created on this cluster in an incomplete state. The temporary destination volume must be deleted.

Corrective Action

If necessary, identify which temporary destination volume must be deleted by running the "volume show -fields volume,vserver -dsid" command, and then take that volume offline by running the "volume offline" command. Delete the volume by running the "volume delete" command while it is offline.

Syslog Message

MetroCluster disaster recovery event requires deletion of the temporary destination volume (DSID: %llu) created by a recent volume move operation running on the partner cluster. Failure to delete the temporary destination volume might cause future switchback operations to fail.

Parameters

volume_dsid (LONGINT): Destination volume data set ID (DSID).

moveagent.cleanup.src

Severity

ERROR

Description

This message occurs when a volume move operation is interrupted by a disaster recovery event (such as switchover or switchback) in the MetroCluster(tm) configuration after the cutover phase has started but before the source volume is deleted. The source volume must be deleted.

Corrective Action

If necessary, identify which source volume must be deleted by running the "volume show -fields volume, vserver -dsid" command, and then take the volume offline by running the "volume offline" command. Delete the volume by running the "volume delete" command while it is offline.

Syslog Message

A MetroCluster disaster recovery event interrupted the volume move operation before the source volume was deleted. Delete the source volume (DSID: %llu). Failure to delete the source volume might cause future switchback operations to fail.

Parameters

volume_dsid (LONGINT): Source volume data set ID (DSID).

moveagent.commitdst events

moveagent.commitdst.fail

Severity

ALERT

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination but fails to update the appropriate information on the destination. The system continues to retry the operation until it is successful. In the time between the failure and a successful retry, there might be disruption to client traffic associated with the volume being moved.

Corrective Action

Monitor the volume move job. If the problem persists, contact NetApp technical support

Syslog Message

Unable to finish the volume move operation for DSID %llu. Failed to commit the destination volume.

Parameters

volume_dsid (LONGINT): Destination volume Data Set ID (DSID).

moveagent.commitsrc events

moveagent.commitsrc.fail

Severity

ALERT

Description

This message occurs when an active volume move operation cannot commit the source volume. The system continues to retry the operation until it is successful. In the time between the failure and a successful retry, there might be disruption to client traffic associated with the volume being moved.

Corrective Action

Monitor the volume move job. If the problem persists, contact NetApp technical support

Syslog Message

Unable to finish the volume move operation for DSID %llu. Failed to commit the source volume.

Parameters

volume_dsid (LONGINT): Source volume Data Set ID (DSID).

moveagent.cutovercomp events

moveagent.cutovercomp.fail

Severity

ALERT

Description

This message occurs when a 'volume move' operation cannot complete cutover. The system continues to retry the operation until it is successful.

Corrective Action

Monitor the volume move job. If the problem persists, contact NetApp technical support

Syslog Message

Unable to finish the volume move operation for DSID %llu. Failed to complete cutover.

Parameters

volume_dsid (LONGINT): Destination volume Data Set ID (DSID).

moveagent.detected events

moveagent.detected.on.MCC.SO

Deprecated

This EMS is no longer needed as the issue that caused the volume inconsistency after an MCC switchback operation is fixed.

Severity

ERROR

Description

This message occurs when a volume move operation is interrupted by a disaster after the critical cutover phase has started but before the source volume is deleted. It might lead to volume inconsistencies and data access disruption on the disaster site when a MetroCluster® switchback operation is performed.

Corrective Action

To avoid data access disruption after MetroCluster switchback, some additional cleanup steps might need to be taken on the disaster site. Please run the commands 'debug vreport show' and 'debug vreport fix' on the disaster site to perform the cleanup. Contact NetApp technical support for further assistance if needed.

Syslog Message

A disaster event interrupted the volume move operation in the critical cutover phase before the source volume %s was deleted.

Parameters

volname (STRING): Source volume name.

moveagent.dst events

moveagent.dst.partial.commit

Severity

ALERT

Description

This message occurs when the move agent detects that the attributes of the destination volume are partially updated during the commit destination phase. In such scenarios, the volume move operation may not be able to complete successfully and the client access will be blocked during this whole period.

Corrective Action

Monitor the volume move job using the 'volume move show' command. If the problem presists, please contact NetApp technical support for recovery procedures.

Syslog Message

Unable to finish the volume move operation as the destination volume with dsid:%llu and uuid:%s is partially committed.

Parameters

volume_dsid (LONGINT): The destination volume data set identifier (dsid)
volume_uuid (STRING): The destination volume uuid.

moveagent.exceed events

moveagent.exceed.window

Severity

NOTICE

Description

This message occurs when the time window for a volume move operation exceeds the specified limit.

Corrective Action

(None).

Syslog Message

Cutover window was exceeded for volume with source DSID %llu in Vserver with ID %llu Total elapsed cutover time elapsed is %llums; cutover window is %llums. Time spent in committing the source volume is %llums and for destination cutover operations is %llums.

Parameters

volume (LONGINT): Volume data set ID(DSID).
vserver (LONGINT): Vserver ID where the move takes place.
total_cutover_time (LONGINT): Total cutover time elapsed.
cutover_window (LONGINT): Predetermined cutover window.
source_commit_time (LONGINT): Time for the source volume to be commited on disk.
destination_operation_latency (LONGINT): Time for commit destination and swap VLDB.

moveagent.outofmemory events

moveagent.outofmemory

Severity

NOTICE

Description

This message occurs when the move agent fails to allocate memory for the move object. The system continues to retry the operation until it is successful.

Corrective Action

If the problem persists, it indicates a system-level problem. Contact NetApp technical support.

Syslog Message

Unable to finish the volume move operation for DSID %llu. Failed to allocate sufficient memory.

Parameters

volume_dsid (LONGINT): Source or destination volume data set ID (DSID).

moveagent.phase events

moveagent.phase.queryerr

Severity

NOTICE

Description

This message occurs when an active volume move operation cannot access the volume move phase information.

Corrective Action

Monitor the currently running volume move job using the 'volume move show' clustered Data ONTAP command. If the volume move completes successfully, no further action is necessary. If the volume move

fails, you can retry the volume move or contact NetApp technical support for assistance.

Syslog Message

Cannot determine the vol move phase information for volume with DSID %llu.

Parameters

volume_dsid (LONGINT): Destination volume data set identifier(DSID).

moveagent.swapvldb events

moveagent.swapvldb.fail

Severity

ALERT

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination but fails to update the volume location database (VLDB). Failing to update the VLDB causes continued attempts to access the original location instead of the new location. The system continues to retry the operation until it is successful. In the time between the failure and a successful retry, there might be disruption to data access on the volume being moved.

Corrective Action

Monitor the volume move job for 30 minutes by running the "volume move show -vserver <vservername> -volume <volName%gt;" command. If the cutover phase continues to fail while trying to swap VLDB records, contact NetApp technical support.

Syslog Message

Unable to finish the volume move operation for DSID %llu. Failed to complete the swap VLDB operation successfully.

Parameters

volume_dsid (LONGINT): Destination volume data set ID (DSID).

moveagent.swapvldb.sync.fail

Severity

ERROR

Description

This message occurs when a 'volume move' operation finishes moving the volume to the destination but fails to replicate swapping of volume location database (VLDB) to the MetroCluster(tm) sync destination.

Corrective Action

Monitor the volume move job. If the problem persists, contact NetApp technical support

Syslog Message

Unable to finish replicating swap VLDB operation to MetroCluster(tm) destination for the volume move operation for DSID %llu.

Parameters

volume_dsid (LONGINT): Destination volume Data Set ID (DSID).

moveagent.switchback events

moveagent.switchback.veto

Severity

INFORMATIONAL

Description

This message occurs when the volume move operation vetoes a MetroCluster(tm) switchback because the operations are mutually exclusive.

Corrective Action

Reissue the "metrocluster switchback" command to initiate the MetroCluster switchback after the volume move operation is complete. Or use the "volume move abort" command to abort the volume move operation. Monitor the currently running volume move operation by using the "volume move show" command.

Syslog Message

The volume move operation in progress prevents MetroCluster switchback. Monitor the currently running volume move operation by using the "volume move show" command.

Parameters

(None).

moveagent.switchover events

moveagent.switchover.veto

Severity

INFORMATIONAL

Description

This message occurs when the volume move operation vetoes a MetroCluster(tm) switchover because the operations are mutually exclusive.

Corrective Action

Reissue the "metrocluster switchover" command to initiate the MetroCluster switchover after the volume move operation is complete. Or use the "-override-vetoes true" option to abort the volume move. Administrators can also abort running volume move operations by using the "volume move abort" command. Monitor the currently running volume move operation by using the "volume move show" command.

Syslog Message

The volume move operation in progress prevents MetroCluster switchover. Monitor the currently running volume move operation by using the "volume move show" command.

Parameters

(None).

mpt events

mpt.action events

mpt.action.reset.bus

Severity

NOTICE

Description

This message occurs when the system bus is reset in the message processing technology (MPT) adapter driver.

Corrective Action

(None).

Syslog Message

Bus reset on path %s for device status %s.

Parameters

path (STRING): Device path.
msg (STRING): Detail about device status.

mpt.action.reset.dev

Severity

NOTICE

Description

This message occurs when the system device is reset in the message processing technology (MPT) adapter driver.

Corrective Action

(None).

Syslog Message

Device reset on path %s for device status %s.

Parameters

path (STRING): Device path.
msg (STRING): Detail about device status.

mpt.bus events

mpt.bus.reg

Severity

NOTICE

Description

This message occurs when the message processing technology (MPT) adapter driver registration fails.

Corrective Action

(None).

Syslog Message

%s : Bus registration failed.

Parameters

mpt (STRING): MPT device name for which registration failed.

mpt.busreg events

mpt.busreg.phydisk.failed

Severity

ERROR

Description

This message occurs when physical disk bus registration fails in the message processing technology (MPT) adapter driver.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

%s : Physical disk bus registration failed.

Parameters

mpt (STRING): MPT device name on the path that failed.

mpt.path events

mpt.path.failure

Severity

ERROR

Description

This message occurs when the system cannot allocate a path in the message processing technology (MPT) adapter driver.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

%s : Unable to allocate path.

Parameters

    mpt (STRING): MPT device name on the path that failed.

mpt.phydisk events

mpt.phydisk.path.failed

Severity

    ERROR

Description

    This message occurs when the system cannot allocate a physical disk path in the message processing technology (MPT) adapter driver.

Corrective Action

    Check whether the device is connected correctly.

Syslog Message

    %s : Unable to allocate physical disk path.

Parameters

    mpt (STRING): MPT device name on the path that failed.

mpt.tmf events

mpt.tmf.req

Severity

    NOTICE

Description

    This message occurs when the system cannot allocate a SCSI Task Management Function (TMF) request in the message processing technology (MPT)adapter driver.

Corrective Action

    (None).

Syslog Message

    Unable to allocate dedicated TMF request for device %s.

Parameters

    mpt (STRING): MPT device name.

msata events

msata.boot events

msata.boot.device.failed

Severity

ERROR

Description

This message occurs when Data ONTAP® module that is responsible for monitoring the health of the mSATA device determines that the associated boot device is reporting a failure condition.

Corrective Action

Replace the device.

Syslog Message

Boot device %s has become read-only.

Parameters

device (STRING): Name of the device.

msata.boot.device.pfa

Severity

ERROR

Description

This message occurs when Data ONTAP® determines that failure is forthcoming for the associated mSATA boot device.

Corrective Action

Replace the device.

Syslog Message

Failure predicted for boot device %s.

Parameters

device (STRING): Name of the device.

msata.unable events

msata.unable.to.monitor

Severity

ERROR

Description

This message occurs when Data ONTAP® module that is responsible for monitoring the health of the

mSATA device cannot extract health information from the associated device.

Corrective Action

Replace the device. If the problem persists, contact NetApp technical support.

Syslog Message

Data ONTAP could not monitor device %s.

Parameters

device (STRING): Name of the device.

msrespmon events

multi events

multi.dsk events

multi.dsk.cksum.err

Severity

EMERGENCY

Description

This message occurs when multiple errors are detected during checksum verification, and the adapter is not taken offline or the "disk.offline_adapter.enable" option is disabled.

Corrective Action

Contact Contact NetApp technical support. for assistance with troubleshooting the reason for the write verification errors.

Syslog Message

Checksum verification failures reported by multiple disks connected to adapter %s.

Parameters

adapterName (STRING): Name of the adapter.

mw events

mw.hir events

mw.HiR.maxref.notify

Severity

NOTICE

Description

This message occurs when extent reference has reached a pre-determined threshold value. This is a temporary notification till we support OVERFLOW file - where we can support infinite reference.

Corrective Action

Limit the # of clone/snapshot operation.

Syslog Message

This message occurs when extent reference has reached a pre-determined threshold value. Limit the # of clone/snapshot operation till we support OVERFLOW file in metawafl. Aggr: %s%s%s EID: 0x%llx

Parameters

name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
eid (LONGINT): EID on which maxref is reached.

mw.iron events

mw.iron.mount.idlog.purge

Severity

INFORMATIONAL

Description

This message is used to notify idlog purge at mount after 7 consecutive unsuccessful iron runs.

Corrective Action

(None).

Syslog Message

Volume[%s] : Wafliron mount performance may be significantly impacted, because idlog purge is triggered after[%d] unsuccessful iron runs.

Parameters

vol (STRING): Name of the volume.
generation (INT): Iron generation number.

nameserv events

nameserv.conf events

nameserv.conf.limit.reached

Severity

ERROR

Description

This message occurs when a UNIX user or group name exceeds 64 characters. This check is performed on the last node upgrade from Data ONTAP® 8.2 to 8.3. The names that exceed this limit will not get resolved in Data ONTAP 8.3.

Corrective Action

Replace the name with a name that is no longer than 64 characters.

Syslog Message

%s exceeds 64 characters for Vserver %s and configuration %s.

Parameters

name (STRING): Name of the user or group that exceeded 64 characters.
vserver_name (STRING): Name of the Vserver.
ns_config_name (STRING): Name of the name service configuration (unix-user or unix-group).

nameserv.config events

nameserv.config.write.failed

Severity

ERROR

Description

This message occurs when a file write for name service configuration fails.

Corrective Action

Autocorrection is triggered for failing Vserver, configuration and node. Ensure that the root volume File System(FS) is available and has enough space and check the status using "vserver services name-service file-version show". Contact technical support if the problem persists.

Syslog Message

%s configuration failed for Vserver %s on node %s.

Parameters

vserver_name (STRING): Name of the Vserver.
ns_config_name (STRING): Name of the name service configuration.
node_name (STRING): Name of the node.

nameserv.ddns events

nameserv.ddns.bulk.delete

Severity

ALERT

Description

This message occurs when a request to delete the fully qualified domain name (FQDN) of all or some of the logical interfaces of a Vserver from the DNS server fails, resulting in stale records on the DNS server. This can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Use the (privilege: advanced) "vserver services name-service dns dynamic-update record delete" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS delete operation has failed for all or some of the logical interfaces having FQDN "%s" for Vserver "%s".

Parameters

FQDN (STRING): FQDN for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.ddns.bulk.failure

Severity

ALERT

Description

This message occurs when a dynamic request to update the fully qualified domain name (FQDN) of all or some of the logical interfaces of a Vserver in the DNS server fails after repeated retries, resulting in stale records on the DNS server. This can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Use the (privilege: advanced) "vserver services name-service dns dynamic-update record" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS %s operation has failed for all or some of the logical interfaces having FQDN "%s" for Vserver "%s".

Parameters

Operation (STRING): Type of operation.
FQDN (STRING): FQDN for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.ddns.bulk.warning

Severity

ERROR

Description

This message occurs when a dynamic request to update the fully qualified domain name (FQDN) of all or some of the logical interfaces of a Vserver on the DNS server fails, resulting in stale records on the DNS server. This can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Data ONTAP® retries the failed dynamic DNS update operation. Check the DNS record to ensure that it is up to date. Use the (privilege: advanced) "vserver services name-service dns dynamic-update record" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS %s operation has failed for all or some of the logical interfaces having FQDN "%s" for Vserver "%s".

Parameters

Operation (STRING): Type of operation.
FQDN (STRING): FQDN for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.ddns.lif.delete

Severity

ALERT

Description

This message occurs when an attempt to delete a fully qualified domain name (FQDN) from the DNS server fails, resulting in a stale record on the server. The FQDN belongs to the logical interface (LIF) of the given Vserver. Retaining the stale record can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Use the (privilege: advanced) "vserver services name-service dns dynamic-update record delete" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS delete operation of FQDN "%s" failed for LIF with IP %s on Vserver "%s".

Parameters

FQDN (STRING): FQDN for which the operation failed.
IP (STRING): IP address for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.ddns.lif.failure

Severity

ALERT

Description

This message occurs when an attempt to update a fully qualified domain name (FQDN) on the DNS server fails after repeated retries, resulting in a stale record on the server. The FQDN belongs to the logical interface (LIF) of the given Vserver. Retaining the stale record can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Use the (privilege: advanced) "vserver services name-service dns dynamic-update record" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS %s operation of FQDN "%s" failed for LIF with IP %s on Vserver "%s".

Parameters

Operation (STRING): Type of operation.
FQDN (STRING): FQDN for which the operation failed.
IP (STRING): IP address for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.ddns.lif.warning

Severity

ERROR

Description

This message occurs when an attempt to update a fully qualified domain name (FQDN) on the DNS server fails, resulting in a stale record on the server. The FQDN belongs to the logical interface (LIF) of the given Vserver. Retaining the stale record can lead to DNS lookup failures, resulting in mount problems.

Corrective Action

Data ONTAP® retries the failed dynamic DNS update operation. Check the DNS record to ensure that it is up to date. Use the (privilege: advanced) "vserver services name-service dns dynamic-update record" command to attempt a manual update of the record for the LIF. If this fails, check documentation for dynamic DNS updates to correct the failure or update the record directly on the DNS server.

Syslog Message

DDNS %s operation of FQDN "%s" failed for LIF with IP %s on Vserver "%s".

Parameters

Operation (STRING): Type of operation.
FQDN (STRING): FQDN for which the operation failed.
IP (STRING): IP address for which the operation failed.
vserver_name (STRING): Name of the Vserver.

nameserv.netgrpbyhost events

nameserv.netgrpbyhost.failed

Severity

ERROR

Description

This message occurs when netgroup is configured but the netgroup byhost database is not generated during an upgrade operation. Absence of the netgroup byhost database might impact performance or access during subsequent netgroup-related data access attempts.

Corrective Action

Use the "vserver services name-service netgroup load" command to reload the netgroup configuration file. Use the (privilege: advanced) "vserver services name-service netgroup status" command to verify that the netgroup file was successfully loaded and the netgroup byhost database successfully generated. If there are any syntax errors after the load operation, fix them and reload the netgroup file.

Syslog Message

Netgroup byhost database failed to generate for Vserver %s on node %s with error %s.

Parameters

vserver_name (STRING): Name of the Vserver.
node_name (STRING): Name of the node.
error_string (STRING): Error encountered during creation of netgroup byhost.

nand events

nand.predict events

nand.predict.fail

Severity

ALERT

Description

This message occurs when Data ONTAP® determines that failure is forthcoming for the associated flash device on the NVRAM module.

Corrective Action

Replace the device to prevent future failures. Contact technical support for assistance.

Syslog Message

NVRAM destage Failure predicted for device: %s.

Parameters

device (STRING): Name of the device.

nand.unable events

nand.unable.to.monitor

Severity

ALERT

Description

This message occurs when Data ONTAP® module that is responsible for monitoring the health of the NVRAM device cannot extract health information. This failure might indicate the NVRAM device is not operating properly.

Corrective Action

Use the "system environment sensors show" command to verify the device's status. If the failure still exists, contact technical support for assistance.

Syslog Message

Unable to monitor NVRAM device: %s.

Parameters

device (STRING): Name of the device.

nblade events

nblade.aclcompliance events

Nblade.AclCompliance

Severity

ALERT

Description

This message occurs when the nfs "-v4-acl-compliance" option is enabled but not functional because the SnapMirror Synchronous secondary cluster or FlexCache origin cluster is running an ONTAP version older than 9.14.1

Corrective Action

Upgrade the secondary cluster to ONTAP 9.14.1 or later to use the ACL compliance feature or disable the "-v4-acl-compliance" option by running the "vserver nfs modify "-v4-acl-compliance disabled" command.

Syslog Message

NFS "-v4-acl-compliance" option is enabled but not functional because the SnapMirror Synchronous secondary cluster or FlexCache origin cluster is running an ONTAP version older than 9.14.1

Parameters

(None).

nblade.callbacktimedout events

Nblade.CallbackTimedOut

Severity

ERROR

Description

This message occurs when the Nblade is unable to successfully complete a PORTMAP/SM call to the client within 1 seconds. The PORTMAP/SM calls are done as part of the per-aggregate lock reclaim process after a Dblade reboot. If a large number of such calls fail for a particular aggregate, then it delays the completion of the lock reclaim process for that aggregate. That delay prevents the aggregate from granting new locks to NFS clients.

Corrective Action

Check if the RPC program number displayed above with the correct program version is running on the client and if not start it. You can use "rpcinfo -p" on the client to check that. It is also possible that the client is unreachable due to firewall/network connectivity issues.

Syslog Message

SM NOTIFY: Vserver %d, Vif %d: %s program (Program number:%d Program version:%d) on client %s is not responding.

Parameters

virtualServer (INT): Identifier for the Vserver associated with this operation.
lifId (INT): Identifier for the logical interface associated with this operation.
program (STRING): Client program not responding.
programNum (INT): RPC Program Number.
programVersion (INT): RPC Program Version.
remoteIpAddress (STRING): IP address of the client machine.

nblade.cifs events

Nblade.cifs.budgetAllocFailure

Severity

ERROR

Description

This message occurs when there is a budget allocation failure for a CIFS subsystem because other CIFS subsystems are consuming too much memory. The three displayed CIFS subsystem have consumed most of the memory.

Corrective Action

Consider distributing the CIFS load by moving data LIFs, adding data LIFs, and redirecting workloads, or by shutting down nonessential workloads to alleviate the memory pressure. If the problem persists after addressing issues on the network or the client, contact NetApp technical support.

Syslog Message

Memory Allocation failed for %s. The CIFS subsystem on this node has exceeded its allotment of %llu bytes of node memory. CIFS subsystems that have consumed the most memory are %s.

Parameters

budgetname (STRING): Name of the CIFS subsystem for which memory allocation failed.
TotalCifsBudget (LONGINT): Amount of memory available to the CIFS subsystem.
topConsumers (STRING): CIFS subsystem that have consumed the most memory, and the amount of memory consumed.

Nblade.cifs.logon.audit.fail

Severity

ERROR

Description

This message occurs when a CIFS logon fails when guaranteed audit is enabled and audit log generation fails due to no space remaining in either destination volumes or staging volumes.

Corrective Action

Use the command "event log show -messagename adt.service.block" to check for destination volume space unavailability. If the message entry exists, use the command "event log show -messagename adt.service.block -fields action" and follow the corrective action. If the message entry does not exist, then staging volumes are full and no corrective action is necessary. The audit process self-heals and normal auditing continues in 10 seconds after audit logging cleanup occurs.

Syslog Message

CIFS logon failed due to audit log generation failure for the vserver %u.

Parameters

vsId (INT): Id of the vserver, on which this event occurred.

nblade.cifsencsessaccessdenied events

Nblade.cifsEncSessAccessDenied

Severity

ERROR

Description

This message occurs when a client not capable of SMB encryption tries to establish a CIFS session that requires SMB encryption.

Corrective Action

Either ensure that the client is capable of SMB encryption or disable SMB encryption on the Vserver.

Syslog Message

Client (IP: %s, Vserver: %d) could not establish a CIFS session because SMB encryption is required.

Parameters

IpAddress (STRING): IP address of the client attempting to establish a CIFS session.
vserverId (INT): Identifier of the Vserver associated with this operation.

nblade.cifsencshraccessdenied events

Nblade.cifsEncShrAccessDenied

Severity

ERROR

Description

This message occurs when a client not capable of SMB encryption tries to connect to a CIFS share that requires SMB encryption.

Corrective Action

Either ensure that the client is capable of SMB encryption or disable SMB encryption on the CIFS share.

Syslog Message

Client (IP: %s, Vserver: %d) could not connect to CIFS share "%s" because SMB encryption is required.

Parameters

IpAddress (STRING): IP address of the client from which Share Connect requests are being attempted.
vserverId (INT): Identifier of the Vserver associated with this operation.
shareName (STRING): Name of the share to which the client is connecting.

nblade.cifsetcdactionfailed events

Nblade.cifsEtcdActionFailed

Severity
ERROR

Description
This message occurs when the DMAP container encounters an error processing an etcd request, such as a connection failure.

Corrective Action
Check the network connectivity of the etcd server to the ONNIX pod, and correct any networking faults. Scan the DMAP and etcd logs for additional information.

Syslog Message
Received an etcd failure event, Message is %s.

Parameters
pMessage (STRING): Description of the SMB configuration update failure.

nblade.cifsetcdmaxtxnlimit events

Nblade.cifsEtcdMaxTxnLimit

Severity
ERROR

Description
This message occurs when the number of Access Control Entries (ACE) present in an MSRPC request for updating share permissions exceeds the supported maximum etcd limit of 1,022 entries.

Corrective Action
Retry the operation with less than the maximum supported number of ACEs in the MSRPC request.

Syslog Message
Received an etcd failure event. Message is %s.

Parameters
pMessage (STRING): Description of the error.

nblade.cifslongrunpattmatch events

Nblade.CifsLongRunPattMatch

Severity
ERROR

Description

This message occurs when a CIFS query directory command that includes wildcard characters exceeds the reporting time threshold for completion. Pattern-matching searches on strings including wildcard characters consume excessive CPU resources.

Corrective Action

Check the Windows client that is requesting searches containing wildcard characters. For assistance, contact NetApp technical support.

Syslog Message

Detected a long running CIFS pattern matching operation. SMB dialect: %s Allowed pattern matching threshold (ms): %llu Total pattern matching time taken(ms): %llu Client IP address: %s Target Vserver name: %s Target Vserver ID: %d Wildcard Pattern: %s Share name: %s Directory Path: %s

Parameters

dialect (STRING): Negotiated SMB dialect.
allowedThresholdInMs (LONGINT): Pattern-matching threshold value.
totalTimeTakenInMs (LONGINT): Total time taken for pattern matching.
clientIpAddress (STRING): IP address of the client machine.
vservername (STRING): Identifier for the Vserver name associated with this operation.
vserverId (INT): Identifier for the Vserver associated with this operation.
pattern (STRING): Wildcard pattern sent.
shareName (STRING): Target share name.
dirPath (STRING): Target directory path.

nblade.cifsmanyauths events

Nblade.cifsManyAuths

Severity

ERROR

Description

This message occurs when many authentication negotiations occur simultaneously. There are 256 new session requests from this client that are not yet complete.

Corrective Action

Investigate why the client is creating 256 or more new connection requests. It might be necessary to contact the vendor of the client or of the application in order to determine why this is occuring.

Syslog Message

Many simultaneous new CIFS connections are occurring on Vserver ID %u from IP address %s object type is %s with UUID %s.

Parameters

vsId (INT): ID of the Vserver on which this event occurred.
remoteIpAddress (STRING): IP address of the client machine.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the Vserver.

nblade.cifsmaxopensamefile events

Nblade.cifsMaxOpenSameFile

Severity

ERROR

Description

This message occurs when the number of times a user tries to open a file over a TCP connection is exceeded. This request and any further requests to open the same file by the user are denied until some open instances of the file are closed. This typically indicates abnormal application behavior.

Corrective Action

Inspect the application running on the client using this TCP connection. The client might be operating incorrectly due to the application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set using the (privilege: advanced) "cifs option modify -max-opens-same-file-per-tree" command.

Syslog Message

Received too many open file requests for the same file by one user on a connection: clientIP:port %s:%d, file "%s" on share "%s", vserver: "%s". Object type is: %s with UUID: %s.

Parameters

IpAddress (STRING): IP address of the client from which open requests are denied.
port (INT): Port number of the client from which the connection has been established.
filePath (STRING): Path of the file that cannot be opened.
shareName (STRING): Name of the share that holds the file.
vserverName (STRING): Vserver associated with this operation.
object_type (STRING): Type of resource object.
object_uuid (STRING): UUID of the resource object.

nblade.cifsmaxopensamefilenotice events

Nblade.cifsMaxOpenSameFileNotice

Severity

NOTICE

Description

This message occurs when the number of open instances of a particular file under a CIFS tree nears the configuration limit. Upon reaching this limit, any further requests to open the same file by the user are denied until some open instances of the file are closed. This typically indicates abnormal application behavior.

Corrective Action

Inspect the application running on the client using this TCP connection. The client might be operating incorrectly due to the application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set by using the (privilege: advanced) "cifs option modify -max-opens-same-file-per-tree" command.

Syslog Message

Received %d open file requests, nearing the configured limit of %d, for the same file by one user on a connection: clientIP:port %s:%d, file: "%s" on share: "%s", vserver: "%s".

Parameters

currentCount (INT): Current count of the open instances on the file.
maxValue (INT): Maximum allowed open instances on a file.
IpAddress (STRING): IP address of the client requesting the file open.
port (INT): Port number of the client from which the connection has been established.
filePath (STRING): Path of the file being opened.
shareName (STRING): Name of the share that holds the file.
vserverName (STRING): Vserver associated with this operation.

nblade.cifsmaxsessperusrconn events

Nblade.cifsMaxSessPerUsrConn

Severity

ERROR

Description

This message occurs when the number of sessions allowed per user over a TCP connection is exceeded. This request and any further session establishment requests are denied until some sessions are released. This is typically caused by a faulty client or application.

Corrective Action

Inspect all applications running on the client, and terminate any that are not operating properly. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set using the (privilege: advanced) "cifs option modify -max-same-user-sessions -per-connection" command.

Syslog Message

Received too many session requests from the same user on one TCP connection: clientIP:port %s:%d, user "%s", vserver: "%s". Object type is: %s with UUID: %s.

Parameters

IpAddress (STRING): IP address of the client requesting a session.
port (INT): Port number of the client from which the TCP connection has been established.
userName (STRING): User that has exceeded session requests.
vserverName (STRING): Vserver associated with this operation.
object_type (STRING): Type of resource object.
object_uuid (STRING): UUID of the resource object.

nblade.cifsmaxsessperusrconnnotice events

Nblade.cifsMaxSessPerUsrConnNotice

Severity

NOTICE

Description

This message occurs when the number of sessions allowed per user over a TCP connection nears the configured limit. Upon reaching this limit, any further session establishment requests are denied until some sessions are released. This is typically caused by a faulty client or application.

Corrective Action

Inspect all applications running on the client, and terminate any that are not operating properly. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set by using the (privilege: advanced) "cifs option modify -max-same-user -sessions-per-connection" command.

Syslog Message

Received %d session requests, nearing the configured limit of %d, from the same user on one TCP connection: clientIP:port %s:%d, user: "%s", vserver: "%s".

Parameters

currentCount (INT): Current count of the sessions.
maxValue (INT): Maximum allowed sessions per user over a TCP connection.
IpAddress (STRING): IP address of the client requesting a session.
port (INT): Port number of the client from which the TCP connection has been established.
userName (STRING): User that is nearing the session requests limit.
vserverName (STRING): Vserver associated with this operation.

nblade.cifsmaxwatchespertree events

Nblade.cifsMaxWatchesPerTree

Severity

ERROR

Description

This message occurs when the total number of directory watch (Change Notify) requests exceed the per-tree limit. This request and any further directory watch requests are denied. This typically indicates abnormal client behavior.

Corrective Action

Inspect the application using the connection and also monitor the other applications on the client. The client might be operating incorrectly due to a faulty application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which can be set using the (privilege: advanced) "cifs option modify -max-watches-set-per-tree" command.

Syslog Message

Received too many Change Notify requests on one tree: clientIP:port %s:%d, directory "%s" on share "%s", vserver: "%s".

Parameters

IpAddress (STRING): IP address of the client requesting Change Notify functionality.
port (INT): Port number of the client from which the TCP connection has been established.
dirPath (STRING): Path of the directory on which Change Notify is requested.
shareName (STRING): Name of the share that holds the directory.
vserverName (STRING): Vserver associated with this operation.

nblade.cifsmaxwatchespertreenotice events

Nblade.cifsMaxWatchesPerTreeNotice

Severity

NOTICE

Description

This message occurs when the total number of directory watch (Change Notify) requests nears the configured limit. Upon reaching this limit, any further directory watch requests are denied. This typically indicates abnormal client behavior.

Corrective Action

Inspect the application using the connection, and also monitor the other applications on the client. The client might be operating incorrectly due to a faulty application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which can be set by using the (privilege: advanced) "cifs option modify -max-watches-set-per-tree" command.

Syslog Message

Received %d Change Notify requests, nearing the configured limit of %d, on one tree: clientIP:port %s:%d, directory: "%s" on share: "%s", vserver: "%s".

Parameters

currentCount (INT): Current count of the Change Notify on the tree.
maxValue (INT): Maximum allowed Change Notify on the tree.
IpAddress (STRING): IP address of the client requesting Change Notify functionality.
port (INT): Port number of the client from which the TCP connection has been established.
dirPath (STRING): Path of the directory on which Change Notify is requested.
shareName (STRING): Name of the share that holds the directory.
vserverName (STRING): Vserver associated with this operation.

nblade.cifsmemexceeded events

Nblade.cifsMemExceeded

Severity

ERROR

Description

This message occurs when the CIFS subsystem, which operates all the CIFS servers exposed through a given node, has requested more memory than it is allowed in this node. The subsystem is restricted to a percentage of total memory in the node, so the node itself need not be low on memory for this to occur. CIFS memory is not allocated in advance and so CIFS memory requests compete with other system processes. This message might not appear if a memory request from CIFS cannot be honored because the node is already low on memory. This might result in CIFS client operation failures.

Corrective Action

Compare the number of memory allocation failures with the previous occurence of this event to understand the load on the system. Further analyze the memory allocated to the CIFS subsystem on this node by viewing the nblade_cifs object instance for this node through the "statistics show" interface. Based on that data, consider distributing CIFS load by moving data LIFs, adding data LIFs, and redirecting workloads, or

by shutting down non-essential workloads to alleviate the memory pressure.

Syslog Message

The CIFS subsystem on this node has exceeded its allotment of %llu bytes of node memory with currently %llu memory allocation failures since boot time. This might result in unexpected CIFS application failures.

Parameters

availableMemoryInBytes (LONGINT): Amount of memory available to the CIFS subsystem.
memAllocFailures (LONGINT): Number of memory allocation failures in the CIFS subsystem since boot time.

nblade.cifsnbnameconflict events

Nblade.cifsNbNameConflict

Severity

ERROR

Description

This message occurs when the NetBIOS Name Service receives a negative response from a remote machine for a name registration request. This is typically caused by a conflict in the NetBIOS name or an alias. As a result, clients might not be able to access data or connect to the right data-serving node in the cluster.

Corrective Action

1. If applicable, delete the duplicate NetBIOS alias by using the "vserver cifs delete -aliases alias -vserver vserver" command. Alternatively, rename a NetBIOS alias by deleting the duplicate name and adding an alias with a new name by using the "vserver cifs create -aliases alias -vserver vserver" command. 2. If there are no aliases configured and there is a conflict in the NetBIOS name, then rename the CIFS server by using the "vserver cifs delete -vserver vserver" and "vserver cifs create -cifs-server netbiosname" commands. Note that deleting a CIFS server can cause data to be inaccessible. 3. Remove or rename the NetBIOS name on the remote machine.

Syslog Message

The NetBIOS Name Service received a negative name registration response. The name %s is owned by a remote machine. The IP address being registered is %s. Object type is: %s with UUID: %s.

Parameters

nbName (STRING): NetBIOS name or alias being registered by the NetBIOS Name Service.
IpAddress (STRING): IP address being registered by the NetBIOS Name Service.
object_type (STRING): Type of resource object.
object_uuid (STRING): UUID of the resource object.

nblade.cifsnonaesnibytesproc events

Nblade.cifsNonAesNiBytesProc

Severity

ALERT

Description

This message occurs when a system with CPUs that do not support the AES-NI instruction set is performing SMB3 encryption or signing of a large amount of data. These cryptographic operations can degrade performance severely for both SMB and other system operations.

Corrective Action

Avoid encrypted or signed SMB3 traffic on systems that do not support the AES-NI instruction set.

Syslog Message

Excessive SMB3 cryptographic processing load (AES-NI instruction set is not supported).

Parameters

(None).

nblade.cifsnonunicoderequest events

Nblade.cifsNonUnicodeRequest

Severity

ERROR

Description

This message occurs when a client attempts to send a non-unicode request to a Vserver. The request is rejected.

Corrective Action

Check the client to verify that it supports unicode characters and negotiates unicode support with the Vserver.

Syslog Message

Vserver ID %u rejected non-unicode request from client IP: %s.

Parameters

vserverId (INT): Identifier for the Vserver that received the non-unicode request.
clientIp (STRING): IP address of the client sending the non-unicode request.

nblade.cifsnoprivshare events

Nblade.cifsNoPrivShare

Severity

EMERGENCY

Description

This message occurs when a client attempts to connect to a nonexistent ONTAP_ADMIN$ share.

Corrective Action

Ensure that the vscan is enabled for the mentioned Vserver ID. Enabling vscan on a Vserver causes the ONTAP_ADMIN$ share to be created for the Vserver automatically.

Syslog Message

Vserver ID: %d, user name: %s, client ip: %s, Object type is: %s with UUID: %s.

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.
userName (STRING): User name of the client attemping to access the nonexistent ONTAP_ADMIN$ share.
clientIp (STRING): IP address of the client attemping to access the nonexistent ONTAP_ADMIN$ share.
object_type (STRING): Type of resource object.
object_uuid (STRING): UUID of the resource object.

nblade.cifsoperationtimedout events

Nblade.CifsOperationTimedOut

Severity

ERROR

Description

This message occurs when a CIFS operation times out because it could not be processed completely within 40 seconds.

Corrective Action

Check the QoS policy configuration for the target volume. If there are no QoS policies set, check the load on the target volume and check IP connectivity over the cluster interfaces between the two nodes. For further assistance, contact NetApp technical support and indicate that you need assistance with a potential internal cluster performance problem.

Syslog Message

Detected a timed out CIFS operation. SMB command for this operation: %s, Number of times this command was suspended: %llu, Number of times this command was restarted: %llu, Last CSM error during this operation: %s, Remote blade UUID: %s, Is QoS enabled: %s, Last nBlade error during this operation: %s, Client IP address: %s, Local IP address: %s, Target Vserver ID: %d, Target disk's DSID: %d, Target Vserver Name: %s, Target Volume Name: %s

Parameters

commandName (STRING): CIFS command for this operation.
suspensionCnt (LONGINT): Number of times this command has been suspended.
cmdRestartCnt (LONGINT): Number of times this command has been restarted.
lastCsmError (STRING): Last CSM error.
remoteBladeID (STRING): Remote blade ID for this CSM session.
isQosEnabled (STRING): Whether QoS is enabled.
lastSpinNpError (STRING): Last internal network component(nBlade) error.
clientIpAddress (STRING): IP address of the client machine.
localIpAddress (STRING): IP address of the local interface serving the protocol operation.
vserverId (INT): Identifier for the Vserver associated with this operation.
dsId (INT): Data set ID (DSID) of the target volume.
vserverName (STRING): Vserver name associated with this operation.
volumeName (STRING): Volume name corresponding to the DSID.

nblade.cifssametreepersess events

Nblade.cifsSameTreePerSess

Severity

ERROR

Description

This message occurs when the number of connections to the same share allowed per session is exceeded. This request and any further requests to establish another connection to that share are denied until some connections to the share are released. This typically indicates abnormal client behavior.

Corrective Action

Inspect the application using the connection and also monitor the other applications on the client. The client might be operating incorrectly due to a faulty application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set using (privilege: advanced) "cifs option modify -max-same-tree-connect-per-session" command.

Syslog Message

Received too many connection requests to the same share from one session: clientIP:port %s:%d, share "%s", user "%s", vserver "%s".

Parameters

IpAddress (STRING): IP address of the client from which multiple share connections have been attempted.
port (INT): Port number of the client from which the TCP connection has been established.
shareName (STRING): Name of the share to which the client is attempting connection.
userName (STRING): User that is attempting to connect to the share.
vserverName (STRING): Vserver associated with this operation.

nblade.cifssametreepersessnotice events

Nblade.cifsSameTreePerSessNotice

Severity

NOTICE

Description

This message occurs when the number of connections to the same share allowed per session nears the configured limit. Upon reaching this limit, any further requests to establish another connection to that share are denied until some connections to the share are released. This typically indicates abnormal client behavior.

Corrective Action

Inspect the application using the connection, and also monitor the other applications on the client. The client might be operating incorrectly due to a faulty application running on it. Rebooting the client might also be helpful. In some cases, clients are operating as expected but require a higher threshold, which you can set by using the (privilege: advanced) "cifs option modify -max-same-tree-connect-per-session" command.

Syslog Message

Received %d connection requests to the same share, nearing the configured limit of %d, from one session: clientIP:port %s:%d, share: "%s", user: "%s", vserver: "%s".

Parameters

    currentCount (INT): Current count of the connections on the session.

    maxValue (INT): Maximum allowed connections on the session.

    lpAddress (STRING): IP address of the client from which multiple share connections have been attempted.

    port (INT): Port number of the client from which the TCP connection has been established.

    shareName (STRING): Name of the share to which the client is attempting connection.

    userName (STRING): User that is attempting to connect to the share.

    vserverName (STRING): Vserver associated with this operation.

nblade.cifsshrconnectfailed events

Nblade.cifsShrConnectFailed

Severity

    ERROR

Description

    This message occurs when the network blade cannot connect to the path specified in the CIFS share.

Corrective Action

    Verify that the CIFS share path is valid and that the volume it belongs to is accessible.

Syslog Message

    Vserver name: %s, Vserver ID: %d, error description: %s, error code: %d, share name: %s, Windows user name: %s, UNIX user name: %s, server IP address: %s, client IP address: %s.

Parameters

    vserverName (STRING): Name for the Vserver associated with this operation.

    vserverId (INT): Identifier for the Vserver associated with this operation.

    errorDescription (STRING): Description of the error for the CIFS share connection failure.

    errorCode (INT): Error code that describes the reason for the CIFS share connection failure.

    shareName (STRING): Name of the share to which the connection attempt failed.

    domainWinUserName (STRING): Windows domain\user that is attempting to connect to the share.

    unixUserName (STRING): UNIX user name.

    serverIp (STRING): IP address of the server.

    clientIp (STRING): IP address of the client.

nblade.cifswitnessfonotify events

Nblade.cifsWitnessFONotify

Severity

    INFORMATIONAL

Description

    This message occurs when the Witness system has requested its CIFS clients to move their Continuously Available connections to the local node, due to a failure of the partner node.

Corrective Action

    (None).

The Witness service received a failure notification for the partner node. Notification of %d CIFS clients to move their Continuously Available connections to this node took %d milliseconds to complete.

Parameters

numNotificationsSent (INT): Number of clients notified.
timeTakenInMsecs (INT): Number of milleseconds taken to notify the clients.

nblade.css events

nblade.css.s3.AccessDenied

Severity

ERROR

Description

This message occurs when ONTAP® object-store-server denies access to a user.

Corrective Action

Verify that the user has permission to access the resource. Check access and bucket policy configurations using these commands: 'vserver object-store-server policy show', 'vserver object-store-server policy show-statements', 'vserver object-store-server bucket policy show'.

Syslog Message

Access is denied for user '%s' (Vserver %d), from client IP %s accessing resource '%s'.

Parameters

userName (STRING): Name of the user.
vserverId (INT): ID of the Vserver.
ipAddress (STRING): IP address of the client.
resource (STRING): Resource that the user is trying to access.

nblade.cvo events

nblade.cvo.remote.access

Severity

NOTICE

Description

This message occurs when a remote volume has been accessed in the Cloud Volumes ONTAP® environment.

Corrective Action

(None).

Syslog Message

Detected remote volume access (Vserver: %s) from client IP %s to LIF IP %s. Volume: %s.

Parameters

> **vserver** (STRING): Vserver name.
> **client_ipaddr** (STRING): IP address of the client.
> **lif_ipaddr** (STRING): IP address of the LIF.
> **volume** (STRING): Name of the volume.

nblade.dbladenoresponse events

Nblade.dBladeNoResponse.CIFS

Severity

> ERROR

Description

> This message occurs when a CIFS network data protocol operation times out because the requesting node cannot communicate with the data-serving node to complete the file operation. If this condition persists, there is likely a problem with the communication between the node that generated the event and the node where the data is located in the cluster.

Corrective Action

> Identify the node where the data is located by using the (privilege: advanced) "system node show" command and the UUID of the node. Verify network connectivity between the node that generated the event and the node where the data is located by using the "cluster ping-cluster" and "network ping" commands.

Syslog Message

> File operation timed out because there was no response from the data-serving node. Node UUID: %s, file operation protocol: %s.

Parameters

> **DBladeUuid** (STRING): Universally Unique Identifier (UUID) of the node where this operation is trying to access.
> **protocol** (STRING): Network data protocol that timed out while attempting the file operation.

Nblade.dBladeNoResponse.NFS

Severity

> ERROR

Description

> This message occurs when an NFS network data protocol operation times out because the requesting node cannot communicate with the data-serving node to complete the file operation. If this condition persists, there is likely to be a problem with the communication between the node that generated the event and the node where the data is located in the cluster.

Corrective Action

> Identify the node where the data is located by using the (privilege: advanced) "system node show" command and the UUID of the node. Verify network connectivity between the node that generated the event and the node where the data is located by using the "cluster ping-cluster" and the "network ping" commands.

Syslog Message

File operation timed out because there was no response from the data-serving node. Node UUID: %s, file operation protocol: %s, client IP address: %s, Opcode/Procedure: %s(%d).

Parameters

DBladeUuid (STRING): Universally unique identifier (UUID) of the node where this operation is trying to access.
protocol (STRING): Network data protocol that timed out while attempting the file operation.
clientip (STRING): IP address of client that attempted the file operation.
nfsOpcode (STRING): Opcode corresponding to file operation.
fileoperation (INT): File operation during which the timeout happened.

nblade.delayedoplockbreakack events

Nblade.delayedOplockBreakAck

Severity

NOTICE

Description

This message appears when the SMB clients experience delays in responding to oplock recalls.

Corrective Action

Check the client's network connection, evaluate processing load, and ensure no other factors are hindering prompt oplock recall responses.

Syslog Message

SMB Clients are showing delays in responding to oplock recalls, potentially due to network latency, heavy processing load, or other factors impacting responsiveness.

Parameters

(None).

nblade.didnotinitialize events

Nblade.DidNotInitialize

Severity

EMERGENCY

Description

The appliance's network process failed during initialization due to an internal error (likely there is not enough system memory available to start the necessary kernel threads). Because the network process is not running, file access to volumes on local aggregates is not currently available, and cluster and management virtual interfaces for this appliance are also not currently available.

Corrective Action

Initiate a storage failover (takeover) of any aggregates on this appliance, and perform a "sendhome" operation on these aggregates after this appliance is operational again. Also, verify that data virtual interfaces have properly migrated to another appliance. It is possible that a reboot or a reversion to a known compatible software version could also correct this problem.

Syslog Message

The Network Blade kernel module has failed during initialization.

Parameters

(None).

nblade.ecv events

nblade.ecv.not.ready

Severity

NOTICE

Description

This message occurs when ONTAP® software uses a default Effective Cluster Version (ECV) before the actual ECV has been conclusively determined. Some features might not work as expected until ONTAP can select the correct ECV.

Corrective Action

(None).

Syslog Message

Default ECV %s has been used. The ECV value '%d' does not reflect the cluster's true ECV status.

Parameters

ecv_variable_name (STRING): Name of the ECV value being used.
ecv_variable_value (INT): ECV value being used.

nblade.execsoverlimit events

nblade.execsOverLimit

Severity

NOTICE

Description

This message occurs when the number of active requests to a connection exceeds the allowed in-flight request threshold, which results in request throttling. Client connection performance might be degraded.

Corrective Action

Check the RPC slot setting on the client. Refer to TR-4067 "NFS Best Practice and Implementation Guide" for the recommended value and how to set it. For additional guidance, search the NetApp knowledgebase on the support web site for "nblade.execsOverLimit".

Syslog Message

The number of in-flight requests from client IP "[%s]:%d" to destination LIF "%s" (Vserver "%d") is greater than the maximum allowed (%d).

Parameters

clientIpAddress (STRING): IP address of the client.
clientPort (INT): Network port of the client.
lifIpAddress (STRING): IP address of the network interface (LIF).
vserverId (INT): ID of the Vserver.
execsLimit (INT): Maximum number of in-flight requests allowed per connection.

nblade.exportaccesschkfailed events

Nblade.exportAccessChkFailed

Severity

ERROR

Description

This message occurs when the network blade denies access to an exported share when a connection attempt violates an export policy.

Corrective Action

Ensure that the export policy rule for this SVM is defined properly by using the "export-policy rule show" command. If necessary, add a new rule to the policy that allows access to the share using the "export-policy rule create" command.

Syslog Message

Access denied due to a violation of an export policy. SVM ID: %d, error description: %s, share name: %s, client IP address: %s.

Parameters

vserverId (INT): Identifier for the storage virtual machine (SVM) associated with this operation.
errorDescription (STRING): Error that describes the export access check failure.
shareName (STRING): Name of the share that the user attempted to access.
clientIp (STRING): IP address of the client.

nblade.exportaccessindeterm events

Nblade.exportAccessIndeterm

Severity

ERROR

Description

This message occurs when client access cannot be evaluated because of an error while matching the client against export rules. Client access might be disrupted due to unresponsive or misconfigured external servers, problems with external server configuration on Data ONTAP®, or internal errors while processing the rules.

Corrective Action

Verify that external name services (such as DNS, NIS, LDAP, Kerberos, or AD) are responsive to queries from Data ONTAP®. Use the "vserver show -fields id" command to get the Vserver name corresponding to Vserver ID, and use the "vol show -fields msid" command to get the volume name corresponding to the volume MSID. Use the "vserver export-policy check-access" command to troubleshoot it further, or contact

NetApp technical support for further assistance in reviewing the name services logs.

Syslog Message

Access to volume with MSID %llu in Vserver %u could not be evaluated for client "%s" as per export ruleset %llu.

Parameters

msid (LONGINT): MSID of the volume on which access was attempted.
vserverId (INT): Identifier for the Vserver associated with this access.
clientAddr (STRING): IP address of the client attempting access.
rulesetID (LONGINT): Export rule set ID.

nblade.fastrecoverybegin events

Nblade.fastRecoveryBegin

Severity

NOTICE

Description

This message occurs when the NFSv4.x server enters the fast recovery mode as part of the LIF migration event, during which the NFS server will not be able to serve any data for NFSv4.x clients.

Corrective Action

(None).

Syslog Message

NFS server fast recovery has started for SVM "%s", LIF ID "%d", LIP IP address "%s".

Parameters

vserverName (STRING): SVM Name.
lifId (INT): LIF ID
lifIpAddress (STRING): LIF IP address for the NFS server.

nblade.fastrecoveryend events

Nblade.fastRecoveryEnd

Severity

NOTICE

Description

This message occurs when the NFSv4.x server finishes the recovery and is ready to serve data from NFSv4.x clients.

Corrective Action

(None).

Syslog Message

NFS server fast recovery has ended for SVM "%s", LIF ID "%d", LIF IP address "%s".

Parameters

vserverName (STRING): SVM Name.
lifId (INT): LIF ID
lifIpAddress (STRING): LIF IP address for the NFS server.

nblade.fcvoldisconnected events

Nblade.fcVolDisconnected

Severity

EMERGENCY

Description

This message occurs when the NFS client attempts to access a FlexCache® volume, but the origin of the FlexCache volume cannot be accessed due to poor network connectivity. As a result, NFS clients will lose access to the FlexCache volume.

Corrective Action

Verify that the FlexCache volume can connect with its origin. If the FlexCache volume and origin volume are on the same cluster, then check the node health by using the "system node show" command. If the FlexCache volume and origin volume are on different clusters, then ensure that the intercluster LIFs on both clusters can connect by using the "network ping" commands to check the connectivity on both the clusters.

Syslog Message

Attempt to access FlexCache volume with MSID %u on Vserver ID %u failed because FlexCache origin volume with MSID %u is not reachable.

Parameters

cacheMsid (LONGINT): MSID of the FlexCache volume.
cacheVserverId (INT): Identifier for the FlexCache Vserver associated with this operation.
originMsid (LONGINT): MSID of the origin of the FlexCache volume.

nblade.fileopenlimitexceeded events

Nblade.fileOpenLimitExceeded

Severity

NOTICE

Description

This message occurs when the number of open files on a single SMB connection or session exceeds the system limit.

Corrective Action

(None).

Syslog Message

Number of open files has reached the maximum limit of (%d).

Parameters

> **filesopen** (INT): Number of files that are open.

nblade.flexcachecaaccess events

Nblade.flexcacheCAAccess

Severity

> ERROR

Description

> This message occurs when a client tries to access a FlexCache® volume via SMB3 using a continuously available share but is denied because FlexCache does not support persistent handle capability.

Corrective Action

> Either remove the continuously available property from the CIFS share or create a new share without this property to access the FlexCache volume over SMB.

Syslog Message

> Attempt to access FlexCache volume with MSID %u via SMB3 over a continuously available share is denied.

Parameters

> **msid** (INT): MSID of the FlexCache volume being accessed.

nblade.flexcachevolumeaccess events

Nblade.flexCacheVolumeAccess

Severity

> ERROR

Description

> This message occurs when a client tries to access a FlexCache volume through an unsupported protocol. Currently only NFSv3,NFSv4,NFSv4.1 and SMB clients are supported by FlexCache.

Corrective Action

> Make sure a FlexCache-supported protocol is specified for all client mount operations through which a FlexCache volume can be accessed. If using FlexCache, specify 'nfsvers=3' or 'nfsvers=4' or 'nfsvers=4.1' as an option for the 'mount' command on all clients accessing a FlexCache volume.

Syslog Message

> Attempt to access FlexCache volume %s in SVM %s via %s denied for client %s.

Parameters

> **volName** (STRING): Name of the FlexCache volume being accessed.
> **vserverName** (STRING): Name of the vserver associated with this operation.
> **protocol** (STRING): Client protocol.
> **clientIpAddress** (STRING): IP address of the client machine.

nblade.flexgroupstatefulprotocolaccess events

Nblade.flexgroupStatefulProtocolAccess

Severity

ERROR

Description

This message occurs when the system detects an attempt to use Network Lock Manager (NLM) shared locks on a FlexGroup volume. FlexGroup volumes do not support NLM shared locks.

Corrective Action

FlexGroup volumes do not support shared locks. Consider using FlexGroup volumes that support stateful protocols such as NFSv4.0,NFSv4.1,SMB1 or SMB2 in order to use shared locks.

Syslog Message

Attempt to access FlexGroup volumes with Master Data Set ID "%u" with "%s" is denied.

Parameters

msid (INT): Master Data Set ID of the FlexGroup volume being accessed.
protocol (STRING): Client protocol being used.

nblade.fpolicy events

nblade.fpolicy.extn.failed

Severity

EMERGENCY

Description

This message occurs when an I/O operation directed at a FlexCache® volume fails because the file extension include and exclude list of one of the policies is too long to send to the origin of the FlexCache volume.

Corrective Action

Decrease the number of file extensions configured in the include and exclude list in the FPolicy scope by using the "fpolicy policy scope modify" command.

Syslog Message

FPolicy processing failed on volume MSID "%lu", for Vserver ID "%lu", policy ID "%lu", as the combined length for the file extension include and exclude list is greater than %llu. Decrease the number of file extensions configured.

Parameters

msid (LONGINT): MSID of FlexCache volume.
vserverid (LONGINT): ID of the Vserver.
policyid (LONGINT): ID of the FPolicy.
maxmimumListLengthAllowed (LONGINT): Maximum length that can be sent to the origin volume.

Nblade.fpolicy.flow.control

Severity

ERROR

Description

This message occurs when FPolicy flow control is engaged due to large number of file operations being monitored by FPolicy. If this condition persists, there might be an adverse effect on client operation latency.

Corrective Action

Check the FPolicy configuration to make sure that only intended file operations are monitored and appropriate filters are applied.

Syslog Message

FPolicy flow control is engaged as the monitored file operations rate crossed the sustainable limit[%d] for this platform.

Parameters

flowControlLimit (INT): Maximum number of file operations per second that can be monitored by FPolicy.

nblade.fpolicy.policy.skip

Severity

EMERGENCY

Description

This message occurs when a non-mandatory FPolicy(tm) policy check is skipped while processing an I/O on the FlexCache® volume because the file extension include and exclude list of the policy is too long to send to the origin volume of the FlexCache volume. The error does not fail the operation and other policies, if any, are matched.

Corrective Action

Decrease the number of file extensions configured in the include and exclude list in the FPolicy scope by using the "fpolicy policy scope modify" command.

Syslog Message

FPolicy check is skipped for a non-mandatory policy ID "%lu" on volume MSID "%lu" for Vserver ID "%lu" because the combined length for the file extension include and exclude list is greater than %llu.

Parameters

policyid (LONGINT): ID of the FPolicy policy.
msid (LONGINT): MSID of the FlexCache volume.
vserverid (LONGINT): ID of the Vserver.
maximumListLengthAllowed (LONGINT): Maximum length that can be sent to the origin volume.

nblade.fpolpassthruconnect events

Nblade.fpolPassthruConnect

Severity

INFORMATIONAL

Description

This message occurs when a pass-through read channel is established between the node and the FPolicy server.

Corrective Action

(None).

Syslog Message

Pass-through read channel with the FPolicy server was established. Vserver ID [%d], FPolicy server IP address [%s].

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.
fpserverIp (STRING): IP address of the FPolicy server.

nblade.fpolpassthrudisconn events

Nblade.fpolPassthruDisconn

Severity

INFORMATIONAL

Description

This message occurs when the pass-through read channel between the node and the FPolicy server is disconnected.

Corrective Action

(None).

Syslog Message

Pass-through read channel with the FPolicy server is disconnected. Vserver ID [%d], FPolicy server IP address [%s], Disconnect reason [%s].

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.
fpserverIp (STRING): IP address of the FPolicy server.
disconnReason (STRING): Reason for disconnection.

nblade.fpolpassthruonsmb1 events

Nblade.fpolPassthruOnSMB1

Severity

ERROR

Description

This message occurs during a client attempt to establish an FPolicy pass-through read channel over SMB1, which is not supported.

Corrective Action

Verify that both the client and Data ONTAP® support and are configured for SMB2 or later.

Syslog Message

For Vserver "%s", the FPolicy pass-through read channel request coming from the client "%s" is rejected because it is not supported for SMB1.

Parameters

vserverName (STRING): Vserver associated with this operation.
fpserverIp (STRING): IP address of the client.

nblade.fpolpsinitfail events

Nblade.fpolPsInitFail

Severity

ERROR

Description

This message occurs when initialization of any FPolicy persistent store resource fails. It includes free and active staging buffer pool, fname cache and dirty SVM cache.

Corrective Action

Contact NetApp technical support.

Syslog Message

Initialization of FPolicy resource the "%s" is unsuccessful.

Parameters

resource (STRING): Uninitialized resource.

nblade.fpolpsvolmoving events

Nblade.fpolPsVolMoving

Severity

ERROR

Description

This message occurs when the FPolicy persistent store volume is being moved. This causes disruption in FPolicy where persistent store is enabled.

Corrective Action

Disable the FPolicy with a persistent store until volume move is completed.

Syslog Message

FPolicy persistent store volume "%s" belonging to SVM "%s" is being moved.

Parameters

volName (STRING): Persistent store volume.
vserverName (STRING): Name of the SVM.

nblade.fpolpsvolnoaccess events

Nblade.fpolPsVolNoAccess

Severity

ERROR

Description

This message occurs when events cannot be written into persistent store volume due to insufficient permissions. This causes disruption in FPolicy where persistent store is enabled.

Corrective Action

Check the permissions of the persistent store volume and provide full access.

Syslog Message

Events cannot be written into the persistent store volume "%s" in SVM "%s" due to insufficient permissions.

Parameters

volName (STRING): Persistent store volume
vserverName (STRING): Name of the SVM.

nblade.fpolpsvolnospace events

Nblade.fpolPsVolNoSpace

Severity

ERROR

Description

This message occurs when persistent store volume is full. This causes disruption in FPolicy where persistent store is enabled.

Corrective Action

Increase the persistent store volume size.

Syslog Message

FPolicy persistent store volume "%s" belonging to SVM "%s" has no space for new notifications. This leads to drop of notifications.

Parameters

volName (STRING): Persistent store volume.
vserverName (STRING): Name of the SVM.

nblade.fpolpsvolnotfound events

Nblade.fpolPsVolNotFound

Severity
ERROR

Description
This message occurs when volume corresponding to persistent store is not found. This causes disruption in FPolicy where persistent store is enabled.

Corrective Action
Check the volume corresponding to the persistent store. Either recreate the volume with same name or delete the persistent store.

Syslog Message
FPolicy persistent store volume "%s" belonging to SVM "%s" was not found.

Parameters
volName (STRING): Persistent store volume.
vserverName (STRING): Name of the SVM.

nblade.fpolpsvolofflined events

Nblade.fpolPsVolOfflined

Severity
ERROR

Description
This message occurs when persistent store volume is offline. This causes disruption in FPolicy where persistent store is enabled.

Corrective Action
Check the volume corresponding to the persistent store. Either online the volume for use or delete the corresponding persistent store.

Syslog Message
FPolicy persistent store volume "%s" belonging to SVM "%s" is offline.

Parameters
volName (STRING): Persistent store volume.
vserverName (STRING): Name of the SVM.

nblade.gracebegin events

Nblade.graceBegin

Severity

NOTICE

Description

This message occurs when the NFS server enters the grace state.

Corrective Action

(None).

Syslog Message

NFS server grace state has begun for Vserver "%s", LIF ID "%d", LIP IP address "%s".

Parameters

vserverName (STRING): Vserver Name.
lifId (INT): LIF ID
lifIpAddress (STRING): LIF IP address for the NFS server.

nblade.graceend events

Nblade.graceEnd

Severity

NOTICE

Description

This message occurs when the NFS server exits the grace state.

Corrective Action

(None).

Syslog Message

NFS server grace state has ended for Vserver "%s", LIF ID "%d", LIF IP address "%s".

Parameters

vserverName (STRING): Vserver Name.
lifId (INT): LIF ID
lifIpAddress (STRING): LIF IP address for the NFS server.

nblade.httpmaxconntimeouts events

Nblade.httpMaxConnTimeOuts

Severity

ERROR

Description

This message occurs when the HTTP subsystem, which monitors connection timeouts due to an unresponsive client or data not received from the client within a specified time, especially a PUT request or an HTTP Request containing Request Body. If the number of timeouts allowed in a given period of time is being exceeded, it could be due to network failures or DoS(Denial of Service) attacks. This might result in

HTTP client connection failures, because most connections are using resources and waiting for data.

Corrective Action

Inspect the clients that are experiencing a long delay in packet trace tools. Inspecting the client network might be helpful as well.

Syslog Message

The HTTP subsystem on this node on vserver %u has exceeded its connection timeout limit of %llu times, currently %llu connection timeout failures observed since boot time. This might result in unexpected HTTP connection failures.

Parameters

vsId (INT): Id of the vserver, on which this event occurred.
currentNumConnTimeouts (LONGINT): Total number of connection timeouts that occured in the HTTP subsystem.
totalNumConnTimeouts (LONGINT): Maximum number of connection timeouts allowed in the HTTP subsystem.

nblade.httpmemexceeded events

Nblade.httpMemExceeded

Severity

ERROR

Description

This message occurs when the HTTP subsystem, which operates all the HTTP servers exposed through a given node, has requested more memory than it is allowed in this node. The subsystem is restricted to a percentage of total memory in the node, so the node itself need not be low on memory for this to occur. HTTP memory is not allocated in advance and so HTTP memory requests compete with other system processes. This message might not appear if a memory request from HTTP cannot be honored because the node is already low on memory. This might result in HTTP client connection failures.

Corrective Action

Compare the number of memory allocation failures with the previous occurence of this event to understand the load on the system. Further analyze the memory allocated to the HTTP subsystem on this node by viewing the nblade_http object instance for this node through the "statistics show" interface. Based on that data, consider distributing HTTP load by moving data LIFs, adding data LIFs, and redirecting workloads, or by shutting down non-essential workloads to alleviate the memory pressure.

Syslog Message

The HTTP subsystem on this node has exceeded its allotment of %llu bytes of node memory with currently %llu memory allocation failures since boot time. This might result in unexpected HTTP connection failures.

Parameters

availableMemoryInBytes (LONGINT): Amount of memory available to the HTTP subsystem.
memAllocFailures (LONGINT): Number of memory allocation failures in the HTTP subsystem since boot time.

nblade.invtcprecordmarker events

Nblade.invTcpRecordMarker

Severity

ERROR

Description

This message occurs when a TCP connection is reset due to an invalid TCP record marker in an Open Network Computing/Remote Procedure Call request.

Corrective Action

1. Use the IP address from the log to identify the client machine that sent the invalid TCP record marker. 2. Use the TCP port number to determine which service was being requested by the client. 3. Contact the OS vendor for the client machine for a software patch.

Syslog Message

Invalid TCP record marker received from remote IP address %s on local port %d. Vserver ID associated with this operation is %d. Invalid reason is %s, invalid record marker is %d.

Parameters

remoteIpAddress (STRING): IP address of the client machine.
localPort (INT): Local TCP port number that received the data.
VirtualServer (INT): Identifier for the Vserver associated with this operation.
reason (STRING): Reason the record marker was invalid: - "TCP_FRAGMENT" indicates that RPC TCP fragments that are not supported at this time. - "TCP_DATA_LENGTH_OVERFLOW" indicates an oversized record marker; that is, the record marker value was greater than the maximum supported size, currently 1MB. - "TCP_DATA_LENGTH_UNDERFLOW" indicates an undersized record marker; that is, the record marker value was below the minimum supported size, currently 40 bytes.
recordMarker (INT): Actual 32-bit record marker that was received and marked as invalid.

nblade.junctionrootlookup2 events

Nblade.JunctionRootLookup2

Severity

ERROR

Description

This message occurs when the system cannot obtain the root file handle of the volume mounted on a junction path. The cause of the problem might be that the target node is down or the target volume or aggregate is offline. The typical client operation that triggers a junction root lookup is a directory list operation where one of the directory entries is a junction. As long as the root of the volume at the junction cannot be looked up, the NFS client that is listing the directory appears to hang.

Corrective Action

Check whether the volume or aggregate or node that matches the given MSID is offline. If it is, bring it online if possible.

Syslog Message

Junction root lookup failed for a volume (Name: %s, MSID: %llu) in Vserver (Name: %s, ID: %llu) with reason: %s.

Parameters

volName (STRING): Name of the volume mounted at the junction being looked up.
msid (LONGINT): Master Data Set ID (MSID) of the volume mounted at the junction being looked up.
vserverName (STRING): Vserver name for this MSID.
vserverId (LONGINT): Vserver for this MSID.
reason (STRING): Additional information about why the operation failed.

nblade.longrunningrpcop events

Nblade.longRunningRpcOp

Severity

ERROR

Description

This message occurs when a running remote procedure call (RPC) operation takes longer than a defined length of time. The message indicates that the RPC operation has not been completed. If the condition persists, any operation to that RPC server is likely to fail.

Corrective Action

Check the progress of the operation by using the (privilege: advanced) "statistic show -component nblade_rpc_server -instance [RPC_server_name] -raw true -counter curr_head*" command. If the curr_head_proc_time_secs counter keeps incrementing, the operation has not been completed. This condition might cause network configuration and status commands to fail consistently. If the operation does not get completed, contact technical support for assistance.

Syslog Message

Detected a long-running RPC operation (procedure number %u) for RPC server %s. The server has not responded in %lu seconds, which is over the threshold of %lu seconds.

Parameters

procedure (INT): Procedure number of the RPC operation.
RpcServer (STRING): Name of the RPC server.
timeSecs (LONGINT): Time in seconds since the current longest operation was allocated.
timeThresholdSecs (LONGINT): Time threshold that an operation should finish by.

nblade.nbnstoomanylifs events

Nblade.NbnsTooManyLifs

Severity

ERROR

Description

This message occurs when the NetBIOS Name Service receives more than 25 IP addresses for a name registration request. This is typically caused because of an upgrade from a previous release that had more than 25 IP addresses configured for a Vserver and WINS was configured. In such a scenario, clients might

not be able to access data because some of the IP addresses might not have registered with WINS.

Corrective Action

If there are more than 25 IP addresses configured for a Vserver, modify the "nbns-enabled-lifs" CIFS option to no more than a maximum of 25 LIFs by using the 'vserver cifs options modify -vserver <vserver> -nbns -enabled-lifs' command in advanced privilege mode when the effective cluster version is Data ONTAP 9.0 or later. In a mixed-mode cluster with a node running Data ONTAP 8.3, do not configure more than 25 LIFs per Vserver because of the following WINS server limitation: https://www.microsoft.com/resources/documentation/windowsnt/4/server/reskit/en-us/net/sur_wins.mspx

Syslog Message

The NetBIOS Name Service received more than 25 IP addresses for name registration for Vserver %u.

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.

nblade.newclientidmismatch events

Nblade.NewClientIdMismatch

Severity

ALERT

Description

This message occurs when a namestring collision occurs between NFS clients.

Corrective Action

Ensure client has unique hostname and NFSv4 mount clientaddr to avoid this.

Syslog Message

NFSv4 name string "%s" collision between clients %s and %s.

Parameters

clientNameStr (STRING): Client identifier namestring during SETCLIENTID operation.
existingStr (STRING): IP address of the existing client.
newStr (STRING): IP address of the new client.

nblade.nfs4illegaldirentname events

Nblade.Nfs4IllegalDirentName

Severity

ERROR

Description

This message occurs when a user attempts to list a directory over NFSv4 that contains an entry name with non UTF-8 characters. The problematic directory entry name was most likely created over NFSv2 or NFSv3 and could not be translated to Unicode using the translation table determined by the virtual server's language setting. A possible reason for this could be a client or server language misconfiguration issue.

Corrective Action
