Use the "vol show -fields msid" command to find the volume name corresponding to the volume MSID. Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Access the parent directory from an NFSv3 client, and then rename the entry using Unicode characters.

Syslog Message

Directory entry with file ID '%u' on the volume with MSID '%llu' cannot be listed. Directory entry name is illegal for NFSv4.

Parameters

fileid (INT): File ID of the directory entry.
msid (LONGINT): MSID of the volume, where the directory entry resides.

nblade.nfs4opnotsupported events

Nblade.Nfs4OpNotSupported

Severity

NOTICE

Description

This message occurs when a NFSv4 client presents an unsupported operation to the server.

Corrective Action

(None).

Syslog Message

NFSv4 operation '%d' is not supported.

Parameters

opcode (INT): ID of unssupported operation.

nblade.nfs4sequenceinvalid events

nblade.nfs4SequenceInvalid

Severity

NOTICE

Description

This message occurs when an NFS server detects an unexpected value for an incoming sequence number from a client.

Corrective Action

(None).

Syslog Message

NFS client (IP: %s) sent sequence# %d, but server expected sequence# %d. Server error: %s.

Parameters

clientIpAddress (STRING): IP address of the NFS client.
InSeqid (INT): Incoming sequence number from the client.
NextSeqid (INT): Expected sequence number from the server.
NfsError (STRING): NFS protocol error.

nblade.nfs4trunkmaxlimit events

Nblade.nfs4TrunkMaxLimit

Severity

ERROR

Description

This message occurs when a session trunking group created by the NFSv41 client exceeds the maximum number of supported trunk connections. NFS traffic does not respond on the new trunk connection over the maximum limit.

Corrective Action

Use only up to the maximum number of supported LIFs for session trunked NFS41 clients. Modify the NFS client configurations to limit the number of trunked sessions to the maximum supported to avoid the issue.

Syslog Message

In-flight requests from client IP [%s]:%d to destination LIF "%s" (Vserver: %s) is trying to use more than max supported:"%d" trunking connections. This results in NFS41 request getting not responded by NFS server due to limit reached.

Parameters

clientIpAddress (STRING): IP address of the client.
clientPort (INT): Network port of the client.
lifIpAddress (STRING): IP address of the logical interface.
vserverName (STRING): Name of the Vserver associated with this operation.
maxTrunkConnectionLimit (INT): Maximum number of allowed trunked connection by NFS41 server.

nblade.nfs4unoptimizedio events

Nblade.nfs4UnOptimizedIO

Severity

ALERT

Description

This message occurs when a session trunking group that is created by the NFSv41 client is split across multiple nodes. This can occur when one or more trunked data LIFs used in the trunking group migrate to the partner node. A split session trunking group can severely degrade performance of NFS client operations.

Corrective Action

Address any network or hardware issues that might have caused the LIFs to migrate. Ensure trunked data LIFs are on the same node. Use the "network interface show" and "network interface migrate" commands to revert the migrated LIF to the original node where the trunking relationship was created for that LIF.

Syslog Message

In-flight requests from client IP [%s]:%d to destination LIF "%s" (Vserver: %s) was using an unoptimized path for processing the request because of a split session trunking group. The NFSv4 client might experience degraded performance.

Parameters

clientIpAddress (STRING): IP address of the client.
clientPort (INT): Network port of the client.
lifIpAddress (STRING): IP address of the logical interface.
vserverName (STRING): Name of the Vserver associated with this operation.

nblade.nfsconnresetandclose events

Nblade.nfsConnResetAndClose

Severity

ERROR

Description

This message occurs when the server aborts the connection with the client by sending one or more RST segments, immediately resulting in the connection state being discarded.

Corrective Action

If this message occurs more than three times for a particular client in 30-60 minutes, make note of the IP address of the affected client. Verify that the network between the client and the storage system is functioning normally. After verifying the health of the network, verify that there are no issues related to networking on the client side. Check IP connectivity over the cluster interfaces between the two nodes. If the problem persists after addressing issues on the network or the client, contact NetApp technical support.

Syslog Message

Shutting down connection with the client. Vserver ID is %d; network data protocol is %s, Rpc Xid 0x%x; client IP address:port is %s:%d. local IP address is %s; reason is %s.

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.
serviceProtocol (STRING): Network data protocol used in the connection.
rpcXid (INT): Remote procedure call XID.
remoteAddr (STRING): IP address of the client machine.
remotePort (INT): TCP or UDP port number used by the remote client to send the data.
localAddr (STRING): IP address of the local interface serving the protocol operation.
reason (STRING): Reason for the disconnection.

nblade.nfscredcacheflushed events

Nblade.nfsCredCacheFlushed

Severity

NOTICE

Description

This message occurs when the administrator modifies the options "extended-groups-limit", "auth-sys-extended-groups" or "v4-id-domain" option using the "vserver nfs modify" command. This results in the flushing of the credential cache of that corresponding storage virtual machine (SVM) that holds credentials on connections that use mixed-mode security style volumes, RPCSEC_GSS authentication or extended groups over AUTH_SYS. As a result, the subsequent operations are slower for a short while until the credential cache is repopulated.

Corrective Action

(None).

Syslog Message

Credential cache flushed on SVM "%s" after modification of "extended-groups-limit", "auth-sys-extended-groups" or "v4-id-domain" NFS options. NFS connection operations are slower until the credential cache is repopulated.

Parameters

vserverName (STRING): Name of the SVM associated with this operation.

nblade.nfsmountrootonly events

Nblade.NfsMountRootOnly

Severity

NOTICE

Description

This message occurs when a non-root user performs MOUNT or NFS operation when the respective options '-mount-rootonly' or 'nfs-rootonly' are enabled.

Corrective Action

(None).

Syslog Message

%s operation by non-root user failed. Vserver ID is %d; ProgramNumber is %d; client IP address:port is %s:%d; local IP address is %s; Procedure number is %d.

Parameters

serviceProtocol (STRING): Network data protocol used in the connection.
vserverId (INT): Identifier for the vserver associated with this operation.
programNumber (INT): RPC Program Number.
remoteAddr (STRING): IP address of the client machine.
remotePort (INT): Remote port number that sent the data.
localAddr (STRING): IP address of the local interface serving the protocol operation.
procedureNum (INT): RPC Procedure Number for the requested operation.

nblade.nfspathresmaxlinks events

Nblade.nfsPathResMaxLinks

Severity

ERROR

Description

This message occurs while resolving an input path, when the server has reached the limit of maximum links it can follow and the corresponding RPC fails.

Corrective Action

Use the client IP address included in this message to identify the client sending the request. An operation such as mount or rquota. failing on this client might be due to this error. Reduce the number of symlinks to be followed for the failing operation.

Syslog Message

NFS maximum symbolic link limit reached when resolving path. Vserver ID: %d, service protocol:version is %s:%d, client IP address:port is %s:%d, local IP address: %s, RPC procedure number: %d.

Parameters

vserverId (INT): Identifier for the Vserver associated with this operation.
serviceProtocol (STRING): Network data protocol used in the connection.
programVersion (INT): RPC program version.
remoteAddr (STRING): IP address of the client machine.
remotePort (INT): Remote port number that sent the data.
localAddr (STRING): IP address of the local interface serving the protocol operation.
procedureNum (INT): RPC procedure number for the requested operation.

nblade.nfsrcchecksummismatch events

Nblade.nfsRCChecksumMismatch

Severity

ALERT

Description

This message occurs when the server detects a retransmitted request from the client with a modified payload. Modified requests from the client could cause corruption and pose a security threat to the server. Please use the information in the event to identify and monitor the bad client connection.

Corrective Action

1. Use the IP address from the log to identify the client machine and connection that retransmitted the invalid modified request. 2. Monitor the client connection and if invalid modified requests are persistent, take steps to ensure the security of the connection has not been compromised. 3. If there are no security concerns with the client connection, then the application driving traffic on that connection and the client OS NFS implementation should be examined to identify potential software defects.

Syslog Message

Replay cache checksum mismatch detected in retransmitted NFS request from client. Vserver ID is %d; service protocol:version is %s:%d, Rpc Xid 0x%x; client IP address:port is %s:%d. local IP address is %s; NFS procedure number is %d.

Parameters

vserverId (INT): Identifier for the vserver associated with this operation.
serviceProtocol (STRING): Network data protocol used in the connection.
programVersion (INT): RPC Program Version.
rpcXid (INT): Remote procedure call XID.
remoteAddr (STRING): IP address of the client machine.
remotePort (INT): Remote port number that sent the data.
localAddr (STRING): IP address of the local interface serving the protocol operation.
procedureNum (INT): RPC Procedure Number for the requested operation.

nblade.nfsv3writetoolarge events

Nblade.Nfsv3WriteTooLarge

Severity

ERROR

Description

This message occurs when a client attempts to write over NFSv3 with an amount of data that is greater than the maximum allowed TCP or UDP transfer size. This is an invalid request from the client and the data is not written.

Corrective Action

Try the operation again with the number of bytes of data that is less than or equal to the maximum allowed TCP or UDP transfer size configured in the server. You can set the write size option in the 'mount' command to the TCP or UDP transfer size.

Syslog Message

%d bytes of data to be written is greater than the maximum allowed TCP or UDP transfer size, which is %d. Data is not written. Associated object type is %s with UUID: %s.

Parameters

opaqueLen (INT): Number of bytes of data that were to be written.
maxXferSize (INT): Maximum allowed TCP/UDP transfer size configured in the server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.nfsv4blockclient events

Nblade.nfsV4BlockClient

Severity

NOTICE

Description

This message occurs when an NFSv4 client consumes the maximum allowed store pool resources and the store pool system threshold has also been reached. In response, the NFSv4 server disconnects the client, places the client in the blocked client list and does not allow it to reconnect for 24 hours.

Corrective Action

If you need further assistance, contact NetApp technical support.

Syslog Message

NFSv4 client "%s" has consumed the maximum store pool resources of type "%s". It is disconnected and is marked as a blocked client.

Parameters

clientIpAddress (STRING): IP address of the client.
poolName (STRING): NFSv4 store pool type.

nblade.nfsv4nsdbdomainmismatch events

Nblade.Nfsv4NsdbDomainMismatch

Severity

ERROR

Description

This message occurs when an NFSv4 client queries or updates the user or group attribute of a file object but the requested value does not match the '-v4-id-domain' option value of a virtual server's NFS service. In NFSv4, users and groups are represented as names of the form string@domain. The domain string must match on the client and server to ensure correct operation. The NFSv4 client request, on whose behalf this event message is issued, is rejected with an NFS4ERR_BADOWNER error.

Corrective Action

Update the client or server NFSv4 domain string to ensure that they match. If a single client experiences the issue, you typically just need to modify that client. See the client vendor's documentation to change the NFSv4 domain name configuration. If multiple clients experience the issue, you typically need to update the value of the '-v4-id-domain' option in the NFS server configuration.

Syslog Message

NFSv4 server %s received domain string %s from client %s, which does not match the '-v4-id-domain' value %s.

Parameters

serverIp (STRING): IP address of the server processing the NFSv4 request.
clientDomain (STRING): NFSv4 domain string received from the client
clientIp (STRING): IP address of the client.
serverDomain (STRING): Domain string that the NFSv4 server expected.

nblade.nfsv4poolexhaust events

Nblade.nfsV4PoolExhaust

Severity

EMERGENCY

Description

This message occurs when one of the NFSv4 store pools is exhausted.

Corrective Action

If the NFS server is unresponsive for more than 10 minutes after this error occurs, contact NetApp technical support.

Syslog Message

NFS Store Pool for %s exhausted. Associated object type is %s with UUID: %s.

Parameters

poolname (STRING): NFSv4 store pool type where the exhaustion happened.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.nfsv4poolthreshold events

Nblade.nfsV4PoolThreshold

Severity

NOTICE

Description

This message occurs when one of the NFSv4 store pools is nearing exhaustion (80% of max size). If the condition is allowed to continue, the store pool limits will be reached leading certain NFSv4 request failures.

Corrective Action

Reduce NFSv4 workload like active opens, users and client connections which consume store pool objects to ensure their counts remain under pre-defined limits.

Syslog Message

NFS Store Pool for %s is nearing exhaustion (%s of pool currently in use).

Parameters

poolname (STRING): NFSv4 store pool type where the maximum limits are nearing.
percent (STRING): Percentage of store pool objects of type currently in use.

nblade.nfsv4writetoolarge events

Nblade.Nfsv4WriteTooLarge

Severity

ERROR

Description

This message occurs when a client attempts to write over NFSv4 with an amount of data that is greater than the maximum allowed TCP transfer size. This is an invalid request from the client and the data is not written.

Corrective Action

Try the operation again with the number of bytes of data that is less than or equal to the maximum allowed TCP transfer size configured in the server. You can set the write size option in the 'mount' command to the TCP transfer size.

Syslog Message

%d bytes of data to be written is greater than the maximum allowed TCP transfer size, which is %d. Data is not written. Associated object type is %s with UUID: %s.

Parameters

opaqueLen (INT): Number of bytes of data that were to be written.
maxtcpxferSize (INT): Maximum allowed TCP transfer size configured in the server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.nocsmsession events

Nblade.noCsmSession

Severity

NOTICE

Description

This message occurs when the local node could not acquire a Connection Session Manager (CSM) session. CSM sessions are used to communicate file operations between nodes in the cluster. This might be a transient condition. If this condition persists, volumes on the destination node remain unavailable from this node. The destination node can be either local or remote.

Corrective Action

Check IP connectivity over the cluster interfaces between the two nodes. If further assistance is needed, contact NetApp technical support.

Syslog Message

(None).

Parameters

bladeId (STRING): UUID of the node that could not be reached.

nblade.nosmbvernegotiated events

Nblade.noSmbVerNegotiated

Severity

ERROR

Description

This message occurs when Data ONTAP® does not support any of the SMB protocol versions sent by the client for negotiation.

Corrective Action

Ensure that the client supports at least one of the enabled SMB versions. You can determine whether an SMB version is enabled by running the "vserver cifs options show" command in advanced mode.

Syslog Message

For Vserver "%s", Data ONTAP® could not negotiate with the client "%s" because it does not support any of

the SMB protocol versions that the client sent in the list "%s".

Parameters

> **vserverName** (STRING): Vserver associated with this operation.
> **clientIp** (STRING): IP address of the client attempting to negotiate.
> **clientVersionList** (STRING): List of the SMB protocol versions sent by the client.

nblade.notactivevscanserver events

Nblade.NotActiveVscanServer

Severity

ERROR

Description

This message occurs when a connection from a remote IP is not found in the Vscan scanner pool belonging to the storage virtual machine (SVM). Session setup request fails.

Corrective Action

Investigate if the associated IPs need to be added to the active scanner pool.

Syslog Message

CIFS connection on SVM %s (ID %u) from IP address %s fails to bind to an established Vscan related session because the IP address is not in the active scanner pool.

Parameters

> **vserverName** (STRING): Name of the SVM associated with this operation.
> **vsId** (INT): ID of the SVM on which this event occurred.
> **remoteIpAddress** (STRING): IP address of the client machine.

nblade.pcp events

Nblade.pcp.linkThrashing

Severity

INFORMATIONAL

Description

This message occurs when a network port undergoes multiple link state transitions within a short period of time. The event might be triggered in response to a rapid sequence of switch events or there might be a bad link.

Corrective Action

If this problem persists, check the physical connections between the affected port and its network switch. You can identify the faulty port by reviewing the event log for link state transitions reported by the NIC. One or more ports should have reported multiple linkUp and linkDown events prior to the linkThrashing message. ::> event log show -node <node> -messagename netif.link* If checking physical connections does not identify the problem, consider replacing the corresponding NIC.

Link thrashing detected on port %u.

Parameters

port (INT): Port ID.

nblade.qosvioldetectregfail events

Nblade.QoSViolDetectRegFail

Severity

ERROR

Description

This message occurs when the Quality-of-Service (QoS) subsystem fails to register for updates during initialization due to an internal error (e.g. there is not enough system memory available). As a result, workloads might not meet their minimum throughput or their service-level objectives (SLOs).

Corrective Action

The registration will continue to be retried. If this message continues to occur, perform a planned takeover/giveback sequence to reset the reporting node nondisruptively by using the "takeover -ofnode (reporting_node)" and "giveback -ofnode (reporting_node)" commands. If the problem persists, contact Contact NetApp technical support.

Syslog Message

Failed to register for violation detection updates. QoS min-throughput might operate in a limited capacity.

Parameters

errorCode (INT): Error code that was returned during registration.

nblade.rcbinid events

nblade.RCBinId.timeout

Severity

NOTICE

Description

This message occurs when an NFS replay cache bin ID entry expires.

Corrective Action

(None).

Syslog Message

Found replay cache expired entry for NFS client IP address: %s.

Parameters

ipaddr (STRING): IP address of the NFS client.

nblade.recoverybegin events

Nblade.recoveryBegin

Severity

NOTICE

Description

This message occurs when the NFS server enters the lock recovery state.

Corrective Action

(None).

Syslog Message

NFS server lock recovery has begun for Vserver "%s", LIFID "%d", LIF IP address "%s".

Parameters

vserverName (STRING): Vserver Name.
lifId (INT): LIF ID
lifIpAddress (STRING): LIF IP address for the NFS server.

nblade.s3bucketpathnotfound events

Nblade.s3BucketPathNotFound

Severity

ERROR

Description

This message occurs when the path of the NAS directory corresponding to an S3 NAS Bucket was not found. This would cause all accesses to that S3 bucket to fail.

Corrective Action

Check the NAS path corresponding to the S3 bucket. Either recreate the NAS path or delete the S3 bucket.

Syslog Message

NAS path "%s" corresponding to S3 bucket "%s" was not found on Vserver "%s".

Parameters

nasPath (STRING): NAS directory path of the S3 bucket that was not found.
bucketName (STRING): Name of the S3 bucket associated with this operation.
vserverName (STRING): Vserver associated with this operation.

nblade.scannerconnected events

Nblade.scannerConnected

Severity

NOTICE

Description

This message occurs when a Vserver connects successfully to a Vscan server.

Corrective Action

(None).

Syslog Message

Vserver "%s" connected to Vscan server (IP: %s).

Parameters

vserverName (STRING): Name of the connecting Vserver.
scannerIp (STRING): IP address of the Vscan server.

nblade.scannerdisconnected events

Nblade.scannerDisconnected

Severity

NOTICE

Description

This message occurs when any Vserver disconnects from a Vscan server.

Corrective Action

(None).

Syslog Message

Vserver "%s" disconnected from Vscan server (IP: %s).

Parameters

vserverName (STRING): Name of the disconnected Vserver.
scannerIp (STRING): IP address of the Vscan server.

nblade.sectracequeoverload events

Nblade.sectraceQueOverload

Severity

ALERT

Description

This message occurs when there are too many Sectrace work items. This might be the result of a very generic filter. For example, tracing of succesful NFS accesses can quickly generate a large number of Sectrace items, since all ops (each read or write) might generate a security trace.

Corrective Action

Check the Sectrace filter and make it more specific.

nblade.sharemaxconnlimit events

Nblade.shareMaxConnLimit

Severity

ERROR

Description

This message occurs when a CIFS share exceeds its maximum configured connection limit.

Corrective Action

Increase the "max-connections-per-share" limit using "vserver cifs share modify" command.

Syslog Message

CIFS share: %s of Vserver: %s hit its maximum connection limit.

Parameters

shareName (STRING): Name of the CIFS share that the user attempted to connect.
vserverName (STRING): Name for the Vserver associated with this operation.

nblade.showmountdisabled events

nblade.showmountdisabled

Severity

ERROR

Description

This message occurs when the "showmount" command is triggered by client, but the command is disabled on the NFS server. The "showmount" command enables NFS clients to see the Vserver's NFS exports list.

Corrective Action

Use the "nfs modify -showmount enabled" command to enable the feature. Use the "nfs show -fields showmount" command to verify that, if the showmount feature was enabled successfully on the NFS server.

Syslog Message

Showmount is disabled on Vserver %d.

Parameters

vserverid (INT): Identifier for the Vserver associated with this operation.

nblade.smb1onlyclientfound events

Nblade.smb1OnlyClientFound

Severity
NOTICE

Description
This message occurs when ONTAP® detects a client that supports only the SMB1 protocol. This message can help in identifying such clients and preparing for their upgrade to SMB2 or later before ONTAP deprecates the SMB1 version of the protocol.

Corrective Action
(None).

Syslog Message
For Vserver "%s", Data ONTAP® detected a client "%s" that supports only the SMB1 version of the protocol.

Parameters
vserverName (STRING): Vserver associated with this operation.
clientIp (STRING): IP address of the client.

nblade.smbsignaturemismatch events

Nblade.smbSignatureMismatch

Severity
ERROR

Description
This message occurs when the SMB signature sent by client does not match the SMB signature generated by the CIFS server.

Corrective Action
Ensure that the SMB client is authenticated in order to access the files. Alternatively, disable SMB signing.

Syslog Message
Client (protocol dialect: %s, IP: %s) sent an SMB signature that does not match the signature generated by the CIFS server: %s (Vserver: %s).

Parameters
SmbDialect (STRING): SMB protocol dialect negotiated by the client.
IpAddress (STRING): IP address of the client.
CifsServerName (STRING): Cifs server name of the client.
VserverName (STRING): Vserver name.

nblade.testevent events

Nblade.TestEvent

Severity

INFORMATIONAL

Description

This is a test EMS event generated by the Network Blade for functional verification only. No action is required.

Corrective Action

No corrective action is required. If this message is appearing without being intentionally triggered by the customer or by support activity, please contact support.

Syslog Message

The Network Blade kernel module has generated a test EMS event.

Parameters

(None).

nblade.tlsconfigerror events

Nblade.TLSConfigError

Severity

ERROR

Description

This message occurs when the client is trying to use NFS over TLS (Transport Layer Security), but it is disabled on the NFS server side.

Corrective Action

Enable the configuration by running "nfs tls interface enable" command.

Syslog Message

Failed to create NFS over TLS (Transport Layer Security) connection from client IP address:"%s", because NFS over TLS configuration not found for SVM:"%s", LIF:"%s".

Parameters

clientIpAddress (STRING): Client IP address.
vsName (STRING): Storage virtual machine (SVM) name.
lifIpAddress (STRING): LIF IP address of NFS server.

nblade.tlshandshakefailed events

Nblade.TLSHandshakeFailed

Severity

ERROR

Description

This message occurs when the NFS over TLS (Transport Layer Security) handshake fails between NFS client and NFS server.

Corrective Action

Verify the TLS configuration for the LIF, verify the health of the network and address issues on the network or the client. If the problem persists, contact NetApp technical support.

Syslog Message

Failed to complete TLS handshake for SVM:"%s", LIF:"%s", client IP address:"%s", NFS server certificate UUID:"%s".

Parameters

vsName (STRING): Storage virtual machine (SVM) name.
lifIpAddress (STRING): LIF IP address of NFS server.
remoteIpAddress (STRING): Client IP address.
certificateUuid (STRING): Universal unique identifier (UUID) of the TLS certificate of the NFS server (ONTAP).

nblade.vifdel events

Nblade.vifdel.ipRemoveFailed

Severity

ERROR

Description

This message occurs when there is a failure removing the IP address of a LIF that is being deleted. While this condition persists, most networking configuration or status operations can not be performed.

Corrective Action

A system reboot may be required if the operation did not complete successfully after it was retried. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. After the reboot is complete, issue a "giveback" command to return services to this partner.

Syslog Message

Error deleting IP address from LIF %d, error %d.

Parameters

lif (INT): LIF Id.
error (INT): Operation error code.

Nblade.vifdel.longRunning

Severity

ERROR

Description

This message occurs when there is an excessive delay in removing connections before LIF deletion can be completed. While this condition persists, most networking configuration or status operations can not be performed.

Corrective Action

A system reboot may be required if this message has occurred multiple times for the same LIF and the number of connections remaining has not decreased across these messages. In addition, network configuration and status commands are still not working. For HA configurations, operational disruption can be minimized by initiating a partner takeover followed by a reboot of this partner. Prior to reboot or takeover, a full autosupport must be generated for the affected node. This is done via the "autosupport invoke -type full" command. If possible, a sync core of the affected node should be provided to help find the root cause. A sync core can be generated via the "reboot -dump true" command for the affected node. After the reboot is complete, issue a "giveback" command to return services to this partner for HA configurations.

Syslog Message

Excessive delay while deleting connections on LIF %d, %d connections remaining.

Parameters

lif (INT): LIF Id.
remainingConns (INT): Number of connections still remaining on this LIF.

nblade.vldb events

Nblade.vldb.LeakedBladeList

Severity

NOTICE

Description

This message occurs when a protocol requests a list of blades but one cannot be generated due to one or more references to a previous request or requests still outstanding.

Corrective Action

If this condition is not cleared by a subsequent free message within 30 minutes, a reboot of the node might be required. Rebooting the node with the "system node reboot -dump true" command saves a core dump that allows diagnosis of this issue by NetApp technical support. For more information or assistance, contact NetApp technical support.

Syslog Message

"%s" operation issued by "%s" on cached volume location database (VLDB) blade list with references pending beyond expiry time.

Parameters

operation (STRING): Type of operation the caller is attempting.
caller (STRING): Caller that is trying to perform the operation.

Nblade.vldb.Timeout

Severity

ERROR

Description

This message occurs when a request from the network module to the volume location database (VLDB) times out. The VLDB is used to identify the node that currently controls a volume. This might be a transient condition. If the condition persists, some volumes might be inaccessible.

Corrective Action

Contact NetApp technical support.

Syslog Message

Request from the network module to the volume location database (VLDB) timed out.

Parameters

(None).

nblade.vscanbadipprivaccess events

Nblade.vscanBadIPPrivAccess

Severity

ERROR

Description

This message occurs during a client attempt to connect to the privileged ONTAP_ADMIN$ share, when the IP address of that client is not found in the list of allowed IP addresses.

Corrective Action

Ensure that the mentioned IP address is configured in one of the active vscan scanner pools. Use the "vserver vscan scanner pool show-active" command to view the currently active scanner pool configuration.

Syslog Message

For Vserver "%s", the attempt to connect to the privileged ONTAP_ADMIN$ share by the client "%s" using the logged-in user "%s" is rejected because its IP or hostname is not configured in any of the Vserver active scanner pools.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the client.
userName (STRING): Logged-in user of the client.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanbadprotomagicnum events

Nblade.vscanBadProtoMagicNum

Severity

ERROR

Description

This message occurs when an incorrectly formatted message is received from the AV Connector. This might result in delay or failure in AV scanning.

Corrective Action

Ensure that the compatible version of AV Connector is running on the AV server, and that no other user or software is attempting to connect to the "\\PIPE\vscan" resource on the Vserver.

Syslog Message

Data ONTAP® received incorrectly formatted message for Vserver "%s" from AV Connector running on the AV server "%s".

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the AV server.

nblade.vscanbaduserprivaccess events

Nblade.vscanBadUserPrivAccess

Severity

ERROR

Description

This message occurs during a client attempt to connect to the privileged ONTAP_ADMIN$ share, when the logged-in user of that client is not found in the list of allowed users.

Corrective Action

Ensure that the mentioned user name and IP address is configured in one of the active vscan scanner pools. Use the "vserver vscan scanner pool show-active" command to view the currently active scanner pool configuration.

Syslog Message

For Vserver "%s", the attempt to connect to the privileged ONTAP_ADMIN$ share by the client "%s" is rejected because its logged-in user "%s" is not configured in any of the Vserver active scanner pools.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the client.
userName (STRING): Logged-in user of the client.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanconnbackpressure events

Nblade.vscanConnBackPressure

Severity

ERROR

Description

This message occurs when an AV server is too busy to accept new scan requests.

Corrective Action

If this message occurs frequently, ensure that there are enough AV servers to handle the virus-scanning load being generated by the mentioned Vserver.

Syslog Message

For Vserver "%s", AV server "%s" is too busy to accept new scan requests.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the AV server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanconninactive events

Nblade.vscanConnInactive

Severity

NOTICE

Description

This message occurs when ONTAP® detects a nonresponsive antivirus (AV) server and forcibly closes its vscan connection.

Corrective Action

Ensure that the AV Connector, installed on the AV server, can connect to the Vserver and receive the scan requests.

Syslog Message

For Vserver "%s", ONTAP® forcibly closed the vscan connection originated from the nonresponsive AV server "%s".

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the AV server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanconninvaliduser events

Nblade.vscanConnInvalidUser

Severity

NOTICE

Description

This message occurs during a client attempt to establish a vscan connection, when the logged-in user of that client is not found in the list of allowed users.

Corrective Action

Ensure that the mentioned user name is configured in one of the active vscan scanner pools. Use the "vserver vscan scanner pool show-active" command to view the currently active scanner pool configuration.

Syslog Message

For Vserver "%s", the vscan connection request coming from client "%s" is rejected because the logged-in user "%s" is not configured in any of the Vserver active scanner pools.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the client attempting to establish a vscan connection.
userName (STRING): User name of the client attempting to establish a vscan connection.

nblade.vscanconnreqonsmb1 events

Nblade.vscanConnReqOnSMB1

Severity

ERROR

Description

This message occurs during a client attempt to establish a vscan connection over SMB1, which is not supported.

Corrective Action

Verify that both the client and Data ONTAP® support and are configured for SMB2 or later.

Syslog Message

For Vserver "%s", the vscan connection request coming from the client "%s" is rejected because it is not supported for SMB1.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the client.

nblade.vscanexcessivetos events

Nblade.vscanExcessiveTOs

Severity

ERROR

Description

This message occurs when ONTAP logs excessive timed-out scanning events which are due to delays in scanning response from the virus scanning (Vscan) server. Too many timed-out scanning events indicate that files are not being scanned in a timely manner.

Corrective Action

Investigate the Vscan server for timed-out scanning events to ascertain the root cause for the delays.

Syslog Message

Vscan timed-out scanning events exceeded %d in the last 30 minutes for Vscan server (IP: %s) in SVM "%s".

Parameters

ExcessiveVscanTimeOutsCount (INT): Threshold count for for the maximum number of timed-out scanning events that can occur within a 30 minute interval.
scannerIp (STRING): IP address of the Vscan server.
vserverName (STRING): Name of the SVM.

nblade.vscannodispatcher events

Nblade.vscanNoDispatcher

Severity

ALERT

Description

This message occurs when the vscan-dispatcher component cannot be created. This might be due to internal errors on the system, such as nonavailability of memory. This might cause data unavailability if the scan-mandatory option is enabled.

Corrective Action

Disable Vscan and enable it again by using the "vserver vscan disable/enable" command. If the problem persists, contact NetApp technical support.

Syslog Message

Vscan dispatcher component for Vserver "%s" could not be created. Error: %d.

Parameters

vserverName (STRING): Vserver associated with this operation.
errorCode (INT): Error code that describes the reason for the failure.

nblade.vscannopolicyenabled events

Nblade.vscanNoPolicyEnabled

Severity

ALERT

Description

This message occurs when a file access is not considered for virus scanning because none of the configured On-Access policies are enabled for the Vserver.

Corrective Action

Enable one of the configured On-Access policies for the Vserver.

Syslog Message

For Vserver "%s", the file access was not considered for virus scanning because none of the configured On-Access policies are enabled.

Parameters

vserverName (STRING): Vserver associated with this operation.

nblade.vscannoregdscanner events

Nblade.vscanNoRegdScanner

Severity

ERROR

Description

This message occurs when AV Connector notifies ONTAP® that it does not have a registered scan-engine. This could happen if the scan-engine never registered or unregistered because of some reason like it is misconfigured or shutdown. This might cause data unavailability if the scan-mandatory option is enabled.

Corrective Action

Ensure that the scan-engine software installed on the AV server is compatible with ONTAP®. Also ensure that it is running and is configred to connect to the AV Connector over local loopback.

Syslog Message

For Vserver "%s", AV Connector running on the AV server "%s" does not have a registered scan-engine to it.

Parameters

vserverName (STRING): Vserver associated with this operation.
scannerIp (STRING): IP address of the AV server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscannoscannerconn events

Nblade.vscanNoScannerConn

Severity

EMERGENCY

Description

This message occurs when ONTAP® has no vscan connection for servicing virus scan-requests. This might cause data unavailability if the scan-mandatory option is enabled.

Corrective Action

Ensure that the scanner pool is properly configured and the AV servers are active and connected to ONTAP.

Syslog Message

Vserver "%s" has no virus scanner connection.

Parameters

vserverName (STRING): Vserver associated with this operation.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanvirusdetected events

Nblade.vscanVirusDetected

Severity

ERROR

Description

This message occurs when a vscan server reports an error to the storage system. Normally this indicates that a virus has been found by the vscan server; however, other error conditions on the vscan server can result in this event. Client access to the file is denied. The vscan server might, depending on its settings and configuration, clean the file, quarantine it, or delete it.

Corrective Action

Check the log of the vscan (antivirus) server reported in the syslog message to see if it was able to successfully quarantine or delete the infected file. If it was not able to do so, a system administrator might want to manually delete the file.

Syslog Message

Possible virus detected. Vserver: %s, vscan server IP: %s, file path: %s, client IP: %s, SID: %s, vscan engine status: %u, vscan engine result string: %s.

Parameters

vserverName (STRING): Name of the Vserver associated with this operation.
vscanServerIp (STRING): IP address of the vscan server.
filePath (STRING): Path of the file that was found to be infected.
clientIp (STRING): IP address of the client.
SID (STRING): SID of the client.
vscanEngineStatus (INT): Status code returned by the vscan server.
vscanEngineResultString (STRING): Result string returned by the vscan server.
object_type (STRING): Type of the resource object under notification.
object_uuid (STRING): UUID of the resource object.

nblade.vscanworkqueueoverloaded events

Nblade.vscanWorkQueueOverloaded

Severity

NOTICE

Description

This message occurs when there are too many events being generated by the Vscan subsystem in ONTAP® software, which might be the result of a misconfigured Vscan server.

Corrective Action

Check the Vscan server configurations to make sure that there are no connectivity or configuration issues between the storage system and Vscan server. Use the "vserver vscan connection-status show-all" command to see the connection states of all configured Vscan servers.

Syslog Message

Too many events [%d] present in Vscan work queue.

Parameters

workQueueDepth (INT): Number of queued events waiting to be processed.

ndmp events

ndmp.ctrl events

ndmp.ctrl.on.e0m

Severity

ALERT

Description

This message occurs when the IP address of the logical interface (LIF) that hosts the NDMP control connection is hosted on maintenance port "e0M". This port does not provide sufficient bandwidth for NDMP.

Corrective Action

Ensure that the LIF is moved out of port "e0M" and hosted on a high bandwidth port, or use a LIF hosted on a high bandwidth port for the control connection.

Syslog Message

NDMP control connection is established on "%s" which is hosted on port "%s". This is a low bandwidth port and might impact performance.

Parameters

lif_addr (STRING): Local control connection IP address.
lif_port (STRING): Port on which the control connection IP address is hosted.

ndmp.data events

ndmp.data.on.e0m

Severity

ALERT

Description

This message occurs when the IP address of the logical interface (LIF) that hosts the NDMP data connection is hosted on maintenance port "e0M". This port does not provide sufficient bandwidth for NDMP.

Corrective Action

Ensure that the LIF is moved out of port "e0M" and hosted on a high bandwidth port, or create a new LIF hosted on a high bandwidth port which NDMP can use for the data connection.

Syslog Message

NDMP data connection is established on "%s" which is hosted on port "%s". This is a low bandwidth port and might impact performance.

Parameters

lif_addr (STRING): Local data connection IP address.
lif_port (STRING): Port on which the data connection IP address is hosted.

ndmp.fail events

ndmp.fail.log

Severity

ERROR

Description

This event is generated when there is an error in NDMP

Corrective Action

(None).

Syslog Message

Error message: %s

Parameters

Error_message (STRING): The error is hinted

ndmp.max events

ndmp.max.warning

Severity

NOTICE

Description

This message occurs when the maximum number of NDMP sessions has been reached.

Corrective Action

(None).

Syslog Message

Cannot accept new requests because the NDMP connection limit has been reached.

Parameters

(None).

ndmp.password events

ndmp.password.warning

Severity

ERROR

Description

This message occurs on NDMP service startup, when the password for the NDMP user account is still the
default password.

Corrective Action

Use the 'ndmpd password' command to change the default password.

Syslog Message

The NDMP user account has the default password set. Use the 'ndmp password' command to change the default password.

Parameters

(None).

ndo events

ndo.cr events

ndo.cr.canceled

Severity

NOTICE

Description

This message occurs when a controller replacement operation is canceled by the operator.

Corrective Action

(None).

Syslog Message

Controller replacement operation on node "%s" is canceled by the operator.

Parameters

nodeName (STRING): Name of the node that was being replaced when the operation was canceled.

ndo.cr.completed

Severity

NOTICE

Description

This message occurs when a controller replacement operation has been completed successfully in the HA group.

Corrective Action

(None).

Syslog Message

Controller replacement operation completed. New node "%s" (model: %s), HA partner node "%s" (model: %s)

Parameters

newNodeName (STRING): Node name of the first new controller.
newModelName (STRING): Model name of the first new controller.
haNodeName (STRING): Node name of the new HA partner controller.
haModelName (STRING): Model name of the new HA partner controller.

ndo.cr.completed.firstNode

Severity

NOTICE

Description

This message occurs when a controller replacement operation has been completed on the first node of the HA group.

Corrective Action

(None).

Syslog Message

Controller replacement operation completed on the first controller of the HA group. New node: %s (model: %s).

Parameters

nodeName (STRING): Node name of the new controller.
modelName (STRING): Model name of the new controller.

ndo.cr.nso.canceled

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has been canceled.

Corrective Action

(None).

Syslog Message

NSO-based controller replacement operation was canceled from node: %s. Remote cluster node: %s, remote cluster HA partner node: %s.

Parameters

initiatingClusterNodeName (STRING): Name of the node from where controller replacement operation was canceled.
targetClusterNodeName (STRING): Node name of the controller that will be replaced.
targetClusterHApartnerNodeName (STRING): Node name of the HA partner controller that will be replaced.

ndo.cr.nso.completed

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster FC configuration has completed.

Corrective Action

(None).

Syslog Message

NSO-based controller replacement operation completed. Initiating cluster node: %s, remote cluster node: %s (model: %s), remote cluster HA partner node: %s (model: %s).

Parameters

initiatingClusterNodeName (STRING): Node name of the controller that has initiated the upgrade.
newTargetClusterNodeName (STRING): Node name of the new controller.
newTargetClusterModelName (STRING): Model name of the new controller.
newTargetClusterHApartnerNodeName (STRING): Node name of the new HA partner controller.
newTargetClusterHApartnerModelName (STRING): Model name of the new HA partner controller.

ndo.cr.nso.mccip.canceled

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been canceled.

Corrective Action

(None).

Syslog Message

An NSO-based controller replacement operation was canceled in a MetroCluster IP configuration from node "%s". The remote cluster node is "%s", and the remote cluster HA partner node is "%s".

Parameters

initiatingClusterNodeName (STRING): Name of the node where the controller replacement operation was canceled.
targetClusterNodeName (STRING): Node name of the controller that was to be replaced.
targetClusterHApartnerNodeName (STRING): Node name of the HA partner controller that was to be replaced.

ndo.cr.nso.mccip.completed

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has completed.

Corrective Action

(None).

Syslog Message

An NSO-based controller replacement operation completed in a MetroCluster IP configuration. The initiating cluster node is "%s", remote cluster node is "%s" (model "%s"), and the remote cluster HA partner node is "%s" (model "%s").

Parameters

initiatingClusterNodeName (STRING): Node name of the controller that initiated the controller replacement operation.
newTargetClusterNodeName (STRING): Node name of the new controller.
newTargetClusterModelName (STRING): Model name of the new controller.
newTargetClusterHApartnerNodeName (STRING): Node name of the new HA partner controller.
newTargetClusterHApartnerModelName (STRING): Model name of the new HA partner controller.

ndo.cr.nso.mccip.paused

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been paused.

Corrective Action

Use the "system controller replace show-details" command to check the status of the operation. Then, use the "system controller replace resume" command to resume the replacement operation.

Syslog Message

An NSO-based controller replacement operation was paused in a MetroCluster IP configuration from node "%s". The remote cluster node is "%s", and the remote cluster HA partner node is "%s".

Parameters

initiatingClusterNodeName (STRING): Name of the node from where the controller replacement operation was paused.
targetClusterNodeName (STRING): Node name of the controller that is being replaced.
targetClusterHApartnerNodeName (STRING): Node name of the HA partner controller that is being replaced.

ndo.cr.nso.mccip.paused.error

Severity

ERROR

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration was paused due to an error.

Corrective Action

Use the "system controller replace show-details" command to check the status of the operation. Resolve the error. Then, use the "system controller replace resume" command to resume the replacement operation.

Syslog Message

An NSO-based controller replacement operation has been paused in a MetroCluster IP configuration on node "%s" during a task "%s" due to the following error: %s.

Parameters

nodeName (STRING): Name of the node where the controller replacement operation was paused due to an error.

taskName (STRING): Name of the task.
taskReport (STRING): Detailed error report.

ndo.cr.nso.mccip.paused.userInput

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been paused for operator intervention.

Corrective Action

Use the "system controller replace show-details" command to check the status of the operation. Collect the requested information or perform the steps as mentioned in the "system controller replace show-details" command output. Then, use the "system controller replace resume" command to resume the replacement operation.

Syslog Message

An NSO-based controller replacement operation from initiating node "%s" has been paused in a MetroCluster IP configuration. The remote cluster node "%s" and remote cluster HA partner node "%s" have been paused for operator interventio while performing a "%s" task during the "%s" phase.

Parameters

initiatingClusterNodeName (STRING): Name of the node where the controller replacement operation was initiated.
targetClusterNodeName (STRING): Node name of the controller that is being replaced.
targetClusterHApartnerNodeName (STRING): Node name of the HA partner controller that is being replaced.
taskName (STRING): Name of the task where the controller replacement operation has been paused for operator intervention.
phaseInfo (STRING): Name of the phase where the controller replacement operation has been paused for operator intervention.

ndo.cr.nso.mccip.resumed

Severity

NOTICE

Description

This message occurs when a controller replacement operation using negotiated switchover (NSO) in a MetroCluster IP configuration has been resumed.

Corrective Action

modelName (STRING): Model name of the controller that will be replaced.
haNodeName (STRING): Node name of the HA partner controller that will be replaced.
haModelName (STRING): Model name of the HA partner controller that will be replaced.

net events

net.cg events

net.cg.backpressureEntered

Severity

NOTICE

Description

This message occurs when the current connection group experiences backpressure. The client workload is distributed among connection groups. If a connection group has too much work waiting to be processed, incoming packets will be dropped. If one connection group experiences backpressure, it might indicate an imbalance that could affect the subset of clients using that connection group. If all connection groups are experiencing backpressure, it might indicate that the workload is nearing the capacity of the storage controller.

Corrective Action

Use the "statistics show -raw -object cgstat -counter is_backpressured" command to monitor the connection group backpressure status. Use the "statistics show -raw -object cgstat -counter bkp_exited" command to monitor the connection group backpressure rate. Use the "statistics show -raw -object cgstat -counter bkp_ipv4_drops" and "statistics show -raw -object cgstat -counter bkp_ipv6_drops" commands to monitor packet drops due to the connection group backpressure. Adjust the workload or increase the capacity to avoid over-utilization.

Syslog Message

Connection group "%d" experienced backpressure %d times.

Parameters

connection_group (INT): Connection group which dropped packets due to backpressure.
count (INT): Number of times the current connection group experienced backpressure.

net.cg.ratelimited

Severity

NOTICE

Description

This message occurs when the rate of incoming traffic exceeds the threshold limit of the current connection group. The client workload is distributed among connection groups. If a connection group is receiving certain kinds of packets at a rate exceeding the allowed threshold, those incoming packets will be dropped. Packets subject to rate limits include UDP, ICMP, IP fragments, broadcast, and multicast. If a connection group is receiving packets at a rate that exceeds its threshold, the storage controller might be experiencing a packet storm.

Corrective Action

Use the "statistics show -raw -object cgstat -counter ratelimit_icmp", "statistics show -raw -object cgstat -counter ratelimit_bcast", "statistics show -raw -object cgstat -counter ratelimit_frag", "statistics show -raw -object cgstat -counter ratelimit_udp", and "statistics show -raw -object cgstat -counter ratelimit_other" commands to monitor packets that are being dropped because they are being received by the connection group at a rate that exceeds the threshold limit. Use packet traces to determine if there is a packet storm or

network misconfiguration causing packets not intended for consumption by the storage controller to be sent to the connection group. If using NFS-over-UDP, adjust the workload or increase the capacity to avoid over-utilization.

Syslog Message

"%s traffic received by connection group "%d" was received at a rate that exceeded the threshold limit.

Parameters

reason (STRING): The type of packets the current connection group received at a rate greater than its threshold limit.
connection_group (INT): Connection group which dropped packets because it received them at a rate greater than its threshold limit.

net.cg.utilThresholdExceed

Severity

NOTICE

Description

This message occurs when the current connection group utilization exceeds the configured threshold. The client workload is distributed among connection groups. If one connection group utilization is much higher than the others, it might indicate an imbalance that could affect the subset of clients using that connection group. If all connection groups are experiencing high utilization, it might indicate that the workload is nearing the capacity of the storage controller.

Corrective Action

Use the "statistics show -raw -object nwk_ctx -counter utilization" command to monitor the connection group utilization. Adjust the workload or increase the capacity to avoid over-utilization.

Syslog Message

Utilization of connection group "%d" (%d%%) exceeds the configured threshold (%d%%).

Parameters

connection_group (INT): Connection group whose utilization exceeded the configured threshold.
current_utilization (INT): Current connection group utilization.
configured_threshold (INT): Configured connection group utilization threshold.

net.fib events

net.fib.createfailed

Severity

ERROR

Description

This message occurs when a Vserver resource allocation fails. This leaves the system with an unusable Vserver, and additional Vservers cannot be created. This might also lead to system performance degradation.

Corrective Action

Delete the Vserver created by using the "vserver delete" command. Use the diagnostic privilege "debug

smdb table vserver_by_name show" command to determine the Vserver name corresponding to the ID. You must delete the other associated entities, such as LIFs and volumes, before deleting a Vserver.

Syslog Message

Resource allocation for Vserver (ID: %d) failed.

Parameters

vsid (INT): Vserver ID.

net.fib.nearinglimit

Severity

NOTICE

Description

This message occurs when Vserver resources have reached 90% and will soon be exhausted. When the resources are exhausted, additional Vservers cannot be created. The system will function normally with respect to other Vservers.

Corrective Action

Check for configured Vservers by using the "vserver show" command, and delete unused Vservers by using the "vserver delete" command. You must delete the the the other associated entities, such as LIFs and volumes, before deleting a Vserver.

Syslog Message

Vserver resource allocation is nearing the limit.

Parameters

(None).

net.ifconfig events

net.ifconfig.addLimitExceed

Severity

ERROR

Description

This message occurs when the limit for adding logical virtual local area network (VLAN) and interface group (ifgrp) interfaces is exceeded. The latest attempt to add an interface did not succeed.

Corrective Action

Delete any existing unused VLAN or ifgrp interface and retry adding the new logical interface.

Syslog Message

The limit for adding logical virtual local area network (VLAN) and interface group (ifgrp) interfaces is exceeded. The maximum limit per host is %d.

Parameters

maxlimitperhost (INT): Maximum interfaces per host.

net.ifconfig.ioctlError

Severity

NOTICE

Description

This event is generated when the ifconfig command encounters an error while attempting to perform an ioctl.

Corrective Action

(None).

Syslog Message

ioctl error encountered while configuring interface '%s' using ioctl '%s' (error string='%s', error code=%d).

Parameters

ifname (STRING): The name of the interface
ioctl (STRING): The name of the ioctl
errorString (STRING): The error string
error (INT): The internal error code

net.ifgrp events

net.ifgrp.addLimitExceeded

Severity

ERROR

Description

This message occurs when the system fails to create a new interface group because the number of such groups already present on the node exceed either the number of physical ports on the node or the upper bound on number of interface groups supported.

Corrective Action

Delete any existing unused interface groups and retry adding the new interface group. Use the "network port ifgrp delete" and "network port ifgrp create" commands, respectively, to do so.

Syslog Message

ifgrp %s could not be created because the limit for logical interface groups on this node has been reached. The limit per node is equal to the number of physical ports present on the node with an upper bound of %d.

Parameters

vifName (STRING): Name of the interface group that could not be created.
maxIfgrp (INT): Upper bound on number of interface groups supported.

net.ifgrp.lacp.key.mismatch

Severity

ERROR

Description

This message occurs when ONTAP receives differing system-ID or keys information from the Link Aggregation Control Protocol (LACP) peer, leading to one or more interfaces not being active in the port interface group (ifgrp). This can indicate a configuration error at the LACP peer.

Corrective Action

Search the knowledgebase of the NetApp technical support support web site for the "LACP port down due to mismatched peer keys" phrase.

Syslog Message

Partner mismatch occured on ifgrp "%s", port "%s". Expected by aggregate: system-priority "0x%02x", system-ID "%s", and key "0x%04x". Found at Port: system-priority "0x%02x", system-ID "%s", and key "0x%04x".

Parameters

ifgrpName (STRING): Name of the ifgrp.
portName (STRING): Name of the ifgrp member-port.
aggregateSysPriority (INT): Ifgrp aggregate system priority.
aggregateSysMAC (STRING): Ifgrp aggregate system MAC address.
aggregateKey (INT): Ifgrp aggregate key.
portSysPriority (INT): Ifgrp member-port system priority.
portSysMAC (STRING): Ifgrp member-port system MAC address.
portKey (INT): Ifgrp member-port key.

net.ifgrp.lacp.link.active

Severity

NOTICE

Description

This message occurs when a link in an Link Aggregation Control Protocol (LACP) aggregate becomes active.

Corrective Action

(None).

Syslog Message

ifgrp %s, port %s has transitioned to the active state.

Parameters

aggregateName (STRING): Name of the interface group.
portName (STRING): Name of the member port.

net.ifgrp.lacp.link.inactive

Severity

ERROR

Description

This message occurs when a link is operationally up, but becomes inactive in the Link Aggregation Control Protocol (LACP) aggregate with which it has been associated. This can occur due to a configuration, software, or link error, or a hardware failure.

Corrective Action

Search kb.netapp.com for "How to troubleshoot LACP port channel groups".

Syslog Message

ifgrp %s, port %s has transitioned to an inactive state. The interface group is in a degraded state.

Parameters

aggregateName (STRING): Name of the interface group.
portName (STRING): Name of the member port.

net.ipsconfig events

net.ipsconfig.failed

Severity

ALERT

Description

This message occurs when creation of an IPspace fails. This failure leaves the system with an unusable IPspace.

Corrective Action

Delete the IPspace reporting the failure by using the "ipspace delete" command. Use the (privilege: diag) "debug smdb table ipspaces_byname show" command to find the mapping from the ID reported in the event to the IPspace name required to delete this IPspace.

Syslog Message

IPspace (%d) needs to be deleted because configuration (%s) failed with error (%s).

Parameters

ipsid (INT): IPspace ID.
configuration (STRING): Configuration attempted.
error (STRING): Error returned.

net.static events

net.static.hostroute.replaced

Severity

NOTICE

Description

This event is generated when user configured static host route entry being replaced with a dynamic entry by route redirect message.

Corrective Action

(None).

rtredirect_fib: User static route to destination(%s) through gateway(%s) being redirected to new gateway(%s)

Parameters

Dest (STRING): IP address of the destination.
OldGW (STRING): IP address of the old gateway.
NewGW (STRING): IP address of the new gateway.

net.vserverupdatefailure events

net.vServerUpdateFailure

Severity

NOTICE

Description

This message occurs when a node cannot be updated with Vserver configuration. This can result in that node not being able to host LIFs.

Corrective Action

(None).

Syslog Message

Unable to update node %s with current Vservers.

Parameters

remote_node (STRING): Node being updated.

net.vserverupdatesuccess events

net.vServerUpdateSuccess

Severity

NOTICE

Description

This message occurs when the Vserver configuration on a node is successfully updated after a previous failure.

Corrective Action

(None).

Syslog Message

Vserver configuration is successfully updated on node %s.

Parameters

remote_node (STRING): Node that was updated.

netgroup events

netgroup.files events

netgroup.files.missing

Severity

ERROR

Description

This message occurs when a netgroup lookup request finds that files is specified as a ns-switch source, but a netgroup file cannot be found.

Corrective Action

Check that the local netgroup file is present and load it if necessary. The commands to perform this are "vserver services netgroup load" and "vserver services netgroup status".

Syslog Message

Netgroup file missing for Vserver "%s" during lookup for netgroup "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netgroup.ldap events

netgroup.ldap.byhost.missing

Severity

INFORMATIONAL

Description

This message occurs when netgroup.byhost is disabled in the Lightweight Directory Access Protocol (LDAP) client configuration on the storage system, and LDAP is configured as an ns-switch source for the Vserver. Enabling netgroup.byhost enables mount operations to succeed faster when the netgroup size is large.

Corrective Action

Consider configuring the netgroup.byhost database on the LDAP server and enabling netgroup.byhost on the LDAP client configuration on the storage system by using the "ldap client modify" command.

Syslog Message

LDAP client config has netgroup.byhost disabled for Vserver "%s" during lookup for netgroup "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netgroup.ldap.config

Severity
ERROR

Description
This message occurs when a netgroup lookup request finds that Lightweight Directory Access Protocol (LDAP) is specified as a ns-switch source, but LDAP is not configured for the Vserver. Netgroup lookups using LDAP will not function.

Corrective Action
Check the ns-switch sources configured for the netgroup database using "vserver services name-service ns-switch show" and the LDAP configuration for the Vserver using "ldap show" and "ldap client show". Either remove LDAP as a ns-switch source, or configure LDAP.

Syslog Message
LDAP configuration issues found for Vserver "%s" during lookup for netgroup "%s".

Parameters
vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netgroup.nis events

netgroup.nis.byhost.decode

Severity
ERROR

Description
This message occurs when the netgroup.byhost remote procedure call to the Network Information Service (NIS) server returns a response that cannot be decoded.

Corrective Action
Check the netgroup byhost database on the NIS server for lines that have more than 1024 characters.

Syslog Message
NIS server returned an undecodable response for Vserver "%s" during lookup for netgroup "%s".

Parameters
vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netgroup.nis.byhost.missing

Severity
INFORMATIONAL

Description
This message occurs when the netgroup.byhost map is not configured on the Network Information Service (NIS) server and NIS is configured as a ns-switch source for the Vserver. Enabling netgroup.byhost enables

mount operations to succeed faster when the netgroup size is large.

Corrective Action

Consider configuring the netgroup.byhost map on the NIS server to gain better performance with netgroups.

Syslog Message

NIS server missing netgroup.byhost map for Vserver "%s" during lookup for netgroup "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netgroup.nis.config

Severity

ERROR

Description

This message occurs when a netgroup lookup request finds that Network Information Service (NIS) is specified as a ns-switch source, but NIS is not configured for the Vserver. Netgroup lookups using NIS will not function.

Corrective Action

Check the ns-switch sources configured for the netgroup database using "vserver services name-service ns-switch show" and the NIS configuration for the Vserver using "nis-domain show". Either remove NIS as a ns-switch source, or configure NIS.

Syslog Message

NIS configuration issues found for Vserver "%s" during lookup for netgroup "%s".

Parameters

vserver (STRING): Name of the Vserver on which the problem is occurring.
netgroup (STRING): Name of the netgroup for the lookup request.

netif events

netif.autonegfailed events

netif.autoNegFailed

Severity

ERROR

Description

This message occcurs when autonegotiation fails and the interface is operating at half-duplex, which might not be the desired mode.

Corrective Action

Verify that autonegotiation is enabled on the switch or device to which the interface is connected. Or, if the desired speed is 10 or 100 Mbps, disable autonegotiation on the interface by setting the mediatype.

Syslog Message

Autonegotiation failed, interface %s operating at %d Mbps half-duplex.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".
speed (INT): Speed used by the interface.

netif.badeeprom events

netif.badEeprom

Severity

EMERGENCY

Description

This message occurs when the network interface has an electronically erasable programmable read-only memory (EEPROM) with a bad cyclic redundancy check (CRC) or media access control (MAC) address.

Corrective Action

Replace the component associated with the network interface (PCIe card or controller motherboard).

Syslog Message

Network interface %s has an EEPROM with a bad CRC or MAC address.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.badoversizepacket events

netif.badOversizePacket

Severity

ERROR

Description

This message occurs when the network interface card (NIC) receives a bad oversize packet.

Corrective Action

Try a different switch port.

Syslog Message

Bad oversize packet received on network interface %s. Check for NIC receive errors (CRC, runts, fragments). Might indicate a bad switch port.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.cpreventcompleted events

netif.cprEventCompleted

Severity

INFORMATIONAL

Description

This message occurs when a CPR Event (core PCI resiliency) has completed.

Corrective Action

PCI reset has occurred automatically to correct.

Syslog Message

CPR Event (core PCI resiliency) completed on network interface %s and the count since boot is %d.

Parameters

ifname (STRING): Name of network interface.
count (INT): Number of times a CPR Event (core PCI resiliency) has been completed since boot.

netif.cpreventdetected events

netif.cprEventDetected

Severity

INFORMATIONAL

Description

This message occurs when a CPR Event (core PCI resiliency) is detected.

Corrective Action

PCI reset will occur automatically to correct.

Syslog Message

CPR Event (core PCI resiliency) detected on network interface %s and the count since boot is %d.

Parameters

ifname (STRING): Name of network interface.
count (INT): Number of times CPR Event (core PCI resiliency) has occurred since boot.

netif.cprmaxeventsreached events

netif.cprMaxEventsReached

Severity

ERROR

Description

This message occurs when the maximum number of CPR Events (core PCI resiliency) has occurred since boot.

Corrective Action

Replace the failing hardware.

Syslog Message

Replace hardware — maximum number of CPR Events (core PCI resiliency) since boot has occurred on network interface %s.

Parameters

ifname (STRING): Name of network interface.

netif.eepromreadfailed events

netif.eepromReadFailed

Severity

ERROR

Description

This message occurs when there is a failure in reading the electronically erasable programmable read-only memory (EEPROM) for a network interface. The interface is not initialized.

Corrective Action

Rebooting the system might clear the problem. The problem might be caused by a software bug and should be reported to NetApp technical support.

Syslog Message

Failure in reading EEPROM for network interface %s.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.excesslinkinterrupts events

netif.excessLinkInterrupts

Severity

ERROR

Description

This message occurs when excessive link status change interrupts occur on the network interface. One or two events might indicate a momentary glitch on the link, but many events might indicate a bad switch port, cable, or network interface card (NIC).

Corrective Action

Try using a different switch port and cable. If the problem persists, replace the NIC.

Syslog Message

Excessive link status change interrupts occurred on network interface %s.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.fatal events

netif.fatal.err

Severity

ALERT

Description

This message occurs when the network device's driver encounters an error from which it cannot recover.

Corrective Action

Replace the network interface card.

Syslog Message

The network device in slot %d encountered fatal error %s.

Parameters

slot (INT): Slot number.
info (STRING): Device specific information

netif.fwupdatefailed events

netif.fwUpdateFailed

Severity

ERROR

Description

This message occurs when there is an error during a network interface firmware update.

Corrective Action

In very rare cases, a firmware update failure might leave the interface inoperable. If the driver initialization routine subsequently fails and logs a message, the motherboard or card might need to be replaced. For more information or assistance, contact NetApp technical support.

Syslog Message

Firmware update of network interface %s to version %s failed :%s.

Parameters

ifName (STRING): Name of the network interface.
version (STRING): Version of the firmware update.
reason (STRING): Reason for the firmware update failure.

netif.fwupdatestatus events

netif.fwUpdateStatus

Severity

NOTICE

Description

This message occurs to indicate the status of a network interface firmware update.

Corrective Action

(None).

Syslog Message

Firmware update of network interface %s to version %s %s.

Parameters

ifName (STRING): Name of the network interface.
version (STRING): Version of firmware update.
status (STRING): Status of firmware update process (started or completed)

netif.hangdetected events

netif.hangDetected

Severity

ERROR

Description

This message occurs when a network interface driver detects that an interface is hung.

Corrective Action

If hardware is reset and there are no further hangs, no corrective action is required. Otherwise, if the system reports frequent hangs, a core dump is forced, or no action is taken by the driver, contact NetApp technical support.

Syslog Message

Network interface %s hung (%s). %s. Driver: %s.

Parameters

ifName (STRING): Name of the network interface: for example, "e4a".
hangType (STRING): Type of hang. For example, "transmit", "PCIe RcvMstAbt".
recoveryAction (STRING): Action, if any, that will be taken by the driver to recover. For example, "Resetting to recover" or "Forcing panic for core dump" (for root cause analysis).
driver (STRING): Driver name.

netif.hn events

netif.hn.setDataPathFailure

Severity

ERROR

Description

This message occurs when Hyper-V virtual NIC fails to switch the data path from a Physical Function (PF) vPort to a Virtual Function (VF) vPort or vice-versa when accelerated networking is enabled on the virtual NIC. When the data path switch fails, the traffic might or might not continue to flow through existing path. If no traffic flows, then it can result in a complete outage on the LIFs hosted by the virtual NIC.

Corrective Action

Redeploy the CVO instance on another host machine. If the problem persists, contact NetApp technical support.

Syslog Message

%s: Failed to set data path to %s. Error: %d.

Parameters

ifName (STRING): Name of the network interface.
path (STRING): Data path: synthetic (via PF) or virtual (via VF).
error (INT): Failure to set data path.

netif.hv events

netif.hv.heartbeatFail

Severity

ERROR

Description

This message occurs when the heartbeat between hypervisor and the guest virtual machine (VM) fails. There is no functional impact but the resource health in the Azure portal for this VM shows as unavailable.

The heartbeat is restored after reboot of the VM or detach and attach of heartbeat device.

Corrective Action

Reboot the Cloud Volumes ONTAP (CVO) instance or run the following two commands from BSD systemshell using diagnostic privilege: sudo devctl disable hvheartbeat0 sudo devctl enable hvheartbeat0 If the problem persists, contact NetApp technical support.

Syslog Message

Failed to respond to heartbeat message from the hypervisor.

Parameters

(None).

netif.init events

netif.init.failed

Severity

ALERT

Description

This message occurs when initialization of a network interface failed due to an unexpected software error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Initialization of network interface %s failed due to unexpected software error %s:%d.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".
module (STRING): Name of the software module or driver.
error (INT): Module-specific error code.

netif.linkdown events

netif.linkDown

Severity

INFORMATIONAL

Description

This message occurs when a network link goes down or the interface is not operational when first configured up.

Corrective Action

If the message describes the link as "down," check the cabling and switch port configuration. If the message states "controller initialization failure", report this to NetApp technical support.

Syslog Message

%s %s: Link %s.

Parameters

lanType (STRING): Local area network (LAN) type.
ifName (STRING): Name of the network interface.
status (STRING): Brief information about the problem.

netif.linkerrors events

netif.linkErrors

Severity

ERROR

Description

This message occurs when the driver detects an excessive link error rate. Link errors are cyclic redundancy checks (CRC), runt frames, fragment, jabber, and alignment errors. Use the 'ifstat' command to display counts.

Corrective Action

Verify that the cable is securely connected at both ends. Verify that both devices are configured the same with respect to autonegotiation, speed, and duplex. If the problem persists, there might be bad hardware at one end, or a bad cable or connector.

Syslog Message

Excessive link errors on network interface %s. Might indicate a bad cable, switch port, or NIC, or that a cable connector is not fully inserted in a socket. On a 10/100 port, might indicate a duplex mismatch.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.linkinfo events

netif.linkInfo

Severity

INFORMATIONAL

Description

This message occurs when a network interface is reset by the software or is configured down by the administrator.

Corrective Action

(None).

Syslog Message

%s %s: Link %s.

Parameters

> **lanType** (STRING): Local area network (LAN) type.
> **ifName** (STRING): Name of the network interface.
> **info** (STRING): Brief description of the event.

netif.linkup events

netif.linkUp

Severity

> INFORMATIONAL

Description

> This message occurs when the state of a network link changes to "up".

Corrective Action

> (None).

Syslog Message

> %s %s: Link %s.

Parameters

> **lanType** (STRING): Local area network (LAN) type.
> **ifName** (STRING): Name of the network interface.
> **status** (STRING): Status of the link, "up".

netif.nicnotsupported events

netif.nicNotSupported

Severity

> ERROR

Description

> This message occurs when the installed network interface card (NIC) version is not supported.

Corrective Action

> Replace the NIC with one purchased from NetApp.

Syslog Message

> The NIC in slot %d is not supported. The %s is not supported.

Parameters

> **slot** (INT): Slot number of the NIC.
> **reason** (STRING): Specific reason the NIC is not supported.

netif.overtemperror events

netif.overTempError

Severity

EMERGENCY

Description

This message occurs when a network port is too hot or a sensor has malfunctioned. Depending on how the port is deployed, the failure may disrupt user data access, node access or cluster communication.

Corrective Action

Ensure adequate cooling and ventilation is available. If that does not resolve the issue, replace the failed card.

Syslog Message

Network port %s is over temperature.

Parameters

ifName (STRING): Name of the network port: for example, "e4a".

netif.phynotread events

netif.phyNotRead

Severity

ERROR

Description

This message occurs when the system cannot read identification information from the physical layer (PHY) of a network interface. This might be caused by a software bug or hung hardware, and the link might not come up.

Corrective Action

If the link does not come up, power-cycle (not just reboot) the system. If the link still does not come up, replace the motherboard or network interface card, depending on the location of the interface.

Syslog Message

Cannot read PHY for network interface %s, status mask=0x%llx.

Parameters

ifName (STRING): Name of the network interface, for example, "e8a".
statusMask (LONGINTHEX): Technical information about the event for Data ONTAP® developers.

netif.phyoperationfailed events

netif.phyOperationFailed

Severity

ERROR

Description

This message occurs when there is a failure in reading or writing the physical layer (PHY) of a network interface.

Corrective Action

This might be caused by a software bug. If there are problems with the interface after seeing this message, replace the component associated with the network interface (PCIe card or controller motherboard). If the problem persistis, contact NetApp technical support.

Syslog Message

Failure in reading or writing PHY for network interface %s. Driver=%s, error=%d, regaddr=0x%x, command=0x%x, status=0x%x.

Parameters

ifName (STRING): Name of the network interface; for example, "e2a".
driver (STRING): Driver name.
error (INT): Error code.
regaddr (INTHEX): PHY register address.
command (INTHEX): PHY command.
status (INTHEX): PHY status.

netif.phyread events

netif.phyRead

Severity

ERROR

Description

This message occurs when there is a failure in reading the physical layer (PHY) of a network interface.

Corrective Action

This might be caused by a software bug. If there are problems with the interface after seeing this message, contact NetApp technical support.

Syslog Message

Failure in reading PHY for network interface %s.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".

netif.ratelimitthreshold events

netif.rateLimitThreshold

Severity

ERROR

Description

This message occurs when the protocol rate threshold is reached on a network interface.

Corrective Action

Fix the faulty network configuration or incorrect setup that enables a sudden spike in broadcast packets to bring down the node. If you still want a high ARP rate threshold, use the "bootarg.arp.ratelimit.threshold" boot argument to set that threshold.

Syslog Message

High rate limit on network interface %s for broadcast protocol %s being detected: %d pkts/sec.

Parameters

ifName (STRING): Name of the network interface that reached the protocol rate threshold.
protocol (STRING): Name of the broadcast protocol that overloaded the network.
packetRate (INT): Observed incoming packet rate per second on the interface.

netif.sfpeventerrorcode events

netif.sfpEventErrorCode

Severity

ERROR

Description

This message occurs when the installed Small Form-factor Pluggable (SFP+ or QSFP+) module is either not supported or faulty.

Corrective Action

The cable could be unsupported or faulty. Replace the cable and check the switch port configuration for errors.

Syslog Message

Unsupported or faulty transceiver or cable in port %s. Error :%s.

Parameters

ifName (STRING): Name of the network interface.
error_string (STRING): module event error string.

netif.sfpnotsupported events

netif.sfpNotSupported

Severity

ERROR

Description

This message occurs when the installed Small Form-factor Pluggable (SFP+ or QSFP+) module is not supported.

Corrective Action

Replace the SFP+ or QSFP+ module with one purchased from NetApp for this interface.

Syslog Message

The SFP+ or QSFP+ module (%s %s) installed in %s is not supported with this network interface.

Parameters

sfpVendor (STRING): SFP+ or QSFP+ vendor name.
sfpPn (STRING): SFP+ or QSFP+ part number.
ifName (STRING): Name of the network interface; for example, "e2a".

netif.speeddowngraded events

netif.speedDowngraded

Severity

ERROR

Description

This message occcurs when the interface is operating at a lower speed than expected.

Corrective Action

The physical connection may be faulty. Replace the cable and check the switch port configuration for errors.

Syslog Message

Interface %s operating at %d Mbps. This might occur due to faulty cable, faulty switch hardware, or faulty switch software.

Parameters

ifName (STRING): Name of the network interface.
speed (INT): Speed used by the interface.

netif.speednotsupported events

netif.speedNotSupported

Severity

ERROR

Description

This message occurs when a network interface autonegotiates to an unsupported speed.

Corrective Action

Connect to 1 or 10 gigabits per second (Gbps) switch port.

Syslog Message

Autonegotiation on network interface %s resolved to speed %d. This speed is not supported.

Parameters

ifname (STRING): Name of network interface.
speed (INT): Speed in megabits per second (Mbps).

netif.tcp events

netif.tcp.conn.bad.checksum

Severity

ERROR

Description

This message occurs when a bad checksum is detected in the incoming TCP packets.

Corrective Action

If experiencing network issues, corrupted TCP packets might be an issue. Check the network components along the path of TCP connection.

Syslog Message

TCP packet with bad checksum detected on port %s. The packet arrived on connection with source address %s and destination_address %s.

Parameters

local_port (STRING): Ethernet port where the TCP bad checksum packets were detected.
source_address (STRING): Source IP address of the connection.
destination_address (STRING): Destination IP address of the connection.

netif.toomanynics events

netif.tooManyNics

Severity

ERROR

Description

This message occurs when a network interface was not initialized because the number of interfaces of this type exceeds the maximum supported.

Corrective Action

Remove a network interface card (NIC).

Syslog Message

Network interface %s was not initialized because the number of interfaces of this type exceeds the maximum (%d) supported.

Parameters

ifName (STRING): Name of the network interface; for example, "e8a".
maxIf (INT): Maximum number of interfaces of this type that is supported.

netif.uncoreccerror events

netif.uncorEccError

Severity

EMERGENCY

Description

This message occurs when the network interface controller reports an unrecoverable ECC error.

Corrective Action

Reboot the controller. If the problem persists, replace the component associated with the network interface (PCIe card or controller motherboard). If the problem persists, contact NetApp technical support.

Syslog Message

Unrecoverable ECC error on network interface %s.

Parameters

ifName (STRING): Name of the network interface; for example, "e4a".

netif.unknownswrequest events

netif.unknownSwRequest

Severity

ERROR

Description

This message occurs when a network driver does not recognize a request from another software module, possibly because the request is invalid.

Corrective Action

Power-cycle the controller; a reboot is not sufficient. If the problem persists, contact NetApp technical support.

Syslog Message

Software module %s was passed unknown %s %d for %s.

Parameters

driver (STRING): Driver module reporting the error.
object (STRING): Name of the requested object.
value (INT): Value that is not recognized.
ifName (STRING): Name of the network interface.

netinet events

netinet.ethr events

netinet.ethr.arpstorm

Severity

ERROR

Description

This message occurs when a high arrival rate of address resolution protocol (ARP) frames has been detected (possible ARP storm). This condition can indicate a possible network configuration issue.

Corrective Action

If you are experiencing network issues, an ARP storm might be a concern. Confirm the ARP storm event is valid and check the network configuration.

Syslog Message

The node detected a possible ARP storm on port %s. Detected rate: %d packets per second.

Parameters

port_name (STRING): Port where the possible ARP storm was detected.
rate_count (LONGINT): ARP arrival rate seen at the port where the possible ARP storm was detected.

netinet.ethr.broadcstAddr

Severity

ERROR

Description

This message occurs when the system finds that the Ethernet address for the IP address is found to be a broadcast address.

Corrective Action

(None).

Syslog Message

ARP: Ethernet address is a broadcast address for IP address %s!

Parameters

ipAddress (STRING): IP address in Standard Internet dotted notation.

netinet.ethr.dup.clustIP

Severity

EMERGENCY

Description

This message occurs when a new node that is trying to join the cluster is using the same IP address that is configured on this node's cluster interface. This can prevent data from being served to clients and

potentially bring down the entire cluster.

Corrective Action

Use the Ethernet (MAC) address with the "network port show -mac <mac>" command to find the network port. Use the "network interface show -curr-port <port>" command to identify the cluster interface that is configured with the duplciate IP address. Remove the LIF on the cluster interface of the new node in the cluster network by using the "net int delete -vserver <vserver_name> -lif <lif_name>" command. After removing the LIF, assign a new, unique IP address to the cluster interface.

Syslog Message

Duplicate IP address %s (Ethernet MAC: %s) configured on the cluster network.

Parameters

ipaddr (STRING): Duplicate IP address that was detected on the cluster network.
ethaddr (STRING): Ethernet (MAC) address that uniquely identifies the node configured with the duplicate IP address.

netinet.ethr.duplct.ipAdrr

Severity

ERROR

Description

This message occurs when another system is detected using an IP address configured on this system.

Corrective Action

The Ethernet address uniquely identifies the other system that is using the IP address. If you are using static IP addresses, change the IP address configured on one of the systems. If DHCP is in use on the network, ensure that the static IP address is not in the range being used by the DHCP server.

Syslog Message

Duplicate IP address %s!! sent from Ethernet address: %s.

Parameters

ipaddr (STRING): IP address.
ethaddr (STRING): Ethernet address.

netinet.icmp events

netinet.icmp.redirect

Severity

NOTICE

Description

This message occurs when an ICMPv4 redirect message is received. The redirect might be received due to either a misconfigured route or a man-in-the-middle ICMP redirect attack.

Corrective Action

When enabled, ICMP redirects can be disabled using the "network tuning icmp modify -is-drop-redirect -enabled true" command. However, disabling ICMP redirects might lead to connectivity problems or longer

delays of data transfers.

Syslog Message

Received %lu ICMPv4 redirect messages for IPspace "%s".

Parameters

no_of_redirects (LONGINT): Total number of ICMPv4 redirects received for the specific IPspace.
ipspace (STRING): The IPspace for which the redirect packets are received.

netinet6 events

netinet6.frag events

netinet6.frag.bytes.overlap

Severity

ERROR

Description

This message occurs when the incoming fragment overlaps some of the existing previous fragment in the reassembly queue.

Corrective Action

(None).

Syslog Message

%d bytes of a fragment from %s overlapped the %s fragment

Parameters

bytes (INT): Number of bytes.
ipAddress (STRING): Printable that is loggable representation of IP address.
message (STRING): String passed as "previous" or "succeeding".

netinet6.icmp events

netinet6.icmp.chksum

Severity

ERROR

Description

This message occurs when the system receives an Internet Control Message Protocol(ICMP) message, and while processing the ICMP message it finds a checksum error.

Corrective Action

(None).

Syslog Message

ICMP6 checksum error (%d|%x) %s.

Parameters

icmpType (INT): ICMP header type field.
checksum (INTHEX): Checksum value.
ipAddress (STRING): Printable that is a loggable representation of IP address.

netinet6.icmp.redirect

Severity

NOTICE

Description

This message occurs when an ICMPv6 redirect message is received. The redirect might be received due to either a misconfigured route or a man-in-the-middle ICMP redirect attack.

Corrective Action

When enabled, ICMP redirects can be disabled using the "network tuning icmp6 modify -is-v6-redirect -accepted false" command. However, disabling ICMP redirects might lead to connectivity problems or longer delays of data transfers.

Syslog Message

Received %lu ICMPv6 redirect messages for IPspace "%s".

Parameters

no_of_redirects (LONGINT): Total number of ICMPv6 redirects received for the specific IPspace.
ipspace (STRING): The IPspace for which the redirect packets are received.

netinet6.icmp.reject.equal

Severity

ERROR

Description

This message occurs when the system rejects a redirect because both router case and on-link destination case are equal.

Corrective Action

(None).

Syslog Message

ICMP6 redirect rejected; neither router case nor onlink case: %s.

Parameters

addressBuff (STRING): Contains IP6 addresses.

netinet6.icmp.reject.length

Severity

INFORMATIONAL

Description

This message occurs when there is a lladdrlen mismatch for the specified IP6 address.

Corrective Action

(None).

Syslog Message

icmp6_redirect_input: lladdrlen mismatch for %s (if %d, icmp6 packet %d): %s.

Parameters

ip6address (STRING): Printable that is a loggable representation of the IP address.
mediaAddrlen (INT): Media address length.
lladdrlen (INT): Address length.
addressBuff (STRING): Contains IP6 addresses.

netinet6.icmp.reject.link

Severity

ERROR

Description

This message occurs when the system rejects an Internet Control Message Protocol6 (ICMP6) redirect.

Corrective Action

(None).

Syslog Message

ICMP6 redirect sent from %s rejected;It must be from the linklocal address.

Parameters

ipAddress (STRING): Printable that is a loggable representation of the IP address.

netinet6.icmp.reject.ndopt

Severity

INFORMATIONAL

Description

This message occurs because of invalid neighbor discovery options.

Corrective Action

(None).

Syslog Message

icmp6_redirect_input: Invalid neighbor discovery option, rejected: %s.

Parameters

addressBuff (STRING): Contains IP6 addresses.

netinet6.in6 events

netinet6.in6.invlid.prfxLen1

Severity

ERROR

Description

This message occurs because of equal prefix length.

Corrective Action

(None).

Syslog Message

in6_are_prefix_equal: Invalid prefix length (%d).

Parameters

prfxLen (INT): Prefix length.

netinet6.in6.invlid.prfxLen2

Severity

ERROR

Description

This message occurs because of invalid prefix length.

Corrective Action

(None).

Syslog Message

in6_prefixlen2mask: Invalid prefix length (%d).

Parameters

prfxLen (INT): Prefix length.

netinet6.input events

netinet6.input.addr.notReady

Severity

INFORMATIONAL

Description

This message occurs when the destination address is not ready, so the packet is discarded.

Corrective Action

(None).

Syslog Message

ip6_input: packet was sent to an unready address %s→%s.

Parameters

srcAddr (STRING): Source IP6 address.
dstAddr (STRING): Destination IP6 address.

netinet6.input.opt.payload

Severity

ERROR

Description

This message occurs when the length of the payload option in the header is inconsistent.

Corrective Action

(None).

Syslog Message

Length of jumbopayload option is inconsistent(%d).

Parameters

option (INT): Length of option.

netinet6.input.opt.rtrAlert

Severity

ERROR

Description

This message occurs when the length of the router alert option in the header is inconsistent.

Corrective Action

(None).

Syslog Message

Length of router alert option is inconsistent(%d).

Parameters

option (INT): Length of option.

netinet6.mld6 events

netinet6.mld6.illegal.type

Severity

ERROR

Description

This message occurs when the system discovers an illegal Internet Control Message Protocol (ICMP) type field in a multicast listener discovery structure.

Corrective Action

(None).

Syslog Message

mld6_input: Illegal ICMP type field (%d).

Parameters

type (INT): ICMP type field.

netinet6.mld6.srcAdr.invld

Severity

ERROR

Description

This message occurs during validation of the source address, when the system finds that the source address is a non-linked local address.

Corrective Action

(None).

Syslog Message

mld6_input: Source address %s is not link-local.

Parameters

srcAddr (STRING): Source IP6 address.

netinet6.nbr events

netinet6.nbr.bad.addr

Severity

ERROR

Description

This message occurs when ONTAP receives unexpected Neighbor Discovery (ND) packets. The packets could come from various sources, but usually they come from a source IP address. The EMS message shows the information from the packet. If something specific is wrong, another EMS message with more information will display with this EMS message.

Corrective Action

ONTAP received an invalid Neighbor Discovery (ND) packet. If the condition persists, check your network infrastructure, such as switches, routers, or other connected equipment.

Syslog Message

nd6_ns_input: src=%s, dst=%s, tgt=%s.

Parameters

srcIpAddress (STRING): Source IPv6 address.
dstIpAddress (STRING): Destination IPv6 address.
tgtIpAddress (STRING): Target IPv6 address.

netinet6.nbr.bad.tgtAddr

Severity

INFORMATIONAL

Description

This message occurs when the target address packet is found to be multicast.

Corrective Action

(None).

Syslog Message

nd6_ns_input: Bad NS target (multicast).

Parameters

(None).

netinet6.nbr.badDstAddr.pkt1

Severity

INFORMATIONAL

Description

This message occurs when the destination address packet is bad due to a wrong destination IP6 address.

Corrective Action

(None).

Syslog Message

nd6_ns_input: Bad DAD packet (wrong ip6 dst).

Parameters

(None).

netinet6.nbr.badDstAddr.pkt2

Severity

INFORMATIONAL

Description

This message occurs when the destination address packet is bad due to link-layer address option.

Corrective Action

(None).

Syslog Message

nd6_ns_input: Bad DAD packet (link-layer address option).

Parameters

(None).

netinet6.nbr.dad.complete

Severity

ALERT

Description

This message occurs when Duplicate address Detection (DAD) for the specified interface address is completed, and duplicate address is found.

Corrective Action

(None).

Syslog Message

%s: DAD complete for %s - duplicate found.

Parameters

ifAddress (STRING): Interface address.
ip6address (STRING): Printable that is a loggable representation of the IP address.

netinet6.nbr.dad.ignrNS

Severity

INFORMATIONAL

Description

This message occurs when Duplicate address Detection (DAD) ignores Neighbor Solicitation (NS) packet for the specified interface address.

Corrective Action

(None).

Syslog Message

nd6_dad_ns_input: Ignoring DAD NS packet for address %s(%s).

Parameters

targetAddress (STRING): Printable that is loggable representation of target IPv6 address.
ifAddress (STRING): Interface address.

netinet6.nbr.dad.memAlcFail

Severity

ALERT

Description

This message occurs when Duplicated Address Detection (DAD) is started and memory allocated fails for the specified interface address.

Corrective Action

(None).

Syslog Message

nd6_dad_start: Memory allocation failed for %s(%s).

Parameters

ip6address (STRING): Printable that is a loggable representation of an IP6 address.
ifAddress (STRING): Interface address.

netinet6.nbr.dad.timeout

Severity

NOTICE

Description

This message occurs during Duplicated Address Detection (DAD), when number of tries or count to transmit DAD packet exceeds the predefined maximum number of tries.

Corrective Action

(None).

Syslog Message

%s: could not run DAD, driver or link problem?

Parameters

ifAddress (STRING): Interface address.

netinet6.nbr.dadtmr.duplcAdr

Severity

NOTICE

Description

This message occurs when Duplicated Address Detection (DAD) timer is called, and the parameter passed to it, is a duplicated interface address.

Corrective Action

(None).

Syslog Message

nd6_dad_timer: Called with duplicated address %s(%s).

Parameters

ip6address (STRING): Printable that is a loggable representation of an IP6 address.
ifAddress (STRING): Interface address.

netinet6.nbr.dadTmr.nTntvAdr

Severity

NOTICE

Description

This message occurs when Duplicated Address Detection (DAD) Timer is called with non tentative interface address.

Corrective Action

(None).

Syslog Message

nd6_dad_timer: Called with non-tentative address %s(%s).

Parameters

ip6address (STRING): Printable that is a loggable representation of an IP6 address.
ifAddress (STRING): Interface address.

netinet6.nbr.dadtmr.nullPrm

Deprecated

Deprecated as of Data ONTAP 9.8 since this EMS is no longer needed.

Severity

NOTICE

Description

This message occurs when Duplicated Address Detection (DAD) timer is called and the interface address passed to it is NULL.

Corrective Action

(None).

Syslog Message

nd6_dad_timer: Called with null parameter.

Parameters

(None).

netinet6.nbr.duplcte.taddr

Severity

ALERT

Description

This message occurs when there is a duplicate target IP6 address.

Corrective Action

(None).

Syslog Message

nd6_na_input: Duplicate IP6 address %s.

Parameters

targetAddress (STRING): Printable that is a loggable representation of target IP6 address.

netinet6.nbr.duplcteSrc.addr

Severity

INFORMATIONAL

Description

This message occurs when there is duplicate source IP6 address.

Corrective Action

(None).

Syslog Message

nd6_ns_input: Duplicate IP6 address %s.

Parameters

srcAddress (STRING): Printable that is a loggable representation of source IP6 address.

netinet6.nbr.invld.ndOpt1

Severity

INFORMATIONAL

Description

This message occurs because of invalid Neighbor Discovery (ND)option.

Corrective Action

(None).

Syslog Message

nd6_ns_input: Invalid ND option; ignored.

Parameters

(None).

netinet6.nbr.invld.ndOpt2

Severity

INFORMATIONAL

Description

This message occurs because of an invalid Neighbour Discovery (ND) option during neighbor advertising input handling.

Corrective Action

(None).

Syslog Message

nd6_na_input: Invalid ND option; ignored.

Parameters

(None).

netinet6.nbr.invld.tgtAddr

Severity

NOTICE

Description

This message occurs during Neighbor Advertising (NA)input handling, because of invalid target address.

Corrective Action

(None).

Syslog Message

nd6_na_input: Invalid target address %s.

Parameters

targetAddress (STRING): Target IP6 address.

netinet6.nbr.manl.intvtnReq

Severity

ERROR

Description

This message occurs when 'dad_duplicated' is called and manual intervention is required.

Corrective Action

(None).

Syslog Message

%s: Manual intervention required.

Parameters

ifAddress (STRING): Interface address.

netinet6.nbr.misMth.lladrln1

Severity

INFORMATIONAL

Description

This message occurs when there is a lladdrlen mismatch for the specified IP6 address.

Corrective Action

(None).

Syslog Message

nd6_ns_input: lladdrlen mismatch for %s (if %d, NS packet %d).

Parameters

ip6address (STRING): Printable that is a loggable representation of an IP address.
ifAddrlen (INT): Interface address length.
lladdrlen (INT): Address length.

netinet6.nbr.misMth.lladrln2

Severity

INFORMATIONAL

Description

This message occurs during Neighbor Advertising (NA) input handling, when there is a lladdrlen mismatch for the specified IP6 address.

Corrective Action

(None).

Syslog Message

nd6_na_input: lladdrlen mismatch for %s (if %d, NA packet %d).

Parameters

ip6address (STRING): Printable that is a loggable representation of target IP address.
ifAddrlen (INT): Interface address length.
lladdrlen (INT): Address length.

netinet6.nbr.solAdv.mlticstd

Severity

NOTICE

Description

This message occurs during Neighbor Advertising(NA) input handling, as solicited advertising is multicast.

Corrective Action

(None).

Syslog Message

nd6_na_input: A solicited advertising is multicast.

Parameters

(None).

netinet6.nd6 events

netinet6.nd6.setmtu.small

Severity

NOTICE

Description

This message occurs when the port MTU (Maximum Transmission Unit) is set to a smaller value than the IPv6 minimum MTU of 1280. If you set the port MTU value to less than 1280, which is not recommended, IPv6 packets larger than the set value cannot be sent from or received by the controller.

Corrective Action

Use the 'broadcast-domain modify' command with the '-mtu' option to increase MTU of all ports in the domain to at least the IPv6 minimum MTU of 1280.

Syslog Message

nd6_setmtu: new port MTU '%lu' on the port '%s' is too small for IPv6.

Parameters

linkmtu (LONGINT): Configured MTU value for the port.
ifName (STRING): Name of the port on which the MTU is being set.

netinet6.rtr events

netinet6.rtr.high.mtu

Severity

INFORMATIONAL

Description

This message occurs when the Maximum Transmission Unit (MTU) size of the Router Advertisement (RA) message, sent from the specified source IPv6 address, is higher than the upper bound of the Link MTU.

Corrective Action

(None).

Syslog Message

nd6_ra_input: MTU option mtu=%d sent from %s; exceeds the maxmtu %d on '%s'; ignoring.

Parameters

mtu (INT): MTU size.
ip6Address (STRING): Printable that is a loggable representation of the source IPv6 address.
maxmtu (INT): Upper bound of the Link MTU.
ifName (STRING): Interface name.

netinet6.rtr.invld.ndOpt1

Severity

INFORMATIONAL

Description

This message occurs because of an invalid Neighbor Discovery(ND) option.

Corrective Action

(None).

Syslog Message

nd6_rs_input: Invalid ND option; ignored.

Parameters

(None).

netinet6.rtr.invld.ndOpt2

Severity

INFORMATIONAL

Description

This message occurs because of an invalid Neighbor Discovery(ND) option in the receiving Router Advertising (RA)message.

Corrective Action

(None).

Syslog Message

nd6_ra_input: Invalid ND option; ignored.

Parameters

(None).

netinet6.rtr.invld.optLength

Severity

INFORMATIONAL

Description

This message occurs because of an invalid option length for a prefix information option, when receiving a Router Advertising (RA)message. The option length must be equal to 4. This invalid option length is ignored.

Corrective Action

(None).

Syslog Message

nd6_ra_input: Invalid option length %d for prefix information option; ignored.

Parameters

optLength (INT): Option length.

netinet6.rtr.invld.prefix

Severity

INFORMATIONAL

Description

This message occurs because of an invalid prefix in the prefix information structure, when receiving Router Advertising(RA) message.

Corrective Action

(None).

Syslog Message

nd6_ra_input: Invalid prefix %s; ignored.

Parameters

    prefix (STRING): Prefix.

netinet6.rtr.invld.prfxLen1

Severity

    INFORMATIONAL

Description

    This message occurs because of an invalid prefix length for prefix information option, when receiving Router Advertising(RA) message. The prefix length must be less than 128.

Corrective Action

    (None).

Syslog Message

    nd6_ra_input: Invalid prefix length %d for prefix information option; ignored.

Parameters

    prfxLength (INT): Prefix length.

netinet6.rtr.low.mtu

Severity

    INFORMATIONAL

Description

    This message occurs when the Maximum Transmission Unit (MTU) size is lower than 1,280, which is the minimal MTU and reassembly size.

Corrective Action

    (None).

Syslog Message

    nd6_ra_input: MTU option mtu=%d sent from %s is less than the minimum Link MTU on '%s'; ignoring.

Parameters

    mtu (INT): MTU size.
    ip6Address (STRING): Printable that is a loggable representation of the source IPv6 address.
    ifName (STRING): Interface name.

netinet6.rtr.misMth.lladrln1

Severity

    INFORMATIONAL

Description

    This message occurs when there is a lladdrlen mismatch for the specified IP6 address of the Router Solicitation (RS) packet.

Corrective Action

(None).

Syslog Message

nd6_rs_input: lladdrlen mismatch for %s (if %d, RS packet %d).

Parameters

ip6address (STRING): Printable that is a loggable representation of source IPv6 address.
ifAddrlen (INT): Interface address length.
lladdrlen (INT): Address length.

netinet6.rtr.misMth.lladrln2

Severity

INFORMATIONAL

Description

This message occurs when there is a lladdrlen mismatch for the specified IPv6 address of the Router
Advertising (RA) packet.

Corrective Action

(None).

Syslog Message

nd6_ra_input: lladdrlen mismatch for %s (if %d, RA packet %d).

Parameters

ip6address (STRING): Printable that is a loggable representation of source IPv6 address.
ifAddrlen (INT): Interface address length.
lladdrlen (INT): Address length

netinet6.rtr.srcAdr.invld

Severity

NOTICE

Description

This message occurs during the validation of source address in the received Router Solicitation (RS)
message, when it is found that the source address is a non-link local address.

Corrective Action

(None).

Syslog Message

nd6_ra_input: Source %s is not a link-local address.

Parameters

srcAddr (STRING): Source IPv6 address.

netport events

netport.eth events

netport.eth.discovered

Severity

NOTICE

Description

This message occurs when a physical network port has been discovered.

Corrective Action

(None).

Syslog Message

Physical network port %s (node %s) has been discovered.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.

netport.pvlan events

netport.pvlan.created

Severity

NOTICE

Description

This message occurs when a pseudo-VLAN port has been created.

Corrective Action

(None).

Syslog Message

Pseudo-VLAN port "%s" was created on node "%s".

Parameters

port (STRING): Name of the pseudo-VLAN port.
node (STRING): Name of the node on which the pseudo-VLAN port resides.

nfs events

nfs.client events

nfs.client.cache.modify.err

Severity

ERROR

Description

This message occurs when an NFS connected client's cache settings are changed using the REST API "/api/protocol/nfs/connected-client-settings", but the value is not updated in the network component. This might lead to the cache refresh behavior not working as expected.

Corrective Action

Use the REST API PATCH "/api/protocol/nfs/connected-client-settings" to update the value.

Syslog Message

Connected-clients cache settings could not be updated. Error: %s.

Parameters

reason (STRING): Reason for the failure.

nfs.krb events

nfs.krb.lif.disabled

Severity

ALERT

Description

This message occurs when a Kerberos-enabled LIF in a Vserver shares NFS Kerberos credentials with a LIF in another Vserver. NFS Kerberos is automatically disabled by Data ONTAP® on LIFs that share Kerberos credentials across Vservers, because of the security violation this causes. Disabling Kerberos on a LIF can cause service disruption to NFS clients that use these LIFs, mounted using the '-sec=krb5' option.

Corrective Action

NFS Kerberos has been automatically disabled by Data ONTAP on the LIF because it shared Kerberos credentials with another Vserver, causing a security violation. NFS Kerberos can be reenabled using the command: "vserver nfs kerberos interface enable". During the reenable process, Kerberos credential sharing across Vservers is disallowed.

Syslog Message

NFS Kerberos disabled on LIF "%s" with SPN "%s" for Vserver "%s" due to a security conflict with another Vserver. NFS Kerberos can be reenabled using the command: "vserver nfs kerberos interface enable".

Parameters

lif (STRING): Name of the LIF on which NFS Kerberos is disabled.
spn (STRING): The service principal name associated with the LIF.
vserver (STRING): Name of the Vserver that owns the LIF.

nfs.tlscreateatnbladefailed events

Nfs.TLSCreateAtNbladeFailed

Severity

ERROR

Description

This message occurs when the creation of TLS (Transport Layer Security) configuration fails at network component for NFS.

Corrective Action

Disable TLS and enable again with the help of command "nfs tls interface".

Syslog Message

Failed to replicate TLS (Transport Layer Security) configuration at network component for SVM:"%s", LIF:"%s", Certificate UUID:"%s".

Parameters

vsName (STRING): Storage virtual machine (SVM name.
lifIpaddress (STRING): LIF IP.
certificateUuid (STRING): Universal unique identifier (UUID) of TLS certificate.

nis events

nis.active events

nis.active.false.removed

Severity

NOTICE

Description

This message occurs when the last system to be upgraded in a cluster removes NIS configurations that were marked as inactive.

Corrective Action

(None).

Syslog Message

All NIS configurations with the "-active" parameter set to "false" were removed.

Parameters

(None).

nis.db events

nis.db.job.queue.failure

Severity

ERROR

Description

This message occurs when the NIS group database job queue fails.

Corrective Action

Use the "vserver services name-service nis-domain group-database build" command to queue the NIS database job.

Syslog Message

NIS group database job queue failed for Vserver %s.

Parameters

vserver_name (STRING): Name of the Vserver.

nis.group events

nis.group.db.build.failure

Severity

ERROR

Description

This message occurs when the NIS group database build fails.

Corrective Action

Ensure that the configured NIS domain is reachable and bound. Ensure that the number of characters per record in the NIS server for group database does not exceed 1,024. Run the "vserver services name-service nis-domain group-database build" command to build the NIS group database again.

Syslog Message

Failed to build the NIS group database for Vserver %s. Error: %s.

Parameters

vserver_name (STRING): Name of the Vserver.
error_string (STRING): Error encountered while building the NIS group database.

nis.group.db.build.success

Severity

NOTICE

Description

This message occurs when the NIS group database build is successful.

Corrective Action

(None).

Syslog Message

NIS group database is successfully built for Vserver %s.

Parameters

vserver_name (STRING): Name of the Vserver.

nis.netgrp events

nis.netgrp.db.build.failure

Severity

ERROR

Description

This message occurs when the Network Information Service (NIS) netgroup database build fails.

Corrective Action

Ensure that the configured NIS domain is reachable for the SVM and bound. Ensure that the number of characters per record in the NIS server for the netgroup database does not exceed 1,024. See the ONTAP® 9 Documentation Center for managing NIS domains.

Syslog Message

Failed to build the NIS netgroup database for Vserver "%s". Error: %s.

Parameters

vserver_name (STRING): Name of the Vserver.
error_string (STRING): Error encountered while building the NIS netgroup database.

nis.netgrp.db.build.success

Severity

NOTICE

Description

This message occurs when the Network Information Service (NIS) netgroup database build is successful.

Corrective Action

(None).

Syslog Message

NIS netgroup database is successfully built for Vserver "%s".

Parameters

vserver_name (STRING): Name of the Vserver.

nis.netgrp.db.job.kick.fail

Severity

ERROR

Description

This message occurs when the system fails to run the NIS netgroup.byhost database job. The NIS netgroup.byhost database available on the local system is not refreshed. The subsequent netgroup-by-host query might return outdated information.

Corrective Action

Use the (privilege: advanced) "vserver services name-service nis-domain netgroup-database build" command to run the NIS netgroup database job.

Syslog Message

NIS netgroup database job run failed for Vserver %s.

Parameters

vserver_name (STRING): Name of the Vserver.

nis.netgrp.db.job.queue.fail

Severity

NOTICE

Description

This message occurs when the system fails to queue the NIS netgroup.byhost database job. The NIS netgroup.byhost database is not available on the local system. The subsequent netgroup-by-host query will be fetched from the external NIS server.

Corrective Action

(None).

Syslog Message

NIS netgroup database job queue failed for Vserver %s.

Parameters

vserver_name (STRING): Name of the Vserver.

nis.server events

nis.server.active

Severity

INFORMATIONAL

Description

This message occurs when the Storage Virtual Machine (SVM, formerly Vserver) binds to any of the configured NIS servers.

Corrective Action

(None).

Syslog Message

SVM '%s' has successfully bound to the %s NIS server.

Parameters

vserver_name (STRING): Name of the SVM.
nis_server (STRING): Configured NIS server.

nis.server.inactive

Severity

ERROR

Description

This message occurs when one of the NIS servers configured for a Storage Virtual Machine (SVM, formerly Vserver) cannot be contacted.

Corrective Action

From a UNIX ® workstation, make sure that the NIS server is responding to requests. Also make sure that the portmapper on the NIS server is responding to requests. Make sure that there are no networking issues stopping the cluster from communicating with this NIS server.

Syslog Message

%s NIS server configured for SVM '%s' cannot be contacted.

Parameters

nis_server (STRING): Configured NIS server.
vserver_name (STRING): Name of the SVM.

nis.server.invalid.domain

Severity

ERROR

Description

This message occurs when the Network Information Service (NIS) servers configured for a storage virtual machine (SVM, formerly Vserver) cannot be contacted due to "Invalid Domain" error.

Corrective Action

Make sure that the NIS server with the correct domain is configured.

Syslog Message

%s NIS server configured for SVM '%s' cannot be contacted due to "Invalid Domain" error.

Parameters

nis_server (STRING): Configured NIS server.
vserver_name (STRING): Name of the SVM.

nis.server.not.available

Severity

ERROR

Description

This message occurs when none of the NIS servers configured for a Storage Virtual Machine (SVM, formerly Vserver) can be contacted.

Corrective Action

From a UNIX ® workstation, make sure that the NIS server is responding to requests. Also make sure that the portmapper on the NIS server is responding to requests. Make sure that there are no networking issues stopping the cluster from communicating with this NIS server.

Syslog Message

None of the NIS servers configured for SVM '%s' can be contacted.

Parameters

vserver_name (STRING): Name of the SVM.

no events

no.halt events

no.halt.brokenDisk

Severity

ALERT

Description

This message occurs when the option raid.timeout is set to 0 or if the option hasn't been set by the user, disabling automatic shutdown on a disk failure.

Corrective Action

Add an appropriate spare disk.

Syslog Message

%s in RAID group "%s" %s broken. Automatic system shutdown has been disabled.

Parameters

type (STRING): Type of disk.
rgname (STRING): RAID group name.
verb (STRING): Failed disk verb.

no.halt.brokenDisk.notice

Severity

NOTICE

Description

This message occurs when a node is in a degraded state because of a broken disk, but the option raid.timeout is set to 0 or its value hasn't been modified by the user, disabling automatic shutdown on a disk failure. Shutdown is to encourage you to replace broken disks. This message occurs on a capacity-optimized platform with broken disks irrespective of the value of the option raid.timeout.

Corrective Action

Consult other logged messages or use the "storage disk show -broken" command to determine the identity of broken disks. Remove any broken disks. Automatic system shutdown can be enabled by altering the "raid.timeout" value using the "storage raid-options modify" command. NOTE: The option "raid.timeout" will not affect the automatic shutdown on a capacity-optimized platform.

Syslog Message

%s. automatic system shutdown is disabled. Replace the disk immediately.

Parameters

type (STRING): Type of degradation.

no.halt.nvramLowBatt.info

Severity

ALERT

Description

This message occurs when the option raid.timeout has been set to 0, disabling automatic shutdown on a low NVRAM Battery condition.

Corrective Action

Replace the NVRAM battery. Automatic system shutdown can be enabled by altering the "raid.timeout" value using the "storage raid-options modify" command.

Syslog Message

Automatic system shutdown is disabled. If the NVRAM battery is dangerously low, replace it immediately.

Parameters

(None).

no.halt.nvramLowBatteries

Severity

ALERT

Description

This message occurs when the option raid.timeout is set to 0, disabling automatic shutdown on a low NVRAM Batteries condition.

Corrective Action

Replace the NVRAM batteries.

Syslog Message

NVRAM batteries are dangerously low. Automatic system shutdown is disabled. Replace the batteries immediately!

Parameters

(None).

no.halt.nvramLowBattery

Severity

ALERT

Description

This message occurs when the option raid.timeout is set to 0, disabling automatic shutdown on a low NVRAM Battery condition.

Corrective Action

Replace the NVRAM battery.

Syslog Message

NVRAM battery is dangerously low. Automatic system shutdown is disabled. Replace the battery immediately!

Parameters

(None).

no.halt.nvramLowBatts.info

Severity

NOTICE

Description

This message occurs when the option raid.timeout has been set to 0, disabling automatic shutdown on a low NVRAM Batteries condition.

Corrective Action

Replace the NVRAM batteries. Automatic system shutdown can be enabled by altering the "raid.timeout" value using the "storage raid-options modify" command.

Syslog Message

Automatic system shutdown is disabled. If the NVRAM batteries are dangerously low, we encourage you to replace it immediately.

Parameters

(None).

noderun events

noderun.login events

noderun.login.success

Severity

INFORMATIONAL

Description

This message occurs when a cluster user successfully logs in to the node using the 'run' command.

Corrective Action

(None).

Syslog Message

'%s' logged in from cluster: '%s'.

Parameters

user (STRING): Name of the user who logged in to the node.
cluster (STRING): Cluster name from where the user logged in to the node.

nodewatchdog events

nodewatchdog.config events

nodewatchdog.config.invalid

Severity

ERROR

Description

This message occurs when bootarg.nodewatchdog.level is set to an invalid value. This can only be done manually. When an invalid value is set, Node Watchdog reverts to the default behavior.

Corrective Action

Set bootarg.nodewatchdog.level to a valid value at the LOADER> prompt, or modify the value by using the "system node watchdog modify" command.

Syslog Message

The value of bootarg.nodewatchdog.level is set to an invalid value, "%s." Node Watchdog reverted to the default behavior (%s).

Parameters

bootarg (STRING): Value of bootarg.nodewatchdog.level.
defaultVal (STRING): Default value of bootarg.nodewatchdog.level.

nodewatchdog.gfc events

nodewatchdog.gfc.too.long

Severity

ALERT

Description

This message occurs when the storage system is low in networking buffers (mbuf) for longer than the duration threshold, which indicates abnormal circumstances. When this happens, CLI commands might hang, and clients could experience timeouts.

Corrective Action

If CLI commands are responding slowly or clients are timing out, reboot the node using the "reboot -node [node] -dump true" option. Also call the support team to investigate further, because this is an abnormal circumstance that might recur if not addressed. Contact NetApp technical support.

Syslog Message

Networking buffer depletion detected. Consumption exceeded %d%% in use and did not recede to %d%% for %d seconds.

Parameters

enter_percentage (INT): Percentage of in-use mbufs necessary to enter the flow control state.
exit_percentage (INT): Percentage of in-use mbufs necessary to exit the flow control state.
duration (INT): Duration for which there is a scarcity of available mbufs.

nodewatchdog.node events

nodewatchdog.node.failure

Severity

EMERGENCY

Description

This message occurs when Data ONTAP® experiences a prolonged outage of internal services critical to continued data service. The node experiencing this failure might operate in a degraded mode until the condition is addressed. Data ONTAP will attempt to recover by restarting the affected process.

Corrective Action

The affected process may produce a core file which can be analyzed. Contact NetApp technical support if the condition persists and possible analysis of the core file.

Syslog Message

Data ONTAP has experienced a serious internal error: %s. This might cause the node experiencing the problem to become unresponsive to data access.

Parameters

condition (STRING): Condition that caused the failure.
diagnosis (STRING): List of system diagnoses that could cause node watchdog issues.

nodewatchdog.node.longreboot

Severity

ALERT

Description

This message occurs when a node fails to reboot within the configured time allowed for rebooting.

Corrective Action

Contact NetApp technical support.

Syslog Message

Data ONTAP has experienced a serious internal error. The node experiencing this problem is unable to reboot within it's allotted time of %d seconds causing it to be unavailable. The node has been panicked to enable it to recover.

Parameters

timeout (INT): The time in seconds within which reboot did not complete.

nodewatchdog.node.panic

Severity

ALERT

Description

This message occurs when Data ONTAP® experiences a prolonged outage of internal services critical to continued data service. The node has been restarted to recover from the condition.

Corrective Action

Contact NetApp technical support for additional assistance.

Syslog Message

Data ONTAP has experienced a serious internal error: %s. This might cause the node experiencing the problem to become unresponsive to data access. %s

Parameters

condition (STRING): Condition that caused the failure.
action (STRING): Automatic corrective action taken (or why avoided) as a result of detecting this condition.
diagnosis (STRING): List of system diagnoses that could cause node watchdog issues.

nodewatchdog.node.ucore.hung

Severity

ALERT

Description

This message occurs when a node fails to generate an application core within the time allotted for application coredump due to a serious internal error. The node is panicked to recover from the internal error.

Corrective Action

Contact NetApp technical support.

Syslog Message

Unable to generate an application core for %s (pid %d) within the allotted time of %d seconds causing the application to become unavailable. The node has been panicked to recover.

Parameters

process_name (STRING): Name of the application that failed to generate core.
process_id (INT): PID of the application that failed to generate core.
timeout (INT): Time in seconds within which the application coredump did not complete.

nodewatchdog.resrc events

nodewatchdog.resrc.alloc.failure

Severity

ALERT

Description

This message occurs when a critical system resource required for Data ONTAP® to continue serving data cannot be allocated for an extended period of time. Data ONTAP might operate in a degraded mode.

Corrective Action

If Data ONTAP operates in a degraded mode, reboot the node using the "-dump true" option. Contact NetApp technical support. When Node Watchdog is configured to "node_restart", Data ONTAP will detect and recover from this condition automatically.

Syslog Message

Resource allocation failures detected for %s. The percentage of %d allocation failure attempts were met or exceeded for %d seconds.

Parameters

resource (STRING): Type of resource that cannot be allocated.
percentage (INT): Failure percentage threshold.
duration (INT): Duration of the resource allocation failure.
diagnosis (STRING): List of system diagnoses that could cause node watchdog issues.

nodewatchdog.resrc.lng.running.crit

Severity

ALERT

Description

This message occurs when the count of certain critical resources internal to Data ONTAP® are consumed with long running operations. When this happens, Data ONTAP might operate in a degraded mode.

Corrective Action

If Data ONTAP operates in a degraded mode, reboot the node using the "-dump true" option. Contact NetApp technical support. When Node Watchdog is configured to "node_restart", Data ONTAP will detect and recover from this condition automatically.

Syslog Message

Long running %s detected. Exceeded threshold of %d%% for %d seconds.

Parameters

resource (STRING): Resource that is consumed with long running operations.
percentage (INT): Percentage of the long running resource.
duration (INT): Duration for which the resources were long running.

nodewatchdog.svc events

nodewatchdog.svc.rpc.noresp

Severity

ALERT

Description

This message occurs when a service critical to data access fails to respond to service monitoring and is restarted. Data ONTAP® might have experienced a serious error and might operate in a degraded mode.

Corrective Action

If the message reports that the service has "restarted" then no action is required. If the status is "not restarted" or "unsuccessfully restarted," then reboot the node using the "system node reboot" command with the "-dump true" option, and then contact NetApp technical support.

Syslog Message

The %s service internal to Data ONTAP that is required for continuing data service was unavailable. The service failed, but was %s.

Parameters

    service (STRING): Service that failed.

    restarted (STRING): Whether the service was restarted. Possible values are "restarted," "not restarted," and "unsuccessfully restarted."

    diagnosis (STRING): List of system diagnoses that could cause node watchdog issues.

nonha events

nonha.resvconflicthalt events

nonha.resvConflictHalt

Severity

EMERGENCY

Description

This message occurs when the controller halts itself after it finds disk with reservation conflicts.

Corrective Action

Contact NetApp technical support for recovery assistance.

Syslog Message

A disk reservation conflict was detected on disk %s at %-20s.

Parameters

disk_name (STRING): Name of the disk.
time (STRING): Time when the disk reservation conflict was detected.
last_update (INT): Time passed since last rescan, in milliseconds.

nse events

nse.authlockout events

nse.authLockOut

Severity

ERROR

Description

This message occurs when a NetApp® Storage Encryption (NSE) self-encrypting drive (SED) reports excessive sequential failed authentication attempts with an incorrect Authentication Key (AK) on the indicated SED authority. To prevent brute-force AK attacks, the SED will no longer accept even the correct AK. Access and control of the SED are affected. This condition applies to drives that implement the Trusted Computing Group (TCG) "Enterprise" and "Opal" specifications. Enterprise BandMaster1 authority lockout and Opal User1 authority lockout affect protection controls on user data. User data on the drive is permanently irretrievable for lockouts on these authorities. For other lockouts, some aspect of compliance with Federal Information Processing Standard (FIPS) PUB 140-2 is compromised. Enterprise "Erase Master" and Opal "Owner" authority lockouts disable cryptographic sanitize and destroy ONTAP® operations.

Corrective Action

The data cannot be recovered from the drive, but it might be possible to return the drive to service. To prevent lockouts, ensure that all cluster NSE nodes have all SED AKs. Display SED key IDs by using the "storage encryption disk show [-fips]" command. Verify them against those retrieved from the AK storage method: KMIP servers: Use the "security key-manager restore" command. Onboard key management: Use the "security key-manager key show" command. If the FIPS key on the drive remains at the default MSID value, for BandMaster1 or User1 authority lockout, reset the AK to its default value and simultaneously erase user data by using the "storage encryption disk sanitize" command or the (advanced privilege) "disk encrypt sanitize" command in node shell/maintenance mode. Power-cycle clears Physical Ownership lockout in some SEDs. Ensure that the SED AKs are are available as above, and power-cycle the drive to see if it clears the lockout. For other lockouts, reset the SED to its as-manufactured state and erase user data by using the "storage encryption disk revert-to-original-state" command or the (advanced privilege) "disk encrypt revert_original" command in node shell/maintenance mode with the PSID value from the device label. If the PSID is not available, replace the drive. After clearing the lockout, make the drive a spare by using the "storage disk assign" command and (advanced privilege) "storage disk unfail [-spare]" command as needed.

Syslog Message

Lockout on self-encrypting drive %s; security provider: %s, authority: %s, during operation "%s".

Parameters

deviceName (STRING): Name of the device.
securityProvider (STRING): Name of the TCG security provider process.
authority (STRING): Name of the TCG authority.
operation (STRING): Description of the operation that attempted authentication.

nse.op events

nse.op.failed

Severity

ERROR

Description

This message occurs when ONTAP® does not succeed in performing an operation on a NetApp® Storage Encryption (NSE) self-encrypting drive (SED). The message applies to drives that implement either the Trusted Computing Group (TCG) "Enterprise" or "Opal" specification. Some aspect of the operation of NSE drives is compromised.

Corrective Action

If the error persists, replace the drive.

Syslog Message

Control failure on self-encrypting drive %s; security provider: %s, authority: %s, during operation "%s".

Parameters

deviceName (STRING): Name of the device.
securityProvider (STRING): Name of the TCG security provider process.
authority (STRING): Name of the affected TCG authority.
operation (STRING): Description of the operation that failed.

nv events

nv.data events

nv.data.loss.possible

Severity

NOTICE

Description

This message occurs when a Cloud Volumes ONTAP node configured for high write speed unexpectedly shuts down, possibly resulting in a loss of data. This is expected because the NVRAM data does not have a chance to be flushed during the unforeseen shutdown.

Corrective Action

(None).

Syslog Message

An unexpected shutdown occurred while in high write speed mode, which possibly caused a loss of data.

Parameters

(None).

nv.extension events

nv.extension.disabled

Severity

INFORMATIONAL

Description

This message occurs when NVRAM segments of a nvlog client are disabled in a NVRAM section.

Corrective Action

(None).

Syslog Message

%s segments have been disabled in %s NVRAM section.

Parameters

cid (STRING): Nvlog client ID.
nv_section (STRING): The NVRAM section in which the nvlog client segments are disabled.

nv.extension.enabled

Severity

INFORMATIONAL

Description

This message occurs when NVRAM segments of a nvlog client are enabled in a NVRAM section.

Corrective Action

(None).

Syslog Message

%s segments have been enabled in %s NVRAM section.

Parameters

cid (STRING): Nvlog client ID.
nv_section (STRING): The NVRAM section in which nvlog client segments are enabled.

nv.extension.failed

Severity

ERROR

Description

This message occurs when nvlog client segments cannot be enabled in a partner NVRAM section following a controller failover. When this event occurs, the system continues to operate, but with diminished performance due to the increased failover load coupled with decreased NVRAM capacity for logging.

Corrective Action

For a System ID-related failure message, verify that each member node in this configuration is assigned a valid and unique system ID by using the "system show -fields systemid" command. Do not physically move a controller or NVRAM card in an HA or MetroCluster(tm) configuration. A failure message of "Configuration Recovery Needed" means that a reboot is needed to recover persistent MetroCluster configuration at a switchover site.

Syslog Message

Client segments cannot be enabled in the %s NVRAM section, because of %s.

Parameters

nv_section (STRING): NVRAM section in which nvlog client segments cannot be enabled.
failure_reason (STRING): Reason client segments cannot be enabled in this partner NVRAM section.

nv.fake events

nv.fake

Severity

NOTICE

Description

This message occurs when the nonvolatile (NV) driver detects that system memory is being used to simulate NVRAM.

Corrective Action

Reset the 'fake-nvram?' boot environment variable from the boot loader: 'unsetenv fake-nvram?'.

Syslog Message

%u MB system memory being used to simulate NVRAM.

Parameters

memory_size (INT): Memory size (in MB) being used to simulate NVRAM.

nv.fio events

nv.fio.write.err

Severity

ERROR

Description

This message occurs when the write to VNVRAM fails and the retry count has been exhausted.

Corrective Action

(None).

Syslog Message

The write to VNVRAM failed with error %u; retry limit exhausted.

Parameters

error (INT): Error returned by the last write.

nv.fio.write.retry

Severity

NOTICE

Description

This message occurs when the write to VNVRAM fails. The write will be retried.

Corrective Action

(None).

Syslog Message

The write to VNVRAM failed with error %u; will retry.

Parameters

error (INT): Error returned by the write.

nv.flash events

nv.flash.predict.fail

Severity

ALERT

Description

This message occurs when ONTAP® determines that failure is forthcoming or has occurred for the associated flash device on the nonvolatile memory (NVRAM) module.

Corrective Action

Replace the device to prevent future failures.

Syslog Message

%s

Parameters

reason (STRING): Reason for failure.

nv.flash.unable.to.monitor

Severity

ALERT

Description

This message occurs when the ONTAP® module that is responsible for monitoring the health of the NVRAM device cannot extract health information. This failure might indicate the NVRAM device is not operating properly.

Corrective Action

Use the "system environment sensors show" command to verify the device's status. If the failure still exists, contact technical support for assistance.

Syslog Message

Unable to monitor NVRAM device "%s".

Parameters

device (STRING): Name of the device.

nv.none events

nv.none

Severity

EMERGENCY

Description

This message occurs when the system cannot detect a nonvolatile (NV) device.

Corrective Action

Contact NetApp technical support.

Syslog Message

No NV device has been detected.

Parameters

(None).

nv.partner events

nv.partner.disabled

Severity

INFORMATIONAL

Description

This message occurs when checking the partner nonvolatile RAM (NVRAM) and the partner NVRAM is disabled. This event most commonly occurs during the takeover or switchover process after the partner has gone down.

Corrective Action

(None).

Syslog Message

NVRAM validate: %s NVRAM was disabled.

Parameters

host (STRING): Name of the partner host.

nv.partner.nvcheck.failure

Severity

ALERT

Description

This message occurs when nonvolatile RAM (NVRAM) inconsistencies are detected during takeover. Takeover is continued only if the option for consistent NVRAM mirroring is disabled or if the takeover is forced.

Corrective Action

When the partner node recovers, NVRAM will be reinitialized to a consistent state. The error string provides additional information to assist NetApp technical support in identifying the inconsistency and subsystem that caused the failure.

Syslog Message

NVRAM validate: %s

Parameters

error (STRING): Error string describing which subsystem caused the failure and what the mismatching values are.

nv.partner.size.mismatch

Severity

ALERT

Description

This message occurs when the HA pair nonvolatile RAM (NVRAM) sizes do not match. In this case, an HA pair cannot be formed.

Corrective Action

Check to make sure that the local NVRAM hardware size matches the partner NVRAM hardware size. Verify that the same bootargs are in use on both nodes. One or both nodes might need to be rebooted. Contact NetApp technical support if the problem persists.

Syslog Message

CF monitor: NVRAM size mismatch between nodes detected; node requires %llu bytes, partner exported %llu bytes.

Parameters

localNVSize (LONGINT): Size of the local NVRAM.
partnerNVSize (LONGINT): Size of the partner NVRAM.

nv.partner.takeover.continued

Severity

ALERT

Description

This message occurs when takeover proceeds even when nonvolatile RAM (NVRAM) inconsistencies are detected in the HA pair. This most commonly occurs when the NVRAM mirror consistency has been disabled or if the takeover is forced.

Corrective Action

(None).

Syslog Message

NVRAM validate: Error encountered (%s), but continuing takeover; some data might be lost.

Parameters

error (STRING): Error string.

nv.rename events

nv.rename.err

Severity

INFORMATIONAL

Description

This message occurs when there is an error while renaming the files specified in /etc/nvfail_rename.

Corrective Action

(None).

Syslog Message

nvfail_rename: %s: %s.

Parameters

fileName (STRING): File name.
error (STRING): Error string.

nv.rename.files

Severity

INFORMATIONAL

Description

This message occurs while renaming the files specified in /etc/nvfail_rename.

Corrective Action

(None).

Syslog Message

Renaming files specified in /etc/nvfail_rename.

Parameters

(None).

nv.rename.longName

Severity

INFORMATIONAL

Description

This message occurs while renaming the files specified in /etc/nvfail_rename, when the file name is too long.

Corrective Action

(None).

Syslog Message

nvfail_rename: %s: File name too long.

Parameters

fileName (STRING): File name.

nv.switchover events

nv.switchover.continued

Severity

ALERT

Description

This message occurs when switchover proceeds even when nonvolatile RAM (NVRAM) inconsistencies are detected in the DR partner sections.

Corrective Action

(None).

Syslog Message

NVRAM validate: Error encountered (%s), but continuing switchover; some data might be lost.

Parameters

error (STRING): Error string.

nvd events

nvd.biodone events

nvd.biodone.bio.flush.error

Severity

NOTICE

Description

This message occurs when there is an error during a block I/O flush operation.

Corrective Action

Check the host logs for any drive errors related to the device reported in this event.

Syslog Message

Block I/O flush operation (bio_flush) for opcode: 0x%x failed for device: %s.

Parameters

opcode (INTHEX): SCSI opcode.
dev_path (STRING): Device path.

nvd.biodone.error.code

Severity

NOTICE

Description

This message occurs when there is an error during an I/O operation.

Corrective Action

Check the host logs for any drive errors related to the device reported in this event.

Syslog Message

I/O for opcode: 0x%x returned with error code: %d for device: %s.

Parameters

opcode (INTHEX): SCSI opcode.
bio_error (INT): Error code.
dev_path (STRING): Device path.

nvdimm events

nvdimm.excessive events

nvdimm.excessive.cecc.errs

Severity

ALERT

Description

This message occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVDIMM controller.

Corrective Action

Use the "system environment sensors show -hidden true" clustershell command to view the current "NV Correctable ECC Count" value. Contact NetApp technical support for further assistance.

Syslog Message

Excessive correctable ECC errors in the NVDIMM in slot-%d. Count: %d.

Parameters

slot (INT): NVDIMM slot location.
count (INT): CECC count.

nvdimm.flash events

nvdimm.flash.lifetime.low

Severity

ALERT

Description

This message occurs when the NVDIMM device exceeds its warning threshold. This issue typically indicates that the NVDIMM hardware is approaching the end of its service life and should be replaced soon.

Corrective Action

Contact NetApp technical support for assistance with replacing the NVDIMM hardware.

Syslog Message

Service lifetime of NVDIMM device in slot-%d is low at %d%%.

Parameters

slot (INT): NVDIMM slot location.
percent (INT): Lifetime percentage.

nvdimm.fw events

nvdimm.fw.upgrade.failure

Severity

ERROR

Description

This message occurs when NVDIMM controller firmware failed to upgrade.

Corrective Action

Power-cycle the controller and reboot ONTAP to attempt the firmware update again. If the error persists, contact NetApp technical support for assistance.

Syslog Message

NVDIMM controller in slot-%d failed to upgrade firmware because of %s.

Parameters

slot (INT): NVDIMM slot location.
error (STRING): Reason for upgrade failure, which could be: 1. the image file does not exist or is corrupted 2. it is unable to enter update mode 3. it is unable to clear update mode 3. the firmware image transfer failed 4. of a CRC mismatch with the transferred image 5. it failed to validate or commit the image 6. it failed to restart after the image upgrade

nvdimm.fw.upgrade.succeed

Severity

NOTICE

Description

This message occurs when the NVDIMM controller sucessfully upgrades its own firmware image..

Corrective Action

(None).

Syslog Message

NVDIMM controller firmware in slot-%d was upgraded to %s.

Parameters

slot (INT): NVDIMM slot location.
version (STRING): New firmware version.

nvdimm.nvmem events

nvdimm.nvmem.checkfail

Severity

EMERGENCY

Description

This message occurs when NVDIMM-based NVMEM checks fail.

Corrective Action

For all errors, check that the right type of NVDIMM is properly installed at the designated DIMM slot.

Syslog Message

NVMEM subsystem configuration check failed because %s. To prevent NVMEM data loss, halt the system.

Parameters

error (STRING): Description of the error, which could be: 1 device in slot-N is not accessbile. 2. device in slot-N is missing. 3. device in slot-N is not NVDIMM. 4. device in slot-N is the wrong size (N); expected size (N)

nvdimm.nvmem.destage.failure

Severity

ALERT

Description

This message occurs when NVDIMM fails to copy nonvolatile data to the flash on the NVDIMM-device.

Corrective Action

This type of error indicates that the volatile data on the local NVMEM has been lost. A storage system in an HA configuration might recover the NVMEM content from its partner. To prevent future possible data loss, take the appropriate actions based on the error: 1. If the failure is caused by a malfunctioning battery, contact NetApp technical support for assistance with battery replacement. 2. If the failure is caused by an NVDIMM intermittent hardware failure, contact NetApp technical support for assistance.

Syslog Message

NVMEM subsystem failed to copy nonvolatile data to flash memory on NVIDMM device because %s.

Parameters

error (STRING): Reason for destage failure could be: (1) SDRAM is not in self-refresh mode (2) energy source (battery) is not functioning properly (3) of insufficient battery (4) destage process timeout (5) an intermitten hardware error results partial data saved (6) of a hardware error (7) of a firmware error (8) of a flash error

nvdimm.nvmem.destage.succeed

Severity

NOTICE

Description

This message occurs when all NVDIMM devices have copied nonvolatile data to flash memory.

Corrective Action

(None).

Syslog Message

NVMEM subsystem successfully copied nonvolatile data to flash memory on NVDIMM device in %ld seconds.

Parameters

seconds (INT): Time taken by the destage operation.

nvdimm.nvmem.initfail

Severity

EMERGENCY

Description

This message occurs when the nvdimm-based NVMEM subsystem is not initialized succesfully.

Corrective Action

For all errors, check if the error is persistent or intermittent by power cycling the controller and rebooting ONTAP. Note: If the last reboot is a dirty shutdown, set the bootarg.init.battery_override to force system to replay the NVLOG first when booting. Then, gracefully shut down and power cycle the controller.. If the failure is persistent: (a) For error (1) (2) (3) (5) (6) (7) (8), contact NetApp technical support for assistance with replacement.of NVDIMM or upgrade NVDIMM firmware. (b) For error (4), b.1 If failure cause is battery, contact NetApp technical support for assistance with replacement of the battery. b.2 For other failures, contact NetApp technical support for assistance with replacement of NVDIMM. (c) For error (9), contact NetApp technical support for assistance with replacement of the controller. (d) For error (10), verify the NVDIMM is installed properly and check if the correct BIOS is installed.

Syslog Message

NVMEM subsystem initialization failed because %s. To prevent NVMEM data loss, halt the system.

Parameters

error (STRING): Description of the error, which could be: 1.NVDIMM device in slot-N not accessible. 2.NVDIMM device in slot-N not ready. 3.NVDIMM device in slot-N is busy. 4.NVDIMM device in slot-N lost persistence due to [reason] 5.NVDIMM device in slot-N has worn-out flash (N percent remaining) 6.NVDIMM device in slot-N failed to configure energy source 7.NVDIMM device in slot-N failed to configure saveNPin. 8.NVDIMM device in slot-N failed to enable data preservation. 9.failed to enable battery. 10.NVDIMM memory address not mapped contiguously.

nvdimm.nvmem.restage.failure

Severity

ALERT

Description

This message occurs when nonvolatile data on the NVDIMM is either corrupt or not accessible. Because these errors cannot be corrected, nonvolatile data in flash memory is lost.

Corrective Action

Frequent occurrence of these errors indicates that the NVDIMM is experiencing persistent intermittent hardware failure. Contact NetApp technical support for assistance with replacement.

Syslog Message

NVMEM subsystem failed to restore nonvolatile data from flash memory on the NVIDMM module because of %s.

Parameters

error (STRING): Reason for restage failure could be: (1) SDRAM is not in self-refresh mode (2) of SDRAM uncorrectable error (3) restage process timeout (4) of a hardware error

nvdimm.nvmem.restage.succeed

Severity

NOTICE

Description

This message occurs when all NVDIMM devices have restored nonvolatile data from flash memory.

Corrective Action

(None).

Syslog Message

NVMEM subsystem successfully restored nonvolatile data from flash memory on NVDIMM device in %ld seconds.

Parameters

seconds (INT): Time taken by the restage operation.

nvlog events

nvlog.replay events

nvlog.replay.source

Severity

NOTICE

Description

This message occurs on Cloud Volumes ONTAP platforms to identify the source of the nonvolatile log (nvlog) replay that follows.

Corrective Action

(None).

Syslog Message

nvlog replay data source is %s.

Parameters

Source (STRING): Source of the nvlog replay data.

nvme events

nvme.boot events

nvme.boot.fw.update.complete

Severity

   NOTICE

Description

   This message occurs when the NVMe boot device firmware has been updated.

Corrective Action

   (None).

Syslog Message

   The NVMe boot device has completed the firmware update from %s to %s.

Parameters

   old_ver (STRING): Previous firmware version.
   new_ver (STRING): New firmware version.

nvme.boot.fw.update.failure

Severity

   ALERT

Description

   This message occurs when the NVMe boot device firmware has failed to update.

Corrective Action

   Contact NetApp technical support for assistance.

Syslog Message

   The NVMe boot device has failed a firmware update from %s to %s.

Parameters

   old_ver (STRING): Previous firmware version.
   new_ver (STRING): New firmware version.

nvme.card events

nvme.card.degraded

Severity

   ERROR

Description

This message occurs when the NVMe caching module has gone into a degraded state due to a warning reported by the drive. Performance, integrity, or reliability may be compromised.

Corrective Action

Replace the NVMe caching module.

Syslog Message

NVMe caching module in slot %s with serial number %s, and model number %s is degraded with status 0x%llx.

Parameters

slot_subslot (STRING): PCI slot of the NVMe device.
serial (STRING): Serial number of the controller.
model (STRING): Model number of the controller.
reason (LONGINTHEX): Internal reason why the card is degraded.

nvme.card.removed

Severity

ERROR

Description

This message occurs when an NVMe drive has been "hot-removed" from the system (while the system was powered on). The caching module is unavailable and system performance will be degraded.

Corrective Action

Insert an NVMe caching module into the system.

Syslog Message

NVMe caching module in slot %s with serial number %s, and model number %s was removed from the system.

Parameters

slot_subslot (STRING): PCI slot of the NVMe device.
serial (STRING): Serial number of the controller.
model (STRING): Model number of the controller.

nvme.fw events

nvme.fw.activate.complete

Severity

NOTICE

Description

This message occurs when new firmware has been successfully activated on the drive and running normally.

Corrective Action

(None).

Syslog Message

NVMe caching module in physical slot %s with serial number %s, and model number %s successfully replaced firmware version %s with %s in firmware slot %u.

Parameters

slot_subslot (STRING): PCI slot of the NVMe device.
serial (STRING): Serial number of the controller.
model (STRING): Model number of the controller.
old (STRING): Version of firmware that has been replaced.
new (STRING): Version of firmware that was activated.
fw_slot (INT): Firmware slot that the new version was programmed to.
reset (INT): An indication on whether the device had to be reset or not in order to activate the firmware.

nvme.fw.activate.failed

Severity

ERROR

Description

This message occurs when there was an issue while activating the new firmware on the the NVMe drive. The caching module will continue normal operation with obsolete firmware.

Corrective Action

The caching module is still completely functional, but it is running with obsolete firmware. Contact NetApp technical support for alternative solutions.

Syslog Message

NVMe caching module in slot %s with serial number %s and model number %s failed to activate firmware. Error code: 0x%llx.

Parameters

slot_subslot (STRING): PCI slot of the NVMe device.
serial (STRING): Serial number of the controller.
model (STRING): Model number of the controller.
code (LONGINTHEX): Internal error code.

nvme.fw.program.failed

Severity

ERROR

Description

This message occurs when there was an issue while downloading new firmware to the NVMe drive. The caching module will continue normal operation with obsolete firmware.

Corrective Action

The caching module is still completely functional however it is running with obsolete firmware. Contact NetApp technical support for alternative solutions.

Syslog Message

NVMe caching module in slot %s with serial number %s, and model number %s failed to download firmware version %s to the drive with error code 0x%llx.

Parameters

slot_subslot (STRING): PCI slot of the NVMe device.
serial (STRING): Serial number of the controller.
model (STRING): Model number of the controller.
version (STRING): Version of firmware attempted to download.
code (LONGINTHEX): Internal error code.

nvme.link events

nvme.link.disabled.error

Severity

ERROR

Description

This message occurs when the NVMe driver disables the PCIe link due to excessive errors.

Corrective Action

Remove or replace the NVMe SSD.

Syslog Message

PCIe link disabled for NVMe SSD in slot %d due to excessive errors.

Parameters

slot (INT): Slot number of associated NVMe SSD.

nvme.link.error

Severity

ERROR

Description

This message occurs when the NVMe SSD PCIe link does not intialize.

Corrective Action

Remove or replace the NVMe SSD.

Syslog Message

PCIe link initialization error for NVMe SSD in slot %d.

Parameters

slot (INT): Slot number of associated NVMe SSD.

nvme.ssd events

nvme.ssd.attach.error

Severity

ERROR

Description

This message occurs when the NVMe drive encounters an error before the drive is reported to upper layers. The drive will not be discovered, and will not appear in sysconfig output.

Corrective Action

The drive could not be attached. Remove or replace the drive.

Syslog Message

NVMe SSD encountered error: "%s" on slot %d. Could not attach drive.

Parameters

error (STRING): Type of error that occurred.
slot (INT): Slot number of associated NVMe SSD.

nvmem events

nvmem.battery events

nvmem.battery.capacity.low

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery lacks the capacity to preserve the NVMEM contents for the required minimum of 72 hours. The system is at the risk of data loss if the power fails. This message repeats every hour while the problem continues and the system shuts down in 24 hours if automatic recharging of the battery does not restore its charge.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. The battery charges automatically. If the capacity is not restored in several hours, replace the battery pack. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery lacks the capacity to preserve the NVMEM contents.

Parameters

(None).

nvmem.battery.capacity.low.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery capacity is below normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery capacity is below normal.

Parameters

(None).

nvmem.battery.capacity.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery capacity is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery capacity is normal.

Parameters

(None).

nvmem.battery.capLow

Severity

ALERT

Description

This message occurs when the NVMEM battery capacity is low. To prevent data loss, the system schedules a clean shutdown if the problem is not corrected.

Corrective Action

Correct any environmental problems, such as chassis overheating. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after the system is powered on, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery capacity is low (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvmem.battery.capLowCrit

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery capacity is critically low. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Correct any environmental problems, such as overheating. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after the system is powered on, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery capacity is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

> **reading** (STRING): Reading that triggered this message.
> **num_minutes** (INT): Number of minutes until the system shuts down.

nvmem.battery.capLowWarn

Severity

> ERROR

Description

> This message occurs when the NVMEM battery capacity is below normal.

Corrective Action

> Correct any environmental problems, such as overheating. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after the system is powered on, replace the NVMEM battery within three months. If the problem persists, replace the controller module.

Syslog Message

> The NVMEM battery capacity is below normal (%s).

Parameters

> **reading** (STRING): Reading that triggered this message.

nvmem.battery.capNormal

Severity

> NOTICE

Description

> This message occurs when the NVMEM battery capacity is normal.

Corrective Action

> (None).

Syslog Message

> The NVMEM battery capacity is normal.

Parameters

> (None).

nvmem.battery.chgrFailed

Severity

> ERROR

Description

> This message occurs when the NVMEM battery charger is disabled because a bad charger circuit is detected. The system continues to run as normal but the NVMEM battery does not start charging when it falls below a certain capacity.

Corrective Action

Contact NetApp technical support for assistance to replace the circuit at the next available maintenance window.

Syslog Message

The NVMEM battery charger is disabled because a bad charger circuit is detected.

Parameters

(None).

nvmem.battery.current.high

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery current is excessively high and the system will shut down.

Corrective Action

First, correct any environmental problems, such as chassis over- temperature. If the NVMEM battery current is still too high, replace the battery pack. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery current is excessively high and the system will shut down.

Parameters

(None).

nvmem.battery.current.high.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery current is above normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery current is above normal.

Parameters

(None).

nvmem.battery.current.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery current is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery current is normal.

Parameters

(None).

nvmem.battery.currentHigh

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery charging current is critically high. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery current is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.currentHiWarn

Severity

ALERT

Description

This message occurs when the NVMEM battery charging current is above normal. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery current is above normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.currentLow

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery detects a short circuit. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the controller module.

Syslog Message

The NVMEM battery has a short circuit (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.currentLowWarn

Severity

ALERT

Description

This message occurs when the NVMEM battery is discharging when it should not. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery current is below normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.discFET.normal

Severity

NOTICE

Description

This message occurs when the NVMEM battery discharge field-effect transistor (FET) is on.

Corrective Action

(None).

nvmem.battery.discFET.off

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery discharge field-effect transistor (FET) is off. To prevent data loss, the system shuts down.

Corrective Action

Shut down the system and power-cycle the controller. If the discharge FET remains off, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery discharge FET is off. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.end_of_life.high

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery-cycle count indicates that the battery has reached its anticipated life expectancy.

Corrective Action

(None).

Syslog Message

The NVMEM battery has reached its anticipated life expectancy.

Parameters

(None).

nvmem.battery.end_of_life.high.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery-cycle count indicates that the battery is nearing its anticipated life expectancy.

Corrective Action

(None).

Syslog Message

The NVMEM battery is nearing its anticipated life expectancy.

Parameters

(None).

nvmem.battery.end_of_life.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery-cycle count indicates that the battery is well below its anticipated life expectancy.

Corrective Action

(None).

Syslog Message

The NVMEM battery is well below its anticipated life expectancy.

Parameters

(None).

nvmem.battery.fccLow

Severity

ALERT

Description

This message occurs when the NVMEM battery full-charge capacity is low. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Use the "system battery show" SP CLI command to get the battery manufactured date. If the battery is newer than three years old, correct any chronic environmental problems, such as overheating. If the full-charge capacity is still below normal, contact technical support for assistance with replacement of the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery full-charge capacity is low (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.fccLowCrit

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery full-charge capacity is critically low. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Use the "system battery show" SP CLI command to get the battery manufactured date. If the battery is newer than three years old, correct any chronic environmental problems, such as overheating. If the full-charge capacity is still below normal, contact technical support for assistance with replacement of the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery full-charge capacity is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.fccLowWarn

Severity

ALERT

Description

This message occurs when the NVMEM battery full-charge capacity is below normal.

Corrective Action

Use the "system battery show" SP CLI command to get the battery manufactured date. If the battery is newer than three years old, correct any chronic environmental problems, such as overheating. If the full-charge capacity is still below normal, contact technical support for assistance with replacement of the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery full-charge capacity is below normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvmem.battery.fccNormal

Severity

NOTICE

Description

This message occurs when the NVMEM battery full-charge capacity is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery full-charge capacity is normal.

Parameters

(None).

nvmem.battery.FET.normal

Severity

NOTICE

Description

This message occurs when the NVMEM battery charge field-effect transistor (FET) is on.

Corrective Action

(None).

Syslog Message

The NVMEM battery charge FET is on.

Parameters

(None).

nvmem.battery.FET.off

Severity

ALERT

Description

This message occurs when the NVMEM battery charge field-effect transistor (FET) is off. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Shut down the system and power-cycle the controller. If the charge FET remains off, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery charge FET is off. To prevent data loss, the system will shut down %s.

Parameters

countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.noCharge

Severity

ALERT

Description

This message occurs when the NVMEM battery requests a charge but does not receive it. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Pull the controller from the slot and ensure that the NVMEM battery connector is seated properly. If the problem occurs again, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery is requesting to be charged but the charger is not charging the battery. To prevent data loss, the system will shut down %s.

Parameters

countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.normalCharge

Severity

NOTICE

Description

This message occurs when the NVMEM battery charging status is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery charging status is normal.

Parameters

(None).

nvmem.battery.notPresent

Severity

ALERT

Description

This message occurs when the NVMEM battery is not present. To prevent data loss, the system shuts down.

Corrective Action

While the system is shut down, pull the controller from the slot and ensure that the NVMEM battery is present. If the NVMEM battery is already present, ensure that the connector is seated properly. Push the controller back in and power on the system. If this does not correct the problem, replace the NVMEM battery. If the system still does not detect the battery, replace the controller module.

Syslog Message

The NVMEM battery is not present. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.packInvalid

Severity

EMERGENCY

Description

This message occurs when an unsupported NVMEM battery pack is installed in the system. To prevent data loss, the system initiates a clean shutdown if the problem is not corrected.

Corrective Action

Shut down the system and replace the NVMEM battery with a correct battery pack.

Syslog Message

The incorrect NVMEM battery is installed. Expected part number is %s. To prevent data loss, the system will shut down in %d minutes.

Parameters

partnum (STRING): Valid battery part number.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.packInvalidHrs

Severity

EMERGENCY

Description

This message occurs when an unsupported NVMEM battery pack is installed in the system. To prevent data loss, the system initiates a clean shutdown if the problem is not corrected.

Corrective Action

Shut down the system and replace the NVMEM battery with a correct battery pack.

Syslog Message

The incorrect NVMEM battery is installed. Expected part number is %s. To prevent data loss, the system will shut down in %s.

Parameters

partnum (STRING): Valid battery part number.
remaining_time (STRING): Number of hours until the system shuts down.

nvmem.battery.packValid

Severity

NOTICE

Description

This message occurs when a valid NVMEM battery pack is present and readable.

Corrective Action

(None).

Syslog Message

A valid NVMEM battery pack is present.

Parameters

(None).

nvmem.battery.powerFault

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery is not receiving power. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Pull the controller from the slot and ensure that the NVMEM battery connector is seated properly. Push the controller back in and boot the system. If the NVMEM battery is still not receiving power, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery is not receiving power. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.powerNormal

Severity

NOTICE

Description

This message occurs when the NVMEM battery power is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery power is normal.

Parameters

(None).

nvmem.battery.sensor.unread

Severity

ERROR

Description

This message occurs when the battery state of the battery-backed memory (NVMEM) is unknown. One of the battery sensors is not readable.

Corrective Action

Shut down the system and power-cycle the controller module. If the problem is not corrected, replace the battery. If the sensor is still not readable, replace the controller module.

Syslog Message

The battery state of the battery-backed memory (NVMEM) is unknown. Sensor "%s" is not readable.

Parameters

sensor_name (STRING): Sensor name.

nvmem.battery.temp.high

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery is too hot and the system is at a high risk of data loss if power fails. The system will shut down.

Corrective Action

If the system is excessively warm, allow it to cool gradually. If the NVMEM battery temperature reading is still too high, replace the battery pack. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery is too hot and the system is at a high risk of data loss if power fails. The system will shut down to prevent data loss.

Parameters

(None).

nvmem.battery.temp.high.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery temperature high.

Corrective Action

(None).

Syslog Message

The NVMEM battery temperature is high.

Parameters

(None).

nvmem.battery.temp.low

Severity

ALERT

Description

This message occurs when the NVMEM battery is too cold and the system is at a high risk of data loss if power fails.

Corrective Action

If the system is excessively cold, allow it to warm gradually. If the NVMEM battery temperature reading is still too low, replace the battery pack. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery is too cold and the system is at a high risk of data loss if power fails.

Parameters

(None).

nvmem.battery.temp.low.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery temperature is low.

Corrective Action

(None).

Syslog Message

The NVMEM battery temperature is low.

Parameters

(None).

nvmem.battery.temp.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery temperature is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery temperature is normal.

Parameters

(None).

nvmem.battery.tempHigh

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery temperature is critically high. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Correct any environmental problems, such as a overheating. If the NVMEM battery temperature is still above normal, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery temperature is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.tempLow

Severity

ALERT

Description

This message occurs when the NVMEM battery is too cold. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

If the system is excessively cold, allow it to warm gradually. If the NVMEM battery temperature is still too low, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery is too cold (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.unread

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery state cannot be determined because the sensor is unreadable. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Pull the controller from the slot and ensure that the NVMEM battery connector is seated properly. If the problem is not corrected, replace the NVMEM battery. If the sensor is still not readable, replace the controller module.

Syslog Message

The NVMEM battery state cannot be determined because the '%s' sensor is unreadable. To prevent data loss, the system will shut down in %d minutes.

Parameters

sensor_name (STRING): Sensor name.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.unreadHrs

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery state cannot be determined because the sensor is unreadable. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Pull the controller from the slot and ensure that the NVMEM battery connector is seated properly. If the problem is not corrected, replace the NVMEM battery. If the sensor is still not readable, replace the controller module.

Syslog Message

The NVMEM battery state cannot be determined because the '%s' sensor is unreadable. To prevent data loss, the system will shut down in %s.

Parameters

sensor_name (STRING): Sensor name.
remaining_time (STRING): Remaining time before chassis shutdown.

nvmem.battery.voltage.high

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery voltage is excessively high and the system will shut down.

Corrective Action

First, correct any environmental problems, such as chassis over- temperature. If the NVMEM battery voltage is still too high, replace the battery pack. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery voltage is excessively high and the system will shut down.

Parameters

(None).

nvmem.battery.voltage.high.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery voltage is above normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery voltage is above normal.

Parameters

(None).

nvmem.battery.voltage.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM battery voltage is normal.

Corrective Action

(None).

Syslog Message

The NVMEM battery voltage is normal.

Parameters

(None).

nvmem.battery.voltageHigh

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery voltage is critically high. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery voltage is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.voltageHiWarn

Severity

ALERT

Description

This message occurs when the NVMEM battery voltage is above normal. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Correct any environmental problems, such as overheating. If the NVMEM battery voltage is still above normal, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery voltage is above normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvmem.battery.voltageLow

Severity

EMERGENCY

Description

This message occurs when the NVMEM battery voltage is critically low. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Correct any environmental problems, such as overheating. If the NVMEM battery voltage is still critically low, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery voltage is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvmem.battery.voltageLowWarn

Severity

ALERT

Description

This message occurs when the NVMEM battery voltage is below normal. To prevent data loss, the system schedules a clean shutdown if the problem is not corrected.

Corrective Action

Correct any environmental problems, such as overheating. If the NVMEM battery voltage is still below normal 30 minutes after environmental problems have been corrected, replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery voltage is below normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvmem.battery.wrongCharge

Severity

ALERT

Description

This message occurs when the NVMEM battery charger charges the battery without a request to do so. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Replace the NVMEM battery. If the problem persists, replace the controller module.

Syslog Message

The NVMEM battery charger is charging the battery even though the battery is not requesting to be charged. To prevent data loss, the system will shut down %s.

Parameters

countdown (STRING): Remaining time before chassis shutdown.

nvmem.voltage events

nvmem.voltage.high

Severity

EMERGENCY

Description

This message occurs when the NVMEM supply voltage is high and the system is at a high risk of data loss if power fails. The system will shut down.

Corrective Action

Correct any environmental or battery problems. If the problem persists, replace the controller module.

Syslog Message

The NVMEM supply voltage is high and the system is at a high risk of data loss if power fails. The system will shut down to prevent data loss.

Parameters

(None).

nvmem.voltage.high.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM supply voltage is above normal.

Corrective Action

(None).

Syslog Message

The NVMEM supply voltage is above normal.

Parameters

(None).

nvmem.voltage.low

Severity

ALERT

Description

This message occurs when the NVMEM supply voltage is low and the system is at a high risk of data loss if power fails.

Corrective Action

First, correct any environmental or battery problems. If the problem continues, replace the controller module.

Syslog Message

The NVMEM supply voltage is low and the system is at a high risk of data loss if power fails.

Parameters

(None).

nvmem.voltage.low.warn

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM supply voltage is below normal.

Corrective Action

(None).

Syslog Message

The NVMEM supply voltage is below normal.

Parameters

(None).

nvmem.voltage.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVMEM supply voltage is normal.

Corrective Action

(None).

Syslog Message

The NVMEM supply voltage is normal.

Parameters

(None).

nvmens events

nvmens.512blksz events

NVMeNS.512blksz.repl.unsupp

Severity

ERROR

Description

This message occurs when replication of a volume containing NVMe namespaces that use 512-byte block sizes fails because the destination does not support NVMe namespaces with this block size.

Corrective Action

Replicate volumes containing NVMe namespaces with 512-byte block sizes only to destinations that support namespaces that use this block size.

Syslog Message

Logical replication failed for volume %s (DSID %llu): No 512-byte block size NVMe namespace support on the destination.

Parameters

volume_name (STRING): Name of the source volume.
volume_dsid (LONGINT): Data set ID (DSID) of the source volume.

nvmens.destroy events

NVMeNS.destroy

Severity

NOTICE

Description

This message occurs when an NVMe namespace has been destroyed.

Corrective Action

(None).

Syslog Message

NVMe namespace %s, vol %s (DSID %llu) was destroyed (UUID: %s).

Parameters

NVMeNS_path (STRING): Path for the NVMe namespace that was destroyed.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the NVMe namespace.
object_type (STRING): Type of object under notification.

nvmens.offline events

NVMeNS.offline

Severity

NOTICE

Description

This message occurs when an NVMe namespace has been brought offline manually.

Corrective Action

(None).

Syslog Message

NVMe namespace %s, vol %s (DSID %llu) was brought offline (UUID: %s).

Parameters

path (STRING): Path for the NVMe namespace that has been brought offline.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the NVMe namespace.
object_type (STRING): Type of object under notification.

nvmens.online events

NVMeNS.online

Severity

NOTICE

Description

This message occurs when an NVMe namespace is brought online manually.

Corrective Action

(None).

Syslog Message

NVMe namespace %s, vol %s (DSID %llu) was brought online (UUID: %s).

Parameters

path (STRING): Path for the NVMe namespace that was brought online.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the NVMe namespace.
object_type (STRING): Type of object under notification.

nvmens.out events

NVMeNS.out.of.space

Severity

EMERGENCY

Description

This message occurs when an NVMe namespace has been brought offline because of a write failure due to lack of space.

Corrective Action

Add space to the volume, and then bring the NVMe namespace online using the "vserver nvme namespace modify" command.

Syslog Message

NVMe namespace %s, vol %s (DSID %llu) is out of space (UUID: %s).

Parameters

path (STRING): Path for the NVMe namespace that has been brought offline.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Data set ID (DSID) of the containing volume.
object_uuid (STRING): UUID of the NVMe namespace.
object_type (STRING): Type of object under notification.

nvmens.repl events

NVMeNS.repl.unsupp.ver

Severity

ERROR

Description

This message occurs when replication of a volume containing NVMe namespaces has failed because the destination does not support NVMe namespaces.

Corrective Action

Replicate volumes with NVMe namespaces only to destinations that support NVMe namespaces.

Syslog Message

Logical replication failed for volume %s (DSID %llu): No NVMe namespace support on the destination.

Parameters

volume_name (STRING): Name of the source volume.
volume_dsid (LONGINT): Data set ID (DSID) of the source volume.

nvmens.smbc events

NVMeNS.SMBC.vol.unsupp

Severity

ERROR

Description

This message occurs when an NVMe namespace is partially restored to a SnapMirror® active sync volume because the SnapMirror® active sync volume does not support NVMe namespace.

Corrective Action

Restore of NVMe namespace to the SnapMirror® active sync volume is not supported although it is partially created on the SnapMirror® active sync volume as part of restore. The NVMe namespace needs to be manually deleted. Contact NetApp technical support for assistance.

Syslog Message

NVMe namespace "%s" is not supported on SnapMirror® active sync volume "%s" (DSID %llu).

Parameters

path (STRING): Path for the NVMe namespace that has been restored.
volume_name (STRING): Name of the containing volume.
volume_dsid (LONGINT): Dataset ID (DSID) of the containing volume.

nvmeof events

nvmeof.cabling events

nvmeof.cabling.clear

Severity

NOTICE

Description

This message occurs when all of the cabling issues to the shelf have been corrected.

Corrective Action

(None).

Syslog Message

The storage cabling issues on node "%s" have been corrected.

Parameters

node_name (STRING): Node name connected to the cable.

nvmeof.cabling.error

Severity

ERROR

Description

This message occurs when there are errors with the cabling to the shelf.

Corrective Action

Run the "storage check-cables" node shell command to list the errors. Follow the cabling guide to correct the issues.

Syslog Message

There is a storage cabling issue on node "%s". Run the "storage check-cables" node shell command to list the errors.

Parameters

node_name (STRING): Node name connected to the cable.

nvmeof.hostport events

nvmeof.hostport.clear

Severity

NOTICE

Description

This message occurs when a node shelf is no longer cabled incorrectly from a port that is not a storage

port. Indicates condition has cleared.

Corrective Action

(None).

Syslog Message

Shelf on node %s with SN %s is no longer cabled incorrectly from a port that is not a storage port.

Parameters

node_name (STRING): Host name connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.hostport.error

Severity

ERROR

Description

This message occurs when the host port is incorrectly cabled to the shelf.

Corrective Action

Reconnect the host port to a Storage Ethernet port.

Syslog Message

Port %s is not configured as a Storage Ethernet port on node %s. It is incorrectly cabled to Shelf with SN %s.

Parameters

host_port (STRING): Host port connected to the cable.
node_name (STRING): Host name connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.mixedports events

nvmeof.mixedports.clear

Severity

NOTICE

Description

This message occurs when there is no longer a nonrecommended mix of a dedicated port and a nondedicated port cabled from a node to a shelf.

Corrective Action

(None).

Syslog Message

There is no longer a nonrecommended mix of a dedicated port and a nondedicated port cabled from node %s to shelf with SN %s.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.mixedports.error

Severity

ERROR

Description

This message occurs when both primary and secondary host ports are incorrectly cabled to a shelf. This cabling might compromise physical data link redundancy and inhibit system performance.

Corrective Action

Connect either primary dedicated ports or secondary nondedicated ports to the shelf, but not both port types.

Syslog Message

There is a nonrecommended mix of a dedicated port and a nondedicated port cabled from node %s to Shelf with SN %s.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.onlyoneport events

nvmeof.onlyoneport.clear

Severity

NOTICE

Description

This message occurs when there is no longer only one port cabled from a node to a shelf.

Corrective Action

(None).

Syslog Message

There is no longer only one port cabled from node %s to shelf with SN %s.

Parameters

node_name (STRING): Host name connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.onlyoneport.error

Severity

ERROR

Description

This message occurs when host port is incorrectly cabled to a shelf.

Corrective Action

The host port is incorrectly cabled to shelf. two ports must be connected to ensure redundancy.

Syslog Message

There is only one port cabled from node %s to Shelf with SN %s.

Parameters

node_name (STRING): Host name connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.port events

nvmeof.port.modify

Severity

NOTICE

Description

This message occurs when the mode of an NVMe-oF port is changed.

Corrective Action

(None).

Syslog Message

Changing NVMe-oF port %s to %s mode.

Parameters

port (STRING): Name of port being configured.
mode (STRING): Mode in which to configure port: network or storage.

nvmeof.portioma events

nvmeof.portioma.clear

Severity

NOTICE

Description

This message occurs when there are no longer two ports cabled incorrectly from a node to top module (A) on a shelf.

Corrective Action

(None).

Syslog Message

Two ports are no longer cabled incorrectly from node %s to top module (A) on shelf with SN %s.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.portioma.error

Severity

ERROR

Description

This message occurs when there are two ports cabled to the top module (A) on a shelf.

Corrective Action

Connect two ports to different modules to provide redundancy.

Syslog Message

There are two ports cabled from node %s to top module (A) on Shelf with SN %s. One of these cables should be removed.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.portiomb events

nvmeof.portiomb.clear

Severity

NOTICE

Description

This message occurs when there are no longer two ports cabled incorrectly from a node to bottom module (B) on a shelf.

Corrective Action

(None).

Syslog Message

Two ports are no longer cabled incorrectly from node %s to bottom module (B) on shelf with SN %s.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.portiomb.error

Severity

ERROR

Description

This message occurs when there are two ports cabled to the bottom module (B) on a shelf.

Corrective Action

Connect two ports to different modules to provide redundancy.

Syslog Message

There are two ports cabled from node %s to bottom module (B) on Shelf with SN %s. One of these cables should be removed.

Parameters

node_name (STRING): Host port connected to the cable.
shelf_sn (STRING): Serial number of the shelf connected to the cable.

nvmeof.rdma events

nvmeof.rdma.disconnect.event

Deprecated

Deprecated as of version 9.13.1.

Severity

NOTICE

Description

This message occurs when the NVMe-oF driver detects an RDMA disconnect. There might be a decrease in performance while reconnecting.

Corrective Action

(None).

Syslog Message

NVMe-oF RDMA disconnect on subnqn %s, controller ID %d, qpair ID %d.

Parameters

subnqn (STRING): Subsystem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.

nvmeof.rdma.disconnect.status

Deprecated

Deprecated as of version 9.13.1.

Severity

NOTICE

Description

This message occurs when the NVMeoF driver detects a command that finishes with a disconnect status. There might be a decrease in performance while reconnecting.

Corrective Action

(None).

Syslog Message

NVMe-oF disconnect on subnqn %s, controller ID %d, qpair ID %d.

Parameters

subnqn (STRING): Subsystem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.

nvmeof.subsystem events

nvmeof.subsystem.add

Severity

NOTICE

Description

This message occurs when an NVMe-oF subsystem is added.

Corrective Action

(None).

Syslog Message

NVMe-oF subsystem added at address %s.

Parameters

address (STRING): IP address of susbsystem.

nvmeof.subsystem.delete

Severity

NOTICE

Description

This message occurs when an NVMe-oF subsystem is deleted.

Corrective Action

(None).

Syslog Message

NVMe-oF subsystem deleted at address %s.

Parameters

address (STRING): IP address of susbsystem.

nvmeof.timeout events

nvmeof.timeout

Severity

NOTICE

Description

This message occurs when the NVMeoF driver detects a timeout on a request. There might be a decrease in performance while retrying.

Corrective Action

(None).

Syslog Message

Timeout on subnqn %s, controller ID %d, qpair ID %d, sequence number %d.

Parameters

subnqn (STRING): Subsytem NVMe qualified name.
ctrlr_id (INT): Controller ID.
qpair (INT): Qpair ID.
cid (INT): NVMe-oF CID.

nvmf events

nvmf.graceperiod events

nvmf.graceperiod.active

Severity

ALERT

Description

This message occurs daily while the NVMe over Fabrics (NVMe-oF) protocol is in use and the license grace period is active. NVMe-oF functionality requires a license in this version of ONTAP® software after the license grace period expires.

Corrective Action

Contact your sales representative to obtain an NVMe-oF license and add it to the cluster, or remove all NVMe-oF configuration from the cluster.

Syslog Message

The NVMe-oF feature requires a license in this version of ONTAP. NVMe-oF functionality will be disabled in %d days (%s) unless a license is added to the cluster.

Parameters

days_remaining (INT): Days until the license grace period expires.
expiration_date (STRING): Date the license grace period expires.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type is CLUSTER.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID is that of the cluster.

nvmf.graceperiod.expired

Severity

ALERT

Description

This message occurs when the NVMe over Fabrics (NVMe-oF) license grace period expires and NVMe-oF functionality is disabled. NVMe-oF functionality requires a license in this version of ONTAP® software after the license grace period expires.

Corrective Action

Contact your sales representative to obtain an NVMe-oF license, and then add it to the cluster.

Syslog Message

The NVMe-oF feature requires a license in this version of ONTAP and the grace period has expired. NVMe-oF functionality will be disabled until a license is added to the cluster.

Parameters

object_type (STRING): Type of resource object under notification. For this EMS, the object_type is CLUSTER.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID is that of the cluster.

nvmf.graceperiod.start

Severity

ALERT

Description

This message occurs when an NVMe over Fabrics (NVMe-oF) configuration is detected during upgrade to ONTAP® 9.5 software. NVMe-oF functionality requires a license in this version of ONTAP after the license grace period expires.

Corrective Action

Contact your sales representative to obtain an NVMe-oF license, and then add it to the cluster.

Syslog Message

The NVMe-oF feature requires a license in this version of ONTAP. NVMe-oF functionality will be disabled in %d days (%s) unless a license is added to the cluster.

Parameters

days_remaining (INT): Days until the license grace period expires.
expiration_date (STRING): Date the license grace period expires.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type is CLUSTER.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID is that of the cluster.

nvmf.mgmt events

nvmf.mgmt.op.failed

Severity

EMERGENCY

Description

This message occurs when a management operation fails in an NVMe-oF subsystem. The NVMe-oF subsystem on this node will be out of sync with the subsystems on the other nodes in the cluster. This can result in the failure of administrative commands and IO.

Corrective Action

To recover from this condition in HA pair configurations, take over the node with the problem by using the "storage failover takeover" command, and then give back the node by using the "storage failover giveback" command. To recover from this condition in non-HA configurations, reboot the nodes having this condition by using the "system node reboot" command.

Syslog Message

NVMe-oF operation "%s" failed (reason=%s).

Parameters

operation (STRING): Management operation that failed.
reason (STRING): Reason for the failure.

nvmf.mgmt.port.cmd.full

Severity

ERROR

Description

This message occurs when the NVMe-oF command fan-in on a physical port exceeds the port's capabilities. At this point, NVMe-oF I/O throughput and latency could severely degrade.

Corrective Action

To recover from this condition, evaluate the host fan-in on the port, and then take one of the following actions: - Reduce the number of hosts that are logging in to this port. - Reduce the number of NVMe-oF subsystems that are being accessed by the hosts. - Reduce the queue depths and number of queues for hosts connecting to this port. After completing the appropriate mitigation step, you can see the number of command slots currently being used via the fcp_port CM object. Example: statistics show -object fcp_port -counter nvmf_command_slots -instance port.portname -raw

Syslog Message

NVMe-oF port name "%s" command slots full (current number provisioned = %d).

Parameters

portname (STRING): Port name on which the command slots are full.
command_slots (INT): Current number of command slots provisioned on the port.

nvmf.mgmt.port.cmd.threshold

Severity

NOTICE

Description

This message occurs when the NVMe-oF command fan-in on a physical port starts approaching levels close to the port's capabilities.

Corrective Action

Consider adding more NVMe-oF ports or access the NVMe-oF subsystems via other ports instead of using this port. You can see the number of command slots currently being used via the fcp_port CM object. Example: statistics show -object fcp_port -counter nvmf_command_slots -instance port.portname -raw

Syslog Message

NVMe-oF port name "%s" command slots high threshold reached (current number provisioned = %d).

Parameters

portname (STRING): Port name on which the command slots are being filled up.
command_slots (INT): Current number of command slots provisioned on the port.

nvmf.mgmt.roce.port.cq.full

Severity

ERROR

Description

This message occurs when the NVMe/RoCE completion queue entry utilization exceeds the port's capabilities. At this point, NVMe/RoCE I/O throughput and latency could severely degrade.

Corrective Action

To recover from this condition, evaluate the host fan-in on the port, and then take one of the following actions: - Reduce the number of hosts that are logging in to this port. - Reduce the number of NVMe-oF subsystems that are being accessed by the hosts. - Reduce the queue depths and number of queues for hosts connecting to this port.

Syslog Message

Completion queue entries on NVMe/RoCE port "%s" are exhausted (current number used is %d).

Parameters

portname (STRING): Port name on which the completion queue entries are exhausted.
cq_entries (INT): Current number of completion queue entries used on the port.

nvmf.qos events

nvmf.qos.mismatch.policy.r2

Severity

ERROR

Description

This message occurs when an NVMe over Fabrics (NVMe-oF) target subsystem contains namespaces that have different quality of service (QoS) policies which might affect the I/O of the namespaces with higher QoS policies. It is best practice to have the same QoS policy across all namespaces within a subsystem.

Corrective Action

Determine which namespaces exist within the subsystem NQN by using the "vserver nvme subsystem map show" command. Verify that these namespaces share the same QoS policy by using the "vserver nvme namespace show -fields path,qos-policy-group" command.

Syslog Message

NVMe-oF target subsystem NQN %s contains %d namespaces that do not have the same QoS policy.

Parameters

subsystem_nqn (STRING): NVMe Qualified Name (NQN) of the subsystem.
ns_count (INT): Number of namespaces that do not match.

nvmf.qos.mismatched.policy

Severity

ERROR

Description

This message occurs when an NVMe-oF target subsystem contains namespaces that have different QoS policies.

Corrective Action

Determine which volumes exist within the named subsystem NQN by using the "vserver nvme subsystem map show" command. Verify that these volumes share the same QoS policy by using the "volume show -fields name,qos-policy-group" command.

Syslog Message

NVMe-oF target subsystem NQN %s contains %d namespaces that do not have the same QoS policy.

Parameters

subsystem_nqn (STRING): NVMe Qualified Name (NQN) of the subsystem.
ns_count (INT): Number of namespaces that do not match.

nvmf.qos.viodet.regfail

Severity

ERROR

Description

This message occurs when the Quality-of-Service (QoS) subsystem fails to register for updates during initialization due to an internal error (e.g. there is not enough system memory available). As a result, workloads might not meet their minimum throughput or their service-level objectives (SLOs).

Corrective Action

The registration will continue to be retried. If this message continues to occur, perform a planned takeover/giveback sequence to reset the reporting node nondisruptively by using the "takeover -ofnode (reporting_node)" and "giveback -ofnode (reporting_node)" commands. If the problem persists, contact Contact NetApp technical support..

Syslog Message

Failed to register for violation detection updates. QoS min-throughput might operate in a limited capacity.

Parameters

errorCode (INT): Error code that was returned during registration.

nvmf.remote events

nvmf.remote.status.cb

Severity

NOTICE

Description

This message occurs when NVMe over Fabric(NVMeOF) receives a status callback from the connection manager for the Cluster Session Manager(CSM) session is used for remote IO.

Corrective Action

(None).

Syslog Message

NVMeOF remote status callback endpoint=%s, status=%s.

Parameters

> **endpoint** (STRING): CSM session endpoint on which the status callback is received.
> **status** (STRING): Reason for the status callback.

nvmf.roce events

nvmf.roce.lif.create.failed

Severity

> ERROR

Description

> This message occurs when there was an internal error while creating a NVMe over RoCE logical network interface (LIF).

Corrective Action

> To recover from this condition, use the "network interface modify" command to change the status-admin of the LIF to "down" and then back to "up" again.

Syslog Message

> NVMe/RoCE LIF "%s" create operation failed because of an internal error.

Parameters

> **lifname** (STRING): Name of the NVMe/RoCE LIF that encountered the failure.

nvmf.tcp events

nvmf.tcp.lif.create.fail

Severity

> ERROR

Description

> This message occurs when there is an internal error while creating a NVMe-over-TCP (NVMe/TCP) logical network interface (LIF).

Corrective Action

> To recover from this condition, use the "network interface modify" command to change the state of "status-admin" of the LIF to "down" and then back to "up" again.

Syslog Message

> NVMe/TCP LIF "%s" create operation failed because of the following internal error: "%d".

Parameters

> **lifname** (STRING): Name of the NVMe/TCP LIF that encountered the failure.
> **errorCode** (INT): Error code returned during the creation of the LIF.

nvmf.tcp.trans.init.fail

Severity

ERROR

Description

This message occurs when there is an internal error during the NVMe-over-TCP (NVMe/TCP) transport initialization.

Corrective Action

NVMe-oF logs at "/mroot/etc/log/rastrace" need to be collected for further analysis. Trigger an ALL AutoSupport® message by using the following command: "autosupport invoke -node * -message "nvmf.tcp.transport.init.failed" -type all". Also trigger the diagnostic AutoSupport function by using the following command "autosupport invoke-diagnostic -node * -message "nvmf.tcp.transport.init.failed" -subsystems nvmf". Then contact NetApp technical support support.

Syslog Message

NVMe/TCP transport initialization failed because of the following internal error: "%d".

Parameters

errorCode (INT): Error code returned during transport initialization.

nvpm events

nvpm.extend events

nvpm.extend.failed

Severity

ERROR

Description

This message occurs when nvlog client segments cannot be enabled in a partner NVRAM section following a controller failover or MetroCluster® switchover. When this event occurs, the system continues to operate, but with diminished performance due to the increased failover load coupled with decreased NVRAM capacity for logging.

Corrective Action

Perform a storage system giveback operation or a metrocluster switchback operation to restore operating performance.

Syslog Message

Client segments cannot be enabled due to a %s.

Parameters

event (STRING): Event that triggered the extension.
current_state (INT): (debug only) Current Non-volatile RAM Partition Manager (NVPM) state.
expected_state (INT): (debug only) Expected NVPM state.
reason (INT): (debug only) Reason for the extension failure.

nvram events

nvram.battery events

nvram.battery.capacity.low.critical

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery capacity is critically low. To prevent data loss, the system will shut down.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after system power is on, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery capacity is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.capacity.low.warn

Severity

NOTICE

Description

This message occurs when the NVRAM battery capacity is below normal.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after system power is on, replace the NVRAM battery within three months. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery capacity is below normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvram.battery.capacity.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery capacity is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery capacity is normal.

Parameters

(None).

nvram.battery.capacityLow

Severity

ERROR

Description

This message occurs when the NVRAM battery capacity is low. To prevent data loss, the system will schedule a clean chassis shutdown if the problem is not corrected.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. The battery charges automatically. If the capacity is not restored automatically within 30 minutes after system power is on, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery capacity is low (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvram.battery.chargeFET.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery charge FET is on.

Corrective Action

(None).

Syslog Message

The NVRAM battery charge FET is on.

Parameters

(None).

nvram.battery.chargeFET.off

Severity

ERROR

Description

This message occurs when the NVRAM battery charge FET is off. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Shut down the system and power-cycle the controller. If the charge FET remains off, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery charge FET is off. To prevent data loss, the system will shut down %s.

Parameters

countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.charging.nocharge

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery is requesting to be charged but the charger is not charging the battery. To prevent data loss, the system will shut down.

Corrective Action

Reseat the NVRAM battery connector. If the problem occurs again, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery is requesting to be charged but the charger is not charging the battery. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.charging.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery charging status is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery charging status is normal.

Parameters

(None).

nvram.battery.charging.wrongcharge

Severity

ERROR

Description

This message occurs when the NVRAM battery charger is charging the battery even though the battery is not requesting to be charged. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery charger is charging the battery even though the battery is not requesting to be charged. To prevent data loss, the system will shut down %s.

Parameters

countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.current.high

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery charging current is critically high. To prevent data loss, the system will shut down.

Corrective Action

Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery current is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.current.high.warn

Severity

ERROR

Description

This message occurs when the NVRAM battery charging current is above normal. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery current is above normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.current.low

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery detects a short circuit. To prevent data loss, the system will shut down.

Corrective Action

Contact NetApp technical support for assistance with identification and replacement of the appropriate component.

Syslog Message

The NVRAM battery has a short circuit (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.current.low.warn

Severity

ERROR

Description

This message occurs when the NVRAM battery is discharging when it should not. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery current is below normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.current.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery current is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery current is normal.

Parameters

(None).

nvram.battery.dischargeFET.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery discharge FET is on.

Corrective Action

(None).

Syslog Message

The NVRAM battery discharge FET is on.

Parameters

(None).

nvram.battery.dischargeFET.off

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery discharge FET is off. To prevent data loss, the system will shut down.

Corrective Action

Shut down the system and power-cycle the controller. If the discharge FET remains off, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery discharge FET is off. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.endOfLife.high

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery-cycle count indicates that the battery has reached its anticipated life expectancy.

Corrective Action

Replace the NVRAM battery in the next three months.

Syslog Message

The NVRAM battery has reached its anticipated life expectancy.

Parameters

(None).

nvram.battery.endOfLife.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery-cycle count indicates that the battery is well below its anticipated life expectancy.

Corrective Action

(None).

Syslog Message

The NVRAM battery is well below its anticipated life expectancy.

Parameters

(None).

nvram.battery.fault

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery is reporting a fatal fault condition. To prevent data loss, the system will shut down.

Corrective Action

Correct any environmental problems, such as chassis over-temperature. If the battery still reports a fatal fault, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery is reporting a fatal fault condition. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.fault.cleared

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery internal fault condition has been cleared.

Corrective Action

(None).

Syslog Message

The NVRAM battery internal fault condition has been cleared.

Parameters

(None).

nvram.battery.fault.warn

Severity

NOTICE

Description

This message occurs when the NVRAM battery is reporting a non-fatal fault condition.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the condition persists, replace the NVRAM battery in the next three months.

Syslog Message

The NVRAM battery is reporting a non-fatal fault condition.

Parameters

(None).

nvram.battery.fcc.low

Severity

ERROR

Description

This message occurs when the NVRAM battery full-charge capacity is low. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Use the "sysconfig -M" command in 7-Mode or the "run local sysconfig -M" command in clustered Data ONTAP® to get the battery manufacturer date. If the battery is newer than three years old, correct any chronic environmental problems, such as chassis over-temperature. Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery full-charge capacity is low (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.fcc.low.critical

Deprecated

Deprecated as of version 9.2.0 to address the EMS ID length violation.

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery full-charge capacity is critically low. To prevent data loss, the system will shut down.

Corrective Action

Use the "sysconfig -M" command in 7-Mode or the "run local sysconfig -M" command in clustered Data ONTAP® to get the battery manufacturer date. If the battery is newer than three years old, correct any chronic environmental problems, such as chassis over-temperature. Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery full-charge capacity is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

>**reading** (STRING): Reading that triggered this message.
>**num_minutes** (INT): Number of minutes until the system shuts down.

nvram.battery.fcc.low.warn

Severity

>NOTICE

Description

>This message occurs when the NVRAM battery full-charge capacity is below normal.

Corrective Action

>Replace the NVRAM battery in the next three months. Use the "sysconfig -M" command in 7-Mode or the "run local sysconfig -M" command in clustered Data ONTAP® to get the battery manufacturer date. If the battery is newer than three years old, correct any chronic environmental problems, such as chassis over-temperature.

Syslog Message

>The NVRAM battery full-charge capacity is below normal (%s).

Parameters

>**reading** (STRING): Reading that triggered this message.

nvram.battery.fcc.normal

Severity

>INFORMATIONAL

Description

>This message occurs when the NVRAM battery full-charge capacity is normal.

Corrective Action

>(None).

Syslog Message

>The NVRAM battery full-charge capacity is normal.

Parameters

>(None).

nvram.battery.fccLowCrit

Severity

>EMERGENCY

Description

>This message occurs when the NVRAM battery full-charge capacity is critically low. To prevent data loss, the system will shut down.

Corrective Action

Use the "system node run -node local sysconfig -M" command to obtain the battery manufacturing date. If the battery is over three years old, replacement might be necessary. Contact NetApp technical support for troubleshooting assistance.

Syslog Message

The NVRAM battery full-charge capacity is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.fcmto.warn

Severity

NOTICE

Description

This message occurs when the NVRAM battery fast-charge timeout expires. The battery will not be charged until this condition is corrected.

Corrective Action

Shut down the controller and power cycle it from the Service Processor (SP) command line interface (CLI) with the "system power cycle" command. The fast-charge timeout will be reset after the power cycle.

Syslog Message

The NVRAM battery has reached a charging timeout fault. The battery charger will not turn on again until the contoller has been power cycled. Low capacity warning messages begin in %s weeks.

Parameters

num_weeks (STRING): Number of weeks before low capacity warning messages begin.

nvram.battery.not.present

Severity

EMERGENCY

Description

This message occurs when the presence of the NVRAM battery cannot be detected. To prevent data loss, the system will shut down.

Corrective Action

While the system is shut down, ensure that the NVRAM battery is present. If the NVRAM battery is already present, ensure that the connector is seated properly. Power on the system. If this does not correct the problem, replace the NVRAM battery. If the system still does not detect the battery, contact NetApp technical support.

Syslog Message

The presence of NVRAM battery cannot be detected. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.pack.invalid

Severity

ERROR

Description

This message occurs when an unsupported NVRAM battery pack is installed in the system. To prevent data loss, the system initiates a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Shut down the system and replace the NVRAM battery with a correct battery pack.

Syslog Message

The incorrect NVRAM battery is installed. Expected part number is %s. To prevent data loss, the system will shut down in %d minutes.

Parameters

partnum (STRING): Valid battery part number.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.pack.valid

Severity

INFORMATIONAL

Description

This message occurs when a valid NVRAM battery pack is now present and readable.

Corrective Action

(None).

Syslog Message

A valid NVRAM battery pack is present.

Parameters

(None).

nvram.battery.packInvalidHrs

Severity

EMERGENCY

Description

This message occurs when an unsupported NVRAM battery pack is installed in the system. To prevent data loss, the system initiates a clean shutdown if the problem is not corrected.

Corrective Action

Shut down the system and replace the NVRAM battery with the correct battery pack.

Syslog Message

The incorrect NVRAM battery is installed. Expected part number is "%s". To prevent data loss, the system shuts down %s.

Parameters

partnum (STRING): Valid battery part number.
remaining_time (STRING): Number of hours until the system shuts down.

nvram.battery.power.fault

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery is not receiving power. To prevent data loss, the system will shut down.

Corrective Action

Ensure that the NVRAM battery connector is seated properly. Boot up the system. If the NVRAM battery is still not receiving power, replace the NVRAM battery. If the problem persists, contact NetApp technical support.

Syslog Message

The NVRAM battery is not receiving power. To prevent data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.power.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery power is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery power is normal.

Parameters

(None).

nvram.battery.sensor.unreadable

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery state cannot be determined because the sensor cannot be read. To prevent data loss, the system will shut down.

Corrective Action

Ensure that the NVRAM battery connector is seated properly. Power on the system. If the problem is not corrected, replace the NVRAM battery. If the sensor still cannot be read, contact NetApp technical support.

Syslog Message

The NVRAM battery state cannot be determined because the "%s" sensor cannot be read. To prevent data loss, the system will shut down in %d minutes.

Parameters

sensor_name (STRING): Sensor name.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.temp.high

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery temperature is critically high. To prevent data loss, the system will shut down.

Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the NVRAM battery temperature is still above normal, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery temperature is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.temp.high.warn

Severity

NOTICE

Description

This message occurs when the NVRAM battery temperature is above normal. Battery life will be severely compromised.

Corrective Action

Correct any environmental issues, such as a high ambient temperature. If the NVRAM battery temperature is still above normal, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery temperature is above normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvram.battery.temp.low

Severity

ERROR

Description

This message occurs when the NVRAM battery is too cold. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

If the system is excessively cold, allow it to warm gradually. If the NVRAM battery temperature is still too low, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery is too cold (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.temp.low.warn

Severity

NOTICE

Description

This message occurs when the NVRAM battery temperature is below normal.

Corrective Action

Allow the system to warm gradually. If the NVRAM battery temperature is still low, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery temperature is below normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvram.battery.temp.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery temperature is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery temperature is normal.

Parameters

(None).

nvram.battery.unreadHrs

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery state cannot be determined because the sensor is unreadable. If this issue is not resolved within the specified time, the system shuts down to prevent data loss.

Corrective Action

Ensure that the NVRAM battery connector is seated properly. If the problem is not corrected, replace the NVRAM battery. If the sensor is still not readable, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery state cannot be determined because the "%s" sensor is unreadable. To prevent data loss, the system shuts down %s.

Parameters

sensor_name (STRING): Sensor name.
remaining_time (STRING): Remaining time before chassis shutdown.

nvram.battery.voltage.high

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery voltage is critically high. To prevent data loss, the system will shut down.

Corrective Action

Replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

The NVRAM battery voltage is critically high (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.voltage.high.warn

Severity

ERROR

Description

This message occurs when the NVRAM battery voltage is above normal. To prevent data loss, the system will initiate a clean chassis shutdown if the problem is not corrected within 24 hours of first detection.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the NVRAM battery voltage is still above normal, replace the NVRAM battery. If the problem returns or persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery voltage is above normal (%s). To prevent data loss, the system will shut down %s.

Parameters

reading (STRING): Reading that triggered this message.
countdown (STRING): Remaining time before chassis shutdown.

nvram.battery.voltage.low

Severity

EMERGENCY

Description

This message occurs when the NVRAM battery voltage is critically low. To prevent data loss, the system will shut down.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the NVRAM battery voltage is still critically low, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery voltage is critically low (%s). To prevent data loss, the system will shut down in %d minutes.

Parameters

reading (STRING): Reading that triggered this message.
num_minutes (INT): Number of minutes until the system shuts down.

nvram.battery.voltage.normal

Severity

INFORMATIONAL

Description

This message occurs when the NVRAM battery voltage is normal.

Corrective Action

(None).

Syslog Message

The NVRAM battery voltage is normal.

Parameters

(None).

nvram.battery.voltageLowWarn

Severity

ERROR

Description

This message occurs when the NVRAM battery voltage is below normal. To prevent data loss, the system will schedule a clean chassis shutdown if the problem is not corrected.

Corrective Action

Correct any environmental problems, such as chassis over- temperature. If the NVRAM battery voltage is still below normal 30 minutes after environmental problems have been corrected, replace the NVRAM battery. If the problem persists, replace the FRU (field-replaceable unit) NVRAM card or PCM, where the battery is located.

Syslog Message

The NVRAM battery voltage is below normal (%s).

Parameters

reading (STRING): Reading that triggered this message.

nvram.excessive events

nvram.excessive.cecc.errs

Severity

ALERT

Description

This message occurs when excessive correctable error-correcting code (ECC) memory errors are reported by the NVRAM complex.

Corrective Action

Use the "system environment sensors show -hidden true" cluster shell command to view the current "NV Correctable ECC count" and "NV Correctable ECC rate" values. Contact NetApp technical support for further assistance.

Syslog Message

Excessive correctable ECC errors in the NVRAM card.

Parameters

(None).

nvram.excessive.sbit.ecc.errs

Deprecated

Deprecated as of version 9.2.0 to address the EMS ID length violation.

Severity

ALERT

Description

This event is issued to report excessive singlebit ECC errors.

Corrective Action

(None).

Syslog Message

Excessive singlebit ECC errors in the NVRAM card

Parameters

(None).

nvram.flash events

nvram.flash.spare.low

Severity

ALERT

Description

This message occurs periodically when the capacity of the NVRAM flash memory spare blocks is low, before it becomes critically low. This issue typically indicates that the NVRAM hardware is approaching the end of its service life and should be replaced soon.

Corrective Action

Contact NetApp technical support for replacement assistance.

Syslog Message

NVRAM flash memory spare capacity is low: %s.

Parameters

problem (STRING): Information about the NVRAM flash memory spare blocks whose capacity is low and about its condition.

nvram.hw events

nvram.hw.degraded

Severity

ERROR

Description

This message occurs when the NVRAM hardware is degraded.

Corrective Action

Contact NetApp technical support for replacement assistance.

Syslog Message

NVRAM hardware is degraded: %s.

Parameters

reasonText (STRING): Reason the NVRAM hardware is degraded.

nvram.hw.initFail

Severity

EMERGENCY

Description

This message occurs when the Data ONTAP® NVRAM hardware fails to initialize.

Corrective Action

Typically, this type of error is unexpected and indicates that the NVRAM hardware is failing and should be replaced. Contact NetApp technical support for assistance with the replacement.

Syslog Message

NVRAM hardware initialization failed: %s.

Parameters

error (STRING): Description of the error.

nvram.hw.normal

Severity

NOTICE

Description

This message occurs when the NVRAM hardware is operating normally.

Corrective Action

(None).

Syslog Message

NVRAM hardware is operating normally.

Parameters

(None).

nwd events

oauth2 events

oauth2.httpd events

oauth2.httpd.restart.failed

Severity

ERROR

Description

This message occurs when the httpd process fails to restart when the OAuth 2.0 status changes.

Corrective Action

Contact NetApp technical support.

Syslog Message

When the OAuth 2.0 status changed, the httpd process failed to restart for the following reason: %s.

Parameters

reason (STRING): Reason why the httpd process failed to restart when there was a change in the OAuth 2.0 status of the cluster.

oauth2.localroles events

oauth2.localroles.unauth

Severity

ERROR

Description

This message occurs when an authentication fails when the "use-local-roles-if-present" setting is set to "true", but the user information does not exist in ONTAP, or the scope information within the access token does not grant sufficient access in ONTAP.

Corrective Action

Add a local user entry using the "security login create" command, or include the relevant scope information in the access token.

Syslog Message

Authentication of requested user "%s" in SVM "%s" failed because the "use-local-roles-if-present" setting is set to "true"; however, the user information does not exist in ONTAP, or the scope information within the access token does not grant sufficient access in ONTAP.

Parameters

user (STRING): User for whom authentication failed.
vserver (STRING): SVM to which the user belongs.

oauth2.status events

oauth2.status.disabled

Severity

NOTICE

Description

This message occurs when the OAuth 2.0 status of the cluster is changed to DISABLED.

Corrective Action

(None).

Syslog Message

Status of OAuth 2.0 has been changed to DISABLED.

Parameters

(None).

oauth2.status.enabled

Severity

NOTICE

Description

This message occurs when the OAuth 2.0 status of the cluster is changed to ENABLED.

Corrective Action

(None).

Syslog Message

Status of OAuth 2.0 has been changed to ENABLED.

Parameters

(None).

oauth2.wsdb events

oauth2.wsdb.set.failed

Severity

ERROR

Description

This message occurs when setting the SSL trusted server CA path in web services database fails. Potential reason could be that the application is busy or unresponsive. This will impact OAuth2.0 user authentication.

Corrective Action

Ensure all nodes in the cluster are online and healthy by running the "cluster show" command and verifying that the "Health" and "Eligibility" fields displayed as true. If true, retry the operation. If the issue persists,

contact NetApp technical support.

Syslog Message

Failed to set the SSL trusted server CA path in web services database.

Parameters

(None).

object events

object.store events

object.store.available

Severity

NOTICE

Description

This message occurs when the node can connect to the object store again after an "object.store.unavailable" error.

Corrective Action

(None).

Syslog Message

Able to connect to the object store "%s" from node %s.

Parameters

configname (STRING): Object store configuration name.
node_uuid (STRING): UUID of the node.

object.store.c2s.clock.ahead

Severity

ERROR

Description

This message occurs when the cluster has a Commercial Cloud Services (C2S) object store configured, and the clock on a node is skewed forward more than the maximum allowed number of minutes.

Corrective Action

Correct the clock on a node by using the "date" command. Make sure that the nodes sync their clocks through the NTP service by using the "cluster time-service ntp" commands. If the condition persists, contact NetApp technical support.

Syslog Message

The clock on node "%s" is ahead by more than the maximum of %d minutes. Current skew is %d:%d minutes.

Parameters

node_uuid (STRING): UUID of the node.
max_allowed_skew_minutes (INT): Maximum allowed number of minutes by which the clock on a node can be skewed forward.
clock_skew_minutes (INT): Number of minutes by which the clock on a node is skewed forward.
clock_skew_seconds (INT): Number of seconds by which the clock on a node is skewed forward.

object.store.c2s.clock.late

Severity

ERROR

Description

This message occurs when the cluster has a Commercial Cloud Services (C2S) object store configured, and the clock on a node is skewed backwards more than the maximum allowed number of minutes. Data in the C2S object store might become inaccessible for some time because the node might not update expired temporary credentials on time.

Corrective Action

Correct the clock on a node by using the "date" command. Make sure that the nodes synchronize their clocks through the NTP service by using the "cluster time-service ntp" commands. If the condition persists, contact NetApp technical support.

Syslog Message

The clock on node "%s" is behind by more than the maximum of %d minutes. Current skew is %d:%d minutes.

Parameters

node_uuid (STRING): UUID of the node.
max_allowed_skew_minutes (INT): Maximum allowed number of minutes by which the clock on a node can be skewed backwards.
clock_skew_minutes (INT): Number of minutes by which the clock on a node is skewed backwards.
clock_skew_seconds (INT): Number of seconds by which the clock on a node is skewed backwards.

object.store.c2s.notupdated

Severity

EMERGENCY

Description

This message occurs when the node fails to update temporary credentials required for accessing a Commercial Cloud Services (C2S) object store. Data in the C2S object store might not be accessible.

Corrective Action

Verify that LIFs in the appropriate IPSpace are online and functional by using the "network interface show" command. Also, check network connectivity to the CAP through a LIF in the appropriate IPSpace by using the "network ping" command. Additionally, ensure that security certificates for the server certificate authorities (CA) and for the client are installed and valid. If the condition persists, contact NetApp technical support.

Syslog Message

Failed to update temporary credentials that expired on %s in object store "%s" from node "%s". %s. CAP URL: %s

Parameters

credentials_expiration (STRING): Date and time when temporary credentials expired.
object_store_name (STRING): Object store configuration name.
node_uuid (STRING): UUID of the node.
reason (STRING): Reason the temporary credentials were not updated.

cap_url (STRING): Full URL of the request to a C2S Authentication Portal (CAP).

object.store.c2s.updated

Severity

NOTICE

Description

This message occurs when the node updates temporary credentials required for accessing a Commercial Cloud Services (C2S) object store after an "object.store.c2s.notupdated" error.

Corrective Action

(None).

Syslog Message

Successfully updated temporary credentials for object store "%s" from node "%s". New expiration: %s, CAP URL: %s

Parameters

object_store_name (STRING): Object store configuration name.
node_uuid (STRING): UUID of the node.
credentials_expiration (STRING): Updated date and time when temporary credentials expire.
cap_url (STRING): Full URL of the request to a C2S Authentication Portal (CAP).

object.store.certificate.off

Severity

NOTICE

Description

This message occurs when SSL/TLS certificate validation is disabled for an object store configuration.

Corrective Action

Enable certificate validation by using the "storage aggregate object-store config modify -object-store-name <name> -is-certificate-validation-enabled true" command.

Syslog Message

SSL/TLS certificate validation is disabled for an object store configuration %s.

Parameters

object_store_name (STRING): Name of the object store configuration.

object.store.certificate.on

Severity

NOTICE

Description

This message occurs when SSL/TLS certificate validation is enabled for an object store configuration for which it was previously disabled.

Corrective Action

(None).

Syslog Message

SSL/TLS certificate validation is enabled for object store configuration %s.

Parameters

object_store_name (STRING): Name of the object store configuration.

object.store.degraded.mirror.swapped

Severity

NOTICE

Description

This message occurs when a FabricPool's primary object store and its mirror object store are swapped while the mirror object store is in a degraded state.

Corrective Action

(None).

Syslog Message

The primary object store (%s) and the degraded mirror object store (%s) are swapped for FabricPool %s.

Parameters

primary_object_store (STRING): Name of the primary object store before swap.
mirror_object_store (STRING): Name of the mirror object store before swap.
aggr (STRING): Name of the FabricPool.

object.store.force.tier.mcc

Severity

NOTICE

Description

This message occurs when the "-force-tiering-on-metrocluster" parameter is changed for an object store attached to a FabricPool that is in a MetroCluster(tm) configuration.

Corrective Action

(None).

Syslog Message

The "-force-tiering-on-metrocluster" parameter is set to "%s" on the object store "%s" attached to FabricPool "%s".

Parameters

is_force_tier_on_mcc (STRING): Current setting of the "-force-tiering-on-metrocluster" parameter (true or false).
object_store (STRING): Name of the object store.
aggr (STRING): Name of the FabricPool.

object.store.full

Severity

ALERT

Description

This message occurs when the node failed to write data to the specified object store because it is out of space. You may see other EMS notifications from dependent subsystems.

Corrective Action

Examine the object store, check the space settings, and if necessary, create space by adding capacity to the object store.

Syslog Message

Failed to write to object store %s because it is out of space.

Parameters

config_name (STRING): Object store configuration name.

object.store.mirror.added

Severity

NOTICE

Description

This message occurs when the second object store is attached to the FabricPool. After mirror operation, FabricPool contain primary and mirror object store.

Corrective Action

(None).

Syslog Message

A second object store (%s) is added to FabricPool %s with primary object store (%s) as a mirror.

Parameters

mirror_object_store (STRING): Name of the mirror object store.
aggr (STRING): Name of the FabricPool.
primary_object_store (STRING): Name of the primary object store.

object.store.mirror.swapped

Severity

NOTICE

Description

This message occurs when a FabricPool's primary object store and its mirror object store are swapped.

Corrective Action

(None).

Syslog Message

The primary object store (%s) and the mirror object store (%s) are swapped for FabricPool %s.

Parameters

primary_object_store (STRING): Name of the primary object store before swap.
mirror_object_store (STRING): Name of the mirror object store before swap.
aggr (STRING): Name of the FabricPool.

object.store.mirror.unmirror

Severity

NOTICE

Description

This message occurs when the mirror object store is removed from a FabricPool. FabricPool is said to be unmirrored.

Corrective Action

(None).

Syslog Message

The mirror object store (%s) is removed from FabricPool %s with primary object store (%s).

Parameters

mirror_object_store (STRING): Name of the mirror object store.
aggr (STRING): Name of the FabricPool.
primary_object_store (STRING): Name of the primary object store.

object.store.no.proxy

Severity

ALERT

Description

This message occurs when one or more object store configurations have use-http-proxy set to true but no HTTP proxy is configured for the IPspace. This can lead to client I/O failures.

Corrective Action

Create an HTTP proxy configuration for the IPspace or change use-http-proxy to false for the object store configurations associated with that IPspace.

Syslog Message

One or more object store configurations have use-http-proxy set to true but no HTTP proxy configuration was found for the IPspace.

Parameters

ipspace_name (STRING): Name of the IPspace that does not have an HTTP proxy server configured.

object.store.unavailable

Severity

EMERGENCY

Description

This message occurs when the node cannot connect to the object store.

Corrective Action

Verify that your intercluster LIF is online and functional by using the "network interface show" command. Also, check network connectivity to the object store server by using the "ping" command over the destination node intercluster LIF. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information is still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Unable to connect to the object store "%s" from node %s. Reason: %s.

Parameters

configname (STRING): Object store configuration name.
node_uuid (STRING): UUID of the node.
reason (STRING): Reason for the failure to connect.

objectattach events

objectattach.hw events

objectAttach.hw.unsupported

Severity

NOTICE

Description

This message occurs when an object store attach failed due to an unsupported hardware configuration.

Corrective Action

(None).

Syslog Message

Object store attach failed because node %s with model %s is not supported by FabricPools.

Parameters

node (STRING): Node that has the unsupported hardware version.
model (STRING): Model information.

objstore events

objstore.host events

objstore.host.unresolvable

Severity

ERROR

Description

This message occurs when the object-store server host name cannot be resolved to an IP address. The object-store client will not be able to communicate with the object-store server without resolving to an IP address.

Corrective Action

Check the DNS configuration to verify that the host name is configured correctly with an IP address.

Syslog Message

Object-store server host name "%s" cannot be resolved to an IP address on node %s.

Parameters

hostname (STRING): Host name of the object-store server.
nodeUuid (STRING): UUID of the node.

objstore.interclusterlifdown events

objstore.interclusterlifDown

Severity

ERROR

Description

This message occurs when the object store client cannot find an operational LIF to communicate with the object store server. This node does not allow object store client traffic until the intercluster LIF is operational.

Corrective Action

Check the intercluster LIFs and route configurations. Use the "network interface show -role intercluster" command to check intercluster LIF status. Verify that the intercluster LIF is configured correctly and is operational. If an intercluster LIF is not configured, use the "network interface create -role intercluster" command to create it.

Syslog Message

Object store client cannot find an operational intercluster LIF (system SVM ID: %d) or an associated route on node with UUID %s, making the object store server unreachable.

Parameters

sysVserverID (INT): System storage virtual machine ID of the intercluster LIF.
nodeUuid (STRING): Universal unique identifier (UUID) of the node.

old events

old.replica events

old.replica.volume

Severity

ALERT

Description

This message occurs when a wafliron operation determines that a volume served as a SnapMirror® destination for a previous release of Data ONTAP®.

Corrective Action

Retry the wafliron operation after the SnapMirror relationship is updated for this volume.

Syslog Message

Wafliron cannot start on aggregate %s because aggregate contains a volume %s which served as a snapmirror destination for a previous release of ONTAP.

Parameters

aggrname (STRING): Name of the aggregate.
volname (STRING): Name of the volume.

openssh events

openssh.unsupported events

openssh.unsupported.cipher

Severity

ERROR

Description

This message occurs when an unsupported cipher is used while attempting an SSH connection.

Corrective Action

Attempt to connect with SSH by using a supported cipher.

Syslog Message

Attempted an SSH connection using unsupported cipher %s.

Parameters

ciphername (STRING): Cipher used for the SSH connection.

openssh.unsupported.hostalgo

Severity

ERROR

Description

This message occurs when an unsupported host key algorithm is used while attempting an SSH connection.

Corrective Action

Attempt to connect with SSH by using a supported host key algorithm.

Syslog Message

SSH connection from %s was attempted using an unsupported host key algorithm %s.

Parameters

ipaddress (STRING): IP address of the remote host that was trying to establish an SSH connection.
hostkeyalgorithm (STRING): Host key algorithm used for the SSH connection attempt.

openssh.unsupported.kexalgo

Severity

ERROR

Description

This message occurs when an unsupported key exchange algorithm is used while attempting an SSH connection.

Corrective Action

Attempt to connect with SSH by using a supported key exchange algorithm.

Syslog Message

Attempted an SSH connection using unsupported key exchange algorithm %s.

Parameters

kexalgorithm (STRING): Key exchange algorithm used for the SSH connection.

openssh.unsupported.MAC

Severity

ERROR

Description

This message occurs when an unsupported Message Authentication Code (MAC) is used while attempting an SSH connection.

Corrective Action

Attempt to connect with SSH by using a supported MAC.

Syslog Message

Attempted an SSH connection using unsupported MAC %s.

Parameters

macname (STRING): MAC used for the SSH connection.

osc events

osc.bucket events

osc.bucket.notFound

Severity

ERROR

Description

This message occurs when the object-store bucket or container is not found while trying to access an object.

Corrective Action

Verify that the bucket or container has been created on the object-store server and the same name has been correctly configured in ONTAP before accessing the bucket.

Syslog Message

Bucket or container "%s" not found on object-store server %s when performing %s operation.

Parameters

bucket (STRING): Name of the bucket or container.
serverHostname (STRING): Hostname of the object-store server.
operation (STRING): Request name.

osc.signaturemismatch events

osc.signatureMismatch

Severity

ERROR

Description

This message occurs when the request signature sent to the object-store server does not match the signature calculated.

Corrective Action

Verify that the secret access key is configured correctly. If it is correct, contact NetApp technical support for assistance.

Syslog Message

Object-store %s operation server-calculated request signature does not match the signature sent to object-store server %s for bucket or container "%s" on node %s. Check the keys and signing method.

Parameters

operation (STRING): Request name.
serverHostname (STRING): Hostname of the object-store server.
bucket (STRING): Name of the object-store bucket.
nodeUuid (STRING): UUID of the node.

osc.tcp events

osc.tcp.connectFailed

Severity

ERROR

Description

This message occurs when ONTAP is unable to connect to the IP address that the object store server hostname resolves to.

Corrective Action

Check if the object store server is listening on this IP address. Check network configuration.

Syslog Message

TCP connection to object store server hostname "%s" fails over IP address "%s" on node "%s".

Parameters

hostname (STRING): Hostname of the object store server.
ipAddress (STRING): IP address over which the TCP connection fails.
nodeUuid (STRING): Universal unique identifier (UUID) of the node.

other events

other.veto events

other.veto.kmgr.keysmissing

Severity

ERROR

Description

This message occurs when a giveback or aggregate relocation operation fails but ONTAP® software cannot determine the specific operation type. The specific operation failed due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the partner or destination node.

Corrective Action

Wait a few minutes, and then try the failed operation again. If the problem persists, run the "security key-manager external restore" command for external key manager, or the "security key-manager onboard sync" command for Onboard Key Manager. Then try failed operation again. The commands retrieve the encryption keys for the encrypted volumes of the aggregate from the key manager.

Syslog Message

Relocation or giveback of aggregate %s has failed due to the unavailability of volume encryption keys for the encrypted volumes of the aggregate on the destination (if a relocation operation) or partner node %s (if a giveback operation). Operation code: %d. Details: %s.

Parameters

aggr (STRING): Name of the aggregate that was not relocated or given back.
dest_node (STRING): Name of the destination node that is missing encryption keys.
op_code (INT): Code of the failed operation
details (STRING): Detailed reason for failure.

other.veto.query.timeout

Severity

ERROR

Description

This message occurs when a query operation on the VEK table times out. The specific operation failed because either a network connection issue occured or the query could not be completed within the time limit .

Corrective Action

Verify that there are no network connectivity issue, and then, if the query still times out, consider overriding the veto.

Syslog Message

Relocation or giveback of aggregate "%s" has failed because the restoration status of all of the encryption keys on the destination (if a relocation operation) or partner node (if a giveback operation) "%s" could not be verified within the allotted time.

Parameters

    aggr (STRING): Name of the aggregate that was being queried when the timeout occurred.
    dest_node (STRING): Name of the destination node.

pac events

pac.access events

pac.access

Severity

INFORMATIONAL

Description

This message occurs when the access is denied or unsuccessful for the specified source host, destination host, and network interface combination.

Corrective Action

If you want to provide access, then modify 'options.(protocol).access' to allow access.

Syslog Message

%s: %s from if = %s, source IP = %s, destination IP = %s. Check options %s.access, if desired.

Parameters

protocol1 (STRING): Protocol.
status (STRING): Access status.
ifIpAdr (STRING): Interface address.
srcIpAdr (STRING): Source IP address.
dstIpAdr (STRING): Destination IP address.
protocol2 (STRING): Protocol.

pac.if events

pac.if.getName

Severity

INFORMATIONAL

Description

This message occurs when the protocol access control fails to get the interface name with the address.

Corrective Action

(None).

Syslog Message

%s: getifnamewithaddr() failed with address %s in protocol access control.

Parameters

protocol (STRING): Protocol.
ifAddr (STRING): Interface IP address in internet standard dotted notation.

pac.peer events

pac.peer.getName

Severity

INFORMATIONAL

Description

This message occurs when the protocol access control fails to get the peer name.

Corrective Action

Check Domain Name System (DNS) for possible errors.

Syslog Message

%s: getpeername() failed in protocol access control with %s.

Parameters

protocol (STRING): Protocol.
errMessage (STRING): Internal error message indicating why the peer name could not be obtained.

pac.sock events

pac.sock.getName

Severity

INFORMATIONAL

Description

This message occurs when the protocol access control fails to get the socket name.

Corrective Action

(None).

Syslog Message

%s: getsockname() failed in protocol access control with %s.

Parameters

protocol (STRING): Protocol.
errMessage (STRING): Internal error message indicating why the socket name could not be obtained.

passwd events

passwd.changed events

passwd.changed

Severity
NOTICE

Description
The password for a user has been changed.

Corrective Action
(None).

Syslog Message
passwd for user '%s' changed.

Parameters
username (STRING): The name of the user whose password has just been changed.

pci events

pci.init events

PCI.init.process.timeWarn

Severity

NOTICE

Description

This message occurs to warn about the time taken by PCI initialization when PCI configuration is waiting for outstanding background threads that might still be running.

Corrective Action

(None).

Syslog Message

The PCI initialization process has taken %d seconds.

Parameters

processTime (INT): Time taken by PCI initialization process.

pcie events

pcie.errors events

pcie.errors

Severity

NOTICE

Description

This message occurs when correctable PCI Express errors are detected.

Corrective Action

(None).

Syslog Message

PCI Express correctable error - %s

Parameters

pcie_errors (STRING): String contains details about the PCI Express correctable error(s) and which device(s) was/were the source of error(s).

pcie.link events

pcie.link.errors

Severity

NOTICE

Description

This message occurs when PCI Express link errors are detected.

Corrective Action

(None).

Syslog Message

PCI Express link error - %s

Parameters

pcie_link_errors (STRING): String contains details about the PCI Express link error(s) and which device(s) was/were the source of error(s).

pcnfsd events

pcnfsd.auth events

pcnfsd.auth.failure

Severity

ERROR

Description

This message occurs when the authorization for a user fails due to a corrupted password entry in /etc/passwd.

Corrective Action

Restore the password entry for the user.

Syslog Message

Corrupted password in /etc/passwd file.

Parameters

(None).

pcp events

pcp.linkstatechangesucceed events

pcp.linkStateChangeSucceed

Severity

NOTICE

Description

This message occurs when a change of network port state can now be confirmed after the initial attempt failed due to some race condition. The affected port is now operational.

Corrective Action

(None).

Syslog Message

Link state change for port %s can now be confirmed after the change %u seconds ago.

Parameters

portname (STRING): Port name.
retrySeconds (INT): Number of seconds that the port state change could not be confirmed.

pcp.linkstateinprogress events

pcp.linkStateInProgress

Severity

ERROR

Description

This message occurs when a change of network port state cannot be confirmed because another configuration task is in progress. The change of the network port state happens when the node is booting up or the administrator changes the network port state manually, via the "network port modify -up-admin [true|false]" command. The affected port might still be operating in the state before the attempted change. While this condition exists, any further configuration or status operations will not be possible.

Corrective Action

The link state change request will be retried in the next 5 minutes. If it succeeds, a linkStateChangeSucceed event will be generated. If the issue persists for more than 5 minutes, and the linkStateChangeSucceed event is not generated, there is a configuration task that has not proceeded correctly. The system state will be automatically collected and and an AutoSupport® callhome event will be generated. The node from which this event was triggered needs to be rebooted to clear the issue.

Syslog Message

Link state change cannot be confirmed on port %s.

Parameters

portname (STRING): Port name.

perclientstorepoolthreshold events

perclientstorepoolthreshold events

PerClientStorePoolThreshold

Severity

NOTICE

Description

This message occurs when one of the NFSv4 clients is consuming more resources of a particular store pool type.

Corrective Action

(None).

Syslog Message

NFSv4 client %s has consumed more resources for store pool type %s.

Parameters

clientIpAddress (STRING): IP address of the client machine.
poolName (STRING): NFSv4 store pool type.

perf events

perf.ccma events

perf.ccma.off

Severity

ALERT

Description

This message occurs when the performance archiver is not enabled, which makes it difficult for technical support to troubleshoot performance issues on the system.

Corrective Action

Enable the performance archiver to track system activity and allow technical support to troubleshoot performance problems by running the "statistics archive config modify -is-enabled true" command. Note that the performance archiver is disabled during takeover and giveback, and in a failure scenario when the archiver loses communication with the Counter Manager Quota Management system; these two scenarios do not resolve by administratively enabling the archiver.

Syslog Message

Performance archiver is not enabled for datastore '%s'.

Parameters

datastore (STRING): Datastore name.

perf.ccma.startupFailed

Severity

ALERT

Description

This message occurs when the performance archiver fails to startup.

Corrective Action

(None).

Syslog Message

Performance archiver failed to startup.

Parameters

reason (STRING): Reason for failure to startup

perf.ccma.stop

Severity

NOTICE

Description

This message occurs when the performance archiver is disabled.

Corrective Action

(None).

Syslog Message

Performance archiver stopped.

Parameters

(None).

perfstatd events

perfstatd.dir events

perfstatd.dir.permission

Severity

ERROR

Description

This message occurs when the perfstat daemon (perfstatd) startup fails due to improper permissions for the '/mroot/etc/log' directory. This failure impacts the continuous archiving of performance data that technical support uses to troubleshoot performance issues.

Corrective Action

Verify that the permissions of the '/mroot/etc/log' directory are 'rwxr-xr-x' by executing the 'fsecurity show /vol/vol0/etc/log' command from the nodeshell. After correcting the permissions for this directory, restart perfstatd by executing the 'spmctl -e -h perfstatd' command from the freebsd shell.

Syslog Message

The perfstat daemon startup failed due to improper directory permissions.

Parameters

(None).

perfstatd.disk events

perfstatd.disk.full

Severity

ERROR

Description

This message occurs when the perfstat daemon (perfstatd) startup fails due to a full disk.This failure impacts the continuous archiving of performance data that technical support uses to troubleshoot performance issues.

Corrective Action

Verify that the '/mroot' file system is full by executing the 'df /mroot' command from the freebsd shell. After clearing some space, restart perfstatd by executing the 'spmctl -e -h perfstatd' command from the freebsd shell.

Syslog Message

The perfstat daemon startup failed due to a full disk.

Parameters

(None).

perfstatd.start events

perfstatd.start.unsuccessful

Severity

ERROR

Description

This message occurs when the perfstat daemon (perfstatd) startup fails. This failure impacts the continuous archiving of performance data that technical support uses to troubleshoot performance issues.

Corrective Action

The startup failure might be due to improper permissions for the '/mroot/etc/log' directory or a full disk. Verify that the permissions of the '/mroot/etc/log' directory are 'rwxr-xr-x' by executing the 'fsecurity show /vol/vol0/etc/log' command from the nodeshell. Verify that the '/mroot' file system is not full. After fixing the cause of the failure, restart perfstatd by executing the 'spmctl -e -h perfstatd' command from the freebsd shell.

Syslog Message

The perfstat daemon startup failed.

Parameters

(None).

pha events

pha.add events

pha.add.dev.limitExceeded

Severity

ERROR

Description

This message occurs when an attempt to add a passthrough host adapter (PHA) disk to a virtual disk adapter fails because the supplied disk number exceeds the maximum supported disk ID.

Corrective Action

Reduce the number of devices connected to Data ONTAP® and retry this operation.

Syslog Message

Failed to add a device with unit number %d to virtual disk adapter. Reason: Supplied disk number exceeds the max number of supported disks.

Parameters

disk_num (INT): Unit number for the rejected disk.

pha.dev events

pha.dev.get.capacity.failed

Severity

ERROR

Description

This message occurs when ONTAP®software fails to get a drives's capacity after an extended wait. As a result, cannot add the drive.

Corrective Action

Ensure that the hypervisor's device is still connected and accessible by ONTAP.

Syslog Message

Failed to get drive capacity for device %s%d after %d seconds.

Parameters

devname (STRING): Name of the device.
unit (INT): Unit number of the device.
wait_time (INT): Number of seconds waited for capacity information.

pha.dev.get.uuid.bioReadErr

Severity

ERROR

Description

This message occurs when block read operation for the passthrough host adapter (PHA) disk header returns an error. As a result, Data ONTAP® is unable to add or manage this device.

Corrective Action

Ensure that the device is still connected to and accessible by Data ONTAP® and retry the operation.

Syslog Message

Failed to get UUID for device %s%d. Reason: Block read operation returned an error: 0x%x.

Parameters

devname (STRING): Name of the device.
unit (INT): Unit number of the device.
bio_error (INTHEX): Error code returned by block read operation.

pha.dev.get.uuid.devNotAdded

Severity

ERROR

Description

This message occurs when Data ONTAP® fails to get disk header after multiple retries and finally give up. As a result, Data ONTAP® is unable to add the disk.

Corrective Action

Ensure that the device is still connected to and accessible by Data ONTAP® and retry the operation.

Syslog Message

Failed to get disk header for device %s%d. Number of bioerr %d Retries %d.

Parameters

devname (STRING): Name of the device.
unit (INT): Unit number of the device.
bioerr_cnt (INT): Number of BIO errors.
retry_cnt (INT): Number of retries.

pha.dev.get.uuid.devNotExist

Severity

ERROR

Description

This message occurs when Data ONTAP® fails to retrieve the the descriptor for the passthrough host adapter (PHA) device. As a result, Data ONTAP® fails to read the header on this device and is unable to add or manage it.

Corrective Action

Ensure that the device is still connected to and accessible by Data ONTAP® and retry the operation.

Syslog Message

Failed to retrieve the descriptor for device %s%d. Reason: %s.

Parameters

>**devname** (STRING): Name of the device.
>**unit** (INT): Unit number of the device.
>**error** (STRING): Error message.

pha.dev.header.err

Severity

>ERROR

Description

>This message occurs when a disk header operation encounters a device error. As a result, ONTAP® might be unable to add or manage this device.

Corrective Action

>Ensure that the device is still connected to and accessible by ONTAP. If the device is reported as healthy by the hypervisor, contact NetApp technical support to open a support case to investigate the underlying cause.

Syslog Message

>Functional operation "%s" failed for device %s%d. Error number: 0x%x, CAM status: 0x%x, SCSI (status: 0x%x, sense key: x%x, sense code: 0x%x, additional sense code: 0x%x, additional sense code qualifier: 0x%x).

Parameters

>**operation** (STRING): Name of the functional operation.
>**devname** (STRING): Name of the device.
>**unit** (INT): Unit number of the device.
>**bio_error** (INTHEX): Error code returned by the device.
>**cam_status** (INTHEX): Common Access Method (CAM) status code returned by the device.
>**scsi_status** (INTHEX): SCSI status code returned by the device, if available.
>**error_code** (INTHEX): SCSI error code returned by the device, if available.
>**sense_key** (INTHEX): SCSI sense key returned by the device, if available.
>**asc** (INTHEX): SCSI additional sense code returned by the device, if available.
>**ascq** (INTHEX): SCSI additional sense code qualifier returned by the device, if available.

pha.dev.uuidWriteHeaderErr

Severity

>ERROR

Description

>This message occurs when Data ONTAP® fails to write the header to the passthrough host adapter (PHA) device. As a result, Data ONTAP® is unable to add or manage this device.

Corrective Action

>Ensure that the device is still connected to and accessible by Data ONTAP® and retry the operation.

Syslog Message

>Failed to write header to the device %s%d.

Parameters

    devname (STRING): Name of the device.
    unit (INT): Unit number of the device.

pha.disk events

pha.disk.type.changed

Severity

    ERROR

Description

    This message occurs when the backing disk type for an existing disk was changed from the cloud API.

Corrective Action

    Check whether the disk type of the failed disk was changed. Change the backing disk type to the original value.

Syslog Message

    Backing disk type changed for Disk: %s, Volume: %s. Error: %s.

Parameters

    d_name (STRING): Disk name
    d_id (STRING): Disk ID
    errmsg (STRING): Indicating the stage at which the disk lookup failed.

pha.disk.type.lookup.failed

Severity

    ERROR

Description

    This message occurs when the backing disk type lookup fails.

Corrective Action

    Check that the disk type of the failed disk is supported. Remove the affected disk.

Syslog Message

    Failed to recognize backing disk type for Disk: %s, Volume: %s. Error: %s.

Parameters

    d_name (STRING): Disk name.
    d_id (STRING): Disk ID
    errmsg (STRING): Indicating the stage at which the disk lookup failed.

pha.obj events

pha.obj.blobGone

Severity

NOTICE

Description

This message occurs when ONTAP® detects that a blob has been deleted from a container.

Corrective Action

If the identified blob was not intentionally deleted, attempt to recover it with the object store provider.

Syslog Message

Blob "%s" is no longer seen in object store, "%s".

Parameters

blob (STRING): Object name.
configName (STRING): Object store configuration name.

pha.obj.scanFailure

Severity

ERROR

Description

This message occurs when ONTAP® cannot get a list of objects from the object store server.

Corrective Action

If the error text indicates an authentication problem, verify that the stored credentials are correct by using the "system node virtual-machine disk-object-store modify" command. If the error text describes a connection problem, determine the IP address for the object store server. If the address reported in this event does not match, examine the DNS cache for errors by using the "system node virtual-machine disk-object-store dns-cache show" command. If the address does match, check the status of both the object store server and the network.

Syslog Message

ONTAP could not get a list of objects from the object store, "%s", at "%s", using IP address "%s" with error: %s.

Parameters

configName (STRING): Object store configuration name.
server (STRING): Object store server name.
ipAddress (STRING): Object store IP address.
error (STRING): Error string.

pha.obj.scanSuccess

Severity

NOTICE

Description

This message occurs when ONTAP® succeeds at retrieving a list of objects from the object store server after reporting a failure.

Corrective Action

(None).

Syslog Message

ONTAP successfully retrieved a list of objects from the object store, "%s".

Parameters

configName (STRING): Object store configuration name.

pha.obj.storeAvailable

Severity

NOTICE

Description

This message occurs when ONTAP® can communicate with the object store server.

Corrective Action

(None).

Syslog Message

ONTAP successfully communicated with the object store, "%s".

Parameters

configName (STRING): Object store configuration name.

pha.obj.storeCreateFailed

Severity

ERROR

Description

This message occurs when ONTAP® software cannot create the object store configuration.

Corrective Action

Verify that the values provided for the create operation are correct. ONTAP supports either the HTTPS or HTTP protocol and not a mixed configuration. The value for the port should be the same as the first object store's (object_store0) port. Verify the first object store's port by using the "system node virtual-machine disk-object-store show -object-store-name object_store0 -node node_name" command, which will display the port as "Port Number of the Object Store".

Syslog Message

ONTAP could not create the object store, "%s", due to reason: %s.

Parameters

configName (STRING): Object store configuration name.
reason (STRING): An object store create operation was attempted with a port value that wasn't equal to that of object_store0.

pha.obj.storeDeleted

Severity

NOTICE

Description

This message occurs when ONTAP® finishes deleting the connection to the object store server.

Corrective Action

(None).

Syslog Message

ONTAP has removed the object store configuration, "%s".

Parameters

configName (STRING): Object store configuration name.

pha.obj.storeDeleting

Severity

NOTICE

Description

This message occurs when ONTAP® begins to tear down the connection to the object store server.

Corrective Action

(None).

Syslog Message

ONTAP began removing the object store configuration, "%s".

Parameters

configName (STRING): Object store configuration name.

pha.obj.storeUnavailable

Severity

EMERGENCY

Description

This message occurs when ONTAP® cannot communicate with the object store server.

Corrective Action

Verify that the configuration of the object store, including the login credentials, is still accurate by using the "system node virtual-machine disk-object-store show" command. Check the network status for connectivity errors.

Syslog Message

ONTAP could not communicate with the object store, "%s".

Parameters

configName (STRING): Object store configuration name.

pha.obj.storeUpdateFailed

Severity

ERROR

Description

This message occurs when ONTAP® cannot update the object store configuration.

Corrective Action

Verify that the updates are correct. Then create a new object store configuration with the updated fields. Delete the old configuration after ONTAP detects the new disk paths.

Syslog Message

ONTAP could not update the object store configuration, "%s", due to reason: %s.

Parameters

configName (STRING): Object store configuration name.
reason (STRING): Reason for the failure.

pha.obj.throttle

Severity

NOTICE

Description

This message occurs when the passthrough host adapter object (PHA Obj) throttled on the disks due to receiving the OSC_CONNECTION_UNAVAILABLE, OSC_TIMEOUT or AZURE_SERVER_BUSY error from OSC.

Corrective Action

(None).

Syslog Message

PHA Obj throttled %llu times on the blob %s in the container %s due to the "%s".

Parameters

counter (LONGINT): The throttle counter.
blobName (STRING): The throttling blob name.
containerName (STRING): The throttling container name.
throttleReason (STRING): The error which triggered throttling.

pha.obj.unknownTier

Severity

ERROR

Description

This message occurs when ONTAP® does not recognize the tier of a page blob.

Corrective Action

Change the blob tier to one that ONTAP will recognize: P10, P15, P20, P30, P40, P50, or P60.

Syslog Message

ONTAP did not recognize tier "%s" of blob "%s", on object store "%s". Assuming Standard Storage Tier.

Parameters

tier (STRING): Blob tier.
blob (STRING): Blob name.
configName (STRING): Object store configuration name.

pha.vsa events

pha.vsa.uuid.too.long

Severity

ALERT

Description

This message occurs when ONTAP® software detects a device with a device descriptor length greater than 40 characters. Such devices are not presented to ONTAP.

Corrective Action

Detach the device from all ONTAP virtual machines, and then delete it. Create a similar device with a descriptor length less than or equal to 40 characters, and then attach it to the ONTAP virtual machines.

Syslog Message

The device descriptor %s is too long and was not presented to ONTAP.

Parameters

Descriptor (STRING): Descriptor of the device.

phf events

phf.manage events

phf.manage.add.upcall

Severity

NOTICE

Description

This message occurs when peripheral host bus adapter freebsd (phf) detects a device to be added to the system.

Corrective Action

(None).

Syslog Message

Added unit %d type %d.

Parameters

unit (INT): Unit number.
pman_disk_type (INT): Disk type.

platform events

platform.chsismobonamediff events

platform.ChsisMoboNameDiff

Severity

ERROR

Description

This message occurs when the product name on the chassis is different from the one on the controller.

Corrective Action

Place the controller in a compatible chassis.

Syslog Message

The product names on the chassis (%s) and the controller (%s) are different. Contact NetApp technical support to resolve this.

Parameters

prodNameChsis (STRING): Product name on the chassis.
prodNameCtrlr (STRING): Product name on the controller.

platform.dimmconfigerror events

platform.dimmConfigError

Severity

ALERT

Description

This message occurs when the DIMM configuration of the controller is different from the configuration supported by this model. This often occurs when an incorrect DIMM memory size is used in a DIMM slot.

Corrective Action

Place correctly sized and supported DIMMs in the designated slots. For replacement instructions, search the NetApp technical support support web site using the keywords "replacing", "DIMM", and "system".

Syslog Message

Memory DIMM configuration mismatch in slots %s.

Parameters

slots (STRING): List of slots with the incorrect DIMM.

platform.insufficientmemory events

platform.insufficientMemory

Severity

EMERGENCY

Description

This message occurs when there is not enough system memory for the system to function, likely due to slots that contain incorrect, failed, or missing DIMMs.

Corrective Action

Replace the incorrect, failed, or missing DIMMs.

Syslog Message

Not enough system memory for the system to function. Detected %d GB, expected %d GB. Check DIMMs slots %s.

Parameters

mem_detected (INT): Amount of system memory that was detected.
mem_expected (INT): Amount of system memory that this model supports.
slots (STRING): List of slots with incorrect, failed, or missing DIMMs.

platform.nopartnerpresent events

platform.noPartnerPresent

Severity

NOTICE

Description

This message occurs when the HA partner's presence cannot be read via the GPIO ports on the controller.

Corrective Action

(None).

Syslog Message

Controller partner's presence could not be read via GPIO. Read partner ID: %d.

Parameters

partner_id (INT): The partner ID that was read from the GPIO pins.

platform.reducedmemory events

platform.reducedMemory

Severity

ALERT

Description

This message occurs when system memory is less than expected for this model, likely due to slots that contain incorrect, failed, or missing DIMMs.

Corrective Action

Replace the incorrect, failed, or missing DIMMs.

Syslog Message

System memory (%d GB) is less than expected (%d GB). Check DIMMs slots %s.

Parameters

mem_detected (INT): Amount of system memory that was detected.
mem_expected (INT): Amount of system memory that this model supports.
slots (STRING): List of slots with incorrect, failed, or missing DIMMs.

pn events

pn.driver events

pn.driver.send.latency.high

Severity

NOTICE

Description

This message occurs when the pass-through network layer detects driver send latencies that are too high, indicating a noisy neighbor issue in cloud providers that is causing an I/O latency spike.

Corrective Action

(None).

Syslog Message

Pass-through network layer is reporting an average driver send latency of %d microseconds, which might cause an I/O latency spike.

Parameters

latency (INT): Average driver send latency in microseconds.

pn.mvia events

pn.mvia.freeq.empty

Severity

NOTICE

Description

This message occurs when the pass-through network layer depletes its supply of buffers for sending traffic, which could cause an Interconnect timeout.

Corrective Action

(None).

Syslog Message

Pass-through network layer free queue empty for %d msecs, which might cause Interconnect timeout.

Parameters

time (INT): Duration of depletion in msecs.

pn.mvia.nic.reset

Severity

NOTICE

Description

This message occurs when the passthrough network layer detects network interface card (NIC) state change caused by an NIC reset.

Corrective Action

(None).

Syslog Message

Passthrough network layer detected NIC %s has changed its operational state. New state: %s.

Parameters

nic_name (STRING): NIC name.
nic_state_change (STRING): NIC state change.

pn.mvia.send.starvation

Severity

NOTICE

Description

This message occurs when the pass-through network layer takes too long to execute the logic for sending traffic, which could cause an Interconnect timeout.

Corrective Action

(None).

Syslog Message

Pass-through network layer "send" thread not run for %d msecs, which might cause Interconnect timeout.

Parameters

time (INT): How long the pass-through network layer has not executed the logic for sending traffic.

probedone events

probedone.inquiry events

probedone.inquiry.failed

Severity

ERROR

Description

This message occurs when the inquiry data fails the comparison at the domain validation (DV) step.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

In path %s, inquiry data fails comparison at the domain validation DV%d step of protocol type %d.

Parameters

path (STRING): Device path.
inquirydata (INT): Comparison between the inquiry data failure and the domain validation, and whether the probe inquiry domain validation is type 1 or 2.
protocol_type (INT): Protocol type.

protocol events

protocol.exportcheckfailed events

protocol.exportCheckFailed

Severity

ERROR

Description

This message occurs when there is an export check failure due to, either export-policy configuration not allowing access, or a non-existing filesystem/junction access attempt.

Corrective Action

Check the export policy configuration or filesystem name depending on the reason due to which export access check failed.

Syslog Message

Export access check failed on Vserver %s for client %s, trying to access volume %s, having policy %s, via protocol %s. Reason: %s

Parameters

vserver (STRING): Name of the Vserver where the issue occurs.
clientIP (STRING): Client for which the export access check failure happened.
volumeName (STRING): Volume name for which export access check failed.
policyName (STRING): Name of the export policy from which export access check failed.
protocol (STRING): Access protocol used by client for filesystem access.
reason (STRING): Reason for which export access check failed.

prov events

prov.rollback events

prov.rollback.fail.cmd

Severity

ERROR

Description

This message occurs when ONTAP® software cannot complete a rollback of a provisioning operation sequence that failed. Depending on the action that failed, objects might need to be created, deleted, or modified to bring the system back to a consistent state.

Corrective Action

Resolve the error and attempt the failed command again. If the problem persists, contact NetApp technical support to resolve the rollback failure. It is possible that other related rollback actions have also failed. Check for other 'prov.rollback.fail.*' messages with similar time stamps, and perform the suggested corrective actions in the same order that the messages occurred.

Syslog Message

Failed to roll back an action performed by the provisioning engine. Command: "%s". Reason: %s.

Parameters

failed_command (STRING): Command that failed.
error (STRING): Error that the provisioning engine encountered.

prov.rollback.fail.obj

Severity

ERROR

Description

This message occurs when ONTAP® software cannot complete a rollback of a provisioning operation sequence that failed. Depending on the action that failed, objects might need to be created, deleted, or modified to bring the system back to a consistent state.

Corrective Action

Contact NetApp technical support to resolve the rollback failure. It is possible that other related rollback actions have also failed. Check for other 'prov.rollback.fail.*' messages with similar time stamps, and perform the suggested corrective actions in the same order that the messages occurred.

Syslog Message

Failed to roll back an action performed by the provisioning engine. Action: "%s". Object: "%s". Fields: "%s". Reason: %s.

Parameters

action (STRING): Attempted action.
object (STRING): Type of object.
fields (STRING): Fields of the object.

error (STRING): Error that the provisioning engine encountered.

prov.rollback.fail.rest

Severity

ERROR

Description

This message occurs when ONTAP® software cannot complete a rollback of a provisioning operation sequence that failed. Depending on the action that failed, objects might need to be created, deleted, or modified to bring the system back to a consistent state.

Corrective Action

Resolve the error and attempt the failed REST API again. If the problem persists, contact NetApp technical support to resolve the rollback failure. It is possible that other related rollback actions have also failed. Check for other 'prov.rollback.fail.*' messages with similar time stamps, and perform the suggested corrective actions in the same order that the messages occurred.

Syslog Message

Failed to roll back an action performed by the provisioning engine. API: curl -X %s 'https://<mgmt-ip>%s' -H 'accept: application/hal+json' -d '%s' Reason: %s.

Parameters

failed_uri (STRING): REST API resource that failed.
failed_body (STRING): REST API JSON body that failed.
failed_method (STRING): REST API method that failed.
error (STRING): Error that the provisioning engine encountered.

pubsub events

pubsub.kernel events

pubsub.kernel.flow.control.enabled

Deprecated

This event is deprecated as of 9.10.0.

Severity

ERROR

Description

This message will not be published as flow control is enabled on kernel pubsub.

Corrective Action

Check the network connectivity to the broker and ensure the broker is running properly.

Syslog Message

Kernel pubsub failed to send message with topic %s, object %s, object UUID %s and operation %s. Flow control is enabled.

Parameters

topic (STRING): Topic of the message.
object (STRING): Object of the message.
object_uuid (STRING): Object UUID of the message.
operation (STRING): Operation of the message.

pubsub.kernel.send.msg.failed

Deprecated

This event is deprecated as of 9.10.0.

Severity

ERROR

Description

This message occurs when kernel pubsub fails to send a message to the broker.

Corrective Action

Check the network connectivity to the broker and ensure the broker is running properly.

Syslog Message

Kernel pubsub failed to send message with topic %s, object %s, object UUID %s, operation %s, and error code %d.

Parameters

topic (STRING): Topic of the message.
object (STRING): Object of the message.
object_uuid (STRING): Object UUID of the message.

operation (STRING): Operation of the message.
error_code (INT): Error code associated with the failure.

pvif events

pvif.badmtu events

pvif.badMtu

Severity

ERROR

Description

This message occurs when the interface group (ifgrp) driver fails to update the MTU size on a member port because it does not support the requested configuration.

Corrective Action

Use the "ifgrp remove-port" command to remove the member port that does not support the requested MTU size, or use the "broadcast-domain remove-ports" and "broadcast-domain add-ports" commands to assign the ifgrp to a broadcast domain whose MTU are supported on all member ports.

Syslog Message

ifgrp %s: unable to update MTU size to %d on %s.

Parameters

ifgrpName (STRING): Name of the ifgrp.
mtuSize (INT): Requested MTU size.
portName (STRING): Name of the member port.

pvif.lacp events

pvif.lacp.outofsync

Severity

ALERT

Description

This message occurs when a link is operationally up and cannot be aggregated into its configured ifgrp within the time limit. This might occur due to misconfiguration, physical link error, or implementation limits on the number of links allowed.

Corrective Action

Verify that the switch configuration is correct, and that the physical links are operating without error.

Syslog Message

ifgrp %s, port %s cannot synchronize with the LACP aggregate.

Parameters

vifName (STRING): Name of the ifgrp.
linkName (STRING): Name of the link.

qos events

qos.bgtask events

qos.BgTask.Throttle

Severity

NOTICE

Description

This message occurs when the Quality of Service (QoS) subsystem starts throttling requests to help critical background tasks meet their min-throughput and their service-level objectives (SLOs).

Corrective Action

(None).

Syslog Message

QoS throttle limit for background task: "%s" with id: "%u" is %u IOPS.

Parameters

bg_task_name (STRING): Name of the Background Task that requested QoS to throttle requests.
bg_task_id (INT): ID of the Background Task that requested QoS to throttle requests.
limit (INT): The limit value enforced in terms of IOPS and a block size of 4K.

qos.mgmt events

qos.mgmt.operation.failed

Severity

ERROR

Description

This message indicates that cluster quality of service (QoS) cannot propagate settings to the classification and control components on the specified node. This might be a transient condition, or it might indicate insufficient resources to complete the operation. QoS workload classification and control might behave incorrectly on this node.

Corrective Action

Inspect the management gateway process log for errors indicating why the command failed. If this behavior persists, contact NetApp technical support.

Syslog Message

QoS configuration update failed on node %s: %s

Parameters

node (STRING): Node on which operation failed.
error (STRING): Error description.

qos.min events

qos.min.tput.not.honoured.for.sync

Severity

NOTICE

Description

This message occurs when minimum throughput value is not honoured if adaptive QoS is set on a SnapMirror Synchronous protected storage object.

Corrective Action

(None).

Syslog Message

Adaptive QoS policy "%s" set on SnapMirror Synchronous volume "%s" or any of it's storage object has a min-throughput value set. SnapMirror Synchronous does not support min-throughput hence min-throughput setting will not be honoured from the policy, only max-throughput setting will be honoured.

Parameters

policy (STRING): Policy group name.
volume (STRING): Volume name.

qos.mintp events

qos.mintp.high.intrconct.lat

Severity

NOTICE

Description

This message occurs when the Quality of Service (QoS) subsystem notices high latency in the cluster interconnect for workloads associated with minimum-throughput policy groups. As a result, workloads might not be able to meet their minimum-throughput values.

Corrective Action

Consider using the "qos statistics" CLI command to monitor the workloads and policy groups that have high cluster interconnect latency and also do not meet their minimum-throughput Service Level Objectives (SLOs). Either avoid the interconnect by moving workloads or LIFs, or reduce contention for the interconnect by applying QoS maximum throughput constraints on interfering workloads.

Syslog Message

QoS has noticed high cluster interconnect latency. Some workloads and policy groups might not meet their specified minimum-throughput.

Parameters

(None).

qos.monitor events

qos.monitor.memory.abated

Severity

NOTICE

Description

This message occurs when the Quality of Service (QoS) subsystem's dynamic memory is no longer at its limit for the current platform hardware. All QoS features will operate as normal.

Corrective Action

(None).

Syslog Message

QoS dynamic memory is no longer at its limit. All QoS features will operate as normal.

Parameters

subject (STRING): QoS Memory message title.
count (INT): Number of times this has happened.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

qos.monitor.memory.maxed

Severity

ERROR

Description

This message occurs when the Quality of Service (QoS) subsystem's dynamic memory hits its limit for the current platform hardware. As a result, some QoS features might operate in a limited capacity.

Corrective Action

Some active workloads or streams should be deleted to free up memory. Use the 'statistics show -object workload -counter ops' command to determine which workloads are active. Active workloads will show non-zero ops. Then use the 'workload delete [workload name]' command multiple times to remove particular workloads. Alternatively, use the 'stream delete -workload [workload name] *' command to delete the associated streams from the active workload.

Syslog Message

QoS dynamic memory has reached its limit. Some QoS features might operate in a limited capacity.

Parameters

subject (STRING): QoS Monitor message title.
count (INT): Number of times this has happened.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

qos.onnix events

qos.onnix.classf.failure

Severity

ERROR

Description

This message occurs when the classification subsystem for Quality of Service (QoS) fails. Any limits that are configured for volumes will not be applied.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

QoS classification failed. Any limits that are configured for volumes will not be applied.

Parameters

(None).

qos.qtree events

qos.qtree.fh.error.report

Severity

ERROR

Description

This message occurs when the Quality of Service (QoS) subsystem recognizes that an older version of a filehandle is still being used to access a qtree associated with a QoS policy group. Use of this filehandle will impact the ability of the qtree workload to meet its service-level objectives (SLOs).

Corrective Action

Use the "qos workload show -wid workloadID" command to show the affected qtree. Use the "network connections active show -local-port 2049" command to show all of the active NFS protocol connections to each node. Verify that, after a QoS policy group was associated with the qtree, each client did in fact remount all of its mount points with the qtree. If any client did not remount, first determine which Vserver exported the mount points by using the "volume qtree show -fields qtree,vserver" command. Next stop all applications that are using the qtree and unmount all exports from the Vserver in question. Finally, remount the exports and restart the applications.

Syslog Message

QoS qtree violation for qtree with workload ID = %u.

Parameters

wid (INT): The QoS workload ID of the qtree.

qos.viodet events

qos.VioDet.maxThrottle

Severity

NOTICE

Description

This message occurs when the Quality of Service (QoS) subsystem has already throttled requests severely to help workloads meet their min-throughput and their service-level objectives (SLOs) and will not throttle any further. Possible reasons for severe throttling could be that there are bully workloads or insufficient resources, which means the system cannot support the specified targets in the SLOs.

Corrective Action

Collect ONTAP statistics counters and use 'qos statistics' CLI command on the node to monitor the workload and policy group to find the workloads that do not meet their min-throughput SLOs. The cpu utilization and aggregate utilization can be used to help identify if there is sufficient load or if the system is over-provisioned. First validate if the policy group client generates sufficient load. If the system is over provisioned, identify the critical resources (cpu, memory, network, disk, etc.) that could lead to the violation, or identify the hot spot in a clustered system and move workloads around to avoid the hot spot or limit bully workloads by setting a QoS limit to reduce the contention.

Syslog Message

QoS violation limit for %s %s is %u IOPS.

Parameters

object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.
vdlimit (INT): Current limit value in terms of IOPS and a block size of 4K.

qos.VioDet.Mintput.Throttle

Severity

INFORMATIONAL

Description

This message occurs when the Quality of Service (QoS) subsystem starts throttling requests to help workloads meet their min-throughput and their service-level objectives (SLOs). Possible reasons for throttling could be that there are bully workloads or insufficient resources, which means the system cannot support the specified targets in the SLOs.

Corrective Action

Collect ONTAP statistics counters and use 'qos statistics' CLI command on the node to monitor the workload and policy group to find the workloads that do not meet their min-throughput SLOs. The CPU utilization and aggregate utilization can be used to help identify if there is sufficient load or if the system is over-provisioned. Firstly validate if the policy group client generates sufficient load. If the system is over provisioned, identify the critical resources (CPU, memory, network, disk, etc.) that could lead to the violation, or identify the hot spot in a clustered system and move workloads around to avoid the hot spot. Or limit bully workloads by setting a QoS limit to reduce the contention.

Syslog Message

QoS min-throughput feature has started throttling requests for node: "%s" with uuid: "%s".

Parameters

object_type (STRING): Type of resource object under notification. The object_type will always be NODE.
object_uuid (STRING): Universal unique identifier (UUID) of the resource object. The UUID is of the node.

qos.VioDet.noMemory

Severity

ERROR

Description

This message occurs when the Quality-of-Service (QoS) process cannot allocate memory required for the Violation Detection subsystem (likely there is not enough system memory available). As a result workloads will not meet their min-throughput and their service-level objectives (SLOs).

Corrective Action

(None).

Syslog Message

QoS dynamic memory has reached its limit. QoS min-throughput might operate in a limited capacity.

Parameters

object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

qos.VioDet.publishFail

Severity

ERROR

Description

This message occurs when the Quality-of-Service (QoS) process cannot communicate throttle limits due to an internal error. As a result workloads might not meet their min-throughput and their service-level objectives (SLOs).

Corrective Action

Contact NetApp technical support.

Syslog Message

QoS subsystem cannot publish throttle limits.

Parameters

object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

qos.violation events

qos.violation.report

Deprecated

Deprecated as of version 9.4.0 since the QoS violation detection functionality has been deprecated.

Severity

NOTICE

Description

This message occurs every hour to provide a snapshot of violation detection status for the Quality of Service (QoS) policy groups. The snapshot shows the states of those policy groups that either cannot meet their service-level objectives (SLOs), or are impacted by (deactivation) actions taken by QoS to remedy the situations. Possible violation states include LOW_OFFERED, which means the offered load for a policy group is too low, or INSUFFICIENT_RESOURCES, which means the system can not support the specified targets in the SLO. The deactivation states include ACTIVATED, which means this policy group is not impacted by deactivation, or DEACTIVATED, which means this policy group is deactivated to support other violated policy group.

Corrective Action

After observing a violation, one should collect ONTAP statistics counters and use 'qos statistics' CLI command to monitor the violated policy group. Increase the client load if a low offered violation is present and the policy group client does not generate sufficient load. For other violations, identify the critical resources (cpu, memory, network, disk, etc.) that could lead to the violation, or identify the hot spot in a clustered system. The solution to the former is to add more resources; while the latter is to move workloads around to avoid the hot spot.

Syslog Message

QoS violation state for policy group %s is (pgid= %u violation= %s deactivation= %s).

Parameters

name (STRING): The QoS policy group name.
id (INT): The QoS policy group identifier.
vdstate (STRING): The violation state for a QoS policy group.
dastate (STRING): The deactivation state for a QoS policy group.

qtree events

qtree.delete events

qtree.delete.failed

Severity

ERROR

Description

This message occurs when the delete operation on a qtree fails.

Corrective Action

Check and resolve the failure reason and attempt the qtree deletion again.

Syslog Message

Failed to delete qtree "%s" in volume "%s" on Vserver "%s". Error: "%s" (%d).

Parameters

qtree (STRING): Name of the qtree.
volume (STRING): Name of the volume on which the qtree resides.
vserver (STRING): Name of the Vserver on which the volume resides.
reason (STRING): Reason for the failure.
errorCode (INT): Error number of the failure.

qtree.delete.start

Severity

NOTICE

Description

This message occurs when a qtree is being deleted. A subsequent event will indicate the success or failure of the operation.

Corrective Action

(None).

Syslog Message

Deleting qtree "%s" in volume "%s" on Vserver "%s".

Parameters

qtree (STRING): Name of the qtree.
volume (STRING): Name of the volume on which the qtree resides.
vserver (STRING): Name of the Vserver on which the volume resides.

qtree.delete.success

Severity

NOTICE

Description

This message occurs when the delete operation on a qtree succeeds.

Corrective Action

(None).

Syslog Message

Successfully deleted qtree "%s" in volume "%s" on Vserver "%s".

Parameters

qtree (STRING): Name of the qtree.
volume (STRING): Name of the volume on which the qtree resides.
vserver (STRING): Name of the Vserver on which the volume resides.

query events

query.execution events

query.execution.console

Severity

NOTICE

Description

This message occurs when the dotsql command-line program processes an SQL query.

Corrective Action

(None).

Syslog Message

(None).

Parameters

query (STRING): Query that was executed.

query.execution.failed

Severity

NOTICE

Description

This message occurs when a SQL query of the system fails for any reason.

Corrective Action

This type of failure can occur legitimately during the course of normal system operation. In cases of unexpected failure, the requestor provides diagnostic advice.

Syslog Message

(None).

Parameters

query (STRING): Query that was executed.
error (STRING): Error message that occurred.

quota events

quota.inconsistent events

quota.inconsistent

Severity

ERROR

Description

This message occurs when the quota database is corrupted.

Corrective Action

Use the 'quota off' command followed by the 'quota on' command to clear the corruption and reenable quotas on the volume.

Syslog Message

Quota database on %s%s%s is corrupted. Disabling quotas until the corruption is fixed.

Parameters

vol_name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique dentifier for the volume in cases in which the volume name alone is insufficient.

quota.intr events

quota.intr.boot.fschk

Severity

INFORMATIONAL

Description

This message occurs when previous quota initialization was interrupted due to a system reboot or file system consistency checking.

Corrective Action

(None).

Syslog Message

WAFL: Reboot or file system consistency checking interrupted quota initialization on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.

quota.parse events

quota.parse.error

Severity

ERROR

Description

This message occurs when the system detects an error while scanning the quota rules. The parser would be skipping this quota definition.

Corrective Action

Fix the error in quota rules definition using the CLI commands "quota policy rule modify" or "quota policy rule delete".

Syslog Message

%s

Parameters

errmsg (STRING): Message describing the error in detail.

quota.push events

quota.push.rules.complete

Severity

NOTICE

Description

This message occurs when the system has completed pushing rules into the quota database.

Corrective Action

(None).

Syslog Message

Quota rules push completed on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.push.rules.start

Severity

NOTICE

Description

This message occurs when the system starts pushing rules into the quota database.

Corrective Action

(None).

Syslog Message

Quota rules push started on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.reinit events

quota.reinit.required

Severity

ERROR

Description

This message occurs when an unplanned MetroCluster(tm) switchover happens. If a quota operation was running on a volume located on a disaster site during the unplanned switchover, the quota database could be in an incomplete state and quotas need to be reinitialized on that volume.

Corrective Action

After the unplanned switchover is complete, use the "quota off" CLI command followed by the "quota on" CLI command to reinitialize quotas for the indicated volume.

Syslog Message

Quota reinitialization is required on %s%s%s due to an unplanned switchover.

Parameters

volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.

quota.resize events

quota.resize.start

Severity

NOTICE

Description

This message occurs when quota resize starts.

Corrective Action

None.

Syslog Message

%s

Parameters

noticestring (STRING): Quota resize started.

quota.resize.stop

Severity

NOTICE

Description

This message occurs when quota resize stops or finishes.

Corrective Action

None.

Syslog Message

%s

Parameters

noticestring (STRING): Quota resize stopped or completed. It also reports the duration for the quota resize.

quota.scan events

quota.scan.abort

Severity

ERROR

Description

This message occurs after the administrator uses the "volume quota on" command, when the quota scanner aborts without finishing due to an error condition. Any quotas configured on the volume will not be tracked or enforced.

Corrective Action

If the volume quota status is not displayed as "off", turn quotas off by executing the "volume quota off" command, and then retry the "volume quota on" command. If this condition persists, contact NetApp technical support.

Syslog Message

Quota scan aborted on %s %s%s%s%s.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.scan.cancel

Severity

> NOTICE

Description

> This message occurs after the administrator uses the "volume quota on" command, when the quota scanner is canceled by other activity in the system. An example of such activity would be the "volume quota off" command.

Corrective Action

> (None).

Syslog Message

> Quota scan canceled on %s %s%s%s%s.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.scan.complete

Severity

> NOTICE

Description

> This message occurs when the administrator uses the "volume quota on" command and the quota scanner has completed scanning.

Corrective Action

> (None).

Syslog Message

> Quota scan completed on %s %s%s%s%s.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.

volident (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.scan.start

Severity

NOTICE

Description

This message occurs when the administrator uses the "volume quota on" command and starts the quota scanner.

Corrective Action

(None).

Syslog Message

Quota scan started on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Additional volume identifier, used to uniquely identify the volume if the volume name alone cannot.

quota.softlimit events

quota.softlimit.exceeded

Severity

NOTICE

Description

This message occurs when a user exceeds the soft quota limit (file and/or block limit).

Corrective Action

(None).

Syslog Message

%s %s for %s on volume %s%s%s%s

Parameters

ltype (STRING): Type of soft limit (file or block).
verb (STRING): Error condition (exceeded).
whom (STRING): Entity for whom this event is generated.
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfname (STRING): vFiler(tm) name.

quota.softlimit.normal

Severity
NOTICE

Description
This message occurs when a user's soft quota limit (file and/or block limit) returns to normal.

Corrective Action
(None).

Syslog Message
%s %s for %s on volume %s%s%s%s

Parameters
ltype (STRING): Type of soft limit (file or block).
verb (STRING): Status "normal" to indicate that the previously violated condition is now fixed.
whom (STRING): Entity for whom this event is generated.
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfname (STRING): vFiler(tm) name.

quota.upgrade events

quota.upgrade

Severity
INFORMATIONAL

Description
This message occurs when a quota upgrade on the volume is started, ended or aborted.

Corrective Action
(None).

Syslog Message
Quota upgrade %s for volume %s%s%s.

Parameters
status (STRING): Indicates that the upgrade has started or is over for this vFiler.
volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which volume name alone is insufficient.

raid events

raid.aggr events

raid.aggr.autoGrow.abort

Severity

NOTICE

Description

This message occurs when the usable size of an aggregate does not expand after a corresponding increase in the size of the underlying storage.

Corrective Action

Check the sizes of all disks in the affected aggregate, and make sure that the backing volumes have increased to the same size. Run the "storage disk show -virtual-machine-disk-info" command to get the name of the backing volume for a disk, under the "VM Disk File" column in the command output.

Syslog Message

The capacity of aggregate %s couldn't be expanded. The parameters to increase size are raidgroup_count: %d, min_new_size: %llu, max_new_size: %llu. Reason for failure: %s.

Parameters

aggr_name (STRING): Name of the aggregate that did not expand in size.
rg_count (INT): Number of RAID groups that have disks that have increased in size.
max_new_size (LONGINT): Maximum possible new usable size across the RAID group
min_new_size (LONGINT): Minimum possible new usable size across the RAID group
reason (STRING): Short string describing why the aggregate capacity was not changed.

raid.aggr.autoGrow.notAllowed

Severity

NOTICE

Description

This message occurs when the aggregate cannot be allowed to auto grow due to some transient condition.

Corrective Action

(None).

Syslog Message

The aggregate "%s" cannot grow. Reason: "%s".

Parameters

aggr (STRING): Name of the aggregate.
reason (STRING): Reason for not allowing aggregate to grow.

raid.aggr.autoGrow.success

Severity

NOTICE

Description

This message occurs when the usable size of an aggregate is able to expand after a corresponding increase in the size of the underlying storage.

Corrective Action

(None).

Syslog Message

The capacity of aggregate %s has increased from %llu blocks to %llu blocks.

Parameters

aggr_name (STRING): Name of the aggregate that has increased in size.
old_size (LONGINT): Previous size, in blocks, of the aggregate that has increased in size.
new_size (LONGINT): New usable size, in blocks, of the aggregate.

raid.aggr.lock.conflict

Severity

INFORMATIONAL

Description

This message occurs when a configuration operation on an aggregate (for example, adding disks, relocating aggregate disks, etc.), fails to get exclusive lock access because of a conflict with an existing configuration operation that is already holding the exclusive lock on the aggregate.

Corrective Action

Retry the failed operation after the current operation is complete.

Syslog Message

Exclusive access on the aggregate %s by operation %s failed because of a conflict with current operation %s. Retry after a few minutes.

Parameters

aggregate (STRING): Name of the aggregate.
attempted_op_name (STRING): Name of the operation that tried to get exclusive access.
current_op_name (STRING): Name of the operation that is currently holding the exclusive access.

raid.aggregate events

raid.aggregate.relocate

Severity

INFORMATIONAL

Description

This message occurs when the source node prepares an aggregate for relocation to the specified destination node.

Corrective Action

(None).

Syslog Message

Aggregate %s%s: Prepared for 'relocation' operation.

Parameters

owner (STRING): String indicating the owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.aggrvote events

raid.aggrvote.pullNotOk

Severity

INFORMATIONAL

Description

This message occurs when the mirror vote pull from the replicated database (RDB) to the mailbox fails. SyncMirror® aggregates with only one plex will be kept offline. The mirror vote pull is retried automatically.

Corrective Action

(None).

Syslog Message

RAID: mirror vote pull from the RDB failed. SyncMirror aggregates with only one plex will be kept offline.

Parameters

(None).

raid.aggrvote.updateNotOk

Severity

ERROR

Description

This message occurs when the mirror vote update to a replicated database (RDB) fails.

Corrective Action

The update is retried automatically. If the condition persists, contact NetApp technical support.

Syslog Message

RAID: mirror vote update to the RDB failed with error %s for aggregate UUID %s (num of plexes %d; ids: %d, %d).

Parameters

reason (STRING): Reason for the failure.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
num_plexes (INT): Number of plexes recorded in the mirror vote.
plex0_id (INT): ID of plex 0 in the mirror vote.
plex1_id (INT): ID of plex 1 in the mirror vote.

raid.aggrvote.updateOk

Severity

NOTICE

Description

This message occurs when the mirror vote update to a replicated database (RDB) succeeds.

Corrective Action

(None).

Syslog Message

RAID: mirror vote update to the RDB succeeded for aggregate UUID %s (num of plexes %d; ids: %d, %d), action %s.

Parameters

aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
num_plexes (INT): Number of plexes recorded in the mirror vote.
plex0_id (INT): ID of plex 0 in the mirror vote.
plex1_id (INT): ID of plex 1 in the mirror vote.
action_type (STRING): Action performed on the RDB table entry. "CREATE" or "MODIFY".

raid.assim events

raid.assim.add.offline.disk

Severity

NOTICE

Description

This event is generated when adding an offline disk into a raidtree.

Corrective Action

(None).

Syslog Message

Adding offline %s to plex_id:%d

Parameters

disk_info (STRING): Formatted information of the offline disk.
plexId (INT): The identifier for the plex.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is

located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.build.errorDisk

Severity

NOTICE

Description

This message occurs when RAID cannot build a RAID tree for a specific plex from a specific disk. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Error building RAID tree %s, plex %d, from disk %s.

Parameters

tree (STRING): Volume type.
plexId (INT): Identifier for the plex.
disk (STRING): Name of the disk.

raid.assim.cfo.aggr.offline

Severity

INFORMATIONAL

Description

This event occurs when a CFO aggregate which is orginally homed to the disaster recovery (DR) partner or DR auxiliary partner is taken offline during assimilation after switchover in a MetroCluster(tm) configuration. Switched over CFO aggregates are kept offline.

Corrective Action

(None).

Syslog Message

Aggregate %s%s originally homed to %u is taken offline. Reason: %s.

Parameters

owner (STRING): Owner of affected aggregate.
aggregate (STRING): The name of the aggregate.
dr_home_owner_id (INT): NVRAM system ID of the aggregate's disaster recovery (DR) home owner.
reason (STRING): The reason for taking the aggregate offline.

raid.assim.cls.mismatchGens

Severity

NOTICE

Description

This message occurs when Data ONTAP® excludes a disk from assimilation into this RAID tree because of

a configuration error detected by the consistent label set (CLS) algorithm: the disk transaction generation contains an internal inconsistency. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Data ONTAP takes appropriate recovery actions but if the aggregate is still shown as 'failed' when the command 'sysconfig -r' or 'aggr status -r' is run, then contact NetApp technical support for information about how to resolve the issue.

Syslog Message

Orphaning disk %s, because of generation count mismatch (%d/%d).

Parameters

disk (STRING): Name of the disk.
l1gen (INT): Generation count of the disk's L1 transaction.
l2gen (INT): Generation count of the disk's L2 transaction.

raid.assim.cls.noStableCls

Severity

NOTICE

Description

This message occurs when the consistent label set (CLS) algorithm is restarted because Data ONTAP® could not determine a consistent CLS for all of the RAID aggregates. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Unable to find a stable CLS for all RAID trees. Resorting disks.

Parameters

(None).

raid.assim.cls.noStableCls2

Severity

NOTICE

Description

This message occurs when the consistent label set (CLS) algorithm is restarted because Data ONTAP® could not determine a consistent CLS for all of the RAID aggregates with Label 2. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Unable to find a stable CLS for all RAID trees with Label 2. Resorting disks.

Parameters

(None).

raid.assim.cls.retryCls

Severity

NOTICE

Description

This message occurs when the consistent label set (CLS) algorithm is restarted due to a disk that appears with an unreasonable timestamp (appears to be a future time). Data ONTAP® takes appropriate recovery actions, as described in additional logged events

Corrective Action

(None).

Syslog Message

Suspect unreasonable timestamp in future for disk in plex %s/%d. Restarting CLS algorithm.

Parameters

plex (STRING): Plex name.
pid (INT): Plex ID.

raid.assim.cls.tooManyPlexes

Severity

NOTICE

Description

This message occurs when the number of plexes detected exceeds the maximum limit allowed, during consistent label set (CLS) computation. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Raidtree %s has more than %d plexes (plex IDs %d, %d, %d)

Parameters

vol (STRING): Name of the aggregate.
maxPlexes (INT): Maximum number of plexes allowed per tree.
plex1 (INT): Plex #1.
plex2 (INT): Plex #2.
plex3 (INT): Plex #3.

raid.assim.cls.tooRecent

Severity

NOTICE

Description

This message occurs when Data ONTAP® excludes a disk from assimilation into this RAID tree because of a configuration error detected by the consistent label set (CLS) algorithm: the disk transaction identifier indicates that it is more recent than the base transaction ID of the CLS. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Data ONTAP takes appropriate recovery actions but if the aggregate is still shown as 'failed' when the command 'sysconfig -r' or 'aggr status -r' is run, then contact NetApp technical support for information about how to resolve the issue.

Syslog Message

Orphaning disk %s, because its generation (%d/%d) is more recent than %d/%d.

Parameters

disk (STRING): Name of the disk.
t1gen (INT): Generation count of the disk's transaction.
t1time (INT): Timestamp of the disk's transaction.
vgen (INT): Generation count of the aggregate.
vtime (INT): Timestamp of the aggregate transaction.

raid.assim.cxt.degradedDirty

Severity

INFORMATIONAL

Description

This message occurs when RAID detects that a context parity protected aggregate contains a degraded RAID group and has dirty parity.

Corrective Action

(None).

Syslog Message

%s "%s%s" is degraded and has dirty parity.

Parameters

vol_type (STRING): Volume type.
host (STRING): 'Local' or 'Partner' where the aggregate is located.
vol (STRING): Name of the aggregate.

raid.assim.disk.badlabelversion

Severity

ALERT

Description

This message occurs when RAID assimilation discovers that a disk has an invalid raid label version. Data ONTAP® marks the disk as broken.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.assim.disk.badlabelversion" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

%s has %s RAID label with version (%d), which is not within the currently supported range (%d - %d).

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM and carrier serial number.
gen (STRING): Non-empty string for the old format label.
version (INT): Label version number.
versionLow (INT): Lower range of the valid label version.
versionHigh (INT): Upper range of the valid label version.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.disk.broken

Severity

ERROR

Description

This message occurs when we discover that a broken disk has been discovered during assimilation.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Broken %s detected during assimilation.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM

carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.disk.brokenPreAssim

Severity

ERROR

Description

This message occurs when we discover that a broken disk has been discovered prior to assimilation.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Broken %s detected prior to assimilation.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.disk.md5error

Severity

NOTICE

Description

This event occurs when we detect that a disk label has an MD5 signature that is different from the MD5 signature of the disk that it's on. Usually this is due to a disk serial number change.

Corrective Action

(None).

Syslog Message

%s%s%s, diskobj_verify: MD5 signature of disk %s (S/N %s) does not match with its label signature. This has been corrected.

Parameters

container (STRING): The type of container (aggregate, disk pool).
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
disk (STRING): The name of the disk
serial (STRING): The serial number of the disk
oldmd5 (STRING): The old MD5 checksum of the disk
newmd5 (STRING): The new MD5 checksum of the disk

raid.assim.disk.nolabels

Severity

EMERGENCY

Description

This event occurs when we detect that a disk has no valid labels. Disks in NetApp systems should always have valid labels; therefore, a disk without labels implies that there is corruption somewhere in the data path to the disk. (This is the most common cause, often because of loose cables or a newly added shelf.) It is possible, although much less likely, that the disk itself is experiencing silent data corruption. The affected disk is taken out of service for the reason "bad label."

Corrective Action

If the disk was newly added and really should be treated as a spare, the "disk unfail" command will mark the disk as a spare. Otherwise, if the disk was previously working normally, check the connectivity to the disk. Are all the cables secured? Sometimes newly added shelves or loose cables can cause electrical noise on the bus that corrupts data transmission. If the connectivity to the disk is good and there is filesystem data on the disk, contact NetApp technical support for help.

Syslog Message

%s has no valid labels. It will be taken out of service to prevent possible data loss.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.disk.region.hole

Severity

ALERT

Description

This message occurs when RAID assimilation detects that a disk has a hole between the two disk regions. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.assim.disk.region.hole" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

Disk %s (S/N %s) has a hole in its allocated space between region %d (type %s,start %llu, size %llu) and region %d (type %s, start %llu, size %llu).

Parameters

disk (STRING): Name of the disk.
diskSerialno (STRING): Serial number of the disk.
regionId1 (INT): First disk region identifier.
region1 (STRING): First disk region name.
start1 (LONGINT): Start of the first disk region.
size1 (LONGINT): Size of the first disk region.
regionId2 (INT): Second disk region identifier.
region2 (STRING): Second disk region name.
start2 (LONGINT): Start of the second disk region.
size2 (LONGINT): Size of the second disk region.

raid.assim.disk.region.overlap

Severity

ERROR

Description

This message occurs when RAID assimilation detects that a disk has two regions overlapping. Data ONTAP®takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.assim.disk.region.overlap" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

On disk %s (S/N %s), region %d (type %s, start %llu, size %llu) overlaps with region %d (type %s, start %llu, size %llu).

Parameters

disk (STRING): Name of the disk.
diskSerialno (STRING): Serial number of the disk.
regionId1 (INT): First disk region identifier.
region1 (STRING): First disk region name.
start1 (LONGINT): Start of the first disk region.
size1 (LONGINT): Size of the first disk region.
regionId2 (INT): Second disk region identifier.
region2 (STRING): Second disk region name.
start2 (LONGINT): Start of the second disk region.
size2 (LONGINT): Size of the second disk region.

raid.assim.disk.rightsizeChange

Severity

INFORMATIONAL

Description

This event indicates that the rightsize stored in this disk's Table Of Contents(TOC) is different from the rightsize currently being reported by the disk.

Corrective Action

(Call support).

Syslog Message

(None).

Parameters

diskType (STRING): Indicates if this a spare or filesystem disk.
disk_info (STRING): Formatted information of the disk
toc_rightsize (LONGINT): The disk rightsize according to the disk TOC.
changeType (STRING): Type of change: growth or shrinkage.
storage_rightsize (LONGINT): The disk rightsize according to the storage layer.
systemAction (STRING): The action being taken by the system to deal with this event.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm)(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.disk.spare

Severity

NOTICE

Description

This event is generated when we spare an error disk.

Corrective Action

(None).

Syslog Message

Sparing %s, because %s

Parameters

disk_info (STRING): Formatted information of the disk
reason (STRING): (None).
shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.assim.fatal

Severity

EMERGENCY

Description

This message occurs when assimilation encounters a fatal error, such as running out of memory.

Corrective Action

Contact NetApp technical support.

Syslog Message

Assimilation failed: %s

Parameters

reason (STRING): Reason assimilation failed.

raid.assim.fatal.upgrade

Severity

EMERGENCY

Description

This message occurs when RAID assimilation encounters a fatal error during an unsuccessfull upgrade to a newer version of Data ONTAP®.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.assim.fatal" keyword on the Knowledgebase of the NetApp Support Site. You can also boot with the previous version of Data ONTAP.

Syslog Message

Assimilation failed: This system appears to be upgrading from a previous version of Data ONTAP. Errors were found while upgrading the aggregates. The upgrade will abort now.

Parameters

(None).

raid.assim.label.makeForeignVol

Severity

ERROR

Description

This message occurs when ownership cannot be claimed over a previously non-native aggregate.

Corrective Action

Use the 'storage aggregate online' command to bring the aggregate online.

Syslog Message

%s %s could not be turned into a %snative aggregate; it will appear to be foreign.

Parameters

vol_type (STRING): Volume type. Always aggregate.
vol (STRING): Name of the aggregate.
host (STRING): Empty string for local aggregates, or "partner" for partner aggregates.
vol_type2 (STRING): No longer used.

raid.assim.label.makeNativeVol

Severity

NOTICE

Description

This event is generated when we claim ownership over a previously non-native aggregate.

Corrective Action

(None).

Syslog Message

%s %s turned into a %snative %s.

Parameters

vol_type (STRING): Volume type.
vol (STRING): Name of the aggregate.
host (STRING): Empty string for local aggregates, or "partner " for partner aggregates.
vol_type2 (STRING): Volume type.

raid.assim.label.noNativeVols

Severity

NOTICE

Description

This event is generated when we complete assimilation and discover that none of the volumes or aggregates match the local system id. This can occur if the NVRAM card has been swapped. The system will attempt to select a set of volumes and aggregates to make native.

Corrective Action

(None).

Syslog Message

No native volumes or aggregates detected, assuming NVRAM card swap. %d NVRAM system id(s) (%u, %u, %u…) found among all volumes. NVRAM system id %u selected. NVRAM card swap detected by %s.

Parameters

nsets (INT): Number of different serial numbers found in non-native volumes.
nvram_sysid1 (INT): First NVRAM system id to select from.
nvram_sysid2 (INT): Second NVRAM system id to select from.
nvram_sysid3 (INT): Third NVRAM system id to select from.
selected_nvram_sysid (INT): Selected NVRAM system id of volumes before swap.
who (STRING): Module detected NVRAM card swap.

raid.assim.label.upgrade

Severity

INFORMATIONAL

Description

This event is generated when we upgrade RAID labels to the new 6.2-and-later format.

Corrective Action

(None).

Syslog Message

Upgrading RAID labels.

Parameters

(None).

raid.assim.label.upgrade.corruptSize

Severity

ALERT

Description

This message occurs when an old RAID label is being upgraded and the label appears to be corrupted due to the parity type and the sizes[0] entry (describing the size of the parity disk) conflicting. This deals with burt 79966.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal. Contact NetApp technical support.

Syslog Message

Disk %s has a corrupt old label: sizes[%d] is %u.

Parameters

disk (STRING): Disk with the corrupted label.
rgdn (INT): Disk number given by the RAID Group.
size (INT): Size of the disk.

raid.assim.label.upgrade.parityMismatch

Severity

ALERT

Description

This message occurs when an old RAID label is being upgraded and the label appears to be corrupted due to the parity type and the sizes[0] entry (describing the size of the parity disk) conflicting. This deals with burt 79966.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal. Contact NetApp technical support.

Syslog Message

Disk %s has a corrupt old label: parity type mismatch.

Parameters

disk (STRING): Disk with the corrupted label.

raid.assim.mark.error.disk.broken

Severity

NOTICE

Description

This message occurs when RAID moves an invalid disk into a broken disk pool. Invalid disks can be ones with bad labels or with an unsupported label version.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Marking disk %s, which failed assimilation in %s %s, as broken, because %s.

Parameters

disk (STRING): Name of the disk.
vol_type (STRING): Volume type.
tree (STRING): Name of the aggregate.
reason (STRING): Reason for marking the disk broken.

raid.assim.rg.dupChildId

Severity

ALERT

Description

This event occurs when we detect that a RAID group object has an inconsistent list of disk objects in its label configuration record.

Corrective Action

(Call support).

Syslog Message

%s %s%s, rgobj_verify: RAID object %d has duplicate child objects (%s and %s) with ID %d.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
rgId (INT): The RAID group identifier
diskName1 (STRING): One disk with this identifier
diskName2 (STRING): Another disk with this identifier
childId (INT): The child identifier

raid.assim.rg.offlineVerifyFailed

Severity

NOTICE

Description

This message occurs when an offline disk within a RAID group fails verification checks. For example, ownership information differs with the parent aggregate, or the parent tree map specifies this disk is unmapped. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s "%s%s", Offline child object (ID=%d) in RAID object %d failed verification

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
rgId (INT): RAID group identifier.
childId (INT): Child identifier.

raid.assim.tree.degradedDirty

Severity

EMERGENCY

Description

This message occurs when an aggregate contains a degraded RAID group and has dirty parity. Wafliron must be run before the aggregate can be brought online.

Corrective Action

Run wafliron for the aggregate by using the command 'aggr wafliron start'.

Syslog Message

%s "%s%s" is degraded and has dirty parity. You must run wafliron on this aggregate before it can be brought online.

Parameters

vol_type (STRING): Volume type.
host (STRING): 'Local' or 'Partner' where the aggregate is located.
vol (STRING): Name of the aggregate.
vol_type2 (STRING): Volume type.

raid.assim.tree.dupId

Severity

ALERT

Description

This message occurs when RAID assimilation detects that a duplicate volume identifier exists. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.assim.tree.dupId" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

%s %s%s and %s %s%s have the same RAID tree ID. RAID assimilation will be aborted.

Parameters

vol_type1 (STRING): Volume type.
owner1 (STRING): Owner of the first aggregate.
vol1 (STRING): Name of the first aggregate.
vol_type2 (STRING): Volume type.
owner2 (STRING): Owner of the second aggregate.
vol2 (STRING): Name of the second aggregate.

raid.assim.tree.dupName

Severity

NOTICE

Description

This message occurs when the system detects a duplicate name for a volume or an aggregate. In this case, the second volume or aggregate with that name is renamed.

Corrective Action

Use the 'vol rename' command or 'aggr rename' command to resolve the conflict permanently.

Syslog Message

Duplicate %s names found, an instance of %s%s is being renamed to %s%s.

Parameters

vol_type (STRING): Whether the duplicate name is for a volume or an aggregate.
owner1 (STRING): String indicating the owner of the volume or aggregate.
vol (STRING): Original name of the volume or aggregate.
owner2 (STRING): String indicating the owner of the volume or aggregate.
newName (STRING): New name of the volume or aggregate.

raid.assim.tree.foreign

Severity

ERROR

Description

This message occurs when a RAID tree object contains an ownership identifier that is different from the local system. In this case, the aggregate is declared "foreign" and is marked offline.

Corrective Action

Use the 'storage aggregate online' command to bring the aggregate online.

Syslog Message

raidtree_verify: %s %s is a foreign aggregate and is being taken offline. Use the 'storage aggregate online' command to bring it online.

Parameters

vol_type (STRING): Volume type. Always aggregate.
vol (STRING): Name of the aggregate.
vol_type2 (STRING): No longer used.
vol_type3 (STRING): No longer used.

raid.assim.tree.multipleRootVols

Severity

EMERGENCY

Description

This message occurs when the system detects an assimilation error indicating that two aggregates claim to be the root volume.

Corrective Action

Go into Maintenance mode and use the 'aggr options' command with the 'root' option to pick a root aggregate.

Syslog Message

Volume %s and volume %s both claim to be the %sroot volume.

Parameters

vol1 (STRING): Name of the first aggregate.
vol2 (STRING): Name of the second aggregate.
host (STRING): Empty string for local aggregate, or "partner " for partner aggregate.

raid.assim.tree.noRootVol

Severity

ERROR

Description

This message occurs when the system detects an assimilation error indicating that no root aggregate is found.

Corrective Action

Go into Maintenance mode and use the 'aggr options' command with the 'root' option to pick an aggregate to be the root volume.

Syslog Message

No usable %sroot volume was found!

Parameters

host (STRING): Empty string for local aggregates, or "partner " for partner aggregates.

raid.assim.tree.tooManyChild

Severity

ALERT

Description

This event occurs when we detect that a RAID tree object has more than one root volume objects in its label configuration record.

Corrective Action

(Call support).

Syslog Message

%s %s%s,raidtree_verify: Raidtree has multiple root objects.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.assim.upgrade.aggr.fail

Severity

EMERGENCY

Description

This message occurs when assimilation is attempting to upgrade the RAID labels for all aggregates (usually because of a kernel upgrade) and a aggregate can not be successfully upgraded. The RAID label upgrade is aborted. Boot with the previous release to fix the problem with the aggregate (which should be noted in the boot-time messages).

Corrective Action

Boot with the previous version of Data ONTAP to fix the problem with the aggregate (which should be noted in the boot-time messages).

Syslog Message

RAID label upgrade of %s %s%s failed.

Parameters

voltype (STRING): Type of RAID volume (volume or aggregate)
owner (STRING): Whether this is a partner or local volume
volume (STRING): Name of the volume that had a problem.

raid.autopart events

raid.autoPart.disabled

Severity

ALERT

Description

This message occurs when auto-partitioning for root aggregate creation is disabled on a system. When auto-partitioning is disabled, the root aggregate is created on whole disks. Systems with a root aggregate on partitioned disks can devote more space to non-root aggregates than systems with a root aggregate on whole disks. If this message occurs after root aggregate creation, then further partitioning of the disks is disabled.

Corrective Action

If the system is already initialized with root aggregate on partitioned disks, ONTAP will try to re-enable auto-partitioning after the system boots up and the root aggregate is online. The event raid.autoPart.enabled will be logged when auto-partitioning is re-enabled. To create a root aggregate on partitioned disks: 1. Halt the controller. 2. Replace any failed internal disks (see the "reason" field in the EMS message). 3. Reboot the controller. 4. Re-initialize the system. If this message is seen after the system initialization and the root aggregate is already created on partitioned disks, then the system will continue to function, as follows: 1. Expansion of existing aggregates created from partitioned disks may not work. 2. If a disk fails in a RAID group created out of partitioned disks, then a spare will fail to be partitioned and disk reconstruction will not start. 3. If a disk is marked for predictive failure in a RAID group created out of partition disks, then a spare will fail to be partitioned and the sick disk copy will not start. 4. If disks are available, then manually partition the disks and keep them as spares. 5. If you were previously directed to disable ADP by NetApp technical support, reach out to NetApp technical support to re-enable ADP.

Syslog Message

Disk auto-partitioning is disabled on this system: %s.

Parameters

reason (STRING): Reason that auto-partitioning was disabled.

raid.autoPart.done

Severity

NOTICE

Description

This message indicates that auto-partitioning has completed.

Corrective Action

(None).

Syslog Message

Successfully auto-partitioned %d of %d disks.

Parameters

n_partitioned (INT): Number of disks successfully auto-partitioned.
n_total (INT): Number of disks available for auto-partitioning.

raid.autoPart.enabled

Severity

NOTICE

Description

This message occurs when auto-partitioning for root volume creation is enabled on the system.

Corrective Action

None.

Syslog Message

Auto-partitioning is enabled on the system %s for partition method %s with %llu root size blocks.

Parameters

node (STRING): Node on which auto-partitioning is enabled.
partition_method (STRING): Partition method which is enabled.
size_blocks (LONGINT): Thin partition size in blocks for root.

raid.autoPart.paramsModified

Severity

NOTICE

Description

This message occurs when the "root-configuration" environment variable, which controls auto-partitioning for the initial root volume, contains one or more invalid parameters. When invalid parameters are discovered, the system reverts to using default parameters instead of the invalid parameters.

Corrective Action

Use the suggested "root-configuration" setting instead of the existing "root-configuration" setting.

Syslog Message

Invalid "root-configuration" settings: "%s". The system will auto-partition as if "root-configuration" had been set to: "%s".

Parameters

original_setting (STRING): Original environment variable.
modified_setting (STRING): Modified environment variable.

raid.autoPart.start

Severity

NOTICE

Description

This message indicates that auto-partitioning has started.

Corrective Action

(None).

Syslog Message

System has started auto-partitioning %d disks.

Parameters

n_total (INT): Number of disks available for auto-partitioning.

raid.capacity events

raid.capacity.license.alloc

Severity

NOTICE

Description

This message occurs when the system creates a new aggregate, or registers a new capacity for an existing aggregate.

Corrective Action

(None).

Syslog Message

Registered licensed capacity (%llu%s) for %s aggregate %s UUID %s - operation: %s, simulated: %d.

Parameters

capacity (LONGINT): Capacity registered for the aggregate against the license manager.
capacity_unit (STRING): Capacity unit (MB, GB, TB) for registered capacity.
mirrored (STRING): "mirrored" if the aggregate is mirrored; "unmirrored" otherwise.
aggregate_name (STRING): Name of the aggregate.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
operation (STRING): Aggregate operation triggering the license capacity update.
simulated (INT): 1 if the operation is simulated; 0 if the operation is not simulated.
root (INT): 1 if the aggregate is a root aggregate; 0 if it is a data aggregate.
status (INT): Synchronous status returned by the license capacity alloc call.
callback (INT): Indicates whether callback requested
sequence (INT): Sequence number to prevent suppression of duplicate messages.

raid.capacity.license.free

Severity

NOTICE

Description

This message occurs when the system destroys an aggregate, and thus frees its registered license capacity.

Corrective Action

(None).

Syslog Message

Freed licensed capacity of aggregate %s UUID %s operation: %s.

Parameters

aggregate_name (STRING): Name of the aggregate.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
operation (STRING): Aggregate operation triggering the license capacity free.
status (INT): Synchronous status returned by the license capacity free call.
sequence (INT): Sequence number to prevent suppression of duplicate messages.

raid.capacity.license.status

Severity

NOTICE

Description

This message occurs when the system attempts to update the licensed capacity of the system due to an aggregate operation.

Corrective Action

(None).

Syslog Message

Status of licensing request %s, aggregate %s, licensed capacity %llu%s, capacity remaining %llu%s, additional capacity required %llu%s.

Parameters

status_string (STRING): Status of the licensing request.
aggregate_name (STRING): Name of the aggregate.
licensed_size (LONGINT): Licensed capacity of the aggregate.
licensed_size_unit (STRING): Capacity unit (MB, GB, TB) for licensed capacity.
capacity_left (LONGINT): Capacity remaining in the license.
capacity_left_unit (STRING): Capacity unit (MB, GB, TB) for capacity remaining.
capacity_required (LONGINT): Additional licensed capacity required for this operation.
capacity_required_unit (STRING): Capacity unit (MB, GB, TB) for additional capacity required.
status_code (INT): Specific status code returned by the licensing request.
sequence (INT): Sequence number to prevent suppression of duplicate messages.

raid.carrier events

raid.carrier.diskEvacuated

Severity

NOTICE

Description

This message occurs when the evacuation operation is complete on a disk in a multidisk carrier that contains at least one failed disk. When a disk in a multidisk carrier fails, Data ONTAP® initiates evacuation of the other disks in the carrier so that you can replace the carrier after the evacuation is done. The disk's amber Attention LED is lit continuously after the carrier evacuation is complete.

Corrective Action

(None).

Syslog Message

Disk evacuation operation is complete on %s.

Parameters

disk_info (STRING): Formatted information of the disk being evacuated.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of the disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.carrier.doNotRemove

Severity

NOTICE

Description

This message occurs when a single disk fails while it is in a carrier that contains more than one disk. This disk carrier should not be removed because another disk might be in use. If another disk is in use, Data ONTAP® performs a disk copy operation on the other disk so that the carrier can be replaced after the disk copy is completed.

Corrective Action

Do not remove the disk carrier with the failed disk until the disk copy operation is completed. You can remove the carrier after the 'raid.carrier.remove' event is issued.

Syslog Message

%s in a multi-disk carrier failed. DO NOT REMOVE the disk carrier with the failed disk until the 'raid.carrier.remove' event is issued.

Parameters

disk_info (STRING): Formatted information of the disk object.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of the disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.carrier.remove

Severity

ALERT

Description

This message occurs when the last disk in a carrier that contains more than one disk has failed.

Corrective Action

Replace the carrier containing the failed disks.

Syslog Message

%s failed after all other disks have failed in the carrier. Replace the carrier.

Parameters

disk_info (STRING): Information about the last failed disk, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): String representing the model type of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is "Local".

raid.cksum events

raid.cksum.bad.file.block

Severity

ERROR

Description

This event is issued when WAFL accesses a block that was zeroed because it could not be recovered correctly.

Corrective Action

Please restore the corrupted file from snapshot or from the backup media.

Syslog Message

Reading bad block on %s %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the block was being accessed for a flexible volume or an aggregate.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): The name of the volume or aggregate
disk_info (STRING): Formatted information of the disk
blockNum (LONGINT): The block number
ino_type (STRING): The inode type
fileid (INT): The file identifier
snapid (INT): The snapshot identifier
bno (LONGINT): The block number in the file
level (INT): The level
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.buf.read.error.embedded

Severity

NOTICE

Description

This message occurs when the system detects an embedded checksum error. This can occur when a zeroing disk is added to the RAID group for reconstruction, and the zeroing is never completed.

Corrective Action

(None).

Syslog Message

Embedded checksum error on %s %s%s, %s, phys checksum block %llu

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.

vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Disk block number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.bypass

Severity

NOTICE

Description

This message occurs when a read error has occurred while media error bypass is enabled.

Corrective Action

(None).

Syslog Message

raid_cksum_compare: media error bypass enabled; Ignoring read error - %s %s%s, %s disk block %llu

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Block number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.bypass.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch while media error bypass is enabled. The expected virtual block number (VBN)/disk block number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. The error is ignored.

Corrective Action

(None).

Syslog Message

Block number mismatch: %s %s%s, %s stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu; media error bypass enabled; ignoring read error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information about the disk.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.bypass.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry while media error bypass is enabled. The checksum computed over the checksum entry does not match the embedded checksum, indicating that the checksum entry is corrupted. The error is ignored.

Corrective Action

(None).

Syslog Message

Invalid checksum entry: %s %s%s, %s disk block %llu; Media error bypass enabled; Ignoring read error.

Parameters

vol_type (STRING): Volume type.

owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.bypass.unknown

Severity

NOTICE

Description

This message occurs when a read error has occurred and has been ignored because media error bypass is enabled.

Corrective Action

(None).

Syslog Message

raid_cksum_compare: media error bypass enabled; Ignoring read error - %s %s%s, on disk block %llu

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
blockNum (LONGINT): Block number.

raid.cksum.bypass.unkwn.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch while media error bypass is enabled. The expected virtual block number (VBN)/disk block number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. The error is ignored. Details on which disk the error was encountered on are not Available because the disk transitioned to an unavailable state between the detection of the error and the logging of this message.

Corrective Action

(None).

Syslog Message

Block number mismatch: %s %s%s, stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu; Media error bypass enabled; Ignoring read error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.

raid.cksum.bypass.unkwn.embd

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry while media error bypass is enabled. The embedded checksum computed over the checksum entry does not match the stored embedded checksum in the checksum entry, indicating the corruption of the checksum entry. The error is ignored. Details on which disk the error was encountered on are not Available, because the disk transitioned to an unavailable state between the detection of the error and the logging of this message.

Corrective Action

(None).

Syslog Message

Invalid checksum entry: %s %s%s, on block %llu; Media error bypass enabled; Ignoring read error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
blockNum (LONGINT): Physical disk block number containing the error.

raid.cksum.bypass.unkwn.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry while media error bypass is enabled. The checksum entry is zeroed, but the corresponding block is not zeroed. The error is ignored. Details on which disk the error was encountered on are not Available because the disk transitioned to an unavailable state between the detection of the error and the logging of this message.

Corrective Action

(None).

Empty checksum entry for non-zeroed block: %s %s%s, on disk block %llu; Media error bypass enabled; Ignoring read error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
blockNum (LONGINT): Physical disk block number containing the error.

raid.cksum.bypass.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry while media error bypass is enabled. The checksum entry is zeroed, but the corresponding block is not zeroed. The error is ignored.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block: %s %s%s, %s disk block %llu; Media error bypass enabled; Ignoring read error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.disabled

Severity

NOTICE

Description

This event is issued when we disable checksums on an aggregate.

Corrective Action

(None).

Syslog Message

Disabled checksums on %s %s%s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.embedded.error

Severity

INFORMATIONAL

Description

This message occurs when the stored checksum of a checksum block does not match the computed checksum of the checksum block. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Checksum Entry of volume %s, disk %s, disk block %llu is bad: expected checksum %x, actual checksum %x

Parameters

vol (STRING): Name of the aggregate.
disk (STRING): Name of the disk.
blockNum (LONGINT): Disk block number.
expected_cksum (INT): Expected checksum of the checksum entry.
actual_cksum (INT): Actual embedded checksum in the checksum entry.

raid.cksum.enabled

Severity

NOTICE

Description

This event is issued when we enable checksums on an aggregate.

Corrective Action

(None).

Syslog Message

Enabled checksums on %s %s%s.

Parameters

vol_type (STRING): Volume type.

owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.err.recFail

Severity

NOTICE

Description

This message occurs when a disk is recommended for failure because we encountered more than allowed number of checksum errors.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Disk recommended for failure for exceeding threshold of %d checksum errors on %s%s.

Parameters

threshold (INT): The threshold for checksum errors
owner (STRING): String indicating the owner of the affected volume.
disk_info (STRING): The name of the disk.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.fsm.phase1

Severity

INFORMATIONAL

Description

This event is generated when phase 1 of a checksum upgrade is complete.

Corrective Action

(None).

Syslog Message

Completed RAID checksum upgrade phase 1 (of 2) on %s %s%s; phase 2 will occur during the next disk scrub.

Parameters

> **vol_type** (STRING): Volume type.
> **host** (STRING): Owner of the aggregate.
> **vol** (STRING): Name of the aggregate.

raid.cksum.fsm.phase1.abort

Severity

> INFORMATIONAL

Description

> This event is generated when phase 1 of a checksum upgrade is aborted.

Corrective Action

> (None).

Syslog Message

> RAID checksum upgrade phase 1 (of 2) on %s %s%s %s aborted.

Parameters

> **vol_type** (STRING): Volume type.
> **host** (STRING): Owner of the aggregate.
> **vol** (STRING): Name of the aggregate.
> **disk_info** (STRING): Formatted information of disk object that has completed its zeroing operation
> **shelf** (STRING): Shelf identifier where the disk is located
> **bay** (STRING): Disk bay within the shelf where disk is located
> **vendor** (STRING): Name of the vendor of the disk
> **model** (STRING): Model string of the disk drive
> **firmware_revision** (STRING): Firmware revision number of the disk
> **serialno** (STRING): Serial number of the disk
> **disk_type** (INT): Type of disk drive
> **disk_rpm** (STRING): Rotational speed of disk in RPM

> **site** (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.fsm.reinit

Severity

> INFORMATIONAL

Description

> This event is generated when reinitialization of checksums is complete.

Corrective Action

> (None).

Syslog Message

> Completed RAID checksum reinitialization on %s %s%s.

Parameters

    vol_type (STRING): Volume type.
    host (STRING): Owner of the aggregate.
    vol (STRING): Name of the aggregate.

raid.cksum.fsm.reinit.abort

Severity

    INFORMATIONAL

Description

    This event is generated when checksum reinitialization is aborted.

Corrective Action

    (None).

Syslog Message

    RAID checksum reinitialization on %s %s%s %s aborted.

Parameters

    vol_type (STRING): Volume type.
    host (STRING): Owner of the aggregate.
    vol (STRING): Name of the aggregate.
    disk_info (STRING): Formatted information of disk object that has completed its zeroing operation
    shelf (STRING): Shelf identifier where the disk is located
    bay (STRING): Disk bay within the shelf where disk is located
    vendor (STRING): Name of the vendor of the disk
    model (STRING): Model string of the disk drive
    firmware_revision (STRING): Firmware revision number of the disk
    serialno (STRING): Serial number of the disk
    disk_type (INT): Type of disk drive
    disk_rpm (STRING): Rotational speed of disk in RPM
    carrier (STRING): Unique ID of the carrier in which the disk is installed.
    site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.fsm.revert

Severity

    INFORMATIONAL

Description

    This event is generated when a checksum revert is complete.

Corrective Action

    (None).

Syslog Message

    Checksum revert of %s %s%s completed; vol copy, aggr copy and snapmirror now allowed.

Parameters

vol_type (STRING): Volume type.
host (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.ignore.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch. The expected virtual block number (VBN)/disk block number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. This error is ignored if one of the following conditions is true: - It was encountered during WAFL® check. - It was encountered during wafliron and in ignore unrecoverable checksum error mode. - The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. - It was encountered in ignore checksum error mode. - It was encountered in boot bypass media error mode.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s %s %s, %s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu. Ignoring unrecoverable error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): VBN stored in the checksum entry.
expected_vbn (LONGINT): Expected VBN.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.ignore.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry. The embedded checksum computed over the checksum entry does not match, indicating the corruption of the checksum entry. This error is ignored if one of the following conditions is true: - It was encountered during WAFL® check. - It was encountered during wafliron and in ignore unrecoverable checksum error mode. - The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. - It was encountered in ignore checksum error mode. - It was encountered in boot bypass media error mode.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s %s %s, %s, disk block %llu. Ignoring unrecoverable error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number of the disk containing the error.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.ignore.error

Severity

NOTICE

Description

This message occurs when the system ignores a checksum error. This error is ignored if one of the following conditions is true: * It was encountered during WAFL® check. * It was encountered during wafliron and in ignore unrecoverable checksum error mode. * The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. * It was encountered in ignore checksum error mode. * It was encountered in boot bypass media error mode.

Corrective Action

(None).

Syslog Message

%s on %s %s%s, %s, disk block %llu. Ignoring unrecoverable error.

Parameters

error (STRING): Name of the error.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Block number.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.ignore.file.bno

Severity

ALERT

Description

This message occurs when the system detects a block number mismatch in a block of a file. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry indicating that the block is read from the wrong location. This error is ignored if one of the following conditions is true: - It was encountered during WAFL® check. - It was encountered during wafliron and in ignore unrecoverable checksum error mode. - The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. - It was encountered in ignore checksum error mode. - It was encountered in boot bypass media error mode.

Corrective Action

Contact technical support for information about how to resolve the unrecoverable checksum error in the referenced file.

Syslog Message

Block number mismatch on %s %s %s, %s, stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu, %s inode number %d, snapid %d, file block %llu, level %d. Ignoring unrecoverable error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information of the disk drive.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
ino_type (STRING): The inode type

fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Level.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.ignore.file.embed

Severity

ERROR

Description

This message occurs when the system detects an invalid checksum entry in a block of a file. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. This error is ignored if one of the following conditions is true: - It was encountered during WAFL® check. - It was encountered during wafliron and in ignore unrecoverable checksum error mode. - The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. - It was encountered in ignore checksum error mode. - It was encountered in boot bypass media error mode.

Corrective Action

Contact technical support for information about how to resolve the unrecoverable checksum error in the referenced file.

Syslog Message

Invalid checksum entry on %s %s %s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d. Ignoring unrecoverable error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Formatted information of the disk drive.
blockNum (LONGINT): Physical disk block number containing the error.
ino_type (STRING): The inode type
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Level.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.ignore.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry. The checksum entry is zeroed, but the corresponding block is not zeroed. This error is ignored if one of the following conditions is true: - It was encountered during WAFL® check. - It was encountered during wafliron and in ignore unrecoverable checksum error mode. - The block cannot be recovered from parity and the volume is ignoring unrecoverable errors. - It was encountered in ignore checksum error mode. - It was encountered in boot bypass media error mode.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s %s %s, %s, disk block %llu. Ignoring unrecoverable error.

Parameters

vol_type (STRING): Volume type.

owner (STRING): Owner of the affected aggregate.

vol (STRING): Name of the aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

blockNum (LONGINT): Physical disk block number of the disk containing the error.

shelf (STRING): Identifier of the disk shelf where the disk drive is located.

bay (STRING): Disk bay within the disk shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): String representing the name of the model of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.nvram.error

Severity

NOTICE

Description

This message occurs when we cannot write out the checksum for an aggregate because of uninitialized NVRAM. System panics because of this error and will attempt to perform recovery in the next boot.

Corrective Action

(None).

Syslog Message

Cannot write checksum for %s %s%s, %s, disk block %llu: NVRAM is not initialized.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Block number.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.nvram.uninit

Severity

NOTICE

Description

This message occurs when an aggregate checksum cannot be repaired because of uninitialized NVRAM.

Corrective Action

(None).

Syslog Message

Cannot repair checksum for %s %s%s, %s, disk block %llu: NVRAM is not initialized.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Block number.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where disk drive is located.

vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.replay.bad.entry

Severity

ERROR

Description

This event is issued at the end of checksum replay when bad checksum entries are detected in NVRAM during that replay (indicating corrupted NVRAM). Reparity will start automatically and update checksum blocks involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Skipped %d bad checksum entries in NVRAM.

Parameters

nentries (INT): The number of bad entries

raid.cksum.replay.disk.missing

Severity

INFORMATIONAL

Description

This event is issued when we encounter an NVRAM checksum entry for a missing disk during checksum replay. The disk will be reconstructed if an appropriate spare is available.

Corrective Action

(None).

Syslog Message

Skipping checksum block %llu because disk with index %d is missing in %s %s%s, plex %s, RAID group %d.

Parameters

cbn (LONGINT): Checksum block number
diskid (INT): Index of the disk in the RAID group.
vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
plex (STRING): The name of the plex.

rgid (INT): The identifier of the RAID group.

raid.cksum.replay.mismatch

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM checksum entry which does not match the partner NVRAM shadow checksum entry.

Corrective Action

(None).

Syslog Message

Skipping checksum block %ld for disk %s because the checksum 0x%x and shadow checksum 0x%x do not match.

Parameters

block_number (LONGINT): Checksum block number.
diskname (STRING): Name of the disk.
checksum (INT): Checksum value.
shadow_checksum (INT): Shadow checksum value.

raid.cksum.replay.nvgen.mismatch

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM generation mismatch for an aggregate during checksum replay. Reparity will start automatically and update checksum blocks involved in recent writes.

Corrective Action

(None).

Syslog Message

NVRAM generation mismatch for %s %s%s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.replay.plex.missing

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM checksum entry for a missing plex during checksum

replay. Reparity will start automatically when the plex comes online. At that time, reparity will update checksum blocks involved in recent writes.

Corrective Action

(None).

Syslog Message

Cannot find plex with identifier %d in %s %s%s.

Parameters

plexid (INT): The identifier of the plex.
vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.replay.plex.unavailable

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM checksum entry for an offline or failed plex during checksum replay. Reparity will start automatically when the plex comes online. At that time, reparity will update checksum blocks involved in recent writes.

Corrective Action

(None).

Syslog Message

Plex %s in %s %s%s is offline or failed.

Parameters

plex (STRING): The name of the plex.
vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.replay.rg.invalid

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM checksum entry for a missing RAID group during checksum replay.

Corrective Action

(None).

Syslog Message

Invalid RAID group identifier %d in %s %s%s, plex %s.

Parameters

>**rgid** (INT): The identifier of the RAID group.
>**vol_type** (STRING): Volume type.
>**owner** (STRING): Owner of the aggregate.
>**vol** (STRING): Name of the aggregate.
>**plex** (STRING): The name of the plex.

raid.cksum.replay.summary

Severity

>INFORMATIONAL

Description

>This event is generated when checksum replay is complete.

Corrective Action

>(None).

Syslog Message

>Replayed %u checksum blocks.

Parameters

>**nblocks** (INT): The number of blocks

raid.cksum.replay.vol.clean

Severity

>NOTICE

Description

>This event is issued when we encounter an NVRAM checksum entry for a cleanly shutdown aggregate during checksum replay.

Corrective Action

>(None).

Syslog Message

>%s %s%s was cleanly shut down.

Parameters

>**vol_type** (STRING): Volume type.
>**owner** (STRING): Owner of the aggregate.
>**vol** (STRING): Name of the aggregate.

raid.cksum.replay.vol.missing

Severity

>NOTICE

Description

This event is issued when we encounter an NVRAM checksum entry for a missing volume or aggregate during checksum replay. Reparity will start automatically when the aggregate appears again. At that time, reparity will update checksum blocks involved in recent writes.

Corrective Action

(None).

Syslog Message

Cannot find aggregate with identifier %s.

Parameters

volId (STRING): The identifier of the volume or aggregate.

raid.cksum.replay.vol.offline

Severity

NOTICE

Description

This event is issued when we encounter an NVRAM checksum for an offline aggregate during checksum replay. Reparity will start automatically when the aggregate comes online. At that time, reparity will update checksum blocks involved in recent writes.

Corrective Action

(None).

Syslog Message

%s %s%s is not online.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.unverify.file.block

Severity

ERROR

Description

This event is issued when WAFL accesses a block that could not be verified because of medium error on the checkusm block.

Corrective Action

Please restore the corrupted file from snapshot or from the backup media.

Syslog Message

Reading unverified block on %s %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the block was being accessed for a flexible volume or an aggregate.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): The name of the volume or aggregate
disk_info (STRING): Formatted information of the disk
blockNum (LONGINT): The block number
ino_type (STRING): The inode type
fileid (INT): The file identifier
snapid (INT): The snapshot identifier
bno (LONGINT): The block number in the file
level (INT): The level
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.validate.zoned

Severity

NOTICE

Description

This event is issued when the aggregate cannot support Zone checksum.

Corrective Action

(None).

Syslog Message

Checksums cannot be enabled on %s %s%s due to its disk sizes.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.cksum.verify.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch in an aggregate when it is being accessed by RAID, and not in response to a WAFL® request; therefore, there is no usable WAFL® context. The expected virtual block Number (VBN)/ disk block number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. Additional

messages are logged as the system attempts to perform recovery.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s %s%s, %s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu. System will attempt to perform recovery.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Identifier of the disk shelf where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry in an aggregate when it is being accessed by RAID, and not in response to a WAFL® request; therefore, there is no usable WAFL context. The embedded checksum computed over the checksum entry does not match, indicating the corruption of the checksum entry. Additional messages are logged as the system attempts to perform recovery.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s %s%s, %s, disk block %llu. System will attempt to perform recovery.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number of the disk containing the error.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): String representing the name of the model of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.error

Severity

NOTICE

Description

This message occurs when the system detects a checksum error in an aggregate when it is being accessed by RAID, and not in response to a WAFL® request; therefore, there is no usable WAFL® context. Additional messages are logged as the system attempts to perform recovery.

Corrective Action

(None).

Syslog Message

%s on %s %s%s, %s, disk block %llu, cpcount %d, buftreeid %llu. System will attempt to perform recovery.

Parameters

error (STRING): Name of the error.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Block number.
stored_cpcount (INT): Stored CP count in the checksum entry.
stored_buftreeid (LONGINT): Stored buftree identifier in the checksum entry.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.error.file

Severity

NOTICE

Description

This message occurs when the system discovers a checksum error in a block of a file. The computed checksum over the stored data does not match the stored checksum, indicating corruption.Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

%s on %s %s%s, %s, disk block %llu, cpcount %d, buftreeid %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

error (STRING): Name of the error.
vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information of the disk drive.
blockNum (LONGINT): Block number.
stored_cpcount (INT): Stored CP count in the checksum entry.
stored_buftreeid (LONGINT): Stored buftree identifier in the checksum entry.
ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Level.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of the disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.file.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch in a block of a file. The expected virtual block number (VBN)/disk block number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s %s%s, %s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information of the disk drive.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Level.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of the disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.file.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid file block checksum. The embedded checksum does not match the computed checksum, indicating corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions, and other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information about the disk drive.
blockNum (LONGINT): Physical disk block number that contains the error.
ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Level.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of the disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster™ configuration, indicates the site {local|remote} where the disk is located. For non-MetroCluster configurations, the site is 'local'.
physDiskBlockNum (LONGINT): Physical disk block number of the partitioned disk.

raid.cksum.verify.file.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry in a block of a file. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information of the disk drive.
blockNum (LONGINT): Physical disk block number containing the error.
ino_type (STRING): Inode type.
fileid (INT): File identifier.

snapid (INT): Snapshot identifier.

bno (LONGINT): Block number in the file.

level (INT): Level.

shelf (STRING): Disk shelf identifier where the disk drive is located.

bay (STRING): Disk bay within the disk shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): Model string of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of the disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.verify.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry for a non-zeroed block in an aggregate when it is being accessed by RAID, and not in response to a WAFL® request; therefore there is no usable WAFL® context. The checksum entry is zeroed, but the corresponding block is not zeroed. Additional messages are logged as the system attempts to perform recovery.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s %s%s, %s, disk block %llu. System will attempt to perform recovery.

Parameters

vol_type (STRING): Volume type.

owner (STRING): Owner of the affected aggregate.

vol (STRING): Name of the aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

blockNum (LONGINT): Physical disk block number of the disk containing the error.

shelf (STRING): Identifier of the disk shelf where the disk drive is located.

bay (STRING): Disk bay within the disk shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): String representing the name of the model of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.wc.blkErr

Severity

NOTICE

Description

This message occurs when the system detects a checksum error due to a WAFL® context mismatch. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

Please restore the corrupted file from snapshot or from the backup media.

Syslog Message

Checksum error due to WAFL context mismatch on %s %s%s, %s, disk block %llu, buftree ID %d, %s inode number %d, snapshot ID %d, file block %llu, level %d: checksum context has buftree ID %d, file block %llu, %s.

Parameters

vol_type (STRING): Whether the file is contained in an aggregate or within a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Block number.
buftreeid (LONGINT): Buftree identifier.
ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
bno (LONGINT): Block number in the file.
level (INT): Indirection level in the WAFL buffer.
stored_buftreeid (LONGINT): Stored buftree identifier in the checksum entry.
stored_fbn (LONGINT): Stored file block number in the checksum entry.
remaining_stored_context (STRING): String containing CP count, Physical Volume Block Number (PVBN), encrypted flag, encyption key index stored in the checksum entry.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.cksum.wc.sblkErr

Severity

ALERT

Description

This message occurs when the system encounters a super block with bad WAFL® context information in its checksum entry.

Corrective Action

Start wafliron on the indicated volume or aggregate.

Syslog Message

Checksum error due to WAFL context mismatch for super block %llu on %s %s%s, %s.

Parameters

blockNum (LONGINT): Block number.
vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information of the disk drive.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of the disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.zeroed.blkErr

Severity

NOTICE

Description

This message occurs when the system discovers that the stored checksum for a block allocated by WAFL® is zero. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum error due to zeroed block on %s %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
disk_info (STRING): Formatted information of the disk drive.
blockNum (LONGINT): Block number.
ino_type (STRING): Inode type.

fileid (INT): File identifier.

snapid (INT): Snapshot identifier.

bno (LONGINT): Block number in the file.

level (INT): Level.

shelf (STRING): Disk shelf identifier where the disk drive is located.

bay (STRING): Disk bay within the shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): Model string of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.cksum.zeroed.sblkErr

Severity

NOTICE

Description

This message occurs when the system encounters a zeroed super block.Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum error due to zeroed super block %llu on %s %s%s, %s.

Parameters

blockNum (LONGINT): Block number.

vol_type (STRING): Whether the file is contained in an aggregate or a flexible volume.

owner (STRING): Owner of the affected volume or aggregate.

vol (STRING): Name of the volume or aggregate.

disk_info (STRING): Formatted information of the disk drive.

shelf (STRING): Disk shelf identifier where the disk drive is located.

bay (STRING): Disk bay within the shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): Model string of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of the disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

physDiskBlockNum (LONGINT): Physical disk block number for partitioned disk.

raid.config events

raid.config.check.failed

Severity

ERROR

Description

This message occurs during a mirror check, when the system discovers that all plexes have failed in an aggregate.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem volume from the system logs. 2. Determine the reason for the plex failures, such as disk drive, disk shelf, or loop failure. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

Syslog Message

%s %s%s: All plexes have failed.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.config.check.failedPlex

Severity

ERROR

Description

This message occurs during a mirror check, when the system discovers that an aggregate has a failed plex.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem volume and failed plex from the system logs. 2. Determine the reason for the plex failure, such as disk drive, disk shelf, or loop failure. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

Syslog Message

Plex %s%s has failed.

Parameters

owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.config.check.offlinePlex

Severity

ERROR

Description

This message occurs during a mirror relationship check when the system discovers that an aggregate has become mirror-degraded due to an offline plex.

Corrective Action

Bring the plex back online with the "storage aggregate plex online" command.

Syslog Message

Plex %s%s is offline.

Parameters

aggr (STRING): Name of the aggregate.
plex (STRING): Name of the plex.

raid.config.disk.bad.label

Severity

NOTICE

Description

This message occurs when configuration management detects that an unassimilated disk has a label with unexpected or missing data, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s has bad or missing data on label.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.bad.label.version

Severity

NOTICE

Description

This message occurs when configuration management detects that an unassimilated disk has a label with an unsupported version, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s has an unsupported label version.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.failed

Severity

ERROR

Description

This message occurs when configuration management has detected that an unassimilated disk has failed, and has permanently removed that disk from service.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

%s failed.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM

failure_reason (STRING): A text description of storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.init.failed

Severity

NOTICE

Description

This message occurs when configuration management detects that a disk has failed its device initialization sequence, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s initialization failed.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.labeled.broken

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem disk was failed under a previous release of Data ONTAP®, and has permanently removed that disk from service. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

%s was labeled "broken" in a previous release.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.missing

Severity

INFORMATIONAL

Description

This event is issued when configuration management has detected that an unassimilated disk has gone missing from the filer, and has removed that disk from the configuration.

Corrective Action

(None).

Syslog Message

%s is missing.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.multipleFail

Severity

INFORMATIONAL

Description

This event is generated when we detect additional disk failures during the processing of a failed disk.

Corrective Action

(None).

Syslog Message

While processing failed disks, %d additional disks suffered a failure

Parameters

ndisks (INT): The number of additional disks that have failed

raid.config.disk.not.responding

Severity

NOTICE

Description

This message occurs when configuration management detects that an unassimilated disk is temporarily not responding to requests, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s is not responding.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.rawsize.shrank

Severity

NOTICE

Description

This message occurs when configuration management detects that an unassimilated disk's stored rawsize is greater than the physical size of the disk, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s shrank.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.recovering

Severity

NOTICE

Description

This message occurs when configuration management detects an unassimilated disk that has failed to respond to requests. The disk is temporarily removed from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Attempting to bring %s back into service.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.disk.tradvol

Severity

NOTICE

Description

This message occurs when configuration management detects that the disk belongs to a traditional volume which is not supported on clustered Data ONTAP® systems. The disk is removed from service.

Corrective Action

Install a version of Data ONTAP® that supports the traditional volume, or remove the traditional volume disks.

Syslog Message

The label on %s indicates that the disk belongs to a traditional volume which is not supported on clustered Data ONTAP® systems.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM and carrier serial number.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.admin.failed

Severity

INFORMATIONAL

Description

This event is issued after the "disk fail -i" command is used to administratively fail a filesystem disk, and configuration management has permanently removed that disk from service.

Corrective Action

(None).

Syslog Message

File system %s is being failed by administrator.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.admin.failed.after.copy

Severity

INFORMATIONAL

Description

This message occurs when the "disk fail" command is used to administratively fail a filesystem disk. The disk was copied to a replacement and configuration management has permanently removed that disk from service.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

File system %s is being failed after it was successfully copied to a replacement.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.bad.label

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem disk has a label with unexpected or missing data, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

File system %s has bad or missing data on label.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.bad.label.version

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem disk has a label with an unsupported version, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

File system %s has an unsupported label version.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.failed

Severity

ERROR

Description

This message occurs when configuration management has detected that a filesystem disk has failed, and has permanently removed that disk from service.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

File system %s failed.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.failed.after.copy

Severity

ERROR

Description

This message occurs when a disk reported a predictive failure. Data ONTAP used Rapid RAID Recovery to copy the disk to a replacement. Copying was successful and now the disk is permanently removed from

service.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

File system %s is being failed after it was successfully copied to a replacement.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.missing

Severity

INFORMATIONAL

Description

This event is issued when configuration management has detected that a filesystem disk has gone missing from the filer, and has removed that disk from the configuration.

Corrective Action

(None).

Syslog Message

File system %s is missing.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.not.responding

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem disk is temporarily not responding to requests, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

File system %s is not responding.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.rawsize.shrank

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem disk's stored rawsize is greater than the physical size of the disk, and temporarily removes that disk from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

File system %s shrank.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.disk.recovering

Severity

NOTICE

Description

This message occurs when configuration management detects a filesystem disk that has failed to respond to requests. The disk is temporarily removed from service. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Attempting to bring file system %s back into service.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.filesystem.lun.resized

Severity

NOTICE

Description

This message occurs when configuration management detects that a filesystem gateway LUN's stored rawsize does not match the physical size of the LUN. Resizing of a filesystem gateway LUN is not supported. Only gateway LUNs that are spare can be resized. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

File system %s resized.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.online.notComp

Severity

ERROR

Description

This message occurs when a volume or aggregate cannot be brought online because SnapLock® is not supported on this version of Data ONTAP®.

Corrective Action

Install a version of Data ONTAP that is supported with SnapLock, available from your vendor.

Syslog Message

%s %s%s is being taken offline. SnapLock is not supported on this version of Data ONTAP.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.config.online.notCompressComp

Severity

ERROR

Description

This message occurs when a compressed virtual volume cannot be brought online because compressed volumes have adaptive storage efficiency which is not supported in this release of Data ONTAP®.

Corrective Action

Install a version of Data ONTAP that supports adaptive storage efficiency.

Syslog Message

Volume '%s%s' is being taken offline because it is compressed and the container uses adaptive storage efficiency which is not supported in this version of Data ONTAP.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.

raid.config.online.req.bad.fsid

Severity

NOTICE

Description

This message occurs when a aggregate cannot be mounted because it has an invalid file system identifier (FSID) or the same FSID as another aggregate.

Corrective Action

(None).

Syslog Message

%s %s%s has a duplicate or invalid FSID.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.config.online.req.badvers

Severity

ERROR

Description

This message occurs when an aggregate that appeared to be mountable could not be mounted because the WAFL® version is invalid.

Corrective Action

Install a new version of Data ONTAP® because the aggregate is from a later version of software.

Syslog Message

This version of Data ONTAP does not recognize the filesystem of %s %s%s. The %s is probably from a later version of the software and is being left unmounted.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that could not be mounted.
vol_type2 (STRING): Repeat volume type for the syslog message.

raid.config.online.req.corrupt4

Severity

ERROR

Description

This event occurs when dynamic assimilation produced a writable aggregate which could not be mounted because it has been marked as having an inconsistent file system.

Corrective Action

Run wafliron for the aggregate.

Syslog Message

%s %s%s is inconsistent. Mounting it prior to running wafliron raises the risk of further file system inconsistencies and data corruption.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that could not be mounted.

raid.config.online.req.failed

Severity

NOTICE

Description

This message occurs when an attempt to mount an aggregate fails, even though it appeared to be mountable.

Corrective Action

(None).

Syslog Message

Unable to mount %s %s%s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that could not be mounted.

raid.config.online.req.inconsist

Severity

ERROR

Description

This event occurs when dynamic assimilation produced an aggregate which appeared to be mountable, but it could not be mounted because the WAFL magic number in the volume information block was incorrect. This is caused by an incomplete aggregate copy or snapmirror initialization.

Corrective Action

Repeat aggr copy or snapmirror initialize that was not completed.

Syslog Message

%s %s%s was left in an inconsistent state by an aborted vol copy or aggr copy copy or an aborted snapmirror initial (level 0) transfer. In order to bring it online, you must either destroy and re-create it, or complete an initial snapmirror transfer or vol copy or aggr copy.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that could not be mounted.

raid.config.online.req.invalid

Severity

NOTICE

Description

This message occurs when an aggregate that appeared to be mountable could not be mounted because neither volume info block was valid.

Corrective Action

(None).

Syslog Message

Neither volume information block of %s %s%s is valid.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that could not be mounted.

raid.config.online.req.mt.iv

Severity

ERROR

Description

This message occurs when WAFL® attempts to take over a mirror volume that does not have a valid mirror type. This might be caused by upgrading to the current version of Data ONTAP®, which requires the mirror-type attribute, from a previous version that does not.

Corrective Action

You cannot fix this condition by file system repair mechanisms such as wafliron. The data is not lost, but it is inaccessible as a mirror volume with invalid mirror information, and it cannot be brought online or taken offline. To reclaim the space you can destroy the mirror volume, but this results in the loss of all data on the mirror volume. If you choose to destroy the mirror volume anyway, the command to do so is as follows: 'volume delete -vserver vserver_name -volume vol_name'.

Syslog Message

The mirror type associated with the mirror volume %s %s%s is invalid.

Parameters

vol_type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the affected volume.
vol (STRING): Name of the volume.

raid.config.online.req.nospace

Severity

ERROR

Description

This event occurs when there is insufficient free space in the containing aggregate to online a flexible volume and apply the flexible volumes space guarantees.

Corrective Action

This error can be corrected by making more space available in the aggregate.

Syslog Message

Containing aggregate does not have enough space to allow %s to be onlined.

Parameters

vol (STRING): The name of the flexible volume which could not be onlined.

raid.config.online.req.ok

Severity

NOTICE

Description

This message occurs when dynamic assimilation produced an aggregate which was successfully mounted.

Corrective Action

(None).

Syslog Message

%s %s%s is mounted. Time taken to mount the aggregate was %llu milliseconds.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that was mounted.

time (LONGINT): Time taken to mount the aggregate.

raid.config.online.req.unsup

Severity

EMERGENCY

Description

This message occurs when the system determines that the deployment in which this aggregate was created does not match the current (clustered or nonclustered) deployment of Data ONTAP®.

Corrective Action

Bring the aggregate online on a node that matches the clustered or nonclustered deployment in which it was created.

Syslog Message

This deployment of Data ONTAP does not support the file system of '%s %s'. It is being taken offline.

Parameters

type (STRING): Volume type.
vol (STRING): Name of the aggregate.

raid.config.raidsize.change

Severity

NOTICE

Description

This message occurs when a change to the raidsize parameter is made to match the change made to the raidtype parameter for a given volume or aggregate.

Corrective Action

If the new raidsize is not appropriate, change it with the "storage aggregate modify -aggregate aggregate_name -maxraidsize new_size" command. For cache raidsize change, change it with the "storage aggregate modify -aggregate aggregate_name -cache_raid_group_size new_size" command.

Syslog Message

%s %s%s:%sraidsize is adjusted from %d to %d after changing raidtype.

Parameters

vol_type (STRING): Volume type.
host (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
cache_string (STRING): String to indicate if its cache raidsize change. If this is a raidsize change for cache (SSD) RG then the string "cache" will be printed, it is empty otherwise.
old_size (INT): Previous raidsize value.
new_size (INT): New raidsize value.

raid.config.rg.size.reminder

Severity

ERROR

Description

Size limits for raid4 groups are significantly reduced in Data ONTAP® 6.5. Very large raid4 groups do not provide adequate protection from data loss and they are not supported any more. Volumes with large raidgroups should be converted to raid_dp. This message occurs daily as part of system check if some raid groups are too large for raid4 raidtype. That can happen after upgrade from an older version of Data ONTAP with more lax raidsize restrictions. It can also be the result of changing raidtype from raid_dp to raid4. That should be used only to revert to an older version of Data ONTAP. In all other cases, change raidtype of volumes with such large raid groups to raid_dp.

Corrective Action

Change raidtype of the aggregate to raid_dp: "storage aggregate modify -aggregate aggregate_name -raidtype raid_dp"

Syslog Message

Volume %s%s has a raid group larger than the limit for raid4 raidtype (max. raid group size: %d, limit is %d). Convert the volume to raid_dp.

Parameters

host (STRING): Owner of the volume.
vol (STRING): Volume name.
rg_size (INT): Size of the largest raid group in the volume.
limit (INT): Size limit for raid4 group.

raid.config.spare.disk.admin.removed

Severity

INFORMATIONAL

Description

This event is issued when the "disk remove" command is used to administratively fail a spare disk, and configuration management has temporarily removed that disk from service.

Corrective Action

(None).

Syslog Message

Spare %s is being removed by administrator.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.bad.label

Severity

NOTICE

Description

This message occurs when configuration management detects that a spare disk has a label with unexpected or missing data, and has temporarily removed that disk from service.

Corrective Action

(None).

Syslog Message

Spare %s has bad label.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.bad.label.version

Severity

NOTICE

Description

This message occurs when configuration management detects that a spare disk has a label with an unsupported version, and has temporarily removed that disk from service.

Corrective Action

(None).

Syslog Message

Spare %s has an unsupported label version.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.failed

Severity

ERROR

Description

This message occurs when configuration management has detected that a spare disk has failed, and has permanently removed that disk from service.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Spare %s failed.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.missing

Severity

INFORMATIONAL

Description

This event is issued when configuration management has detected that a spare disk has gone missing from the filer, and has removed that disk from the configuration.

Corrective Action

(None).

Syslog Message

Spare %s is missing.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.not.responding

Severity

NOTICE

Description

This message occurs when configuration management detects that a spare disk is not responding to requests, and has temporarily removed that disk from service.

Corrective Action

(None).

Syslog Message

Spare %s is not responding.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.rawsize.shrank

Severity

NOTICE

Description

This message occurs when configuration management detects that a spare disk's stored rawsize is greater than the physical size of the disk, and has temporarily removed that disk from service.

Corrective Action

(None).

Syslog Message

Spare %s shrank.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.spare.disk.recovering

Severity

NOTICE

Description

This message occurs when configuration management detects a spare disk that has failed to respond to requests. The disk is temporarily removed from service. Attempts will be made to automatically bring this disk back into service. Unless the disk continues to exhibit the same problem, recovery should be complete within one hour. Otherwise, a follow-on notification will be sent within five hours to signal that the disk is being permanently removed from service.

Corrective Action

(None).

Syslog Message

Attempting to bring spare %s back into service.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.config.vol.destroyed

Severity

INFORMATIONAL

Description

This event is issued when an aggregate is destroyed.

Corrective Action

(None).

Syslog Message

%s '%s%s' destroyed.

Parameters

vol_type (STRING): Volume type.

owner (STRING): Owner of the affected aggregate.

volumeName (STRING): Name of the aggregate object.

raid.config.vol.renamed

Severity

INFORMATIONAL

Description

This event is issued when an aggregate is renamed.

Corrective Action

(None).

Syslog Message

%s '%s%s' renamed to '%s%s'.

Parameters

vol_type (STRING): Volume type.

oldOwner (STRING): Owner of the aggregate.

oldVolumeName (STRING): The original name of the object.

newOwner (STRING): String indicating the owner of the affected object. This is exactly the same as the oldOwner parameter (or should be).

newVolumeName (STRING): The new name of the object.

raid.config.vol.set.raid.cv

Severity

NOTICE

Description

This event is issued when an aggregate with block checksums is changing its checksum verification flag value.

Corrective Action

(None).

Syslog Message

%s %s%s: checksum verification %s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
volumeName (STRING): Name of the aggregate object.
status (STRING): The status of the command.

raid.data events

raid.data.lw.blkErr

Severity

NOTICE

Description

This message occurs when a WAFL® generated read detects a stale block due to a lost write. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Bad data detected on %s%s, disk block (DBN) %llu, aggregate block (VBN) %llu.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number that contains the error.
blockNum (LONGINT): Physical block number containing the error.
vbn (LONGINT): Volume block number containing the error.

raid.data.lw.recFail

Severity

ALERT

Description

This message occurs when raid recommends a drive for failure because it detected more than the allowed number of lost-write errors on the disk. These errors are caused by a malfunction in the disk.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Disk recommended for failure for exceeding threshold of %d lost-write error%s on %s%s.

Parameters

threshold (INT): The threshold for checksum errors due to wafl context mismatches
suffix (STRING): The suffix used to report in syslog
owner (STRING): String indicating the owner of the affected volume.
disk_info (STRING): The name of the disk.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.data.ws.blkErr

Severity

NOTICE

Description

This message occurs when RAID detects a stale data block using WAFL® sanity check. The bad block is then reconstructed from parity and the remaining data disks. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

WAFL sanity check detected bad data on volume %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

owner (STRING): Owner of the affected volume.
vol (STRING): Name of the volume.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Block number.

ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
fileBlockNum (LONGINT): Block number in the file.
level (INT): Indirection level.

raid.data.ws.blkErr.ignore

Severity

NOTICE

Description

This message occurs when WAFL® sanity check detects a stale data block while wafliron is running. RAID ignores the error because wafliron fixes it. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

WAFL sanity check detected bad data on volume %s%s, %s, disk block %llu, %s inode number %d, snapid %d, file block %llu, level %d. RAID is ignoring this error because wafliron is already running.

Parameters

owner (STRING): String indicating the owner of the affected volume.
vol (STRING): Name of the volume.
disk_info (STRING): Formatted information about the disk.
blockNum (LONGINT): Block number.
ino_type (STRING): Inode type.
fileid (INT): File identifier.
snapid (INT): Snapshot identifier.
fileBlockNum (LONGINT): Block number in the file.
level (INT): Indirection level.

raid.data.ws.sblkErr

Severity

NOTICE

Description

This message occurs when a WAFL® sanity check detects a stale superblock. The bad superblock is reconstructed from parity and the remaining data disks. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

WAFL sanity check detected bad superblock on volume %s%s, %s, disk block (DBN) %llu, aggregate block (VBN) %llu.

Parameters

> **owner** (STRING): Owner of the affected aggregate.
> **vol** (STRING): Name of the volume.
> **disk_info** (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.
> **blockNum** (LONGINT): Block number.
> **vbn** (LONGINT): Volume block number.

raid.data.ws.sblkErr.ignore

Severity

> NOTICE

Description

> This message occurs when WAFL® sanity check detects a stale superblock while wafliron is running. RAID ignores the error because wafliron tries to fix it. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

> (None).

Syslog Message

> WAFL sanity check detected bad superblock on volume %s%s, %s, block %llu. RAID is ignoring this error because wafliron is already running.

Parameters

> **owner** (STRING): String indicating the owner of the affected volume.
> **vol** (STRING): Name of the volume.
> **disk_info** (STRING): Formatted information of the disk.
> **blockNum** (LONGINT): Block number.

raid.debug events

raid.debug

Severity

> INFORMATIONAL

Description

> The SCSI debug event.

Corrective Action

> (None).

Syslog Message

> %s

Parameters

> **debug_string** (STRING): The debug statement that occurred.

raid.disable events

raid.disable.remote.nvlog

Severity

INFORMATIONAL

Description

This event is issued when RAID sub system disables recording in the partner's NVRAM entries for the log based file system.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Disabled Remote NVRAM logging.

Parameters

(None).

raid.disk events

raid.disk.capacity.info

Severity

NOTICE

Description

This event is issued to inform what the sum of all disk sizes is as well as what system capacity limit is.

Corrective Action

(Call support).

Syslog Message

System capacity visible is %s of the %s maximum.

Parameters

actual (STRING): Actual capacity of system
limit (STRING): Capacity limit of system

raid.disk.cksum.type.changed

Severity

INFORMATIONAL

Description

This message occurs when a disk's checksum type changes from either block to zoned, or zoned to block. It might occur, for example, due to a disk firmware update or a user request.

Corrective Action

(None).

Syslog Message

Disk %s checksum type was changed from %s to %s.

Parameters

disk_info (STRING): Formatted disk information
old_type (STRING): Old checksum type. "block" or "zoned".
new_type (STRING): New checksum type. "block" or "zoned".
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.failed.unknownPool

Severity

INFORMATIONAL

Description

This event is issued when a disk is failed but is not in an aggregate or a known disk pool.

Corrective Action

(None).

Syslog Message

Failed %s without a tree but with a unknown pool as a parent.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.fast.zero.done

Severity

NOTICE

Description

This message occurs when a fast zeroing operation is completed on a disk.

Corrective Action

(None).

Syslog Message

%s : disk zeroing complete (0x%llx).

Parameters

disk_info (STRING): Formatted information about the disk which has completed its zeroing operation.
fz_signature (LONGINTHEX): Random generated unique fast zero signature.
fz_signature_old (LONGINTHEX): Random generated unique fast zero signature, previous one.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of disk in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.home.id.changed

Severity

INFORMATIONAL

Description

This event is issued when a change in a disk's home id is detected, independent of any disk change notification event.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): Formatted disk information
old_home_id (STRING): Previous home host.
new_home_id (STRING): New home host.
old_home_sysid (LONGINT): Previous home sysid.
new_home_sysid (LONGINT): New home sysid.
shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.illegalAttach

Severity

ALERT

Description

This message occurs when ONTAP detects that a disk has been incorrectly attached to the system.

Corrective Action

Check disk shelf cabling and verify it meets SyncMirror requirements and wiring rules for this system.

Syslog Message

%s is illegally attached. %s

Parameters

disk_info (STRING): Name of the disk.
err_string (STRING): Illegal Attach error.
instanceId (INT): Instance identifier.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of disk in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.inserted

Severity

INFORMATIONAL

Description

This event is issued when a disk is inserted into the system.

Corrective Action

(None).

Syslog Message

%s has been inserted into the system

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.io.bypass

Severity

INFORMATIONAL

Description

This event is issued when a read error is detected but ignored because the aggregate is in media error bypass mode.

Corrective Action

(None).

Syslog Message

media error bypass enabled, ignoring read error on disk block %llu of %s

Parameters

blockNum (LONGINT): The disk block number
disk_info (STRING): The formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.io.toFailedDisk

Severity

ERROR

Description

This event is issued when an attempt is made to I/O a failed disk.

Corrective Action

In maintenance mode, remove ownership of this disk and assign the correct ownership

Syslog Message

DBG: %s is attempting I/O to failed %s

Parameters

who (STRING): Module attempting I/O
disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.abort

Severity

NOTICE

Description

This event occurs when the administrator aborts maintenance testing of a disk or when an error that is unrelated to the disk occurs. The disk is failed because testing could not be completed.

Corrective Action

(None).

Syslog Message

%s tests were aborted.

Parameters

disk_info (STRING): Formatted information of the disk
start_code (STRING): Start code for internal support use
end_code (STRING): End code for internal support use
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk
disk_rpm (STRING): Rotational speed of disk, in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.admin.abort

Severity

NOTICE

Description

This event occurs when administrator-initiated maintenance testing of a disk is aborted by the administrator or when an error that is unrelated to the disk occurs. The disk is made available as a spare.

Corrective Action

(None).

Syslog Message

%s tests were aborted.

Parameters

disk_info (STRING): Formatted information of the disk
end_code (STRING): End code for internal support use
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where the disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk
disk_rpm (STRING): Rotational speed of disk, in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.admin.done

Severity

NOTICE

Description

This event occurs when administrator- initiated maintenance testing of a disk is completed successfully. The disk is made available as a spare.

Corrective Action

(None).

Syslog Message

%s tests were completed successfully.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where the disk is located

vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk
disk_rpm (STRING): Rotational speed of disk, in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.admin.failed

Severity
NOTICE

Description
This message occurs when a disk fails one or more maintenance tests. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action
(None).

Syslog Message
%s tests failed.

Parameters
disk_info (STRING): Formatted information about the disk.
end_code (STRING): End code for internal support use.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.admin.start

Severity
NOTICE

Description
This event occurs when the administrator starts maintenance testing on a disk.

Corrective Action
(None).

%s will be tested.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk
disk_rpm (STRING): Rotational speed of disk, in RPM
start_reason (STRING): This states that the administrator started maintenance testing on a disk.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.bypassed

Severity

INFORMATIONAL

Description

This message occurs when a disk that has an error bypasses maintenance testing, even though the error typically would cause the disk to enter the maintenance center. The reason might be that the maintenance center is disabled, that there are not enough spare disks available in the system, or that there are already the maximum number of disks in the maintenance center.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of the disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
bypass_reason (STRING): Reason for bypassing maintenance testing on the disk.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.done

Severity

NOTICE

Description

This event occurs when maintenance testing of a disk is completed successfully. The disk is made available as a spare.

Corrective Action

(None).

Syslog Message

%s tests were completed successfully.

Parameters

disk_info (STRING): Formatted information of the disk
start_code (STRING): Start code for internal support use
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where the disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk
disk_rpm (STRING): Rotational speed of disk, in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.exceed

Severity

NOTICE

Description

This message occurs when a disk exceeds the number of times it is allowed to be tested. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s exceeded the number of allowed entries to maintenance testing.

Parameters

disk_info (STRING): Formatted information about the disk.
start_code (STRING): Start code for internal support use.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.failed

Severity

NOTICE

Description

This message occurs when a disk fails one or more maintenance tests. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s tests failed.

Parameters

disk_info (STRING): Formatted information about the disk.

start_code (STRING): Start code for internal support use.

end_code (STRING): End code for internal support use.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.maint.start

Severity

NOTICE

Description

This event occurs when a disk begins maintenance testing.

Corrective Action

(None).

Syslog Message

%s will be tested.

Parameters

disk_info (STRING): Formatted information of the disk

shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where the disk is located

vendor (STRING): Name of the vendor of the disk

model (STRING): Model string of the disk

firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk

disk_rpm (STRING): Rotational speed of disk, in RPM

start_reason (STRING): The reason for starting maintenance testing on the disk.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.mcc.mismatch

Severity

ERROR

Description

This message occurs when a disk with a non-zero disaster recovery (DR) home ID is illegally attached to a system that is not configured for MetroCluster(tm) operation.

Corrective Action

To reuse this disk on a non MetroCluster enabled system, use the "storage disk removeowner" command, followed by the "storage disk assign" command.

Syslog Message

The disk %s was previously owned by a MetroCluster enabled system. This system is not configured for MetroCluster operations.

Parameters

disk_info (STRING): Name of the disk.

instanceId (INT): Instance identifier.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

dr_home_owner_id (LONGINT): NVRAM system ID of the disk's DR home owner.

raid.disk.missing

Severity

INFORMATIONAL

Description

This event is issued either when a disk is pulled from the system or when all paths to it have disappeared.

Corrective Action

(None).

Syslog Message

%s is missing from the system

Parameters

disk_info (STRING): Formatted disk information
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.offline

Severity

NOTICE

Description

This event is issued when offlining a drive

Corrective Action

(None).

Syslog Message

Marking %s%s offline.

Parameters

owner (STRING): The owner of the drive
disk_info (STRING): Formatted information of the disk

raid.disk.online

Severity

NOTICE

Description

This event is issued when onlining an offline drive.

Corrective Action

(None).

Syslog Message

Onlining %s%s.

Parameters

owner (STRING): The owner of the drive
disk_info (STRING): Formatted information of the disk

raid.disk.online.fail

Severity

NOTICE

Description

This event is issued if the drive failed while it was offline. The drive will be moved to broken pool as part of the online process.

Corrective Action

(None).

Syslog Message

Failing %s%s during online.

Parameters

owner (STRING): The owner of the drive
disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.owner.change.fail

Severity

EMERGENCY

Description

This message occurs when an ownership change request initiated by RAID, for either spare disks or the disks of an aggregate, fails due to an error from SANOWN.

Corrective Action

The system automatically retries changing ownership of the disks. If the condition persists, contact NetApp technical support.

Syslog Message

RAID initiated ownership change request failed (aggregate: %s error: %s). This request will be retried.

Parameters

aggregate (STRING): Empty string for spare disks, or name of the aggregate for filesystem disks.
reason (STRING): Reason for failure.
retry_count (INT): Number of retry attempts.
disk_count (INT): Number of disks in the ownership change request.

raid.disk.owner.changed

Severity

INFORMATIONAL

Description

This event is issued when change in a disk's owner is detected, independent of any disk change notification event.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): Formatted disk information
old_owner (STRING): Previous disk owner.
new_owner (STRING): New disk owner.
old_owner_id (LONGINT): Old disk owner ID.
new_owner_id (LONGINT): New disk owner ID.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.ownership.change

Severity

NOTICE

Description

This message occurs when a non-filesystem disk is prepared for ownership change by administrator forcibly.

Corrective Action

(None).

Syslog Message

Ownership of %s, is being changed by administator forcibly.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.pool.changed

Severity

INFORMATIONAL

Description

This message occurs when a change in a disk's current pool is detected, independent of any disk change notification event.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): Formatted disk information.
old_pool (STRING): Previous pool for this disk.
new_pool (STRING): New pool for this disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.predictiveFailure

Severity
ERROR

Description
This message occurs when some condition of the disk indicates that it may fail soon. It is first marked as prefailed. If an appropriate spare is available, it will be selected for Rapid RAID Recovery. In that process, the prefailed disk will be copied to the spare. The filer will stop using the prefailed disk when copying is done. At that time, the disk may be removed and replaced.

Corrective Action
The raid.rg.diskcopy.done event is issued when the disk copy is complete. After that wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message
%s reported a predictive failure and it is prefailed; it will be copied to a spare and failed

Parameters
disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.read.abort.detect

Severity
NOTICE

Description
This message occurs when a disk encounters an abort error during a read operation. The system retries the disk read request and gradually takes the disk out of service by copying the content to a replacement disk.

Corrective Action
(None).

Syslog Message
Read abort error encountered on %s, disk rebuild assist mode %s, block #%llu, length = %u; I/O will be

retried.

Parameters

    disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
    disk_ra_mode (STRING): Disk rebuild assist mode indicating whether mode is enabled.
    blockNum (LONGINT): Physical disk block number of the first block in this I/O chain.
    length (INT): Number of disk blocks in this I/O chain.
    error_code (INT): Error code returned by the disk driver.
    shelf (STRING): Shelf identifier where the disk is located.
    bay (STRING): Disk bay within the shelf where the disk is located.
    vendor (STRING): Name of the disk vendor.
    model (STRING): Model string of the disk.
    firmware_revision (STRING): Disk firmware revision number.
    serialno (STRING): Serial number of the disk.
    disk_type (INT): Type of disk.
    disk_rpm (STRING): Rotational speed of the disk, in RPM.
    carrier (STRING): Unique ID of the carrier in which the disk is installed.
    site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.read.abort.recons

Severity

    NOTICE

Description

    This message occurs when a disk encounters an abort error during a read operation, and a subsequent attempt to retry the read request fails. The system services the read request by reconstructing the data from parity data. The system gradually takes the disk out of service by copying the content to a replacement disk.

Corrective Action

    (None).

Syslog Message

    Read retry failed on %s, block #%llu.

Parameters

    disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
    blockNum (LONGINT): Physical disk block number on which the read operation failed.
    error_code (INT): Error code returned by the disk driver.
    shelf (STRING): Shelf identifier where the disk is located.
    bay (STRING): Disk bay within the shelf where the disk is located.
    vendor (STRING): Name of the disk vendor.
    model (STRING): Model string of the disk.
    firmware_revision (STRING): Disk firmware revision number.
    serialno (STRING): Serial number of the disk.
    disk_type (INT): Type of disk.
    disk_rpm (STRING): Rotational speed of the disk, in RPM.
    carrier (STRING): Unique ID of the carrier in which the disk is installed.
    site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.replace.job.done

Severity

NOTICE

Description

This message occurs when a disk replace job finishes successfully.

Corrective Action

(None).

Syslog Message

Disk %s replaced with disk %s.

Parameters

srcName (STRING): Name of the source disk.
dstName (STRING): Name of the destination disk.

raid.disk.replace.job.failed

Severity

ERROR

Description

This message occurs when a disk replace job fails.

Corrective Action

Take any corrective action indicated by the specific reason for the failure and then retry the disk replace operation. If the condition persists, contact NetApp technical support.

Syslog Message

Failed to replace disk %s with disk %s. Reason: %s.

Parameters

srcName (STRING): Name of the source disk.
dstName (STRING): Name of the destination disk.
reason (STRING): Reason for failure.

raid.disk.replace.job.start

Severity

NOTICE

Description

This message occurs when a job to replace a shared disk with a spare disk begins. The operation can be triggered either by an administrator or automatically by Data ONTAP®. A couple of such scenarios follows: a) There is a mix of drives from different SyncMirror® pools in the same plex of a mirrored aggregate. b) An aggregate is using a partitioned disk on an external shelf when there is a spare disk available on an internal shelf.

Corrective Action

(None).

Syslog Message

Starting disk replacement of disk %s with disk %s.

Parameters

srcName (STRING): Name of the source disk.
dstName (STRING): Name of the destination disk.

raid.disk.replace.job.stop

Severity

NOTICE

Description

This message occurs when a disk replace job is stopped by an administrator.

Corrective Action

(None).

Syslog Message

Stopping disk replacement of disk %s with disk %s.

Parameters

srcName (STRING): Name of the source disk.
dstName (STRING): Name of the destination disk.

raid.disk.sanitization.aborted

Severity

INFORMATIONAL

Description

This event is issued when disk sanitization is aborted using the "disk sanitize" abort" command.

Corrective Action

(None).

Syslog Message

Sanitization aborted for %s

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'

raid.disk.sanitization.failed

Severity
INFORMATIONAL

Description
This event is issued if disk sanitization fails due to a fatal error.

Corrective Action
(None).

Syslog Message
Sanitization failed for %s

Parameters
disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, the site is 'Local'.

raid.disk.timeout.force.recovery

Severity
NOTICE

Description
This event is issued when a disk continues to exhibit symptoms of long response times (timeouts) while it is in the process of being replaced via a copy. In this case, a forced recovery is initiated by removed the disk from the raid group. A complete rewrite of the disk is expected to help recover bad media patches.

Corrective Action
(None).

Syslog Message
Forcing recovery of %s%s as a result of exceeding timeout recovery threshold of %d.

Parameters
owner (STRING): String indicating the owner of the affected volume.
disk_info (STRING): The name of the disk.

threshold (INT): Threshold for the maximum number of timeouts which can be tolerated while a disk is in the process of being replaced.

shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where disk is located

vendor (STRING): Name of the vendor of the disk

model (STRING): Model string of the disk drive

firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.timeout.recommend.recovery

Severity

NOTICE

Description

This event is issued when a disk repeatedly exhibits symptoms of long response times (timeouts) due to bad media patches. The disk is recommended for a full recovery as a result of crossing timeout recovery thresholds. The contents of the disk will be copied to a replacement. A complete rewrite of the disk is expected to help recover bad media patches.

Corrective Action

(None).

Syslog Message

%s%s recommended for recovery as a result of exceeding timeout recovery threshold of %d.

Parameters

owner (STRING): String indicating the owner of the affected volume.

disk_info (STRING): The name of the disk.

threshold (INT): Threshold for the maximum number of timeout recovery operations above which the disk is recommended for recovery.

shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where disk is located

vendor (STRING): Name of the vendor of the disk

model (STRING): Model string of the disk drive

firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.timeout.recovery.invalid.range

Severity

NOTICE

Description

This event is issued if an invalid blockNum range was reported during disk timeout recovery

Corrective Action

(None).

Syslog Message

Invalid block range reported for %s during disk timeout recovery : start %llu, end %llu

Parameters

disk_info (STRING): Formatted information of the disk for which the invalid blockNum range was reported.
start (LONGINT): Starting disk block number for the recovery range
end (LONGINT): Ending disk block number for the recovery range

raid.disk.timeout.recovery.read.err

Severity

NOTICE

Description

This event is issued when timeout recovery io detects a read error

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu during aggressive timeout recovery

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.tooBig.all.reminder

Severity

ERROR

Description

This message occurs when the sum of disk sizes of all disks connected in the system exceed the maximum capacity supported for this platform.

Corrective Action

Contact NetApp technical support. For information about correcting the problem, search for the "raid.disk.tooBig.all.reminder" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

System capacity %s exceeds the %s maximum supported disk capacity.

Parameters

actual (STRING): Actual total capacity of disks currently connected to the system.
limit (STRING): Maximum supported disk capacity limit of the system.

raid.disk.unfail.done

Severity

INFORMATIONAL

Description

This event is issued when a failed disk has been unfailed using the "disk unfail" command, and returned to service as a spare.

Corrective Action

(None).

Syslog Message

%s unfailed, and is now a spare

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.unfail.error

Severity

INFORMATIONAL

Description

This event is issued when an error is encountered while attempting to unfail a disk.

Corrective Action

(None).

Syslog Message

%s could not be unfailed

Parameters

disk_info (STRING): Formatted information of the disk object
error_str (STRING): A raid error string, describing the error encountered during disk unfail.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.unfail.reassim

Severity

INFORMATIONAL

Description

This event occurs when a failed disk was unfailed using the "disk unfail" command, and is in process of being reassimilated.

Corrective Action

(None).

Syslog Message

%s was unfailed, and is now being reassimilated

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.unload.done

Severity

INFORMATIONAL

Description

This event is issued when a failed or removed disk has been spun down by the driver.

Corrective Action

It is safe to pull the disk from the shelf.

Syslog Message

Unload of %s has completed successfully

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.verify.abort.detec

Severity

NOTICE

Description

This message occurs when a disk encounters an abort error during a background media verify operation. The system gradually takes the disk out of service by copying the content to a replacement disk.

Corrective Action

(None).

Syslog Message

Media verify abort error encountered on %s, block #%llu, length = %llu.

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
blockNum (LONGINT): Physical disk block number of the first block in this I/O chain.
length (LONGINT): Number of disk blocks in this I/O chain.
error_code (INT): Error code returned by the disk driver.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.zero.aborted

Severity

NOTICE

Description

This message occurs when disk zeroing has been aborted. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s : disk zeroing aborted (%s).

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.
reason (STRING): Reason for abort.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.zero.done

Severity

NOTICE

Description

This message occurs when a disk zeroing operation completes.

Corrective Action

(None).

Syslog Message

%s : disk zeroing complete

Parameters

disk_info (STRING): Formatted information of disk object that has completed its zeroing operation
duration (INT): The amount of time the zeroing operation required, in seconds

shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.zero.done.failed.die

Severity

NOTICE

Description

This message occurs when a disk zeroing operation completes.

Corrective Action

(None).

Syslog Message

%s : disk zeroing for failed die complete

Parameters

disk_info (STRING): Formatted information of disk object that has completed its zeroing operation
duration (INT): The amount of time the zeroing operation required, in seconds
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disk.zero.fake

Severity

NOTICE

Description

This message occurs when disk zeroing has been faked on a disk.

Corrective Action

(Call support).

Syslog Message

%s: fake disk zeroing complete

Parameters

disk_info (STRING): Formatted information of the disk on which zeroing has been faked
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.diskadd events

raid.diskadd.abort

Severity

ERROR

Description

This message occurs when the system aborts the addition of disks to an aggregate.

Corrective Action

Use the reason provided to determine an action from the following list: - Change in raidgroup size: Retry adding disks to the volume. - One of the target plexes has failed: Delete the failed plex. Use the "storage aggregate plex delete" command. When the failed plex is removed and the aggregate state appears as "unmirrored", retry adding disks to the volume. - For further information or assistance, contact NetApp technical support.

Syslog Message

Addition of disks to %s %s%s aborted %s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
reason (STRING): Reason the disk addition was aborted.

raid.diskadd.add.abort

Severity

ERROR

Description

This message occurs when the addition of disks to an aggregate is aborted due to a detected disk failure.

Corrective Action

Retry adding disks to the aggregate. If disk list was specified for addition, replace the failed disk with a good disk in the list.

Syslog Message

Addition of disks to %s %s%s aborted due to failure of %s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.diskadd.create.abort

Severity

ERROR

Description

This message occurs when the creation of a an aggregate is aborted due to a detected disk failure.

Corrective Action

Retry the aggregate creation. If disk list was specified for creation, replace the failed disk with a good disk in the list.

Syslog Message

Creation of %s %s%s aborted due to failure of %s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the disk shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): String representing the name of the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disktoc events

raid.disktoc.rawsizeChange

Severity

INFORMATIONAL

Description

This event is generated when it is detected from the disk Table Of Contents that a disk's stored rawsize does not match the physical size of the disk. (see burt 81939 for more details).

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): The Formatted information of the disk
label_rawsize (LONGINT): The rawsize according to the label.
phys_rawsize (LONGINT): The rawsize according to the storage layer
instanceFile (STRING): The internal file code
instanceId (INT): The internal instance identifier
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.disktoc.tooRecent

Severity

ALERT

Description

This message occurs when RAID discovers that the disk's table of contents version is newer than that supported by this release of Data ONTAP®. Data ONTAP takes appropriate recovery actions, as described in additional logged events.

Corrective Action

If this message was seen during boot, reboot with the previous kernel version. If this message was seen when the system was up and running, it is likely due to adding a disk to a running system. Remove the disk from system. if the intent is to add the disk as a spare disk, use the 'priv set advanced;unfail -s disk_name' command to mark the disk as not zeroed spare. NetApp technical support For information about correcting the problem, search for the "raid.disktoc.tooRecent" keyword on the Knowledgebase of the NetApp Support Site.

Syslog Message

%s has a disk table of contents version (%d) more recent than the currently supported version (%d).

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
disktocVersion (INT): Disk table of contents version.
disktocCurrentVersion (INT): Current disk table of contents version supported by the software.
instanceFile (STRING): Internal file code.
instanceId (INT): Internal instance identifier.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.enable events

raid.enable.remote.nvlog

Severity

INFORMATIONAL

Description

This event is issued when RAID sub system enables recording in the partner's NVRAM entries for the log based file system.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Enabled Remote NVRAM logging; status: %d.

Parameters

status (INT): Remote NVRAM log enable status

raid.encrypt events

raid.encrypt.disabled

Severity
ALERT

Description
This message occurs when a node is enabled for encryption by RAID, but the system is not FIPS compliant. Volume encryption and decryption will not be available because the system is not considered secure. Encrypted volumes will not be accessible until this problem is solved.

Corrective Action
Reboot the system. If the issue persists after a reboot contact NetApp technical support for assistance.

Syslog Message
RAID encryption is not available because the system is not FIPS compliant. Error: %d.

Parameters
error_code (INT): Reason for non FIPS compliance.

raid.encrypt.no.key

Severity
ERROR

Description
This message occurs when an encrypted volume is being mounted and the encryption key can not be found. The volume is inaccessible until this problem is solved.

Corrective Action
Verify that the network is accessible. Verify that the key manager server is available by using the "security key-manager external show-status" command.

Syslog Message
No encryption key is available for volume '%s' because of error '%d'.

Parameters
volume (STRING): Volume involved.
error (INT): Reason code for the failure to find a key.

raid.fdr events

raid.fdr.failed.ok

Severity
INFORMATIONAL

Description
This message occurs when we detect an entry in the failed disk registry, and have forcibly failed the disk.

Corrective Action

Please make sure that the event message raid.disk.unload.done or raid.carrier.remove has been seen in the log. And then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

%s successfully deleted from spare pool

Parameters

disk_info (STRING): Formatted information of the disk object
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.fdr.full

Severity

ERROR

Description

This message occurs when we determine that the failed disk registry is full and we must eliminate an existing disk entry.

Corrective Action

Please make sure that the event message raid.disk.unload.done or raid.carrier.remove has been seen in the log. And then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Failed disk registry full! Recycling entry for %s model %s (S/N %s)

Parameters

vendor (STRING): The name of the vendor
model (STRING): The model number
serialno (STRING): The serial number

raid.fdr.inservice

Severity

NOTICE

Description

This message occurs when the system detects an entry in the failed disk registry, but the disk appears to be incorporated into an aggregate.

Corrective Action

(None).

Syslog Message

WARNING: %s previously failed, but is currently in service (%s %s).

Parameters

disk_info (STRING): Formatted information about the disk object.
vol_type (STRING): Volume type, which is always aggregate.
vol (STRING): Name of the aggregate.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.fdr.reminder

Severity

ERROR

Description

This message occurs as a reminder that a previously detected failed disk is still present in the system and needs to be removed.

Corrective Action

The failed disk carrier is fully prepared for removal. Remove and replace the failed disk carrier.

Syslog Message

Failed %s is still present in the system and should be removed.

Parameters

disk_info (STRING): Formatted information about the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.fdr.update.error

Severity

NOTICE

Description

This message occurs when RAID fails to add an entry for a failed disk into the failed disk registry. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Unable to %s to %s (error %d).

Parameters

op (STRING): Type of add operation that failed.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.
errorCode (INT): Error code.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.flexvol events

raid.flexvol.lock.conflict

Severity

INFORMATIONAL

Description

This message occurs when a configuration operation on an aggregate (for example, adding disks, relocating aggregate disks, etc.), fails to get exclusive lock access because of one or more indirect conflict volume locks held by child volumes within the aggregate.

Corrective Action

Retry the failed operation after the current operation has completed.

Syslog Message

Exclusive access on the aggregate %s by operation %s failed because of an indirect conflict flexvol lock with current operation %s.

Parameters

aggregate (STRING): Name of the aggregate.
attempted_op_name (STRING): Name of the operation that tried to get exclusive access.
current_op_name (STRING): Name of the operation that is currently holding exclusive access.

raid.fm events

raid.fm.disasterSummary

Severity

ERROR

Description

This event contains summary information for the disaster takeover. It is only generated if a disaster takeover occurs.

Corrective Action

(None).

Syslog Message

RAID disaster takeover summary: number of partner volumes and aggregates=%d, number of rewrite-fsid partner volumes and aggregates=%d, number of out-of-date partner volumes and aggregates=%d, number of ignored partner volumes and aggregates=%d, number of local volumes and aggregates=%d, number of out-of-date local volumes and aggregates=%d

Parameters

nPvols (INT): The number of partner volumes involved in the takeover
nRwPvols (INT): The number of rewrite-fsid partner volumes
nOodPvols (INT): The number of out-of-date partner volumes
nIgnPvols (INT): The number of ignored partner volumes
nLvols (INT): The number of local volumes involved in the takeover
nOodLvols (INT): The number of out-of-date local volumes

raid.fm.fixedMixedOwnership

Severity

NOTICE

Description

This message occurs when assimilation detects that an aggregate contains disks with multiple current owner IDs and fixes the ownership issue.

Corrective Action

(None).

Syslog Message

Aggregate %s was detected to have disks with mixed current owner IDs and the ownership has been fixed.

Parameters

aggregate (STRING): Name of the aggregate that contained disks with mixed owner IDs.
disk_count (INT): Number of disks that had their current owner ID fixed.
current_owner_id (INT): NVRAM system ID of the aggregate's current owner.

raid.fm.leftBehindAggr

Severity

NOTICE

Description

This message occurs when an aggregate is not returned to its original owner in a giveback operation.

Corrective Action

Run the 'storage failover giveback' command to return the aggregate to its original owner.

Syslog Message

Aggregate %s was left behind during giveback.

Parameters

aggregate (STRING): Name of the aggregate that was left behind.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
current_owner_id (LONGINT): NVRAM system ID of the aggregate's current owner.

raid.fm.replayFail

Severity

NOTICE

Description

This message occurs when RAID replay fails for partner aggregates during takeover. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID takeover: RAID replay failed. Status: %d.

Parameters

status (INT): Replay failure status code.

raid.fm.takeoverFail

Severity

ALERT

Description

This message occurs when a high-availability (HA) takeover attempt fails due to an assimilation error.

Corrective Action

If partner aggregates are failing to assimilate on the surviving node of the HA pair, contact technical support for assistance with bringing these aggregates online.

Syslog Message

RAID takeover failed: %s.

Parameters

reason (STRING): Reason the takeover failed.

raid.fm.volDisasterBadState

Severity

ERROR

Description

This message occurs when the system cannot split an out-of-date volume due to a bad volume state.

Corrective Action

(None).

Syslog Message

Partner volume %s identity unaltered during HA disaster takeover: bad state %s. Clients might see stale data.

Parameters

vol (STRING): Name of the aggregate.
state (STRING): Aggregate state.

raid.fm.volDisasterFail

Severity

ERROR

Description

This message occurs when the system encounters an error during a high availability (HA) disaster takeover.

Corrective Action

(None).

Syslog Message

Partner volume %s HA disaster takeover error (%s): %s. Clients will not be able to access this volume.

Parameters

vol (STRING): Name of the aggregate.
type (STRING): Type of error
reason (STRING): Internal reason code

raid.fm.volDisasterIgnore

Severity

ERROR

Description

This message occurs when the system ignores a volume during a high availability (HA) disaster takeover.

Corrective Action

(None).

Syslog Message

Partner volume %s identity unaltered during HA takeover: %s. Clients might see stale data.

Parameters

vol (STRING): Name of the aggregate.
reason (STRING): Reason for ignoring the volume
code (INT): Internal code

raid.fm.volDisasterWarn

Severity

ERROR

Description

This message occurs when the system encounters a nonfatal error during a high availability (HA) disaster takeover

Corrective Action

(None).

Syslog Message

Partner volume %s HA disaster takeover warning (%s): %s Volume takeover might be incomplete and clients might see stale data.

Parameters

vol (STRING): Name of the aggregate.
type (STRING): Type of error
reason (STRING): Internal reason code

raid.fm.volFsidRewrite

Severity

ERROR

Description

This message occurs when the system rewrites a volume's or aggregate's canceling giveback high availability (HA) disaster takeover.

Corrective Action

Remount the clients of the volume.

Syslog Message

Partner %s %s FSID was rewritten during HA disaster takeover. Clients must be remounted.

Parameters

vol_type (STRING): Volume type.
vol (STRING): Name of the aggregate.
oldFsid (INT): Old fsid
newFsid (INT): New fsid

raid.fm.volFsidRewriteOod

Severity

ERROR

Description

This message occurs when the system rewrites a volume's File System ID (FSID) during a high availability (HA) disaster takeover with an out-of-date volume.

Corrective Action

Remount the clients of the volume.

Syslog Message

Partner volume %s FSID was rewritten during HA disaster takeover. Clients must be remounted.

Parameters

vol (STRING): Name of the aggregate.
oldFsid (INT): Old fsid
newFsid (INT): New fsid

raid.foreignaggregate events

raid.foreignAggregate.online.rtIDChanged

Severity

NOTICE

Description

This message occurs when the system changes the RAID tree ID of a foreign aggregate that is being brought online.

Corrective Action

(None).

Syslog Message

%s: RAID tree ID was changed from %s to %s.

Parameters

aggregate (STRING): Name of the aggregate.
oldrtID (STRING): Old RAID tree ID of the aggregate.
newrtID (STRING): New RAID tree ID of the aggregate.

raid.fs events

raid.fs.disk.ownership.change

Severity

NOTICE

Description

This message occurs when a filesystem disk is prepared for ownership change by administrator forcibly.

Corrective Action

(None).

Syslog Message

Ownership of %s, which is part of an aggregate %s, is being changed by administrator forcibly.

Parameters

disk_info (STRING): Formatted information of the disk.
vol_name (STRING): Name of the aggregate.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.hybrid events

raid.hybrid.SSDHAExceed

Severity

ERROR

Description

This message occurs when the sum of all sizes of solid state disks (SSDs) disks of hybrid aggregates on this node and its partner node is larger than the maximum system limit. Takeover might fail because of this. It is issued by the Storage Health Monitor.

Corrective Action

Bring the sum of all sizes of SSDs of hybrid aggregates on this node and its partner below the limit. If you cannot bring the sum of all sizes of SSDs of hybrid aggregates on both nodes below the limit, disable HA failover by using the 'storage failover modify -node [nodename] -enabled false' command. However, this compromises the high availability of your system and is only recommended for use until the size issue has been resolved. To avoid this problem in the future, be careful when adding SSDs to existing hybrid aggregates not to exceed the limit for both nodes in the HA pair.

The sum of all sizes of SSD disks of hybrid aggregates on this node and its partner %s, exceeds %s. Takeover might fail because of this.

Parameters

hybrid_ssd_disks_sizes (STRING): Sum of sizes of SSDs disks of hybrid aggregates on this node and its partner node.
limit (STRING): Maximum system limit total of sizes of SSDs of hybrid aggregates.

raid.hybrid.SSDTotExceed

Severity

ERROR

Description

This message occurs as a reminder that the sum of all sizes of SSD disks of hybrid aggregates is too large. It is issued by Storage Health Monitor.

Corrective Action

Contact NetApp technical support.

Syslog Message

The sum of sizes of SSD disks of hybrid aggregates %s exceeds the %s maximum. Contact NetApp technical support.

Parameters

ssd_disks_size (STRING): Total of sizes of SSD disks of hybrid aggregates.
limit (STRING): Maximum total of sizes of SSD disks of hybrid aggregates.

raid.initialize events

raid.initialize.nonhomed.disk

Severity

NOTICE

Description

This message occurs when a foreign or partner homed spare disk is detected during system initialization.

Corrective Action

In Maintenance mode, remove this disk's ownership by using the 'disk remove_ownership disk_name' command and assign it to the intended node by using the 'disk assign disk_name' command.

Syslog Message

%s: foreign or partner homed spare disk detected during system initialization.

Parameters

disk_info (STRING): Formatted information of the foreign spare disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.label events

raid.label.io.readError

Severity

NOTICE

Description

This message occurs when a RAID label read I/O failure is detected. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Label read on %s failed with storage error %s. The system will stop using the disk for I/O operations.

Parameters

disk_info (STRING): Formatted information about the disk.

error_str (STRING): Error string.

instanceFile (STRING): Internal file code.

instanceId (INT): Internal instance identifier.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Character string representing the model of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.label.io.revertError

Severity

NOTICE

Description

This message occurs when a RAID label revert to consistent state fails during assimilation. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Label revert on plex %s, %s failed.

Parameters

plex (STRING): Name of the containing plex.
disk_info (STRING): Formatted information about the disk.
error_str (STRING): Error string.
instanceFile (STRING): Internal file code.
instanceId (INT): Internal instance identifier.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Character string representing the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.label.io.writeError

Severity

NOTICE

Description

This message occurs when a RAID label write I/O failure is detected. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Label write on %s failed with storage error %s. The system will stop using the disk for I/O operations.

Parameters

disk_info (STRING): Formatted information about the disk.
error_str (STRING): Error string.
instanceFile (STRING): Internal file code.
instanceId (INT): Internal instance identifier.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Character string representing the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.label.raidarea.invalidVersion

Severity

NOTICE

Description

This message occurs when the system discovers that a disk has a RAIDArea object version of 0, which is invalid. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s has %s RAIDArea object with a version (%d) that is not supported (the current object version is %d).

Parameters

disk_info (STRING): Formatted information about the disk.
type (STRING): RAIDArea object type.
version (INT): RAIDArea object version.
currentVersion (INT): Current version of this RAIDArea object type supported by the software.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Character string representing the model of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.label.raidarea.tooRecent

Severity

NOTICE

Description

This message occurs when the system discovers that a disk has an invalid RAIDArea object version. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s has %s raidarea object with a version (%d) more recent than the currently supported version (%d).

Parameters

disk_info (STRING): Formatted information about the disk.
type (STRING): RAIDArea object type.
version (INT): RAIDArea object version.
currentVersion (INT): Current version of this RAIDArea object type supported by the software.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Character string representing the model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.labeledit events

raid.labeledit.buildtree

Severity

NOTICE

Description

This event occurs when you run the 'label buildtree' command to create an aggregate from a collection of disks.

Corrective Action

(None).

Syslog Message

%s %s was created using the 'label buildtree' command.

Parameters

voltype (STRING): Volume type.
volname (STRING): Name of the aggregate created by the command.
cmdline (STRING): Command line used to create the aggregate.

raid.labelmaint events

raid.labelmaint.isolate.aggr

Severity

INFORMATIONAL

Description

This message occurs when the system places an aggregate into online label maintenance mode.

Corrective Action

(None).

Syslog Message

Placing volume %s%s into online label maintenance mode.

Parameters

owner (STRING): Owner of the disk drive.
vol (STRING): Name of the aggregate.

raid.labelmaint.isolate.disk

Severity

INFORMATIONAL

Description

This message occurs when the system places a disk drive into online label maintenance mode. Online label maintenance is a utility available in normal mode that enables users to perform operations on disk drives that typically are allowed only in maintenance mode. Examples of such operations are label editing and volume recovery.

Corrective Action

(None).

Syslog Message

Placing %s%s into online label maintenance mode.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk drive.

raid.labelmaint.unisolate

Severity

INFORMATIONAL

Description

This message occurs when the system takes a disk drive out of online label maintenance mode.

Corrective Action

(None).

Syslog Message

Taking %s%s out of online label maintenance mode.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk drive.

raid.mcc events

raid.mcc.disasterSummary

Severity

INFORMATIONAL

Description

This message reports the summary information for the MetroCluster(tm) switchover operation.

Corrective Action

(None).

Syslog Message

RAID switchover summary: number of DR aggregates=%d number of mirrored aggregates=%d number of unmirrored aggregates=%d number of out-of-date aggregates=%d number of mirrored aggregates with both plexes online=%d number of offline aggregates switched over=%d

Parameters

nTotalAggrs (INT): Number of DR aggregates switched over.
nMirAggrs (INT): Number of mirrored aggregates switched over.
nUnmirAggrs (INT): Number of unmirrored aggregates switched over.
nOodPlexes (INT): Number of mirrored aggregates with out-of-date plexes.
nMirComplete (INT): Number of mirrored aggregates with both the plexes online during switchover.
nOfflineAggrs (INT): Number of offline aggregates switched over.

raid.mcc.heal.aggrs.canceled

Severity

ERROR

Description

This message occurs when a 'metrocluster heal -phase aggregates' operation is canceled due to the presence of left-behind high-availability (HA) aggregates.

Corrective Action

Giveback still in progress can cause this condition. To see if this is the case, execute 'storage failover show-giveback'. If it is in progress, wait until it completes and retry the 'metrocluster heal -phase aggregates' command. If giveback is not in progress then execute a 'storage failover giveback -ofnode' from the node currently hosting the left-behind aggregate. After this is complete, retry the 'metrocluster heal -phase aggregates' command.

Syslog Message

Aggregate %s homed on %s is a %s, canceling heal aggregates operation.

Parameters

aggregate (STRING): Name of the aggregate
home_owner_name (STRING): Name of the node home to the left behind aggregate.
reason (STRING): Activity that is preventing heal aggregates operation.

raid.mcc.heal.roots.canceled

Severity

ERROR

Description

This message occurs when a 'metrocluster heal -phase root-aggregates' operation is canceled because a switched over root aggregate is busy with another configuration operation. An ongoing configuration operation can cause this condition.

Corrective Action

Wait a few minutes, then retry the 'metrocluster heal -phase root-aggregates' command.

Syslog Message

Aggregate %s is busy with another configuration operation. Canceling heal root-aggregates operation.

Parameters

aggregate (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing the heal root-aggregates operation.

raid.mcc.ISL.down

Severity

ERROR

Description

This message occurs when a MetroCluster(tm) DR operation other than disaster switchover is canceled because remote site storage is not visible; this can happen if the Inter-Switch Links are down.

Corrective Action

1. Verify remote cluster connectivity. Use the "storage switch add -switch-ipaddress <switch-ip-address>" command to start monitoring the switches if not already so. Then use the "storage switch show -port" and "storage switch show -san-config" commands to verify FC connectivity to the remote site. 2. Retry the operation. If the error persists, contact technical support for assistance.

Syslog Message

%s was canceled because remote site storage is not visible; Inter-Switch Links might be down.

Parameters

operation (STRING): The DR operation which was canceled.

raid.mcc.leftBehindAggr

Severity

NOTICE

Description

This message occurs when an aggregate is not returned to its original owner in a switchback operation.

Corrective Action

Run the 'metrocluster switchback' command to return the aggregate to its original owner. If the condition persists, contact NetApp technical support.

Syslog Message

Aggregate %s was left behind during switchback.

Parameters

aggregate (STRING): Name of the aggregate that was left behind.
aggregate_uuid (STRING): Universal Unique Identifier(UUID) of the aggregate.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
current_owner_id (LONGINT): NVRAM system ID of the aggregate's current owner.
dr_home_owner_id (LONGINT): NVRAM system ID of the aggregate's disaster recovery(DR) home owner.

raid.mcc.leftBehindSpare

Severity

NOTICE

Description

This message occurs when a spare disk is not returned to its original owner in a switchback operation.

Corrective Action

Run the 'metrocluster switchback' command to return the disk to its original owner.

Syslog Message

Disk %s was left behind during switchback.

Parameters

disk (STRING): Name of the disk that was left behind.
disk_uuid (STRING): Universal Unique Identifier(UUID) of the disk.
home_owner_id (LONGINT): NVRAM system ID of the disk's home owner.
current_owner_id (LONGINT): NVRAM system ID of the disk's current owner.
dr_home_owner_id (LONGINT): NVRAM system ID of the disk's disaster recovery(DR) home owner.

raid.mcc.nso.canceled

Severity

ERROR

Description

This message occurs when a MetroCluster negotiated switchover is canceled due to activity in RAID on a volume or aggregate.

Corrective Action

Reissue the 'metrocluster switchover' command after the pending or in-progress operation on the aggregate is complete. The 'override-vetoes' option may be used to proceed without waiting for the pending or in-progress operation to complete.

Syslog Message

Aggregate %s is %s, canceling negotiated switchover.

Parameters

aggregate (STRING): Name of the aggregate.

reason (STRING): Activity that is preventing negotiated switchover.

raid.mcc.nso.dr.leftbehind

Severity

ERROR

Description

This message occurs when a MetroCluster switchover is canceled due to the presence of left behind aggregates from a switchback operation.

Corrective Action

If the aggregate is not in a "failed" or "limbo" state, issue the 'metrocluster switchback' command to return the aggregate to its original owner. Reissue the 'metrocluster switchover' command.

Syslog Message

Aggregate %s was left behind from a switchback operation, canceling negotiated switchover.

Parameters

aggregate (STRING): Name of the aggregate that was left behind.
aggregate_uuid (STRING): Universal Unique Identifier of the aggregate.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
current_owner_id (LONGINT): NVRAM system ID of the aggregate's current owner.
dr_home_owner_id (LONGINT): NVRAM system ID of the aggregate's disaster recovery home owner.

raid.mcc.nso.ha.leftbehind

Severity

ERROR

Description

This message occurs when a MetroCluster switchover is canceled due to the presence of left behind aggregates from a giveback operation.

Corrective Action

If the aggregate is not in a "failed" or "limbo" state, issue the 'storage failover giveback' command to return the aggregate to its original owner. Reissue the 'metrocluster switchover' command.

Syslog Message

Aggregate %s was left behind from a giveback operation, canceling negotiated switchover.

Parameters

aggregate (STRING): Name of the aggregate that was left behind.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
home_owner_id (LONGINT): NVRAM system ID of the aggregate's home owner.
current_owner_id (LONGINT): NVRAM system ID of the aggregate's current owner.

raid.mcc.remote.storage.down

Severity

ERROR

Description

This message occurs when a MetroCluster(tm) DR operation other than disaster switchover is canceled because remote site storage is not visible; this can happen if the FC or SAS links to the remote storage are down.

Corrective Action

1. Verify remote cluster connectivity. Use the "fcp interface show" command to verify FC connectivity to the remote site. 2. Retry the operation. If the error persists, contact technical support for assistance.

Syslog Message

%s was canceled because remote site storage is not visible; FC or SAS links might be down.

Parameters

operation (STRING): The DR operation which was canceled.

raid.mcc.root.configError

Severity

ALERT

Description

This message occurs when the system detects a configuration error on the root aggregate in a MetroCluster(tm) configuration. Remote disks and local disks are not being used in the proper configuration. One plex should comprise only disks from the local pool, Pool0, and the other plex should comprise only disks from the remote pool, Pool1. If the inter-site communication fails between the MetroCluster sites, access to remote disks will be lost. This creates an elevated risk of local site downtime.

Corrective Action

Replace all remote (Pool1) disks in the local plex with local (Pool0) spares. In the remote plex, replace all local (Pool0) disks with remote (Pool1) spares. Use the 'storage disk replace' command to initiate disk replacements.

Syslog Message

In the root aggregate, %s

Parameters

error_message (STRING): Description of which plexes have disks from the wrong pool.

raid.mcc.root.unmirrored

Severity

ALERT

Description

This message occurs when the root aggregate is not mirrored in a MetroCluster(tm) configuration.

Corrective Action

Mirror the root aggregate by using the 'storage aggregate mirror' command.

Syslog Message

The root aggregate is not mirrored. This aggregate must be mirrored in a MetroCluster configuration or a switchover of this site might not be possible in case of a disaster.

Parameters

(None).

raid.mcc.switchbackCanceled

Severity

ERROR

Description

This message occurs when a MetroCluster switchback is canceled due to activity in RAID on a disaster partner volume or aggregate.

Corrective Action

Reissue the 'metrocluster switchback' command after the pending or in-progress operation on the DR partner aggregate is complete. The override-vetoes option may be used to proceed without waiting for the pending or in-progress operation to complete.

Syslog Message

DR aggregate %s is %s, canceling switchback.

Parameters

vol (STRING): Name of the aggregate
reason (STRING): Activity that is preventing DR switchback

raid.mcc.switchbackSummary

Severity

INFORMATIONAL

Description

This message occurs when a node has finished releasing switched over aggregates and spare disks during switchback.

Corrective Action

(None).

Syslog Message

RAID switchback summary: switched back aggregates: %d, left behind aggregates: %d, switched back spares: %d

Parameters

switched_back_aggr_count (INT): Count of aggregates that were switched back.
left_behind_aggr_count (INT): Count of switched over aggregates that remain after switchback.
switched_back_spare_count (INT): Count of spare disks that were switched back.

raid.mgrio events

raid.mgrio.lw.id.inconsist

Severity

NOTICE

Description

This message occurs during a SyncMirror® resynchronization operation, when the system detects an inconsistent RAID write signature on a RAID stripe. This RAID inconsistent write signature might be due to a write operation on disk that was not committed successfully. Data ONTAP® attempts to recover such a bad block automatically. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature on RAID group %s%s, stripe #%llu, during SyncMirror resync operation.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.mgvio events

raid.mgvio.lw.id.inconsist

Severity

NOTICE

Description

This message is generated after detecting an inconsistent RAID write signature on a RAID stripe, during SyncMirror verify operation. This inconsistent RAID write signature may be due to a write operation on disk was not committed successfully. Data ONTAP will attempt to recover such bad block automatically. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature on RAID group %s%s, stripe #%llu, during a SyncMirror verify operation.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.mirror events

raid.mirror.aggrSnapUse

Severity

NOTICE

Description

This message occurs when a SyncMirror® aggregate uses aggregate snapshots other than SyncMirror aggregate snapshots. SyncMirror uses aggregate snapshots to allow fast resynchronization after one plex was temporarily offline. However, Data ONTAP® sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another. To reduce the chance of deleting SyncMirror snapshots, you should not create or schedule aggregate snapshots in SyncMirror aggregates.

Corrective Action

Disable automatic aggregate snapshots and delete all snapshots in the aggregate except those with names starting with "mirror_resync" or "mirror_verify". To disable automatic aggregate snapshots, use the 'snap sched -A aggr-name 0' command. To list snapshots in the aggregate, use the 'snap list -A aggr-name' command. To delete a snapshot, use the 'snap delete -A aggr-name snapshot-name' command. For further information or assistance, contact NetApp technical support.

Syslog Message

Aggregate snapshots are used in SyncMirror %s '%s%s'. Creating or scheduling snapshots in SyncMirror aggregates is not recommended.

Parameters

vol_type (STRING): Always "aggregate," indicating that the warning is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.mirror.bigio.restrict

Severity

ALERT

Description

An aggregate that experienced a medium error during reconstruction is restricted and marked wafl-inconsistent, but starting wafliron has failed. This event is issued to alert operator that aggregate is not accessible and wafliron must be started to allow access to it.

Corrective Action

Start wafliron on the indicated aggregate.

Syslog Message

%s %s is restricted. Start wafliron to allow access to it

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.mirror.bigio.restrict.failed

Severity

EMERGENCY

Description

This message occurs when automatically restricting an aggregate fails after a medium error happened during a reconstruction.

Corrective Action

Contact NetApp technical support. For further information about correcting the problem, see the knowledgebase article 3013638.

Syslog Message

Failed to restrict the %s %s (%s)

Parameters

vol_type (STRING): Volume type.
vol (STRING): Name of the aggregate.
reason (STRING): Specific reason preventing the restrict operation.

raid.mirror.bigio.wafliron.nostart

Severity

EMERGENCY

Description

This message occurs when wafliron fails to start automatically on an aggregate that experienced a medium error during reconstruction and is restricted and marked WAFL® inconsistent.

Corrective Action

Contact NetApp technical support. For further information about correcting the problem, see the knowledgebase article 3013638.

Syslog Message

Wafliron cannot start on %s %s (%s)

Parameters

vol_type (STRING): Volume type.
vol (STRING): Name of the aggregate.
reason (STRING): Specific reason preventing wafliron to start.

raid.mirror.faultIsolation.reminder

Severity

ERROR

Description

This message occurs when both plexes of a SyncMirror® configuration have disks in the same hardware-based disk pool.

Corrective Action

a) Identify the problem aggregate from the system logs. b) Determine which mirror plexes have disks in the same hardware-based pools. c) Determine how this occurred: possible causes include 1) Wiring problem 2) Reconstruction forced mixed pools 3) Mirror was created forcibly d) Based on the information you gather, determine how to correct the issue. For example, use the "storage disk replace" command to copy the disk belonging to the wrong pool to a disk belonging to the right pool. e) If you need assistance, contact NetApp technical support.

Syslog Message

%s %s plexes not fault isolated. Multiple plexes have disks in: %s

Parameters

voltype (STRING): Aggregate or volume.
volname (STRING): Name of the aggregate or volume.
pool (STRING): Disk pools that have disks from the aggregate.

raid.mirror.lowSnapReserve

Severity

ERROR

Description

This message occurs when the aggregate snapshot reserve in a SyncMirror® aggregate is too low, increasing the risk of deleting SyncMirror snapshots. SyncMirror uses aggregate snapshots to allow fast resynchronization after a temporary loss of connectivity to one plex. However, Data ONTAP® sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another.

Corrective Action

Increase the aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'. Do not decrease the aggregate snapshot reserve in SyncMirror aggregates below the default 5%. The suggested snapshot reserve might vary from message to message for the same aggregate if the write load on the aggregate changes and especially if the aggregate option 'resyncsnaptime' is set to a significantly lower value than the default 60 minutes. If one suggestion seems unreasonably high, you might want to track messages for several days and set the aggregate snapshot reserve to the highest value that is consistently suggested during periods of high write load on the aggregate.

Syslog Message

Aggregate snapshot reserve in SyncMirror %s '%s%s' is too low. It is set to %d%%. Increase it to %d%%.

Parameters

vol_type (STRING): Always "aggregate," indicating that the warning is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
current_snap_reserve (INT): Current aggregate snapshot reserve (percent).
suggested_snap_reserve (INT): Suggested higher aggregate snapshot reserve (percent).

raid.mirror.read.mismatch

Severity

NOTICE

Description

This message occurs when the system detects a mismatch between data in two plexes of a SyncMirror® aggregate. The system does not perform data verification by reading from both plexes during normal operation, but it does so during wafliron. The system fixes the inconsistency across mirrored plexes.

Corrective Action

(None).

Syslog Message

Mirror read verification failed in the %s '%s%s': mismatch between disks %s and %s (vbn %llu, blockNum %llu).

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
srcDisk (STRING): Name of the disk in the first plex.
dstDisk (STRING): Name of the disk in the second plex.
volumeBno (LONGINT): Volume block number.
blockNum (LONGINT): Disk block number.

raid.mirror.readerr.block.rewrite

Severity

NOTICE

Description

This event is issued when mirror read error handling fixes a multi-disk media or checksum error on Raid0 volumes.

Corrective Action

(None).

Syslog Message

Mirror error handler rewriting bad block on %s%s, block #%llu

Parameters

owner (STRING): Owner of the affected aggregate.
disk (STRING): The name of the disk containing the block being rewritten.
blockNum (LONGINT): The physical block number of the disks being rewritten.

raid.mirror.resync.deferred

Severity

NOTICE

Description

This message occurs when a mirror plex resynchronization is deferred due to inadequate incore resources.

Corrective Action

(None).

Syslog Message

%s%s: resynchronization deferred (%s)

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): Name of the mirror object that could not resynchronize.
reason (STRING): Text describing the reason.

raid.mirror.resync.deferred.ok

Severity

NOTICE

Description

This message occurs when a previously deferred resynchronization is now ready to proceed because of availability of incore resources.

Corrective Action

(None).

Syslog Message

%s%s: resynchronization previously deferred, now proceeding

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): Name of the mirror object that can now resynchronize.

raid.mirror.resync.done

Severity

NOTICE

Description

This event is issued when resynchronization has been completed on a specific mirror.

Corrective Action

(None).

Syslog Message

%s: resynchronization completed in %s

Parameters

mirror (STRING): The name of the mirror object that is completed resynchronization
duration (STRING): The amount of time the resynchronization required

raid.mirror.resync.progress

Severity

NOTICE

Description

This message occurs every five minutes while RAID mirror resynchronization is in progress. It also occurs at the end of RAID group synchronization.

Corrective Action

(None).

Syslog Message

%s: mirror resync is %s%% completed. At current throughput rate of %d MB/s it is estimated to finish in %s (HH:MM:SS).

Parameters

tree (STRING): RAID mirrored tree name.
percent (STRING): Percentage of mirror resync completed.
throughput (INT): Current input/output (I/O) rate.
eta_duration (STRING): The amount of time the resynchronization is expected to run.

raid.mirror.resync.snap.base

Severity

INFORMATIONAL

Description

This message occurs at the beginning of a resynchronization and it lists the base and the resynchronization snapshots for the resynchronization.

Corrective Action

(None).

Syslog Message

%s %s%s: base snapshot %d, CP %d (%d), resync snapshot %d, CP %d (%d)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
base_snapid (INT): Base snapshot identifier.
base_CP_count (INT): Base snapshot consistency point count.
base_timestamp (INT): Base snapshot timestamp (seconds since 1/1/1970).
next_snapid (INT): Resynchronization snapshot identifier.
next_CP_count (INT): Resynchronization snapshot consistency point count.
next_timestamp (INT): Resynchronization snapshot timestamp (seconds since 1/1/1970).

raid.mirror.resync.snapcrtfail

Severity

ERROR

Description

This message occurs when resynchronization fails to create a mirror resync snapshot.

Corrective Action

Increase the size of the root volume or delete old snapshots.

Syslog Message

%s %s%s: could not create mirror resynchronization snapshot %s (%s)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being resynchronized.
snapName (STRING): Name of the snapshot that was not created.
error (STRING): Error code returned by the failed operation.

raid.mirror.resync.snapdelfail

Severity

NOTICE

Description

This message occurs when resynchronization fails to delete a mirror resync snapshot. The WAFL® snapshot autodelete functionality will automatically delete the snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s: could not delete mirror resynchronization snapshot %s (%s)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being resynchronized.
snapName (STRING): Name of the snapshot that was not deleted.
error (STRING): Error code returned by the failed operation.

raid.mirror.resync.snaprenamefail

Severity

NOTICE

Description

This message occurs when resynchronization has failed to rename a mirror resync snapshot. The snapshot is marked as invalid and is deleted.

Corrective Action

(None).

%s %s%s: could not rename mirror resynchronization snapshot %s to %s (%s)

Parameters

> **vol_type** (STRING): Volume type.
> **owner** (STRING): Owner of the affected aggregate.
> **vol** (STRING): Name of the aggregate object that is being resynchronized.
> **snapName** (STRING): Name of the snapshot that was not renamed.
> **snapName2** (STRING): Attempted new name of the snapshot.
> **error** (STRING): Error code returned by the failed operation.

raid.mirror.resync.snaprenameok

Severity

> INFORMATIONAL

Description

> This message occurs when resynchronization renames a mirror resync snapshot.

Corrective Action

> (None).

Syslog Message

> %s %s%s: renamed mirror resynchronization snapshot %s to %s

Parameters

> **vol_type** (STRING): Volume type.
> **owner** (STRING): Owner of the affected aggregate.
> **vol** (STRING): Name of the aggregate object that is being resynchronized.
> **snapName** (STRING): Old name of the snapshot that has been renamed.
> **snapName2** (STRING): New name of the snapshot that has been renamed.

raid.mirror.resync.start

Severity

> NOTICE

Description

> This message occurs when resynchronization is initiated on a specific mirror.

Corrective Action

> (None).

Syslog Message

> %s%s: start resynchronize to target %s

Parameters

> **owner** (STRING): Owner of the affected aggregate.
> **mirror** (STRING): Name of the mirror object that is initiating resynchronization.
> **plex** (STRING): Name of the plex object that is the resynchronization target.

raid.mirror.snapDel.degraded

Severity

ALERT

Description

This message occurs when a SyncMirror® aggregate snapshot is deleted while one plex is offline or resynchronizing. Fast resynchronization of that plex (level 1) is no longer possible. The plex must be resynchronized by copying all data from the online plex (level 0). Without an intervention, it is likely that the level 0 resynchronization will also fail repeatedly, and that it will never be completed. SyncMirror uses aggregate snapshots for resynchronization after a temporary loss of connectivity to one plex. Data ONTAP® sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. This message indicates that configuration of aggregate space use must be changed for SyncMirror resynchronization to be completed.

Corrective Action

1. Disable automatic aggregate snapshots in the aggregate using the command 'snap sched -A aggr-name 0'. 2. Get a list of snapshots in the aggregate using the command 'snap list -A aggr-name'. Delete all snapshots in the aggregate except those with names starting with "mirror_resync". 3. Increase the aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'. Increase the aggregate snapshot reserve by as much free space as the aggregate allows, but there is no need to increase it beyond 50%. 4. If further increasing the aggregate snapshot reserve is not possible, disable automatic deletion of aggregate snapshots using the command 'aggr options snapshot_autodelete off'. That might also disable space guarantees on flexible volumes in the aggregate. In that case, you must monitor space used in the aggregate with the command 'df -A aggr-name'. If the aggregate gets full, the application write operations will fail. In environments that are sensitive to that error, such as CIFS or LUNs, disabling automatic deletion of aggregate snapshots should be avoided if possible. If you enable automatic deletion of aggregate snapshots using the command 'aggr options snapshot_autodelete on', the plex resynchronization will probably fail again. 5. If resynchronization cannot be completed without filling up the aggregate, consider adding more disks to the aggregate. 6. After successful resynchronization, enable automatic deletion of aggregate snapshots using the command 'aggr options snapshot_autodelete on'. Also restore the original aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'. Do not decrease the aggregate snapshot reserve in SyncMirror aggregates below the default 5%.

Syslog Message

The SyncMirror aggregate snapshot in %s '%s%s' is being deleted while the aggregate is mirror-degraded. Level 1 resync is not possible.

Parameters

vol_type (STRING): Always "aggregate," indicating that the message is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.mirror.snapDel.normal

Severity

ERROR

Description

This message occurs when a SyncMirror® aggregate snapshot is deleted while plexes are synchronized. This creates no immediate problem because Data ONTAP® creates a new SyncMirror aggregate snapshot, but it indicates that the same event can occur when one plex is offline or resynchronizing, which is a

problem. SyncMirror uses aggregate snapshots to allow fast resynchronization after a temporary loss of connectivity to one plex. Data ONTAP sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another.

Corrective Action

Increase the aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'. Do not decrease the aggregate snapshot reserve in SyncMirror aggregates below the default 5%. The suggested snapshot reserve might vary from message to message for the same aggregate if the write load on the aggregate changes. If one suggestion seems unreasonably high, you might want to track messages for several days and set the aggregate snapshot reserve to the highest value that is consistently suggested during periods of high write load on the aggregate.

Syslog Message

The SyncMirror aggregate snapshot in %s '%s%s' is being deleted. The aggregate snapshot reserve is set to %d%%. Increase it to %d%%.

Parameters

vol_type (STRING): Always "aggregate," indicating that the warning is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
current_snap_reserve (INT): Current aggregate snapshot reserve (percent).
suggested_snap_reserve (INT): Suggested higher aggregate snapshot reserve (percent).

raid.mirror.snapEst.degraded

Severity

ERROR

Description

This message occurs periodically when one plex in a SyncMirror® aggregate is offline or failed, and automatic deletion of aggregate snapshots is enabled. It provides an estimate of the time before a SyncMirror snapshot might get deleted. SyncMirror uses aggregate snapshots to allow fast resynchronization after a temporary loss of connectivity to one plex. However, Data ONTAP® sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another.

Corrective Action

1. Disable automatic aggregate snapshots in the aggregate using the command 'snap sched -A aggr-name 0'. 2. Get a list of snapshots in the aggregate using the command 'snap list -A aggr-name'. Delete all snapshots in the aggregate except those with names starting with "mirror_resync". 3. Bring online the plex that is offline or failed as soon as possible. 4. Do not rely only on the estimate of the time before automatic deletion of aggregate snapshots. Monitor space used by the SyncMirror snapshots with the command 'df -A aggr-name'. If SyncMirror snapshots grow beyond the aggregate snapshot reserve, they might be automatically deleted, and that prevents fast SyncMirror resynchronization.

Syslog Message

SyncMirror %s '%s%s' is mirror-degraded. %d%% of the snapshot reserve is used. SyncMirror snapshot is estimated to be automatically deleted in %s.

Parameters

vol_type (STRING): Always "aggregate," indicating that the message is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
snap_reserve_used (INT): Percent of snapshot reserve space used.
est_time_left (STRING): Estimated time until automatic deletion of aggregate snapshots.

raid.mirror.snapResChanged

Severity

NOTICE

Description

This message occurs when the aggregate snapshot reserve in a SyncMirror® aggregate is changed.

Corrective Action

(None).

Syslog Message

The reserve of the aggregate snapshot in SyncMirror aggregate "%s%s" was changed from %d%% to %d%%.

Parameters

owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
old_snap_reserve (INT): Percent of the reserve of the old aggregate snapshot.
new_snap_reserve (INT): Percent of the reserve of the new aggregate snapshot.

raid.mirror.snapResExpand.failed

Severity

ERROR

Description

This message occurs when one plex in a SyncMirror® aggregate is offline, failed, or resynchronizing, and Data ONTAP® attempts to increase the aggregate snapshot reserve in that aggregate to delay deleting SyncMirror snapshots, but changing the aggregate snapshot reserve fails. SyncMirror uses aggregate snapshots to allow fast resynchronization after a temporary loss of connectivity to one plex. However, Data ONTAP sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another.

Corrective Action

1. Try to increase aggregate snapshot reserve using the command 'snap reserve -A aggr-name new-snap-reserve'. 2. Disable automatic aggregate snapshots in the aggregate using the command 'snap sched -A aggr-name 0'. 3. Get a list of snapshots in the aggregate using the command 'snap list -A aggr-name'. Delete all snapshots in the aggregate except those with names starting with "mirror_resync". 4. Bring online the plex that is offline or failed as soon as possible. 5. Monitor space used by the SyncMirror snapshots with the command 'df -A aggr-name'. If SyncMirror snapshots grow beyond the aggregate snapshot reserve, they might be automatically deleted, and that prevents fast SyncMirror resynchronization. 6. When resynchronization is complete, restore the old value for the aggregate snapshot reserve using the command 'snap reserve -A aggr-name old-snap-reserve'.

Syslog Message

An attempt to increase the aggregate snapshot reserve in SyncMirror %s '%s%s' from %d%% to %d%% failed (%s).

Parameters

vol_type (STRING): Always "aggregate," indicating that the message is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
old_snap_reserve (INT): Old aggregate snapshot reserve (percent).
new_snap_reserve (INT): New higher aggregate snapshot reserve (percent).
reason (STRING): Reason for the failure.

raid.mirror.snapResExpanded

Severity

NOTICE

Description

This message occurs when one plex in a SyncMirror® aggregate is offline, failed, or resynchronizing, and the aggregate snapshot reserve in that aggregate is increased to delay deleting SyncMirror snapshots. The aggregate snapshot reserve will be reverted to its previous value when resynchronization is complete. You can always change the aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'. SyncMirror uses aggregate snapshots to allow fast resynchronization after a temporary loss of connectivity to one plex. However, Data ONTAP® sometimes must delete aggregate snapshots to preserve space guarantees for flexible volumes. If that happens during SyncMirror resynchronization or while one plex is offline, the mirror must be reinitialized by copying all data from one plex to another.

Corrective Action

1. Disable automatic aggregate snapshots in the aggregate using the command 'snap sched -A aggr-name 0'. 2. Get a list of snapshots in the aggregate using the command 'snap list -A aggr-name'. Delete all snapshots in the aggregate except those with names starting with "mirror_resync". 3. Bring online the plex that is offline or failed as soon as possible. 4. Monitor space used by the SyncMirror snapshots with the command 'df -A aggr-name'. If SyncMirror snapshots grow beyond the aggregate snapshot reserve, they might be automatically deleted, and that prevents fast SyncMirror resynchronization.

Syslog Message

Aggregate snapshot reserve in SyncMirror %s '%s%s' is increased from %d%% to %d%% while the mirror is degraded or resyncing. Aggregate snapshot reserve will be reverted to the old value when resync is complete.

Parameters

vol_type (STRING): Always "aggregate," indicating that the message is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
old_snap_reserve (INT): Old aggregate snapshot reserve (percent).
new_snap_reserve (INT): New higher aggregate snapshot reserve (percent).

raid.mirror.snapResReverted

Severity

NOTICE

Description

This message occurs when the aggregate snapshot reserve in a SyncMirror® aggregate is reverted to the original value after a successful resynchronization in that aggregate.

Corrective Action

Verify that the new snapshot reserve is correct. You can always change the aggregate snapshot reserve using the command 'snap reserve -A aggr-name percent'.

Syslog Message

Aggregate snapshot reserve in SyncMirror %s '%s%s' was reverted from %d%% back to %d%%.

Parameters

vol_type (STRING): Always "aggregate," indicating that the message is issued about an aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
old_snap_reserve (INT): Old aggregate snapshot reserve (percent).
new_snap_reserve (INT): New aggregate snapshot reserve (percent).

raid.mirror.verify.aborted

Severity

NOTICE

Description

This event is issued when verification has been completed on a specific mirror due to abort.

Corrective Action

(None).

Syslog Message

%s%s: verification stopped after %s

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): The name of the mirror object that has aborted verification
duration (STRING): The amount of time the verification required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.mirror.verify.deferred

Severity

NOTICE

Description

This message occurs when the mirror verification process is postponed due to inadequate resources. Mirror verification is a long running I/O operation that compares the blocks on both sides of mirror and reports any mismatches it finds. The operation will start when it get available resources.

Corrective Action

(None).

Syslog Message

%s%s: verification deferred (%s)

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): Name of the mirror object that could not be verified.
reason (STRING): Reason code.

raid.mirror.verify.deferred.ok

Severity

NOTICE

Description

This message occurs when a deferred mirror verify operation is now ready to proceed because of availability of incore resources.

Corrective Action

(None).

Syslog Message

%s%s: verification previously deferred, now proceeding

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): Name of the mirror object that can now be verified.

raid.mirror.verify.done

Severity

NOTICE

Description

This event is issued when verification has been completed on a specific mirror.

Corrective Action

(None).

Syslog Message

%s%s: verification completed in %s

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): The name of the mirror object that is completed verification
duration (STRING): The amount of time the verification required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.mirror.verify.mismatch

Severity

NOTICE

Description

This message occurs when mirror verification detected and corrected a mismatch.

Corrective Action

(None).

Syslog Message

%s: verify mismatch, disks %s and %s (vbn %llu, blockNum %llu)%s.

Parameters

grpName (STRING): Name of the RAID group object that is being corrected.
srcDisk (STRING): Name of the disk with data used to correct the mismatch.
dstDisk (STRING): Name of the disk being corrected.
volumeBno (LONGINT): Volume block number.
blockNum (LONGINT): Disk block number.
correcting (STRING): " : correcting" if normal verify, "" if -n verify.

raid.mirror.verify.resume

Severity

NOTICE

Description

This event is issued when a verify has been resumed on a mirror pair.

Corrective Action

(None).

Syslog Message

%s%s: resume mirror verification

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): The name of the mirror object that is resuming verification
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.mirror.verify.snapcrtfail

Severity

ERROR

Description

This message occurs when mirror verification fails to create a mirror verify snapshot due to no space on the device for a snapshot or the maximum number of snapshots were reached. Mirror verification is a long running I/O operation that compares the blocks on both sides of mirror and reports any mismatches it finds.

Corrective Action

Increase the size of the root volume or delete old snapshots.

Syslog Message

%s %s%s: could not create mirror verification snapshot %s (%s)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Name of the snapshot that was not created.
error (STRING): Error code returned by the failed operation.

raid.mirror.verify.snapcrtok

Severity

INFORMATIONAL

Description

This event is issued when verification has created a mirror verify snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s: created mirror verification snapshot %s

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Name of the snapshot that has been created.

raid.mirror.verify.snapdelfail

Severity

NOTICE

Description

This message occurs when verification fails to delete a mirror verify snapshot. The WAFL® snapshot autodelete functionality will automatically delete the snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s: could not delete mirror verification snapshot %s (%s)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Name of the snapshot that was not deleted.
error (STRING): Error code returned by the failed operation.

raid.mirror.verify.snapdelok

Severity

INFORMATIONAL

Description

This event is issued when verification has deleted a mirror verify snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s: deleted mirror verification snapshot %s

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Name of the snapshot that has been deleted.

raid.mirror.verify.snaprenamefail

Severity

NOTICE

Description

This message occurs when verification fails to rename a mirror verify snapshot. It is marked as invalid and is deleted.

Corrective Action

(None).

Syslog Message

%s %s%s: could not rename mirror verification snapshot %s to %s (%s)

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Name of the snapshot that was not renamed.
snapName2 (STRING): Attempted new name of the snapshot.
error (STRING): Error code returned by the failed operation.

raid.mirror.verify.snaprenameok

Severity

INFORMATIONAL

Description

This event is issued when verification has renamed a mirror verify snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s: renamed mirror verification snapshot %s to %s

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate object that is being verified.
snapName (STRING): Old name of the snapshot that has been renamed.
snapName2 (STRING): New name of the snapshot that has been renamed.

raid.mirror.verify.start

Severity

NOTICE

Description

This event is issued when a verify has been initiated on a mirror pair.

Corrective Action

(None).

Syslog Message

%s%s: start mirror verification

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): The name of the mirror object that is initiating verification
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.mirror.verify.suspend

Severity

NOTICE

Description

This event is issued when a verify has been suspended on a mirror pair.

Corrective Action

(None).

Syslog Message

%s%s: suspend mirror verification

Parameters

owner (STRING): Owner of the affected aggregate.
mirror (STRING): The name of the mirror object that is suspending verification
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.mirror.vote.badCksum

Severity

INFORMATIONAL

Description

This message occurs when the mirror vote blob contains an invalid checksum. The mirror vote blob holds information describing the active set of mirrored volumes.

Corrective Action

(None).

Syslog Message

RAID: mirror information has an inconsistent checksum.

Parameters

(None).

raid.mirror.vote.incorrectRecords

Severity

INFORMATIONAL

Description

This message occurs when the mirror vote blob has inconsistent contents. The mirror vote blob holds information describing the active set of mirrored volumes. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID: mirror information has inconsistent contents.

Parameters

count (INT): Number of records listed in the blob.

raid.mirror.vote.invalidVersion

Severity

INFORMATIONAL

Description

This message occurs when the mirror vote blob contains an invalid version. The mirror vote blob holds information describing the active set of mirrored volumes.

Corrective Action

(None).

Syslog Message

RAID: mirror information has an unsupported version number (%d).

Parameters

    version (INT): Version information in the blob.

raid.mirror.vote.invalidVol

Severity

    INFORMATIONAL

Description

    This message occurs when the mirror vote information describing a volume is internally inconsistent. The mirror vote information describes the active set of mirrored aggregate. The mirror vote information is ignored.

Corrective Action

    (None).

Syslog Message

    RAID: mirror information for volume UUID %s is inconsistent.

Parameters

    aggr_id (STRING): UUID of the affected volume.

raid.mirror.vote.noRecord

Severity

    INFORMATIONAL

Description

    This message occurs when a mirror vote is required on an aggregate but no vote is present in the mirror vote record. In this case, as both the plexes are available, we ignore mirror voting check.

Corrective Action

    (None).

Syslog Message

    RAID: mirror record missing for %s %s%s.

Parameters

    vol_type (STRING): Volume type.
    owner (STRING): Owner of the affected aggregate.
    vol (STRING): Name of the aggregate.

raid.mirror.vote.noRecord1Plex

Severity

    ERROR

Description

    This message occurs when a mirror vote is required on an aggregate but no vote is present in the mirror vote record. In this case, only one plex is available. The aggregate will be kept offline because the existing plex might contain stale data.

Corrective Action

1. In a storage environment with RAID SyncMirror®, the plex could be missing due to several reasons such as disaster at the site, shelf failure, disk failures, and so on. Try to bring the missing plex online after addressing some of the listed possible causes. 2. If the plex does not come online, bring the aggregate online using the 'storage aggr online' or 'storage plex online' command. This aggregate was kept offline because the existing plex might contain stale data.

Syslog Message

WARNING: Only one plex in %s %s%s is available. %s might contain stale data.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
vol_type2 (STRING): Volume type.

raid.mirror.vote.outOfDate

Severity

NOTICE

Description

This message occurs when Data ONTAP® detects an out-of-date plex. The plex is marked as out-of-date and a transaction subsequently occurs to update the internal RAID tree state.

Corrective Action

(None).

Syslog Message

%s %s%s has been detected as out-of-date and is being marked offline.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.mirror.vote.sbFailed

Severity

ERROR

Description

This message occurs when the local node cannot transfer mirror vote records for aggregates being switched back as part of a switchback operation.

Corrective Action

1. Verify that the DR partner node is up. 2. Run the 'network interface show' command to verify that the cluster network interfaces on the local and DR partner node are up. If not, correct any network issues that could be preventing it.

Syslog Message

Could not communicate with the DR node over the intercluster network while attempting a switchback operation.

Parameters

dr_host (STRING): Disaster recovery (DR) host to which the local node failed to transfer the mirror vote records.

raid.mirror.vote.versionZero

Severity

INFORMATIONAL

Description

This message occurs when the mirror vote blob contains version 0. Typically, this occurs when the mirror vote blob is empty.

Corrective Action

(None).

Syslog Message

RAID: mirror information is empty.

Parameters

(None).

raid.mirror.vote.xferFailed

Severity

ERROR

Description

This message occurs when the local node fails to transfer the mirror vote record of the aggregate during aggregate migration as part of giveback or aggregate relocation.

Corrective Action

1. Verify that the destination node is up. 2. Run the 'network interface show' command to verify that the cluster network interfaces on the local and partner node are up. If they are not up, address any network issues.

Syslog Message

Failed to communicate with the destination node over the cluster network while migrating the aggregate "%s" (UUID: %s) during giveback or aggregate relocation because %s.

Parameters

aggregate (STRING): Name of the aggregate.
aggregate_uuid (STRING): UUID of the aggregate.
reason (STRING): The reason the transfer failed.

raid.monitor events

raid.monitor.maxVols

Severity

ERROR

Description

This message occurs when the hourly monitor indicates that the current aggregate or volume number exceeded the maximum number of supported volumes on the host.

Corrective Action

Check the number of volumes on the host. Destroy the newly created volume if the maximum for the total number of volumes on this host is exceeded.

Syslog Message

WARNING: There are too many (%d) volumes on the host. The limit is %d in %s configuration.

Parameters

numVols (INT): Current number of volumes on the host.
maxVols (INT): Maximum number of volumes supported.
configType (STRING): Current configuration.

raid.multierr events

raid.multierr.bad.block

Severity

ERROR

Description

This message occurs when RAID encounters more errors than the RAID level protection affords, and RAID cannot recover the block. The blocks with errors are marked as bad. When the file system reads this bad block, an error is returned. The file system identifies the bad file and block and recommends the necessary corrective action.

Corrective Action

Check for the WAFL® message "wafl.raid.incons.xxx" and follow the corrective actions outlined there.

Syslog Message

Marking '%s%s', block number %llu, volume block number %llu, as a bad block.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical block number containing the error.
volumeBno (LONGINT): Volume block number.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during an error recovery operation. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during an error recovery operation.

Parameters

owner (STRING): Owner of the affected aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

stored_dbn (INT): Physical disk block number stored in the checksum entry.

expected_dbn (LONGINT): Expected physical disk block number.

stored_vbn (LONGINT): Volume block number stored in the checksum entry.

expected_vbn (LONGINT): Expected volume block number.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the disk shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during error recovery operations. The embedded checksum computed over the checksum entry does not match, indicating the corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during an error recovery operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.cksum.err

Severity

NOTICE

Description

This message occurs when the system detects a checksum error during error recovery operations. The checksum computed does not match the stored checksum, indicating that the block is corrupted. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum error on %s%s, block #%llu during an error recovery operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.cksum.rderr

Severity

NOTICE

Description

This message occurs when the system detects a checksum block media error in an advanced_zoned checksum's (AZCS) RAID group during an error recovery operation. In this case, the data cannot be verified. Data ONTAP® takes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during error recovery.

Parameters

owner (STRING): Owner of the affected aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

blockNum (LONGINT): First physical disk block number containing the error.

LblockNum (LONGINT): Last physical disk block number containing the error.

shelf (STRING): Shelf identifier for the disk shelf on which the disk is located.

bay (STRING): Disk bay within the disk shelf on which the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during an error recovery operation. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during an error recovery operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.lw.block.rewrite

Severity

NOTICE

Description

This message occurs on a RAID stripe with an inconsistent RAID write signature, when the system cannot detect the bad blocks or if the number of blocks with an error are more than the RAID protection level. The system restores the RAID write signature consistency by rewriting one or more disk blocks with the same data, but with the RAID write signature being corrected.

Corrective Action

(None).

Syslog Message

Rewriting %s%s, block #%llu with RAID write signature corrected.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical Disk block number being rewritten.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.lw.block.rewrite.dirty

Severity

INFORMATIONAL

Description

This message occurs on a RAID stripe with an inconsistent RAID write signature that belongs to a dirty parity region, when the system cannot detect the bad blocks or if the number of blocks with an error are more than the RAID protection level. The system restores the RAID write signature consistency by rewriting one or more disk blocks with the same data, but with the RAID write signature being corrected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical Disk block number being rewritten.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.multierr.lw.id.inconsist

Severity

NOTICE

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe while fixing multiple errors on a stripe. Data ONTAP® makes appropriate recovery actions. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature detected on RAID group %s%s, stripe #%llu, during RAID multiple error handling operation.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the raid group.
stripe (LONGINT): Stripe number.

raid.multierr.lw.id.inconsist.dirty

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe while fixing multiple errors on a stripe that belongs to a dirty parity region.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.multierr.unverified.blk

Severity

EMERGENCY

Description

This message occurs when RAID encounters more errors than the RAID level protection allows and RAID cannot recover the block. Any block with a checksum error is marked as unverified.

Corrective Action

Check for the WAFL® error message "wafl.raid.incons.xxx" and follow the corrective actions in that message, or contact NetApp technical support.

Syslog Message

Marking '%s%s', block number [%llu - %llu], volume block number [%llu - %llu], as an unverified block.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): First physical block number containing the error.
LblockNum (LONGINT): Last physical block number containing the error.
volumeBno (LONGINT): First volume block number containing the error.

LvolumeBno (LONGINT): Last volume block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster® configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.mv events

raid.mv.defVol.online

Severity

INFORMATIONAL

Description

This message occurs when aggregates are brought online in a deferred way after mirror votes are retrieved automatically. Mirror votes are retrieved from the replicated database (RDB) in a deferred way when the RDB comes online.

Corrective Action

(None).

Syslog Message

RAID: Aggregate %s was brought online in a deferred way.

Parameters

aggregate_name (STRING): Name of the aggregate that was brought online.

raid.mv.defVol.online.fail

Severity

EMERGENCY

Description

This message occurs when the system fails to bring an aggregate online because mirror vote could not be retrieved from RDB. The reason could be a missing or incorrect mirror vote record or if the previous attempt to retrieve mirror votes failed. Mirror vote retrieval is retried automatically.

Corrective Action

The mirror vote retrieval is retried automatically. If that is not successful, aggregates that are kept offline due to the absence of mirror votes can be brought online by using the (privilege: diagnostic) ""storage aggregate online -forced"" command. Doing so, however, can cause data loss, and should only be attempted with help from NetApp Technical Support. Otherwise, wait until the other plex comes online for the aggregate to come online. For example, if one plex is missing due to disaster at that site, perform Disaster Recovery. Use the ""storage aggregate show"" command to see if plex is missing. If the condition persists, contact NetApp technical support.

Syslog Message

RAID: Could not bring aggregate %s online because %s.

Parameters

aggregate_name (STRING): Name of the aggregate that could not be brought online.
reason (STRING): Reason the aggregate was not brought online.

raid.mv.defVol.online.skip

Severity

NOTICE

Description

This message occurs when the system determines that the mirror vote should not be retrieved at this time, resulting in not bringing the aggregate online. The mirror vote retrieval process is retried automatically.

Corrective Action

If the aggregate is a left-behind aggregate, use the "metrocluster switchback" command to return it to its original owner where it can be brought online. Otherwise, the system will automatically retry the mirror vote retrieval process.

Syslog Message

RAID: Aggregate %s was not brought online because %s.

Parameters

aggregate_name (STRING): Name of the aggregate that was skipped.
reason (STRING): Reason the aggregate was skipped.

raid.mv.transfer.write

Severity

NOTICE

Description

This message occurs when mirror votes are received via HA message and are written to the local mailbox. Extended mirror vote write times can potentially prevent or delay the partner's ability to change ownership of a mirrored aggregate to this node.

Corrective Action

(None).

Syslog Message

The mailbox write for %d received records took %llu milliseconds.

Parameters

records (INT): Number of new records written to the mailbox.
write_time (LONGINT): Time it took to write to the mailbox in milliseconds.

raid.mv.unexpected.local

Severity

INFORMATIONAL

Description

This message occurs when we pull mirror votes from the replicated database (RDB), and there is a stale vote present in the mailbox. The vote from the RDB is treated as the correct vote, and the stale vote is discarded. The stale vote was probably due to not having been cleaned or deleted in the past.

Corrective Action

(None).

Syslog Message

RAID: Found a stale vote for aggregate %s in the mailbox when the mirror vote was pulled from the RDB.

Parameters

aggregate (STRING): Name of the aggregate.

raid.no events

raid.no.parity.aggr

Severity

EMERGENCY

Description

This message occurs periodically to warn the user that the aggregate has no RAID protection and is not safe for storing data.

Corrective Action

Use the "aggregate delete" command to delete the aggregate, if possible.

Syslog Message

Aggregate "%s" does not use any RAID-level data protection; any data is unprotected.

Parameters

aggr (STRING): Name of the aggregate.

raid.ns events

raid.ns.init.removeOwnership

Severity

NOTICE

Description

This message occurs when the system removes ownership of its disks during initialization of a non-shared HA system.

Corrective Action

(None).

Syslog Message

Removed ownership of %d disks.

Parameters

num_disks_reverted (INT): Number of disks whose ownership was removed.
num_disks_not_reverted (INT): Number of disks whose ownership was not removed.
status (STRING): Status of the disk ownership remove operation.

raid.ns.init.skipUnpartition

Severity

NOTICE

Description

This message occurs when the system skips unpartitioning a disk during initialization of a non-shared HA system.

Corrective Action

(None).

Syslog Message

Skipped unpartitioning disk %s(UID: %s) due to %s.

Parameters

disk_name (STRING): Name of the disk.
disk_uid (STRING): Unique identifier of the disk.
reason (STRING): Reason for skipping unpartitioning the disk.

raid.ns.init.unpartition

Severity

NOTICE

Description

This message occurs when the system unpartitions one or more disks during initialization of a non-shared HA system.

Corrective Action

(None).

Syslog Message

Unpartitioned %d disk(s).

Parameters

num_disks_unpartitioned (INT): Number of disks unpartitioned.

raid.nvram events

raid.nvram.bad.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains some bad entries. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains bad entries.

Parameters

(None).

raid.nvram.clean.vol.entry

Severity

NOTICE

Description

This message tracks the status of RAID nonvolatile RAM (NVRAM), which contained entries for a clean shutdown volume. No action is required.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains entries for a clean shutdown volume.

Parameters

(None).

raid.nvram.miss.disk.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains entries for nonexistent disks. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains entries for nonexistent disks.

Parameters

(None).

raid.nvram.miss.group.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains entries for nonexistent RAID groups. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains entries for nonexistent groups.

Parameters

(None).

raid.nvram.miss.plex.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains entries for nonexistent plexes. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains entries for nonexistent plexes.

Parameters

(None).

raid.nvram.miss.vol.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains entries for nonexistent volumes. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains entries for nonexistent volumes.

Parameters

(None).

raid.nvram.stale.entry

Severity

NOTICE

Description

This message occurs when RAID NVRAM contains some stale entries. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

RAID NVRAM contains stale entries.

Parameters

(None).

raid.offline events

raid.offline.busy

Severity

NOTICE

Description

This message occurs when an attempt to offline an aggregate fails due to active operations on the contained volumes.

Corrective Action

(None).

Syslog Message

Active operations in progress on aggregate %s: %s.

Parameters

aggrname (STRING): Aggregate name.
operation (STRING): Operation.

raid.olm events

raid.olm.disk.ownership.change

Severity

NOTICE

Description

This message occurs when a disk which is under online label maintenance(OLM) is prepared for ownership change by administrator forcibly.

Corrective Action

(None).

Syslog Message

Ownership of %s, which is under online label maintenance (OLM) is being changed by administator forcibly.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.partition events

raid.partition.disk

Severity

NOTICE

Description

This message indicates a disk was successfully partitioned.

Corrective Action

(None).

Syslog Message

Disk partition successful on %s, partitions created %u, partition sizes specified %u, partition spec summary%s.

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.

partition_count (INT): The number of partitions created.

partition_specs (INT): The number of partitions created with the size specified.

partition_spec_summary (STRING): A summary of the partition sizes specified by partition specifications. The form is [index]=size [index]=size .. Where index is a partition index, and size capacity of the partition specified in disk blocks.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the disk vendor.

model (STRING): Model string of the disk.

firmware_revision (STRING): Disk firmware revision number.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.partition.disk.fail

Severity

NOTICE

Description

This message occurs when an attempt to partition a disk fails. The error and error_info fields indicate the reason why the attempt failed.

Corrective Action

(None).

Syslog Message

Disk partition failed on %s, error %s, additional error info (%s).

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.

error (STRING): String name for the error.

error_info (STRING): Additional error information.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the disk vendor.

model (STRING): Model string of the disk.

firmware_revision (STRING): Disk firmware revision number.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.plex events

raid.plex.faultIsolation.reminder

Severity

ERROR

Description

This message occurs when disks in a plex do not have the same hardware-based pool.

Corrective Action

a) Identify the problem aggregate from the system logs. b) Determine how this occurred: possible cause is a wiring problem. c) Based on the information you gather, determine how to correct the issue. For example, use the "storage disk replace" command to copy the disk belonging to the wrong pool to a disk belonging to the right pool. d) If you need assistance, contact NetApp technical support.

Syslog Message

Plex %s has disks from mixed pools: %s

Parameters

plex (STRING): Name of the plex.
num_disks (STRING): Number of disks of the plex in other pools.

raid.plex.vbn.error

Severity

NOTICE

Description

This message occurs when the system attempts to start up a plex and discovers that part of its Virtual Block Number(VBN) range is missing.

Corrective Action

(None).

Syslog Message

%s %s%s: Plex object %d is missing a VBN segment starting at %llu.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
plexId (INT): Identifier of the plex.
vbn (LONGINT): Starting VBN that is missing.

raid.pmdopt events

raid.pmdOpt.misconfigured

Severity

ERROR

Description

The option raid.panic.missing.disks was set to panic and halt the appliance when a hardware error prevents access to multiple file system disks. However, the regular value of that option is not accessible during boot. Therefore, the option value is stored in the firmware environment variable halt-missing-disks, if the appliance has such capability. This event occurs hourly as long as the two values are not equal. Here are some examples of possible undesirable behavior caused by inconsistency between the two values: If halt-missing-disks is 0 and option raid.panic.missing.disks is 2, and if a failure causes the appliance to lose access to two or more file system disks, the appliance panics but does not halt. Multiple reconstructions might start after reboot, and that is what would have been prevented by setting the option. If halt-missing-disks is 2 and option raid.panic.missing.disks is 0, the appliance does not panic if it loses access to multiple file system disks. However, it might halt if multiple filesystem disks are missing during boot. If one value is 2 and the other is 3, the appliance panics and halts as expected only if a failure prevents access to three or more file system disks.

Corrective Action

Try resetting the option raid.panic.missing.disks to the desired value.

Syslog Message

The option raid.panic.missing.disks is set to %d, but during boot it will have value %d. Reset the option.

Parameters

value (INT): Value of the option raid.panic.missing.disks.
boot_value (INT): Value of the option raid.panic.missing.disks during boot that is stored in the firmware environment variable halt-missing-disks.

raid.pmdOpt.nonpersistent

Severity

NOTICE

Description

This message occurs when an attempt is made to set the "raid.panic.missing.disks" option to panic and halt the system when a hardware error prevents access to multiple file system disks. However, the system cannot store the option persistently to be accessible during boot, and the option was not set to the new value. That happens on systems that do not have the capability to store environment variables in firmware. The "raid.panic.missing.disks" option cannot be used on such systems.

Corrective Action

(None).

Syslog Message

Setting the "raid.panic.missing.disks" option to %d failed because it could not be stored in the firmware environment variable.

Parameters

value (INT): Value of the "raid.panic.missing.disks" option.

raid.pmdOpt.set

Severity

ERROR

Description

The option raid.panic.missing.disks has been set to panic and halt the appliance when a hardware error prevents access to multiple file system disks. This option might be useful to prevent multiple unnecessary reconstructions if such errors occur, especially on NearStore® appliances. It is not recommended that you use this option on filer appliances. This option is always disabled during takeover. When using this option, you must have a monitoring system that alerts an administrator if the appliance halts. The Remote LAN Module (RLM) can provide such alerts if it is present in the appliance and properly configured. Otherwise, you need an external monitoring system.

Corrective Action

Verify that the setting is correct. Verify that RLM or an external monitoring system can alert the administrator when the appliance halts. To disable this behavior, set option raid.panic.missing.disks to 0.

Syslog Message

The option raid.panic.missing.disks is set to panic and halt the appliance when an error affects %d or more file system disks. RLM %s present.

Parameters

value (INT): Value of the option raid.panic.missing.disks.
rlm_present_string (STRING): String to indicate whether RLM is present: "is" or "is not".
rlm_present (INT): Indicates whether RLM is present in the system: 1 if RLM is present, 0 if it is not present.

raid.pmdOpt.singleDisk

Severity

ERROR

Description

This message occurs when the option 'raid.panic.missing.disks' is set to 1, which causes the system to panic and halt on any disk failure. You should set that option to 1 only when directed by NetApp technical support for handling a specific condition, and you should change that value from 1 as soon as the condition is rectified. This event is issued periodically as a reminder to change the option as soon as possible.

Corrective Action

Change the option 'raid.panic.missing.disks' to a more appropriate value (0, or 2 or higher) when conditions to keep it at 1 no longer apply.

Syslog Message

The option 'raid.panic.missing.disks' is set to 1, which causes the system to panic and halt on any disk failure. Change the option as soon as possible.

Parameters

(None).

raid.poolsort events

raid.poolsort.disks_per_channel

Severity

INFORMATIONAL

Description

This message occurs when the system detects an invalid number of disks on a single channel.

Corrective Action

(None).

Syslog Message

(None).

Parameters

channel_name (STRING): Name of the channel containing too many disks.
num_disks (INT): Number of disks connected to this channel.
max_disks (INT): Maximum number of disks expected to be connected to this channel.

raid.poolsort.disks_per_shelf

Severity

ALERT

Description

This message occurs when the system detects too many disks reporting the same disk shelf ID. This usually indicates that multiple shelves on one channel are using the same shelf ID.

Corrective Action

Change the conflicting shelf IDs to unique values using the supported procedures for the affected shelves.

Syslog Message

Shelf ID %d on channel %s is reporting too many disks.

Parameters

shelf_id (INT): Shelf ID being reported by the disks.
channel_name (STRING): Channel the disks are connected to.
num_disks (INT): Number of disks reporting this shelf ID.
max_disks (INT): Maximum number of disks expected to report this shelf ID.

raid.poolsort.num_channels

Severity

INFORMATIONAL

Description

This message occurs when the system detects an invalid number of channels.

Corrective Action

(None).

Syslog Message

(None).

Parameters

num_channels (INT): Number of channels detected.
max_channels (INT): Maximum number of channels allowed on the system.

raid.poolsort.shelves_per_channel

Severity

INFORMATIONAL

Description

This message occurs when the system detects an invalid number of disk shelves on a single channel.

Corrective Action

(None).

Syslog Message

(None).

Parameters

channel_name (STRING): Channel containing too many shelves.
num_shelves (INT): Number of shelves connected to this channel.
max_shelves (INT): Maximum number of shelves expected to be connected to this channel.

raid.preserve events

raid.preserve.nvram

Severity

INFORMATIONAL

Description

During RAID replay of NVRAM, entries associated with a non-existent (offline or missing) aggregate were discovered. Since the volume is not available to replay those NVRAM entries, it will be saved in a system file on the root volume and will be replayed when the aggregate becomes available. This event is issued if the system is able to successfully save the NVRAM RAID entries associated with a non-existent aggregate.

Corrective Action

(None).

Syslog Message

RAID replay detected NVRAM entries for a non-existent aggregate having raidtreeID %s. %d checksum, %d stripe and %d pzero entries were successfully preserved.

Parameters

raidtreeID (STRING): RAIDtree identifier of the aggregate.
nchecksum_saved (INT): Identifies the number of checksum NVRAM entries preserved
nstripe_saved (INT): Identifies the number of stripe NVRAM entries preserved
nblkbuf_saved (INT): Identifies the number of pzero NVRAM entries preserved

raid.preserve.nvram.issue

Severity

INFORMATIONAL

Description

This event occurs when system finds an issue during an nvfile save or nvfile replay operation. During RAID replay of NVRAM, entries associated with a nonexistent (offline or missing) aggregate are discovered. Because the volume is unavailable to replay those NVRAM entries, it is saved in a system file on the root volume and is replayed when the aggregate becomes available.

Corrective Action

(None).

Syslog Message

%s %s

Parameters

reason (STRING): Description of the issue during nvfile save or replay phase.
identifier (STRING): Description of raidtree identifier or filen name

raid.quiesce events

raid.quiesce.diskProcessTime

Severity

INFORMATIONAL

Description

This message occurs during the ownership change of a disk to indicate the time taken by RAID to quiesce disk active I/O's.

Corrective Action

(None).

Syslog Message

(None).

Parameters

process (STRING): Description of the process.
disk (STRING): Name of the disk.
time (LONGINT): Time taken by the specified process.

raid.read events

raid.read.cksum.blk.err

Deprecated

Deprecated as of version 9.9.1 because this EMS does not appropriately describe the checksum block error.

Severity

NOTICE

Description

This message occurs when the system detects a checksum block media error in an advanced zoned checksums(AZCS) RAID group during a read operation. Data ONTAP® takes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during RAID group I/O.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.

raid.read.cksum.blk.notAvail

Severity

NOTICE

Description

This message occurs when the system detects a checksum block media error in an advanced zoned checksums(AZCS) RAID group during a read operation. As a result checksum information is not available. Data ONTAP® takes appropriate recovery actions to reconstruct the block. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block is not available on %s%s for blocks [#%llu - #%llu] during RAID group I/O.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.

raid.read.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during a read operation. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during a read operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.

raid.read.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during a read operation. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during a read operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number containing the error.

raid.read.cksum.err

Severity

NOTICE

Description

This message occurs when the system detects a checksum error during a read operation. The checksum computed does not match the stored checksum, indicating that the block is corrupted. Data ONTAP®

makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum error on %s%s, block #%llu.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical block number containing the error.

raid.read.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during a read operation. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during a read operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical disk block number containing the error.

raid.read.media.err

Severity

NOTICE

Description

This message occurs when rg i/o detects a single-disk medium error

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu

Parameters

> **owner** (STRING): Owner of the affected aggregate.
> **disk_info** (STRING): Formatted information of disk object that contains the error.
> **blockNum** (LONGINT): The physical block number containing the error.
> **shelf** (STRING): Shelf identifier where the disk is located
> **bay** (STRING): Disk bay within the shelf where disk is located
> **vendor** (STRING): Name of the vendor of the disk
> **model** (STRING): Model string of the disk drive
> **firmware_revision** (STRING): Firmware revision number of the disk
> **serialno** (STRING): Serial number of the disk
> **disk_type** (INT): Type of disk drive
> **disk_rpm** (STRING): Rotational speed of disk in RPM
> **carrier** (STRING): Unique ID of the carrier in which the disk is installed.
> **site** (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.read.media.recommend.reassign.err

Severity

> NOTICE

Description

> This message occurs when rg i/o detects a single-disk recommend reassign error

Corrective Action

> (None).

Syslog Message

> Block recommended for reassignment on %s%s, block #%llu

Parameters

> **owner** (STRING): Owner of the affected aggregate.
> **disk_info** (STRING): Formatted information of the disk object that contains the error.
> **blockNum** (LONGINT): The physical block number containing the error.
> **shelf** (STRING): Shelf identifier where the disk is located
> **bay** (STRING): Disk bay within the shelf where disk is located
> **vendor** (STRING): Name of the vendor of the disk
> **model** (STRING): Model string of the disk drive
> **firmware_revision** (STRING): Firmware revision number of the disk
> **serialno** (STRING): Serial number of the disk
> **disk_type** (INT): Type of disk drive
> **disk_rpm** (STRING): Rotational speed of disk in RPM
> **carrier** (STRING): Unique ID of the carrier in which the disk is installed.
> **site** (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.readerr events

raid.readerr.lw.data.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature, during a RAID error handling operation to log the on-disk RAID checksum information of the data block on the corresponding RAID stripe.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the data disk.
dbn (LONGINT): Disk block number of the block being reported.
disk_pos (INT): Position of this data disk in the corresponding RAID group. The generation count of this data block on the parity bitmap resides at this position.
stripe_id (INTHEX): Stripe ID field of the RAID write signature on the data block.
gen_cnt (INTHEX): Generation count field of the RAID write signature on the data block.
comp_cksum (INTHEX): Computed RAID checksum of the disk block.
sto_vbn (LONGINT): Volume block number stored in the checksum entry.
wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.lw.dparity.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature, during a RAID error handling operation to log the on-disk RAID checksum information of the diag parity block on the corresponding RAID stripe.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the diag parity disk.
dbn (LONGINT): Disk block number of the block being reported.
stripe_id (INTHEX): Stripe ID field of the RAID write signature on the diag parity block.
gen_cnt1 (INTHEX): Generation count bitmap field of the RAID write signature on the diag parity block, for data blocks 0-15.
gen_cnt2 (INTHEX): Generation count bitmap field of the RAID write signature on the diag parity block, for data blocks 16-27.
comp_cksum (INTHEX): Computed RAID checksum of the disk block.
wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.lw.id.inconsist

Severity

NOTICE

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe, during a RAID error handling operation. Data ONTAP® makes appropriate recovery actions. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature detected on RAID group %s%s, stripe #%llu, during RAID error handling operation

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.readerr.lw.id.inconsist.dirty

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe that belongs to a dirty parity region, during a RAID error handling operation.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.readerr.lw.parity.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature, during a RAID error handling operation to log the on-disk RAID checksum information of the row parity block on the corresponding RAID stripe.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the row parity disk.
dbn (LONGINT): Disk block number of the block being reported.
stripe_id (INTHEX): Stripe ID field of the RAID write signature on the row parity block.
gen_cnt1 (INTHEX): Generation count bitmap field of the RAID write signature on the row parity block, for data blocks 0-15.
gen_cnt2 (INTHEX): Generation count bitmap field of the RAID write signature on the row parity block, for data blocks 16-27.
comp_cksum (INTHEX): Computed RAID checksum of the disk block.
wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.lw.reconsBadBlk.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system encounters a RAID stripe with an inconsistent RAID write signature that might indicate a bad data block somewhere on the stripe. Based on this block's RAID signature, the system suspects this block as containing bad data and reconstructs the the block for a data integrity check. This message logs the RAID checksum information from the reconstructed block.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the data disk.
dbn (LONGINT): Disk block number of the block being reported.
comp_cksum (INTHEX): Computed RAID checksum of the reconstructed block.
wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
iteration (INT): Parity consistency of this RAID stripe is restored by performing a data integrity check on one or two stripe blocks at a time in an iteration. This variable prints the current iteration.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.lw.reconsGoodBlk.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system encounters a RAID stripe with an inconsistent RAID write signature that might indicate a bad data block somewhere on the stripe. Based on this block's RAID signature, the system identifies this block as containing good data and reconstructs the block to perform a data integrity check on a suspected bad data block in the stripe. This message logs the RAID checksum information from the reconstructed good block.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the data disk.
dbn (LONGINT): Disk block number of the block being reported.
comp_cksum (INTHEX): Computed RAID checksum of the reconstructed block.

wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
iteration (INT): Parity consistency of this RAID stripe is restored by performing a data integrity check on one or two stripe blocks at a time in an iteration. This variable prints the current iteration.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.lw.tparity.ckinfo

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature, during a RAID error handling operation to log the on-disk RAID checksum information of the tparity block on the corresponding RAID stripe.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_name (STRING): Name of the tparity disk.
dbn (LONGINT): Disk block number of the block being reported.
stripe_id (INTHEX): Stripe ID field of the RAID write signature on the tparity block.
gen_cnt1 (INTHEX): Generation count bitmap field of the RAID write signature on the tparity block, for data blocks 0-15.
gen_cnt2 (INTHEX): Generation count bitmap field of the RAID write signature on the tparity block, for data blocks 16-27.
comp_cksum (INTHEX): Computed RAID checksum of the disk block.
wafl_cxt0 (INTHEX): Bytes 0-3 of WAFL® context information in the checksum.
wafl_cxt1 (INTHEX): Bytes 4-7 of WAFL context information in the checksum.
wafl_cxt2 (INTHEX): Bytes 8-11 of WAFL context information in the checksum.
wafl_cxt3 (INTHEX): Bytes 12-15 of WAFL context information in the checksum.
wafl_cxt4 (INTHEX): Bytes 16-19 of WAFL context information in the checksum.
wafl_cxt5 (INTHEX): Bytes 20-23 of WAFL context information in the checksum.
wafl_cxt6 (INTHEX): Bytes 24-27 of WAFL context information in the checksum.
wafl_cxt7 (INTHEX): Bytes 28-31 of WAFL context information in the checksum.
disk_serialno (STRING): Serial number of the disk drive.

raid.readerr.recovered.file

Severity

NOTICE

Description

This event is issued when a lost write block has been recovered from parity and other remaining data disks.

Corrective Action

(None).

Syslog Message

Recovered the bad disk block %llu on %s%s, %s inode number %d, snapid %d, treeid %d, file block %llu level %d.

Parameters

blockNum (LONGINT): The disk block number
owner (STRING): String indicating the owner of the affected volume.
disk_info (STRING): Formatted information of the disk
ino_type (STRING): The inode type
fileid (INT): The file identifier
snapid (INT): The snapshot identifier
treeid (INT): The snapshot identifier
fileBlockNum (LONGINT): The block number in the file
level (INT): The level

raid.recons events

raid.recons.lw.id.inconsist

Severity

NOTICE

Description

This message occurs during a RAID reconstruction operation, when the system detects an inconsistent RAID write signature on a RAID stripe. Data ONTAP® makes appropriate recovery actions. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature detected on RAID group %s%s, stripe #%llu, during reconstruction.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the raid group.
stripe (LONGINT): Stripe number.

raid.recons.lw.id.inconsist.dirty

Severity

INFORMATIONAL

Description

This message occurs during a RAID reconstruction operation, when the system detects an inconsistent RAID write signature on a RAID stripe that belongs to a dirty parity region.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.recons.MP

Severity

NOTICE

Description

This message occurs when a user enables or disables multiprocessing for reconstruction. It also is emitted when reconstruction actually starts and multiprocessing is enabled.

Corrective Action

(None).

Syslog Message

RAID reconstruct multiprocessing is %s (raid.reconstruct.threads: %d rows, RAID I/O threads: %d).

Parameters

status (STRING): Whether multiprocessing is enabled or disabled
rows (INT): Number of reconstruct rows ("raid.reconstruct.threads") in use per RAID I/O thread.
raidio_nthreads (INT): Number of RAID I/O threads in use.

raid.reparity events

raid.reparity.lw.id.inconsist

Severity

INFORMATIONAL

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe, during a RAID reparity operation.

Corrective Action

(None).

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.replay events

raid.replay.nvfile.done

Severity

INFORMATIONAL

Description

This event is issued when an aggregate becomes available and system successfully replayed the preserved NVRAM entries associated with that aggregate. The NVRAM entries replayed are saved in a system file on the root volume.

Corrective Action

(None).

Syslog Message

Successfully replayed %d checksum, %d stripe %d pzero block entries from preserved NVRAM file for %s %s%s having raidtreeID %s.

Parameters

nchecksum_replayed (INT): Identifies the number of checksum NVRAM entries replayed
nstripe_replayed (INT): Identifies the number of stripe NVRAM entries replayed
nblkbuf_replayed (INT): Identifies the number of pzero entries replayed
vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
raidtreeID (STRING): RAIDtree identifier of the aggregate.

raid.replay.nvfile.start

Severity

INFORMATIONAL

Description

This event is issued while starting the raid nvfile replay for an aggregate. When a aggregate becomes available and system determines that there are relevant nvram entries saved in a system file for such aggregate, those saved nvram entries must be replayed.

Corrective Action

(None).

Syslog Message

Starting raid nvfile replay for %s %s%s having raidtreeID %s stored on %s host root volume.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
raidtreeID (STRING): Raidtree identifier of the aggregate.
host (STRING): The preserved nvfile being replayed for this aggregate was found on the host root volume.

raid.replay.partner.nvram

Severity

NOTICE

Description

This message occurs when RAID replays partner nonvolatile RAM (NVRAM).

Corrective Action

(None).

Syslog Message

Replaying partner NVRAM.

Parameters

(None).

raid.rg events

raid.rg.bigio.fatal

Severity

ALERT

Description

This message occurs when a RAID group background long running I/O encounters an error that is fatal to the RAID group and the aggregate (cannot be fixed even by a mirror read from the other plex, if it exists).

Corrective Action

Contact technical support to bring this aggregate online.

Syslog Message

%s: long-running raid I/O operation experienced fatal multi-disk error.

Parameters

rg (STRING): Name of the RAID group object that failed.

raid.rg.context.clear

Severity

NOTICE

Description

This message occurs when the context flag is cleared from the RAID group, and therefore from the parent aggregate, as part of context parity scrub testing. This event is only logged during internal testing; it is not seen on customer systems.

Corrective Action

(None).

Syslog Message

Scrub testing: %s%s: group parity context is now reset.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group whose context flag is cleared.

raid.rg.degraded

Severity

NOTICE

Description

This message occurs when a RAID group becomes degraded, double degraded, or triple degraded.

Corrective Action

Reconstruction will occur unless there is no matching spare disk or the number of failed disks is greater than the parity reconstruction level of the RAID group (1 for raid4, 2 for raid_dp and 3 for raid_tec). If reconstruction does not occur, then follow the following steps: 1. Identify the failed disk or disks from the system logs and determine the reason for the failure. 2. Replace the faulty disks.

Syslog Message

%s: Raid group %s is degraded

Parameters

owner (STRING): Owner of the RAID group.
name (STRING): Relative path name of the RAID group.
aggr_UUID (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.die_recons.aborted

Severity

NOTICE

Description

This message occurs when die reconstruction has been aborted on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: die reconstruction aborted at disk %s block %llu after %s

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is aborted die reconstruction.
disk (STRING): Name of the disk object for which die reconstruction aborted.
blockNum (LONGINT): The physical block number die reconstruction stopped
duration (STRING): The amount of time the die reconstruction required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.die_recons.cant.start

Severity

NOTICE

Description

This message occurs when the raid group has a disk with failed die but the die reconstruction cannot be started.

Corrective Action

(None).

Syslog Message

%s%s: unable to start die reconstruction for %s: %s.

Parameters

owner (STRING): Owner of the raid group
rg (STRING): Name of the raid group
disk (STRING): Name of the disk which has a failed die
reason (STRING): Reason the die reconstruction cannot start

raid.rg.die_recons.deferred

Severity

NOTICE

Description

This message occurs when die reconstruction has been deferred on a specific raid group due to inadequate incore resources.

Corrective Action

(None).

Syslog Message

%s%s: die reconstruction deferred for %s (%s)

Parameters

owner (STRING): Owner of the raid group
rg (STRING): Name of the raid group object that is unable to reconstruct die
disk (STRING): Name of the disk object for which die reconstruction aborted.

> **reason** (STRING): A text reason code

raid.rg.die_recons.done

Severity

> NOTICE

Description

> This message occurs when die reconstruction has been completed on a specific raid group.

Corrective Action

> (None).

Syslog Message

> %s%s: die reconstruction completed for %s in %s.

Parameters

> **disk_info** (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.
> **owner** (STRING): Owner of the raid group.
> **disk** (STRING): Name of the disk object for which die reconstruction completed.
> **duration** (STRING): The amount of time the die reconstruction required.
> **shelf** (STRING): Shelf identifier where the disk is located
> **bay** (STRING): Disk bay within the shelf where disk is located
> **vendor** (STRING): Name of the vendor of the disk
> **model** (STRING): Model string of the disk drive
> **firmware_revision** (STRING): Firmware revision number of the disk
> **serialno** (STRING): Serial number of the disk
> **disk_type** (INT): Type of disk drive
> **disk_rpm** (STRING): Rotational speed of disk in RPM
> **carrier** (STRING): Unique ID of the carrier in which the disk is installed.
> **site** (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
> **aggregate_uuid** (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.die_recons.start

Severity

> NOTICE

Description

> This message occurs when die reconstruction has been initiated on a specific raid group.

Corrective Action

> (None).

Syslog Message

> %s%s: starting die reconstruction on disk %s

Parameters

> **disk_info** (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.

owner (STRING): Owner of the raid group.
disk (STRING): Name of the disk object where die reconstruction happens
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.disk.reconstruction.failed

Severity
NOTICE

Description
This event is issued when a disk has failed reconstruction.

Corrective Action
(None).

Syslog Message
%s%s: reconstruction failed for a disk in the raidgroup

Parameters
owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object containing the reconstructing disk

raid.rg.diskcopy.aborted

Severity
NOTICE

Description
This message occurs when RAID disk copy is aborted. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action
(None).

Syslog Message
%s%s: disk copy from %s to %s aborted at disk block %llu after %s. Reason: %s.

Parameters
owner (STRING): Owner of the RAID group.
rg (STRING): RAID group name.
source (STRING): Name of the source disk.
target (STRING): Name of the target disk.

blockNum (LONGINT): Physical block number where the disk copy stopped.
duration (STRING): Amount of time the disk copy lasted.
reason (STRING): Reason for aborting the disk copy operation
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.diskcopy.cant.start

Severity

NOTICE

Description

This message occurs when RAID disk copy cannot be started. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s%s: unable to start disk copy for %s: %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
disk (STRING): Name of the disk to be copied.
reason (STRING): Reason the disk copy cannot start.

raid.rg.diskcopy.deferred

Severity

NOTICE

Description

This message occurs when a RAID disk copy is deferred due to inadequate incore resources. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s%s: disk copy for %s deferred (%s).

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
disk (STRING): Name of the disk to be copied.
reason (STRING): Reason code.

raid.rg.diskcopy.deferred.ok

Severity

INFORMATIONAL

Description

This message occurs when a previously deferred RAID disk copy is now ready to proceed.

Corrective Action

(None).

Syslog Message

%s%s: disk copy for %s previously deferred, now proceeding.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
disk (STRING): Name of the disk to be copied.

raid.rg.diskcopy.done

Severity

INFORMATIONAL

Description

This message occurs when RAID disk copy is completed.

Corrective Action

(None).

Syslog Message

%s%s: disk copy from %s (S/N [%s]) to %s (S/N [%s]) was completed in %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): RAID group name.
source (STRING): Name of the source disk.
source_serialno (STRING): Serial number of the source disk.
target (STRING): Name of the target disk.
target_serialno (STRING): Serial number of the target disk.
duration (STRING): Amount of time it took to complete the disk copy operation.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.diskcopy.failed

Severity

NOTICE

Description

This message occurs when RAID disk copy to the intended target disk cannot be initiated. This type of disk copy is used after new firmware download, to return the disk to its place in a RAID group. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s%s: unable to start disk copy from %s to %s: %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
source (STRING): Name of the disk to be copied.
target (STRING): Name of the target disk.
reason (STRING): Reason the disk copy cannot start.

raid.rg.diskcopy.mismatch

Severity

ERROR

Description

This message occurs when there is no disk for Rapid RAID Recovery that matches all parameters of an ideal replacement in the RAID group. Data ONTAP® selected a disk with a different interface speed or RPM, or from the opposite spare pool in a SyncMirror® configuration.

Corrective Action

Wait for copying to finish. Install an appropriate spare disk. Fail the mismatched disk by using the 'disk fail' command. It will be copied to the new spare disk. After copying is done, use the 'disk unfail' command to unfail the mismatched disk and convert it to a spare.

Syslog Message

%s%s: matching disk not available to copy disk %s; using disk %s %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
source (STRING): Name of the source disk.
target (STRING): Name of the target disk.
detail (STRING): Description of disk mismatch; one or more of: from the opposite spare pool, with different RPM.

raid.rg.diskcopy.recom.fail

Severity

ERROR

Description

This message occurs when an unhealthy disk drive being copied to a replacement disk cannot continue the copy, and must be recommended for failure before the copy is completed. The system will reconstruct the data from parity data.

Corrective Action

(None).

Syslog Message

%s recommend failed after exceeding disk copy error threshold.

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
error_pct (INT): Number of bad blocks on the disk, described as percentage of the total size of the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.diskcopy.resume

Severity

INFORMATIONAL

Description

This message occurs when RAID disk copy is resumed.

Corrective Action

(None).

Syslog Message

%s%s: resuming disk copy from %s to %s (disk block %llu, %d%% complete)

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): RAID group name.
source (STRING): Name of the source disk.
target (STRING): Name of the target disk.
blockNum (LONGINT): Physical block number from which disk copy is continuing.
percent (INT): Percentage of disk copy already complete.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.diskcopy.start

Severity

NOTICE

Description

This message occurs when RAID disk copy is initiated.

Corrective Action

(None).

Syslog Message

%s%s: starting disk copy from %s (S/N [%s]) to %s (S/N [%s]). Reason: %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): RAID group name.
source (STRING): Name of the source disk.
source_serialno (STRING): Serial number of the source disk.
target (STRING): Name of the target disk.
target_serialno (STRING): Serial number of the target disk.
reason (STRING): Reason for starting disk copy.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.drecons

Severity

NOTICE

Description

This message occurs when double reconstruction is initiated after the failure of two disks in RAID-DP or RAID-TEC raid group.

Corrective Action

(None).

Syslog Message

%s%s: starting double reconstruction, using disks %s and %s

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is initiating double reconstruction.
disk (STRING): Name of the disk object that is the first reconstruction target.
disk1 (STRING): Name of the disk object that is the second reconstruction target.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.intl.diskcopy.done

Severity

NOTICE

Description

This message occurs when intelligent disk copy has been completed.

Corrective Action

(None).

Syslog Message

%s%s: intelligent disk copy completed for %s. Used DBN %llu copy done DBN %llu disk size %llu

Parameters

owner (STRING): Owner of the raid group.

rg (STRING): Name of the raid group object that is completed intelligent disk copy.
disk (STRING): Name of the disk object for which intelligent reconstruction completed.
used_dbn (LONGINT): Maximum used Disk block number.
copy_done_dbn (LONGINT): Disk block number when intelligent disk copy was done.
disk_size (LONGINT): Filesystem size of the disk.

raid.rg.intl.recons.done

Severity

NOTICE

Description

This message occurs when intelligent reconstruction has been completed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: intelligent reconstruction completed for %s. Used DBN %llu reconstruction done DBN %llu disk size %llu

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is completed intelligent reconstruction.
disk (STRING): Name of the disk object for which intelligent reconstruction completed.
used_dbn (LONGINT): Maximum used Disk block number.
recons_done_dbn (LONGINT): Disk block number when intelligent reconstruction was done.
disk_size (LONGINT): Filesystem size of the disk.

raid.rg.lw.prot.disabled

Severity

NOTICE

Description

This message occurs when the lost-write protection for RAID I/O is disabled on the RAID group.

Corrective Action

(None).

Syslog Message

%s%s: group lost-write protection for RAID I/O is now disabled (%s)

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group on which lost-write protection is disabled.
reason (STRING): A character string indicating the reason for disabling the lost-write protection for RAID I/O.

raid.rg.media_scrub.cksum_blk.err.bypass

Severity

NOTICE

Description

For a zoned checksum aggregate this event is issued when background media scrub bypasses a media error on a checksum block.

Corrective Action

(None).

Syslog Message

Media error on checksum block bypassed for %s%s, block #%llu

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.media_scrub.done

Severity

NOTICE

Description

This event is issued when media scrub has completed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: media scrub completed in %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that has completed media scrub
duration (STRING): The amount of time the media scrub required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.media_scrub.media.err

Severity

NOTICE

Description

This event is issued when a media_scrub i/o detects a medium error

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu during media_scrub

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): The name of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.media_scrub.media.errs

Severity

NOTICE

Description

This message occurs when background media scrubbing detects a multi-disk media error on a stripe. Data ONTAP® will take appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Multiple checksum block read error on %s%s for blocks [#%llu - #%llu] during media_scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group object that contains the multi-disk media error.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.

raid.rg.media_scrub.media.recommend.reassign.err

Severity

NOTICE

Description

This event is issued when a background media scrub i/o detects a recommend reassign error

Corrective Action

(None).

Syslog Message

Block recommended for reassignment on %s%s, block #%llu during media_scrub

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.media_scrub.resume

Severity

NOTICE

Description

This event is issued when media_scrub resumes on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: resuming media scrub at stripe %llu (%d%% complete)

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is resuming media_scrub
stripe (LONGINT): resuming at stripe.
percentage (INT): (None).
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.media_scrub.rewrite.chunk

Severity

INFORMATIONAL

Description

This message occurs when background media scrub rewrites a chunk of blocks for ATA drives.

Corrective Action

(None).

Syslog Message

media_scrub rewriting chunk on %s%s, start block #%llu, count #%u.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM , and carrier serial number.
blockNum (LONGINT): Physical block number at which the chunk starts.
count (INT): Number of blocks being rewritten.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.media_scrub.start

Severity

NOTICE

Description

This event is issued when media_scrub has been initiated on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: start media scrub

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is initiating media_scrub
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.media_scrub.stopped

Severity

NOTICE

Description

This event is issued when media scrub is stopped on specified raid group.

Corrective Action

(None).

Syslog Message

%s%s: media scrub stopped at stripe %llu after %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object for which media scrub was stopped
stripe (LONGINT): stopped at stripe.
duration (STRING): The amount of time the media scrub has taken.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.media_scrub.summary.media

Severity

NOTICE

Description

This event is generated as a summary report for errors found during a media scrub.

Corrective Action

(None).

Syslog Message

(None).

Parameters

errors (INT): The total number of media errors found
rg (STRING): The name of the raid group
current (STRING): The current status

raid.rg.media_scrub.suspended

Severity

NOTICE

Description

This event is issued when media scrub is suspended on specified raid group.

Corrective Action

(None).

Syslog Message

%s%s: media scrub suspended at stripe %llu after %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object for which media scrub is suspended
stripe (LONGINT): suspended at stripe.
duration (STRING): The amount of time the media scrub has taken.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.mirrorreaderr.fatal

Severity

NOTICE

Description

This message occurs when the RAID mirror read error handling encounters an I/O error on the RAID group in the source plex. This is ultimately fatal error to the aggregate. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s: RAID mirror read error handling experienced fatal multi-disk error; failing RAID group.

Parameters

rg (STRING): Name of the RAIDgroup that failed.

raid.rg.mirrorreaderr.nonfatal

Severity

NOTICE

Description

This message occurs when the RAID mirror read error handling encounters an I/O error on a RAID group during a scrub, or lost write recovery operation. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s: RAID mirror read error handling experienced multi-disk error; continuing.

Parameters

rg (STRING): Name of the RAID group that has a double error.

raid.rg.normal

Severity

NOTICE

Description

This message occurs when a RAID group returns to normal after it was in one of the degraded states, after a resynchronization, or after it was in failed state.

Corrective Action

(None).

Syslog Message

%s: raid group %s is in normal state.

Parameters

owner (STRING): Owner of the raid group.
name (STRING): Relative path name of the raid group.
aggr_UUID (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.readerr.bad.file.block

Severity

EMERGENCY

Description

This message occurs when a reconstructed file block is found out to be marked bad because it could not be recovered correctly earlier.

Corrective Action

Contact NetApp technical support.

Syslog Message

Reading bad block on %s %s%s, %s inode number %d, snapid %d, file block %llu, level %d.

Parameters

vol_type (STRING): String indicating whether the file is contained in a flexible volume or aggregate.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the volume or aggregate
ino_type (STRING): The inode type
fileid (INT): File identifier
snapid (INT): Snapshot identifier
fileBlockNum (LONGINT): Block number in the file
level (INT): Inode indirect pointer level

raid.rg.readerr.block.fail

Severity

ERROR

Description

This event is issued when a missing block could not be properly recovered because a read error that was detected on another disk in the group was bypassed.

Corrective Action

Ensure wafliron successfully completes. Wafliron will preserve the filesystem consistency.

Syslog Message

Block #%llu cannot be properly recovered on %s%s

Parameters

blockNum (LONGINT): The physical block number that could not be recovered
owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk to which the block belongs
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.recalc

Severity

NOTICE

Description

This event is issued when a previously detected bad block is recalculated.

Corrective Action

(None).

Syslog Message

Recalculated bad block on %s%s, block #%llu

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): The name of the disk
blockNum (LONGINT): The disk block number
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.recommend.failure

Severity

ERROR

Description

This message occurs when a detected bad block is repeatly recalculated and written back to disk.

Corrective Action

Wait for the event message raid.disk.unload.done or raid.carrier.remove to be issued and then replace the carrier containing the failed disk. If the disk is contained in a single-disk carrier, raid.disk.unload.done will be issued immediately. Otherwise, wait for raid.carrier.remove which indicates the carrier has been fully prepared for removal.

Syslog Message

Disk failure due to repeated read errors on %s%s, block #%llu

Parameters

owner (STRING): String indicating the owner of the affected volume.
disk_info (STRING): The name of the disk.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.cksum.computed

Severity

NOTICE

Description

This message occurs when a previously detected bad block is repaired and the checksum of that recalculated block matches the computed checksum.

Corrective Action

(None).

Syslog Message

Recalc %s%s, block #%llu matches computed checksum

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk
blockNum (LONGINT): The disk block number

shelf (STRING): Shelf identifier where the disk is located

bay (STRING): Disk bay within the shelf where disk is located

vendor (STRING): Name of the vendor of the disk

model (STRING): Model string of the disk drive

firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.cksum.error

Severity

NOTICE

Description

This message occurs when a previously detected bad block is repaired and the checksum of that recalculated block does not match the stored and computed checksums.

Corrective Action

(None).

Syslog Message

Data recalculated from parity on %s%s; block #%llu does not match the stored and computed checksums.

Parameters

owner (STRING): String indicating the owner of the affected aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier ID.

blockNum (LONGINT): Disk block number.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the disk vendor.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.cksum.stored

Severity

NOTICE

Description

This message occurs when a previously detected bad block is repaired and the checksum of that recalculated block matches the stored checksum.

Corrective Action

(None).

Syslog Message

Recalc %s%s, block #%llu matches stored checksum

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk
blockNum (LONGINT): The disk block number
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.data

Severity

NOTICE

Description

This message occurs when fixing a single-disk media or checksum error on a data disk.

Corrective Action

(None).

Syslog Message

Fixing bad data on %s%s, disk block (DBN) %llu, aggregate block (VBN) %llu.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number containing the block being rewritten.
blockNum (LONGINT): Disk block number.
vbn (LONGINT): Volume block number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is

located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.data.dirty

Severity

NOTICE

Description

This message occurs when fixing a single-disk media or checksum error on a data block that belongs to a dirty parity region.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number containing the block being rewritten.
blockNum (LONGINT): Disk block number.
vbn (LONGINT): Volume block number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.filebno

Severity

NOTICE

Description

This event is issued when a previously detected bad block is repaired.

Corrective Action

(None).

Syslog Message

%s %s%s, %s inode number %d, snapid %d, treeid %d, uid %u, gid %u, file block %llu level %d

Parameters

vol_type (STRING): Whether this error occurred in an aggregate, or a flexible volume.
owner (STRING): Owner of the affected volume or aggregate.

vol (STRING): The name of the volume or aggregate
ino_type (STRING): The inode type
fileid (INT): The file identifier
snapid (INT): The snapshot identifier
treeid (INT): The qtree identifier
uid (INT): The user id that owns the file
gid (INT): The group id that owns the file
bno (LONGINT): The block number in the file
level (INT): The level of the block within the file

raid.rg.readerr.repair.parity

Severity

NOTICE

Description

This message occurs when fixing a single-disk media or checksum error on a parity disk.

Corrective Action

(None).

Syslog Message

Fixing bad parity on %s%s, block #%llu

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk containing the block being rewritten.
blockNum (LONGINT): The disk block number
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.repair.parity.dirty

Severity

NOTICE

Description

This message occurs when fixing a single-disk media or checksum error on a parity block that belongs to a dirty parity region.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk containing the block being rewritten.
blockNum (LONGINT): The disk block number
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.readerr.wc.blkErr

Severity

EMERGENCY

Description

This event occurs when a checksum error due to WAFL context mismatch is detected on a reconsructed block. This error indicates data loss and are caused by misbehaving disks.

Corrective Action

Start wafliron on the indicated volume or aggregate.

Syslog Message

Checksum error due to wafl context mismatch on %s %s%s, %s inode number %d, snapid %d, file block %llu, level %d, RBN %llu. Checksum context has FBN %llu, buftreeid %llu, CP count %u, encrypted flag %d, key index %d, PVBN %lld.

Parameters

vol_type (STRING): String indicating whether the file is contained in a flexible volume or aggregate.
owner (STRING): Owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate
ino_type (STRING): The inode type
fileid (INT): File identifier
snapid (INT): Snapshot identifier
fileBlockNum (LONGINT): Block number in the file
level (INT): Inode indirect pointer level
blockNum (LONGINT): RAID Block Number (RBN) of the block
stored_fbn (LONGINT): Stored file block number in the checksum entry.
stored_buftreeid (LONGINT): Stored buftree identifier in the checksum entry.
stored_cpcount (INT): Stored CP count in the checksum entry.
stored_encrypted_flag (INT): Stored encrypted flag in the checksum entry.
stored_key_index (INT): Stored encryption key index in the checksum entry.
pvbn (LONGINT): Physical Volume Block Number (PVBN) of the block

raid.rg.recon.bad.cksum.embd

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during reconstruction while the aggregate is in media error bypass mode. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. The error is ignored.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu during reconstruction while in media error bypass mode.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recon.bad.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during reconstruction while the aggregate is in media error bypass mode. The checksum entry is zeroed, but the corresponding block is not zeroed. The error is ignored.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during reconstruction while in media error bypass mode.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.

blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.aborted

Severity

NOTICE

Description

This message occurs when reconstruction has been aborted on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction aborted at disk block %llu after %s

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is aborted reconstruction.
blockNum (LONGINT): The physical block number reconstruction stopped
duration (STRING): The amount of time the reconstruction required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.recons.bad.cksum

Severity

NOTICE

Description

This event is issued when reconstruction detects a bad checksum on the stripe while the aggregate is in media error bypass mode.

Corrective Action

(None).

Syslog Message

Checksum mismatch on %s%s, block #%llu during reconstruction; assuming data is correct and fixing checksum

Parameters

>**owner** (STRING): Owner of the aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.bad.cksum.blk

Severity

>NOTICE

Description

>This message occurs when reconstruction corrects a checksum block media error in an advanced_zoned checksums (azcs) RAID group on a stripe while in media error bypass mode. Data ONTAP® takes appropriate recovery actions. Other events describe those actions.

Corrective Action

>(None).

Syslog Message

>Checksum block read error on %s%s for blocks [#%llu - #%llu] during reconstruction; assuming data is correct and fixing checksum.

Parameters

>**owner** (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information about the disk object that contains the error.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.
shelf (STRING): Disk Shelf identifier for the shelf on which the disk drive is located.
bay (STRING): Disk bay within the disk shelf on which the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.bad.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during reconstruction while the aggregate is in media error bypass mode. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. The error is ignored.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during reconstruction while in media error bypass mode.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Disk Shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.block.fail

Severity

ERROR

Description

A block on the reconstructing disk can not be reconstructed because of a media error on another disk in the group. The block is zeroed and written to disk. If the block is allocated, data in that block is corrupted.

Corrective Action

Ensure wafliron successfully completes after this reconstruction is finished. Wafliron will preserve the filesystem consistency.

Syslog Message

Block #%llu can not be properly reconstructed on %s%s - the block will be zeroed

Parameters

blockNum (LONGINT): The physical block number that could not be reconstructed
owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk being reconstructed
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.cantStart

Severity

ERROR

Description

This event is issued when a RAID group is missing a disk but the reconstruction cannot be started.

Corrective Action

Usually, an appropriate spare disk should be installed. Sometimes, the quoted reason and presence of the appropriate spare disks can indicate a different problem.

Syslog Message

The reconstruction cannot start in RAID group %s%s: %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group
reason (STRING): The reason the reconstruction cannot start

raid.rg.recons.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during the RAID reconstruction process. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry. This indicates that the block is read from the wrong location. Data ONTAP® takes appropriate recovery actions, as described in other logged events.

Corrective Action

(None).

Syslog Message

There was a block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during reconstruction.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier ID.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during the RAID reconstruction process. The embedded checksum computed over the checksum entry does not match the stored embedded checksum in the checksum entry, indicating the corruption of the checksum entry. Data ONTAP® takes appropriate recovery actions, as described in other logged events.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during reconstruction.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier ID, and site.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.cksum.err

Severity

NOTICE

Description

This message occurs when the system detects a checksum error on the stripe during a RAID reconstruction operation. The checksum computed is not the same as the stored checksum. Data ONTAP® takes appropriate recovery actions, as described in additional logged events

Corrective Action

(None).

Syslog Message

Checksum error on %s%s, block #%llu during reconstruction.

Parameters

owner (STRING): Owner of the affected aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier ID, and site.

blockNum (LONGINT): Physical block number containing the error.

shelf (STRING): Shelf identifier where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.cksum.rderr

Severity

NOTICE

Description

This message occurs when the system detects a checksum block media error in an advanced_zoned checksum's (AZCS) RAID group during RAID reconstruction. Data ONTAP® takes appropriate recovery actions, as descibed in other logged events.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during reconstruction.

Parameters

owner (STRING): Owner of the disk.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier ID.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during the RAID reconstruction process. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® takes appropriate recovery actions, as described in other logged events.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during reconstruction.

Parameters

owner (STRING): Owner of the disk.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier ID.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.deferred

Severity

NOTICE

Description

This event is issued when the a raid group reconstruction has been deferred due to inadequate incore resources.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction deferred (%s)

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is unable to reconstruct
reason (STRING): A text reason code

raid.rg.recons.deferred.ok

Severity

NOTICE

Description

A previously deferred reconstruction is now ready to proceed.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction previously deferred, now proceeding

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is now able to reconstruct

raid.rg.recons.disabled

Severity

ERROR

Description

This message occurs when a RAID group needs to start reconstruction, but reconstruction is disabled for the RAID group.

Corrective Action

Run the 'aggr recons enable' command for the RAID group.

Syslog Message

Reconstruction needs to be performed on RAID group %s%s, but reconstruction is disabled.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): RAID group name.

raid.rg.recons.done

Severity

NOTICE

Description

This message occurs when reconstruction has been completed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction for %s completed in %s.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.
owner (STRING): Owner of the raid group.
disk (STRING): Name of the disk object for which reconstruction completed.
duration (STRING): The amount of time the reconstruction required
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.recons.info

Severity

NOTICE

Description

This message occurs when a disk is selected for RAID group reconstruction.

Corrective Action

(None).

Spare disk %s will be used to reconstruct one missing disk in RAID group %s%s.

Parameters

disk (STRING): Name of the spare disk object that will be used for reconstruction.
owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.

raid.rg.recons.media.err.bypass

Severity

ERROR

Description

This event is issued when reconstruction detects a read error but the error is bypassed. The block with read error is then zeroed and written to disk.

Corrective Action

Ensure wafliron successfully completes. Wafliron will preserve the filesystem consistency.

Syslog Message

Media error bypass enabled, zeroing block %llu of Disk %s%s

Parameters

blockNum (LONGINT): The physical block number that hit the read error
owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk that hit the read error
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.recons.mismatch

Severity

ERROR

Description

There was no available disk for reconstruction matching all parameters of an ideal replacement in the RAID group. Data ONTAP selected a disk with different interface speed or rpm, or from the opposite spare pool in a sync-mirror configuration.

Corrective Action

Wait for reconstruction to complete. Install an appropriate spare disk. Fail the mismatched disk using 'disk fail'. It will be copied to the new spare disk. After copying is done, use 'disk unfail' to unfail the mismatched

disk and convert it to a spare.

Syslog Message

%s%s: matching disk not available for reconstruction; using disk %s %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group
disk (STRING): The name of the disk used for reconstruction
detail (STRING): Description of disk mismatch; one or more of: from the opposite spare pool, with different rpm.

raid.rg.recons.missing

Severity

NOTICE

Description

Information about disks missing from the RAID group.

Corrective Action

(None).

Syslog Message

RAID group %s%s is missing %d disk(s).

Parameters

owner (STRING): The owner of the RAID group
rg (STRING): The name of the RAID group
missing (INT): Number of disks missing (1 or 2)

raid.rg.recons.multidisk

Severity

NOTICE

Description

This event is issued when the reconstruction encounters an unrecoverable I/O error. We try to avoid panic in this case.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction encountered a multi-disk error

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the reconstructing raid group object.

raid.rg.recons.multidisk.bypass

Severity

NOTICE

Description

Reconstruction can proceed and it will ignore media errors until completion.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction will bypass media errors

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the reconstructing raid group object.

raid.rg.recons.multidisk.fail

Severity

ALERT

Description

The recovery procedure for a media error during reconstruction has failed. The filer will panic to allow recovery after reboot. After reboot, the affected volume will be restricted and marked wafl inconsistent.

Corrective Action

Start wafliron to bring the affected volume online.

Syslog Message

%s%s: failed to recover from a multi-disk error

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the reconstructing raid group object.

raid.rg.recons.resume

Severity

NOTICE

Description

This message occurs when reconstruction has been resumed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: resuming reconstruction, using disk %s (disk block %llu, %d%% complete)

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is initiating reconstruction.
disk (STRING): Name of the disk object that is the reconstruction target.
blockNum (LONGINT): The physical block number on which reconstruction is resuming.
percent (INT): The percentage of reconstruction already complete.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.recons.start

Severity

NOTICE

Description

This message occurs when reconstruction has been initiated on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: starting reconstruction, using disk %s, disk block %llu.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, carrier serial number, and site.
owner (STRING): Owner of the raid group.
disk (STRING): Name of the disk object that is the reconstruction target
startBlockNum (LONGINT): The physical block number on which reconstruction is starting.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.recons.suspended

Severity

NOTICE

Description

This message occurs when reconstruction is suspended on a specific RAID group that is yielding to higher priority reconstruction.

Corrective Action

(None).

Syslog Message

%s%s: reconstruction suspended at disk block %llu after %s, yielding to higher priority reconstruction

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group object that suspended reconstruction.
blockNum (LONGINT): Physical disk block number where reconstruction stopped.
duration (STRING): Amount of time spent on reconstruction before it was suspended.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.recons.throttle

Severity

NOTICE

Description

This event is issued when we start throttling the number of messages that reconstruction generates due to an overwhelming number of messages that are being generated.

Corrective Action

(None).

Syslog Message

Too many bad checksum messages; will emit message once every %d seconds, dropping others.

Parameters

interval (INT): The interval at which we will generate messages

raid.rg.reparity.aborted

Severity

NOTICE

Description

This event is issued when parity recomputation has been aborted on a specific raid group.

Corrective Action

(None).

Syslog Message

%s: parity recomputation aborted after %s

Parameters

rg (STRING): The name of the raid group object that is completed parity recomputation
duration (STRING): The amount of time the reparity ran

raid.rg.reparity.bad.cksum

Severity

NOTICE

Description

This message occurs when the computed checksum of a block does not match the stored checksum during a reparity operation.

Corrective Action

(None).

Syslog Message

Checksum mismatch on %s%s, block #%llu during parity recomputation; data is assumed to be correct and fixing checksum.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM , and carrier serial number.
blockNum (LONGINT): Physical block number containing the error.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during parity recomputation. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during parity recomputation.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Disk Shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during parity recomputation. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during parity recomputation.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.cksum.rderr

Severity

NOTICE

Description

This message occurs when parity recomputation detects a checksum block media error in an advanced_zoned checksum's (azcs) RAID group. Data ONTAP® takes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during parity recomputation.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information about the disk object that contains the error.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.
shelf (STRING): Disk shelf identifier for the disk shelf on which the disk drive is located.
bay (STRING): Disk bay within the disk shelf on which the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during parity recomputation. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during parity recomputation.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Formatted information of the disk object that contains the error.

blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk Shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.deferred

Severity

NOTICE

Description

This event is issued when the a raid group reparity has been deferred due to inadequate incore resources.

Corrective Action

(None).

Syslog Message

%s: parity recomputation deferred (%s)

Parameters

rg (STRING): The name of the raid group object that is unable to reparity
reason (STRING): A text reason code

raid.rg.reparity.deferred.ok

Severity

INFORMATIONAL

Description

This message occurs when a previously deferred reparity operation is now ready to proceed because of availability of incore resources.

Corrective Action

(None).

Syslog Message

%s: parity recomputation previously deferred is now proceeding

Parameters

rg (STRING): Name of the RAID group object that can proceed with reparity operation.

raid.rg.reparity.done

Severity

NOTICE

Description

This event is issued when parity recomputation has been completed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s: parity recomputation completed in %s

Parameters

rg (STRING): The name of the raid group object that is completed parity recomputation
duration (STRING): The amount of time the reparity required

raid.rg.reparity.media.err

Severity

NOTICE

Description

This event is issued when reparity i/o detects a medium error

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu during parity recomputation

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.reparity.rewrite

Severity

NOTICE

Description

This event is issued when we rewrite parity on a stripe.

Corrective Action

(None).

Syslog Message

Rewriting parity on RAID group %s, stripe #%llu.

Parameters

rg (STRING): The name of the RAID group
stripe (LONGINT): The stripe number

raid.rg.reparity.start

Severity

NOTICE

Description

This event is issued when parity recomputation has been initiated on a specific raid group.

Corrective Action

(None).

Syslog Message

%s: starting parity recomputation

Parameters

rg (STRING): The name of the raid group object that is initiating parity recomputation

raid.rg.reparity.throttle

Severity

NOTICE

Description

This event is issued when we start throttling the number of messages that reparity generates due to an overwhelming number of messages that are being generated.

Corrective Action

(None).

Syslog Message

Too many parity/bad checksum messages; will emit message once every %d seconds, dropping others.

Parameters

interval (INT): The interval at which we will generate messages

raid.rg.resync.aborted

Severity

> NOTICE

Description

> This event is issued when resynchronization has been aborted on a specific raid group.

Corrective Action

> (None).

Syslog Message

> %s%s: resynchronization aborted after %s

Parameters

> **owner** (STRING): The owner of the raid group
> **rg** (STRING): The name of the raid group object that is aborting resynchronization
> **duration** (STRING): The amount of time the resynchronization ran
> **aggregate_uuid** (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.resync.done

Severity

> NOTICE

Description

> This event is issued when resynchronization has been completed on a specific raid group.

Corrective Action

> (None).

Syslog Message

> %s%s: resynchronization completed in %s

Parameters

> **owner** (STRING): The owner of the raid group
> **rg** (STRING): The name of the raid group object that is initiating resynchronization
> **duration** (STRING): The amount of time the resynchronization required
> **aggregate_uuid** (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.resync.info

Severity

> NOTICE

Description

> This message occurs periodically at the end of RAID group resynchronization, providing information such as the number of reads and writes issued, and number of blocks copied.

Corrective Action

> (None).

Syslog Message

"%s": number of reads:"%llu" number of writes:"%llu" number of parity blocks read:"%llu" number of blocks copied:"%llu" at throughput rate: %d MB/s.

Parameters

rg (STRING): RAID group in the destination plex.
nreadio (LONGINT): Number of disk reads issued.
nwriteio (LONGINT): Number of tetris writes issued.
nparity_blocks_read (LONGINT): Number of parity blocks read.
nblocks_copied (LONGINT): Number of blocks copied.
throughput (INT): Current throughput rate.

raid.rg.resync.snap.list

Severity

INFORMATIONAL

Description

This message occurs at the beginning and at the end of a resynchronization and it lists a bitmap of snapshots involved in the resynchronization.

Corrective Action

(None).

Syslog Message

%s %s%s: resync snapshots %x %x %x %x %x %x %x %x

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
rg (STRING): RAID group in the resynchronizing plex.
snapmap7 (INT): Bitmap for snapshots 255-224.
snapmap6 (INT): Bitmap for snapshots 223-192.
snapmap5 (INT): Bitmap for snapshots 191-160.
snapmap4 (INT): Bitmap for snapshots 159-128.
snapmap3 (INT): Bitmap for snapshots 127-96.
snapmap2 (INT): Bitmap for snapshots 95-64.
snapmap1 (INT): Bitmap for snapshots 63-32.
snapmap0 (INT): Bitmap for snapshots 31-0.

raid.rg.resync.start

Severity

NOTICE

Description

This event is issued when resynchronization has been initiated on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: start resynchronization (level %d)

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is initiating resynchronization
level (INT): (None).
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.sameCarrier

Severity

NOTICE

Description

This message occurs when the disks selected during aggregate creation and mirroring, disk addition, disk replacement, or reconstruction results in two disks from the same disk carrier being part of a single RAID group. The carrier should not be removed; otherwise the RAID group is doubly degraded, which significantly reduces performance. This situation also increases the chance of data loss. Data loss could occur because of either the user forcing the command to make such a disk selection, or Data ONTAP® could not find more suitable disks. This event is generated for every pair of disks residing in a disk carrier that would become part of a single RAID group. Data ONTAP makes appropriate recovery actions. One or more disk copies are performed to correct the problem.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk1 (STRING): Name of the first disk in the disk carrier.
disk2 (STRING): Name of the second disk in the disk carrier.
owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

raid.rg.scrub.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during RAID parity scrub. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry, indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during RAID parity scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during RAID parity scrub. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during RAID parity scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk Shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is

located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.cksum.err

Severity

NOTICE

Description

This event is issued when scrubbing detects a single-disk checksum error on a stripe.

Corrective Action

(None).

Syslog Message

Checksum error on %s%s, block #%llu during scrub

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.cksum.rderr

Severity

NOTICE

Description

This message occurs when background scrub detects a single-disk checksum block media error in an advanced_zoned checksum's (azcs) RAID group. Data ONTAP® takes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): First physical disk block number containing the error.

LblockNum (LONGINT): Last physical disk block number containing the error.
shelf (STRING): Disk shelf identifier for the disk shelf on which the disk drive is located.
bay (STRING): Disk bay within the disk shelf on which the disk drive is located.
vendor (STRING): Name of the vendor of the disk drive.
model (STRING): Model of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during RAID parity scrub. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during RAID parity scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Disk Shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.context.valid

Severity

NOTICE

Description

This message occurs when scrubbing is completed on a specific RAID group and its context now has parity protection.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group object that completed the scrub.
vol_context (STRING): Status of context parity protection of the aggregate.

raid.rg.scrub.cxt.restart

Severity

NOTICE

Description

This message occurs when a suspended regular scrub is restarting as a context scrub from the beginning instead of resuming regular scrub at the last suspended point. It can happen when a RAID group requires parity updating for context parity protection.

Corrective Action

(None).

Syslog Message

%s%s: restarting suspended scrub for WAFL context parity protection.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.

raid.rg.scrub.deferred

Severity

NOTICE

Description

This event is issued when the a raid group scrub has been deferred due to inadequate incore resources.

Corrective Action

(None).

Syslog Message

%s%s: scrub deferred (%s)

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is unable to scrub
reason (STRING): A text reason code

raid.rg.scrub.deferred.ok

Severity

NOTICE

Description

A previously deferred scrub is now ready to proceed.

Corrective Action

(None).

Syslog Message

%s%s: scrub previously deferred, now proceeding

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is now able to scrub

raid.rg.scrub.done

Severity

NOTICE

Description

This event is issued when scrubbing has been completed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: scrub completed in %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is completed scrub
duration (STRING): The amount of time the scrubbing required
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.scrub.lw.aborted

Severity

NOTICE

Description

This message occurs when the system aborts a special type of RAID scrub because it detected an inconsistent RAID write signature on the specified RAID group. The RAID scrub is required before lost-write protection for RAID I/O can be used on the RAID group.

Corrective Action

(None).

%s%s stripe #%llu: scrub needed to enable lost-write protection for RAID I/O aborted after %s.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group object for which the lost-write scrub was aborted.
stripe (LONGINT): RAID stripe on which the inconsistent write signature was detected.
duration (STRING): Amount of time the lost-write scrub has taken.

raid.rg.scrub.lw.restart

Severity

NOTICE

Description

This message occurs when a suspended regular scrub is restarting from the beginning to allow lost-write protection for RAID I/O instead of resuming regular scrub at the last suspended point. This happens when lost-write protection for RAID I/O is enabled on this RAID group while a regular scrub is suspended.

Corrective Action

(None).

Syslog Message

%s%s: restarting suspended scrub to enable lost-write protection for RAID I/O.

Parameters

owner (STRING): Owner of the RAID group.
rg (STRING): Name of the RAID group.

raid.rg.scrub.media.err

Severity

NOTICE

Description

This message occurs when scrub I/O detects a medium error on a disk that is also called as an unrecoverable access error. This error is fixed immediately by reconstructing blocks from parity data.

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu, during scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Name of the disk object that contains the error.
blockNum (LONGINT): Physical block number containing the error.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.media.err.bypass

Severity
INFORMATIONAL

Description
This event is issued when a read error is detected but ignored due to the presence of media bypass (ignore double errors).

Corrective Action
(None).

Syslog Message
Media error bypass enabled, zeroing disk block %llu of %s%s

Parameters
blockNum (LONGINT): The physical block number containing the error.
owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.media.errs

Severity
NOTICE

Description
This event is issued when scrubbing detects a multi-disk media error on a stripe.

Corrective Action
(None).

Syslog Message

Multiple bad blocks on %s%s, block #%llu during scrub

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): The name of the raid group object that contains the multi-disk error.
blockNum (LONGINT): The physical block number containing the error.

raid.rg.scrub.media.recommend.reassign.err

Severity

NOTICE

Description

This event is issued when scrub i/o detects a recommend reassign error

Corrective Action

(None).

Syslog Message

Block recommended for reassignment on %s%s, block #%llu during scrub

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.pi

Severity

NOTICE

Description

This message occurs when RAID scrub finds an inconsistent parity stripe. Data ONTAP® makes appropriate recovery actions, as described in other logged events.

Corrective Action

(None).

Syslog Message

Inconsistent parity on RAID group %s, stripe #%llu.

Parameters

rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.rg.scrub.resume

Severity

NOTICE

Description

This event is issued when scrubbing has been resumed on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: resuming scrub at stripe %llu (%d%% complete)

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is resuming scrubbing
stripe (LONGINT): resuming at stripe.
percentage (INT): (None).
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.scrub.rewrite.data

Severity

NOTICE

Description

This message occurs when scrub fixes a parity inconsistency error.

Corrective Action

(None).

Syslog Message

Scrub fixing bad data on disk %s%s, block #%llu.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk drive containing the block being rewritten.
blockNum (LONGINT): Disk block number.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.rewrite.parity

Severity

NOTICE

Description

This message occurs when scrub fixes a parity inconsistency error.

Corrective Action

(None).

Syslog Message

Scrub fixing bad parity on disk %s%s, block #%llu.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk drive containing the block being rewritten.
blockNum (LONGINT): Disk block number.
shelf (STRING): Disk shelf identifier where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where disk drive is located.
vendor (STRING): Name of the vendor of the disk drive.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.rg.scrub.start

Severity

NOTICE

Description

This event is issued when scrubbing has been initiated on a specific raid group.

Corrective Action

(None).

Syslog Message

%s%s: starting scrub

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is initiating scrubbing
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.scrub.start.zone

Severity

NOTICE

Description

This event is issued when scrubbing has been initiated on a specific raid group for a specific range.

Corrective Action

(None).

Syslog Message

%s%s: starting scrub at range [%llu - %llu]

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that is initiating scrubbing
begin (LONGINT): starting at stripe.
end (LONGINT): ending at stripe.

raid.rg.scrub.stopped

Severity

NOTICE

Description

This event is issued when scrub is stopped on specified raid group.

Corrective Action

(None).

Syslog Message

%s%s: scrub stopped at stripe %llu after %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that the scrub is stopped
stripe (LONGINT): stopped at stripe.
duration (STRING): The amount of time the scrub has taken.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.scrub.summary.cksum

Severity

NOTICE

Description

This event is generated as a summary report for checksum errors found during a scrub.

Corrective Action

(None).

Syslog Message

Scrub found %d checksum error%s in %s%s

Parameters

errors (INT): The total number of checksum errors found
suffix (STRING): The suffix used to report in syslog
rg (STRING): The name of the raid group
current (STRING): The current status

raid.rg.scrub.summary.lw

Severity

NOTICE

Description

This message occurs as a summary report for lost-write errors found during a scrub.

Corrective Action

(None).

Syslog Message

Scrub found %d RAID write signature inconsistenc%s in %s%s

Parameters

errors (INT): Total number of RAID write signature inconsistencies found.
suffix (STRING): Suffix used to report in syslog.
rg (STRING): Name of the RAID group.
current (STRING): Current status.

raid.rg.scrub.summary.media

Severity

NOTICE

Description

This event is generated as a summary report for media errors found during a scrub.

Corrective Action

(None).

Syslog Message

Scrub found %d media error%s in %s%s

Parameters

errors (INT): The total number of media errors found
suffix (STRING): The suffix used to report in syslog
rg (STRING): The name of the raid group
current (STRING): The current status

raid.rg.scrub.summary.pi

Severity

NOTICE

Description

This event is generated as a summary report for parity inconsistencies found during a scrub.

Corrective Action

(None).

Syslog Message

Scrub found %d parity inconsistenc%s in %s%s

Parameters

pis (INT): The total number of parity inconsistencies found
suffix (STRING): The suffix used to report in syslog
rg (STRING): The name of the raid group
current (STRING): The current status

raid.rg.scrub.suspended

Severity

NOTICE

Description

This event is issued when scrub is suspended on specified raid group.

Corrective Action

(None).

Syslog Message

%s%s: scrub suspended at stripe %llu after %s

Parameters

owner (STRING): The owner of the raid group
rg (STRING): The name of the raid group object that the scrub is suspended
stripe (LONGINT): suspended at stripe.
duration (STRING): The amount of time the scrub has taken.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.rg.spares.low

Severity

ERROR

Description

This message occurs when the number of available spares for a RAID group drops below the value specified in raid.min_spare_count. If a RAID reconstruct operation is required (for example, due to a future disk failure), the system might enter a degraded mode.

Corrective Action

Assign unowned disks to this system. If there are no unowned disks, physically add more spare disks and assign them to this system.

Syslog Message

%s

Parameters

msg (STRING): Name of the RAID group.

raid.rg.trecons

Severity

NOTICE

Description

This message occurs when triple reconstruction is initiated after the failure of three disks in RAID-TEC raid group.

Corrective Action

(None).

Syslog Message

%s%s: starting triple reconstruction, using disks %s and %s and %s

Parameters

owner (STRING): Owner of the raid group.
rg (STRING): Name of the raid group object that is initiating triple reconstruction.
disk (STRING): Name of the disk object that is the first reconstruction target.
disk1 (STRING): Name of the disk object that is the second reconstruction target.
disk2 (STRING): Name of the disk object that is the third reconstruction target.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.root events

raid.root.unmirrored

Severity

ALERT

Description

This message occurs when the root volume is not mirrored in a MetroCluster(tm) configuration.

Corrective Action

Mirror the root volume if this storage controller is part of a MetroCluster configuration by using the "storage aggregate mirror" command.

Syslog Message

The root volume is not mirrored. A takeover/switchover of this storage controller might not be possible if a disaster occurs.

Parameters

(None).

raid.root.vol.noFaultIsolation

Severity

ALERT

Description

This message occurs when creation of the initial root aggregate is forced to use disks that would be from both Pool0 and Pool1 if it was to be upgraded to a mirrored root.

Corrective Action

a) Determine how this occurred: possible cause is a wiring problem. b) Based on the information you gather, determine how to correct the issue. For example, use the "storage disk replace" command to copy the disk belonging to the wrong pool to a disk belonging to the right pool. For MetroCluster configurations, this would mean using "storage disk replace" to copy any pool1 disk in the root to a pool0 disk. c) If you need assistance, contact NetApp technical support.

Syslog Message

Root volume %s%s: Current plex will have disks from mixed pools if the root volume is upgraded to mirror.

Parameters

owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.scrub events

raid.scrub.failed.to.schedule

Severity

NOTICE

Description

This message occurs when scrub cannot be scheduled as specified by the "raid.scrub.schedule" option.

Corrective Action

(None).

Syslog Message

Failed to schedule scrub as specified by the "raid.scrub.schedule" option. Default scrub schedule is added.

Parameters

(None).

raid.scrub.lw.id.inconsist

Severity

NOTICE

Description

This message occurs when the system detects an inconsistent RAID write signature on a RAID stripe during a RAID scrub operation. This inconsistent RAID write signature might be due to a write operation not being successfully committed to disk. Data ONTAP® attempts to recover the bad block automatically. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature on RAID group %s%s, stripe #%llu, stripe bitmap %llu, during scrub.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.
more_stripes (LONGINT): Bitmap representing all of the stripes that encountered the lost write error. The bit set in this bitmap gives the stripe number relative to the stripes parameter.

raid.scrub.suspended

Severity

NOTICE

Description

This event is issued if automatic/scheduled scrub is suspended on some raid group because of a group state transition.

Corrective Action

(None).

Syslog Message

Disk scrub suspended.

Parameters

(None).

raid.scrub.suspended.timer

Severity

NOTICE

Description

This event is issued if automatic/scheduled scrub is suspended on some raid group because the allocated time limit was exceeded.

Corrective Action

(None).

Syslog Message

Disk scrub suspended because the scrub time limit %d was exceeded. It will resume at the next weekly/scheduled scrub.

Parameters

duration (INT): Duration (in mins) after which scrub is automatically suspended.

raid.shared events

raid.shared.disk.awaiting.done

Severity

INFORMATIONAL

Description

This message occurs when a node receives an indication from its HA partner node that a shared disk is undergoing a change in state and the partner is waiting for the local node to complete a shared state transition.

Corrective Action

(None).

Syslog Message

Received shared disk awaiting done %s, state %s, substate 0x%lX, partner state %s, partner substate 0x%lX, partner dblade ID %s host type %d add details %s

Parameters

disk_info (STRING): Formatted information of the shared disk.
local_state (STRING): State of the shared disk on the local node.
local_substate (LONGINTHEX): Sub-state of the shared disk on the local node.
partner_state (STRING): State of the shared disk on the partner node.
partner_substate (LONGINTHEX): Sub-state of the shared disk on the partner node.
received_ack (STRING): Dblade ID of node sending await done ack.
host_type (INT): Type of host node sending await done ack.
add_details (STRING): Additional details of the awaiting done event.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is

located. For non-MetroCluster configurations, site is 'Local'.

raid.shared.disk.exchange

Severity

INFORMATIONAL

Description

This message occurs when a node receives an indication from its HA partner node that a shared disk is undergoing a change in state (e.g., disk is failing, going offline, or is getting unfailed). Accompanying EMS messages will indicate if any corrective action is required.

Corrective Action

(None).

Syslog Message

Received shared disk state exchange %s, event %s, state %s, substate 0x%IX, partner state %s, partner substate 0x%IX, failure reason %s, sick reason %s, offline reason %s, online reason %s, partner dblade ID %s, host %d %s

Parameters

disk_info (STRING): Formatted information of the shared disk.
event (STRING): Describes the event which caused the partner to send this state exchange message. If this is a periodic exchange instead of an event triggered exchange, event is NONE.
local_state (STRING): State of the shared disk on the local node.
local_substate (LONGINTHEX): Sub-state of the shared disk on the local node.
partner_state (STRING): State of the shared disk on the partner node.
partner_substate (LONGINTHEX): Sub-state of the shared disk on the partner node.
failure_reason (STRING): Describes the error leading to the partner node failing the shared disk.
sick_reason (STRING): Describes the error leading to the partner node prefailing the shared disk.
offline_reason (STRING): Describes the reason the partner node is offlining the shared disk.
online_reason (STRING): Describes the reason the partner node is onlining the shared disk.
recv_reply (STRING): Describes the dblade ID of a partner node that sent a reply.
host_type (INT): Type of host sending the reply.
add_details (STRING): Additional partner node details of the shared disk state exchange.
timestamp (INT): Timestamp of the last on-disk state change.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.sp events

raid.sp.add.aggr.grow.noDone

Severity

NOTICE

Description

This message occurs when one or more aggregate's capacity is not increased as part of the storage pool add job.

Corrective Action

Use the (privilege: diagnostic) "storage pool add -storage-pool <storage pool name> -auto-grow -aggregates" command to retry the operation. If the condition persists, contact NetApp technical support.

Syslog Message

Could not grow one or more aggregates provisioned from storage pool %s.

Parameters

name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.add.success

Severity

NOTICE

Description

This message occurs when disks are added to the storage pool and all the aggregates provisioned from the storage pool have been grown to take capacity from new disks.

Corrective Action

(None).

Syslog Message

Disks %s added to storage pool %s.

Parameters

disks (STRING): List of disks added to the storage pool.
name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.aggr.add.rollback

Severity

NOTICE

Description

This message occurs when available capacity is reassigned to a storage pool because adding storage pool capacity to an aggregate failed. This can happen if the node owning the aggregate is rebooted while additional storage pool capacity is zeroing. Other events provide additional failure information.

Corrective Action

(None).

Syslog Message

Aggregate add job for aggregate %s successfully rolled back available capacity to storage pool %s.

Parameters

aggr (STRING): Name of the aggregate to which capacity is being added.
name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
aggrUuid (STRING): UUID of the aggregate.
owner (STRING): Owning node of the aggregate.
curUnit (INT): Current available allocation unit.
prevUnit (INT): Allocation unit available before the job started.
jobid (LONGINT): ID of the job.

raid.sp.aggr.add.success

Severity

NOTICE

Description

This message occurs when capacity from a storage pool is added to an aggregate.

Corrective Action

(None).

Syslog Message

Added %d allocation units from storage pool %s to aggregate %s.

Parameters

allocationUnits (INT): Number of allocation units added.
name (STRING): Name of the storage pool.
aggr (STRING): Name of the aggregate to which capacity is added.
uuid (STRING): UUID of the storage pool.
aggrUuid (STRING): UUID of the aggregate.
jobid (LONGINT): ID of the job.

raid.sp.aggr.grow.success

Severity

NOTICE

Description

This message occurs when an aggregate capacity is successfully increased to span all disks belonging to a storage pool.

Corrective Action

(None).

%s added to aggregate %s from storage pool %s.

Parameters

capacity (STRING): Amount of capacity added to the aggregate.
aggr (STRING): Name of the aggregate whose capacity is increased.
name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
aggrUuid (STRING): UUID of the aggregate.
jobid (LONGINT): ID of the job.

raid.sp.create.failure

Severity

ERROR

Description

This message occurs when a storage pool creation operation fails.

Corrective Action

Use the "storage pool delete -storage-pool <storage pool name>" command to delete the partially created storage pool and then retry the create operation. If the condition persists, contact NetApp technical support.

Syslog Message

Storage pool %s was not successfully created. Reason: %s

Parameters

name (STRING): Name of the storage pool.
reason (STRING): Reason for failure.
uuid (STRING): UUID of the storage pool.
nodes (STRING): List of nodes sharing the storage pool.
disks (STRING): List of disks used to create the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.create.success

Severity

NOTICE

Description

This message occurs when a storage pool is created successfully.

Corrective Action

(None).

Syslog Message

Storage pool %s was created.

Parameters

name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.

nodes (STRING): List of nodes sharing the storage pool.
disks (STRING): List of disks used to create the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.delete.success

Severity

NOTICE

Description

This message occurs when a storage pool is deleted successfully.

Corrective Action

(None).

Syslog Message

Storage pool %s deleted.

Parameters

name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.healthy

Severity

NOTICE

Description

This message occurs when Data ONTAP® detects that a storage pool that was unhealthy earlier has become healthy again.

Corrective Action

(None).

Syslog Message

Storage pool %s is now healthy.

Parameters

name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.

raid.sp.reassign.success

Severity

NOTICE

Description

This message occurs when available capacity is reassigned successfully from one node to another node in a storage pool.

Corrective Action

(None).

Syslog Message

Reassigned %d allocation units from node %s to node %s for storage pool %s.

Parameters

allocationUnits (INT): Number of allocation units reassigned.
source (STRING): Node that owns the available capacity to be reassigned.
destination (STRING): Node to which the available capacity is reassigned.
name (STRING): Name of the storage pool.
uuid (STRING): UUID of the storage pool.
jobid (LONGINT): ID of the job.

raid.sp.unhealthy

Severity

NOTICE

Description

This message occurs when Data ONTAP® detects that a storage pool has become unhealthy.

Corrective Action

(None).

Syslog Message

Storage pool %s is unhealthy. Reason: %s

Parameters

name (STRING): Name of the storage pool.
reason (STRING): Reason for the storage pool being unhealthy.
uuid (STRING): UUID of the storage pool.

raid.sp.unlock.failed

Severity

ALERT

Description

This message occurs when the storage pool cannot be unlocked after the storage pool operation has finished.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to unlock the storage pool %s. Reason: %s

Parameters

name (STRING): Name of the storage pool.
reason (STRING): Reason for failure.

uuid (STRING): UUID of the storage pool.
jobid (LONGINT): ID of the job.

raid.sparecore events

raid.sparecore.disk.ownership.change

Severity

NOTICE

Description

This message occurs when a sparecore disk is prepared for ownership change by administrator forcibly.

Corrective Action

(None).

Syslog Message

Ownership of a sparecore disk %s, is being changed by administator forcibly.

Parameters

disk_info (STRING): Formatted information of the disk.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the disk shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares events

raid.spares.media_scrub.media.err

Severity

NOTICE

Description

This event is issued when a media_scrub i/o detects a medium error on a spare disk

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu during media_scrub

Parameters

owner (STRING): String indicating the owner of the affected spare drive.
disk_info (STRING): The name of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares.media_scrub.media.recommend.reassign.err

Severity

NOTICE

Description

This event is issued when a background media scrub i/o detects a recommend reassign error on a spare drive

Corrective Action

(None).

Syslog Message

Block recommended for reassignment on %s%s, block #%llu during media_scrub

Parameters

owner (STRING): String indicating the owner of the affected spare drive.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares.media_scrub.rewrite.chunk

Severity

INFORMATIONAL

Description

This message occurs when background media scrub rewrites a chunk of blocks for a spare ATA drive.

Corrective Action

(None).

Syslog Message

media_scrub rewriting chunk on %s%s, start block #%llu, count #%d.

Parameters

owner (STRING): Owner of the affected spare disk.
disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
blockNum (LONGINT): Physical block number at which the chunk starts.
count (INT): Number of blocks being rewritten.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model name of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares.media_scrub.start

Severity

NOTICE

Description

This event is issued when media_scrub is initiated on a spare drive.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): String indicating the owner of the affected spare drive.
disk_info (STRING): The name of the disk object that contains the error.
blockNum (LONGINT): Disk block number at which media scrub started.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares.media_scrub.stopped

Severity

NOTICE

Description

This event is issued when media_scrub stops on a spare drive.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): String indicating the owner of the affected spare drive.
disk_info (STRING): The name of the disk object that contains the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.spares.media_scrub.suspend

Severity

NOTICE

Description

This event is issued when media_scrub suspends on a spare drive.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): String indicating the owner of the affected spare drive.
disk_info (STRING): The name of the disk object that contains the error.
blockNum (LONGINT): Disk block number at which media scrub suspended

percentage (INT): Percentage scan completed.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.stripe events

raid.stripe.replay.bad.block

Severity

ERROR

Description

This event is issued when we encounter a bad block buffer entry in NVRAM during stripe replay (indicating corrupted NVRAM). Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Bad block buffer entry in NVRAM.

Parameters

(None).

raid.stripe.replay.bad.checksum

Severity

ERROR

Description

This event is issued when we encounter a checksum error in NVRAM during stripe replay (indicating corrupted NVRAM). Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Checksum error in NVRAM.

Parameters

(None).

raid.stripe.replay.bad.key

Severity

ERROR

Description

This event is issued when we cannot find a block buffer using a key during stripe replay (indicating corrupted NVRAM). Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Stripe %llu: cannot find NVRAM slot using key %d in %s %s.

Parameters

stripe (LONGINT): The stripe number.
key (INT): The key used.
vol_type (STRING): Volume type.
vol (STRING): Aggregate name if found, otherwise NOT FOUND.

raid.stripe.replay.bad.stripe

Severity

ERROR

Description

This event is issued when we encounter a bad stripe entry in NVRAM during stripe replay (indicating corrupted NVRAM). Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Bad stripe entry in NVRAM.

Parameters

(None).

raid.stripe.replay.nvgen.mismatch

Severity

NOTICE

Description

This message occcurs when RAID encounters an NVRAM generation mismatch for an aggregate during stripe replay. Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

(None).

Syslog Message

NVRAM generation mismatch for %s %s%s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.stripe.replay.plex.unavailable

Severity

NOTICE

Description

This message occurs when RAID encounters an NVRAM stripe entry for an offline or failed plex during stripe replay. Reparity will start automatically when the plex comes online. At that time, reparity will update parity in stripes involved in recent writes.

Corrective Action

(None).

Syslog Message

Plex %s in %s %s%s is offline or failed.

Parameters

plex (STRING): Name of the plex.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.stripe.replay.pzero.mismatch

Severity

ERROR

Description

This event is issued when the checksum of the parity block (as stored in the stripe slot) does not match the actual checksum of the parity block. This indicates corrupted NVRAM contents. Reparity will start automatically and update parity in stripes involved in recent writes.

Corrective Action

Need to replace NVRAM if observed repeatedly during different boot-ups.

Syslog Message

Parity block checksum mismatch detected in NVRAM for stripe %llu in %s %s.

Parameters

stripe (LONGINT): The stripe number.
vol_type (STRING): Volume type.
vol (STRING): Aggregate name if found, otherwise NOT FOUND.

raid.stripe.replay.rg.failed

Severity

NOTICE

Description

This message occurs when RAID encounters a RAID group failure during stripe RAID replay. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Replay of %s %s%s, plex %s, RAID group %s, stripe %llu failed because of RAID group failure.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
plex (STRING): Name of the plex.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.

raid.stripe.replay.rg.invalid

Severity

NOTICE

Description

This message occurs when RAID encounters an NVRAM stripe entry for a missing RAID group during stripe replay.

Corrective Action

(None).

Syslog Message

Invalid RAID group identifier %d in %s %s%s, plex %s.

Parameters

rgid (INT): Identifier of the RAID group.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
plex (STRING): Name of the plex.

raid.stripe.replay.summary

Severity

INFORMATIONAL

Description

This event is generated when stripe replay is complete.

Corrective Action

(None).

Syslog Message

Replayed %u stripes.

Parameters

nstripes (INT): The number of stripes

raid.stripe.replay.vol.cleanly.shutdown

Severity

NOTICE

Description

This message occurs when RAID encounters an NVRAM stripe entry for a cleanly shutdown aggregate during stripe replay.

Corrective Action

(None).

Syslog Message

%s %s%s was cleanly shut down.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.stripe.replay.volume.missing

Severity

NOTICE

Description

This message occurs when RAID encounters an NVRAM stripe entry for a missing aggregate during stripe replay. Reparity will start automatically when the aggregate appears again. At that time, reparity will update parity in stripes involved in recent writes.

Corrective Action

(None).

Syslog Message

Cannot find aggregate with identifier %s.

Parameters

volId (STRING): Identifier of the aggregate.

raid.stripe.replay.volume.offline

Severity

NOTICE

Description

This message occurs when RAID encounters an NVRAM stripe entry for an offline aggregate during stripe replay. Reparity will start automatically when the aggregate comes online. At that time, reparity will update parity in stripes involved in recent writes.

Corrective Action

(None).

Syslog Message

%s %s %s is not online.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.switchoverfail events

raid.switchoverFail

Severity

ERROR

Description

This message occurs when a MetroCluster(tm) switchover attempt fails because of an error detected during RAID assimilation.

Corrective Action

Contact NetApp technical support.

Syslog Message

Switchover assimilation failed: %s.

Parameters

reason (STRING): Reason for the switchover assimilation failure.

raid.switchovernodisks events

raid.switchoverNoDisks

Severity

INFORMATIONAL

Description

This message occurs when a MetroCluster(tm) switchover finds no disks during RAID assimilation.

Corrective Action

(None).

Syslog Message

MetroCluster switchover assimilation found no disks.

Parameters

(None).

raid.syncmirr events

raid.syncmirr.at.IOrecovery

Severity

ERROR

Description

This message occurs in a SyncMirror® configuration (with SyncMirror aggressive timeout capability), when RAID cannot service earlier timed-out I/O from the other plex.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem aggregate, offline plex, and plex mirror status from the event logs. 2. Determine the reason for attempting to bring the plex offline, such as adapter, controller or multidisk failures. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

Syslog Message

Expect longer I/O service time on plex %s due to error status %s.

Parameters

plex (STRING): Name of the plex.
status (STRING): Status while the plex was brought offline.

raid.syncmirror events

raid.syncmirror.agrsv.to

Severity

ERROR

Description

This message occurs in a SyncMirror® configuration (with SyncMirror aggressive timeout capability), when a disk I/O times out with an error.

Corrective Action

The system will attempt to recover using the other plex. If the error persists, consider replacing the drive or the adapter.

Syslog Message

Disk driver aggressively timed out an I/O to %s%s belonging to a SyncMirror plex %s. RAID will now attempt to bring the plex offline and redrive the I/O from the other plex.

Parameters

owner (STRING): String indicating the owner of the affected disk.
disk_info (STRING): Name of the disk.
plex (STRING): Name of the affected plex.

raid.syncmirror.at.degraded

Severity

ALERT

Description

This message occurs in a SyncMirror® configuration (with SyncMirror aggressive timeout capability), when a mirror goes into degraded state as a result of an offline plex.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem aggregate, the offline plex, and plex mirror status from the event logs. 2. Determine the reason for the offline plex, such as adapter, controller or multidisk failures. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support. 4. Bring the plex online manually after you replace the faulty components.

Syslog Message

%s%s [UUID:%s] is mirrored and %s plex is offline. It is no longer protected by mirroring.

Parameters

owner (STRING): Owner of the aggregate.
aggregate (STRING): Name of the aggregate.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.
plex (STRING): Name of the offline plex.

raid.syncmirror.in.use

Severity

INFORMATIONAL

Description

This message occurs when the SyncMirror® license is currently in use.

Corrective Action

(None).

Syslog Message

(None).

Parameters

nAggrs (INT): Total number of aggregates on the system.
nMirrored (INT): Number of aggregates mirrored.

rootMirrored (STRING): Indicates whether root aggregate is mirrored or not.

raid.syncmirror.plex.online

Severity

NOTICE

Description

This message occurs in a SyncMirror® configuration, when bringing online an offline plex.

Corrective Action

(None).

Syslog Message

The plex %s is now online.

Parameters

plex (STRING): Name of the plex.

raid.tetris events

raid.tetris.cksum.bno

Severity

NOTICE

Description

This message occurs when the system detects a block number mismatch during a write operation. The expected Virtual Block Number (VBN)/Disk Block Number (DBN) is not the same as the stored VBN/DBN from the checksum entry indicating that the block is read from the wrong location. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Block number mismatch on %s%s: stored_dbn = %u, expected_dbn = %llu; stored_vbn = %llu, expected_vbn = %llu during write operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object that contains the error, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.
stored_dbn (INT): Physical disk block number stored in the checksum entry.
expected_dbn (LONGINT): Expected physical disk block number.
stored_vbn (LONGINT): Volume block number stored in the checksum entry.
expected_vbn (LONGINT): Expected volume block number.
shelf (STRING): Identifier of the shelf where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk drive is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.cksum.embed

Severity

NOTICE

Description

This message occurs when the system detects an invalid checksum entry during a write operation. The embedded checksum computed over the checksum entry do not match, indicating the corruption of the checksum entry. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Invalid checksum entry on %s%s, block #%llu, during write operation.

Parameters

owner (STRING): Owner of the affected aggregate.

disk_info (STRING): Information about the disk object that contains the error, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.

blockNum (LONGINT): Physical disk block number containing the error.

shelf (STRING): Identifier of the shelf where the disk drive is located.

bay (STRING): Disk bay within the shelf where the disk drive is located.

vendor (STRING): Name of the disk drive vendor.

model (STRING): Model string of the disk drive.

firmware_revision (STRING): Firmware revision number of the disk drive.

serialno (STRING): Serial number of the disk drive.

disk_type (INT): Type of disk drive.

disk_rpm (STRING): Rotational speed of the disk drive, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk drive is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.cksum.err

Severity

NOTICE

Description

This message occurs when tetris I/O detects a checksum error. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Checksum error on %s%s, block #%llu during stripe write.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object that contains the error, including disk name, path, shelf, bay, serial number, vendor, model, rpm , and carrier serial number.
blockNum (LONGINT): Physical block number containing the error.
shelf (STRING): Identifier of the shelf where the disk drive is located.
bay (STRING): Disk bay within the shelf where the disk drive is located.
vendor (STRING): Name of the vendor of the disk drive.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk drive is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.cksum.rderr

Severity

NOTICE

Description

This message occurs when the system detects a checksum block media error in an advanced_zoned checksum's (AZCS) RAID group during a stripe write operation. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Checksum block read error on %s%s for blocks [#%llu - #%llu] during stripe write.

Parameters

owner (STRING): Owner of the disk drive.
disk_info (STRING): Information about the disk object that contains the error, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.
blockNum (LONGINT): First physical disk block number containing the error.
LblockNum (LONGINT): Last physical disk block number containing the error.
shelf (STRING): Identifier of the shelf where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk drive is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.cksum.zero

Severity

NOTICE

Description

This message occurs when the system detects an empty checksum entry during a write operation. The checksum entry is zeroed, but the corresponding block is not zeroed. Data ONTAP® makes appropriate recovery actions. Other events describe those actions.

Corrective Action

(None).

Syslog Message

Empty checksum entry for non-zeroed block on %s%s, block #%llu, during a write operation.

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Information about the disk object that contains the error, including disk name, path, shelf, bay, serial number, vendor, model, rpm, and carrier serial number.
blockNum (LONGINT): Physical disk block number containing the error.
shelf (STRING): Identifier of the shelf where the disk drive is located.
bay (STRING): Disk bay within the disk shelf where the disk drive is located.
vendor (STRING): Name of the disk drive vendor.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk drive.
serialno (STRING): Serial number of the disk drive.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of the disk drive, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk drive is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.lw.id.inconsist

Severity

NOTICE

Description

This message occurs during a write operation, when the system detects an inconsistent RAID write signature on a RAID stripe. Data ONTAP® makes appropriate recovery actions. It automatically fails this device safely if the device exceeds the allowed number of inconsistent RAID write signature errors on the disk.

Corrective Action

(None).

Syslog Message

Inconsistent RAID write signature detected on RAID group %s%s, stripe #%llu, stripe bitmap %llu, during write operation.

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the raid group.
stripe (LONGINT): Stripe number.
more_stripes (LONGINT): Bitmap representing all of the stripes that encountered the lost write error. The bit set in this bitmap gives the stripe number relative to the stripes parameter.

raid.tetris.lw.id.inconsist.dirty

Severity

NOTICE

Description

This message occurs during a write operation, when the system detects an inconsistent RAID write signature on a RAID stripe that belongs to a dirty parity region.

Corrective Action

(None).

Syslog Message

(None).

Parameters

owner (STRING): Owner of the affected aggregate.
rg (STRING): Name of the RAID group.
stripe (LONGINT): Stripe number.
more_stripes (LONGINT): Bitmap representing all of the stripes that encountered the lost write error. The bit set in this bitmap gives the stripe number relative to the stripes parameter.

raid.tetris.media.err

Severity

NOTICE

Description

This event is issued when tetris i/o detects a medium error

Corrective Action

(None).

Syslog Message

Read error on %s%s, block #%llu during stripe write

Parameters

owner (STRING): Owner of the affected aggregate.
disk_info (STRING): Formatted information of the disk object that contains the error.
blockNum (LONGINT): The physical block number containing the error.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk

serialno (STRING): Serial number of the disk

disk_type (INT): Type of disk drive

disk_rpm (STRING): Rotational speed of disk in RPM

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tetris.media.recommend.reassign.err

Severity

NOTICE

Description

This message occurs when RAID tetris I/O detects a "recommend reassign" error for a disk block. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

Block recommended for reassignment on %s%s, Block #%llu during stripe write.

Parameters

owner (STRING): Owner of the affected aggregate.

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

blockNum (LONGINT): Physical block number containing the error.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.tree events

raid.tree.remove.activeIOs

Severity

NOTICE

Description

This message occurs when RAID I/Os are active while removing a disk from the RAID tree. This event is logged in debug builds only.

Corrective Action

(None).

Syslog Message

Remove disk %s from vol %s: disk has %d active RAID I/Os.

Parameters

disk_name (STRING): Name of the disk.
tree_name (STRING): Name of the RAID tree.
active_ios (INT): Number of active I/Os to the disk.

raid.uninitialized events

raid.uninitialized.parity.vol

Severity

EMERGENCY

Description

This message occurs periodically to warn the user that the aggregate has no RAID protection and that data loss can occur if a disk fails. Do not fail disks in this aggregate. The state of the aggregate is the result of a special boot mode. If the aggregate requires RAID protection, you should stop writing to it and then restrict it from further writing. Also, avoid creating new aggregates or extending the capacity of existing aggregates. Copy data from existing aggregates to other system and reinitialize the system.

Corrective Action

Contact NetApp technical support.

Syslog Message

• WARNING * %s %s%s was created with no parity; don't fail its data disks!!

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.unpartition events

raid.unpartition.disk

Severity

NOTICE

Description

This message indicates a disk was successfully unpartitioned.

Corrective Action

(None).

Syslog Message

Disk unpartition successful on %s.

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.unpartition.disk.fail

Severity

NOTICE

Description

This message occurs when an attempt to unpartition a disk fails. The error and error_info fields indicate the reason why the attempt failed.

Corrective Action

(None).

Syslog Message

Disk unpartition failed on %s, error %s, additional error info (%s).

Parameters

disk_info (STRING): Formatted information of the disk. This includes the disk's containing volume name and other attributes, such as shelf, bay, vendor, model, firmware revision, serial number, and type.
error (STRING): String name for the error.
error_info (STRING): Additional error information.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the disk vendor.
model (STRING): Model string of the disk.
firmware_revision (STRING): Disk firmware revision number.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.unsupported events

raid.unsupported.bitformat

Severity

ERROR

Description

This message occurs when configuration management detects that the disk belongs to a 32-bit aggregate, the use of which has been deprecated. The disk is removed from service.

Corrective Action

Install a version of Data ONTAP® that supports the 32-bit aggregate, or remove the 32-bit aggregate disks.

Syslog Message

The label on %s indicates that the disk belongs to a 32-bit aggregate, the use of which has been deprecated.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.
shelf (STRING): Identifier of the shelf where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
failure_reason (STRING): Text description of the storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is Local.

raid.unsupported.cksumtype

Severity

ERROR

Description

This message occurs when configuration management detects that the disk belongs to a ZCS aggregate, the use of which has been deprecated. The disk is removed from service.

Corrective Action

Install a version of Data ONTAP® that supports the ZCS aggregate, or remove the ZCS aggregate disks.

Syslog Message

The label on %s indicates that the disk belongs to a ZCS aggregate, the use of which has been deprecated.

Parameters

disk_info (STRING): Information about the disk object, including disk name, path, shelf, bay, serial number, vendor, model, RPM, and carrier serial number.

shelf (STRING): Identifier of the shelf where the disk is located.

bay (STRING): Disk bay within the shelf where the disk is located.

vendor (STRING): Name of the vendor of the disk.

model (STRING): Model string of the disk.

firmware_revision (STRING): Firmware revision number of the disk.

serialno (STRING): Serial number of the disk.

disk_type (INT): Type of disk.

disk_rpm (STRING): Rotational speed of the disk, in RPM.

failure_reason (STRING): Text description of the storage error leading to disk failure.

carrier (STRING): Unique ID of the carrier in which the disk is installed.

site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is Local.

raid.verify events

raid.verify.scrub.aborted

Severity

NOTICE

Description

This message occurs when a media scrub is aborted due to a storage layer error. This event is logged in debug builds only.

Corrective Action

(None).

Syslog Message

Abort media scrub on %s because of storage layer error: %s.

Parameters

disk_name (STRING): Name of the disk.

error (STRING): Storage layer error.

raid.vldb events

raid.vldb.notifyUnsuccessful

Severity

NOTICE

Description

This message occurs when RAID fails to notify the M-host that the VLDB(volume location database) is online. The notification is retried automatically when RAID receives VLDB online notification later. To check whether the VLDB process and the mgwd process are up and running, run the "cluster ring show -unitname vldb/mgmt" advanced command.

Corrective Action

(None).

Syslog Message

This message occurs when RAID fails to trigger the VLDB online notification in the M-host.

Parameters

(None).

raid.vol events

raid.vol.disk.add.done

Severity

NOTICE

Description

This event is issued when a disk is added to a aggregate.

Corrective Action

(None).

Syslog Message

Addition of %s to %s %s%s has completed successfully

Parameters

disk_info (STRING): Formatted information of the disk that has been added to the aggregate.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate to which the disk is added.
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.vol.disk.grow.done

Severity

NOTICE

Description

This message occurs when a drive is grown and is consumed by the owning aggregate by increasing its storage space.

Corrective Action

(None).

Syslog Message

%s of %s %s%s has been grown successfully.

Parameters

disk_info (STRING): Formatted information of the drive that was grown.
vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate to which the drive belongs.
shelf (STRING): Shelf identifier where the drive is located.
bay (STRING): Bay within the shelf where the drive is located.
vendor (STRING): Name of the vendor of the drive.
model (STRING): Model string of the drive.
firmware_revision (STRING): Firmware revision number of the drive.
serialno (STRING): Serial number of the drive.
disk_type (INT): Type of drive.
disk_rpm (STRING): Rotational speed of the drive in RPM.
carrier (STRING): Unique ID of the carrier in which the drive is installed.
site (STRING): For a MetroCluster® configuration, indicates the site {Local|Remote} where the drive is located. For other configurations, the site is 'Local'.

raid.vol.failed

Severity

NOTICE

Description

This message occurs when the system marks an aggregate as "failed". This results from multiple disks missing or failing in the aggregate. This aggregate is already offline or not serving data.

Corrective Action

(None).

Syslog Message

%s %s%s: Failed due to multi-disk error.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.vol.giveback

Severity

NOTICE

Description

This message occurs when the system marks an aggregate as "failed" in preparation for sending the aggregate back to its home (owner) node.

Corrective Action

(None).

Syslog Message

Aggregate %s%s: Prepared for giveback operation.

Parameters

owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.vol.hybrid

Severity

INFORMATIONAL

Description

This message occurs when Solid State Disks (SSDs) are requested to be added for the first time to a hybrid_enabled aggregate. Addition can be delayed if SSDs need to be zeroed before the addition. If the system reboots or if any of the added SSDs fails before the SSD zeroing is complete, the aggregate will not be converted to a hybrid aggregate.

Corrective Action

(None).

Syslog Message

%s%s will become a hybrid %s when the SSDs are added to the aggregate.

Parameters

vol_owner (STRING): Owner of the hybrid volume.
vol_name (STRING): Name of the hybrid volume.
vol_type (STRING): Volume type.

raid.vol.inconsist.unmount

Severity

ERROR

Description

This message occurs when the system unmounts an aggregate because of file system inconsistency.

Corrective Action

Run wafliron to clear file system inconsistency. Contact NetApp technical support for assistance.

Syslog Message

Inconsistent %s %s%s is unmounted.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.vol.mirror.degraded

Severity

ALERT

Description

This message occurs when a mirror goes into degraded state as a result of the failure of a plex.

Corrective Action

To resolve this problem, complete the following steps: 1. Identify the problem volume and failed plex from the system logs. 2. Determine the reason for the plex failure, such as disk drive, disk shelf, or loop failure. 3. Replace any faulty components that you discover. If you need assistance, contact NetApp technical support.

Syslog Message

%s %s%s is mirrored and one plex has failed. It is no longer protected by mirroring.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.vol.mirror.normal

Severity

NOTICE

Description

This message occurs when a mirror that was degraded as a result of a plex failure is no longer degraded. It is also displayed in the following scenarios: 1. When an unmirrored aggregate is mirrored 2. After a resynchronization.

Corrective Action

(None).

Syslog Message

%s%s is mirrored and plex is in normal state.

Parameters

owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
aggregate_uuid (STRING): Universal Unique Identifier (UUID) of the aggregate.

raid.vol.mixed.raid.type

Severity

INFORMATIONAL

Description

This message occurs when an aggregate is converted into a mixed RAID type aggregate.

Corrective Action

(None).

Syslog Message

%s%s is now a mixed RAID type aggregate.

Parameters

vol_owner (STRING): Owner of the volume.
vol_name (STRING): Name of the volume.

raid.vol.noMirrorSupport

Severity

ERROR

Description

This event occurs when a mirrored aggregate is detected, but SyncMirror® is not supported.

Corrective Action

Unmirror the aggregate.

Syslog Message

Mirrored %s %s%s is restricted, the system does not support SyncMirror.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.

raid.vol.online.req.giveback

Severity

ERROR

Description

This message occurs when the volume could not be brought online because it is being given back to the partner node.

Corrective Action

Bring the volume or aggregate online after giveback is complete.

Syslog Message

Bringing '%s %s' online failed because giveback is in progress.

Parameters

vol_type (STRING): Whether it is a volume or aggregate that could not be brought online.
vol (STRING): Name of the volume or aggregate.

raid.vol.online.req.nso

Severity

ERROR

Description

This message occurs when the volume cannot be brought online because the aggregate containing the volume is part of an ongoing MetroCluster(tm) negotiated switchover source operation.

Corrective Action

Wait until the switchover is complete, and then bring the volume online by using the "volume online" command. If the "volume online" command fails with a "snapmirror" or "vol move" error, abort the SnapMirror® or volume move operation, and then restart that operation to bring the volume online.

Syslog Message

Could not bring volume '%s' online because a MetroCluster negotiated switchover source operation is in progress.

Parameters

vol (STRING): Name of the volume.

raid.vol.online.req.relocate

Severity

ERROR

Description

This message occurs when the volume cannot be brought online because the aggregate containing the volume is being relocated to another node.

Corrective Action

Bring the volume online after a 'storage aggregate relocation' operation is complete.

Syslog Message

Bringing flexible volume '%s' online failed because 'storage aggregate relocation' operation is in progress.

Parameters

vol (STRING): Name of the volume.

raid.vol.online.req.sb

Severity

ERROR

Description

This message occurs when the volume cannot be brought online because the aggregate containing the volume is part of an ongoing MetroCluster(tm) switchback operation.

Corrective Action

Wait until the switchback is complete, and then bring the volume online by using the "volume online" command. If the "volume online" command fails with a "snapmirror" or "vol move" error, abort the SnapMirror® or volume move operation, and then restart that operation to bring the volume online.

Syslog Message

Could not bring volume '%s' online because a MetroCluster switchback operation is in progress.

Parameters

vol (STRING): Name of the volume.

raid.vol.read.latency.high

Severity

NOTICE

Description

This message occurs when the time taken for the completion of a WAFL® disk read operation is more than the specified time limit. This message is logged only on the debug kernel and is used for diagnostic purposes.

Corrective Action

(None).

Syslog Message

%s %s%s, vbn #%llu read latency is higher than the specified time limit of %d seconds.

Parameters

vol_type (STRING): Volume type.
vol_owner (STRING): Owner of the aggregate.
vol_name (STRING): Name of the aggregate.
read_vbn (LONGINT): Volume Block Number of the first block in the read block range that encountered high latency.
time_limit (INT): Time limit, in seconds, that was specified for completion of the read operation.

raid.vol.reparity.issue

Severity

NOTICE

Description

This message occurs when an aggregate has a reparity issue involving NVRAM. Data ONTAP® takes appropriate recovery actions, as described in additional logged events.

Corrective Action

(None).

Syslog Message

%s %s%s has %s.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
issue (STRING): Type of issue.

raid.vol.replay.nvram

Severity

INFORMATIONAL

Description

This event is issued when one or more volume needs nvram replay

Corrective Action

(None).

Syslog Message

Performing raid replay on volume(s)

Parameters

(None).

raid.vol.root.noMirrorSupport

Severity

ERROR

Description

This message occurs when a mirrored root aggregate is detected, but the system does not support SyncMirror®.

Corrective Action

Unmirror the aggregate.

Syslog Message

%s aggregate is mirrored, but the system does not support SyncMirror.

Parameters

owner (STRING): Owner of the aggregate.

raid.vol.rootConflictRestrict

Severity

NOTICE

Description

This message occurs when the system forcibly restricts a conflicting root volume, based on a comparison of the name and creation times. This situation could occur if the high-availability (HA) mailbox mirror voting information is lost, following recovery from an HA disaster.

Corrective Action

(None).

Syslog Message

Volume %s%s is being restricted due to a root volume conflict with %s%s.

Parameters

vol_owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
rootvol_owner (STRING): Owner of the root aggregate.
rootvol (STRING): Name of the root volume.

raid.vol.rootRestrictLessRecent

Severity

ERROR

Description

This message occurs when the system detects multiple root volumes at boot time. Only one root volume should exist per system. A root volume with a less recent creation time is restricted by default. This situation could occur in an upgrade/revert scenario whereby stale/old volumes created on the same system are detected.

Corrective Action

If the system default is not the intended root volume, you can switch to the intended root volume.

Syslog Message

Volume %s%s is being restricted based on its less recent creation time.

Parameters

rootvol_owner (STRING): Owner of the restricted volume.
rootvol (STRING): Name of the restricted root volume.

raid.vol.rootSelectMostRecent

Severity

ERROR

Description

This message occurs when the system detects multiple root volumes at boot time. Only one root volume should exist per system and the system selects the one with the most recent creation time by default. This situation could occur in an upgrade/revert scenario whereby stale/old volumes created on the same system are detected.

Corrective Action

If the system default is not the intended root volume, you can switch to the intended root volume.

Syslog Message

Volume %s%s is being selected as the default root volume based on its most recent creation time.

Parameters

rootvol_owner (STRING): Owner of the (default) selected volume
rootvol (STRING): Name of the (default) selected root volume

raid.vol.state.changed

Severity

NOTICE

Description

This message occurs the when system detects that the RAID state of an aggregate is changed to either offline or restricted state.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vol_type (STRING): Volume type.
vol_uuid (STRING): UUID of the aggregate.
vol (STRING): Name of the aggregate.
state (STRING): Aggregate state (offline or restricted).

raid.vol.state.online

Severity

NOTICE

Description

This event occurs when the RAID state of an aggregate is moved to the online state.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vol_type (STRING): Volume type.
vol_uuid (STRING): UUID of the aggregate.
vol (STRING): Name of the aggregate.

raid.vol.tooBig.allp.reminder

Severity

ERROR

Description

This message occurs when the total size of all aggregate plexes is too large.

Corrective Action

(Call support).

Syslog Message

The sum of all aggregate plex sizes is %s, exceeding the %s maximum. Contact NetApp technical support.

Parameters

volsizes (STRING): Total size of volumes, excluding the size of all mirrored plexes.
limit (STRING): Maximum capacity, excluding total size of mirrored plexes.

raid.vol.tooBig.allv.reminder

Severity

ALERT

Description

This message occurs when the sum of all volume sizes is too large for mirroring.

Corrective Action

Physically migrate this aggregate to a node with a larger size limit. If you need assistance, contact technical support.

Syslog Message

The sum of all aggregate sizes is %s, exceeding the %s maximum. Contact NetApp technical support.

Parameters

volsizes (STRING): Total of mirrored volume sizes.
limit (STRING): Maximum total of mirrored volume sizes.

raid.vol.tooBig.ha.reminder

Severity

ERROR

Description

This message occurs when the sum of all aggregate sizes is larger than half of the size allowed in a high availability (HA) pair. If the sum of the sizes for this node and its partner exceeds the limit, takeover might fail.

Corrective Action

Ensure that the sum of all aggregate sizes on this node and its partner does not exceed the limit. Be careful when creating new aggregates and when adding disks to existing volumes and aggregates not to exceed the limit for both nodes in the HA pair. You might need to remove or destroy some aggregates if the limit is exceeded. Disable HA failover using the 'cf disable' command if you cannot bring the sum of all sizes on both nodes below the limit.

Syslog Message

The sum of all aggregate sizes is %s, exceeding %s (half of the maximum in an HA pair). If the sum of all aggregate sizes on this node and its partner exceeds the %s maximum, takeover might fail.

Parameters

volsizes (STRING): Total of mirrored aggregate sizes.
halfpoint (STRING): Maximum total of mirrored sizes allocated to one node in the HA pair.
limit (STRING): Maximum limit of mirrored aggregate sizes.

raid.vol.tooBig.offline

Severity

ALERT

Description

This message occurs when the aggregate cannot be brought online because it is too large.

Corrective Action

Physically migrate this aggregate to a node with a larger size limit. If you need assistance, contact technical support.

Syslog Message

%s %s%s cannot be brought online because its size, %s, is larger than the maximum allowed. Contact NetApp technical support.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.
volsize (STRING): Actual volume size.
limit (STRING): Maximum volume size.

raid.vol.tooBig.reminder

Severity

ERROR

Description

This event is issued as a reminder that the aggregate size is too large.

Corrective Action

(Call support).

Syslog Message

%s size for %s%s %s exceeds limit %s

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
volsize (STRING): The actual volume size
limit (STRING): The maximum volume size

raid.vol.undestroy.info.missing

Severity

INFORMATIONAL

Description

This event is generated when undestroy info raidarea object is missing from one or more disk of a volume or an aggregate.

Corrective Action

(None).

Syslog Message

(None).

Parameters

disk_info (STRING): The formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
carrier (STRING): Unique ID of the carrier in which the disk is installed.
site (STRING): For a MetroCluster(tm) configuration, indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

raid.vol.unprotected.remotesyncmirror

Severity

ALERT

Description

This event is issued when we detect a mirrored aggregate with a plex that is not online. In a remotesyncmirror configuration the aggregate won't be available if the plex is not accessible.

Corrective Action

Bring online the plex that is now offline.

Syslog Message

%s %s%s is mirrored and one plex is not online. The volume will not be available if a takeover occurs and the online plex is not accessible to the partner node.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the affected aggregate.
vol (STRING): Name of the aggregate.

raid.vol.volinfo.mismatch

Severity

EMERGENCY

Description

This message occurs when a mismatch is detected for both copies of the volinfo block during an attempt to mount a SyncMirror aggregate. Data corruption is suspected. The aggregate cannot be mounted. The volinfo block is the superblock in the WAFL® file system. Two copies of the volinfo block are stored in blocks 1 and 2 of the file system. The two copies are the same except when there is an unclean shutdown of the file system, for example, after a panic. In a SyncMirror aggregate, all used blocks are mirrored in two

plexes. Volinfo blocks are written so that either both copies of block 1 are the same in two plexes, or both copies of block 2 are the same in two plexes at any point in time. In an unexpected case when that is not true, it is not possible to determine which copy of the volinfo block points to a consistent state of the file system. The message describes a mismatch for only one copy of the volinfo block. A pair of messages is always issued to describe the mismatch for both copies of the volinfo block, because a mismatch for only one copy is not an unusual event.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s %s%s: volinfo blocks (VBN %llu) do not match in two plexes. %s: disk %s, magic 0x%x, CP count %d, checksum %u; %s: disk %s, magic 0x%x, CP count %d, checksum %u.

Parameters

vol_type (STRING): Volume type.
owner (STRING): Owner of the aggregate.
vol (STRING): Name of the aggregate.
vbn (LONGINT): Volume block number of the volinfo block (1 or 2).
plex1 (STRING): First plex name.
disk1 (STRING): Name of the disk in the first plex.
magic1 (INT): Identifier of the block type in the first plex. It should be 0xdab8fbab for the volinfo block.
CP_count1 (INT): Consistency point count in the first plex.
checksum1 (INT): Block checksum in the first plex.
plex2 (STRING): Second plex name.
disk2 (STRING): Name of the disk in the second plex.
magic2 (INT): Identifier of the block type in the second plex. It should be 0xdab8fbab for the volinfo block.
CP_count2 (INT): Consistency point count in the second plex.
checksum2 (INT): Block checksum in the second plex.

raid.vol.write.latency.high

Severity

NOTICE

Description

This message occurs when the time taken for the completion of a WAFL® tetris write operation is more than the specified time limit. This message is logged only on the debug kernel and is used for diagnostic purposes.

Corrective Action

(None).

Syslog Message

%s %s%s, vbn #%llu write latency is higher than the specified time limit of %d seconds.

Parameters

vol_type (STRING): Volume type.
vol_owner (STRING): Owner of the aggregate.
vol_name (STRING): Name of the aggregate.
write_vbn (LONGINT): Volume Block Number of the first block in the write block range that encountered high latency.
time_limit (INT): Time limit, in seconds, that was specified for completion of the write operation.

raid.warn events

raid.warn.no.sparecore.disk

Severity

ERROR

Description

This message occurs when there are no suitable spare disks left on the node to use for a potential future coredump operation.

Corrective Action

Assign unowned disks to this node by using the "storage disk assign" command. If there are no unowned disks, physically add more spare disks and assign them to this node.

Syslog Message

No suitable spare disks available on the node for a potential future coredump operation.

Parameters

(None).

raidlm events

raidlm.cannotmakeprogress events

raidlm.cannotMakeProgress

Severity

ALERT

Description

This message occurs when a system does not contain enough spares to correct existing disk failures or misconfigurations. This message is only seen on systems containing disk carriers capable of holding more than one disk. When this message occurs, manual intervention is required because Data ONTAP® cannot automatically correct the existing issues with the system's disk configuration.

Corrective Action

To correct this issue on systems that contain carriers with multiple disks, try the following (in the specified order): (1) Assign any unassigned disks that are contained within a multidisk carrier. (2) Add multidisk carriers. (3) If a replacement carrier is available, do the following: a) Fail ALL disks within the carrier. Do not remove a multidisk carrier that contains non-failed disks; doing so results in system degradation and might result in system failure. b) Wait until the disk's amber Attention LEDs stop flashing and are lit continuously. Do not remove a carrier while the shelf OPS panel is alternating between the shelf ID and the Attention Code H1, or while the disks within the carrier are flashing their amber Attention LEDs. c) Replace the carrier. (4) Reassign partner spare disks in the HA configuration. (5) If the problem persists, call NetApp technical support.

Syslog Message

Disk %s cannot be evacuated or copied from a multidisk carrier. The system does not contain spares that are suitable for the copy operation.

Parameters

disk (STRING): Name of the disk in the carrier.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

raidlm.carrier events

raidlm.carrier.copy.abort

Severity

NOTICE

Description

This message occurs when Data ONTAP® determines that an ongoing disk copy operation is no longer required and has stopped the disk copy previously started for this disk.

Corrective Action

(None).

Syslog Message

Disk %s copy from carrier %s is no longer needed. Operation stopped.

Parameters

source_disk (STRING): Name of the disk that was being copied.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

raidlm.carrier.copy.start

Severity

NOTICE

Description

This message occurs when the system detects an undesirable RAID layout and Data ONTAP® is attempting to correct the issue by copying a disk to an available spare. The issue is that two disks from the same carrier are part of a single RAID group. If Data ONTAP does not copy one of the disks to an available spare disk, the RAID group would become double degraded if the carrier is removed accidentally. Such an action would result in significant system performance issues and the possibility of exposing the system to data loss.

Corrective Action

(None).

Syslog Message

Disk %s will be copied to disk %s to correct the RAID layout.

Parameters

source_disk (STRING): Name of the disk being copied.
target_disk (STRING): Name of the copy destination disk.
owner (STRING): RAID group owner.
raid_group_name (STRING): RAID group name.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

raidlm.carrier.evac.abort

Severity

NOTICE

Description

This message occurs when Data ONTAP® determines that an ongoing carrier evacuation operation is no longer required and has stopped the disk copy previously started for this disk.

Corrective Action

(None).

Syslog Message

Copy operation for disk %s no longer needed. Operation stopped.

Parameters

disk (STRING): Name of the disk in the carrier.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier in which the disk is installed.

raidlm.carrier.evac.start

Severity

NOTICE

Description

This message occurs when a carrier evacuation operation is initiated in a multidisk carrier containing at least one failed disk. Do NOT remove the carrier until the carrier evacuation operation is complete. The carrier evacuation operation is not complete until both of the following occur: the shelf OPS panel stops alternating between the shelf ID and Attention Code H1, and all amber Attention LEDs on the disks stop flashing and are lit continuously.

Corrective Action

(None).

Syslog Message

Disk %s is being copied as part of the carrier evacuation process (Shelf Attention Code: H1). Do not remove the carrier until the disk copy is complete.

Parameters

disk (STRING): Name of the disk in the carrier.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier being evacuated.

raidlm.carrier.splitOwner

Severity

ERROR

Description

This message occurs when disks within a multidisk carrier belong to different owners. This situation might occasionally occur in takeover or giveback scenarios (partial giveback).

Corrective Action

All disks within a multidisk carrier should belong to one owner. If the system is in takeover mode, the situation might correct itself when the partner node recovers, or by repeating the giveback. If the system is not in takeover mode, then do the following: (1) Determine which owner should own the disks. (2) If the disk is a spare, assign it to the correct owner. (3) If the disk is not a spare, copy the data to another disk.

Syslog Message

Disk %s belongs to a different owner than other disks within the carrier.

Parameters

disk (STRING): Name of the disk in the carrier.
shelf (STRING): Disk shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where the disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk.
disk_rpm (STRING): Rotational speed of the disk, in RPM.
carrier (STRING): Unique ID of the carrier.

rbac events

rbac.spuser events

rbac.spuser.role.notfound

Severity

ERROR

Description

This message occurs when the role that was earlier associated with the service-processor application user in a previous release was deleted in the current release and is not found during a revert to a previous release.

Corrective Action

Re-create the deleted role for the service-processor application user using the command "security login role create".

Syslog Message

Role "%s" for service-processor user "%s" was not found on SVM "%s".

Parameters

role_name (STRING): Name of the role which was deleted.
user_name (STRING): Name of the user for which the role modification failed.
vserver_name (STRING): Name of the SVM.

rdb events

rdb.corruption events

rdb.corruption.reported

Severity

NOTICE

Description

This message occurs when the cluster management Data Replication Module determines that the node's local replica set is corrupted. Automatic recovery of this data will be attempted.

Corrective Action

(None).

Syslog Message

Corruption reported in the local database of Data Replication Module %s, error: %s.

Parameters

unit (STRING): The unit that is reporting corruption.
message (STRING): Error message.

rdb.env events

rdb.env.IOFailure

Severity

ALERT

Description

This message occurs when the cluster management Data Replication Module determines that I/O operations on the node's mroot filesystem are failing. This could indicate that the mroot filesystem is full, not mounted, or is encountering other error conditions.

Corrective Action

Contact NetApp technical support for assistance with the mroot verification and recovery procedures.

Syslog Message

Error encountered in mroot I/O: %s.

Parameters

message (STRING): Error message.

rdb.env.processDuplicate

Severity

ERROR

Description

This message occurs when multiple conflicting instances of the management subsystem processes are executing. The situation was safely detected, but it is necessary to understand why it occurred. Normal system startup and operation should ensure that only one of each process type executes on any node. This can occur when an operator inadvertently runs a second instance by hand under the command shell.

Corrective Action

Verify that all the cluster management processes are running using the diagnostic command 'cluster ring show.' Verify that only one of each is running on the node by using the 'ps' command in the command shell. If this event continues to occur, or if there is any question as to why the extra process was started, then contact NetApp technical support to investigate.

Syslog Message

Multiple processes executing, detected by advisory locking violation: %s.

Parameters

message (STRING): Error message.

rdb.env.replicaCorrupt

Severity

ALERT

Description

This message occurs when the cluster management Data Replication Module determines that the node's local replica set is corrupted. If the damage extends beyond the replica set, it might be necessary to recover the mroot filesystem.

Corrective Action

Contact NetApp technical support for assistance with the Data Replication Module and mroot filesystem verification and recovery procedures.

Syslog Message

Corruption in the local database of Data Replication Module: %s

Parameters

message (STRING): Error message.

rdb.env.sitelistInvalid

Severity

ALERT

Description

This message occurs when the cluster management Data Replication Module detects an inconsistency in the local cluster configuration (the 'sitelist'). This sitelist is rejected, but the situation must be evaluated with the help of NetApp technical support. This usually occurs as a result of a procedural error, for example, a repurposed node without a wipeconfig, a problem with a controller replacement, a conflict with the node's 'setup' parameters, and so on.

Corrective Action

Contact NetApp technical support to investigate the situation.

Syslog Message

The sitelist content does not match the node environment: %s.

Parameters

message (STRING): Error message.

rdb.ha events

rdb.ha.active

Severity

NOTICE

Description

This message occurs when the management process goes online as the master under two-node 'cluster HA' failover. Any changes to replicated data are synchronized with the peer node after it becomes available.

Corrective Action

(None).

Syslog Message

Entering HA-Active: Going online as active master in a high-availability (HA) configuration.

Parameters

(None).

rdb.ha.mboxError

Severity

ALERT

Description

This message occurs when the system detects a problem with the 'cluster HA' on-disk mailboxes, resulting in failover being currently disabled. No data is at risk, but the situation should be addressed. Note: The 'cluster HA' configuration provides a bidirectional failover mechanism for the management processes in a two-node cluster.

Corrective Action

First ensure that both nodes are booted and operational. Then verify that all the cluster management processes are running on both nodes using the diagnostic command 'cluster ring show'. If there are any problems with this, contact NetApp technical support for guidance. Take the following actions: - Use the 'cluster ha modify -configure false' command to unconfigure high availability (HA). - Use the 'cluster ha modify -configure true' command to reconfigure HA. - Use the 'cluster ha show' diagnostic command to verify that the system is fully configured (both the front-end and on-disk mailboxes should both be 'true').

Syslog Message

Bidirectional failover under the 'cluster HA' configuration is not currently functional due to problem with the on-disk mailboxes.

Parameters

(None).

rdb.ha.synchronized

Severity

NOTICE

Description

This message occurs when the management process synchronizes its replicated data with its peer node. Bidirectional failover has been reestablished in a 'cluster HA' configuration.

Corrective Action

(None).

Syslog Message

Entering HA-Normal: Synchronized with peer in a high-availability (HA) configuration.

Parameters

(None).

rdb.internal events

rdb.internal.error

Severity

ALERT

Description

This message occurs when the cluster management Data Replication Module encounters an internal error, possibly causing the process to exit. The process should restart automatically, with full service restored.

Corrective Action

Verify that all the cluster management processes are running using the diagnostic command 'cluster ring show.' If not, contact NetApp technical support.

Syslog Message

Internal program error encountered: %s.

Parameters

message (STRING): Error message.

rdb.node events

rdb.node.starvation

Severity

ERROR

Description

This message occurs when the replicated database (RDB) detects CPU starvation on this node, potentially causing it to leave cluster quorum.

Corrective Action

Reduce the incoming traffic to this node by migrating network interfaces (LIFs) or moving volumes, as necessary.

Syslog Message

CPU starvation detected in the RDB.

Parameters

(None).

rdb.open events

rdb.open.unit.error

Severity

EMERGENCY

Description

This message occurs when the cluster management data replication module encounters an error and fails to open the unit, causing the process to exit. The process should restart automatically with full service restored.

Corrective Action

Verify that all the units are operational and using the "cluster ring show" diagnostic command. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Module "rdb_module::module_init": failed to open unit "%s" -and is exiting the process to force a restart.

Parameters

unit (STRING): Unit that failed to open.

rdb.recovery events

rdb.recovery.failed

Severity

EMERGENCY

Description

This message occurs when the cluster management Data Replication Module could not automatically repair its local replicas.

Corrective Action

(Call support).

Syslog Message

Error: %s. Unable to recover the local database of Data Replication Module: %s.

Parameters

message (STRING): Error message.
unit (STRING): The unit that failed recovery.

rdb.recovery.started

Severity

NOTICE

Description

This message occurs when the cluster management Data Replication Module starts automatic recovery attempts.

Corrective Action

(None).

Syslog Message

Automatic recovery of Data Replication Module %s started.

Parameters

unit (STRING): The unit that is going to start recovery.

rdb.recovery.succeeded

Severity

NOTICE

Description

This message occurs when the cluster management Data Replication Module determines that an automatic recovery was successful.

Corrective Action

(None).

Syslog Message

Successful recovery of the local database of Data Replication Module %s.

Parameters

unit (STRING): The unit that finished recovery.

rdb.sql events

rdb.sql.upgrade.failed

Severity

ERROR

Description

This message occurs when the cluster management Data Replication Module could not upgrade its database from RDB to SQL.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

Error: %s. Unable to upgrade the local database from RDB to SQL of Data Replication Module: %s.

Parameters

message (STRING): Error message.
unit (STRING): Unit that failed the upgrade.

rdb.sql.upgrade.succeeded

Severity

NOTICE

Description

This message occurs when the cluster management Data Replication Module upgrades its database from RDB to SQL.

Corrective Action

(None).

Syslog Message

Successful upgrade of the local database from RDB to SQL of Data Replication Module: %s. Duration: %s sec Tables: %llu Records: %llu

Parameters

unit (STRING): Unit that finished the upgrade.
duration (STRING): Duration of the upgrade in seconds.
tables (LONGINT): Number of tables processed.
records (LONGINT): Number of records processed.

rdma events

rdma.rlib events

rdma.rlib.adv.failed

Deprecated

Deprecated as of ONTAP 9.1 because this platform is no longer supported.

Severity

ERROR

Description

This message occurs when the system fails to start the advertisement service for the high-availability (HA) interconnect.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to start the advertisement service on HA interface %s.

Parameters

if_name (STRING): Name.

rdma.rlib.config.if.failed

Deprecated

Deprecated as of ONTAP 9.1 because this platform is no longer supported.

Severity

ERROR

Description

This message occurs when configuration for the high-availability (HA) interface fails.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to configure the HA interface %s.

Parameters

if_name (STRING): Interface name.

rdma.rlib.get.if.failed

Severity

ERROR

Description

This message occurs when the system cannot find high availability (HA) capable interface.

Corrective Action

Contact NetApp technical support.

Syslog Message

No HA Interconnect capable interface was found.

Parameters

(None).

rdma.rlib.listen.failed

Severity

ERROR

Description

This message occurs when the system fails to start the listener for the HA interface.

Corrective Action

Verify that link status is up by running the "metrocluster interconnect adapter show" command. Also check the FC-VI connectivity between DR partners. If the issue persists, contact NetApp technical support.

Syslog Message

Failed to start listener for the HA interconnect on interface %s.

Parameters

if_name (STRING): Name.

rdma.rlib.queue.full

Severity

NOTICE

Description

This message occurs when the send or receive queue of a Queue Pair (QP) is full.

Corrective Action

(None).

Syslog Message

%s queue of QP %s is full.

Parameters

send_or_recv (STRING): Send or receive queue of a QP.
qp_name (STRING): QP name.

rdmalib events

rdmalib.abort events

rdmalib.abort.nv.reconnect

Severity

NOTICE

Description

This message occurs when a remote NVLOG operation is aborted due to an error, which is logged here.

Corrective Action

(None).

Syslog Message

Interconnect channel (%s) encountered error (%s), causing the remote NVLOG to be aborted.

Parameters

channel (STRING): Interconnect channel.
err (STRING): Error that caused the abort.

rdmalib.duplicateid events

rdmalib.duplicateId

Severity

ALERT

Description

This message occurs when the local node system identifier matches the partner node's system identifier.

Corrective Action

Contact NetApp technical support.

Syslog Message

Interconnect : Partner ID %u is the same as our id.

Parameters

id (INT): System Id

rdmalib.multichan events

rdmalib.multichan.count

Severity

NOTICE

Description

This message occurs when this node's high-availability (HA) partner reports an update on the number of interconnect channels (multichan count) in use.

Corrective Action

(None).

Syslog Message

Multichan count "(%u)" in use on HA partner is notified via path "%s".

Parameters

count (INT): Multichan count in use on HA partner.
notify_path (STRING): Path where this event is generated.

rdmalib.rcm events

rdmalib.rcm.configMissing

Severity

NOTICE

Description

This message occurs when the configuration of the high-availability (HA) interface cannot be completed due to a missing IP address.

Corrective Action

Verify that the High Availability interconnect card is present on the system and is cabled correctly. If a capable interface is found and the issue persists, contact NetApp technical support.

Syslog Message

HA configuration is missing, error %d.

Parameters

error (INT): Error code of the missing configuration.

recover events

recover.abort events

recover.abort.ROOLR

Severity

NOTICE

Description

This event is generated when restore has been aborted and currently ROOLR (Read Only On Line Replica) is running on the Filer. This might be because of the user terminating restore or might be because of bad tape device

Corrective Action

(None).

Syslog Message

The abort event, %s, is just notified.

Parameters

errmsg (STRING): The error message is notified

recover.abort.STSP

Severity

NOTICE

Description

This event is generated when a recover has been aborted which was started by VERITAS NBU STSP Protocol. This might be because of the user terminating restore or might be because of bad tape device

Corrective Action

(None).

Syslog Message

The abort event, %s, is just notified.

Parameters

errmsg (STRING): The error message is notified

reg events

reg.cookie events

reg.cookie.null

Severity

ERROR

Description

This message occurs when allocation of cookies for traversing all keys under a prefix fails. An EFAULT error indicates that the cause is an empty registry tree. An ENOTSUPP error indicates that the prefix entered might not be supported on a vFiler unit. An ENOMEM error indicates that the system is running low on memory.

Corrective Action

For an EFAULT error, check the prefix for spelling errors. For an ENOTSUPP error, try running the command on physical system, rather than a virtual system. For an ENOMEM error, close all applications that are consuming memory, as needed. If the problem persists,contact NetApp technical support

Syslog Message

registry: Allocation of cookie for traversing all keys under the prefix %s, failed at function %s. Error number %d: %s.

Parameters

location (STRING): Location in the registry code where the failure occurred.
prefix (STRING): Name of the prefix that was passed as an argument to the function.
errorno (INT): Internal error message number.
errormsg (STRING): Internal error message description.

reg.errno events

reg.errno.addAfterReadable

Severity

NOTICE

Description

This event is issued when Data ONTAP(tm) cannot add an errno-style error to the list of errors. The error must be added before the readable version is generated. No action by the system administrator is needed.

Corrective Action

(None).

Syslog Message

registry: ignoring attempt to add an error (%d) after errors_readable was called.

Parameters

errnoval (INT): The numerical value of the error.

reg.errno.addInvalid

Severity

NOTICE

Description

This event is issued when Data ONTAP(tm) cannot add an errno-style error to the list of errors. The error number must be non-zero or the error string must be non-NULL. No action by the system administrator is needed.

Corrective Action

(None).

Syslog Message

registry: in errors_add_real, errnoval must be non-zero or str must be non-NULL.

Parameters

(None).

reg.file events

reg.file.createFail

Severity

ALERT

Description

This message occurs when the system registry file could not be created.

Corrective Action

Use the 'df' nodeshell command to check available space on the root volume. If the root volume is full, free some space on the root volume and retry the operation. If the root volume is not full, the system might be running low on memory. Contact NetApp technical support for further assistance.

Syslog Message

registry: Cannot create %s file. %s. e.g. Cannot create /etc/registry.local.0 file.

Parameters

file (STRING): Name of the file.
errormsg (STRING): Internal error message explaining why the file could not be created.

reg.file.linkFail

Severity

ERROR

Description

Could not create a hard link between system registry files.

Corrective Action

Check whether the source file exists. If the file doesn't exist, contact NetApp technical support.

Syslog Message

registry: Cannot link %s to %s. %s.

Parameters

sourcefile (STRING): Name of the source file.
destfile (STRING): Name of the destination file.
errormsg (STRING): Internal error message explaining why the hard link could not be created.

reg.file.openFail

Severity

ERROR

Description

Could not open a system registry file.

Corrective Action

Check whether the file exists. If it exists, check the file permissions. Make sure it has read and write permissions.

Syslog Message

registry: Cannot open the %s file. %s.

Parameters

file (STRING): Name of the file.
errormsg (STRING): Internal error message explaining why the file could not be opened.

reg.file.renameFail

Severity

ERROR

Description

This message occurs when the system registry file failed to update. The temporary copy of the registry could not be renamed to the active registry file name.

Corrective Action

Contact NetApp technical support.

Syslog Message

registry: Cannot rename %s to %s. %s. e.g. An error occurred trying to rename /etc /registry.bck.new2 to /etc/registry.bck

Parameters

sourcefile (STRING): Name of the source file.
destfile (STRING): Name of the destination file.
errormsg (STRING): Internal error message explaining why the rename could not be completed.

reg.file.statsFail

Severity

ERROR

Description

Could not get file statistics of the system registry file.

Corrective Action

Check whether the file exists. If it exists, check the file permissions. Make sure that it has read and write permissions.

Syslog Message

registry: Cannot get file statistics of %s file. %s.

Parameters

file (STRING): Name of the file.
errormsg (STRING): Internal error message explaining why the file statistics could not be obtained.

reg.file.updateFail

Severity

ERROR

Description

This message occurs when the ONTAP®software could not update the system registry file. Updates are made to the registry files to save the changes to the configuration information. Low disk space and low memory can cause this issue.

Corrective Action

Use the 'df' nodeshell command to check available space on the root volume. If the root volume is full, free some space on the root volume and retry the operation. If the root volume is not full, the system might be running low on memory. Contact NetApp technical support for further assistance.

Syslog Message

registry: Cannot update %s file.

Parameters

file (STRING): Name of the file.

reg.file.writeFail

Severity

ERROR

Description

Could not write to a system registry file.

Corrective Action

Use the 'df' command to check available space on the the root volume. If the root volume is full, free some space on the root volume. If the root volume is not full, the system might be running low on memory. Contact NetApp technical support.

Syslog Message

registry: Cannot write to %s file. %s.

Parameters

file (STRING): Name of the file.
errormsg (STRING): Internal error message explaining why data could not be written to the file.

reg.file.writeMismatch

Severity

ERROR

Description

Could not write completely to a system registry file.

Corrective Action

Use the 'df' command to check available space on the the root volume. If the root volume is full, free some space on the root volume. If the root volume is not full, the system might be running low on memory. Contact NetApp technical support.

Syslog Message

registry: Cannot write completely to to %s file; expected %d, but wrote %d. %s.

Parameters

file (STRING): Name of the file.
actualbytes (INT): Number of bytes that were supposed to be written.
written (INT): Number of bytes that were actually written.
errormsg (STRING): Internal error message explaining why data could not be written completely to the file.

reg.key events

reg.key.invalid

Severity

ERROR

Description

This message occurs when ONTAP® software cannot access the registry because the key is not valid.

Corrective Action

Use a valid key.

Syslog Message

registry: Invalid key %s: %s

Parameters

key (STRING): Registry key that is not valid.
reason (STRING): Reason the key is not valid.
accessID (STRING): Shows how the registry was accessed.

reg.key.null

Severity

ERROR

Description

This message occurs when the value of key is NULL while the registry set is being implemented on a vFiler(tm) key.

Corrective Action

(None).

Syslog Message

vfiler_registry_set: Set of key=%s received NULL for value.

Parameters

keyName (STRING): Name of the key.

reg.options events

reg.options.cf.change

Severity

NOTICE

Description

This message occurs when an option is changed on one cluster node but applies to both the local and partner when the cluster is in takeover mode. The result is that the partner's setting will be overridden during takeover.

Corrective Action

(None).

Syslog Message

Option %s changed on one cluster node.

Parameters

name (STRING): Name of the option

reg.options.cf.mismatch

Severity

ERROR

Description

This message occurs during takeover processing when Data ONTAP(tm) discovers that a mismatch exists between the value of an option on the local node and an option on the partner node.

Corrective Action

(None).

Syslog Message

Option %s is not the same as on the partner node

Parameters

name (STRING): Name of the option

reg.options.nullCookie

Severity

ERROR

Description

This message occurs when an internal error occurs during the processing of the options portion of the registry.

Corrective Action

Contact NetApp technical support.

Syslog Message

registry: Unable to find the option in skiplist datastructure, but the option code is present in ONTAP. Error is %s.

Parameters

error (STRING): Internal error code.

reg.options.overrideRc

Severity

ERROR

Description

This message occurs when Data ONTAP(tm) (or an administrator) sets an option to be a value different than the value in /etc/rc. At the next reboot, the line in /etc/rc will override this setting and a reg.options.overrideRegistry message will be sent.

Corrective Action

If you want the new option to be persistent, check the /etc/rc file for this key and remove it.

Syslog Message

Setting option %s to '%s' conflicts with /etc/rc that sets it to '%s'.

Parameters

name (STRING): Name of the option
newValue (STRING): New value for the option
oldValue (STRING): Existing value in /etc/rc

reg.transaction events

reg.transaction.commitFail

Severity

ERROR

Description

This message occurs when ONTAP® cannot commit a registry transaction. A system registry transaction is used to update a group of registry keys simultaneously.

Corrective Action

Check to see whether the system is running low on memory. Contact NetApp technical support.

Syslog Message

registry: Cannot commit transaction in '%s'. %s

Parameters

location (STRING): Location where the failure occurred.
errormsg (STRING): Internal error message explaining why the transaction commit failed.

reg.transaction.createFail

Severity

ERROR

Description

This message occurs when ONTAP® software cannot create a registry transaction. A system registry transaction is used to update a group of registry keys simultaneously.

Corrective Action

Contact NetApp technical support.

Syslog Message

registry: Cannot create transaction. Operation: %s.

Parameters

operation (STRING): Registry operation involved in the failure.

reg.transaction.setkeyFail

Severity

ALERT

Description

This message occurs when ONTAP® cannot set a registry key to a value within a registry transaction.

Corrective Action

Because the transaction failed, modify the registry key manually. Follow the steps in KB article
https://kb.netapp.com/support/index?page=content&actp=LIST&id=S:1015964.

Syslog Message

registry: Transaction cannot set "%s" to "%s".

Parameters

    key (STRING): Registry key that should have been changed.
    value (STRING): Value that the key should have been changed to.

repl events

repl.archival events

repl.archival.ts.failure

Severity

NOTICE

Description

This message occurs when archival tier scan fails for a cloud snapshot. The cloud snapshot will not be scanned for tiering.

Corrective Action

(None).

Syslog Message

Archival tier scan failure for cloud snapshot "%s" on endpoint %s of volume dsid %llu.

Parameters

snapshot_id (STRING): Snapshot UUID.
ep_uuid (STRING): Endpoint UUID.
volume_dsid (LONGINT): Volume dsid.

repl.autol2l events

repl.autol2l.unsupported.configuration

Severity

INFORMATIONAL

Description

This message occurs when the replication destination engine encounters an unsupported configuration during a transfer with storage efficiency.

Corrective Action

(None).

Syslog Message

Unsupported configuration for relationship '%s'.

Parameters

transferId (STRING): UUID of the SnapMirror transfer that has the unsupported configuration.

repl.cg events

repl.cg.item.limit.exceeded

Severity

ERROR

Description

This message occurs when the number of Consistency Group Items involved in a SnapMirror® Granular Sync relationship exceeds its limit in the system.

Corrective Action

Load balance the system to have fewer Consistency Group Items.

Syslog Message

The number of CG Items involved in a SnapMirror Granular Sync relationship exceeded.

Parameters

(None).

repl.cg.limit.exceeded

Severity

ERROR

Description

This message occurs when the number of Consistency Groups(CG) involved in a SnapMirror® Granular Sync relationship exceeds its limit in the system.

Corrective Action

Load balance the system to have fewer Consistency Groups.

Syslog Message

The number of CGs involved in a SnapMirror Granular Sync relationship exceeded.

Parameters

(None).

repl.checker events

repl.checker.block.missing

Severity

EMERGENCY

Description

This message occurs when a SnapMirror® check command detects a missing block on a SnapMirror® destination volume and the volume might be in an inconsistent state that should be fixed as soon as possible.

Corrective Action

Run WAFL check or wafliron as soon as possible to clear this inconsistency and rebuild from the source or resynchronize. If the block is found to be in a snapshot by running 'vol vbncheck' command, deleting the

snapshot should remove the inconsistency. Please contact NetApp technical support for more options.

Syslog Message

Snapmirror check on volume %s has detected a missing block at volume block number %llu. It is strongly recommended that you run WAFL check or wafliron to clear this inconsistency. Failure to do so might lead to node panic at any time.

Parameters

volname (STRING): Volume name
vvbn (LONGINT): Virtual volume block number of the missing block.

repl.ckpt events

repl.ckpt.update.generation

Severity

INFORMATIONAL

Description

This message occurs to record new checkpoint generations subsequent to the first. Transfer will update the current checkpoint if the new checkpoints are smaller.

Corrective Action

(None).

Syslog Message

Volume '%s%s%s' (DSID %llu) received a new checkpoint generation: %llu, current checkpoint generation: %llu.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
newCkpt (LONGINT): New checkpoint generation received.
oldCkpt (LONGINT): Existing checkpoint generation.

repl.cloud events

repl.cloud.incons.buf

Severity

ERROR

Description

This message occurs when the replication engine encounters an inconsistent block in the cloud.

Corrective Action

Contact NetApp technical support.

Syslog Message

REPL cloud inconsistent: bad block in %s inode (fileid:%s rootcbn:%u) at fbn:%llu level:%u in volume %llu. Abort when corruption is encountered:%u.

Parameters

file_space (STRING): File space.
fileid (STRING): Identifying number for the suspect inode.
rootcbn (LONGINT): Snapshot inofile root.
fbn (LONGINT): File block number.
level (INT): Buffer level.
dsid (LONGINT): Dsid of the volume.
abort (INT): Abort when corrupt block is encountered.

repl.cloud.incons.gc

Severity

ERROR

Description

This message occurs when the replication engine encounters inconsistent map object in the cloud. This does not cause user data corruption but can result in few dangling objects.

Corrective Action

Contact NetApp technical support.

Syslog Message

REPL cloud inconsistent: Corrupted cloud data detected in cloud snapshot:%s, cloud snapshot UUID:%s, cloud object:%s.

Parameters

snapshot_name (STRING): Cloud snapshot name.
snapshot_uuid (STRING): Cloud snapshot Universally Unique ID (UUID).
object_name (STRING): Cloud object name.

repl.core events

repl.core.nanny.cleanup

Severity

INFORMATIONAL

Description

This message occurs when a replication transfer that completed ten or more minutes ago is found and subsequently cleaned up.

Corrective Action

(None).

Syslog Message

The replication transfer identified by transfer Id %s was cleaned up since the transfer finished ten or more minutes ago.

Parameters

> **transferid** (STRING): Identifier given for a particular transfer by the replication initiator.
> **status** (INT): Progress status of the replication transfer when it was cleaned up.
> **failureReason** (INT): Failure reason code if there was a failure. Zero is returned on success.
> **failureMsg** (INT): Failure message code if there was a failure. Zero is returned on success.
> **failureMsgDetail** (INT): Failure message detail code if there was a failure. Zero is returned on success.

repl.data events

repl.data.uncompacted

Severity

> NOTICE

Description

> This message occurs when compacted data is replicated to a volume that does not have data compaction enabled. The data is uncompacted on the destination volume and its original contents are written.

Corrective Action

> (None).

Syslog Message

> Data written to volume %s%s%s will be uncompacted.

Parameters

> **volname** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Unique identifier for the volume.

repl.dest events

repl.dest.css.upload.notsup

Severity

> ERROR

Description

> This message occurs when Replication Engine encounters CSS Upload Table in a snapshot.

Corrective Action

> (None).

Syslog Message

> SnapMirror transfer failed because the transfer snapshot contains CSS upload table.

Parameters

> (None).

repl.dest.ilabels.notsup

Severity

ERROR

Description

This message occurs when a snapshot that contains ilabels is transferred to a destination whose ONTAP version that does not support ilabels.

Corrective Action

Update the destination node version of ONTAP to 9.9.1 or above.

Syslog Message

SnapMirror transfer with transfer ID %s will not send existing ilabels because the destination node %s does not support them.

Parameters

transferUuid (STRING): UUID of the SnapMirror® transfer.
dstNode (STRING): UUID of the node where the SnapMirror® destination is present.

repl.dest.multipart.inodes.notsup

Severity

ERROR

Description

This message occurs when a snapshot that contains multipart inodes is transferred to a destination volume that does not support them. Multipart inodes are created on volumes with granular data enabled.

Corrective Action

Update the destination node to a version of ONTAP that supports granular data and enable granular data on the destination volume.

Syslog Message

SnapMirror transfer failed because the transfer snapshot contains multipart inodes and the destination volume does not support them.

Parameters

(None).

repl.dest.space.guarantee.no.space

Severity

ERROR

Description

This message occurs when replication fails to set the space guarantee on the destination volume because there is not enough space on the destination aggregate.

Corrective Action

Changing the space guarantee type failed because the destination aggregate does not have enough free space. Please increase the amount of free space on the destination aggregate or change the space

guarantee type of the source volume to NONE.

Syslog Message

The volume with DSID %llu, name %s%s, Vserver UUID %s cannot support changing the space guarantee to %s because the aggregate does not have enough free space. Please increase the amount of free space on the destination aggregate by at least %s.

Parameters

dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolName (STRING): Destination volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume
srcSpcGuarantee (STRING): Source volume space guarantee.
shortBy (STRING): Amount of extra free space required on the destination aggregate to support changing the guarantee type of the destination volume.

repl.dest.volume.too.small

Severity

ERROR

Description

This message occurs when the transfer snapshot from the source is unexpectedly larger than the size of the destination volume.

Corrective Action

Increase the destination volume size to be greater than or equal to the source volume size.

Syslog Message

The volume with vserver UUID %s, DSID, %llu, name %s, and size %lld bytes, is not large enough to allow replication of a transfer snapshot with size %lld from the source volume.

Parameters

dstVolOwnerUUID (STRING): UUID of the vserver that owns the destination volume.
dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolName (STRING): Destination volume name.
dstVolSize (LONGINT): Destination volume size in bytes.
srcVolSize (LONGINT): Source transfer snapshot size in bytes.

repl.dst events

repl.dst.snaps.check.failed

Severity

ERROR

Description

This message occurs when a SnapMirror® logical transfer is not possible due to an incompatible reference snapshot on the destination.

Corrective Action

Continue with physical transfers until a new snapshot is created on the source volume and the source volume is converted to dual inode space. Logical transfers can be started after this new snapshot is replicated to the destination volume.

Syslog Message

SnapMirror operation failed because the reference snapshot on the destination volume is either a) from a release prior to Data ONTAP 8.2 b) captured in a nonclustered format c) not upgraded to dual inode space.

Parameters

dstVolMsid (LONGINT): Destination volume Master Data Set ID (MSID).
dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolVserverId (INT): Destination volume Vserver ID.
dstInstanceRefImageUuid (STRING): Destination reference instance snapshot UUID.
dstVersionRefImageUuid (STRING): Destination reference version snapshot UUID.

repl.enable events

repl.enable.seq.split

Severity

NOTICE

Description

This message occurs when sequential splitting mode is enabled for a SnapMirror Synchronous relationship. This mode is unsuitable for large file workloads like LUNs, databases, virtualized workloads and video surveillance.

Corrective Action

(None).

Syslog Message

Enabling sequential splitting mode for relationship with UUID "%s".

Parameters

relationship_id (STRING): Relationship UUID.

repl.exovol events

repl.exovol.not.quiesced

Severity

INFORMATIONAL

Description

This message occurs when an exo-volume scanner detects a loss of volume quiescence during a volume move operation. This typically occurs when there is too much data to transfer within the allowed cutover window.

Corrective Action

Check the network connectivity between the nodes involved in the volume move. Decrease the amount of client traffic to the volume. If those steps do not reduce the amount of data to be transferred enough to allow the transfer, force a volume move cutover with the "-cutover-action force" flag to the "volume move start" command.

Syslog Message

(None).

Parameters

plugin (STRING): Exo-volume plug-in name.
srcVolMsid (LONGINT): Source volume Master Data Set ID (MSID).
srcVolDsid (LONGINT): Source volume Data Set ID (DSID).
srcVolClusterId (STRING): Source volume cluster Universally Unique ID (UUID).
srcVolVserverId (INT): Source volume Vserver ID.
bytes_transferred (LONGINT): Number of bytes already transferred.
elapsed_msecs (LONGINT): Elapsed time in milliseconds.

repl.extended events

repl.extended.time.format.unsupported

Severity

ERROR

Description

This message occurs when the replication engine encounters a destination that does not support extended time format.

Corrective Action

Select a destination that supports extended time format.

Syslog Message

Extended time format not supported on the destination of relationship %s.

Parameters

transferId (STRING): UUID of the SnapMirror® transfer that has the destination that cannot handle extended time.

repl.gsr events

repl.gsr.cache.modify.gs.enfrc.failed

Severity

ERROR

Description

This message occurs when SnapMirror faces internal error while going Out-Of-Sync or source volume comes online.

Corrective Action

Resynchronize SnapmMirror sync relation. Please contact NetApp technical support for more options.

Syslog Message

Unable to modify enforcement for the sync granset relation.

Parameters

transferId (STRING): UUID of the SnapMirror® transfer.
srcCgUUID (STRING): Source CG UUID.
Code (INT): Error code.

repl.gsr.clone.replication

Severity

NOTICE

Description

This message occurs when replication of a clone request fails or cannot be serviced. The clone request completed successfully on the sync mirror primary, but was not completed on the sync mirror secondary. The clone will not be available on the sync mirror secondary.

Corrective Action

Wait for the relationship to automatically resynchronize.

Syslog Message

Failed to replicate clone of /vol/%s/%s to sync mirror secondary.

Parameters

volname (STRING): Volume name.
filename (STRING): Source filename.
reason (STRING): Descriptive reason for the notice.

repl.gsr.snap.replication.failed

Severity

INFORMATIONAL

Description

This message occurs when a snapshot replication request fails or cannot be served.

Corrective Action

(None).

Syslog Message

Failed to replicate snapshot operation to the destination.

Parameters

transferId (STRING): UUID of the SnapMirror® transfer.
srcVolumeDsid (LONGINT): Source volume data set ID (DSID).
srcCgUUID (STRING): Source CG UUID.
snapshotName (STRING): Name of the snapshot to be replicated.

failureReason (STRING): Reason for the failure.
replStatus (INT): Replication Status.
replFailureMsg (INT): Replication failure message.
replFailureMsgDetail (INT): Replication failure message detail.

repl.holdblock events

repl.holdblock.arrived

Severity

INFORMATIONAL

Description

This message occurs during an incremental transfer when the replica volume did a snapshot restore before the transfer. It records the VVBN of the block which is supposed to be held in memory until the end of transfer as it arrives from the source.

Corrective Action

(None).

Syslog Message

Held block for volume '%s%s%s' (DSID %llu) with VVBN %llu has arrived.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
vvbn (LONGINT): VVBN of the held block.

repl.holdblock.begin

Severity

INFORMATIONAL

Description

This message occurs at the beginning of an incremental transfer if the replica volume did a snapshot restore. It records the VVBN of the block that needs to be held in memory until the end of transfer.

Corrective Action

(None).

Syslog Message

Holding block for volume '%s%s%s' (DSID %llu) with VVBN %llu because Revert-to snapshot is set to %d.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
vvbn (LONGINT): VVBN of the block to be held.

snapId (INT): Revert-to snapshot Id.

repl.holdblock.end

Severity

INFORMATIONAL

Description

This message occurs at the end of an incremental transfer when the replica volume did a snapshot restore. The required VVBN arrived from the source and has been applied to WAFL.

Corrective Action

(None).

Syslog Message

Applied held block for volume '%s%s%s' (DSID %llu) with VVBN %llu to WAFL.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
vvbn (LONGINT): VVBN of the held block applied to WAFL.

repl.hole events

repl.hole.raid.error

Severity

ALERT

Description

This message occurs when a SnapMirror® transfer encounters an unrecoverable RAID error.

Corrective Action

Contact NetApp technical support for further assistance.

Syslog Message

SnapMirror transfer with transfer ID %s encountered an unrecoverable RAID error for %s with ID %d in destination volume %d.

Parameters

transferId (STRING): UUID of the SnapMirror transfer that encountered a RAID error.
fileSpace (STRING): File space (metafile or user file).
fileId (INT): File ID of the inode involved if it is a user file space, and metafile name if it is a metafile space.
dstVolDsid (LONGINT): Data set identifier (DSID) of the destination volume.

repl.jumpahead events

repl.jumpahead.failed

Severity

ERROR

Description

This message occurs when the system cannot bring a replica volume online after applying the latest update to the replica because of possible inconsistencies detected in the update. The system rolls back the volume to the file system that existed prior to applying the update and brings the volume back online.

Corrective Action

Run wafliron as soon as possible on the aggregate where the replica volume resides as well as on the aggregate where the source volume of the replica resides. If the problem persists, contact NetApp technical support for further assistance.

Syslog Message

Rolling back after jump-ahead failure for volume '%s%s%s' (DSID %llu) with error %d.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume
volDsid (LONGINT): Data Set Identifier (DSID) of the volume
code (INT): Error code returned while bringing online the volume with the latest update

repl.large events

repl.large.vol.600tb.limits.unsup

Severity

ERROR

Description

This message occurs when the replication engine encounters a destination that cannot handle large 600TB volume limits.

Corrective Action

Take one of the following actions: - Select a destination with version ONTAP 9.14.0 or later. - On the source volume, reduce the volume size "volume modify -vserver vserver_name> -volume vol_name -max-size 300TB".

Syslog Message

Large volume limits not supported on the destination node %s for destination volume with MSID %llu of relationship %s.

Parameters

dstNode (STRING): UUID of the node where the SnapMirror® destination is present.
dstVolMsid (LONGINT): MSID of the SnapMirror® destination volume.
transferId (STRING): UUID of the failed SnapMirror® transfer.

repl.large.vol.limits.unsup

Severity

ERROR

Description

This message occurs when the replication engine encounters a destination that cannot handle large volume limits.

Corrective Action

Take one of the following actions: - Select a destination with version ONTAP 9.12.1 or later. - On the source volume, reduce the volume size "volume modify -vserver vserver_name> -volume vol_name -large-volume -file-limits disable". Now disable large volume limits by using the "volume modify -vserver vserver_name -volume vol_name -large-volume-file-limits disable" command.

Syslog Message

Large volume limits not supported on the destination node %s for destination volume with MSID %llu of relationship %s.

Parameters

dstNode (STRING): UUID of the node where the SnapMirror® destination is present.
dstVolMsid (LONGINT): MSID of the SnapMirror® destination volume.
transferId (STRING): UUID of the failed SnapMirror® transfer.

repl.large.vol.unsup.maxvvbn

Severity

ERROR

Description

This message occurs when the replication engine encounters a destination that cannot handle large volumes.

Corrective Action

Select a destination that supports a volume size greater than 100 TB.

Syslog Message

Large volumes not supported on the destination node %s for destination volume with MSID %llu of relationship %s.

Parameters

dstNode (STRING): UUID of the node where the SnapMirror® destination is present.
dstVolMsid (LONGINT): MSID of the SnapMirror® destination volume.
transferId (STRING): UUID of the SnapMirror® transfer that has the destination that cannot handle large volumes.

repl.large.vol.unsup.nomsize

Severity

ERROR

Description

This message occurs when the replication engine encounters a destination that cannot handle large volumes.

Corrective Action

Take one of the following actions: - On the source volume, disable autosize if it is enabled by using the "volume modify vol_name -autosize-mode" command. Then reduce the size of the volume by using the "volume modify vol_name -size" command. - On the source volume, set the "max autosize" parameter to below 100 TB by using the "volume modify vol_name -max-autosize" command. - On the source volume, reduce the size of the volume to below 100 TB by using the "volume modify vol_name -size" command. - Select a destination that supports a volume size greater than 100 TB.

Syslog Message

Large volume not supported on the destination node %s for destination volume with MSID %llu of relationship %s.

Parameters

dstNode (STRING): UUID of the node where the SnapMirror® destination is present.
dstVolMsid (LONGINT): MSID of the SnapMirror® destination volume.
transferId (STRING): UUID of the failed SnapMirror® transfer.

repl.logical events

repl.logical.dw.rebuild

Severity

INFORMATIONAL

Description

This message occurs when a data warehouse is rebuilt as part of a SnapMirror® restore or resync operation.

Corrective Action

(None).

Syslog Message

A data warehouse rebuild was performed on volume with name %s, MSID %llu, DSID %llu, and Vserver ID %u.

Parameters

volName (STRING): Volume name.
volMsid (LONGINT): Volume master data set ID (MSID).
volDsid (LONGINT): Volume data set ID (DSID).
volVserverId (INT): Volume Vserver ID.

repl.logical.lreToIrse

Severity

INFORMATIONAL

Description

This message occurs when previously enabled compression is disabled on the destination volume of a SnapMirror® relationship with the type XDP, and when it is followed by the "snapmirror update" command with the "enable-storage-efficiency" parameter set to "true". All future transfers to this destination volume from the current source will preserve storage efficiency as long as compression is disabled on it.

Corrective Action

(None).

Syslog Message

All future transfers from the current source to destination volume %s%s with MSID %llu, DSID %llu, from the current source will preserve storage efficiency as long as compression is disabled on the destination volume.

Parameters

dstVolName (STRING): Destination volume name.
dstVolVserverUuid (STRING): Destination volume Vserver ID.
dstVolMsid (LONGINT): Destination volume Master data set ID (MSID).
dstVolDsid (LONGINT): Destination volume data set ID (DSID).

repl.logical.lrseToIre

Severity

INFORMATIONAL

Description

This message occurs when compression is enabled on the destination volume of a SnapMirror® relationship that has type XDP. All future transfers to this destination volume from the current source will not preserve storage efficiency.

Corrective Action

(None).

Syslog Message

All future transfers to destination volume with MSID %llu, DSID %llu, and Vserver ID %u, from the current source will not preserve storage efficiency.

Parameters

dstVolMsid (LONGINT): Destination volume Master Data Set ID (MSID).
dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolVserverId (INT): Destination volume Vserver ID.

repl.logical.rawDirToLogicalDir

Severity

INFORMATIONAL

Description

This message occurs when a SnapMirror® transfer uses logical mode after a previous transfer to the same destination used raw directory mode. This most frequently occurs when the source node of the transfer was upgraded to a newer version of Data ONTAP® than the destination node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

dstVolMsid (LONGINT): Destination volume Master Data Set ID (MSID).
dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolClusterId (STRING): Destination volume cluster Universally Unique ID (UUID).
dstVolVserverId (INT): Destination volume Vserver ID.
srcInstanceImageUuid (STRING): Source transfer instance snapshot UUID.
srcVersionImageUuid (STRING): Source transfer version snapshot UUID.
rawDirsSupported (INT): Indicates whether the destination believes raw directory transfer is supported.
rawDirsRequired (INT): Indicates whether the destination believes raw directory transfer is required.

repl.out events

repl.out.of.band.vbn

Severity

INFORMATIONAL

Description

This message occurs when replication source is asked to send certain blocks out of band because the replica volume did a snapshot restore.

Corrective Action

(None).

Syslog Message

Asked volume '%s%s%s' (DSID %llu) to send out-of-band VVBN %llu; current cursor: %llu; need-many-VBN value: %d.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the volume.
oobVVBN (LONGINT): Out-of-band Virtual Volume Block Number (VVBN).
cursor (LONGINT): Current scan cursor.
many (INT): Whether multiple out-of-band VVBNs were asked for.

repl.out.of.memory

Severity

NOTICE

Description

This message occurs when an out-of-memory error is encountered during a SnapMirror® replication operation.

Corrective Action

(None).

Syslog Message

SnapMirror replication transfer encountered an out-of-memory error.

Parameters

memoryAllocation (STRING): Type of memory allocation.
retry_time_msecs (LONGINT): Retry time in milliseconds.
filename (STRING): Name of the file where the event occurred.
functionName (STRING): Name of the function for which the error occurred.
lineNumber (INT): Line number at which error the occurred.
size (LONGINT): Size of the memory allocation.

repl.physdiff events

repl.physdiff.invalid.hole

Severity

EMERGENCY

Description

This message occurs when a block to replicate was found to be inconsistent in the source volume. Replication has been aborted to avoid propagating the inconsistency to the destination node.

Corrective Action

Run wafliron on the aggregate containing the source volume of the replication.

Syslog Message

Replication of volume '%s%s%s' (DSID %llu) encountered an inconsistent block (VVBN %llu).

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume.
volDsid (LONGINT): Data set identifier (DSID) of the source volume.
vvbn (LONGINT): Virtual Volume Block Number of the affected block.

repl.s2c events

repl.s2c.checksum.mismatch

Severity

ERROR

Description

This message occurs when the checksum of an object's contents does not match with the expected checksum.

Corrective Action

Please contact NetApp technical support for more options.

Syslog Message

Checksum mismatch in cloud object contents. Endpoint UUID = %s. Relationship UUID = %s. Object Name = %s. Slot ID = %d.

Parameters

epUuid (STRING): Endpoint UUID.
relnUuid (STRING): Relationship UUID.
objName (STRING): Cloud object name.
slotId (INT): Slot ID.

repl.s2c.rel.state.inconsistent

Severity

EMERGENCY

Description

This message occurs when the replication source engine encounters a disk error in the relationship state metafile. Replication transfer will abort. Current relationship cannot be resumed.

Corrective Action

Current relationship cannot be resumed. Please create a new relationship.

Syslog Message

relationship state metafile inconsistent in volume '%s%s%s' due to disk errors. Aborting transfer.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

repl.s2c.restore.unsupported.config

Severity

ERROR

Description

This message occurs when we encounter unsupported configuration during SnapMirror® restore.

Corrective Action

Cannot continue with restore.

Syslog Message

Cannot restore to volume '%s%s%s' because %s.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

reason (STRING): Specific reason for failure.

repl.s2c.restore.unsupported.snapshot

Severity

ERROR

Description

This message occurs when we encounter unsupported source snapshot copy during SnapMirror® restore.

Corrective Action

Cannot use the source snapshot copy for SnapMirror® restore.

Syslog Message

Cannot restore from source snapshot copy to volume '%s%s%s' because %s.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
reason (STRING): Specific reason for failure.

repl.s2c.rst.archv.data.fnd

Severity

NOTICE

Description

This message occurs when SnapMirror® restore encounters data present in the cloud archive tier. SnapMirror restore cannot proceed until archival tier data processing has completed.

Corrective Action

Use the "snapmirror show" command to view the status of the processing of the archival tier of the cloud. When the relationship status becomes "Idle", then reissue the SnapMirror restore request.

Syslog Message

SnapMirror restore with transfer UUID "%s", cloud source endpoint UUID "%s", destination volume DSID "%llu", encountered data in the archival tier.

Parameters

transferId (STRING): SnapMirror transfer universal unique identifier (UUID).
srcEpUuid (STRING): Cloud source endpoint UUID.
dstVolDsid (LONGINT): Restore destination volume data set ID (DSID).

repl.s2c.src.inconsistent

Severity

EMERGENCY

Description

This message occurs when the replication source engine encounters a disk error in the file system

metadata. Replication transfer will abort.

Corrective Action

Run wafliron to fix the active file system. To continue replication transfer, run snapmirror abort -h command on the relationship, delete the current transfer snapshot copy and resume replication transfer from a new clean snapshot copy.

Syslog Message

WAFL metadata inconsistent in volume '%s%s%s' due to disk errors. Aborting transfer.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

repl.s2c.unsupported.config

Severity

ERROR

Description

This message occurs when we encounter unsupported configuration during SnapMirror® backup.

Corrective Action

Cannot continue with backup.

Syslog Message

Cannot backup from volume '%s%s%s' because %s.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
reason (STRING): Specific reason for failure.

repl.s2c.vmap.inconsistent

Severity

INFORMATIONAL

Description

This message occurs when the replication source engine encounters a disk error in the replication specifc metadata. Replication transfer will abort.

Corrective Action

(None).

Syslog Message

Replication specific metadata inconsistency in volume '%s%s%s'. Aborting transfer. Transfer will attempt baseline to recover from this condition.

Parameters

    vol (STRING): Name of the volume.
    app (STRING): Application UUID.
    volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

repl.send events

repl.send.mgr.forcedLogical

Severity

    INFORMATIONAL

Description

    This message occurs when a SnapMirror® transfer uses logical mode without even attempting raw directory negotiation.

Corrective Action

    (None).

Syslog Message

    (None).

Parameters

    srcVolMsid (LONGINT): Source volume Master Data Set ID (MSID).
    srcVolDsid (LONGINT): Source volume Data Set ID (DSID).
    srcVolClusterId (STRING): Source volume cluster Universally Unique ID (UUID).
    srcVolVserverId (INT): Source volume Vserver ID.
    srcInstanceImageUuid (STRING): Source transfer instance snapshot UUID.
    srcVersionImageUuid (STRING): Source transfer version snapshot UUID.
    srcInstanceRefImageUuid (STRING): Source reference instance snapshot UUID.
    srcVersionRefImageUuid (STRING): Source reference version snapshot UUID.

repl.seq events

repl.seq.split.enabled.SAN

Severity

    ALERT

Description

    This message occurs when the SnapMirror sequential split is enabled on a SAN operating workload. This is meant to be enabled for NAS workloads only. SAN operating workload would experience a higher latency and is not recommended to be used with sequential splitting mode.

Corrective Action

    Switch back to parallel split mode by running the command "snapmirror policy modify -policy (policy name) -are-data-ops-sequentially-split false".

Syslog Message

    Sequential splitting mode is enabled in SAN operating workload for relationship with UUID "%s".

Parameters

relationship_id (STRING): SnapMirror relationship universal unique identifier (UUID).

repl.ser events

repl.ser.ops.pardir.breach

Severity

NOTICE

Description

This message occurs when number of operations serialized on parent directory exceed an internal limit. This does not harm the system/cluster in any way.

Corrective Action

(None).

Syslog Message

Number of operations serialized on parent directory exceed the internal limit for relationship with UUID %s.

Parameters

relationship_id (STRING): SnapMirror relationship universal unique identifier (UUID).

repl.space events

repl.space.guarantee.transfer.failed

Severity

ERROR

Description

This message occurs when the attempt to change space guarantee type fails on the destination volume.

Corrective Action

Change the space guarantee type of the source volume to be the same as the space guarantee type of the destination volume.

Syslog Message

The volume with DSID %llu, name %s%s, Vserver UUID %s cannot support changing the space guarantee to %s on the destination aggregate, error %d.

Parameters

dstVolDsid (LONGINT): Destination volume Data Set ID (DSID).
dstVolName (STRING): Destination volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume
srcSpcGuarantee (STRING): Source volume space guarantee.
code (INT): Error code returned when setting the space guarantee of the destination volume.

repl.src events

repl.src.snaps.check.failed

Severity

ERROR

Description

This message occurs when SnapMirror® logical transfer is not possible due to incompatible snapshots.

Corrective Action

Create new snapshot on the source volume and use that for Logical transfer.

Syslog Message

SnapMirror operation failed because the reference and/or the transfer snapshots on the source volume are either a) from a release prior to Data ONTAP 8.2 b) captured in a nonclustered format c) not upgraded to dual inode space. These snapshots cannot be used for logical transfer.

Parameters

srcVolMsid (LONGINT): Source volume Master Data Set ID (MSID).
srcVolDsid (LONGINT): Source volume Data Set ID (DSID).
srcVolVserverId (INT): Source volume Vserver ID.
srcInstanceImageUuid (STRING): Source transfer instance snapshot UUID.
srcVersionImageUuid (STRING): Source transfer version snapshot UUID.
srcInstanceRefImageUuid (STRING): Source reference instance snapshot UUID.
srcVersionRefImageUuid (STRING): Source reference version snapshot UUID.

repl.switch events

repl.switch.to.seq.split

Severity

NOTICE

Description

This message occurs when the average Op Latency increases beyond the threshold value in parallel splitting mode.

Corrective Action

Switch to sequential splitting mode by setting the SnapMirror policy option "-are-data-ops-sequentially-split".

Syslog Message

Operation Latency has exceeded the threshold value "%llu" in the parallel split mode for sync relationship with UUID "%s".

Parameters

average_overall_latency (LONGINT): Average overall latency.
relationship_id (STRING): Relationship UUID.

repl.unable events

repl.unable.to.create.css

Severity

NOTICE

Description

This message occurs when the workflow is unable to create a common snapshot due to timeout. This operation is retried automatically.

Corrective Action

(None).

Syslog Message

Unable to create CSS "%s" for relationship with UUID %s.

Parameters

snapshot_name (STRING): Common snapshot name
relationship_id (STRING): SnapMirror relationship universal unique identifier (UUID).

repl.xfer events

repl.xfer.term.timed.out

Severity

ERROR

Description

This message occurs when a replication transfer component (sender or receiver) has taken more than an hour to terminate. Any future manual or scheduled replication transfer for this relationship cannot begin until this condition is corrected.

Corrective Action

Please generate a core file on the node, submit it to NetApp technical support and reboot the node.

Syslog Message

A component of a replication transfer with destination volume DSID '%llu' or SnapMirror® tape ndmp session '%s' is taking a long time to terminate since it is busy performing some operation.

Parameters

dstVolDsid (LONGINT): Data set identifier (DSID) of the destination volume.
smTapeNDMPSession (STRING): NDMP session identifier for SnapMirror® tape transfers.

replaycache events

replaycache.arcbktallocerr events

ReplayCache.ArcBktAllocErr

Severity

ERROR

Description

This message occurs when the replay-cache bucket (which is used to hold the responses of non-idempotent operations, to prevent the execution of duplicate I/O requests) that is associated with a bin (through a client connection) has fully utilized the maximum allowed memory and old bins holding the bucket is not able to release requests due to the configured expiration time. I/O operations are suspended until the bucket has available memory.

Corrective Action

Modify the replay cache bin expiration time using the "spinnp-replay-cache attributes modify -arc-initial -bucket-count 16 -arc-bin-expiration 30" command (privilege: diag). Specify a smaller value for the bin expiration time and initial bucket count, so that the bin eviction will happen sooner and new bin creation will require less memory in the bucket, which might help avoid the issue.

Syslog Message

A replay-cache bucket memory exhaust occurred due to the slow eviction of old bins and the high number of I/O operations being received by the server.

Parameters

(None).

replaycache.nfsv41bindelete events

ReplayCache.Nfsv41BinDelete

Severity

NOTICE

Description

This message occurs when the replay-cache bin associated with an NFSv4.1 session is destroyed due to a policy mismatch. In Data ONTAP® releases prior to 9.0, replay-cache bins for NFSv4.1 session were created with a certain policy. The policy associated with these bins has changed and the data in older bins cannot be migrated. Older bins are destroyed and new bins are created. The process of bin policy conversions for NFSv4.1, occurs when the effective cluster version (ECV) changes due to an upgrade or revert operation. Connection Session Manager (CSM) sessions are used to communicate file operations between nodes in the cluster. During this period, if CSM sessions experience timeouts or other errors, NFSv4.1 clients might receive unexpected results for a few of their outstanding requests. All new NFSv4.1 client requests are unaffected.

Corrective Action

(None).

Syslog Message

The replay-cache bin associated with a NFSv4.1 session was deleted and recreated due to a policy mismatch. Current NFSv4.1 session might temporarily receive unexpected results.

Parameters

(None).

replication events

replication.cluster events

replication.cluster.vol

Severity

ERROR

Description

This message occurs because the transfer of clustered volumes is not supported in nonclustered environments.

Corrective Action

Use clustered ONTAP to transfer cluster volumes.

Syslog Message

Canceled transfer of %s volume '%s', %s transfer of cluster volume is not supported in nonclustered environments.

Parameters

type (STRING): Destination or source.
volume (STRING): Replica volume.
transfertype (STRING): Type of transfer.

replication.dst events

replication.dst.attrsNotSaved

Severity

ERROR

Description

This message is issued at the end of a Qtree SnapMirror® or SnapVault® transfer or checker/fixer operation when the replication destination detects that the replication source has sent file attributes that the replication destination does not support, and the replication destination has not saved those attributes. This may happen when the replication source is running a newer version of ONTAP which supports file attributes that the replication destination does not support.

Corrective Action

To store all of the attributes, upgrade your replication destination filer to a version of ONTAP which is at least as recent as the source. Alternatively, this message can be suppressed for all future transfers or checker/fixer operations for all Qtree SnapMirror and SnapVault relationships by setting the hidden replication option, suppress_attrs_not_saved_warnings.

Syslog Message

The replication destination was unable to replicate all file attributes on %d file(s) or director(y/ies) in %s because it does not support one or more of the attributes sent by the source.

Parameters

    attrs_not_saved (INT): The number of files for which the replication destination could not replicate all file attributes.
    dst_path (STRING): Destination qtree path.

replication.dst.debugLog

Severity

    ERROR

Description

    This message occurs when a SnapMirror® or SnapVault® destination cannot log the replication protocol header for the data received.

Corrective Action

    The reasons for the error cited in the error message might indicate ways to address the problem.

Syslog Message

    Logical Replication header log: %s %s:%s.

Parameters

    reason (STRING): Reason for the failure.
    file_name (STRING): Logging file for which the error was encountered.
    errstr (STRING): Error encountered during logging operation.

replication.dst.err

Severity

    ERROR

Description

    This message occurs when the system detects an error on a SnapMirror® or SnapVault® destination volume or qtree.

Corrective Action

    (None).

Syslog Message

    %s: destination transfer from %s:%s to %s : %s.

Parameters

    rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
    srcfiler (STRING): Replication source system.
    srcpath (STRING): Replication source volume or qtree.
    dstpath (STRING): Replication destination volume or qtree.
    error (STRING): Specific error message.

replication.dst.inodeMissing

Severity

ERROR

Description

This message occurs when a file for which the replication source sent data is not present on the replication destination.

Corrective Action

Check for WAFL® inconsistencies on the replication source.

Syslog Message

The replication destination could not find the file corresponding to %d sent from the replication source. Check for WAFL inconsistencies on the replication source %s:%s.

Parameters

inode (INT): Inode number of the source file for which the corresponding file is not present.
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.

replication.dst.langMismatch

Severity

ERROR

Description

This message occurs when the user continues with the updates of the replication relationship after changing the language setting of the volume in which qtree replicas are configured or that contain replica primary.

Corrective Action

Create a new baseline for the relationship.

Syslog Message

Volume language was changed before this transfer or it was changed before some previous update transfer for the relationship of qtree %s. This might create some problems with further replication transfers of the relationship.

Parameters

qtpath (STRING): Destination qtree path.

replication.dst.lostACL

Severity

ERROR

Description

This message occurs when a replication update discovers that an inode that is supposed to have an ACL does not have one, causing the replication to fail.

Corrective Action

If the replication destination is a SnapMirror® destination, run the 'snapmirror quiesce' command to quiesce

the replication relation, then run the 'snapmirror check -F' command under the guidance of NetApp technical support. If the destination is a SnapVault® destination, run the 'snapvault check -F' command under the guidance of NetApp technical support.

Syslog Message

Replication transfer from %s:%s to %s:%s: the destination could not find ACL %d for source inode %d.

Parameters

srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
acl_inode (INT): Inode number of source ACL.
file_inode (INT): Inode number of the replication source file.

replication.dst.noCommonSnap

Severity

ERROR

Description

This message occurs when a SnapVault® or SnapMirror® relationship cannot be resynchronized because there is no usable snapshot that the source and destination have in common. In such situations, the 'snapvault start -r' and 'snapmirror resync' commands cannot be successfully completed.

Corrective Action

The relationship cannot be resynchronized so it must be reinitialized. For SnapMirror, use the 'snapmirror initialize' command. For SnapVault, use the 'snapvault start' command. Either run the baseline transfer to a new qtree, or remove the existing qtree before starting the transfer. Refer to the Data Protection Guide for details.

Syslog Message

%s: destination transfer from %s:%s to %s:%s : no common snapshot to use as the base for resynchronization.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error

replication.dst.noMemory

Severity

ALERT

Description

This message occurs when there is insufficient memory on the SnapMirror® or SnapVault® destination for the transfer to continue.

Corrective Action

(None).

Syslog Message

System is low on memory; aborting %s destination transfer.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).

replication.dst.noSrcSnap

Severity

ERROR

Description

This message occurs when a SnapVault® or SnapMirror® destination discovers that the relationship's base snapshot no longer exists on the source. In such situations, 'snapvault update' and 'snapmirror update' commands cannot execute successfully.

Corrective Action

For SnapMirror, issue the command 'snapmirror resync' to make SnapMirror attempt to resynchronize the relationship. If the resync operation cannot find a common snapshot, you must reestablish the relationship with the 'snapmirror initialize' command. For SnapVault, issue the command 'snapvault start -r' to make SnapVault attempt to resynchronize the relationship. If the 'snapvault start -r' command cannot find a common snapshot, you must reestablish the relationship with the 'snapvault start' command. If you must reestablish a relationship, either run the baseline transfer to a new qtree, or remove the existing qtree before starting the transfer. Refer to the Data Protection Guide for details.

Syslog Message

%s: destination transfer from %s:%s to %s:%s : base snapshot for transfer no longer exists on the source.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error.

replication.dst.resync.failed

Severity

ERROR

Description

This message occurs when a SnapMirror® or SnapVault® resync operation is not successful.

Corrective Action

See error message.

Syslog Message

%s resync of %s to %s:%s : %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
dstpath (STRING): Replication destination volume or qtree.
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source volume or qtree.
error (STRING): Error message.

replication.dst.resync.success

Severity

NOTICE

Description

This message occurs when a SnapMirror® or SnapVault® resync operation is successful.

Corrective Action

Operation successful; no corrective action required.

Syslog Message

%s resync of %s to %s:%s was successful.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
dstpath (STRING): Replication destination volume or qtree.
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source volume or qtree.

replication.dst.setACLError

Severity

ERROR

Description

This event occurs when ONTAP encounters an illegal data stream during a logical backup operation. This is usually due to an OSSV primary software bug. Normally OSSV sets an ACL (Access Control List) on a regular file or directory. However, as a result of this bug, OSSV attempts to set an ACL on an Alternate Data Stream (ADS) of a file or directory. See bug 148879 for details.

Corrective Action

(None).

Syslog Message

(None).

Parameters

src_base_inum (INT): The base inode number generated by the source. The source is trying to set an ACL on this inode, which happens to be a stream.
dst_base_inum (INT): The corresponding base inode number on the destination.

replication.dst.setACLFailed

Severity

ERROR

Description

This message occurs when ONTAP encounters an error while setting an ACL (Access Control List) for an inode on a SnapVault® or SnapMirror® destination. The replication transfer is aborted upon encountering this error.

Corrective Action

(None).

Syslog Message

Replication transfer from %s:%s to %s:%s: The destination failed to set ACL %d for source inode %d on destination inode %d. The replication transfer is aborted.

Parameters

srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
acl_inode (INT): Inode number of the source ACL.
src_base_inum (INT): Base inode number generated by the source. The destination is trying to set an ACL on this inode.
dst_base_inum (INT): Corresponding base inode number on the destination.

replication.dst.throttleChange

Severity

NOTICE

Description

This event is issued when the replication source, receives a request from the destination to change the current throttle value.

Corrective Action

(None).

Syslog Message

Throttle value changed to %d Kbytes/s for destination %s:%s

Parameters

throttle (INT): The new throttle value.
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination volume or qtree

replication.dst.throttleChange.err

Severity

NOTICE

Description

This event is issued when the replication source, receives a request from the destination to change the current throttle value, but failed to complete the operation.

Corrective Action

(None).

Syslog Message

Failed to change throttle value to %d Kbytes/s for destination %s:%s : %s

Parameters

throttle (INT): The new throttle value.
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination volume or qtree
error (STRING): The error message

replication.dst.waflErr

Severity

ERROR

Description

This message occurs when the system detects an error on a SnapMirror® or SnapVault® destination volume or qtree due to WAFL®.

Corrective Action

(None).

Syslog Message

%s: destination transfer from %s:%s to %s : %s:%s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source volume or qtree.
dstpath (STRING): Replication destination volume or qtree.
rplerror (STRING): Specific replication error message.
waflerror (STRING): Specific WAFL error message.

replication.err events

replication.err.snapCreateFailed

Severity

ERROR

Description

This message occurs when the replication engine fails to create an automatic snapshot.

Corrective Action

Make sure that the snapshot limit is not reached for the volume. The current ONTAP version allows a maximum of 255 snapshots per volume.

Syslog Message

%s transfer from %s:%s to %s:%s : %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error message.

replication.givebackcancel events

replication.givebackCancel

Severity

ERROR

Description

This message occurs when a 'giveback' command is issued while a SnapMirror® or SnapVault® transfer is in progress.

Corrective Action

(None).

Syslog Message

%s transfer in progress or in-sync; canceling giveback.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).

replication.global events

replication.global.throttle

Severity

NOTICE

Description

This event is issued when the request to change/set the throttling value for a replication association is failed. This is because the network layer does not support throttling traffic. This usually happens when the connection is going through a tcp offload device.

Corrective Action

(None).

Failed to set global throttle value for transfer from %s:%s to %s:%s

Parameters

srcfiler (STRING): The replication source filer
srcpath (STRING): The replication src volume or qtree
dstfiler (STRING): The replication destination filer
dstpath (STRING): The replication destination volume or qtree

replication.lcl events

replication.lcl.noHostname

Severity

ERROR

Description

This message occurs when a SnapMirror® or SnapVault® transfer is started on a system without a host name.

Corrective Action

Configure the hostname on the indicated system before attempting a SnapMirror or SnapVault transfer operation.

Syslog Message

%s transfer could not be started because no host name is configured on this system.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error.

replication.nomemory events

replication.noMemory

Severity

ALERT

Description

This message occurs when there is insufficient memory for the replication transfer to continue.

Corrective Action

The system is out of memory. This could be a transient situation. Reduce the load on the system or defer the transfer.

Syslog Message

Replication transfer failed to allocate memory.

Parameters

file (STRING): File in which the software error occurred.
line (INT): Line number in the file for the software error.

replication.qtree events

replication.qtree.dst.disk.error

Severity

ALERT

Description

This message occurs when the replication destination engine receives blocks with disk errors from the source for the first time in a transfer and continues with replication.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror: transfer from %s:%s to %s:%s: Source volume has disk errors. Continuing with replication. See /etc/log/snapmirror for inconsistency details.

Parameters

src_filer (STRING): Source filer of this replication transfer.
src_path (STRING): Source path of this replication transfer.
dst_filer (STRING): Destination filer of this replication transfer.
dst_path (STRING): Destination path of this replication transfer.

replication.qtree.dst.disk.error.abort

Severity

ERROR

Description

This message occurs when the replication destination engine receives blocks with disk errors from the source and aborts because of user-set options.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror: transfer from %s:%s to %s:%s: Source volume has disk errors. (source fid:%u,source fbn:%u,source snapid:%u). Aborting transfer.

Parameters

src_filer (STRING): Source filer of this replication transfer.
src_path (STRING): Source path of this replication transfer.
dst_filer (STRING): Destination filer of this replication transfer.

dst_path (STRING): Destination path of this replication transfer.
sfileid (INT): Identifying number for the suspect file
sfbn (INT): File block number in which the disk error was found.
ssnapid (INT): Incremental snapshot of the source from which this file came.

replication.qtree.dst.disk.error.summary

Severity

ERROR

Description

This message occurs when the replication involving blocks with disk errors happens on the replication destination.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror: transfer from %s:%s to %s:%s: Source volume has disk errors. %u blocks out of %u blocks replicated are inconsistent. See /etc/log/snapmirror for inconsistency details.

Parameters

src_filer (STRING): Source filer of this replication transfer.
src_path (STRING): Source path of this replication transfer.
dst_filer (STRING): Destination filer of this replication transfer.
dst_path (STRING): Destination path of this replication transfer.
total_bad_blks (INT): Total number of blocks with disk errors received.
total_blks (INT): Total number of blocks received.

replication.qtree.dst.inconsistent.acl

Severity

ERROR

Description

This message occurs when the replication destination engine receives an Access Control List (ACL) with disk errors from the source.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror: transfer from %s:%s to %s:%s: Source volume has disk errors. (source acl fid:%u,source snapid:%u). Aborting transfer.

Parameters

src_filer (STRING): Source filer of this replication transfer.
src_path (STRING): Source path of this replication transfer.
dst_filer (STRING): Destination filer of this replication transfer.
dst_path (STRING): Destination path of this replication transfer.
sfileid (INT): Identifying number for the suspect ACL.
snapid (INT): Incremental snapshot of the source from which this ACL came.

replication.qtree.dst.inconsistent.symlink

Severity

ERROR

Description

This message occurs when the replication destination engine receives a symbolic link with disk errors from the source.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror: transfer from %s:%s to %s:%s: Source volume has disk errors. (source symlink fid:%u,source snapid:%u). Aborting transfer.

Parameters

src_filer (STRING): Source filer of this replication transfer.
src_path (STRING): Source path of this replication transfer.
dst_filer (STRING): Destination filer of this replication transfer.
dst_path (STRING): Destination path of this replication transfer.
sfileid (INT): Identifying number for the suspect symbolic link.
snapid (INT): Incremental snapshot of the source from which this symbolic link came.

replication.regoperr events

replication.regOpErr

Severity

ERROR

Description

This message occurs when the system encounters an error during a registry operation related to SnapMirror® or SnapVault®.

Corrective Action

The reasons for the error cited in the error message might indicate ways to address the problem.

Syslog Message

Replication registry operation error: %s.

Parameters

reason (STRING): Reason for registry operation failure.

replication.resync events

replication.resync.cmnSnpCnt

Severity

NOTICE

Description

This message occurs during a SnapMirror® or SnapVault® resync operation to inform the user of the number of common snapshots detected between the source and destination.

Corrective Action

(None).

Syslog Message

Resynchronization of %s:%s to %s:%s found %d matching snapshots; using the most recent one.

Parameters

dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination volume or qtree.
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source volume or qtree.
cmnsnapcnt (INT): Number of common snapshots detected between the source and destination.

replication.rmt events

replication.rmt.noHostname

Severity

ERROR

Description

This message occurs when the remote system of a SnapMirror® or SnapVault® transfer does not have a host name.

Corrective Action

Configure the host name on the remote system before attempting a SnapMirror or SnapVault transfer from that system.

Syslog Message

%s transfer from %s:%s to %s:%s cannot be started because the remote system does not have a host name.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error.

replication.src events

replication.src.err

Severity

ERROR

Description

This message occurs when the system detects an error on a SnapMirror® or SnapVault® source volume or qtree.

Corrective Action

(None).

Syslog Message

%s: source transfer from %s to %s:%s : %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcpath (STRING): Replication source volume or qtree.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination volume or qtree.
error (STRING): Specific error message.

replication.src.inconsistent.snapmap

Severity

ERROR

Description

This message occurs when a replication source engine encounters a disk error in a snapmap block. Replication transfer will abort.

Corrective Action

Run wafliron as soon as possible, and then Contact NetApp technical support.

Syslog Message

WAFL metadata inconsistent due to disk errors in volume %s. The affected snapshot ID is %d (level: %d). Aborting transfer.

Parameters

volname (STRING): Aggregate, traditional volume, or flexible volume name.
snapid (INT): Snapshot ID.
level (INT): Buffer level.

replication.src.throttleChange

Severity

NOTICE

Description

This event is issued when the replication source, receives a request from the destination to change the current throttle value.

Corrective Action

(None).

Syslog Message

Throttle value changed to %d Kbytes/s for destination %s:%s

Parameters

throttle (INT): The new throttle value.
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination volume or qtree

replication.src.throttleChange.err

Severity

ERROR

Description

This event is issued when the replication source, receives a request from the destination to change the current throttle value, but failed to complete the operation.

Corrective Action

(None).

Syslog Message

Failed to change throttle value to %d Kbytes/s for destination %s:%s : %s

Parameters

throttle (INT): The new throttle value.
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination volume or qtree
error (STRING): The error message

replication.src.unknownCommand

Severity

NOTICE

Description

This event is issued when the replication source, SnapMirror or SnapVault, receives a request from the destination which it does not understand. This can be seen when changes are made to the negotiation phase internally during development. This error message should NEVER show up on customer builds.

Corrective Action

This message is normally seen after upgrading the source or the destination. ONTAP version mismatch between the source and destination can cause this. One should not see this problem if the source and destination filers are running the same version of ONTAP.

Syslog Message

Replication source received an unknown command from the destination. This might be due to ONTAP version mismatch between the source and destination.

Parameters

(None).

replication.stats events

replication.stats.notLoaded

Severity

INFORMATIONAL

Description

This message occurs during system boot when SnapMirror® or SnapVault® cannot load the statistics (for example. the number of transfers completed) from the registry. The statistics from the previous run of the system are lost and SnapMirror or SnapVault will start collecting the statistics from scratch.

Corrective Action

(None).

Syslog Message

%s could not load statistics from the registry.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).

replication.stats.notSaved

Severity

INFORMATIONAL

Description

This message occurs when SnapMirror® or SnapVault® cannot save some statistics (for example. the number of transfers completed) in the registry at the end of a transfer. The operation is retried at the end of the next SnapMirror or SnapVault transfer.

Corrective Action

(None).

Syslog Message

%s could not save statistics to the registry.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).

replication.status events

replication.status.timeSkewed

Severity

NOTICE

Description

This message occurs when the time skew between the source and destination system is greater than 1 minute.

Corrective Action

Use either the 'date' or 'rdate' command to synchronize the time between the systems.

Syslog Message

%s: Clock on source %s is ahead of destination system %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on.).
srcfiler (STRING): The host name of the source system.
dstfiler (STRING): The host name of the destination system.

replication.upgrade events

replication.upgrade.complete

Severity

INFORMATIONAL

Description

This message occurs when post-upgrade operations for SnapMirror® and SnapVault®, as a part of ONTAP upgrade, are complete.

Corrective Action

(None).

Syslog Message

Post-upgrade operations for SnapMirror and SnapVault are complete.

Parameters

(None).

replication.vol events

replication.vol.activemapdelta.err

Severity

ERROR

Description

This message occurs when SnapMirror® or VolCopy replication encounters a disk error in the active map delta blocks on the destination and cannot continue replication.

Corrective Action

For a SnapMirror update operation, break the SnapMirror relation and then resynchronize the relation. For a VolCopy or SnapMirror Initialize operation, destroy the destination volume and retry the operation. If the problem persists, contact NetApp technical support.

Syslog Message

WAFL active map delta file is inconsistent due to disk errors '%s%s%s'. Aborting transfer.

Parameters

volname (STRING): Flexible volume name.
app (STRING): Application UUID.
volident (STRING): Volume unique identifier.

replication.vol.dst.disk.error

Severity

ERROR

Description

This message occurs when the replication destination engine receives the first disk error from the replication source in a transfer. Replication will continue. Subsequent disk errors encountered during this transfer will not trigger this event, but will be logged to /etc/log/snapmirror. A replication.vol.dst.disk.error.summary event is logged at the end of the transfer to report on the total number of errors encountered.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s: %s: Source volume has disk errors. Continuing replication. See /etc/log/snapmirror for inconsistency details.

Parameters

rpltype (STRING): Replication type - SnapMirror, Aggr copy, Vol copy.
transfer_paths (STRING): Replication source path and destination path.

replication.vol.dst.disk.error.abort

Severity

ERROR

Description

This message occurs when the replication destination engine receives blocks with disk errors from the source Replication will abort because the user selected the option to abort on disk error.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s: %s: Source volume has disk errors (vbn:%llu). Aborting transfer.

Parameters

rpltype (STRING): Replication type - SnapMirror, Aggr copy, Vol copy
transfer_paths (STRING): Replication source path and destination path
vbn (LONGINT): Volume Block Number

replication.vol.dst.disk.error.summary

Severity

ERROR

Description

This message occurs on the replication destination in a transfer that encounters disk errors. Details about the errors are in /etc/log/snapmirror.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s: %s: Source volume has disk errors. %u blocks out of %llu blocks replicated are inconsistent. See /etc/log/snapmirror for inconsistency details.

Parameters

rpl_type (STRING): Replication type - SnapMirror, Aggr copy, Vol copy.
transfer_path (STRING): Replication source path and destination path.
total_bad_blocks (INT): Total number of blocks with disk errors replicated.
total_blocks (LONGINT): Total number of blocks replicated.

replication.vol.src.inconsistent.metadata

Severity

ALERT

Description

This message occurs when a replication source engine encounters a disk error in the file system metadata. Replication transfer will abort.

Corrective Action

If the specified snapshot IDs contain 0 (active file system), run wafliron to fix the active file system. To continue replication transfer, delete the specified snapshots during the next reboot, either by using the boot menu command 'boot_snap_delete' or by using the CLI command 'vol online -r'. Then contact NetApp technical support.

Syslog Message

%s: %s: WAFL metadata inconsistent due to disk errors. (vbn:%llu level:%u file_type:%d) The affected snapshot IDs are %s. Aborting transfer.

Parameters

rpltype (STRING): Replication type - SnapMirror, Aggr copy, Vol copy
transfer_paths (STRING): Replication source path and destination path.
vbn (LONGINT): Virtual Volume Block Number
level (INT): Buffer level.
file_type (INT): Inode type.
snapstring (STRING): String containing the list of snapshot IDs of the snapshots that have the inconsistent blocks.

replication.wormlog events

replication.wormlog.appendFail

Severity

ERROR

Description

This event is issued when failed to append to the replication worm log file. This can be seen when the worm log volume is full, or other hardware failure in the log volume.

Corrective Action

Check the free space and the sanity of the worm log volume. Add or replace hard disk for the worm log volume.

Syslog Message

Failed to append to the replication worm log: %s.

Parameters

error_msg (STRING): Error message for the failure.

replication.xfr events

replication.xfr.checksum.fail

Severity

ERROR

Description

This message occurs when a SnapMirror®/SnapVault(tm) operation is not completed because a block received from the source system failed checksum verification. This might be caused by corruption in the network stream that went undetected by the TCP checksum.

Corrective Action

Scheduled SnapMirror/SnapVault update operations are automatically retried and should succeed. However, if the problem persists, use the 'netstat -s' command to review the network statistics for TCP packets "discarded for bad checksums". If you find large numbers of such discards, diagnose the network between the source and destination systems for any problems. If TCP does not report any checksum errors and this problem still persists, contact NetApp technical support technical support.

Syslog Message

%s transfer from %s:%s to %s:%s : %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error.

replication.xfr.nonExistSnap

Severity

NOTICE

Description

A SnapMirror® or SnapVault(tm) operation was not completed because the specified snapshot could not be found. Any of the following scenarios can cause this event to occur: (1) The SnapVault schedules are configured incorrectly at the destination. (2) The 'snapmirror initialize' or 'snapmirror update' command was issued with the '-s' option, and the transfer cannot start. (3) The SnapVault or SnapMirror transfer cannot restart from a checkpoint.

Corrective Action

For scheduled SnapVault updates, ensure that the snapshot name on the destination volume and source volume is the same. For 'snapmirror initialize' or 'update' commands from a named snapshot, ensure that the requested snapshot exists on the source volume. For restarted SnapVault or SnapMirror transfers, run the 'snapmirror abort' or 'snapvault abort' command with the '-h' option before retrying the transfer.

Syslog Message

%s transfer from %s:%s to %s:%s : %s.

Parameters

rtype (STRING): Replication type (SnapMirror, SnapVault, and so on).
srcfiler (STRING): Replication source appliance.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination appliance.
dstpath (STRING): Replication destination path.
rplerror (STRING): Replication error message.
waflerror (STRING): WAFL® error.

repository events

repository.cleanup events

Repository.Cleanup.BaseFile

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when there is a failure in the Infinite Volume while creating a stream on a nonexistent file, and the base file was left behind in the Vserver.

Corrective Action

Delete the file created from the mounted file system. Example: To delete a file from the Windows cmd shell: C:\Users\Administrator>del Z:\File.txt If the problem persists, contact NetApp technical support.

Syslog Message

Failure happened in the Infinite Volume while creating a stream on a nonexistent file, and the base file (handle: %s) was left behind in Vserver %u.

Parameters

filehandle (STRING): File handle of the base file that was created.
vserverId (INT): Vserver ID for which the error occurred.

repository.create events

Repository.Create.Placement.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a create request from a client, when the Infinite Volume namespace redirector encounters one or more of the following: 1. It made several attempts to create the item on some data constituents, but failed. It is possible that some data constituents, or aggregates in the Infinite Volume, or nodes in the cluster are not in a healthy state. 2. It could not find a data constituent in which to create the requested item. It is possible that the Infinite Volume is misconfigured or the configuration state of the Infinite Volume is corrupted.

Corrective Action

Verify that the Infinite Volume is configured properly. Verify that all the constituents are online by using the 'volume show' command with the '-constituents' option. Verify that all the aggregates for the Infinite Volume are online by using the 'aggregate show' command. If the problem persists or you need assistance, contact

NetApp technical support.

Syslog Message

A create request failed on the Infinite Volume. Reason: %s. This occurred in VServer %u.

Parameters

reason (STRING): Reason for the failure.
vserverId (INT): Vserver ID for which the error occurred.

repository.ctpupdate events

Repository.CTPUpdate.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when an update to the Create Time Placement (CTP) ruleset fails.

Corrective Action

Retry updating the ruleset by using the "vserver data-policy import" command. If the problem persists, contact NetApp technical support.

Syslog Message

Create Time Placement (CTP) ruleset update failed on the Infinite Volume. Reason: %s.

Parameters

reason (STRING): Reason for the failure.

repository.dangling events

Repository.Dangling.Data.File

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a client file operation request, when the Infinite Volume namespace redirector runs into failures that prevent it from cleaning up a file on a data constituent. This dangling file is unnecessarily consuming resources.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failures caused the Infinite Volume namespace redirector to leave a dangling file (handle: %s) on a data constituent in Vserver %u.

Parameters

filehandle (STRING): File handle of the file that is left dangling in the data constituent.
vserverId (INT): Vserver ID for which the error occurred.

Repository.Dangling.Redirector

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a client file operation request, when the Infinite Volume namespace redirector runs into a dangling redirector file on the namespace constituent.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failures caused the Infinite Volume namespace redirector to leave a dangling redirector file %s on the namespace constituent in Vserver %u.

Parameters

filehandle (STRING): File handle of the redirector file that is left dangling in the namespace constituent.
vserverId (INT): Vserver ID for which the error occurred.

repository.dc events

Repository.DC.Dangling.Lock

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a client file operation request, when the Infinite Volume runs into failures that prevent it from cleaning up a transient or client-originated lock on the data constituent. If there are enough of these dangling locks on the data constituent, the lock resource might be exhausted, which causes certain operations to fail.

Corrective Action

Clear the reported lock ID by using the 'vserver locks break' command at the advanced privilege level.

repository.inconsistent events

Repository.Inconsistent.Attribute

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a client file operation request, when the Infinite Volume namespace redirector detects an inconsistency in the file attributes for a file in the namespace constituent.

Corrective Action

Contact NetApp technical support.

Syslog Message

While servicing a protocol request, the Infinite Volume namespace redirector detected an inconsistency in the attributes of a file (handle: %s) in the namespace constituent in Vserver %u.

Parameters

filehandle (STRING): File handle of the file for which the error occurred.
vserverId (INT): Vserver ID for which the error occurred.

repository.invalid events

Repository.Invalid.Redirector

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs during a client file operation request, when the Infinite Volume namespace redirector detects an internal inconsistency in a redirector file in the namespace constituent.

Corrective Action

Contact NetApp technical support.

Syslog Message

While servicing a protocol request, the Infinite Volume namespace redirector detected an internal inconsistency in a file (handle: %s) in the namespace constituent in Vserver %u.

Parameters

filehandle (STRING): File handle of the file for which the error occurred.
vserverId (INT): Vserver ID for which the error occurred.

repository.ns events

Repository.NS.Dangling.Lock

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs during a client file operation request, when the Infinite Volume namespace redirector runs into failures that prevent it from cleaning up a transient lock on the namespace constituent. If there are enough of these dangling locks on the namespace constituent, the lock resource might be exhausted, which causes certain operations to fail.

Corrective Action

Clear the reported lock ID by using the 'vserver locks break' command at the advanced privilege level.

Syslog Message

Failures prevented the cleanup of a transient lock with UUID %s on the namespace constituent in Vserver %u.

Parameters

lockid (STRING): Lock UUID of the lock that is left dangling.
vserverId (INT): Vserver ID for which the error occurred.

Repository.NS.Dangling.Streams

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when a client wants to truncate the file and only the truncation of the data constituent file succeeds while the redirector truncation fails. This leaves behind dangling stream redirectors. These dangling stream redirectors cannot be read or modified and unnecessarily consume resources on the namespace constituent.

Corrective Action

Go to controller system shell, and delete all streams corresponding to that redirector. Example of deleting dangling streams from the system shell: bash-3.2$ ls /clus/vs0/NS/File.txt/nmatr%/ s1.txt s2.txt bash-3.2$ sudo rm -f /clus/vs0/NS/File.txt/nmatr%/* If the problem persists, contact NetApp technical support.

Syslog Message

Failures caused the Infinite Volume namespace redirector to leave dangling stream redirectors on file (handle: %s) on the namespace constituent in Vserver %u.

Parameters

filehandle (STRING): File handle of the redirector base file that has dangling stream redirectors.
vserverId (INT): Vserver ID for which the error occurred.

repository.snapshot events

Repository.Snapshot.Access

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when the Infinite Volume namespace redirector restores access to the Infinite Volume Snapshot(tm) copies after it recovers from an internal communication problem that had previously shut down access.

Corrective Action

(None).

Syslog Message

Infinite Volume namespace redirector restored access to the Snapshot copies after it recovered from an internal communication problem.

Parameters

(None).

Repository.Snapshot.NoAccess

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when the Infinite Volume namespace redirector cannot get access to Snapshot(tm) mapping updates due to an internal communication issue, so it prevents access to the Infinite Volume Snapshot copies. Several scenarios can cause this condition, including the following: 1. The cluster administrator has made the node ineligible for the cluster. 2. Intense system loading can cause this problem

temporarily.

Corrective Action

If the cluster administrator has made the node ineligible for the cluster (through "cluster modify"), make the node eligible again. If the condition persists or occurs repeatedly, other serious issues might be the cause and you should contact NetApp technical support.

Syslog Message

Infinite Volume namespace redirector shut down access to the Snapshot copies due to an internal communication problem.

Parameters

(None).

respmon events

revert events

revert.ufmt events

revert.ufmt.cap.tier.full

Severity

ALERT

Description

This message occurs when the revert operation to convert the unified object format is paused because the FabricPool aggregate has reached the maximum supported size of the capacity tier. The revert scan will resume when additional space is available in the capacity tier.

Corrective Action

Contact NetApp technical support.

Syslog Message

Revert operation to the convert the object format from "unified" to "native" is paused on aggregate "%s" because the capacity tier usage has reached its maximum allowed size.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.config.invalid

Severity

NOTICE

Description

This message occurs when the revert operation to convert the unified object format from "unified" to "native" is paused because the object store configuration associated with the FabricPool aggregate is not ready.

Corrective Action

This condition might be transient and the revert operation should resume automatically. If the problem persists, contact NetApp technical support.

Syslog Message

Revert operation to convert the object format from "unified" to "native" is paused on FabricPool aggregate "%s" because the associated object store configuration is not ready.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.mirror.not.sync

Severity

NOTICE

Description

This message occurs when the revert operation to convert the unified object format from "unified" to "native" is paused because the FabricPool mirror is not in sync with the primary object store attached to the FabricPool aggregate.

Corrective Action

This condition might be transient, and the revert operation should resume automatically when the FabricPool mirror is synced with the attached primary object store. If the problem persists, contact NetApp technical support.

Syslog Message

Revert operation to convert the object format from "unified" to "native" is paused on FabricPool aggregate "%s" because the FabricPool mirror is not in sync with the attached primary object store.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.objstore.failed

Severity

ERROR

Description

This message occurs when the revert operation to convert the unified object format is paused because it is unable to read objects from an unresponsive object store. Object format revert operation will resume when the object store is responsive.

Corrective Action

Verify that your intercluster LIF is online and functional by using the "network interface show" command. Also, check network connectivity to the object store server by using the "ping" command over the destination node intercluster LIF. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information is still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Revert operation to convert the object format from "unified" to "native" is paused on aggregate "%s" because the object store is unavailable.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.perf.tier.full

Severity

ALERT

Description

This message occurs when the revert operation to convert the unified object format is paused because the FabricPool aggregate does not have enough free space to tier cold data. The revert scan will resume when additional space is available in the performance tier.

Corrective Action

Either free space in the performance tier of the aggregate by moving volumes, removing volumes, or deleting data, or add space to the performance tier of the aggregate by adding disks.If the problem persists, Contact NetApp technical support.

Syslog Message

Revert operation to the convert the object format from "unified" to "native" is paused on aggregate "%s" because the current available space in the performance tier is below the minimum allowed size.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.tlog.disabled

Severity

NOTICE

Description

This message occurs when the revert operation to convert the unified object format is paused because FabricPool tiering is temporarily disabled on a MetroCluster setup. The object format revert will resume when FabricPool tiering is enabled.

Corrective Action

(None).

Syslog Message

Revert operation to convert the object format from "unified" to "native" is paused on aggregate "%s" because FabricPool tiering is disabled.

Parameters

aggregate_name (STRING): Aggregate name.

revert.ufmt.tlog.full

Severity

NOTICE

Description

This message occurs when the revert operation to convert the unified object format is paused because FabricPool tiering is temporarily suspended due to insufficient space to stage new objects. Tiering will resume when space is available after writing existing objects to the object store. The revert scan will resume when FabricPool tiering is enabled.

Corrective Action

(None).

Syslog Message

Revert operation to convert the object format from "unified" to "native" is paused on aggregate "%s" because FabricPool tiering is temporarily suspended on the aggregate.

Parameters

    aggregate_name (STRING): Aggregate name.

revert.ufmt.tlog.punch.pause

Severity

    NOTICE

Description

    This message occurs when the revert operation to convert unified object format is paused because the FabricPool aggregate has complete unified format objects waiting to be tiered to the object store. The revert operation will resume when FabricPool tiering has completed tiering all waiting "unified format" objects to the object store.

Corrective Action

    (None).

Syslog Message

    The operation to revert the object format to the native format paused on aggregate "%s" because the tiering of unified format objects to the object store is pending.

Parameters

    aggregate_name (STRING): Aggregate name.

revertto events

revertto.force events

revertTo.force

Severity

NOTICE

Description

This message occurs when a revert-to process is being initiated with the "force" flag, and configuration errors have been detected.

Corrective Action

(None).

Syslog Message

Forcing revert in spite of detected configuration errors.

Parameters

(None).

revertto.start events

revertTo.start

Severity

NOTICE

Description

This message occurs when a revert to process is started.

Corrective Action

(None).

Syslog Message

Starting revert to %s.

Parameters

target_release (STRING): Target release name to which the revert process was started.

revertto.system events

revertTo.system.reboot

Severity

NOTICE

Description

This message occurs when the system is rebooting to complete the revert process. During reboot, the RAID subsystem will be reverted. After the RAID subsystem reverts and the system reboots, the revert process is complete.

Corrective Action

(None).

Syslog Message

System reverting to work with Data ONTAP %s.

Parameters

target_release (STRING): Target release name to which the revert process was started.

rlib events

rlib.duplicate events

rlib.duplicate.ip.detected

Severity

ERROR

Description

This message occurs when an interconnect link IP address on this node has a conflict with an IP address on another node in the cluster.

Corrective Action

Reboot either this node or the other node reported in this event, while making sure that all interconnect links on the two nodes are connected, up, and operational.

Syslog Message

Interconnect link IP address %s on this node (System ID %d) is also in use by another node (System ID %d) in the cluster.

Parameters

dupIP (STRING): Conflicting IP address.
localSysid (LONGINT): System ID of the local node.
remoteSysid (LONGINT): System ID of the remote node.

rlib.ifconfig events

rlib.ifconfig.linkEvent

Severity

NOTICE

Description

This event is generated when there is a link event on the MCC/IP managed interface.

Corrective Action

(None).

Syslog Message

(None).

Parameters

ifname (STRING): The name of the interface
eventType (STRING): The event type

rlib.mccip events

rlib.mccip.config.failure

Severity

ERROR

Description

This event is generated if any error occurs while configuring MCC/IP.

Corrective Action

(None).

Syslog Message

Configuration error has occured in "%s", while setting up "%s ",with value: "%s", (error string='%s', error code=%d).

Parameters

objectOper (STRING): Operation being executed.
objectType (STRING): Type of Object - IP address/ Netmask/ Interface / Bootarg
objectValue (STRING): Value of IP address/ Netmask/ Interface / Bootarg
errorString (STRING): The error string
errNum (INT): The internal error code

rlib.mccip.config.missing

Severity

NOTICE

Description

This event is generated if any of the environment data relating to the configuration of an MCC/IP DR port is missing on boot.

Corrective Action

(None).

Syslog Message

(None).

Parameters

objectOper (STRING): Interface being configured.

rlib.remote events

rlib.remote.node.event

Severity

NOTICE

Description

This event is generated to print information about remote node such as IP address and sysid along with the event that occurred

Corrective Action

(None).

Syslog Message

(None).

Parameters

peerIP (STRING): IP address of remote node
peerSysid (LONGINT): Sysid of remote node
localIP (STRING): IP address of local node
localPort (STRING): Local rdma port name
eventDesc (STRING): Information about the event (Optional)

rlib.remote.node.update

Severity

NOTICE

Description

This event is generated when remote node sysid has changed as a part of headswap

Corrective Action

(None).

Syslog Message

(None).

Parameters

oldSysid (LONGINT): Old sysid of remote node
sysid (LONGINT): New sysid of remote node

rlm events

rlm.driver events

rlm.driver.hourly.stats

Severity

ERROR

Description

This message occurs when the system encounters an error while trying to get hourly statistics from the Remote LAN Module (RLM).

Corrective Action

1. Issue the 'rlm status' command at the Data ONTAP® prompt to check whether the RLM is online. 2. If the RLM is online and this message persists, issue the 'rlm reboot' command at the Data ONTAP prompt to reboot the RLM.

Syslog Message

The software driver for the Remote LAN Module (RLM) detected a problem: %s.

Parameters

reason (STRING): This error could be due to a communication error with the RLM or because the RLM is not operational.

rlm.driver.mailhost

Severity

ERROR

Description

This message occurs when Remote LAN module (RLM) setup verifies whether a mailhost specified in ONTAP can be reached. In this case, RLM setup cannot connect to the specified mailhost.

Corrective Action

1. Verify that a valid mailhost is configured in Data ONTAP by checking the system AutoSupport configuration. 2. Ensure that Data ONTAP can successfully connect to the specified mailhost by invoking test command to invoke AutoSupport.

Syslog Message

RLM setup could not access the mailhost specified in Data ONTAP.

Parameters

(None).

rlm.driver.network.failure

Severity

ERROR

Description

This message occurs when the system encounters a failure during network configuration of the Remote LAN Module (RLM). The system cannot assign the RLM a DHCP (Dynamic Host Configuration Protocol) or fixed IP address.

Corrective Action

1. Check whether the network cable is correctly plugged into the RLM network port. 2. Check the link status LED on the RLM. 3. The RLM supports a 10/100 Ethernet network in autonegotiation mode. Verify that the network that the RLM is connected to has autonegotiation enabled.

Syslog Message

The network configuration of the Remote LAN Module (RLM) failed due to cable or network errors.

Parameters

(None).

rlm.driver.timeout

Severity

ERROR

Description

This message occurs when there is a failure during communication with the Remote LAN Module (RLM) firmware.

Corrective Action

1. Issue the 'rlm status' command at the Data ONTAP® prompt to check whether the RLM is online. 2. If the RLM is operational and this message persists, issue the 'rlm reboot' command at the Data ONTAP prompt to reboot the RLM. After the reboot, this message should no longer occur. If the message occurs again, contact NetApp technical support and explain that you already performed the preceding steps.

Syslog Message

The software driver for the Remote LAN Module (RLM) detected a problem: %s.

Parameters

reason (STRING): This error could be due to a communication error with the RLM or because the RLM is not operational.

rlm.firmware events

rlm.firmware.upgrade.reqd

Severity

NOTICE

Description

This message occurs when the Remote LAN Module (RLM) firmware version and the Data ONTAP® software version are incompatible and cannot communicate correctly about a particular capability.

Corrective Action

For more information about upgrading your firmware, check your support provider's web site or knowledgebase. After the RLM is running the new firmware, this message should no longer occur. If the problem persists or you need further assistance, contact NetApp technical support.

Syslog Message

The RLM firmware %s is incompatible with Data ONTAP for %s.

Parameters

current_rlm_fw_version (STRING): Current firmware version on the RLM.
capability (STRING): RLM capability needed by Data ONTAP.

rlm.firmware.version.unsupported

Severity

NOTICE

Description

This message occurs when the firmware on the Remote LAN Module (RLM) is not an official release and must be upgraded.

Corrective Action

For more information about upgrading your firmware, check your support provider's web site or knowledgebase. After the RLM is running the new firmware, this message should no longer occur. If the problem persists or you need further assistance, contact NetApp technical support.

Syslog Message

The RLM firmware version %s is not an official release.

Parameters

current_rlm_fw_version (STRING): Current firmware version on the RLM.

rlm.heartbeat events

rlm.heartbeat.resumed

Severity

INFORMATIONAL

Description

This event is generated when the appliance detects resumption of Remote LAN Module (RLM) heartbeat notifications indicating that the RLM is now available. The earlier issue indicated by the rlm.heartbeat.stopped event has been resolved.

Corrective Action

(None).

Syslog Message

Heartbeat received from the Remote LAN Module (RLM).

Parameters

(None).

rlm.heartbeat.stopped

Severity

ERROR

Description

This event is generated when the filer does not receive Remote LAN Module (RLM) heartbeat notifications. The RLM card and the filer exchange heartbeat messages so that they can detect when one or the other is unavailable. This event is generated when the filer has not received an expected heartbeat message from the RLM.

Corrective Action

Connect to the RLM CLI and issue 1. rlm version 2. rlm config 3. priv set advanced 3.1 rlm log debug 3.2 rlm log messages 4. Run RLM system diagnostics 5. Consult RLM Troubleshooting Guide

Syslog Message

Have not received a heartbeat from the Remote LAN Module (RLM) in last %d seconds.

Parameters

max_anx (INT): Heartbeats have not been received from the Remote Lan Module (RLM) for this period of time in seconds.

rlm.network events

rlm.network.link.down

Severity

ERROR

Description

This message occurs when the Remote LAN Module (RLM) detects a link error on the RLM network port. This can happen if a network cable is not plugged into the RLM network port. It can also happen if the network that the RLM is connected to cannot run at 10/100 Mbps.

Corrective Action

1. Check whether the network cable is correctly plugged into the RLM network port. 2. Check the link status LED on the RLM. 3. The RLM supports a 10/100 Mbps Ethernet network in autonegotiation mode. Verify that the network that the RLM is connected to supports autonegotiation to 10/100 Mbps or is running at one of those speeds; otherwise, RLM network connectivity won't work.

Syslog Message

Remote LAN Module (RLM) network port link down due to cable or network errors.

Parameters

(None).

rlm.notconfigured events

rlm.notConfigured

Severity

ERROR

Description

This message occurs weekly to remind you to configure the Remote LAN Module (RLM). The RLM is a physical device that is incorporated into your system to provide remote access and remote management capabilities. To use the full functionality of RLM, you need to configure it first.

Corrective Action

1. Use the 'rlm setup' command to configure the RLM. If necessary, use the 'rlm status' command to obtain its MAC address. 2. Use the 'rlm status' command to verify the RLM network configuration. 3. Use the 'rlm test autosupport' command to verify that the RLM can send AutoSupport email. Note that AutoSupport mailhosts and recipients must be properly configured in Data ONTAP before issuing this command.

Syslog Message

The system's Remote LAN Module (RLM) is not configured. Use the 'rlm setup' command to configure it.

Parameters

(None).

rlm.orftp events

rlm.orftp.failed

Severity

NOTICE

Description

A communication error occured while sending or receiving information from the Remote Lan Module (RLM).

Corrective Action

1. Issue the 'rlm status' command at the Data ONTAP prompt to check whether the RLM is operational. 2. If the RLM is operational and this message persists, issue the 'rlm reboot' command at the Data ONTAP(tm) prompt to reboot the RLM. 3. If this message persists after the RLM has been rebooted, contact NetApp technical support.

Syslog Message

RLM communication error, %s.

Parameters

reason (STRING): This error could be due to : 1. Communication error while the information is being sent or received. 2. Remote Lan Module (RLM) being non-operational.

rlm.snmp events

rlm.snmp.traps.off

Severity

INFORMATIONAL

Description

This message occurs each time a system boots, if the advanced privilege level in Data ONTAP® was used to disable the SNMP Trap feature of the Remote LAN Module (RLM). This message also occurs when the SNMP Trap capability was disabled and a user invokes a Data ONTAP command to use the RLM to send an SNMP trap.

Corrective Action

RLM SNMP Trap support is currently disabled. To enable this feature, set the 'rlm.snmp.traps' option to On.

Syslog Message

RLM's SNMP Trap support is currently disabled. Set option 'rlm.snmp.traps' to 'On' to enable this feature.

Parameters

(None).

rlm.ssh events

rlm.ssh.access.resetup

Severity

ERROR

Description

RLM SSH access list needs to be resetup.

Corrective Action

Use 'system sp_ssh_access_list modify' CLI to resetup RLM SSH access list.

Syslog Message

RLM SSH access list needs to be resetup.

Parameters

(None).

rlm.userlist events

rlm.userlist.update.failed

Severity

ERROR

Description

There was an error while updating user information for the Remote Lan Module (RLM). When user information is updated on Data ONTAP®, the RLM is also updated with the new changes. This allows users to login to the RLM.

Corrective Action

1. Issue the 'rlm status' command at the Data ONTAP() prompt to check whether the Remote Lan Module (RLM) is operational. 2. If the RLM is operational, and this message persists, issue the 'rlm reboot' command at the Data ONTAP® prompt to reboot the RLM. 3. Retry the operation that caused the error message. 4. If this message persists after the RLM has been rebooted, contact NetApp technical support.

Syslog Message

Error updating RLM user information, %s.

Parameters

reason (STRING): User information update for the Remote Lan Module (RLM) may have failed due to : 1. Communication error with the RLM. 2. RLM may not be operational.

rpc events

rpc.unspecified events

rpc.unspecified.error

Deprecated

Deprecated as of version 9.2 where this RPC mechanism was withdrawn.

Severity

NOTICE

Description

This event is issued when turning an ypgroup update fails to occur.

Corrective Action

(None).

Syslog Message

RPC: Failed (unspecified error)

Parameters

(None).

rpc.xprt events

rpc.xprt.limit

Deprecated

Deprecated as of version 9.2 where this RPC mechanism was withdrawn.

Severity

ERROR

Description

This message occurs when the number of active connections to a side band Remote Procedure Call (RPC) reaches the limit. This limit is not configurable.

Corrective Action

To check for stale client connections, use the output from the CLI "netstat" command.

Syslog Message

Active TCP connections to side band RPC service with program number %u has reached a limit of %d connections.

Parameters

prog (INT): TCP program number of RPC service to which the connection request arrived.
max_conn (INT): Maximum number of active connections to RPC service.

rpc.xprt.vfiler.limit

Deprecated

Deprecated as of version 9.2 where this RPC mechanism was withdrawn.

Severity

ERROR

Description

This message occurs when the number of active connections to side band Remote Procedure Call (RPC) services of a vFiler unit reaches the limit. This limit is not configurable.

Corrective Action

To check for stale client connections, use the output from the CLI "netstat" command.

Syslog Message

Active TCP connections to side band RPC services of vFiler %s has reached a limit of %d connections.

Parameters

vfiler (STRING): Name of the vFiler unit to which the connection request arrived.
vf_max_conn (INT): Maximum number of active connections to sideband RPC services of this vFiler unit.

rpl events

rpl.check events

rpl.check.unusable.log.file

Severity

ERROR

Description

This message occurs when SnapMirror® Fixer detects inconsistency in the verifier log file generated by a previous SnapMirror 'check' operation. The SnapMirror 'fixer' operation will be terminated.

Corrective Action

Run the SnapMirror 'fixer' command.

Syslog Message

The SnapMirror verifier log is inconsistent and could not be used.

Parameters

(None).

rpl.fixer events

rpl.fixer.launch.autocheck

Severity

NOTICE

Description

This message occurs when SnapMirror® Fixer cannot use the log files generated by a previous SnapMirror 'check' operation. A new SnapMirror 'check' operation will be started.

Corrective Action

(None).

Syslog Message

SnapMirror Fixer could not use the %s log file. A new SnapMirror 'check' operation will be started.

Parameters

filetype (STRING): Type of SnapMirror checker log file.

rpl.snapshot events

rpl.snapshot.delete.error

Severity

ERROR

Description

This message occurs when SnapMirror® or SnapVault® cannot delete one of its snapshots.

Corrective Action

SnapMirror or SnapVault tries to delete this snapshot during the next update. However, if no further updates are possible or planned, you should delete this snapshot manually.

Syslog Message

(None).

Parameters

snapname (STRING): Snapshot copy name.
volname (STRING): Volume name.
error (STRING): WAFL® error message.

rpl.src events

rpl.src.lun.old_clone

Severity

ERROR

Description

This message occurs when the replication source finds a LUN clone in a snapshot that was created on a ONTAP version earlier than 7.3 and was attempting to transfer as a LUN clone instead of a LUN. Transferring a LUN clone in a snapshot that was created on ONTAP version earlier than 7.3 as a LUN clone might lead to divergence on the replication destination.

Corrective Action

Only SnapVault® transfers that are managed using Ontapi can get into this situation. If SnapVault® restore is using a named snapshot transfer, then choose a different named snapshot. If SnapVault® is not using named snapshot transfer, then delete the snapshot and try again.

Syslog Message

%s transfer from %s:%s to %s:%s is attempting to transfer a LUN clone from a pre ONTAP 7.3 snapshot %s to the destination as a LUN clone.

Parameters

transfer_type (STRING): Type of the transfer.
source_filer (STRING): System name of the replication source.
source_path (STRING): Path of the qtree where the clones reside.
dest_filer (STRING): System name of the replication destination.
dest_path (STRING): Replication destination path.
snapname (STRING): Name of the backup snapshot of the LUN clone.

rpt events

rpt.disk events

rpt.disk.uuid.gen.failed

Severity

ERROR

Description

This message occurs when the generation of a disk UUID fails.

Corrective Action

Investigate the Directed Attached (DA) disk to fix the error, and then reboot the device.

Syslog Message

Disk name %s and disk unit number %d of RAID passthru with error message %s.

Parameters

d_name (STRING): Disk name.
d_unit (INT): Unit number.
errmsg (STRING): Whether the device failed or is misconfigured.

rsh events

rsh.enabled events

rsh.enabled

Severity

NOTICE

Description

This message occurs when rsh is enabled in the cluster using the (privilege: advanced) "security protocol" command.

Corrective Action

(None).

Syslog Message

Insecure protocol service rsh has been enabled in the cluster.

Parameters

(None).

rsh.firewall events

rsh.firewall.policy.remove

Severity

NOTICE

Description

This message occurs when rsh is automatically removed from firewall policies during a revert operation from Data ONTAP® 9.0 to 8.3. Rsh is removed because it is an insecure protocol and it is by default disabled in Data ONTAP 9.0. In Data ONTAP 8.3, the presence of rsh in firewall policies after a revert operation enables rsh. To prevent this, the rsh firewall policy is removed during the operation.

Corrective Action

Use the "system services firewall policy create" command to reenable rsh.

Syslog Message

Rsh removed from firewall policy because of Data ONTAP revert operations. Rsh is now disabled.

Parameters

(None).

rsh.rcmd events

rsh.rcmd.port.bind

Severity

ERROR

Description

This message occurs when there is an error in binding a reserved port.

Corrective Action

(None).

Syslog Message

rcmd.c: Bind error %d on reserved port %d.

Parameters

errNum (INT): Error number.
port (INT): Port number.

rsh.rcmd.port.used

Severity

ERROR

Description

This message occurs when there is no port available for binding to a socket, because all the reserved ports are in use.

Corrective Action

(None).

Syslog Message

rcmd.c: All reserved ports have been used.

Parameters

(None).

rsh.setsockopt events

rsh.setsockopt.failure

Severity

ERROR

Description

This message occurs when the setsockopt option on the RemoteShell(RSH) socket fails; RSH is not available.

Corrective Action

Use the error message to determine the problem.

Syslog Message

RSH setsockopt error: option level '%s', option value '%s', error code '%d', error message '%s'.

Parameters

socketlevel (STRING): Socket option level parameter.
socketoption (STRING): Socket option value parameter.
errorcode (INT): Error code returned from setsockopt.
reason (STRING): Error message for the failure.

rsh.socket events

rsh.socket.failure

Severity

ERROR

Description

The rshd daemon could not create a socket.

Corrective Action

Disable and enable rshd daemon using options rsh.enable.

Syslog Message

RSH socket error: %s.

Parameters

reason (STRING): The reason why the rshd daemon could not create a socket.

rshd events

rshd.failure events

rshd.failure

Severity

ERROR

Description

This event is generated after rshd failed to start.

Corrective Action

Restart the rsh daemon for the affected vfiler by using the vfiler run command to set the rsh.enable option to off and then to on for that vfiler.

Syslog Message

rshd failed to start for vfiler %s

Parameters

vfilername (STRING): The name of the vfiler that attempted to start rshd

s3 events

s3.bucket events

s3.bucket.invalid.accessKey

Severity

ERROR

Description

This message occurs when the access key is invalid and it has been used to access the S3 bucket/object.

Corrective Action

Verify that the access key is valid and it has been configured correctly before accessing the bucket/object.

Syslog Message

S3 %s operation failed while accessing bucket "%s" on S3 server %s because access key "%s" is invalid.

Parameters

operation (STRING): S3 request name.
bucket (STRING): Name of the S3 bucket.
serverHostname (STRING): Hostname of the S3 server.
accessKey (STRING): Access key.

s3.bucket.notFound

Deprecated

This event is renamed to "osc.bucket.notFound"

Severity

ERROR

Description

This message occurs when the bucket is not found while trying to access an S3 object.

Corrective Action

Verify that the bucket has been created on the S3 server and the bucket name has been correctly configured in ONTAP before accessing the bucket.

Syslog Message

Bucket "%s" not found on S3 server %s when performing %s operation.

Parameters

bucket (STRING): Name of the S3 bucket.
serverHostname (STRING): Hostname of the S3 server.
operation (STRING): S3 request name.

s3.bucket.signatureMismatch

Deprecated

This event is renamed to "osc.signatureMismatch"

Severity

ERROR

Description

This message occurs when the request signature sent to the S3 server does not match the signature calculated by the server. This could be due to either an incorrect secret key or an internal ONTAP software error in calculating the signature.

Corrective Action

Verify that the secret access key is configured correctly. If it is correct, contact NetApp technical support for assistance.

Syslog Message

S3 %s operation server-calculated request signature does not match the signature sent to S3 server %s for bucket "%s".

Parameters

operation (STRING): S3 request name.
serverHostname (STRING): Hostname of the S3 server.
bucket (STRING): Name of the S3 bucket.

saml events

saml.cfg events

saml.cfg.idp.download

Severity

NOTICE

Description

This message occurs when the Security Assertion Markup Language (SAML) Service Provider (SP) configuration fails to download the Identity Provider (IdP) metadata. Any partial configuration is removed automatically on this node only.

Corrective Action

Verify that the IdP metadata URI is reachable via the clustered Data ONTAP® "network ping" or "network ping6" command. If you need further assistance, contact NetApp technical support.

Syslog Message

SAML SP IdP metadata download from %s was not completed successfully. Error: '%s'.

Parameters

idp_uri (STRING): IdP metadata location.
reason (STRING): Reason for the download failure.

saml.cfg.setup.incomplete

Severity

NOTICE

Description

This message occurs when the Security Assertion Markup Language (SAML) Service Provider (SP) configuration is not completed successfully. Any partial configuration is removed automatically on this node only. This failure does not prevent authentication of any user. However, the Identity Provider (IdP) cannot retrieve the SP metadata from this node. This node automatically attempts to complete the configuration when the 'security saml modify -is-enabled true' command is executed.

Corrective Action

Use the 'security saml status show' command to see the status of all nodes. Verify the health of all nodes. To create the configuration without enabling SAML authentication, use the 'security saml delete' and 'security saml create' commands to re-create the configuration. If this behavior persists, contact NetApp technical support.

Syslog Message

SAML SP configuration creation was not completed successfully.

Parameters

(None).

saml.cfg.sync.fail

Severity

ERROR

Description

This message occurs when the Security Assertion Markup Language (SAML) Service Provider (SP) configuration fails to synchronize on this node. This synchronization is most commonly performed due to SAML SP configuration changes or as new nodes come online. This failure might impact SAML-based authentication of any user, but will not impact data access.

Corrective Action

Use the 'security saml status show' command to see the status of all nodes. Verify the health of all nodes. If this behavior persists, contact NetApp technical support.

Syslog Message

SAML SP configuration modification was not completed successfully.

Parameters

(None).

san events

san.changedhomenode events

san.ChangedHomeNode

Severity

NOTICE

Description

This message occurs when the home node of an existing SAN LIF is modified during LIF placement.

Corrective Action

(None).

Syslog Message

Home node changed from %s to %s while placing LIF %s in Vserver %s.

Parameters

old_node_name (STRING): Name of the old home node of the existing SAN LIF.
node_name (STRING): Name of the new home node of the existing SAN LIF.
lif (STRING): LIF name.
vserver_name (STRING): Vserver name.

san.changedhomeport events

san.ChangedHomePort

Severity

NOTICE

Description

This message occurs when the home port of an existing SAN LIF is modified during LIF placement.

Corrective Action

(None).

Syslog Message

Home port changed from %s to %s while placing LIF %s in Vserver %s.

Parameters

old_port_name (STRING): Name of the old home port of the existing SAN LIF.
port_name (STRING): Name of the new home port of the existing SAN LIF.
lif (STRING): LIF name.
vserver_name (STRING): Vserver name.

san.duplicateipaddress events

san.DuplicateIpAddress

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations of clustered ONTAP®, when an IP LIF is created in the source cluster, but one of the storage virtual machines (SVMs) in the destination cluster is already configured with an IP LIF having the same IP address.

Corrective Action

Provide a unique IP address for the primary SVM IP LIF when creating or modifying the LIF in the source cluster. After modifying the IP address, check that SVM configuration state is healthy by using the "metrocluster vserver show -vserver <vserver>" command. If Vserver configuration state is not healthy, resynchronize the SVM with its partner by using the "metrocluster vserver resync" command.

Syslog Message

One of the SVM's in the destination cluster is configured with an %s LIF with the same IP address %s. Provide a different unique IP address for the primary SVM %s LIF %s when creating or modifying the LIF in the source cluster.

Parameters

destination_data_protocol (STRING): Data protocol of the destination storage virtual machine (SVM) LIF.
IpAddress (STRING): IP address existing in the destination cluster.
primary_data_protocol (STRING): Data protocol of the primary SVM LIF.
lif (STRING): Name of the primary SVM IP LIF.

san.duplicatewwpn events

san.DuplicateWWPN

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations of clustered Data ONTAP®, when an FC LIF is created in the source cluster, but one of the Vservers in the destination cluster is already configured with an FC LIF having the same WWPN.

Corrective Action

Provide a unique WWPN for the primary Vserver FC LIF when creating or modifying the LIF in the source cluster.

Syslog Message

One of the Vservers in the destination cluster is configured with an FC LIF with the same WWPN %s. Provide a different unique WWPN for the primary Vserver FC LIF %s when creating or modifying the LIF in the source cluster.

Parameters

wwpn (STRING): WWPN existing in the destination cluster.
lif (STRING): Name of the primary Vserver FC LIF.

san.fcadapter events

san.fcadapter.init.failure

Severity

ERROR

Description

This message occurs when FC adapters hosting LIFs fails to initialize during node boot.

Corrective Action

Reboot the affected node. If the problem persists, contact NetApp technical support.

Syslog Message

The following FC adapters with configured LIFs failed to initialize: %s.

Parameters

adapters (STRING): List of FC adapters that failed to initialize.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

san.fcnvmeunsupportedport events

san.FcNvmeUnsupportedPort

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP has an FC NVMe (Nonvolatile Memory Express) logical interface (LIF) hosted on an unsupported FC port.

Corrective Action

Use the "fcp adapter show -fields data-protocols-supported" command to view the list of valid Fibre-Channel ports in the fabric. Identify the Fibre-Channel ports that supports FC-NVMe LIFs with the help of the "data-protocols-supported" field. Bring down the FC-NVMe LIF using the "network interface modify -vserver <vserver_name> -lif <lif_name> -status-admin down" command and move the FC-NVMe LIF to an FC port which support FC-NVMe LIFs using the "network interface modify -vserver <vserver_name> -lif <lif_name> -home-port <FC_NVME_LIF_supported_FC_port_name> -home-node <Node_name_of_supported_FC_port>" command. Bring the FC-NVMe LIF back up using the "network interface modify -vserver <vserver_name> -lif <lif_name> -status-admin up" command, run the "metrocluster check run" command and then verify that the LIF placement succeeded by using the "metrocluster check lif show -vserver <vserver_name> -lif <lif_name>" command.

Syslog Message

Port "%s" on node "%s" does not support hosting FC-NVMe LIF "%s".

Parameters

> **port** (STRING): Unsupported port that hosts the FC-NVMe LIF.
> **node** (STRING): Name of the node on which the LIF is hosted.
> **lif** (STRING): Name of the FC-NVMe LIF hosted on unsupported FC port.

san.initiator events

san.initiator.login

Severity

> NOTICE

Description

> This message occurs when ONTAP detects that an initiator which was previously not logged on is now logged on.

Corrective Action

> (None).

Syslog Message

> Missing login for initiator "%s", Vserver "%s", portset "%s", has been logged on.

Parameters

> **initiator** (STRING): Initiator that was previously not logged on.
> **vserver** (STRING): Name of the Vserver.
> **portset** (STRING): Name of the portset that the initiator must be logged in to.
> **vserver_uuid** (STRING): UUID of the Vserver.

san.initiator.login.missing

Severity

> NOTICE

Description

> This message occurs when ONTAP detects that an initiator configured in one or more igroups is not logged in, which is required to ensure full SAN connectivity. Access to LUNs might be disrupted if a failover occurs.

Corrective Action

> Verify the host and fabric configuration to ensure connectivity to the node.

Syslog Message

> Initiator "%s" is not logged in to any LIFs on this node for Vserver "%s", portset "%s". Access to LUNs might be disrupted if a failover occurs.

Parameters

> **initiator** (STRING): Initiator that is not logged in.
> **vserver** (STRING): Name of the Vserver.
> **portset** (STRING): Name of the portset that the initiator must be logged in to.
> **vserver_uuid** (STRING): UUID of the Vserver.

san.initiator.login.not.req

Severity

NOTICE

Description

This message occurs when ONTAP detects that an initiator which was previously not logged on no longer needs to be logged on.

Corrective Action

(None).

Syslog Message

Missing login for initiator "%s", Vserver "%s", portset "%s" is no longer required.

Parameters

initiator (STRING): The initiator that was previously not logged on.
vserver (STRING): Name of the Vserver.
portset (STRING): Name of the portset that the initiator was not logged on to.
vserver_uuid (STRING): UUID of the Vserver.

san.iscsilifrepaired events

san.iscsiLifRepaired

Severity

NOTICE

Description

This message occurs when an iSCSI LIF is repaired during Vserver initialization. The LIF did not have a relative target port ID (rtpid) assigned, so a unique ID was associated with this LIF.

Corrective Action

None.

Syslog Message

The iSCSI LIF "%s" on Vserver "%s" was repaired during Vserver initialization. The LIF did not have a relative target port ID (rtpid) assigned, so a unique ID was associated with this LIF.

Parameters

lif_name (STRING): Igroup name.
vserver_name (STRING): Vserver name.

san.lifmove events

san.lifmove.fail

Severity

EMERGENCY

Description

This message occurs when a LIF move failed and the recovery action to restore the LIF has also failed. LUNs are no longer accessible through this LIF. The LIF must be recovered manually.

Corrective Action

Restore the LIF using the 'network interface create' command. Also, restore any iscsi access list settings and FQDN settings using 'iscsi interface' commands. Specific recovery commands are listed in the 'recover_commands' parameter. For more information or assistance, contact NetApp technical support.

Syslog Message

Moving LIF %s of vserver %s from %s:%s to %s:%s failed. Manual recovery required.

Parameters

lif_name (STRING): LIF name.
vserver (STRING): Vserver name.
src_node (STRING): LIF was moving from this node.
src_port (STRING): LIF was moving from this port.
dest_node (STRING): LIF was moving to this node.
dest_port (STRING): LIF was moving to this port.
address (STRING): LIF address.
recovery_commands (STRING): Commands to recover the LIF and associated settings.

san.lifmoveafterswitchback events

san.lifmoveafterswitchback

Severity

ERROR

Description

This message occurs during MetroCluster(tm) switchback, when a LIF cannot be placed on one of the disaster recovery (DR) nodes because it is offline. The LIF will be placed on the HA partner of the DR node.

Corrective Action

After the MetroCluster switchback operation is completed successfully, bring online the MetroCluster DR node. Change the home node of the LIF to the MetroCluster DR node by using the "network interface modify" command.

Syslog Message

MetroCluster DR node %s is offline. The LIF %s belonging to Vserver %s will be placed on the HA partner node %s.

Parameters

dr_node_name (STRING): Name of the MetroCluster DR node that is offline.
lif (STRING): LIF name.
vserver_name (STRING): Vserver name.
node_name (STRING): Name of the HA partner node of the MetroCluster DR node.

san.lifrepfieldsmissing events

san.LifRepFieldsMissing

Severity

ERROR

Description

This message occurs when the system cannot replicate a SAN logical interface (LIF) in a MetroCluster(tm) configuration, because one or more attributes of the source LIF cannot be determined.

Corrective Action

Verify that the home node of the LIF created or modified on the primary cluster is up. Also verify that the LIF's operational status is up, by using the "network interface show -vserver <vserver_name> -lif <lif_name>-fields status-oper" command. Check whether the Vserver configuration state is healthy by using the "metrocluster vserver show -vserver <vserver_name>" command. If the configuration state is unhealthy, resynchronize the Vserver with its partner by using the "metrocluster vserver resync" command.

Syslog Message

Attempted LIF replication failed on the destination cluster node %s for SAN LIF %s for Vserver %s.

Parameters

node (STRING): Name of the destination cluster node (DR partner) that attempted LIF replication.
lif (STRING): Name of the SAN LIF.
vserver (STRING): Name of the Vserver.

san.lifspernodelimit events

san.LifsPerNodeLimit

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP cannot replicate a SAN or NVMe logical interface (LIF) in the destination cluster due to the LIF limits per node per Vserver.

Corrective Action

Make sure all the nodes are online by running "storage failover show" command on both the clusters. If a node is taken-over by its HA partner, giveback the node using "storage failover giveback -ofnode <name_of_node_to_giveback>". Once the nodes are online and healthy, run the "metrocluster vserver resync -vserver <vserver_name>" from the source cluster. Verify the vserver's configuration-state is healthy using "metrocluster vserver show -vserver <vserver_name>" command. Contact technical support for assistance if configuration-state of the vserver does not change to healthy.

Syslog Message

Metrocluster does not support more than %s %s LIFs per node per Vserver.

Parameters

limit (STRING): LIF limit supported on Metrocluster
data_protocol (STRING): Data protocol of the LIF that exceeds the LIF per node per Vserver limit.

san.mccpurgeverifyfailed events

san.MCCPurgeVerifyFailed

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered Data ONTAP® systems when a SAN cache purge verify operation fails. The corresponding Vservers are not available to take part in the subsequent switchover or switchback operation until the purge verify operation succeeds.

Corrective Action

Contact NetApp technical support for assistance in purging the SAN cache.

Syslog Message

The following Vservers: %s failed in the SAN cache purge verify operation. Contact NetApp technical support for assistance in purging the SAN cache.

Parameters

vserver (STRING): List of Vservers that failed the purge verify operation.

san.mccvserverinitfailed events

san.MCCVserverInitFailed

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered Data ONTAP® systems when SAN Vserver failed to initialize during a switchover or switchback operation.

Corrective Action

Contact NetApp technical support for assistance in initialization of the SAN Vserver.

Syslog Message

The Vserver %s failed to initialize. Reason: %s. Contact NetApp technical support for assistance in initialization of the Vserver.

Parameters

vserver (STRING): The SAN Vserver that failed to initialize.
reason (STRING): The reason for failure.

san.mccvserverinitpending events

san.MCCVserverInitPending

Severity

ALERT

Description

This message occurs in MetroCluster™ configurations on clustered Data ONTAP® systems when SAN Vservers exceed the time allotted for initialization during a switchover or switchback operation. This is not a failure, but a delay in initialization.

Corrective Action

Contact NetApp technical support for assistance in analyzing the reason for delay in Vserver initialization.

Syslog Message

The following Vservers: %s exceeded the time allotted (%u seconds) for Vserver initialization. Contact NetApp technical support to analyze the reason for delay in Vserver initialization.

Parameters

pending_vservers (STRING): List of the SAN Vservers pending Vserver initialization.
san_budget_in_msecs (INT): Maximum time (in seconds) the system waits for the SAN Vservers to complete initialization during a switchover or switchback operation.

san.missinglicense events

san.MissingLicense

Severity

ERROR

Description

This message occurs during replication of the FC/iSCSI service configuration, when the required service is not licensed or has expired in the cluster.

Corrective Action

Add the missing or expired license in the cluster by using the "license add" command.

Syslog Message

%s license could be missing or expired in the cluster.

Parameters

license_name (STRING): Name of the missing license.

san.noconnectedfcport events

san.NoConnectedFCport

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP cannot replicate an FC/FC-NVMe (Nonvolatile Memory Express) logical interface (LIF) to a candidate port in the destination cluster. A candidate port is one that satisfies the following conditions: 1) It must reside on the disaster recovery (DR) partner node. 2) It must be connected to the same FC fabric as the home port of the primary Vserver FC/FC-NVMe LIF.

Corrective Action

Check the cabling to ensure that ports on the destination cluster node (DR partner) are connected to the same fabric as the source cluster port hosting the primary Vserver FC/FC-NVMe LIF. Use the "fcp adapter show -fields fabric-name" command to view the port-fabric connectivity information. After ensuring proper fabric connectivity, run the "metrocluster check lif repair-placement" command on the source cluster with the Vserver name and LIF name as inputs to perform lif placement followed by the "metrocluster check lif show" command to verify the results of the command.

Syslog Message

There are no ports on node "%s" connected to fabric "%s" in the destination cluster. Cannot place "%s" LIF "%s" hosted on the source cluster port %s of %s adapter type for Vserver "%s".

Parameters

node (STRING): Name of the destination cluster node (DR partner) that does not have a port connected to the fabric.
fabric_name (STRING): Name of the fabric that the source cluster port hosting the primary Vserver FC/FC-NVMe LIF is connected to.
data_protocol (STRING): Data Protocol of the FC/FC-NVMe LIF.
lif (STRING): Name of the FC/FC-NVMe LIF to be placed.
port (STRING): Source cluster port that hosts the primary Vserver FC/FC-NVMe LIF.
adapter_type (STRING): Adapter type of the source cluster port that hosts the primary Vserver FC/FC-NVMe LIF.
vserver (STRING): Name of the secondary Vserver in the MetroCluster relationship.

san.NoConnectedFCport.prim

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when the source cluster FC port that is hosting an FC/FC-NVMe LIF of the primary Vserver is not connected to any fabric. The LIF cannot be placed correctly at the destination cluster because fabric information is not available.

Corrective Action

Check the wiring of the source cluster FC port to ensure that it is connected to the fabric. Use the "fcp adapter show -fields fabric-name" command to view the port-fabric connectivity information. After ensuring proper fabric connectivity, enter the "metrocluster check lif repair-placement -vserver <vserver_name> -lif <lif_name>" command in the source cluster to intiate the LIF placement at the secondary cluster. After LIF placement has been completed, enter the "metrocluster check lif show -vserver <vserver_name> -lif <lif_name>" to see whether lif placement succeeded or not.

Syslog Message

The source cluster FC port %s that is hosting "%s" LIF %s on primary Vserver %s is not connected to any fabric.

Parameters

home_port (STRING): Name of the source cluster FC port.
data_protocol (STRING): Data Protocol of the lif.
lif (STRING): Name of the FC/FC-NVMe LIF.
vserver (STRING): Name of the primary Vserver.

san.noconnectediscsiport events

san.NoConnectediSCSIPort

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered ONTAP® systems, when ONTAP cannot replicate an IP logical interface (LIF) to a candidate port in the destination cluster. A candidate port is one that both resides on the disaster recovery (DR) partner node and is connected to the same subnet as the home port of the primary SVM IP LIF.

Corrective Action

Check the wiring of the network ports and ensure that there are ports on the destination cluster node (DR partner) that are connected to the same subnet as the source cluster port hosting the primary SVM IP LIF. If the wiring is correct but this failure is still reported when you run the "metrocluster check lif show" command, ensure that the source LIF is operationally up. If the admin-status of the source LIF is down, bring it up using the "network interface modify" command. When the source LIF is up, run the "metrocluster check lif repair-placement" command from the source cluster, with the SVM name and the LIF name as inputs. Enter the "metrocluster check lif show" command again to check whether LIF placement succeeded or not.

Syslog Message

Subnet discovery failed during LIF replication. There might not be any ports on the destination cluster node %s that are connected to subnet %s in IP space %s to place the %s LIF %s for SVM %s.

Parameters

node (STRING): Name of the destination cluster node (DR partner) that does not have a port connected to the subnet.
subnet (STRING): The subnet that the primary cluster port hosting the primary SVM IP LIF is connected to.
ipspace_name (STRING): Name of the IP space that the primary cluster port hosting the primary SVM IP LIF is connected to.
data_protocol (STRING): Data protocol of the LIF.
lif (STRING): Name of the IP LIF.
vserver (STRING): Name of the secondary SVM in the MetroCluster relationship.

san.nofcportsonnode events

san.NoFCPortsOnNode

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered Data ONTAP® systems when an attempt to place an FCP LIF on a particular node fails because the system cannot find any active ports on that node.

Corrective Action

List the offline FC ports on the DR partner node by using the "fcp adapter show -node <node_name;> -state down" command. Modify the state of the offline FC ports with the following command: "fcp adapter modify -node <node_name;> -adapter <adapter_name;> -state up". Once the FC ports in question are online, resynchronize the Vserver configuration using the "metrocluster vserver resync" command. With the command "fcp adapter show -node <node_name;>" verify that FC ports are present. If the FC ports are absent in the destination cluster node (DR partner), contact customer support to provision the FC ports.

Syslog Message

Cannot find online FC ports on Node "%s" for placing LIF "%s" in Vserver "%s".

Parameters

node_name (STRING): Node name.
lif (STRING): LIF name.
vserver_name (STRING): Vserver name.

san.nofcportwithadaptertype events

san.NoFCportwithAdapterType

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP cannot replicate an FC/FC-NVMe logical interface (LIF) to a candidate port in the destination cluster. A candidate port is one that satisfies the following conditions: 1) It must reside on the disaster recovery (DR) partner node. 2) It must be of the same adapter type (CNA/FC) as the home port of the primary Vserver FC/FC-NVMe LIF.

Corrective Action

Ensure that there are ports in the destination cluster node (DR partner) that have the same adapter type (FC/CNA) as the source cluster port that hosts the primary Vserver FC/FC-NVMe LIF. Use the "fcp adapter show -fields physical-protocol" command to view the FC port-adapter type information. Run the "metrocluster check lif repair-placement" command in the source cluster with the Vserver name and LIF name as inputs after ensuring that there are ports in the destination cluster node (DR partner) that have the same adapter type. After running the command mentioned previously, run the "metrocluster check lif show" to see whether lif placement succeeded or not.

Syslog Message

There are no ports on node "%s" in the destination cluster that have the adapter type "%s" required to host the "%s" LIF "%s" for Vserver "%s".

Parameters

node (STRING): Name of the destination cluster node (DR partner) that does not have a port of the same adapter type as the port in the source cluster.
adapter_type (STRING): Adapter type of the source cluster port that hosts the primary Vserver FC/FC-NVMe LIF.
data_protocol (STRING): Data Protocol of the lif.
lif (STRING): Name of the FC/FC-NVMe LIF to be placed.
vserver (STRING): Name of the secondary Vserver in the MetroCluster relationship.

san.noifgrpport events

san.NoIfGrpPort

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered ONTAP® systems, when ONTAP places a LIF on a physical port because an ifgrp port cannot be found on the destination cluster node (DR partner) to host an IP LIF.

Corrective Action

Ensure that ifgrp port exists; otherwise create an ifgrp port on the DR partner by taking the following steps. Run the "network port show" command to view the available ports on the DR partner. Use the "network port ifgrp create" command to create ifgrp port and "network port ifgrp add-port" command to populate an ifgrp port. After ifgrp port is available on the DR partner, run the "metrocluster check lif repair-placement" command in the source cluster with the SVM name and LIF name as inputs . After running this command, use the "metrocluster check lif show" command to see whether LIF placement succeeded or not.

Syslog Message

There are no ifgrp ports on node "%s" in IPspace "%s" to host the %s LIF "%s" for SVM "%s".

Parameters

node (STRING): Name of the DR partner that does not have an ifgrp port.
ipspace_name (STRING): Name of the IPspace.
data_protocol (STRING): Data protocol of the LIF.
lif (STRING): Name of the IP LIF.
vserver (STRING): Name of the SVM for which the IP LIF was incorrectly placed.

san.nonetworkportadaptertype events

san.NoNetworkPortAdapterType

Severity

ERROR

Description

This message occurs in MetroCluster™ configurations on clustered ONTAP® systems, when ONTAP cannot find a port on the disaster recovery (DR) node that is of the same adapter type (converged network adapter (CNA)/network interface card (NIC)) as the home port of the primary storage virtual machine (SVM) data LIF.

Corrective Action

Ensure that there are ports in the destination cluster node (DR partner) that have the same adapter type as the source cluster port that hosts the primary SVM IP LIF. Use the "net port show" and "run -node <node-name> sysconfig -ca" commands to view the network port adapter type information. After ensuring same adapter type port is available on the DR partner, run the "metrocluster check lif repair-placement" command in the source cluster with the SVM name and LIF name as inputs after ensuring that there are ports in the destination cluster node (DR partner) that have the same adapter type. After running the repair placement command, run the "metrocluster check lif show" command to see whether LIF placement succeeded or not.

Syslog Message

There are no ports on node "%s" in the destination cluster that have the adapter type "%s" in IPspace "%s" required to host the secondary SVM "%s" %s LIF "%s".

Parameters

node (STRING): Name of the destination cluster node (DR partner) that does not have a port of the same adapter type as the port in the source cluster.
adapter_type (STRING): Adapter type of the source cluster port.
ipspace_name (STRING): Name of the IPspace.
vserver_name (STRING): storage virtual machine (SVM) that owns the LIF.
data_protocol (STRING): Data protocol of the LIF.
lif (STRING): Name of the IP LIF.

san.noportsinipspace events

san.NoPortsInIpspace

Severity

ERROR

Description

This message occurs when an attempt to place an IP LIF on a particular node fails because the system cannot find any ports in an IPspace on that node.

Corrective Action

Add at least one port belonging to the node to the IPspace by using the "network port broadcast-domain add-ports" command and then resynchronize the SVM configuration using the "metrocluster vserver resync" command.

Syslog Message

Cannot find ports in IPspace "%s" on node "%s" for placing LIF "%s" in SVM "%s".

Parameters

ipspace_name (STRING): IPspace name.
node_name (STRING): Node name.
lif (STRING): LIF name.
vserver_name (STRING): SVM name.

san.nosamenamedfcport events

san.NoSameNamedFCport

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP cannot find the same named port to place an FC/FC-NVMe logical interface (LIF) in the destination cluster. A same named port is an FC port in the destination cluster that has the same name as that of the FC port in the source cluster hosting the FC/FC-NVMe logical interface (LIF).

Corrective Action

Check the admin state of the destination cluster FC port to ensure that it is up. Use the "fcp adapter show -fields status-admin" command to view the admin state of the target FC ports. After ensuring the same named port is up, enter the "metrocluster check lif repair-placement -vserver <vserver_name> -lif <lif_name>" command in the source cluster to initiate the LIF placement at the secondary cluster. After LIF placement has been completed, enter the "metrocluster check lif show -vserver <vserver_name> -lif <lif_name>" to see whether LIF placement succeeded or not.

Syslog Message

Same named FC port %s as the one in the source cluster that is hosting %s LIF %s on primary Vserver %s is not found in the destination cluster.

Parameters

home_port (STRING): Name of the source cluster FC port.
data_protocol (STRING): Data Protocol of the lif.
lif (STRING): Name of the FC/FC-NVMe LIF.
vserver (STRING): Name of the primary Vserver.

san.nosamenamediscsiport events

san.NoSameNamedIscsiPort

Severity

ERROR

Description

This message occurs when a MetroCluster™ configuration cannot be implemented, because the destination cluster for an IP logical interface (LIF) does not appear to contain a port with the same name as the one used within the source cluster.

Corrective Action

Check whether the broadcast domain of the destination cluster network port belongs to the IPspace configured for the destination SVM by using the "network ipspace show -vservers <vserver_name> -ports < same_named_network_port_name>" command. Verify that the destination cluster network port is up by using the "network port show -fields link" command. After the destination cluster network port is up, initiate the LIF placement at the destination cluster by using the "metrocluster check lif repair-placement -vserver <vserver_name> -lif <lif_name>" command in the source cluster. Verify that the LIF placement succeeded by using the "metrocluster check lif show -vserver <vserver_name> -lif <lif_name>" command.

Syslog Message

Destination cluster does not contain a port with the same name as network port %s in the source cluster that is hosting %s LIF %s on primary SVM %s.

Parameters

home_port (STRING): Name of the source cluster network port.
data_protocol (STRING): Data protocol of the LIF.
lif (STRING): Name of the IP LIF.
vserver (STRING): Name of the primary SVM.

san.nosupportedsamenamedfcport events

san.NoSupportedSameNamedFCport

Severity

ERROR

Description

This message occurs in MetroCluster(tm) configurations on clustered Data ONTAP® systems, when Data ONTAP cannot find the same named port that support the FCP/FC-NVMe data-protocol to place an FC logical interface (LIF) in the destination cluster. A same named port is an FC port in the destination cluster that has the same name as that of the FC port in the source cluster hosting the FC logical interface (LIF).

Corrective Action

Before enabling the Non-Shared Fabrics lif placement mechanism, please ensure that the same-named ports in the corresponding DR-partner node at the destination cluster have the same capabilities as the source cluster node's port.

Syslog Message

Same named FC port %s as the one in the source cluster that is hosting LIF %s on primary Vserver %s, does not support the %s data-protocol in the destination cluster.

Parameters

home_port (STRING): Name of the destination cluster FC port.
lif (STRING): Name of the FC/FC-NVMe LIF.
vserver (STRING): Name of the primary Vserver.
data_protocol (STRING): Data-Protocol of the LIF.

san.novlanport events

san.NoVlanPort

Severity

ERROR

Description

This message occurs when a clustered Data ONTAP® system is in a MetroCluster™ configuration. The system cannot find a virtual LAN (VLAN) port on the destination cluster node (that is, the DR partner) to host an IP LIF, and has instead chosen to place the LIF on a physical port.

Corrective Action

Ensure that the destination cluster node (DR partner) has ports connected to the same VLANs as in the source with the command "network port show -node <node> -fields vlan-tag". Ensure that the DR partner has VLAN interfaces similar to those in the source with the command "network port show -node <node> -fields type". If necessary, create a VLAN interface or interfaces on the DR partner node using the "network port vlan create" command. After ensuring that the proper VLAN port exists, run the "metrocluster check lif repair-placement" command on the source cluster, with the SVM name and LIF name as inputs to perform LIF placement. Then verify the results with the command "metrocluster check lif show".

Syslog Message

There are no VLAN ports with tag "%s" on node "%s" in IPspace "%s" to host the %s LIF "%s" for SVM "%s".

Parameters

node (STRING): Name of the DR partner that does not have a VLAN port.
vlan_tag (STRING): VLAN tag.
ipspace_name (STRING): Name of the IPspace.
data_protocol (STRING): Data protocol of the LIF.
lif (STRING): Name of the IP LIF.
vserver (STRING): Name of the SVM for which the IP LIF was incorrectly placed.

san.optimizedpersonality events

san.optimizedPersonality.mismatch

Severity

ERROR

Description

This message occurs when a mismatch is detected between the san-optimized personality of a node and the cluster.

Corrective Action

Contact NetApp technical support.

Syslog Message

The san-optimized value "%s" does not match the san-optimized value of the cluster.

Parameters

san_optimized (STRING): The san-optimized value for the node.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

san.replicated events

san.replicated.igroup.map.unreplicated.lun

Severity

NOTICE

Description

This message occurs when an unreplicated LUN becomes mapped to a replicated initiator group.

Corrective Action

Configure replication for the mapped, unreplicated LUN.

Syslog Message

Unreplicated LUN "%s" was mapped to replicated initiator group "%s" in Vserver %s. This does not automatically enable replication for the LUN.

Parameters

lun_path (STRING): The path of the mapped, unreplicated LUN.
igroup_name (STRING): The name of the initiator group.
vserver_name (STRING): The Vserver containing the initiator group and LUN.
vserver_uuid (STRING): The UUID of the Vserver.
igroup_uuid (STRING): The UUID of the initiator group.

san.replicated.igroup.unreplicated.lun

Severity

NOTICE

Description

This message occurs when an unreplicated initiator group becomes replicated but has unreplicated LUNs mapped to it.

Corrective Action

Configure replication for the unreplicated LUNs that are mapped to this initiator group.

Syslog Message

Initiator group "%s" in Vserver %s became replicated, but it contains unreplicated LUNs "%s". Enabling initiator group replication does not automatically enable replication for LUNs that are mapped to it.

Parameters

igroup_name (STRING): The name of the initiator group.
vserver_name (STRING): The Vserver containing the initiator group and LUNs.
lun_path (STRING): The paths of the unreplicated LUNs.
vserver_uuid (STRING): The UUID of the Vserver.
igroup_uuid (STRING): The UUID of the initiator group.

san.slmsupportcheckfailed events

san.slmSupportCheckFailed

Severity

ERROR

Description

This message occurs during reboot when SAN capability is enabled, the cluster has more than 8 nodes and lun.reporting.nodes options is disabled. It leads to host instability as the number of paths exposed exceeds the threshold that the host stacks can handle.

Corrective Action

Set the option "lun.reporting_nodes.enable" to "on" with the command "vserver options lun.reporting_nodes.enable on" and enable Selective LUN Map on existing maps with the command "lun mapping add-reporting-nodes -vserver * -path * -igroup * -local-nodes".

Syslog Message

Clusters with more than 8 nodes must have SLM support enabled.

Parameters

(None).

san.volrehostigroupcreatefailed events

san.volRehostIgroupCreateFailed

Severity

ERROR

Description

This message occurs on clustered Data ONTAP® systems, during Volume Rehost operation when Data ONTAP fails to create igroup on the destination Vserver.

Corrective Action

Please create the igroup using "igroup create".

Syslog Message

Failed to create igroup "%s" for Vserver "%s". Reason: "%s".

Parameters

igroup_name (STRING): Igroup name.
vserver_name (STRING): Vserver name.
reason (STRING): Reason for failure.

san.volrehostlunmapcreated events

san.volRehostLunMapCreated

Severity

INFORMATIONAL

Description

This message occurs on clustered Data ONTAP® systems for Volume Rehost operation on successful creation of the LUN map the destination Vserver.

Corrective Action

(None).

Syslog Message

LUN "%s" successfully mapped with igroup "%s" for Vserver "%s".

Parameters

lun_path (STRING): LUN path.
igroup_name (STRING): Igroup name.
vserver_name (STRING): Vserver name.

san.volrehostlunmapfailed events

san.volRehostLunMapFailed

Severity

ERROR

Description

This message occurs on clustered Data ONTAP® systems, during Volume Rehost operation when Data ONTAP fails to create LUN map the destination Vserver.

Corrective Action

Use "lun map create" command to create the LUN map.

Syslog Message

Failed to map LUN "%s" with igroup "%s" for Vserver "%s". Reason: "%s".

Parameters

lun_path (STRING): LUN path.
igroup_name (STRING): Igroup name.
vserver_name (STRING): Vserver name.
reason (STRING): Reason for failure.

san.volrehostsanbestpractice events

san.volRehostSANBestPractice

Severity

ERROR

Description

This message occurs on ONTAP® systems for volume rehost operation when the destination storage virtual machine (SVM) does not comply with SAN best practices.

Corrective Action

Verify SAN LIFs are present on the LUN-owning node and its high availability (HA) partner in the destination SVM. If needed, create a new SAN LIF on both the nodes by using the "network interface create" command and retry the operation.

Syslog Message

Node "%s" for SVM "%s" does not comply with SAN best practices to create LUN maps. SAN LIFs in a SVM must be available on both nodes in an HA system to create a LUN map.

Parameters

    node_name (STRING): Name of the LUN owning node.
    vserver_name (STRING): SVM name.

sas events

sas.8001 events

sas.8001.firmware.fault

Severity

NOTICE

Description

This message occurs when the PM8001 serial-attached SCSI (SAS) host bus adapter reports an adapter firmware error.

Corrective Action

(None).

Syslog Message

Detected firmware error on serial-attached SCSI (SAS) adapter %s. Scratchpad registers: 0x%x, 0x%x, 0x%x, 0x%x.

Parameters

adapterName (STRING): Name of the associated serial-attached SCSI (SAS) host bus adapter.
scratchpad0 (INTHEX): Contents of the host bus adapter scratchpad register 0.
scratchpad1 (INTHEX): Contents of the host bus adapter scratchpad register 1.
scratchpad2 (INTHEX): Contents of the host bus adapter scratchpad register 2.
scratchpad3 (INTHEX): Contents of the host bus adapter scratchpad register 3.

Severity

NOTICE

Description

This message occurs when the PM8072 serial-att (SAS) host bus adapter reports an adapter firmware error.

Corrective Action

(None).

Syslog Message

Detected firmware error on serial-attached SCSI (SAS) adapter %s. Scratchpad register: 0x%x.

Parameters

adapterName (STRING): Name of the associated serial-attached SCSI (SAS) host bus adapter.
sctratchpad1 (INTHEX): Contents of the host bus adapter scratchpad register.

sas.adapter events

sas.adapter.bad.WWN

Severity

ERROR

Description

The base WWN associated with the SAS adapter is of invalid format. A correct WWN will be synthesized. The adapter will continue to function but this error indicates a manufacturing problem.

Corrective Action

The controller should be replaced with a correctly programmed one.

Syslog Message

The SAS WWN "%s" associated with adapter %s is bad. A valid one will be synthesized.

Parameters

WWN (STRING): The bad WWN.
adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.debug

Severity

INFORMATIONAL

Description

The SAS adapter driver debug event.

Corrective Action

(None).

Syslog Message

(None).

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.
debug_string (STRING): The debug statement that occurred.

sas.adapter.failed

Severity

ERROR

Description

The SAS adapter driver could not recover the adapter after resetting it multiple times. The adapter will be put offline.

Corrective Action

If the adapter is in use check cabling and if connected to disk shelves check the seating of IOM cards and disks. If the problem keeps occurring try replacing the adapter. Finally if the issue is still not resolved please

contact NetApp technical support for assistance in diagnosing a SAS issue.

Syslog Message

Failed to recover SAS %s after multiple resets. Offlining the adapter.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.firmware.download

Severity

INFORMATIONAL

Description

The firmware is being updated on the SAS adapter.

Corrective Action

(None).

Syslog Message

Updating firmware on SAS adapter %s from version %s to version %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.
oldFirmwareVersion (STRING): The version of the firmware currently on the adapter.
newFirmwareVersion (STRING): The version of the firmware being downloaded to the adapter.

sas.adapter.firmware.fault

Severity

NOTICE

Description

A firmware fault was detected on the SAS adapter and it is being reset to recover.

Corrective Action

(None).

Syslog Message

Detected firmware fault 0x%x on SAS adapter %s.

Parameters

faultCode (INTHEX): The firmware fault code.
adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.firmware.update.failed

Severity

EMERGENCY

Description

The firmware on the SAS adapter was unable to be updated.

Corrective Action

The adapter should be replaced as soon as possible. The SAS adapter driver will attempt to continue using the adapter without updating the firmware image.

Syslog Message

Unable to update firmware on SAS adapter %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.not.ready

Severity

ERROR

Description

The SAS adapter did not become ready after being reset.

Corrective Action

The SAS adapter driver will automatically attempt to recover from this error. If the error keeps occurring the adapter may need to be replaced.

Syslog Message

SAS adapter %s did not become ready.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.offline

Severity

INFORMATIONAL

Description

The SAS adapter is now offline.

Corrective Action

(None).

Syslog Message

SAS adapter %s is now offline.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.offlining

Severity

INFORMATIONAL

Description

The SAS adapter is going offline after all outstanding I/O requests have finished.

Corrective Action

(None).

Syslog Message

Offlining SAS adapter %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.online

Severity

INFORMATIONAL

Description

The SAS adapter is now online.

Corrective Action

(None).

Syslog Message

SAS adapter %s is now online.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.online.failed

Severity

ERROR

Description

The SAS adapter failed to come online.

Corrective Action

If the adapter is in use check cabling and if connected to disk shelves check the seating of IOM cards.

Syslog Message

SAS adapter %s failed to come online.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.onlining

Severity

INFORMATIONAL

Description

The SAS adapter is in the process of going online.

Corrective Action

(None).

Syslog Message

Onlining SAS adapter %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.unexpected.status

Severity

NOTICE

Description

The SAS adapter returned an unexpected status and will be reset to recover.

Corrective Action

(None).

Syslog Message

Unexpected status 0x%x received from SAS adapter %s.

Parameters

status (INTHEX): The status returned from the adapter.
adapterName (STRING): The name of the associated SAS host bus adapter.

sas.adapter.wwn.update.fail

Severity

ERROR

Description

This message occurs when the WWN, a unique world wide name that identifies the adapter, fails to update. This message only applies to internal lab systems.

Corrective Action

Contact your administrator.

Syslog Message

SAS adapter "%s" fails to update WWN "%s".

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.
WWN (STRING): WWN of the associated SAS host bus adapter.

sas.adapter.wwn.updated

Severity

NOTICE

Description

This message occurs when an SAS host bus adapter's worldwide name (WWN) is updated successfully. The WWN is a unique name that identifies the serial-attached SCSI (SAS) host bus adapter.

Corrective Action

(None).

Syslog Message

SAS adapter "%s" WWN updated from "%s" to "%s"

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.
OldWWN (STRING): Old WWN of the associated SAS host bus adapter.
WWN (STRING): New WWN of the associated SAS host bus adapter.

sas.cable events

sas.cable.degraded

Severity

ERROR

Description

This message occurs when the cable attached to SAS (Serial Attached SCSI) adapter port is functioning in a degraded mode.

Corrective Action

This condition implies one or more of the lanes in a 4-wide cable is fuctioning at a less-than-optimal speed, or is not functioning and has been disabled. The port will continue functioning but in a degraded, lower-performing mode. The cable should be replaced at some point in the future.

Syslog Message

Cable attached to SAS port "%s" is functioning in a degraded mode.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.cable.linkratelow

Severity

NOTICE

Description

This message occurs when the expander or cable attached to the SAS (serial-attached SCSI) host bus adapter port is functioning at a speed lower than its specification. This could happen because the HBA is connected to an IOM that supports a lower speed, or because of a speed degradation due to a faulty component, or because of a lower common shelf stack speed.

Corrective Action

(None).

Syslog Message

Expander or cable attached to SAS port %s is operating at %s, which is lower than expected.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.
currentSpeed (STRING): Current link rate for SAS host bus adapter, cable, and IOM expander.

sas.cable.unqualified

Severity

EMERGENCY

Description

This message occurs when a Serial Attached SCSI (SAS) cable attached to a controller port has not been qualified by NetApp. Unqualified cables might exhibit unpredictable behavior or experience higher error rates than qualified cables.

Corrective Action

Replace the cable with one qualified by NetApp

Syslog Message

Cable attached to SAS port %s has not been qualified by NetApp

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter port.

sas.config events

sas.config.bad

Severity

ERROR

Description

This message occurs when the SAS (Serial Attached SCSI) adapter is connected to a misconfigured SAS domain. Most likely a shelf in-port is attached to another in-port, or a shelf out-port is attached to another out-port. The SAS domain is effectively inoperative and attached SAS adapters will be taken offline. When the misconfiguration is corrected, the affected adapters can be brought back online.

Corrective Action

Correct the inter-shelf cabling configuration as defined in the applicable hardware documentation, and then bring the affected adapters back online.

Syslog Message

Adapter "%s" is connected to misconfigured SAS domain and being taken offline.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.config.badtransition

Severity

ERROR

Description

This message occurs when a SAS (Serial Attached SCSI) adapter is connected to a misconfigured SAS domain. A shelf with a 12 Gigabit-per-second (12 Gb/s) data rate might have been attached to a 3 or 6 Gb/s homogeneous stack or vice-versa. An external homogeneous stack does not allow for any transitions between 12 Gb/s and other data rates. The only exception is when an adapter is attached to an embedded internal shelf. A single transition between an internal shelf and the first external shelf attached to it is allowed. The message will appear the first time a transition is detected on a reboot or storage discovery operation.

Corrective Action

Correct the inter-shelf cabling configuration as defined in the applicable hardware documentation. Ensure that the shelf stack is homogeneous. 3 Gb/s and 6 Gb/s shelves are considered homogeneous.

Syslog Message

Unsupported speed transition by expander WWN: %s at level %d in SAS stack on adapter port %s.

Parameters

expanderWWN (STRING): WWN of the expander that caused the illegal transition.
expanderLevel (INT): Level of the expander in the stack causing the transition. It is the physical depth of the shelf in the SAS stack where the error occurs, counting outwards from the adapter port.
adapterName (STRING): Name of the associated SAS host bus adapter port.

sas.config.invalid

Severity

ERROR

Description

This message occurs when the SAS (Serial Attached SCSI) adapter is connected to a SAS domain that contains more than the supported number of disk shelves orenclosures. The SAS domain is functional, but some disk shelves/enclosures might not be visible to the system.

Corrective Action

Remove disk shelves or enclosures attached to the applicable SAS adapter in question, until the supported limit is reached. (4 for FAS2040 and FAS2050 systems, 10 for all other systems)

Syslog Message

Adapter "%s" is connected to more than the supported number of disk shelves or enclosures.

Parameters

adapterName (STRING): The name of the associated SAS adapter.

sas.config.mixed.detected

Severity

ERROR

Description

This message occurs when a SAS (Serial Attached SCSI) disk shelf contains a mixture of SAS drives, SATA drives or Bridged SAS drives. Mixing drive types within a disk shelf is not supported.

Corrective Action

Ensure that each SAS disk shelf is populated with drives of only one type.

Syslog Message

SAS shelf "%s" attached to adapter "%s" contains a mixture of drive types. Mixed configurations are not supported.

Parameters

shelfID (STRING): ID or serial number of the disk shelf where a mixture of drive types was detected.
adapterName (STRING): Name of the associated SAS host bus adapter.

sas.cpr events

sas.cpr.failed

Severity

EMERGENCY

Description

This message occurs when the CPR (Core PCIe Resilience) infrastructure determines that the SAS controller hardware cannot be recovered, and the associated SAS ports will be taken offline.

Corrective Action

Replace the SAS controller.

Syslog Message

CPR recovery failed on SAS HBA %s.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter (HBA).

sas.cpr.recoveryThreshold

Severity

EMERGENCY

Description

This message occurs when the SAS driver determines that CPR (Core PCIe Resilience) recovery of the

SAS controller hardware has exceeded thresholds, and the associated SAS ports will be taken offline.

Corrective Action

Replace the SAS controller.

Syslog Message

CPR recovery threshold has been exceeded on SAS HBA %s.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter (HBA).

sas.cpr.recoveryTimeout

Severity

ALERT

Description

This message occurs when the SAS driver determines that CPR (Core PCIe Resilience) recovery of the SAS controller hardware has timed out, and the associated SAS ports will be taken offline.

Corrective Action

Replace the SAS controller.

Syslog Message

CPR recovery timed out on SAS HBA %s.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter (HBA).

sas.device events

sas.device.bad.vmdisk.header

Severity

ERROR

Description

This message occurs when a disk's vmdisk header is bad. The disk is unusable by the system.

Corrective Action

Remove the disk from the system and either write a new vmdisk header to the disk or zero the disk.

Syslog Message

SAS adapter %s reports the device at port identifier %d has an invalid vmdisk header: %s.

Parameters

adapterName (STRING): Name of the associated SAS host bus adapter.
devicePortId (INT): Identifier of the SAS port device.
errorString (STRING): Identifies what is wrong with the vmdisk header.

sas.device.invalid.wwn

Severity

ERROR

Description

The SAS device responded with an invalid World-Wide Name.

Corrective Action

Power-cycling the device may allow it to recover from this problem.

Syslog Message

SAS adapter %s reports the device at port identifier 0x%x has an invalid World-Wide Name.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.
devicePortId (INTHEX): The SAS port identifier of the device.

sas.device.timeout

Severity

ERROR

Description

All outstanding commands to the specified device have not completed within the allotted time. As part of the standard error handling sequence managed by the Data ONTAP SAS driver, all commands to the device will be aborted and reissued.

Corrective Action

Device level timeouts are a common indication of a SAS link stability problem. In some cases the link is operating normally and the specified device is having trouble processing I/O requests in a timely manner. In such cases the specified device should be evaluated for possible replacement. Quite often the problem results from the partial failure of a component involved in the SAS transport. Common things to check include complete seating of drive carriers in enclosure bays, properly secured cable connections, IOM seating, and crimped or otherwise damaged cables.

Syslog Message

Adapter %s encountered a device timeout on %s device %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.
deviceType (STRING): The device type.
deviceName (STRING): The name of the SAS device.

sas.initialization events

sas.initialization.failed

Severity

ERROR

Description

The SAS adapter failed to initialize the link and appears to be unattached/disconnected.

Corrective Action

If the adapter is in use check cabling and if connected to disk shelves check the seating of IOM cards.

Syslog Message

Initialization failed on SAS adapter %s.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.

sas.link events

sas.link.error

Severity

ERROR

Description

The SAS adapter was unable to recover the link and is going offline.

Corrective Action

If the adapter is in use check cabling and if connected to disk shelves check the seating of IOM cards and disks. If this does not resolve the issue please contact NetApp technical support for assistance in diagnosing a SAS issue.

Syslog Message

Could not recover link on SAS adapter %s after %d seconds. Offlining the adapter.

Parameters

adapterName (STRING): The name of the associated SAS host bus adapter.
downTime (INT): The amount of time that the link was down.

sas.reset events

sas.reset.exp.discovery.resp

Severity

NOTICE

Description

This message occurs when SAS adapter driver resets the expander because of failure status of discovery response.

Corrective Action

If this message is infrequent, no action is needed. Otherwise, contact NetApp technical support.

Syslog Message

SAS adapter [%s]: Incorrect status in discovery response, resetting expander: %s

Parameters

adapterName (STRING): Name of the associated SAS adapter.
expanderName (STRING): Name of the expander being reset.

sas.reset.exp.open.dest

Severity

NOTICE

Description

This message occurs when SAS adapter driver resets the expander because open frames are recieving excessive no/bad destination status.

Corrective Action

If this message is infrequent, no action is needed. Otherwise, contact NetApp technical support.

Syslog Message

SAS adapter [%s]: Excessive open no/bad destination status, resetting expander: %s

Parameters

adapterName (STRING): Name of the associated SAS adapter.
expanderName (STRING): Name of the expander being reset.

sas.reset.exp.open.to

Severity

NOTICE

Description

This message occurs when SAS adapter driver resets the expander because of excessive open timeouts.

Corrective Action

If this message is infrequent, no action is needed. Otherwise, contact NetApp technical support.

Syslog Message

SAS adapter [%s]: Excessive open timeouts occured, resetting expander: %s

Parameters

adapterName (STRING): Name of the associated SAS adapter.
expanderName (STRING): Name of the expander being reset.

sas.reset.exp.smp

Severity

NOTICE

Description

This message occurs when SAS adapter driver resets the expander because of excessive SMP failures.

Corrective Action

If this message is infrequent, no action is needed. Otherwise, contact NetApp technical support.

Syslog Message

SAS adapter [%s]: Excessive SMP failures occured, resetting expander: %s

Parameters

adapterName (STRING): Name of the associated SAS adapter.
expanderName (STRING): Name of the expander being reset.

sas.shelf events

sas.shelf.conflict

Severity

ERROR

Description

This message occurs when the system detects that two or more SAS (serial attached SCSI) disk shelves have the same shelf ID. The SAS domain is functional, but references to disk shelves will be based on disk shelf serial numbers, not disk shelf IDs.

Corrective Action

Reassign disk shelf IDs so that no conflict exists.

Syslog Message

At least two SAS disk shelves have the same disk shelf ID.

Parameters

(None).

sas.unsupported events

sas.unsupported.port

Severity

ALERT

Description

This message occurs when ONTAP detects that a cable is attached to an I/O module port that is permanently disabled and does not support attachment.

Corrective Action

Remove the cable from the unsupported port on the I/O module.

Syslog Message

Port 0b2 on shelf ID %lld.%s, cable detected on unsupported port.

Parameters

shelfID (LONGINT): Shelf ID of the shelf reporting the error.
element (STRING): I/O module designator (A or B).

sasmon events

sasmon.adapter events

sasmon.adapter.phy.disable

Severity

ERROR

Description

This message occurs when a Serial Attached SCSI (SAS) transceiver (phy) attached to a SAS host bus adapter (HBA) is disabled due to one of the following reasons: exceeded loss of double word synchronization error threshold; exceeded running disparity error threshold; exceeded invalid double word error threshold; exceeded phy reset problem threshold; exceeded broadcast change threshold.

Corrective Action

If the HBA is in use, check the cabling. If it is connected to the disk shelves, check the seating of the IOM (I/O module) cards. If that does not fix the problem, contact NetApp technical support.

Syslog Message

Phy %d of HBA %s will be disabled due to %s errors.

Parameters

phyNum (INT): Number of the phy being disabled.
adapterName (STRING): Name of the associated SAS HBA.
errorType (STRING): Type of error based on which the phy is being disabled.

sasmon.disable events

sasmon.disable.module

Severity

INFORMATIONAL

Description

This message occurs when the Data ONTAP® module responsible for monitoring Serial Attached SCSI (SAS) domain's transient errors is disabled due to the environment variable disable-sasmon? being set to "true".

Corrective Action

Set the environment variable disable-sasmon? to "false" to enable this monitor module.

Syslog Message

SAS domain is not monitoring transient errors.

Parameters

(None).

savecore events

savecore.completed events

savecore.completed

Severity

INFORMATIONAL

Description

A synchronous savecore operation has completed.

Corrective Action

(None).

Syslog Message

Savecore completed

Parameters

(None).

savecore.nospace events

savecore.nospace

Severity

ERROR

Description

Savecore has determined that the space available for storing the unsaved core is not sufficient.

Corrective Action

Delete old or unneeded files in the root filesystem. Check in "/etc/crash" ("/crash" on Netcaches) for unneeded cores. Make sure to delete any snapshots that include the deleted files.

Syslog Message

The available disk space (%u blocks) is not sufficient to save the core, which may need up to %d blocks.

Parameters

avail (INT): Number of blocks available for saving the core
needed (INT): Number of blocks needed for saving the core

savecore.readonly events

savecore.readonly

Severity

NOTICE

Description

An attempt to run the savecore command was made during a read-only boot. This is not permitted.

Corrective Action

(None).

Syslog Message

Core dumps not saved in last resort read-only mode

Parameters

(None).

savecore.waiting events

savecore.waiting

Severity

INFORMATIONAL

Description

Savecore is running synchronously, and the console will be unresponsive until it is complete. This happens when savecore is given the "-f" or "-w" argument, or when previous attempts to save the core asynchronously fail.

Corrective Action

(None).

Syslog Message

Pausing to wait for savecore admin to finish

Parameters

(None).

sblade events

sblade.duplicate events

sblade.duplicate.iscsi.addr

Severity

ALERT

Description

This message occurs when a duplicate IP address is detected on more than one iSCSI interface. Only one of the interfaces is sent as an iSCSI target portal.

Corrective Action

Delete all but one of the iSCSI interfaces which share an IP address.

Syslog Message

Vserver '%s' iSCSI interface '%s' has the same IP address '%s' as another iSCSI interface. This interface will not be sent as an iSCSI target portal.

Parameters

vserver (STRING): Vserver containing the iSCSI interfaces.
interface (STRING): Interface that contains a duplicate IP address.
ipAddress (STRING): IP address that was duplicated.

scsi events

scsi.cmd events

scsi.cmd.aborted

Deprecated

This event has been removed as it does not provide any useful information for a customer.

Severity

ERROR

Description

The aborted event is issued if an I/O request is aborted by a class driver.

Corrective Action

(None).

Syslog Message

%s device %s: Command aborted: cdb %s (%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command was aborted.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ(10) or a WRITE(10), the logical block address and the transfer length are included as well.
dTime (INT): The delta time from when the command was first issued.

scsi.cmd.abortedByHost

Severity

ERROR

Description

This message occurs when the host adapter aborts an I/O request, either because it was a victim or because of an HA timeout.

Corrective Action

This condition does not necessarily mean that the target device is problematic. High workloads can cause loop saturation, leading to device contention for the bus. Transport issues can also cause loop throughput to decrease, thereby causing I/Os to take longer than normal. Seen occasionally, no action is required; the system handles the condition automatically by retrying the I/O that was aborted. Seen in association with a persistent error condition, such as device resets or transport errors, it is likely the symptom of a loop stability problem.

Syslog Message

%s device %s: Command aborted by host adapter: HA status 0x%x: cdb %s. %s

Parameters

deviceType (STRING): Device type.

deviceName (STRING): Electrical path name of the device on which the command failed.

ha_status (INTHEX): Value returned by the host adapter driver describing the completion status of the I/O request execution at the transport or physical link layer.

cdb (STRING): String containing the opcode byte of the CDB that was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.adapterFatal

Severity

ERROR

Description

The adapter fatal event is issued when the host adapter has detected a problem with either the buffer list or has exceeded the DMA size.

Corrective Action

(None).

Syslog Message

%s device %s: Adapter fatal error: HA status 0x%x: cdb %s.

Parameters

deviceType (STRING): The device type.

deviceName (STRING): The electrical path name of the device on which the command failed.

haStatus (INTHEX): The value of the HA status field for the failed command.

cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

scsi.cmd.adapterHardwareError

Severity

ERROR

Description

The adapter hardware error is issued when the host adapter has detected a loop is down, the scsi bus transport had an error or a problem with the adapter hardware itself.

Corrective Action

Evaluate for partial component failure the following loop hardware involved in the Fibre Channel transport: cables, transceivers, and I/O modules (LRC, ESH/ESH2, AT-FC, AT-FC2, and AT-FCX). If this error occurs in conjunction with transport errors on the same loop, ensure that all drive carriers are seated firmly in their enclosure bays, and verify that all cables are properly connected and undamaged. Also check the backplane connectors—if they are bent or broken, you must replace them. If the error persists for a specific device or I/O module from multiple adapters, you should replace that hardware module.

Syslog Message

%s device %s: Adapter detected hardware error: HA status 0x%x: cdb %s.

Parameters

deviceType (STRING): The device type.

deviceName (STRING): The electrical path name of the device on which the command failed.

haStatus (INTHEX): The value of the HA status field for the failed command.

cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

scsi.cmd.adapterHardwareErrorEMSOnly

Severity

ERROR

Description

This message occurs when the host adapter detects that a loop is down, the scsi bus transport has an error, or the adapter hardware itself has a problem, such as with a disk drive, cable, and so on.

Corrective Action

Evaluate for partial component failure the following loop hardware involved in the Fibre Channel transport: cables, transceivers, and I/O modules (LRC, ESH/ESH2, AT-FC, AT-FC2, and AT-FCX). If this error occurs in conjunction with transport errors on the same loop, ensure that all drive carriers are seated firmly in their enclosure bays, and verify that all cables are properly connected and undamaged. Also check the backplane connectors—if they are bent or broken, you must replace them. If the error persists for a specific device or I/O module from multiple adapters, you should replace that hardware module.

Syslog Message

%s device %s: Adapter detected hardware error: HA status 0x%x: cdb %s. %s

Parameters

deviceType (STRING): The device type.

deviceName (STRING): Physical path name of the device on which the command failed. It is in the format "path_id. device_id", where "path_id := switch:port | adapter". For example, switch1:5:40 or 8b.40.

haStatus (INTHEX): Value of the HA status field for the failed command. For this error message, the value is 6.

cdb (STRING): String containing the opcode byte of the command descriptor block (CDB) that was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are also included. For example, a hardware error during READ is in the format "0x28:logical_block_address:transfer_length".

disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.adapterResources

Severity

ERROR

Description

The adapter resource event is issued when the host adapter has run out of resources.

Corrective Action

(None).

%s device %s: Adapter detected resource issue: HA status 0x%x: cdb %s.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
haStatus (INTHEX): The value of the HA status field for the failed command.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

scsi.cmd.checkCondition

Severity

ERROR

Description

This message occurs when a check condition is recieved from a device. A check condition is the mechanism whereby a target device reports an informational condition or error status to the requesting host. Either the condition that generated this event is an error that occurred during execution of the command and was not cleared by retrying the request or an informational condition reporting status of the present operation or media state.

Corrective Action

A target status of check condition normally indicates an error at the device during execution of the requested command. Such cases are often the result of an intermittent device hardware or firmware problem that is automatically handled by the Data ONTAP drivers through command retries. In cases of repeated events, the specified device should be evaluated for proper operation and possible repair or replacement. A check condition with a SenseKey of "no sense" indicates an informational condition that is automatically handled by the Data ONTAP driver associated with the target device. These are normally not reported as error events. However, on occasion an unexpected informational condition may be reported by a target device. These cases should not be interpreted as a failure of the target device.

Syslog Message

%s device %s: Check Condition: CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d). %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.checkCondition.ATATimeout

Severity

ERROR

Description

An ATATimeout error typically indicates a problem in communicating with a disk in an ATFCX-bridged shelf.

Corrective Action

An initial ATA I/O Timeout will result in a SOFT RESET being issued to the disk in question. Subsequent ATA I/O Timeouts will result in a HARD RESET being performed to the disk followed by a POWER CYCLE of the disk. When any of these errors are encountered, ATFCX shelflog information is also updated. Check shelflog dynamic and persistent log information for controller details on the event. Check environment shelf_stats output for additional error statistics from the disk in question. Check disk shm_stats and disk shm_stats ha.disk_id for SMART log information from the disk in question. Collating this information will help determine if this is an isolated disk problem or a controller related problem. If the environment shelf_stats are clean along with the shelflog entries, then the error is probably a misbehaving disk. If the problem continues, RMA of the disk is recommended. However, if shelf_stats are not clean and/or shelflog errors are present, RMA of the ATFCX module is recommended.

Syslog Message

%s device %s: Check Condition: ATA I/O Timeout CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.ATATimeout.Failure

Severity

ERROR

Description

An ATATimeout error typically indicates a problem in communicating with a disk in an ATFCX-bridged shelf. A Failure message indicates that error recovery was unable to recover access to the drive and hence it is being actively failed.

Corrective Action

An initial ATA I/O Timeout will result in a SOFT RESET being issued to the disk in question. Subsequent ATA I/O Timeouts will result in a HARD RESET being performed to the disk followed by a POWER CYCLE of the disk. When any of these errors are encountered, ATFCX shelflog information is also updated. Check

shelflog dynamic and persistent log information for controller details on the event. Check environment shelf_stats output for additional error statistics from the disk in question. Check disk shm_stats and disk shm_stats ha.disk_id for SMART log information from the disk in question. Collating this information will help determine if this is an isolated disk problem or a controller related problem. If the environment shelf_stats are clean along with the shelflog entries, then the error is probably a misbehaving disk. If the problem continues, RMA of the disk is recommended. However, if shelf_stats are not clean and/or shelflog errors are present, RMA of the ATFCX module is recommended.

Syslog Message

%s device %s: Check Condition: ATA I/O Timeout - Failure CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.ATATimeout.HardReset

Severity

ERROR

Description

An ATATimeout error typically indicates a problem in communicating with a disk in an ATFCX-bridged shelf. A Hard Reset will be performed to the drive to attempt to clear the problem.

Corrective Action

An initial ATA I/O Timeout will result in a SOFT RESET being issued to the disk in question. Subsequent ATA I/O Timeouts will result in a HARD RESET being performed to the disk followed by a POWER CYCLE of the disk. When any of these errors are encountered, ATFCX shelflog information is also updated. Check shelflog dynamic and persistent log information for controller details on the event. Check environment shelf_stats output for additional error statistics from the disk in question. Check disk shm_stats and disk shm_stats ha.disk_id for SMART log information from the disk in question. Collating this information will help determine if this is an isolated disk problem or a controller related problem. If the environment shelf_stats are clean along with the shelflog entries, then the error is probably a misbehaving disk. If the problem continues, RMA of the disk is recommended. However, if shelf_stats are not clean and/or shelflog errors are present, RMA of the ATFCX module is recommended.

Syslog Message

%s device %s: Check Condition: ATA I/O Timeout - Hard Reset CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.ATATimeout.InternalReset

Severity

ERROR

Description

An ATATimeout error typically indicates a problem in communicating with a disk in an ATFCX-bridged shelf. An internal reset (aka power cycle) will be performed to the drive to attempt to clear the problem.

Corrective Action

An initial ATA I/O Timeout will result in a SOFT RESET being issued to the disk in question. Subsequent ATA I/O Timeouts will result in a HARD RESET being performed to the disk followed by a POWER CYCLE of the disk. When any of these errors are encountered, ATFCX shelflog information is also updated. Check shelflog dynamic and persistent log information for controller details on the event. Check environment shelf_stats output for additional error statistics from the disk in question. Check disk shm_stats and disk shm_stats ha.disk_id for SMART log information from the disk in question. Collating this information will help determine if this is an isolated disk problem or a controller related problem. If the environment shelf_stats are clean along with the shelflog entries, then the error is probably a misbehaving disk. If the problem continues, RMA of the disk is recommended. However, if shelf_stats are not clean and/or shelflog errors are present, RMA of the ATFCX module is recommended.

Syslog Message

%s device %s: Check Condition: ATA I/O Timeout - Internal Reset CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.

DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.ATATimeout.SoftReset

Severity

ERROR

Description

An ATATimeout error typically indicates a problem in communicating with a disk in an ATFCX-bridged shelf. A Soft Reset will be performed to the drive to attempt to clear the problem.

Corrective Action

An initial ATA I/O Timeout will result in a SOFT RESET being issued to the disk in question. Subsequent ATA I/O Timeouts will result in a HARD RESET being performed to the disk followed by a POWER CYCLE of the disk. When any of these errors are encountered, ATFCX shelflog information is also updated. Check shelflog dynamic and persistent log information for controller details on the event. Check environment shelf_stats output for additional error statistics from the disk in question. Check disk shm_stats and disk shm_stats ha.disk_id for SMART log information from the disk in question. Collating this information will help determine if this is an isolated disk problem or a controller-related problem. If the environment shelf_stats are clean along with the shelflog entries, then the error is probably a misbehaving disk. If the problem continues, RMA of the disk is recommended. However, if shelf_stats are not clean and/or shelflog errors are present, RMA of the ATFCX module is recommended.

Syslog Message

%s device %s: Check Condition: ATA I/O Timeout - Soft Reset CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.SATA.DriveDown

Severity

ERROR

Description

An SATA.DriveDown error typically indicates a problem in communicating with a disk behind a SAS to SATA bridge. A power cycle will be performed on the drive to attempt to clear the problem.

Corrective Action

A SATA Drive Down condition should clear after a drive power cycle. If the problem persists, the drive will be failed at which point RMA of the disk is recommended.

Syslog Message

device %s: Check Condition: SATA Drive Down CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.checkCondition.SATA.Timeout

Severity

ERROR

Description

An SATA.Timeout error typically indicates a problem in communicating with a disk behind a SAS to SATA bridge. A hard reset will be performed on the drive to attempt to clear the problem.

Corrective Action

A SATA Timeout condition should clear after a drive reset. If the problem persists, the drive report a drive down condition at which point it will be power cycle.

Syslog Message

device %s: Check Condition: SATA Drive Timeout CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d).

Parameters

deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.
sSenseKey (STRING): A string containing a description of the sense key for the failed command.
sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.
iSenseKey (INTHEX): The integer value of the sense key for the failed command.
iASC (INTHEX): The integer value of the sense code for the failed command.
iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): The integer value of the fru for the failed command.
DTime (INT): Delta time from first issued to sense logged.

scsi.cmd.contingentAllegiance

Severity

ERROR

Description

This message occurs when an I/O request receives a check condition, but there is no sense data.

Corrective Action

If there are command check conditions with no associated sense data with the device specified in this event and there are no other devices on the same bus/loop experiencing similar problems, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Contingent allegiance: cdb %s. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command received the contingent allegiance condition.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.driveFailureError

Severity

ERROR

Description

The drive reports failure after startup. Some i/o operation has failed on it and it should be removed.

Corrective Action

(None).

Syslog Message

%s device %s has failed during operation. Device %s is now unusable as a data or parity disk. It should be removed.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The pathname to the device that has failed the operation.
slotName (STRING): The name of the slot in which the event occurred.

scsi.cmd.excessiveVictim

Severity

ERROR

Description

This message occurs when the Storage Area Network (SAN) target or fabric continually aborts I/O operations. An initial victim abort results in the retry of the I/O operation without logging any messages. Subsequent victim aborts result in the logging of messages and additional retries. These messages are logged if there are continual aborts from the fabric or the target.

Corrective Action

Check the fabric ports and the target ports for problems in any of the components, and if necessary, take corrective actions. Check the fabric and the target logs for any event that caused the fabric or the target to abort the I/O operations. If the problem persists, troubleshoot the fabric or target.

Syslog Message

device %s: excessive victim abort: delta time %d: retry CDB %s: victim retry count %d: retry count %d: timeout retry count %d: path retry count %d: adapter status 0x%0x: target status 0x%0x: sense data %s - %s (0x%x - 0x%x 0x%x). %s

Parameters

deviceName (STRING): Path name of the device on which the command failed.
DTime (INT): Time, in milliseconds, from when the command was first issued until this message was logged.
cdb (STRING): String containing the opcode byte of the Command Descriptor Block (CDB) that was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are also included.
victimRetryCount (INT): Number of retries due to I/O failure not related to this I/O operation.
retryCount (INT): Number of retries from the SCSI layer.
timeoutRetryCount (INT): Number of times the I/O opeartion was timed out and retried.
pathRetryCount (INT): Number of retries for the path.
adapterStatus (INTHEX): Host adapter status.
targetStatus (INTHEX): Target status.
sSenseKey (STRING): String containing a description of the sense key for the failed command.
sSenseCode (STRING): String containing a description of the sense code for the failed command. If no description is available, this is an empty string.
iSenseKey (INTHEX): Integer value of the sense key for the failed command.
iASC (INTHEX): Integer value of the sense code for the failed command.
iASCQ (INTHEX): Integer value of the sense code qualifier for the failed command.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.failDevice

Severity

ERROR

Description

The failed device event is issued when a device emits a vendor specific sense key.

Corrective Action

The failed device should be replaced immediately.

Syslog Message

- ALERT! ** %s device %s has failed! Replace device at once!

Parameters

> **deviceType** (STRING): The type of device which has failed.
> **deviceName** (STRING): The electrical path name of the device which failed.

scsi.cmd.floatTimeout

Severity

> NOTICE

Description

> This message occurs when an Azure page blob I/O operation fails due to a timeout. ONTAP retries the I/O command for a maximum of five retries, until the command succeeds or fails. Successive retries increase the timeout period.

Corrective Action

> (None).

Syslog Message

> "%s" device "%s": The page blob I/O operation timeout increased to "%d" seconds: HA status "0x%x": OSC Error "%d": retry count "%d": elapsed time "%d" milliseconds: cdb %s. %s

Parameters

> **deviceType** (STRING): Device type.
> **deviceName** (STRING): Electrical path name of the device on which the command failed.
> **basicTimeout** (INT): Basic timeout, in seconds, set for the I/O operation.
> **haStatus** (INTHEX): Value of the high-availability (HA) status field for the failed command.
> **oscError** (INT): Value of the Object Store Client (OSC) error for the failed command.
> **retryCount** (INT): Number of retries from the SCSI layer.
> **ETime** (INT): Time, in milliseconds, from when the command was first issued until this I/O operation failed.
> **cdb** (STRING): String containing the opcode byte of the Command Descriptor Block (CDB) that was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
> **diskInformation** (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.fw.download.failed.butReverted

Severity

> ERROR

Description

> This event indicates that the download process was unsuccessful and thus the original running firmware is, again, the current running version.

Corrective Action

> If this error continues to be encountered, replace the FC-AT module in the shelf.

Syslog Message

> Firmware download failed, but successfully reverted to the previous running version on %s%d

Parameters

> **shelfName** (STRING): The name of the shelf in which the firmware download status is being provided.
> **shelf_num** (INT): The value of the shelf number.

scsi.cmd.fw.download.failed.notRecoverable

Severity

> ERROR

Description

> This event indicates that the download process failed and the previous running version of the firmware was not recoverable.

Corrective Action

> Replace the FC-AT module in the shelf.

Syslog Message

> Firmware download was unsuccessful and the previous running shelf firmware was not recoverable on %s%d. Once the shelf is power cycled, the FC-AT module may not be operational.

Parameters

> **shelfName** (STRING): The name of the shelf in which the firmware download status is being provided.
> **shelf_num** (INT): The value of the shelf number.

scsi.cmd.fw.download.successful

Severity

> INFORMATIONAL

Description

> This event indicates that the firmware download process completed successfully.

Corrective Action

> (None).

Syslog Message

> Firmware download was successful on %s%d

Parameters

> **shelfName** (STRING): The name of the shelf in which the firmware download status is being provided.
> **shelf_num** (INT): The value of the shelf number.

scsi.cmd.fw.download.successful.onRetry

Severity

> NOTICE

Description

> This event indicates that the download process was successful after being retried.

Corrective Action

(None).

Syslog Message

Firmware download was successful after being retried on %s%d

Parameters

shelfName (STRING): The name of the shelf in which the firmware download status is being provided.
shelf_num (INT): The value of the shelf number.

scsi.cmd.noMorePaths

Severity

ERROR

Description

The no more paths event is issued when all paths to a device have been tried without success.

Corrective Action

(None).

Syslog Message

%s device %s: No more paths to device: cdb %s. All retries have failed.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

scsi.cmd.notReadyCondition

Severity

NOTICE

Description

This message occurs when an I/O request receives a check condition where the device reports that it is not ready to process the I/O request. The I/O request is delayed to wait for the device to become ready, and then it is tried again.

Corrective Action

If command not ready check conditions associated with the device specified in this event persist, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Device returns not yet ready: CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x)(%d). %s

Parameters

deviceType (STRING): The device type.

deviceName (STRING): The electrical path name of the device on which the command failed.

cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

sSenseKey (STRING): A string containing a description of the sense key for the failed command.

sSenseCode (STRING): A string containing a description of the sense code for the failed command. If no description is available, this is a null string.

iSenseKey (INTHEX): The integer value of the sense key for the failed command.

iASC (INTHEX): The integer value of the sense code for the failed command.

iASCQ (INTHEX): The integer value of the sense code qualifier for the failed command.

iFRU (INTHEX): The integer value of the fru for the failed command.

dTime (INT): The delta time from when the command was first issued.

disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.overrun

Severity

ERROR

Description

This message occurs when an I/O request receives an overrun error. Too much data was received. I/O will be retried.

Corrective Action

If there are command overruns associated with the device specified in this event and there are no other devices on the same bus/loop experiencing similar problems, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Received a data overrun: cdb %s. Too much data was received. Possible transmission error. I/O will be retried. %s

Parameters

deviceType (STRING): The device type.

deviceName (STRING): The electrical path name of the device on which the command failed.

cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.pastTimeToLive

Severity

ERROR

Description

This message occurs when an I/O request is not completed in the maximum time allowed. It is possible that the target device is attempting an error recovery operation that is impeding the progress of other I/O requests. Often these conditions are not permanent and can be cleared by retrying the request. However, the system must limit the maximum time it waits for a device to successfully complete a request. Similarly, the number of retries is also limited. If the number of retries is not exhausted before the maximum time

allowed is exceeded, this event is generated.

Corrective Action

If there are command timeouts associated with the device specified in this event and there are no other devices on the same bus/loop experiencing similar problems, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: request failed after try #%d: cdb %s. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
retryCount (INT): The number of times the command was retried before its timer expired.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.requestSenseFailed

Severity

ERROR

Description

The request sense failed event is issued when the HA can not the auto request sense for a command which has failed.

Corrective Action

(None).

Syslog Message

%s device %s: Request sense failed: out status 0x%x: cdb %s.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cmdStatus (INTHEX): The error flags which were set for the command which failed.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.

scsi.cmd.selectionTimeout

Severity

ERROR

Description

This message occurs when the host adapter returns either a selection time out error (SCSI) or an invalid target error (FC). In effect, the specified device failed to acknowledge a request.

Corrective Action

Either the targeted device failed to respond or the address of the targeted device is no longer valid. If an alternate path to the device exists, the I/O will be automatically retried on the alternate path. If seen in conjunction with other timeouts on the same bus/loop, there may be a problem with the bus/loop, not the specific device. If this event is not seen in conjunction with any other error recovery activity on the same bus/loop, the specified device should be evaluated for proper operation and possible replacement.

Syslog Message

%s device %s: Adapter/target error: HA status 0x%x: cdb %s. Targeted device did not respond to requested I/O. I/O will be retried. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
haStatus (INTHEX): The value of the HA status field for the failed command.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.senseDataDump

Severity

ERROR

Description

This message occurs when a device emits a vendor-specific sense key. The returned sense data is dumped to provide the vendor with enough information to track down the problem.

Corrective Action

Because the sense key is vendor-specific, the vendor of the device should be contacted for any corrective actions.

Syslog Message

class 0x%x segment 0x%x sense_key 0x%x info 0x%x 0x%x 0x%x 0x%x length 0x%x resv_1 0x%x sense_code 0x%x sense_code_qualifier 0x%x fru_failed 0x%x flags 0x%x field_pointer 0x%x. %s

Parameters

class (INTHEX): The response code byte of the request sense data.
segment (INTHEX): The segment number byte of the request sense data.
senseKey (INTHEX): The Sense key byte of the request sense data.
info0 (INTHEX): The most significant byte of the information field of the request sense data.
info1 (INTHEX): The second most significant byte of the information field of the request sense data.
info2 (INTHEX): The third most significant byte of the information field of the request sense data.
info3 (INTHEX): The least significant byte of the information field of the request sense data.
length (INTHEX): The additional sense length field of the request sense data.
resv_1 (INTHEX): The command specific information field of the request sense data.
senseCode (INTHEX): The additional sense code field of the request sense data.
senseCodeQualifier (INTHEX): The additional sense code qualifier field of the request sense data.
fruFailed (INTHEX): The field replaceable unit code field of the request sense data.
flags (INTHEX): The flags byte of the sense key specific field of the request sense data.

fieldPointer (INTHEX): The field pointer bytes of the sense key specific field of the request sense data.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.SFRPCrestartError

Severity

EMERGENCY

Description

This message occurs when an SFRPC I/O request failure is being retried and the request exceeds the maximum time allowed for the request ("Max Time to Live"). The system will restart to attempt recovery.

Corrective Action

No additional action is required.

Syslog Message

%s device %s: Transport error exceeded "Max Time to Live" limit during the execution of the command. The system will attempt to restart to clear the requests: HA status 0x%x: ffm_status: %s:%d CDB %s (%d). %s

Parameters

deviceType (STRING): Device type.
deviceName (STRING): Electrical path name of the device on which the command failed.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
ffm_statusName (STRING): Name of the status returned by the FFM services describing the completion status of the I/O request at the FFM layer.
ffm_status (INTHEX): Value returned by the FFM services describing the completion status of the I/O request at the FFM layer.
cdb (STRING): String containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a) command, the logical block address and the transfer length are also included.
dTime (INT): Delta time from when the command was first issued.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, serial number and slice ID.

scsi.cmd.SFRPCtransportError

Severity

ERROR

Description

This message occurs when an SFRPC I/O request encounters a transport error during command execution. Transport errors are typically the result of the SFRPC layer's inability to complete a request successfully.

Corrective Action

Transport errors are typically unexpected events. System software takes appropriate recovery actions by retrying the I/O. No additional action is required.

Syslog Message

%s device %s: Transport error during execution of command: HA status 0x%x: ffm_status: %s:%d CDB %s (%d). %s

Parameters

deviceType (STRING): Device type.
deviceName (STRING): Electrical path name of the device on which the command failed.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
ffm_statusName (STRING): Name of status returned by the FFM services describing the completion status of the I/O request at the FFM layer.
ffm_status (INTHEX): Value returned by the FFM services describing the completion status of the I/O reqeust at the FFM layer.
cdb (STRING): String containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (x02a) command, the logical block address and the transfer length are included as well.
dTime (INT): Delta time from when the command was first issued.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, serial number and slice ID.

scsi.cmd.slotfailureError

Severity

ERROR

Description

The slot failure error event is issued if an I/O request got (0x02, 0x04, 0x05) returned from the sense information.

Corrective Action

(None).

Syslog Message

%s device %s has detected a slot failure. Device %s is now inaccessible. Shelf must be replaced to resolve problem.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
slotName (STRING): The name of the slot in which the event occurred.

scsi.cmd.targetStatus

Severity

ERROR

Description

This message occurs when an I/O request receives a status that is neither a reservation conflict nor a check condition, and represents an error that can not be retried.

Corrective Action

If the command target status associated with the device specified in this event persists and/or the device is failed, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Target Status %s: cdb %s. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
targetStatus (STRING): A string containing the target status received from the command.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.transportError

Severity

ERROR

Description

This message occurs when an I/O request encounters a transport error during command execution. Transport errors are typically the result of an incomplete data transfer (e.g., device expected more data than was received from the host adapter, or the adapter expected more data than was received from the device), a data overrun meaning that more data was transferred than was expected, a physical link transmission (parity or CRC) error, or a bus protocol error (phase error or an unexpected bus state transition.)

Corrective Action

Transport errors are typically unexpected events. The exception is when drives are physically added or removed from the bus or drive enclosure. However, transport protocols do account for detection and recovery of transmission errors through CRC or Parity mechanisms. When such an error is reported to the adapter driver, the associated request is retried. For example, on a Fibre Channel link, an occasional transmission error is consistent with the expected Bit Error Rate specifications of the link. Output from the fcadmin link_stats command can be used to obtain error counts for CRC and transport errors. If they exceed observed values from normally operating loops, loop hardware should be evaluated for partial failure of a component involved in the Fibre Channel transport. Common things to check include complete seating of drive carriers in enclosure bays, properly secured cable connections, LRC/ESH seating, and crimped or otherwise damaged cables.

Syslog Message

%s device %s: Transport error during execution of command: HA status 0x%x: cdb %s.

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (x02a) command, the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.transportErrorEMSOnly

Severity

ERROR

Description

This message occurs when an I/O request encounters a transport error during command execution. Transport errors are typically unexpected events, unless you added or removed disk drives from the bus or drive enclosure. Unexpected transport errors are typically the result of the following conditions: An incomplete data transfer where the device expected more data from the host adapter than it received (or the adapter expected more data from the device than it received); A data overrun where more data than expected was transferred; A physical link transmission (parity or CRC [cyclic redundancy check]) error; Or a bus protocol error (phase error or unexpected bus state transition).

Corrective Action

Transport protocols do account for detection and recovery of transmission errors through CRC or parity mechanisms. When this error is reported to the adapter driver, the associated request is retried. For example, on a Fibre Channel link, an occasional transmission error is consistent with the expected Bit Error Rate specifications of the link. Therefore, use output from the "fcadmin link_stats" command to obtain error counts for CRC and transport errors. If the error counts exceed observed values from normally operating loops, evaluate for partial component failure the loop hardware involved in the Fibre Channel transport. Common things to check include complete seating of drive carriers in enclosure bays, properly secured cable connections, complete LRC/ESH module seating, and crimped or otherwise damaged cables.

Syslog Message

%s device %s: Transport error during execution of command: HA status 0x%x: cdb %s. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): Physical path name of the device on which the command failed. It is in the format "path_id.device_id", where "path_id := switch:port | adapter". For example, switch1:5:40 or 8b.40.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of the I/O request execution at the transport layer or physical link layer. For this error message, the value is 9.
cdb (STRING): String containing the opcode byte of the command descriptor block (CDB) that was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a) command, the logical block address and the transfer length are also included. For example, 0x28:logical_block_address:transfer_length.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.underrun

Severity

ERROR

Description

This message occurs when an I/O request receives an underrun error and has not specifically instructed the SCSI layer to ignore underrun errors.

Corrective Action

If there are command underruns associated with the device specified in this event and there are no other devices on the same bus/loop experiencing similar problems, the device should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Received a data underrun: cdb %s. Not all the data was received. Possible transmission error. I/O will be retried. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.cmd.unexpectedAdapterError

Severity

ERROR

Description

This message occurs when a hardware adapter returns an error that is unknown to the SCSI layer.

Corrective Action

The associated hardware adapter should be evaluated for proper operation and possible repair/replacement.

Syslog Message

%s device %s: Unexpected adapter error: HA status 0x%x: cdb %s. %s

Parameters

deviceType (STRING): The device type.
deviceName (STRING): The electrical path name of the device on which the command failed.
haStatus (INTHEX): The value of the HA status field for the failed command.
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (0x2a), the logical block address and the transfer length are included as well.
disk_information (STRING): Formatted information about the disk, including the disk's vendor, model, firmware revision, and serial number.

scsi.mcc events

scsi.mcc.adt.ioTransportError

Severity

ERROR

Description

Generated when an I/O request encounters an error because of an iSCSI Protocol Error, a end device error, or some stack internal error.

Corrective Action

Transport errors are typically unexpected events; the exception being when drives are physically added or removed from the bus or drive enclosure. However, transport protocols do account for detection and recovery of transmission errors through CRC or Parity mechanisms. When such an error is reported to the adapter driver, the associated request is retried. Common things to check include complete seating of drive carriers in enclosure bays, properly secured cable connections, LRC/ESH seating, and crimped or otherwise damaged cables.

Syslog Message

mcc_adt[%u] - Transport error during execution of command: HA status 0x%x: CAM transport status 0x%x : cdb %s.

Parameters

path_instance (INTHEX): Value returned by the host adapter driver describing path instance.
ha_status (INTHEX): Value returned by the host adapter driver describing completion status of I/O request execution at the transport or physical link layer.
cam_status (INTHEX): Value returned by the host adapter driver in the FreeBSD CAM transport layer
cdb (STRING): A string containing the opcode byte of the CDB which was sent to the device. If the opcode was for a READ (0x28) or a WRITE (x02a) command, the logical block address and the transfer length are included as well.

scsi.path events

scsi.path.excessiveErrors

Severity

ERROR

Description

This message occurs when excessive errors are encountered on this device within a short-enough time period to raise concern that there might be a faulty component between the storage initiator and device. You can use the option 'ra.path_switch.threshold' to control how sensitive Data ONTAP® is to device errors. Setting it to a higher value requires more errors to trigger this event.

Corrective Action

Device errors are a common indication of storage domain stability problems. In some cases, the interconnect is operating normally and the specified device is having trouble processing I/O requests in a timely manner. In such cases, evaluate the specified device for possible replacement. Quite often the problem results from the partial failure of a component involved in the storage transport. Common things to check include complete seating of drive carriers in enclosure bays, properly secured cable connections, shelf IOM seating, failing Fibre Channel switch components, failing FC SAS bridge components and crimped or otherwise damaged cables.

Syslog Message

Excessive errors encountered by adapter %s on %s device %s.

Parameters

adapterName (STRING): Name of the associated storage host bus adapter.
deviceType (STRING): Device type.
deviceName (STRING): Name of the storage device.

scsi.scan events

scsi.scan.bus.halted

Severity

NOTICE

Description

This message occurs when the creation of the SCSI transport (xpt) path fails.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

The path that is creating the xpt path has failed with status 0x%x. Bus scan halted.

Parameters

status (INTHEX): SCSI scan bus halt status.

scsi.scan.lun.halted

Severity

NOTICE

Description

This message occurs when the creation of the SCSI transport (xpt) path fails.

Corrective Action

Check whether the device is connected correctly.

Syslog Message

The path that is creating the xpt path has failed with status 0x%x. Bus scan halted.

Parameters

status (INTHEX): SCSI scan LUN halted status.

scsi.security events

scsi.security.authLockOut

Deprecated

This event is removed to disassociate from SCSI, with the advent of NVMe encrypting drives. See replacement message EMS_nse_authLockedOut.

Severity

ERROR

Description

This message occurs when a self-encrypting drive (SED) reports excessive sequential failed authentication attempts with an incorrect Authentication Key (AK). To prevent brute-force AK attacks, the SED will no

longer accept even the correct AK. Access and control of the SED are affected. BandMaster1 authority lockout affects protection controls on user data. The system cannot authenticate using the data AK. A device power-cycle will result in data loss on the drive. For other lockouts, some aspect of compliance with Federal Information Processing Standard (FIPS) PUB 140-2 is compromised. Erase Master lockout disables cryptographic sanitize and destroy.

Corrective Action

For BandMaster1 authority lockout, reset the AK to its default value and simultaneously erase user data using the "storage encryption disk sanitize" command or the (advanced privilege) "disk encrypt sanitize" command in node shell/maintenance mode. Power-cycle clears Physical Ownership lockout in some SEDs. For other lockouts, reset the SED to its as-manufactured state and erase user data using the "storage encryption disk revert-to-original-state" command or the (advanced privilege) "disk encrypt revert_original" command in node shell/maintenance mode with the PSID value from the device label. If the PSID is not available, replace the drive. After clearing lockout, make the drive a spare by using the "storage disk assign" command and (advanced privilege) "storage disk unfail [-spare]" command as needed. To prevent lockouts, ensure that all cluster NSE nodes have all SED AKs. Display SED key IDs by using the "storage encryption disk show [-fips]" command. Verify them against those retrieved from the AK storage method: KMIP servers: Use the "security key-manager restore" command. Onboard key management: Use the "security key-manager key show" command.

Syslog Message

Lockout on Storage Encryption device %s; security provider: %s, authority: %s, during operation "%s".

Parameters

deviceName (STRING): Name of the device.
securityProvider (STRING): Name of the security provider.
authority (STRING): Name of the authority.
operation (STRING): Description of the operation that attempted authentication.

scsi.sim events

scsi.sim.checkCondition

Severity

ERROR

Description

A Check Condition is the mechanism whereby a target device reports an informational condition or error status to the requesting host. Either the condition that generated this event is an error that occurred during execution of the command and was not cleared by retrying the request or an informational condition reporting status of the present operation or media state.

Corrective Action

A target status of Check Condition normally indicates an error at the device during execution of the requested command. Such cases are often the result of an intermittent device hardware or firmware problem that is automatically handled by the Data ONTAP drivers through command retries. In cases of repeated events, the specified device should be evaluated for proper operation and possible repair or replacement. A Check Condition with a SenseKey of "no sense" indicates an informational condition that is automatically handled by the Data ONTAP driver associated with the target device. These are normally not reported as error events. However, on occasion an unexpected informational condition may be reported by a target device. These cases should not be interpreted as a failure of the target device.

Syslog Message

%s device %s: Check Condition: CDB %s: Sense Data %s - %s (0x%x - 0x%x 0x%x 0x%x) Retry: %d/%d (%d).

Parameters

deviceType (STRING): Device type.

deviceName (STRING): Electrical path name of the device on which the command failed.

cdb (STRING): String containing the opcode byte of the Command block which encountered the error. For opcodes of READ (0x28) or WRITE (0x2a), the logical block address and the transfer length are also included.

sSenseKey (STRING): String containing a description of the sense key for the failed command.

sSenseCode (STRING): String containing a description of the sense code for the failed command. If no description is available, this is a null string.

iSenseKey (INTHEX): Integer value of the sense key for the failed command.

iASC (INTHEX): Integer value of the sense code for the failed command.

iASCQ (INTHEX): Integer value of the sense code qualifier for the failed command.

iFRU (INTHEX): Integer value of the fru for the failed command.

retryCount (INT): Number of times the command was retried

freeRetryCount (INT): Number of free retries the command was given before it was successful.

DTime (INT): Delta time from first issued to sense logged.

scsiblade events

scsiblade.autoheal events

scsiblade.autoheal.disabled

Severity

NOTICE

Description

This message occurs when the node loses connectivity with the majority of the cluster and autoheal has been explicitly disabled by the user. When this occurs, both FCP and iSCSI traffic are disabled on this node and require manual intervention to come back into service.

Corrective Action

(None).

Syslog Message

This node lost connectivity with the majority of the cluster. The option "san.autoheal.enable" is "off", so the cluster's SAN configuration will not automatically recover. Both FCP and iSCSI traffic are disabled on this node.

Parameters

(None).

scsiblade.cache events

scsiblade.cache.commit.fail

Severity

ALERT

Description

This message occurs when the SAN cache encounters an error that might cause configuration inconsistencies within the cluster. SAN data traffic might be interrupted until the problem is addressed.

Corrective Action

Reload the scsi-blade by using the (privilege: diagnostic) "debug san vserver reload" command for all Vservers on this node, or perform a planned takeover/giveback of this node.

Syslog Message

The SAN cache might be inconsistent. SAN data traffic might be interrupted.

Parameters

(None).

scsiblade.disabled events

scsiblade.disabled

Severity

NOTICE

Description

This message occurs when the local node is made ineligible. When this occurs, both FCP and iSCSI traffic are disabled on the local node.

Corrective Action

Modify the node's eligibility by using the (privilege: advanced) "cluster modify -eligibility true" command.

Syslog Message

The local node is ineligible. FCP and iSCSI access is disabled.

Parameters

(None).

scsiblade.dpa events

scsiblade.dpa.disabled

Severity

NOTICE

Description

This message occurs when the node loses connectivity with the majority of the cluster and the Data Plane Availability feature has been explicitly disabled by the user. When this occurs, both FCP and iSCSI traffic are disabled on this node until connectivity is restored.

Corrective Action

(None).

Syslog Message

This node lost connectivity with the majority of the cluster. The option "san.dpa.enable" is "off", so both FCP and iSCSI traffic are disabled on this node until connectivity is restored.

Parameters

(None).

scsiblade.ha events

scsiblade.ha.partner.dblade.id.retrive.error

Severity

ERROR

Description

Unable to retrive HA Partner DBlade ID.

Corrective Action

No corrective action

Syslog Message

Unable to retrive HA Partner DBlade ID.

Parameters

(None).

scsiblade.illegal events

scsiblade.illegal.xfer.len

Severity

ERROR

Description

This message occurs when an error is returned for a SCSI command that exceeds the LUN's maximum supported transfer length of 1MB.

Corrective Action

This error is due to a problem on the host. Use one of the following recovery actions to address the problem. 1) Rescan the LUNs or reboot the host to enable discovery of the supported maximum transfer length. 2) Disable the host application that is causing the problem. 3) Report the bug to the host operating system or application provider.

Syslog Message

Returned Illegal Request response to host type %s for command opcode 0x%x with a transfer length of %lld bytes on LUN %s.

Parameters

host_os_type (STRING): Host OS type.
opcode (INT): SCSI opcode.
length (LONGINT): Request transfer length.
LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.import events

scsiblade.import.attr.mod

Severity

ERROR

Description

This message occurs when attributes of a SAN LUN under LUN import are modified. This is not a supported operation and the LUN import session needs to be deleted and re-created.

Corrective Action

Run the "lun import delete" and "lun import create" commands to re-create the import session.

Syslog Message

Attributes of the following SAN LUN under LUN import are modified: Vserver %s, volume with MSID %llu, LUN serial number %s, LUN UUID %s. This is not a supported operation and the LUN import session needs to be deleted and re-created.

Parameters

vserver (STRING): Name or UUID of the Vserver.
volumeMSID (LONGINT): MSID of the container volume.
LUN_Serial (STRING): LUN serial number.
LUN_UUID (STRING): LUN UUID.

scsiblade.import.dblade.fail

Severity

ERROR

Description

This message occurs when a SAN LUN import failover event fails for a Vserver during takeover or giveback. Some LUN import sessions configured on the Vserver will be affected. The failed LUN import sessions might not progress until a planned takeover or giveback is performed.

Corrective Action

Perform a planned takeover or giveback.

Syslog Message

SAN LUN import failover event failed for Vserver %s. Some LUN import sessions configured on the Vserver will be affected and will be in a failed state.

Parameters

vserver (STRING): Name or UUID of the Vserver.

scsiblade.import.lun.offline

Severity

ERROR

Description

This message occurs when a LUN currently being imported is brought offline by Data ONTAP ® because of an I/O failure on the foreign disk. The issue is either that data cannot be read from or written to the source (foreign LUN), or that there is an internal error.

Corrective Action

Verify the connectivity to the foreign disk. After resolving any connectivity issues, delete the LUN import and create it again.

Syslog Message

LUN %s in volume with MSID %llu on Vserver %s has been brought offline due to an I/O failure on the underlying foreign disk with serial number %s.

Parameters

lunSerial (STRING): Serial number of the LUN.
volumeMSID (LONGINT): MSID of the volume.

vserver (STRING): Name or UUID of the Vserver.
foreignDiskSlNo (STRING): Serial number of the foreign disk.

scsiblade.import.volume.fail

Severity

ERROR

Description

This message occurs when a SAN LUN import failover event fails for a volume during takeover or giveback. All LUN import sessions configured in this volume are affected. The failed LUN import sessions might not progress until a planned takeover or giveback is performed.

Corrective Action

Perform a planned takeover or giveback.

Syslog Message

SAN LUN import failover event failed for Vserver %s, volume with MSID %llu. Some LUN import sessions configured on the volume will be affected and will be in a failed state.

Parameters

vserver (STRING): Name of the Vserver.
volumeMSID (LONGINT): MSID of the volume.

scsiblade.init events

scsiblade.init.abort

Severity

ALERT

Description

This message occurs when the specified Vserver initialization was skipped due to a user-initiated abort. Giveback was allowed to succeed—in a degraded state—to allow further recovery. LUNs in the Vserver might not be accessible or might not be accessible on all paths.

Corrective Action

Resolve the previously identified fault for which the abort was issued, and then restart SAN initialization on the node by using the "debug san node restart-vserver-initialization" command.

Syslog Message

Vserver "%s" was not initialized due to a user-initiated abort request. SAN service for this Vserver might be degraded or unavailable on this node.

Parameters

vserver (STRING): Name of the Vserver.

scsiblade.init.failure

Severity

ALERT

Description

This message occurs when there is a problem initializing the SAN Kernel Agent for one or more Vservers. LUNs in the affected Vserver(s) might not be accessible or might not be accessible via all paths.

Corrective Action

Perform a planned takeover of the node with the failure followed by a giveback.

Syslog Message

There was a problem initializing the SAN Kernel Agent for one or more Vservers. Vserver: %s. Reason: %s.

Parameters

vserver (STRING): Name of the Vserver for which the SAN Kernel Agent failed to initialize.
error (STRING): Error encountered while initializing the SAN Kernel Agent for the Vserver.

scsiblade.invalid events

scsiblade.invalid.xfer.len

Severity

NOTICE

Description

This message occurs when a SCSI command requests a transfer length greater than the LUN's maximum supported transfer length of 1MB. ONTAP® software completes the command normally but the host has sent this request in violation of the SCSI protocol.

Corrective Action

Rescan the LUNs or reboot the host to enable discovery of the supported maximum transfer length for the LUN.

Syslog Message

Host type %s sent command opcode 0x%x with a transfer length of %lld bytes, which exceeds the maximum of 1MB on LUN %s.

Parameters

host_os_type (STRING): Host OS type.
opcode (INT): SCSI opcode.
length (LONGINT): Request transfer length.
LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.isolated events

scsiblade.isolated

Severity

ERROR

Description

This message occurs when the node loses connectivity with the majority of the cluster. When this occurs, both FCP and iSCSI traffic are isolated to local access only. Remote cluster traffic is impacted. After connectivity is restored, the node automatically recovers and allows remote FCP and iSCSI access.

Corrective Action

Correct the issue that caused the node to lose connectivity with the majority of the cluster. After the issue is corrected, remote service is restored.

Syslog Message

This node lost connectivity with the majority of the cluster. When this occurs, both FCP and iSCSI traffic are isolated to local access only. Remote cluster traffic will be impacted until connectivity is restored.

Parameters

(None).

scsiblade.kernel events

scsiblade.kernel.volume.limbo.group

Severity

EMERGENCY

Description

This message occurs when the kernel cluster group for the specified volume is in an indeterminate state.

Corrective Action

Contact NetApp technical support. For further information about correcting the problem, see the knowledgebase article 2017368.

Syslog Message

The kernel cluster group for volume MSID 0x%llx of Vserver %s is in an indeterminate state. This will impact SAN management and configuration. Additionally, LUNs might not be accessible on this volume from this node.

Parameters

volume (LONGINTHEX): Volume identifier.
vserver (STRING): UUID of the Vserver.

scsiblade.kernel.vserver.limbo.group

Severity

EMERGENCY

Description

This message occurs when the kernel cluster group for the specified Vserver is in an indeterminate state.

Corrective Action

Contact NetApp technical support. For further information about correcting the problem, see the Knowledgebase article 2017367.

The kernel cluster group for Vserver %s is in an indeterminate state. This will impact SAN management and configuration. Additionally, LUNs might not be accessible on this Vserver from this node.

Parameters

vserver (STRING): UUID of the Vserver.

scsiblade.lif events

scsiblade.lif.init.fail

Severity

ERROR

Description

This message occurs when the SAN LIF fails to be configured during Vserver initialization. The affected SAN LIF cannot serve data until the issue is resolved.

Corrective Action

Delete and re-create the network interface by using the "network interface delete -vserver [vserver] -lif [lif-name]" command, and then the "network interface create -vserver [vserver] -lif [lif-name]" command. You can find the configuration information required to create the network interface (data-protocol, home-node, port, etc.) by using the "network interface show -vserver [vserver] -lif [lif-name]" command. If the problem persists, contact NetApp technical support for further assistance.

Syslog Message

Vserver %s network interface %s type %s could not be initialized (error %u:%u).

Parameters

vserver (STRING): Name of the Vserver.
lif (STRING): Name of the network interface (LIF).
liftype (STRING): Type of network interface (LIF).
errortype (INT): Error type.
error (INT): Error.

scsiblade.lif.init.timeout

Severity

NOTICE

Description

This message occurs when Vserver initialization finishes, and some volumes are partially initialized. This can happen when nodes are out of quorum. When the initialization timer expires, LIFs in the Vserver are brought online regardless of whether volume initialization is complete.

Corrective Action

(None).

Syslog Message

Delayed LIF initialization timer expired for Vserver "%s".

Parameters
   vserver (STRING): Name of the Vserver.

scsiblade.lu events

scsiblade.lu.gir.end

Severity
   INFORMATIONAL

Description
   This message occurs when this node completes a group internal rebuild for an LU.

Corrective Action
   (None).

Syslog Message
   Group internal rebuild complete for LUN %s on this node.

Parameters
   LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.lu.gir.hung

Severity
   NOTICE

Description
   This message occurs when group internal rebuild for an LUN hangs on this node

Corrective Action
   (None).

Syslog Message
   Group internal rebuild hung for LUN %s on this node.

Parameters
   LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.lu.gir.start

Severity
   INFORMATIONAL

Description
   This message occurs when the distributed LUN group commences an internal rebuild.

Corrective Action
   (None).

Group internal rebuild has started for LUN %s on this node.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.lu.incons.memb

Severity

ALERT

Description

This message occurs when the SCSI target identifies a node that has an incorrect view of the group membership for a LUN. The LUN will be unavailable on this node and will have sporadic availability on other nodes.

Corrective Action

To recover from this condition in HA pair configurations, take over the node with the problem by using the "storage failover takeover" command, and then give back the node by using the "storage failover giveback" command. To recover from this condition in non-HA configurations, reboot the nodes having this condition by using the "system node reboot" command.

Syslog Message

LUN %s on node %s has an incorrect group membership list. Perform a takeover followed by a giveback of this faulty node.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
nodeName (STRING): Name of the node that has an incorrect view of the group.

scsiblade.lu.int.rst.hung

Severity

ALERT

Description

This message occurs when the SCSI target cannot complete an internal reset of a LUN. This LUN is unavailable until the nodes that could not complete the internal reset are taken over and given back.

Corrective Action

To recover from this condition in HA pair configurations, take over the node with the problem by using the "storage failover takeover" command, and then give back the node by using the "storage failover giveback" command. To recover from this condition in non-HA configurations, reboot the nodes having this condition by using the "system node reboot" command.

Syslog Message

Access to LUN %s is restricted because an internal reset of the LUN was not completed in %d milliseconds. Perform a takeover followed by a giveback for the following nodes: %s.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
lu_int_rst_hung_time (INT): Duration of the internal reset attempt in milliseconds.

nodeName (STRING): Names of the nodes on which the internal reset of the LUN was not completed.

scsiblade.lu.int.rst.pending

Severity

NOTICE

Description

This message occurs when the SCSI target cannot complete an internal reset of a LUN in 90 seconds. Internal reset is still pending, waiting for internal reset completion within 10 minutes.

Corrective Action

(None).

Syslog Message

Access to LUN %s is restricted because an internal reset of the LUN was not completed in %d milliseconds. Internal reset of the LUN is still pending.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
lu_int_rst_pending_time (INT): Duration of the internal reset attempt in milliseconds.
nodeName (STRING): Names of the nodes on which the internal reset of the LUN was not completed.

scsiblade.lu.resync.end

Severity

NOTICE

Description

This message occurs when the SCSI target internal resynchronization of a LUN is complete.

Corrective Action

(None).

Syslog Message

Resynchronization of LUN %s on this node was completed successfully.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.lu.resync.start

Severity

NOTICE

Description

This message occurs when the SCSI target internal resynchronization of a LUN starts. The LUN is not accessible on LIFs on this node during the resynchronization, but the LUN will recover automatically.

Corrective Action

(None).

Syslog Message

Resynchronization of LUN %s has started. The LUN is not accessible on LIFs on this node until resynchronization is complete and the LUN recovers automatically.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.lu.resync.timeout

Severity

ALERT

Description

This message occurs when the SCSI target internal resynchronization of a LUN times out. This LUN is not accessible on this node.

Corrective Action

To recover from this condition in HA pair configurations, take over the node with the problem by using the "storage failover takeover" command, and then give back the node by using the "storage failover giveback" command. To recover from this condition in non-HA configurations, reboot the nodes having this condition by using the "system node reboot" command.

Syslog Message

Resynchronization of LUN %s on node %s was not completed in %d seconds. LUN is not accessible on LIFs on this node. Perform a takeover followed by a giveback of this node.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
nodeName (STRING): Name of the node where resynchronization of the LUN was not completed.
resync_time_out_time (INT): Duration of the resynchronization attempt in seconds.

scsiblade.lu.rtpg.lifs

Severity

ERROR

Description

This message occurs when the SCSI Target processes the RTPG command and the number of LIFs per Vserver exceeds 700.

Corrective Action

Reduce the number of LIFS per Vserver to under 700.

Syslog Message

The Vserver hosting LUN %s has %d LIFs. RTPG command expects the number of LIFs per Vserver to be below 700.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.
num_lifs (INT): Number of LIFs on this Vserver.

scsiblade.lun events

scsiblade.lun.ids.change

Severity

ERROR

Description

This message occurs when the system detects a change in identifiers (serial number, UUID, device ID) of a LUN. As a result, SAN hosts might see the previous identifiers of the LUN. Other LUNs on specified volume are also affected. This can occur due to incomplete processing of a 'snapmirror break' operation for the volume containing this LUN. It can also occur due to the command 'lun rescan' having been issued without following up with bringing the volume offline and then bringing it online.

Corrective Action

If the LUN is in a mirrored volume and wafliron has been run on the aggregate containing the volume, issue the command 'lun rescan -oovc-to-vol'. Otherwise, bring the volume offline and then online.

Syslog Message

A change in identifiers of a LUN in Vserver %s and volume with MSID %llu has been detected. The previous and new serial numbers are '%s', '%s'. The previous and new UUIDs are '%s', '%s'. The previous and new device text IDs are '%s', '%s'. The previous and new device binary IDs are '%s', '%s'. Other LUNs on this volume are also affected.

Parameters

vserver (STRING): Name or UUID of the Vserver.
volumeMSID (LONGINT): MSID of the container volume.
prevSerial (STRING): Previous LUN serial number.
newSerial (STRING): New LUN serial number.
prevUUID (STRING): Previous LUN UUID.
newUUID (STRING): New LUN UUID.
prevDevTextID (STRING): Previous LUN Device Text ID.
newDevTextID (STRING): New LUN Device Text ID.
prevDevBinID (STRING): Previous LUN Device Binary ID.
newDevBinID (STRING): New LUN Device Binary ID.

scsiblade.lun.move.error

Severity

ERROR

Description

This message occurs when the result status message of a LUN move job is lost. The LUN move job will not complete until this message is received, even if the LUN has been moved.

Corrective Action

Use the 'lun move show' command to see if the affected job is still running. If it is, then find the affected LUN path by finding the other EMS entries with the same job UUID and file ID. Once the affected LUN has been found, then offlining and onlining the destination volume to which the LUN is being moved will make the On Demand job manager retry the operation. If the success status is 1 then all lun maps and QoS entries were successfully updated, otherwise they were not. For further assistance, contact NetApp technical support.

This message occurs when the result status %d of a LUN move job %s for file ID %llu is lost.

Parameters

Success (INT): Success status contained in the lost message.
OnDemandUUID (STRING): UUID of the On Demand job.
OnDemandIndex (LONGINT): Index of File in the On Demand Job.

scsiblade.lun.move.fail

Severity

ERROR

Description

This message occurs when a commit operation fails while updating LUN maps during a LUN move operation. The LUN move fails if this occurs.

Corrective Action

Use the provided reason to help determine the corrective action, and then retry the command. For further assistance, contact NetApp technical support.

Syslog Message

This message occurs when the RDB update fails for lun move job %s-%llu. Failure reason: %s.

Parameters

OnDemandUUID (STRING): UUID of the On Demand job.
OnDemandIndex (LONGINT): Index of File in the On Demand job.
Reason (STRING): Reason for the failure.

scsiblade.lun.offline.system

Severity

ERROR

Description

This message occurs when a LUN is brought offline by Data ONTAP ® because of a write failure caused by lack of space in the volume.

Corrective Action

Add space to the volume and bring the LUN online using the "LUN modify" command.

Syslog Message

LUN %s in volume with MSID %llu on Vserver %s has been brought offline due to lack of space in the volume.

Parameters

lunSerial (STRING): Serial number of the LUN.
volumeMSID (LONGINT): MSID of the volume.
vserver (STRING): Name or UUID of the Vserver.

scsiblade.lun.stale.map

Severity

ERROR

Description

This message occurs when a LUN or NVMe namespace attributes lookup operation fails because the LUN Vdisk ID or NVMe namespace NSID is not known to Vdisk Operations and Management. This results in degraded switchover, switchback, and Vserver initialization times.

Corrective Action

Verify that the volume is online by using the "volume show -vserver [vserver name] -volume [volume name] -fields state" command. If necessary, bring the volume online by using the "volume online -vserver [vserver name] -volume [volume name]" command. If you cannot find the volume or the problem persists, contact NetApp technical support for assistance with the diagnostic privilege commands to view and remove stale maps.

Syslog Message

Could not look up LUN or NVMe namespace attributes for the object with ID '%s' in volume with MSID '%llu' in Vserver '%s'.

Parameters

vdiskId (STRING): Vdisk ID of the LUN or NSID of the NVMe namespace.
volume (LONGINTHEX): Volume identifier.
vserver (STRING): UUID of the Vserver that hosts the LUN or NVMe namespace.

scsiblade.lun.state.invalid

Severity

ERROR

Description

This message occurs when a LUN map operation fails because the state of the LUN in the SAN cache is incorrect.

Corrective Action

Shut down the node and retry mapping the LUN by issuing the ZAPI/CLI command to one of the other nodes in the cluster. Reboot the node once the LUN has been successfully mapped.

Syslog Message

The LUN with Vdisk ID %s on Vserver "%s" cannot be mapped because its state in the SAN cache is incorrect.

Parameters

vdiskId (STRING): Vdisk ID of the LUN.
vserver (STRING): UUID of the Vserver that hosts the LUN.

scsiblade.mapped events

scsiblade.mapped.ns.attr.mod

Severity

ERROR

Description

This message occurs when a mapped NVMe namespace attribute changes as a result of a management operation. Changes in NVMe namespace attributes like size, state, or OS type, are not supported in this release.

Corrective Action

Remove the namespace map using "vserver nvme subsystem map remove" command, then reapply it with the "vserver nvme subsystem map add" command.

Syslog Message

The Namespace attributes of the Namespace with Vdisk ID '%s' in volume with MSID '%llu' in Vserver '%s' changed.

Parameters

vdiskId (STRING): Vdisk ID of the LUN.
volume (LONGINTHEX): Volume identifier.
vserver (STRING): UUID of the Vserver that hosts the LUN.

scsiblade.mcc events

scsiblade.mcc.vs.load.wm

Severity

NOTICE

Description

This message occurs when the Vserver load during MCC switchover/switchback consumes majority of the 120 second MAX timeout. The LOW and HIGH watermark indicates the possibility of exceeding the 120 second MAX timeout, which could lead to All Paths Down condition on the host.

Corrective Action

(None).

Syslog Message

MCC Vserver load hit %s watermark set to %d seconds.

Parameters

level (STRING): watermark level.
time (INT): time.

scsiblade.mgmt events

scsiblade.mgmt.evt.lost.mem

Severity

ERROR

Description

This message occurs when a SAN management event is lost because the system could not allocate enough free memory. Access to LUNs within the Vserver might be affected. The corresponding Vserver might not be available to process any other management changes and events until the node is rebooted to clear this error condition.

Corrective Action

Perform a planned takeover and giveback.

Syslog Message

A SAN management event was lost because of lack of available memory. Vserver %s might not be available to process additional SAN management commands and events. Access to LUNs within the Vserver might be affected.

Parameters

vserver (STRING): Name or UUID of the Vserver.

scsiblade.mgmt.locked

Severity

NOTICE

Description

This message occurs when there is a connectivity loss within the cluster. The SAN configuration is locked and commands to change the SAN configuration are rejected.

Corrective Action

(None).

Syslog Message

One or more cluster nodes have lost connectivity. The SAN configuration will remain locked and reject any commands to change the configuration until connectivity is restored.

Parameters

(None).

scsiblade.mgmt.unlocked

Severity

NOTICE

Description

This message occurs when connectivity to all cluster nodes is established. The SAN configuration is unlocked and commands to change the SAN configuration are allowed.

Corrective Action

(None).

Syslog Message

Connectivity to all cluster nodes is available. The SAN configuration is unlocked and can be modified.

Parameters

(None).

scsiblade.mgmt.wedged

Severity

EMERGENCY

Description

This message occurs when the SAN management plane encounters an error that prevents further SAN management commands from being processed.

Corrective Action

Contact NetApp technical support.

Syslog Message

SAN management has encountered an error and SAN configuration changes on this node and other nodes in the cluster will fail with timeout errors until corrected.

Parameters

(None).

scsiblade.object events

scsiblade.object.out.of.sync

Severity

ERROR

Description

This message occurs when a SAN management event receives a timeout error due to network congestion in the system and all efforts of recovery fail. The specific SAN object for which the management event is intended will be out of sync and will have different values in cache and in persistent store. Access to LUNs within the Vserver might be affected.

Corrective Action

Contact NetApp technical support. For further information about correcting the problem, see the knowledgebase article 2017369.

Syslog Message

A SAN management event received a timeout error due to network congestion. Management event %llu on Vserver %s left the SAN object's cache copy out of sync with information in the persistent store. Access to LUNs within the Vserver might be affected.

Parameters

opcode (LONGINT): Operation code.
vserver (STRING): Name or UUID of the Vserver.

scsiblade.offline events

scsiblade.offline

Severity

ERROR

Description

This message occurs when the node loses connectivity with the majority of the cluster. When this occurs, both FCP and iSCSI traffic are disabled on this node. Remote cluster traffic is impacted. After connectivity is restored, the node automatically recovers and enables FCP and iSCSI services.

Corrective Action

Correct the issue that caused the node to lose connectivity with the majority of the cluster. After the issue is corrected, service is restored.

Syslog Message

This node lost connectivity with the majority of the cluster. When this occurs, both FCP and iSCSI traffic are disabled on this node.

Parameters

(None).

scsiblade.online events

scsiblade.online

Severity

NOTICE

Description

This message occurs when the node completes initialization of the SAN configuration cache. FCP and iSCSI traffic are enabled on this node.

Corrective Action

(None).

Syslog Message

This node has completed initialization of the SAN configuration cache. FCP and iSCSI traffic are enabled on this node.

Parameters

(None).

scsiblade.pport events

scsiblade.pport.bsh.cancel.timeout

Severity

NOTICE

Description

PPorts LIF migration started before BSH cancel completed.

Corrective Action

No corrective action

Syslog Message

PPorts LIF migration started before BSH cancel API completed.

Parameters

(None).

scsiblade.pport.fcp.dbo.err

Severity

ERROR

Description

This message occurs during a nondisruptive operation such as takeover or giveback, when the persistent port feature is not functioning due to configuration errors.

Corrective Action

Collect the system logs, and then contact NetApp technical support. Support needs to see the system logs to determine the appropriate corrective action.

Syslog Message

FCP LIF "%s" persistence in Vserver "%s" could not be enabled. Error %u/%u: %s.

Parameters

lif (STRING): Name of the network interface (LIF).
vserver (STRING): Name of the Vserver.
errortype (INT): Error type.
error (INT): Error code.
errorDecString (STRING): Error description string.

scsiblade.pport.fcp.init.err

Severity

ERROR

Description

This message occurs when the persistent port object for a SAN FCP network interface (LIF) fails to be configured during a LIF create operation. LIF persistence will not function during nondisruptive operations like takeover and giveback until the issue is resolved.

Corrective Action

Collect the system logs, and then contact NetApp technical support. Support needs to see the system logs to determine the appropriate corrective action.

FCP LIF "%s" persistence in Vserver "%s" failed to initialize. Error %u/%u: %s.

Parameters

lif (STRING): Name of the FCP network interface (LIF).
vserver (STRING): Name of the Vserver.
errortype (INT): Error type.
error (INT): Error code.
errorDecString (STRING): Error description string.

scsiblade.prop events

scsiblade.prop.done.error

Severity

EMERGENCY

Description

This message occurs when a CTRAN "proposal done" message is not received. The SAN management plane is inoperative for the Vserver until the corrective action is taken.

Corrective Action

For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "scsiblade.prop.done.error" keyword.

Syslog Message

An internal error occurred in a %s group (MSID: %llu). The Vserver %s will not be able to process any management commands.

Parameters

groupType (STRING): CTRAN group type.
volumeMSID (LONGINT): MSID of the volume in case the CTRAN group type is "volume"; otherwise, 0.
vserver (STRING): Name or UUID of the Vserver.

scsiblade.qosvioldetectregfail events

scsiblade.QoSViolDetectRegFail

Severity

ERROR

Description

This message occurs when the Quality-of-Service (QoS) subsystem fails to register for updates during initialization due to an internal error (e.g. there is not enough system memory available). As a result, workloads might not meet their minimum throughput or their service-level objectives (SLOs).

Corrective Action

The registration will continue to be retried. If this message continues to occur, perform a planned takeover/giveback sequence to reset the reporting node nondisruptively by using the "takeover -ofnode (reporting_node)" and "giveback -ofnode (reporting_node)" commands. If the problem persists, contact

Contact NetApp technical support.

Syslog Message

Failed to register for violation detection updates. QoS min-throughput might operate in a limited capacity.

Parameters

errorCode (INT): Error code that was returned during registration.

scsiblade.reloading events

scsiblade.reloading

Severity

NOTICE

Description

This message occurs when the local node is recovering from a connectivity loss by purging and reloading the SAN configuration cache. When this occurs, both FCP and iSCSI traffic are temporarily disabled until the reload is complete.

Corrective Action

(None).

Syslog Message

This node is reloading the SAN configuration cache to recover from a loss of connectivity. While reloading, both FCP and iSCSI services are disabled. When the reload is complete, both services are automatically re-enabled.

Parameters

(None).

scsiblade.san events

scsiblade.san.config.active

Severity

NOTICE

Description

This message occurs when the SAN active-active state has changed.

Corrective Action

(None).

Syslog Message

The symmetric active-active state is %s on %lld LUNs.

Parameters

state (STRING): Active-active state.
num_luns (INT): Number of LUNs.

scsiblade.san.rtpgid.err

Severity

ERROR

Description

This message occurs when a report target port group ID space inconsistency between cluster peers is detected. This can result in no I/O progress or I/O disruption or both on the host.

Corrective Action

Recovery from inconsistency is required. Please contact Contact NetApp technical support. for assistance.

Syslog Message

Consistency group that has LUN %s is in an inconsistent state.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.san.ssm.lu.degraded

Severity

ALERT

Description

This message occurs when a LUN is marked as degraded due to a SnapMirror® Active Synchronous relationship going out of sync. The LUN is no longer accessible from the host.

Corrective Action

Restore LUN access to the host by using the "snapmirror resync" command to bring the out-of-sync relationship back in sync. For assistance, contact technical support.

Syslog Message

LUN %s was marked as degraded due to a SnapMirror Active Synchronous relationship going out of sync.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.san.ssm.lu.online

Severity

NOTICE

Description

This message occurs when a LUN is back online and might be accessible again from the host.

Corrective Action

If the host still can't access the LUN even though the LUN is back online, perform a host-side rescan operation or a reboot to enable the host to access the LUN.

Syslog Message

LUN %s is back online.

Parameters

LUNSerialNumber (STRING): Serial number of the LUN.

scsiblade.tiered events

scsiblade.tiered.lun.offline

Severity

ERROR

Description

This message occurs when a LUN is brought offline by Data ONTAP ® because of too many consecutive failures to access object storage or no response from object storage.

Corrective Action

Bring object storage online and bring the LUN online using the "LUN modify" command.

Syslog Message

LUN %s in volume with MSID %llu on Vserver %s has been brought offline due to too many consecutive failed attempts to access object storage or no response from object storage.

Parameters

lunSerial (STRING): Serial number of the LUN.
volumeMSID (LONGINT): MSID of the volume.
vserver (STRING): Name or UUID of the Vserver.

scsiblade.unavailable events

scsiblade.unavailable

Severity

EMERGENCY

Description

This message occurs when the node loses connectivity with the majority of the cluster and is unable to recover automatically. When this occurs, both FCP and iSCSI traffic are disabled on this node and require manual intervention to come back into service.

Corrective Action

Reboot the node, and if the node is waiting for giveback, perform a giveback operation.

Syslog Message

This node lost connectivity with the majority of the cluster. When this occurs, both FCP and iSCSI traffic are disabled and will remain disabled on this node until corrective actions are taken.

Parameters

(None).

scsiblade.vol events

scsiblade.vol.init.failed

Severity

EMERGENCY

Description

This message occurs when SAN initialization fails for the specified volume on this node. Access to LUNs contained in this volume from this node is not available.

Corrective Action

Reboot the node by performing a planned takeover and giveback.

Syslog Message

SAN configuration in Vserver %s failed to initialize for volume with MSID %llu. Access to LUNs contained in this volume from this node is not available.

Parameters

vserver (STRING): Name or UUID of the Vserver.
volumeMSID (LONGINT): MSID of the volume.
errorType (LONGINT): Error type.
errorCode (LONGINT): Error code.

scsiblade.vol.lun.stale.map

Severity

ERROR

Description

This message occurs when a volume lookup operation fails because the volume is not found. This is an indication that there might be stale LUN maps associated with the volume.

Corrective Action

Contact NetApp technical support for assistance with the (privilege: diag) "lun stale-map" commands.

Syslog Message

Could not lookup the volume with MSID '%llu' in Vserver '%s'. This is an indication that there might be stale lun maps associated with the volume.

Parameters

volume (LONGINTHEX): Volume identifier.
vserver (STRING): Name or UUID of the Vserver.

scsiblade.volume events

scsiblade.volume.event.lost

Severity

EMERGENCY

Description

This message occurs when LUNs in the specified Vserver and volume are not accessible on one or more SAN LIFs. Determine the volume name from an MSID by using the "volume show -vserver [vserver name] -msid [id]" command.

Corrective Action

The corrective action for this error must be determined from system logs. For more information or assistance, contact NetApp technical support.

Syslog Message

Access to LUNs in volume with MSID %llu on Vserver %s has been lost through one or more paths.

Parameters

volume (LONGINTHEX): Volume identifier (MSID).
vserver (STRING): Name or UUID of the Vserver.

scsiblade.vs events

scsiblade.vs.purge.fail

Severity

EMERGENCY

Description

This message occurs when the local node fails to purge the SAN configuration cache for a Vserver. Manual intervention is required to allow reinitialization of the specified Vserver.

Corrective Action

Reboot the node, and if the node is waiting for giveback, perform a giveback operation.

Syslog Message

The local node failed to purge the SAN configuration cache for Vserver %s.

Parameters

vserver (STRING): Name or UUID of the Vserver.

scsiblade.vserver events

scsiblade.vserver.op.timeout

Severity

EMERGENCY

Description

This message occurs when a command or other internal operation becomes blocked within Data ONTAP®. When this situation occurs, the corresponding Vserver cannot handle any other management changes for SAN until this condition is resolved. Also, the command that timed out might not have been completed, limiting access to LUNs within the Vserver.

Corrective Action

For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "scsiblade.vserver.op.timeout" keyword.

Syslog Message

A Vserver internal operation (0x%08x) has timed out. Vserver %s might not be available to process additional SAN management commands and events.

Parameters

operation (LONGINT): Operation code.
vserver (STRING): Name or UUID of the Vserver.

scsitarget events

scsitarget.fcp events

scsitarget.fcp.sfp.inserted

Severity

INFORMATIONAL

Description

This message occurs when a small form-factor pluggable (SFP) is inserted into the Fibre Channel (FC) target adapter.

Corrective Action

You can obtain detailed SFP information by using the 'fcp adapter show' command.

Syslog Message

An SFP was inserted into FC target adapter %s.

Parameters

adapter (STRING): Target adapter name.

scsitarget.fcp.sfp.invalid

Severity

ERROR

Description

This message occurs when an invalid Small Form-factor Pluggable (SFP) is inserted into the adapter. For example, a 10-GB SFP was inserted into an 8-GB FC adapter.

Corrective Action

Replace the SFP with a supported SFP.

Syslog Message

The SFP in FC adapter %s is not valid. (%s)

Parameters

adapter (STRING): Target adapter name.
reason (STRING): Reason for invalid SFP.

scsitarget.fcp.sfp.removed

Severity

INFORMATIONAL

Description

This message occurs when a Small Form-factor Pluggable (SFP) is removed from the Fibre Channel (FC) target adapter.

Corrective Action

(None).

Syslog Message

An SFP was removed from FC target adapter %s.

Parameters

adapter (STRING): Target adapter name.

scsitarget.fcp.sfp.warning

Severity

ERROR

Description

This message occurs when a small form-factor pluggable (SFP) that is not supported for FCoE links is inserted into an adapter that is configured for FCoE. For example, a 1-GB SFP is inserted into a converged network adapter (CNA) port. Note that the underlying Ethernet link might still be supported with the original SFP.

Corrective Action

Replace the SFP with an SFP that supports FCoE link speed.

Syslog Message

The SFP in FC adapter %s does not support 10 Gbit/sec speed. FCoE is supported only at 10 Gbit/sec and so the FCoE link will not be online.

Parameters

adapter (STRING): Target adapter name.

scsitarget.fct events

scsitarget.fct.fntimeout

Severity

ERROR

Description

This message occurs when the Fibre Channel (FC) target's fabric name retrieval mechanism times out on a given adapter port. This can cause failures for the "fcp adapter show" command, and it might also be associated with issues during procedures such as storage virtual machine (SVM) disaster recovery initialization.

Corrective Action

Confirm that the port is still connected to the switch port, and that the switch port is functional. On a MetroCluster system, it might be helpful to run the "fcp adapter show -adapter port -field fabric-name" command, prior to performing operations such as MetroCluster resync.

Syslog Message

Fabric name retrieval mechanism timed out for FC target port: %s with WWPN: %s. Status code: %d.

Parameters

adapterName (STRING): The name of the associated Fibre Channel (FC) host bus adapter port.
wwpn (STRING): World wide port name (WWPN) of the target adapter port that gave the error.
fabricStatus (INT): Status code returned by fabric retrieval call.

scsitarget.fct.linkError

Severity

ERROR

Description

This message occurs when a Fibre Channel (FC) Host Bus Adapter (HBA) encounters a physical layer issue. This might result in the frame being dropped. The following are examples of protocol errors that result in this message: - Bad start of frame (SOF) - Bad end of frame (EOF) - CRC error - Running disparity error - Link Reset primitive detection

Corrective Action

Recurring instances of this message indicate a physical layer issue. Perform the following recovery actions: - Verify that the overall SAN fabric is healthy. - Verify that the SFP is healthy at both endpoints, replace if necessary. - Clean or replace the cables. Contact technical support with the code and status information for further analysis.

Syslog Message

FC target HBA: %s received unexpected error: %s, %s Status1: 0x%x, Status2: 0x%x, Status3: 0x%x.

Parameters

hba (STRING): Name of the target HBA that issued the error.
error1 (STRING): String associated with the error.
error2 (STRING): Additional string associated with the error.
status1 (INTHEX): Firmware status code 1.
status2 (INTHEX): Firmware status code 2.
status3 (INTHEX): Firmware status code 3.

scsitarget.fct.loginfailed

Severity

ERROR

Description

This message occurs when the SLI Fibre Channel target driver encounters a FDISC or FLOGI failure. The failure can cause the FC target port or the LIF to be operationally down.

Corrective Action

Contact technical support for further analysis.

Syslog Message

FC port %s, NPIV port %d failed fabric login with status of %d and an extended status of x%x.

Parameters

hba (STRING): FC HBA where the login failure occurred.
npiv_port (INT): NPIV (N Port ID Virtualization) LIF ID.
status (INT): Status value communicated by the firmware after login processing.

extended_status (INTHEX): Extended status value communicated by the firmware after login processing.

scsitarget.fct.npivErr

Severity

ERROR

Description

This message occurs when the Fibre Channel (FC) fabric does not have NPIV (N Port ID Virtualization) enabled.

Corrective Action

Enable NPIV on the FC fabric for the FC LIF (logical interface) to come online. The fabric port related to the FC LIF should be disabled and then reenabled after NPIV is enabled. Use the "network interface" command to mark the operational status of the LIF as "up".

Syslog Message

NPIV is disabled on the fabric %s port %s. The target HBA resides at host %s at port %s.

Parameters

switch_name (STRING): FC fabric name.
switch_port_num (STRING): Fabric port number where NPIV is disabled.
target_host_name (STRING): Host name of the target node.
target_host_port_name (STRING): Port name of the target HBA.

scsitarget.fct.offlineComplete

Severity

NOTICE

Description

This message occurs when the FCT adapter offline process is complete.

Corrective Action

(None).

Syslog Message

Fibre Channel target adapter %s was brought offline.

Parameters

hba (STRING): HBA (host bus adapter) that was taken offline.

scsitarget.fct.offlineStart

Severity

NOTICE

Description

This message occurs when the FCT adapter offline process starts.

Corrective Action

(None).

Syslog Message

Fibre Channel target adapter %s is being brought offline.

Parameters

hba (STRING): Name of the HBA(host bus adapter) that is being taken offline.

scsitarget.fct.onlining

Severity

NOTICE

Description

This message occurs when the FCT adapter is online.

Corrective Action

(None).

Syslog Message

Fibre Channel target adapter %s is being brought online.

Parameters

hba (STRING): Name of the HBA (host bus adapter) that is being brought online.

scsitarget.fct.pingErr

Severity

ERROR

Description

This message occurs when the ELS_ECHO reply does not match the ELS_ECHO request issued by the 'fcp ping' CLI command. This means that the 'fcp ping' command failed the signal quality tests specified in the Methodologies for Signal Quality Specification (MSQS).

Corrective Action

Check the applicable section of MSQS (http://www.t11.org/ftp/t11/pub/fc/msqs/10-314v3.pdf): if a default payload was specified in the 'fcp ping' command and the platform is 8GFC or lower then the JSPAT (scrambled jitter pattern) test failed. Check the MSQS section 2.1 for a list of tests that JSPAT verifies. If the platform is 10GFC or higher and a default payload was specified, then an OMA (Optical Modulation Amplitude) or VMA (Voltage Modulation Amplitude) test failed. Check the MSQS section 2.2.1 for an explanation of these methods.

Syslog Message

FC ping failed because of a mismatch between request and response payloads. The request payload is %s and the response payload is %s at index %d. The link rate of the port is %d.

Parameters

req_payload (STRING): First mismatched character of ELS ECHO request payload.
res_payload (STRING): First mismatched character of ELS ECHO response payload.

index (INT): Index of the first mismatch between the ECHO request and response payloads.
link_rate (INT): Link rate of the Fibre Channel (FC) port.

scsitarget.fct.port.full

Severity

NOTICE

Description

This message occurs when the number of outstanding commands on a physical FC target port exceeds the supported limit on that port.

Corrective Action

To recover from this condition, evaluate the host fan-in on the port, and then take one of the following actions: - Reduce the number of hosts that are logging in to this port. - Reduce the number of LUs being accessed by the hosts logging in to this port. - Reduce the host command queue depth. Monitor the queue_full counter on the fcp_port CM object, and make sure that it is not increasing. Example: statistics show -object fcp_port -counter queue_full -instance port.portname -raw Monitor and verify that the threshold counter is also not increasing. Example: statistics show -object fcp_port -counter threshold_full -instance port.portname -raw

Syslog Message

FC target port %s has %d outstanding commands, which exceeds the maximum number of commands %d that can be supported by this port.

Parameters

portname (STRING): Port name on which the outstanding commands exceeded the supported limit.
active_commands (INT): Number of outstanding commands on the port.
max_commands (INT): Number of maximum commands supported on the port.

scsitarget.fct.port.offline

Severity

ERROR

Description

This message occurs when the Fibre Channel target port is taken offline due to too many errors received by the FCT driver. As a result, the port is not able to support FCP traffic.

Corrective Action

To determine the cause of the errors, run the "fcp adapter show" command and use the output to determine the next course of action.

Syslog Message

Fibre Channel Target port %s was taken operationally offline due to too many errors received by the FCT driver.

Parameters

adapterName (STRING): The name of the associated Fibre Channel host bus adapter.

scsitarget.fct.port.thresh

Severity

NOTICE

Description

This message occurs when the number of outstanding commands on a physical FC target port exceeds best practices as defined in the SAN configuration guide.

Corrective Action

To recover from this condition, evaluate the host fan-in on the port, and then take one of the following actions: - Reduce the number of hosts that are logging in to this port. - Reduce the number of LUs being accessed by the hosts logging in to this port. - Reduce the host command queue depth. Monitor the threshold_full counter on the fcp_port CM object, and make sure that it is not increasing. Example: statistics show -object fcp_port -counter threshold_full -instance port.portname -raw

Syslog Message

FC target port %s has %d outstanding commands, which exceeds the threshold %d for this port.

Parameters

portname (STRING): Port name on which the outstanding commands exceeded the threshold.
active_commands (INT): Number of outstanding commands on the port.
supported_threshold (INT): Threshold of the number of commands supported on the port.

scsitarget.fct.portLogin

Severity

NOTICE

Description

This message occurs when an initiator logs into a target port.

Corrective Action

(None).

Syslog Message

Login at target FC port: '%s' by initiator port: '%s' address 0x%x. The target virtual port is: '%s'.

Parameters

hba (STRING): Name of target Fiber Channel host bus adapter (HBA) where the port logged in.
portname (STRING): Port name of the initiator that logged in.
addr (INTHEX): Initiator's Fibre Channel 'Port Identifier' or 'Port Address'as defined in FC-PH. This identifier is mapped to the WWPN and reported in the output of the filer CLI "fcp initiator show" command.
lifname (STRING): The name of the virtual port of the FC host bus adapter (HBA) where the initiator logged in.

scsitarget.fct.postFailed

Severity

EMERGENCY

Description

This message occurs when the host bus adapter (HBA) failed its power-on self test (POST).

Corrective Action

Configure the HBA down then up again by using the "fcp config" command. If the HBA consistently fails its POST, replace it. Otherwise, monitor the HBA for intermittent errors and replace it if the errors occur too frequently. As part of the failing POST, an SRAM dump file is saved in the /etc/log directory. Contact NetApp technical support with this file for further analysis.

Syslog Message

FC target HBA %s could not initialize because of a POST failure.

Parameters

hba (STRING): HBA that failed its POST.

scsitarget.fct.reset

Severity

NOTICE

Description

This message occurs when the FCT adapter is being reset.

Corrective Action

(None).

Syslog Message

Resetting Fibre Channel target adapter %s.

Parameters

hba (STRING): Name of the target HBA (host bus adapter) being reset.

scsitarget.fct.sfpRxPowerLow

Severity

ALERT

Description

This message occurs when the power received (RX) by a small form-factor pluggable transceiver (SFP) is at a level below the defined threshold, which might indicate a failing or faulty part.

Corrective Action

Monitor the operating value. If it continues to decrease, then replace the SFP and/or the cables.

Syslog Message

The SFP in FC target adapter %s reports that it is receiving (RX) at a low level of power. Operating value %d (uWatts), Threshold value %d (uWatts).

Parameters

adapter (STRING): Target adapter name.
operating_value (INT): The current operating value. The value is in microwatts (uWatts).

threshold_value (INT): The defined threshold value. The value is in microwatts (uWatts).

scsitarget.fct.sfpTxPowerLow

Severity

ALERT

Description

This message occurs when a small form-factor pluggable transceiver (SFP) is transmitting (TX) power at a level below the defined threshold, which might indicate a failing or faulty part.

Corrective Action

Monitor the operating value. If it continues to decrease then replace the SFP and/or the cables.

Syslog Message

The SFP in FC target adapter %s reports that it is transmitting (TX) at a low level of power. Operating value %d (uWatts), Threshold value %d (uWatts).

Parameters

adapter (STRING): Target adapter name.
operating_value (INT): The current operating value. The value is in microwatts (uWatts).
threshold_value (INT): The defined threshold value. The value is in microwatts (uWatts).

scsitarget.hwpfct events

scsitarget.hwpfct.dump.saved

Severity

NOTICE

Description

This message occurs when an unexpected event or illegal condition is detected by the FC target driver and the contents of the FC target's memory is saved. Dump files are stored on the system's root volume in the /etc/log directory, with the following file name format: *fct*[adapter][date]_[time].[dmp |queue]

Corrective Action

Send the dump file to technical support for analysis.

Syslog Message

A dump for adapter %s was stored in %s.

Parameters

adapter (STRING): Target adapter name.
filename (STRING): Name of the file containing the dump.

scsitarget.hwpfct.els.rjt

Severity

ERROR

Description

This message occurs when an Extended Link Services (ELS) request is rejected by the fabric. Depending on the ELS request that is rejected, the initiator might experience issues discovering the target devices.

Corrective Action

Ensure that the fabric is zoned and configured correctly. Consult NetApp technical support providing the reason code, reason string, and explanation for further analysis.

Syslog Message

The Fibre Channel ELS request %s sent from adapter %s NPIV port %d to port ID 0x%x failed with reason code 0x%x (%s) and explanation code 0x%x.

Parameters

elsrequest (STRING): ELS request that was rejected by the destination port ID.
adapterName (STRING): Name of the associated Fibre Channel host bus adapter (HBA).
npiv_port (INT): NPIV (N Port ID Virtualization) LIF ID of the source of the ELS request.
portID (INTHEX): Destination port ID of the ELS request.
reasonCode (INTHEX): Reason code provided by the destination port ID for rejection of the ELS request.
reason (STRING): Reason text provided by the destination port ID for rejection of the ELS request.
explanationCode (INTHEX): Explanation code provided by the destination port ID qualifying the stated reason.

scsitarget.hwpfct.errorReset

Severity

NOTICE

Description

This message occurs when the FCT driver encounters an error which was resolved by resetting the adapter.

Corrective Action

(None).

Syslog Message

An error was encountered in the FC target driver on Fibre Channel target adapter %s. The adapter will be automatically reset to clear the %s condition.

Parameters

hba (STRING): Name of the target HBA (host bus adapter) to reset.
details (STRING): Details of the error that caused the reset.

scsitarget.hwpfct.extraHBA

Severity

ERROR

Description

This message occurs when the system detects more than the maximum number of supported Fibre Channel target host bus adapters (HBAs). The extra HBAs are not initialized.

Corrective Action

Remove the extra Fibre Channel target HBAs from the system.

Syslog Message

HBA %s will not be initialized. More than %d Fibre Channel target HBAs were found in the system.

Parameters

hba (STRING): Name of the Fibre Channel target HBA (host bus adapter) that were not initialized.
max (INT): Maximum number of supported Fibre Channel target HBAs.

scsitarget.hwpfct.fabRegFail

Severity

ALERT

Description

This message occurs when Fibre Channel target port fails to register with the fabric. As a result the intended initiators can not see the target devices.

Corrective Action

If fabric did not send a rejection the next step is to check cables and connection with the switch. Also ensure that the fabric is zoned correctly. Consult NetApp technical support providing the details and if available, the reason code, string and explanation for further analysis.

Syslog Message

Fibre Channel target adapter %s unable to register fc4_type with fabric and export target devices.

Parameters

hba (STRING): The name of the target HBA (host bus adapter) that failed.
portID (INT): Port ID of the target port trying to register with the fabric.
command (INT): Command that failed during fabric registration.
reasonCode (INTHEX): Reason code (as defined in FC-FS) of the rejection response from the fabric.
reasonString (STRING): Reason string explaining why the request from target was rejected.
explanation (INTHEX): Explanation code (as defined in FC-FS). This provides further detail on the rejection.

scsitarget.hwpfct.globalLogout

Severity

NOTICE

Description

This message occurs when the FC HBA (host bus adapter) detects a link down condition and all the initiators have logged out.

Corrective Action

Confirm that the filer is still connected to the switch and that the switch is functional.

Syslog Message

FC Target %s: Link down, all initiators logged out.

Parameters
  hba (STRING): FC target adapter name.

scsitarget.hwpfct.initFailed

Severity
  ALERT

Description
  This message occurs when the FCT driver fails to initialize the HBA (host bus adapter).

Corrective Action
  Replace the adapter.

Syslog Message
  Initialization of adapter failed on Fibre Channel target adapter %s.

Parameters
  hba (STRING): (None).

scsitarget.hwpfct.linkUp

Severity
  NOTICE

Description
  This message occurs when FCT driver receives a link up notification.

Corrective Action
  (None).

Syslog Message
  Link up on Fibre Channel target adapter %s.

Parameters
  hba (STRING): Name of the target HBA which received link-up.

scsitarget.hwpfct.thirdPartyLogout

Severity
  NOTICE

Description
  This message occurs when the FCT driver determines that an initiator has issued a third-party logout. Because the initiator is logged out, all SCSI commands from this port are aborted. If the global bit was set, all initiators are logged out and all commands are terminated.

Corrective Action
  Check to ensure that the initiator is still connected to the fabric.

Syslog Message

FC target %s: The initiator at port ID: 0x%x (WWPN %s) issued a third-party logout with %s.

Parameters

hba (STRING): FC target adapter name.
port_id (INT): Initiator's Fibre Channel "Port Identifier" or "Port Address", as defined in FC-PH. This identifier is mapped to the WWPN and reported in the output of the system CLI command "fcp initiator show" command.
node (STRING): WWPN of the initiator that changed and had commands reset.
globalBit (STRING): Message to indicate whether the global bit in the third-party logout frame was set.

scsitarget.hwpfct.tooManyInitiatorsConnected

Severity

ERROR

Description

This message occurs when the system detects too many initiators on the Fibre Channel fabric.

Corrective Action

Remove initiators from the fabric until the maximum is no longer being hit. You can remove initiators via zoning or physical disconnection.

Syslog Message

Fibre Channel target adapter %s cannot have more than %d initiators connected. Resetting adapter.

Parameters

hba (STRING): System name for the target HBA(host bus adapter) that has too many initiators attempting to connect to it.
max_initiators (INT): Max initiators that can connect to the HBA.

scsitarget.ispfct events

scsitarget.ispfct.AENErr

Severity

ALERT

Description

This message occurs when Fibre Channel host bus adapter(HBA) returns an event notification to the driver but the driver did not recognize the event type.

Corrective Action

Contact technical support with the code and status information for further analysis.

Syslog Message

Fibre Channel target HBA %s received unexpected AEN code 0x%x, Status1 0x%x, Status2 0x%x, Status3 0x%x and Status4 0x%x.

Parameters

    hba (STRING): Name of the target HBA that gave the error.
    code (INTHEX): Firmware error code.
    status1 (INTHEX): Firmware status code 1.
    status2 (INTHEX): Firmware status code 2.
    status3 (INTHEX): Firmware status code 3.
    status4 (INTHEX): Firmware status code 4.

scsitarget.ispfct.cfmodeChanged

Severity

    NOTICE

Description

    This event generates a notification that the cfmode was changed. Changing the cfmode should only be done in coordination with FCP connected hosts as this can cause devices to change, appear, or disappear on the hosts.

Corrective Action

    (None).

Syslog Message

    FCP cfmode changed from %s to %s.

Parameters

    old_mode (STRING): The cfmode setting before the change.
    new_mode (STRING): The cfmode setting after the change.

scsitarget.ispfct.configChanged

Severity

    NOTICE

Description

    This message occurs when the ISPFCT driver determines that a port configuration has changed.

Corrective Action

    Check to ensure the initiator is still connected to the fabric.

Syslog Message

    FCP target %s reported a port configuration change. %s.

Parameters

    hba (STRING): FCP target adapter name.
    message (STRING): Description of the configuration change.

scsitarget.ispfct.fwErr

Severity

    ERROR

Description

This message occurs when firmware on the Fibre Channel (FC) target host bus adapter (HBA) returns a system error. The system is resetting the HBA in an attempt to recover from the error, but further analysis is necessary to determine the cause of the problem and whether further corrective action is needed.

Corrective Action

Contact NetApp technical support with the subsequent SRAM dump so that the cause of the problem and applicable corrective action can be determined.

Syslog Message

Firmware on FC target HBA %s returned a system error code 0x%x, status1 0x%x, status2 0x%x, status3 0x%x, and status4 0x%x. Resetting HBA to recover from the error, but SRAM dump analysis is needed.

Parameters

hba (STRING): Name of the target HBA that failed.
code (INTHEX): Firmware error code.
status1 (INTHEX): Firmware status code 1.
status2 (INTHEX): Firmware status code 2.
status3 (INTHEX): Firmware status code 3.
status4 (INTHEX): Firmware status code 4.

scsitarget.ispfct.fwfileCksumFailed

Severity

ALERT

Description

This message occurs when the Fibre Channel driver fails to load the firmware file when initializing the adapter. The adapter cannot serve data until the firmware is loaded successfully.

Corrective Action

Reboot the node to reinitialize the adapter. If the adapter still fails to initialize, replace the adapter. For further assistance, contact NetApp technical support.

Syslog Message

Fibre Channel target adapter %s firmware file %s failed checksum after reading %d bytes.

Parameters

hba (STRING): Adapter that failed to load the firmware file.
filename (STRING): Name of file that could not be loaded.
bytesread (INT): Number of bytes that have been read in from the firmware file so far.

scsitarget.ispfct.invalidNVRAMNodeName

Severity

ALERT

Description

This message occurs when ONTAP® software reads an invalid World Wide Node Name (WWNN) from a Fibre Channel target adapter's NVRAM. A default WWNN will be temporarily assigned to the adapter. This might cause fabric zoning not to work correctly and might cause problems with anything that depends on consistent WWNNs and WWPNs.

Corrective Action

Reboot the node. If the problem still exists, replace the adapter. Contact NetApp technical support for assistance.

Syslog Message

Invalid WWNN of Fibre Channel target adapter %s. Assigning temporary default: %s.

Parameters

hba (STRING): Name of the target HBA that has invalid NVRAM
default_name (STRING): Node name being applied to the HBA.

scsitarget.ispfct.linkBreak

Severity

ERROR

Description

ispfct link break notification

Corrective Action

If link break is unexpected check cables, switches and the other host (if direct connected). Please check the Firmware status code 1, 2 and 4 for reason.

Syslog Message

Link break detected on Fibre Channel target adapter %s. Firmware status code status1 0x%x, status2 0x%x, and status4 0x%x.

Parameters

hba (STRING): Name of the target HBA which has lost link
status1 (INTHEX): Firmware status code 1.
status2 (INTHEX): Firmware status code 2.
status4 (INTHEX): Firmware status code 4.

scsitarget.slifct events

scsitarget.slifct.asyncError

Deprecated

Deprecated as of ONTAP® version 9.2.0 in an effort reduce event messages.

Severity

ERROR

Description

This message occurs when the Fibre Channel target device driver encounters an unrecognized asynchronous event notification from the firmware, possibly as a result of a firmware update. The unrecognized event is ignored by the system.

Corrective Action

No administrative action is required. If the messages persist, contact NetApp technical support with the event details for assistance.

Syslog Message

FC port %s encountered an unexpected event of x%x, type of x%x, with additional status of x%x, x%x, x%x.

Parameters

hba (STRING): Name of the port where the event occurred.
async_event_code (INTHEX): Asynchronous event code that was unrecognized by the target driver.
async_event_type (INTHEX): Asynchronous event type that was unrecognized by the target driver.
async_event_word1 (INTHEX): Asynchronous event word_1 that was unrecognized by the target driver.
async_event_word2 (INTHEX): Asynchronous event word_2 that was unrecognized by the target driver.
async_event_word3 (INTHEX): Asynchronous event word_3 that was unrecognized by the target driver.

scsitarget.slifct.fwAutoBoot

Severity

NOTICE

Description

This message occurs when the SLIFCT driver successfully updates the firmware version of the host bus adapter (HBA). The controller will be rebooted automatically to complete the process.

Corrective Action

None; the controller will be rebooted automatically to enable the new HBA firmware.

Syslog Message

FC target HBA %s firmware version updated from %s to %s. The controller will be rebooted automatically to enable the new HBA firmware.

Parameters

hba (STRING): HBA where the firmware version update occurred.
currentversion (STRING): Firmware version the HBA was running.
bundleversion (STRING): Firmware version bundled with Data ONTAP®.

scsitarget.slifct.fwNeedBoot

Severity

ERROR

Description

This message occurs when the SLIFCT driver successfully updates the firmware version of the host bus adapter (HBA), and requires a reboot of the controller to complete the process.

Corrective Action

Reboot the controller to enable the new HBA firmware.

Syslog Message

FC target HBA %s firmware version updated from %s to %s. Reboot the controller to enable the new HBA firmware.

Parameters

hba (STRING): HBA where the firmware version update occurred.
currentversion (STRING): Firmware version the HBA was running.

bundleversion (STRING): Firmware version bundled with Data ONTAP®.

scsitarget.slifct.fwUpdDone

Severity

NOTICE

Description

This message occurs when the SLIFCT driver successfully updates the firmware version of the host bus adapter (HBA).

Corrective Action

(None).

Syslog Message

FC target HBA %s firmware version updated from %s to %s.

Parameters

hba (STRING): HBA where the firmware version update occurred.
currentversion (STRING): Firmware version the HBA was running.
bundleversion (STRING): Firmware version bundled with Data ONTAP®.

scsitarget.slifct.fwUpdErr

Severity

ERROR

Description

This message occurs when the SLIFCT driver encounters an error while updating the firmware version of the host bus adapter (HBA).

Corrective Action

The corrective action for this error must be determined from system logs. For assistance, contact NetApp technical support with the current version, bundle version, status, and additional status values for further analysis.

Syslog Message

FC target HBA %s failed to update the firmware version from %s to %s with the status of x%x and an additional status x%x.

Parameters

hba (STRING): HBA where the firmware version update failure occurred.
currentversion (STRING): Firmware version the HBA is running.
bundleversion (STRING): Firmware version bundled with Data ONTAP®.
status (INTHEX): Status code of the firmware update process.
additional_status (INTHEX): Additional status value communicated by the firmware after login processing.

scsitarget.slifct.linkBreak

Severity

ERROR

Description

This message occurs when the SLIFCT driver receives a link break notification.

Corrective Action

If the link break was unexpected, check the cables and switch connection.

Syslog Message

Link break detected on Fibre Channel target HBA %s with event status %d , topology type %d, status1 0x%x, status2 0x%x.

Parameters

hba (STRING): Name of the target HBA (Host bus adapter) that lost link.
status (INTHEX): Reported event's status.
topology (INTHEX): Code for identifying the topology.
status1 (INTHEX): Value of the SLIPORT_ERROR1 register.
status2 (INTHEX): Value of the SLIPORT_ERROR2 register.

scsitarget.slifct.mboxError

Deprecated

Deprecated as of ONTAP® version 9.2.0 in an effort to reduce event messages.

Severity

ERROR

Description

This message occurs when the SLIFCT host bus adapter (HBA) encounters an error while processing a mailbox command.

Corrective Action

Contact NetApp technical support with the command, subsystem, subopcode, status, and extended status code for further analysis.

Syslog Message

FC port %s has a mailbox processing failure for command x%x, subsystem x%x, subopcode x%x, with the status of %d and the extended status of x%x.

Parameters

hba (STRING): HBA where the mailbox command failure occurred.
command (INTHEX): Mailbox command code.
subsystem (INTHEX): Mailbox subsystem code.
subopcode (INTHEX): Mailbox command subsystem opcode.
status (INT): Status communicated by the firmware for the mailbox command.
extended_status (INTHEX): Extended status communicated by the firmware for the mailbox command.

scsitarget.slifct.rebootRequired

Severity

EMERGENCY

Description

This message occurs when a Fibre Channel adapter experiences an unrecoverable error. The adapter cannot serve data without a node reboot.

Corrective Action

Reboot the node to reinitialize the adapter. If the adapter fails to initialize or continues to experience errors, replace the adapter. For further assistance, contact NetApp technical support.

Syslog Message

Unrecoverable error detected on Fibre Channel target HBA %s with error codes %d and %d.

Parameters

hba (STRING): Name of the target HBA that encountered the error.
ERROR_1 (INT): Value of the SLIPORT_ERROR1 register.
ERROR_2 (INT): Value of the SLIPORT_ERROR2 register.

scsitarget.slifct.retryExc

Deprecated

Deprecated as of ONTAP® version 9.2.0 in an effort to reduce event messages.

Severity

ERROR

Description

This message occurs when the SLI Fibre Channel Target driver encounters multiple Work Queue Entry (WQE) failures of a certain type that exhaust the retry limit.

Corrective Action

Contact NetApp technical support with the type, command code, subtype, status, and extended status values for further analysis.

Syslog Message

FC port %s, NPIV port %d has reached the retry limit %d of WQE processing failure for type %s, command %s, subtype x%x with status of %d and an extended status of x%x.

Parameters

hba (STRING): FC HBA where the WQE failure occurred.
npiv_port (INT): NPIV LIF ID.
retry_limit (INT): Number of times that this WQE can be retried.
type (STRING): Type of WQE.
command (STRING): Name of the command in the WQE.
subtype (INTHEX): Subtype of the command.
status (INT): Status value communicated by the firmware after WQE processing.
extended_status (INTHEX): Extended status value communicated by the firmware after WQE processing.

se events

se.changelog events

se.changelog.full

Severity

NOTICE

Description

This message occurs when Single Instance Storage (SIS) change logging metafile is full during migration workflow through Snapmirror. SIS will be disabled and file will be truncated to recover space.

Corrective Action

Upon replication break, sis will enable. If there is significant loss of savings, then Run "volume efficiency start" command with "-scan-old-data".

Syslog Message

Changelog metafile for volume %s%s%s is full.

Parameters

host (STRING): Owning host of the volume.
vol (STRING): Name of the volume.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

se.gatherer events

se.gatherer.done

Severity

NOTICE

Description

This message occurs when Single Instance Storage (SIS) auto gathering scanner completed on the auto adaptive volume.

Corrective Action

(None).

Syslog Message

Auto adaptive gathering scanner completed for %s %s %s %s %s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

se.gatherer.skip

Severity

NOTICE

Description

This message occurs when Single Instance Storage (SIS) auto adaptive gathering scanner could not be triggered on the volume post migration.

Corrective Action

Run "volume efficiency start" command with "-scan-old-data" to manually start the auto adaptive gathering scanner.

Syslog Message

Auto adaptive gathering scanner on volume %s%s could not be triggered for %s due to error: %s.

Parameters

vol (STRING): Name of the volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
trigger_type (STRING): Type of the trigger that was attempted.
err (STRING): Error message that caused the failure.

se.scan events

se.scan.filecg.stopped

Severity

ERROR

Description

This message occurs when the Single Instance Storage (SIS) scanner is attempting to recompress file-based compression (secondary compression or 8k/16K/32K adaptive compression) in a volume and there is insufficient space in the volume.In this case the recompress operation is halted to allow you to check and enable the autogrow/ autodelete setting on the volume if it is not already enabled.

Corrective Action

Consider rerunning the operation manually after enabling the autogrow/autodelete setting on the volume.

Syslog Message

Recompression of file based compressed blocks to container level compression is halted because volume '%s' might run out of space during this procedure. SIS scan type '%s'.

Parameters

volume (STRING): Volume name.
scan_type (STRING): SIS scan type.

secd events

secd.asidtrans events

secd.asidTrans.invalidAsid

Severity

ALERT

Description

This message occurs when ONTAP® software cannot translate an abbreviated SID to a Windows SID. An abbreviated SID is an internal ID maintained by ONTAP. This failure can cause CIFS share access issues.

Corrective Action

Contact NetApp technical support.

Syslog Message

For Vserver "%s", ONTAP could not translate an abbreviated SID to a Windows SID.

Parameters

vserverName (STRING): Vserver associated with this operation.

secd.authsys events

secd.authsys.lookup.failed

Severity

ERROR

Description

This message occurs when the incoming UNIX user ID (UID) that tries to mount or access a mount point cannot be looked up in any of the name-services (NIS, LDAP, file).

Corrective Action

Ensure that the UNIX UID that is trying to mount or access a mount point is part of a name-service, such as NIS, LDAP, or file.

Syslog Message

Unable to retrieve credentials for UNIX user with UID (%u) on Vserver (%s) for client with IP address (%s).

Parameters

uid (INT): UNIX UID.
vserverName (STRING): Name of the Vserver.
clientIP (STRING): IP Address of the client.

secd.cifs events

secd.cifs.machacct.missing

Severity

ALERT

Description

This message occurs when the CIFS server machine account is missing from the Active Directory domain.

Corrective Action

Create the missing CIFS server machine account in Active Directory under the appropriate domain and organizational unit. Then run "vserver cifs password-change" command to begin using it.

Syslog Message

The CIFS server machine account '%s' for Vserver '%s' is missing from the Active Directory domain '%s'.

Parameters

acctName (STRING): Name of the missing CIFS server machine account.
vserverName (STRING): Vserver whose CIFS server machine account is missing.
domainName (STRING): Name of the Active Directory domain.

secd.cifsauth events

secd.cifsAuth.denied

Severity

ERROR

Description

This message occurs when a CIFS authentication attempt fails for any reason other than an unknown user name or bad password.

Corrective Action

Examine the failure details to determine corrective action. A common failure is the inability to communicate with a domain controller.

Syslog Message

vserver (%s) Cannot authenticate CIFS user. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.cifsAuth.noNameMap

Severity

ERROR

Description

This message occurs when a CIFS authentication succeeds, but system cannot map the Windows user to an appropriate UNIX user.

Corrective Action

Examine the failure details to determine corrective action. Common failures include no appropriate Windows-to-UNIX name mapping rules, no configured default UNIX user, or the inability of the system to communicate with NS-SWITCH authorization sources.

Syslog Message

vserver (%s) CIFS name to UNIX name mapping problem. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.cifsAuth.noUnixCreds

Severity

ERROR

Description

This message occurs when the system is unable to retrieve necessary UNIX credentials for a Windows user during the CIFS authentication process.

Corrective Action

Examine the failure details to determine corrective action. A common failure is the inability to communicate with NS-SWITCH authorization sources.

Syslog Message

vserver (%s) Cannot get UNIX credentials for CIFS user. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.cifsAuth.problem

Severity

ERROR

Description

This message occurs when a CIFS authentication attempt fails for any reason other than an unknown user name or bad password.

Corrective Action

Examine the failure details to determine corrective action. Common failures include the inability to communicate with domain controllers, NIS servers, or LDAP servers due to connectivity or configuration problems.

Syslog Message

vserver (%s) General CIFS authentication problem. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.conn events

secd.conn.auth.failure

Severity

NOTICE

Description

This message occurs when the Vserver cannot establish a TCP/UDP connection to or be authenticated by an outside server such as NIS, LSA, LDAP and KDC. Subsequently, some features of the storage system relying on this connection might not function correctly.

Corrective Action

Ensure that the server being accessed is up and responding to requests. Ensure that there are no networking issues stopping the Vserver from communicating with this server. If the error reported is related to an authentication attempt, ensure that any related configurable user credentials are set correctly.

Syslog Message

Vserver (%s) could not %s over the network to server (%s)%s. Error: %s (%s).

Parameters

vserverName (STRING): Vserver associated with this operation.
connAuthAttempt (STRING): Connection or authentication attempt.
serverInfo (STRING): Name or IP:Port of the server that was related to the failure.
sourceInfo (STRING): Information about the source that was making the connection or authentication.
ErrnoMessage (STRING): Errno message from the connection or authentication failure.
operation (STRING): Operation being performed.

secd.dc events

secd.dc.out.of.pipe.instances

Severity

ALERT

Description

This message occurs when the Windows Domain Controller (DC), while responding to an MSRPC request from Data ONTAP®, returns an error indicating that it ran out of pipe instances in the listening state. This can happen when the requests from Data ONTAP are received by the DC during a timing window when the limited number of listening pipe instance are already allocated to other requests. Such errors received by Data ONTAP might result in longer CIFS/NFS authentication and/or access times, potentially resulting in CIFS/NFS client timeouts.

Corrective Action

Contact Microsoft support.

Syslog Message

MSRPC for Vserver %s to %s:%s was retried %d times (delay: %d usecs).

Parameters

vserver (STRING): Vserver that encountered the failure.
dc (STRING): DC that returned the error.
pipe (STRING): Pipe on the DC.
retries (INT): Number of retries.
delay (INT): Time (usecs) spent retrying.

secd.dns events

secd.dns.server.timed.out

Severity

ERROR

Description

This message occurs when the DNS server fails to respond to a query and timeout occurs.

Corrective Action

Make sure that the DNS server is up and running and that there are no networking issues preventing the Vserver from communicating with the DNS server.

Syslog Message

DNS server %s did not respond to vserver = %s within timeout interval.

Parameters

ipaddr (STRING): Ip address of the DNS server.
vsName (STRING): Name of the Vserver for which DNS response timed out.

secd.dns.srv.lookup.failed

Severity

ERROR

Description

This message occurs when the Domain Name Service (DNS) server fails to look up a service name.

Corrective Action

Make sure that the service name is input correctly and that there are no networking issues preventing the Vserver from communicating with the DNS server.

Syslog Message

DNS server failed to look up service (%s) for vserver (%s) with error (%s).

Parameters

serviceName (STRING): Service name to look up.
vsName (STRING): Name of the Vserver.
errorMsg (STRING): Error message of the failure.

secd.ipq events

secd.ipq.invalid.entry

Severity

ERROR

Description

This message occurs when the IP qualified name-mapping entry is omitted because of an error during the name-mapping check. For example, an error can occur if a host name is configured as the value for ip-qualifier but the hostname lookup fails, in combination with no IP address defined in the name-mapping configuration to validate against the incoming user.

Corrective Action

After resolving the error reported in this message, run the "vserver name-mapping refresh-hostname-ip" command to refresh the name-mapping information.

Syslog Message

Skipping the name-mapping entry on Vserver "%s" for user "%s" at position %u. Reason: %s.

Parameters

vserverName (STRING): Vserver associated with this operation.
userName (STRING): Name of the user.
position (INT): Name-mapping position.
errorString (STRING): Description of the specific error condition: for example, "Failed to lookup hostname gpo.co.in."

secd.kerberos events

secd.kerberos.clockskew

Severity

ERROR

Description

This message occurs when there is a "time error"(clock skew, time skew, time out of bounds). This error indicates that there is a time discrepancy between client and node or client and Key Distribution Center (KDC). The Kerberos authentication request from the client or the node was forwarded to the KDC and it failed because the timestamp encrypted in the Kerberos ticket was different by more than the maximum time difference that is configured on the KDC.

Corrective Action

Ensure that the clock time of the node is identical to that of the client and to that of the KDC. To keep the node and KDC time clocks in synchronization automatically, configure Network Time Protocol (NTP) services on the node. Increasing the clock skew interval may also alleviate this condition: To do so, modify the Kerberos-realm configuration clock-skew parameter (denoted as "Maximum tolerance for computer clock synchronization" in Windows® Active Directory) from the default 300 seconds to 600 seconds or more. Note: Increasing the clock-skew interval makes the client protocols less secure against network replay attacks.

Parameters

vserverName (STRING): Name of the vserver that is having the error.
clientInfo (STRING): Information of the client that is having the error if available.

secd.kerberos.lookupFailed

Severity

ERROR

Description

This message occurs when the Kerberos user is not a part of any name-service. ONTAP maps the Kerberos Service Principal Name(SPN) to a NFS user name while establishing a security context. If the NFS user name is not found in any of the name-services (LDAP, NIS, file), it leads to a failure in establishing security context, which in turn fails the Kerberos mount.

Corrective Action

Ensure that there is a corresponding UNIX user name for the Kerberos Service Principal Name(SPN) in name services such as NIS, LDAP, or file.

Syslog Message

Unable to map Kerberos user (%s) to appropriate UNIX user on Vserver (%s).

Parameters

uname (STRING): Kerberos NFS user.
vserverName (STRING): Name of the Vserver.

secd.kerberos.noAuthdata

Severity

ERROR

Description

This message occurs when a Kerberos ticket for a user does not contain authorization data.

Corrective Action

Ask the user to obtain a new, valid Kerberos ticket and map the share again.

Syslog Message

Kerberos client has no authorization data for Vserver "%s" with user account "%s".

Parameters

vserverName (STRING): Name of the Vserver on which the error occurred.
userAccount (STRING): User account for which there is insufficient credential information.

secd.kerberos.preauth

Severity

ERROR

Description

This message occurs when invalid credentials are provided for an Active Directory user or the machine account password is out of sync with the credentials set in the Active Directory.

Corrective Action

If the reported error is due to invalid credentials, make sure valid credentials are provided for the Active Directory user. Otherwise, if the reported error is due to an out-of-sync machine account password, run the "vserver cifs password-reset -vserver vserver_name" command to update the password in the Active Directory.

Syslog Message

A Kerberos pre-authentication failure occurred for SVM "%s" due to %s.

Parameters

vserverName (STRING): Name of the storage VM (SVM) that is having the error.
errReason (STRING): Reason for the pre-authentication error.

secd.kerberos.tktexpired

Severity

ERROR

Description

This message occurs when the client's ticket has expired. This error indicates that the timestamp encrypted in the client's Kerberos ticket has exceeded it's maximum lifetime or expired.

Corrective Action

Ensure that the clock time of the node is identical to that of the client and to that of the KDC. To keep the node and KDC time clocks in synchronization automatically, configure Network Time Protocol (NTP) services on the node. Increasing the clock skew interval may also alleviate this condition: To do so, modify the Kerberos-realm configuration clock-skew parameter (denoted as "Maximum tolerance for computer clock synchronization" in Windows® Active Directory) from the default 300 seconds to 600 seconds or more. Note: Increasing the clock-skew interval makes the client protocols less secure against network replay attacks.

Syslog Message

Kerberos client ticket has expired for vserver (%s)%s

Parameters

vserverName (STRING): Name of the vserver that is having the error.
clientInfo (STRING): Information of the client that is having the error if available.

secd.kerberos.tktnyv

Severity

ERROR

Description

This message occurs when the client presented a ticket to the server that is not yet valid (in relationship to the server time). This error indicates that the clocks on the KDC and the client are not synchronized.

Corrective Action

Ensure that the clock time of the node is identical to that of the client and to that of the KDC. To keep the node and KDC time clocks in synchronization automatically, configure Network Time Protocol (NTP) services on the node. Increasing the clock skew interval may also alleviate this condition: To do so, modify the Kerberos-realm configuration clock-skew parameter (denoted as "Maximum tolerance for computer clock synchronization" in Windows® Active Directory) from the default 300 seconds to 600 seconds or more. Note: Increasing the clock-skew interval makes the client protocols less secure against network replay attacks.

Syslog Message

Kerberos client ticket not yet valid for vserver (%s)%s

Parameters

vserverName (STRING): Name of the vserver that is having the error.
clientInfo (STRING): Information of the client that is having the error if available.

secd.ldap events

secd.ldap.bindDn.missing

Severity

ALERT

Description

This message occurs when the -bind-dn user is not configured and the -bind-as-cifs-server option is set to false in the Lightweight Directory Access Protocol (LDAP) client configuration. This LDAP configuration is not recommended because it might result in CIFS credentials being used for authentication if CIFS configuration is present (even though -bind-as-cifs-server is not set). It might also result in anonymous authentication attempts.

Corrective Action

Configure the bind distinguished name (user) and the bind user's password using the following commands: vserver services name-service ldap client modify -bind-dn vserver services name-service ldap client modify-bind-password

Syslog Message

The LDAP bind DN user is not configured on Vserver %s.

Parameters

vserverName (STRING): Vserver associated with this operation.

secd.ldap.conn.waitTimeout

Severity

ALERT

Description

This message occurs when a connection could not be attempted to any of the configured Lightweight Directory Access Protocol (LDAP) servers. Usually, this issue is seen when the LDAP servers are slow to respond to previous connection requests and SecD has reached the maximum number of simultaneous connection requests. This issue can result in longer CIFS/NFS access times, potentially resulting in client failures or timeouts.

Corrective Action

From an LDAP client workstation, ensure that all configured LDAP servers are responding to requests. Ensure that networking issues do not prevent the cluster from communicating with the servers.

Syslog Message

Connection could not be attempted to the LDAP servers configured on SVM "%s" for LDAP service type (%s) because SecD has exceeded the maximum number of simultaneous connection requests.

Parameters

vserverName (STRING): Storage virtual machine (SVM) associated with this operation.
ldapOperation (STRING): LDAP operation and service for which the connection is required.

secd.ldap.connectFailure

Severity

ALERT

Description

This message occurs when the server could not establish a TCP connection to a Lightweight Directory Access Protocol (LDAP) server.

Corrective Action

From a LDAP client workstation, make sure that the LDAP server is responding to requests. Also make sure that the portmapper on the LDAP server is responding to requests. Make sure that there are no networking issues stopping the cluster from communicating with this LDAP server.

Syslog Message

vserver (%s) could not make a connection over the network to LDAP server (%s) at address (%s) and received error (%s)

Parameters

vserverName (STRING): vserver associated with this operation.
serverName (STRING): Name of the LDAP server that was not responding.
serverAddress (STRING): Address of the LDAP server that was not responding.
ldaperror (STRING): Internal LDAP client library error.

secd.ldap.hostnames.not.resolved

Severity

ERROR

Description

This EMS is generated when none of the configured LDAP hostnames can be resolved.

Corrective Action

Examine the DNS configuration for the corresponding Vserver.

Syslog Message

None of the hostnames can be resolved for Vserver: %s.

Parameters

vserverName (STRING): Vserver associated with this operation.

secd.ldap.hostnames.resolved.partially

Severity

ERROR

Description

This EMS is generated when some of the configured LDAP hostnames cannot be resolved.

Corrective Action

Examine the DNS configuration for the corresponding Vserver.

Syslog Message

Hostnames cannot be resolved for Vserver: %s, unresolvedHosts: %s.

Parameters

vserverName (STRING): Vserver associated with this operation.
unresolvedHostnames (STRING): Hostnames which cannot be resolved.

secd.ldap.noServers

Severity

EMERGENCY

Description

This message occurs when none of the configured Lightweight Directory Access Protocol (LDAP) servers are accepting connections.

Corrective Action

From an LDAP client workstation, make sure that all configured LDAP servers are responding to requests. Ensure that there are no networking issues stopping the cluster from communicating with the configured LDAP servers. Also, ensure that the portmapper running on the LDAP server is working correctly.

Syslog Message

None of the LDAP servers configured for Vserver (%s) are currently accessible via the network for LDAP service type (%s).

Parameters

vserverName (STRING): Vserver associated with this operation.
ldapOperation (STRING): LDAP operation and service for which the connection is required.

secd.ldap.query.timed.out

Severity

ERROR

Description

This message occurs when the LDAP server fails to respond to a query and timeout occurs.

Corrective Action

Because LDAP server timeouts might be the result of connectivity issues between the storage controller and the external service or latency in LDAP server response time, ensure that external connectivity and external services have not been disrupted.

Syslog Message

Vserver '%s': LDAP server %s did not respond to query within timeout (%d seconds) interval.

Parameters

vsName (STRING): Name of the Vserver for which LDAP response timed out.
ipaddr (STRING): IP address of the LDAP server.
timeout (INT): Number of seconds before the LDAP query is timed out.

secd.ldap.referralError

Severity

INFORMATIONAL

Description

This message indicates that the domain controller does not have a copy of the requested object (which exists) and it is providing a location that is more likely to hold the object.

Corrective Action

Modify the environment to avoid LDAP referrals.

Syslog Message

Server (%s) does not hold the target entry for ldap filter (%s) on vserver (%s).

Parameters

serverAddress (STRING): Address of the LDAP server that responded with referral.
ldapSearchFilter (STRING): The Ldap search filter associated with this operation.
vserverName (STRING): Vserver associated with this operation.

secd.ldap.sasl.bind.delayed

Severity

ERROR

Description

This message occurs when a Lightweight Directory Access Protocol (LDAP) server responds slowly to SASL bind requests. This might result in longer SMB/CIFS authentication times, potentially resulting in SMB/CIFS client timeouts. Also, this might affect other LDAP bind requests and Security Daemon (SecD) delays.

Corrective Action

Ensure that there are no networking issues creating intermittent communication problems with the LDAP server. Make sure that the machine running LDAP is responsive and not overloaded.

Syslog Message

LDAP SASL bind taking longer time on server "%s" for SVM "%s".

Parameters

serverAddress (STRING): Address of the LDAP server that is not responding fast enough.
vserverName (STRING): SVM associated with this operation.

secd.ldap.slowServer

Severity

ERROR

Description

This message indicates that the Lightweight Directory Access Protocol (LDAP) server is not responding to requests in the expected time frame.

Corrective Action

Make sure that there are no networking issues creating intermittent communication problems with the LDAP server. Make sure that the machine running LDAP is responsive and not overloaded. From a LDAP client workstation, run LDAP commands to verify long response times.

Syslog Message

from CIFS Server(%s) calls to LDAP server (%s) at address (%s) is executing slowly enough to adversely impact the performance of your server.

Parameters

vserverName (STRING): vserver associated with this operation.
serverName (STRING): Name of the LDAP server that was not responding fast enough.
serverAddress (STRING): Address of the LDAP server that was not responding fast enough.

secd.ldap.starttls.delayed

Severity

ERROR

Description

This message occurs when Lightweight Directory Access Protocol (LDAP) server responses to STARTTLS requests take 5 or more seconds. This might result in longer SMB/CIFS authentication times, potentially resulting in SMB/CIFS client timeouts. Also, this might affect other LDAP bind requests and Security Daemon (SecD) delays.

Corrective Action

Ensure that there are no networking issues creating intermittent communication problems with the LDAP server. Make sure that the machine running LDAP is responsive and not overloaded.

Syslog Message

The STARTTLS operation is taking too long on LDAP server "%s" for SVM "%s".

Parameters

serverAddress (STRING): Address of the LDAP server that is not responding fast enough.
vserverName (STRING): SVM associated with this operation.

secd.ldap.trust.noServers

Severity

ERROR

Description

This message occurs when Security Daemon (SecD) fails to connect to any of the configured Lightweight Directory Access Protocol (LDAP) servers belonging to a trusted domain. Usually, this issue is seen when the LDAP servers are either unreachable or slow to respond. This issue can result in longer CIFS access times, potentially resulting in client failures or timeouts.

Corrective Action

From an LDAP client workstation, ensure that all configured LDAP servers in the trusted domain are responding to requests. Ensure that networking issues do not prevent the cluster from communicating with the servers. If domain controllers (DC's) in trusted domains should not be discovered, run the "vserver cifs options modify -is-trusted-domain-enum-search-enabled false" command.

Syslog Message

None of the LDAP servers configured for SVM "%s" and trusted domain "%s" are currently accessible for LDAP service type "%s".

Parameters

vserverName (STRING): Storage virtual machine (SVM) associated with this operation.
trustedDomain (STRING): Trusted domain for which the LDAP connection is required.
ldapOperation (STRING): LDAP operation and service for which the connection is required.

secd.lsa events

secd.lsa.noServers

Severity

EMERGENCY

Description

This message occurs when none of the configured LSA servers are accepting connections.

Corrective Action

Ensure that all configured LSA servers are responding to requests. Ensure that there are no networking issues stopping the cluster from communicating with the configured LSA servers.

Syslog Message

None of the LSA servers configured for Vserver (%s) are currently accessible via the network.

Parameters

vserverName (STRING): vserver associated with this operation.

secd.nametrans events

secd.nameTrans.groupNotFound

Severity

ERROR

Description

This message occurs when the group name cannot be resolved by any of the entities in the ns-switch for the virtual server.

Corrective Action

If this is a Windows® name, make sure that the name exists in Active Directory. If this is a UNIX® name, make sure that it is in one of the configured ns-switch entities for the virtual server. Make sure that it was entered locally as a unix-group, in the Network Information Service (NIS) maps, or in the Lightweight Directory Access Protocol (LDAP) server.

Syslog Message

vserver (%s) could not resolve the group name (%s) by any of the entities in the ns-switch for the virtual server.

Parameters

vserverName (STRING): vserver associated with this operation.
groupName (STRING): Name of the group that could not be converted to an ID.

secd.nameTrans.invalidConfig

Severity

ERROR

Description

This message occurs when the name resolution configuration for the virtual server is not set up correctly.

Corrective Action

Consult the documentation and correct the ns-switch entry for the virtual server.

Syslog Message

vserver (%s) has an incorrectly configured ns-switch. Check all of the virtual servers to ensure that the ns-switch has been configured correctly.

Parameters

vserverName (STRING): vserver associated with this operation.

secd.nameTrans.invalidUser

Severity

ERROR

Description

This message occurs when the user name cannot be resolved by any of the entities in the ns-switch for the virtual server.

Corrective Action

If this is a Windows® name, make sure the name exists in Active Directory. If this is a UNIX® name, make sure it is in one of the configured ns-switch entities for the virtual server. Make sure that the name was entered locally as a unix-user, in the Network Infomration Service (NIS) maps, or in the Lightweight Directory Access Protocol (LDAP) server.

Syslog Message

vserver (%s) could not resovle user name (%s).

Parameters

vserverName (STRING): vserver associated with this operation.
userName (STRING): Name of the user that could not be converted to an ID.

secd.nameTrans.noNameMapping

Severity

ERROR

Description

This message occurs when no name mappings or default-users are defined to convert a Windows® name to a UNIX® name or a UNIX name to a Windows name.

Corrective Action

Make sure that a default Windows user is defined for the Network File System (NFS) configuration. Make sure that a default UNIX user is defined for the CIFS configuration. Decide to either to create one of the previously mentioned items, or create a mapping rule that maps the user or group in the correct direction.

Syslog Message

vserver (%s) could not map name (%s). Reason: %s.

Parameters

vserverName (STRING): vserver associated with this operation.
userName (STRING): Name of the user that could not be converted to an ID.
attemptedMapping (STRING): Description of the specific error condition.

secd.nameTrans.unknownUser

Severity

ERROR

Description

This message occurs when the user name cannot be resolved by any of the entities in the ns-switch for the virtual server.

Corrective Action

If this is a Windows® name, make sure that the name exists in Active Directory. If this is a UNIX® name, make sure that it is in one of the configured ns-switch entities for the virtual server. Make sure that it was entered locally as a unix-user, in the Network Information Service (NIS) maps, or in the Lightweight Directory Access Protocool (LDAP) server.

Syslog Message

vserver (%s) could not resolve the user name (%s) by any of the entities in the ns-switch for the virtual server

Parameters

vserverName (STRING): vserver associated with this operation.
userName (STRING): Name of the user that could not be converted to an ID.

secd.nameTrans.userNotFound

Severity

ERROR

Description

This message occurs when the user name cannot be resolved by any of the entities in the ns-switch for the virtual server.

Corrective Action

If this is a Windows® name, make sure that the name exists in Active Directory. If this is a UNIX® name, make sure it is in one of the configured ns-switch entities for the virtual server. Make sure that it was entered locally as a unix-user, in the Network Information Service (NIS) maps, or in the Lightweight Directory Access Protocol (LDAP) server.

Syslog Message

vserver (%s) could not resolve the user name (%s) by any of the entities in the ns-switch for the virtual server.

Parameters

vserverName (STRING): vserver associated with this operation.
userName (STRING): Name of the user that could not be converted to an ID.

secd.netgroup events

secd.netgroup.ldap.badFilter

Severity

ERROR

Description

This message occurs if the filter for searching the Lightweight Directory Access Protocol (LDAP) server is found to be invalid. The typical reason for this issue is incorrect LDAP client configuration or a bad netgroup name. Searching for the current netgroup is skipped, so all hosts in the netgroup might not be authorized.

Corrective Action

Use the "vserver services name-service ldap client schema show" command to ensure that the Object Class and Attribute in the LDAP client schema are correct. Check the LDAP configuration on the server side to ensure that the attribute value (such as nisNetgroup) is correct.

Syslog Message

LDAP search on vserver (%s) failed on invalid filter: %s.

vserverName (STRING): The name of the Vserver associated with this operation.
filter (STRING): The invalid filter that caused the LDAP search to fail.

secd.netlogon events

secd.netlogon.noServers

Severity

EMERGENCY

Description

This message occurs when none of the configured Netlogon servers are accepting connections.

Corrective Action

Ensure that all configured Netlogon servers are responding to requests. Ensure that there are no networking issues stopping the cluster from communicating with the configured Netlogon servers.

Syslog Message

None of the Netlogon servers configured for Vserver (%s) are currently accessible via the network.

Parameters

vserverName (STRING): vserver associated with this operation.

secd.nfs events

secd.nfs.groupLimit

Severity

ERROR

Description

This message occurs when Data ONTAP® truncates the number of groups to which a user belongs. This can happen when a user of a UNIX-based system is in more groups than the limit supported by the system.

Corrective Action

Determine the maximum number of groups allowed for the Vserver in question with the "nfs show -vserver <vservername> -fields extended-groups-limit" command. If necessary, configure the limit of extended groups on the Vserver by using the (privilege mode: advanced) command "nfs modify -vserver <vsname> -extended-groups-limit <0..1024>". Make sure that the user does not belong to more than the maximum number of groups supported on the site NIS or LDAP server. (This maximum should correspond to the value of the "extended-groups-limit" field that was either displayed or set in the given commands.)

Syslog Message

User (%s) is in too many groups (%d): on Vserver (%s).

Parameters

uname (STRING): UNIX user name.
gidCount (INT): Total number of auxillary groups that a user belongs to, in various name services.
vserverName (STRING): Name of the Vserver.

secd.nfsauth events

secd.nfsAuth.noCifsCred

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails because of the inability of the system to retrieve a matching CIFS credential for use in multi-protocol security operations.

Corrective Action

Examine the failure details to determine corrective action. This failure usually occurs because the system is unable to communicate with Active Directory.

Syslog Message

vserver (%s) NFS authorization cannot retrieve CIFS credentials. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.nfsAuth.noCifsSid

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails because the system could not resolve an associated Windows security identifier (SID).

Corrective Action

Examine the failure details to determine corrective action. This failure usually occurs because the system is unable to communicate with Active Directory.

Syslog Message

vserver (%s) Unable to resolve CIFS security identifier (SID). %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.nfsAuth.noCifsUser

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails because the Windows user that NFS maps to cannot be found.

Corrective Action

Examine the failure details to determine corrective action. Common failures include faulty UNIX-to-Windows name mapping rules, an improperly configured default Windows user, or the system is unable to communicate with Active Directory.

Syslog Message

vserver (%s) Mapped CIFS user name not found. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.nfsAuth.noNameMap

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails because of a UNIX to Windows name mapping issue.

Corrective Action

Examine the failure details to determine corrective action. Common failures include no appropriate UNIX-to-Windows name mapping rules, no configured default Windows user, or the inability of the system to contact LDAP if LDAP is configured for name mapping.

Syslog Message

vserver (%s) Cannot map UNIX name to CIFS name. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.nfsAuth.noUnixCreds

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails because credentials for a UNIX user cannot be determined.

Corrective Action

Examine the error journal for the collection of events that led to the specific failure. A common failure is the inability to communicate with NS-SWITCH authorization sources.

Syslog Message

Vserver "%s" cannot determine UNIX identity. %s

Parameters

vserverName (STRING): Vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem.

secd.nfsAuth.problem

Severity

ERROR

Description

This message occurs when an NFS authorization attempt fails.

Corrective Action

Examine the failure details to determine corrective action. Common failures include name mapping issues, or the inability to communicate with domain controllers, NIS servers, or LDAP servers due to connectivity or configuration problems.

Syslog Message

vserver (%s) General NFS authorization problem. %s

Parameters

vserverName (STRING): vserver associated with this operation.
failureDetail (STRING): Error journal is a collection of events leading up to a failure. This failure is likely to impact many (if not all) users, and might reflect a misconfiguration or environmental problem..

secd.nis events

secd.nis.connectFailure

Deprecated

Deprecated as of version 9.5 since this EMS is no longer needed.

Severity

ALERT

Description

This message occurs when the server could not establish a TCP connection to a Network Information Service (NIS) server.

Corrective Action

From a UNIX ® workstation, make sure that the NIS server is responding to requests. Also make sure that the portmapper on the NIS server is responding to requests. Make sure that there are no networking issues stopping the cluster from communicating with this NIS server.

Syslog Message

vserver (%s) could not make a connection over the network to NIS server (%s) at address (%s) and received error (%s)

Parameters

vserverName (STRING): vserver associated with this operation.
serverName (STRING): Name of the NIS server that was not responding.
serverAddress (STRING): Address of the NIS server that was not responding.
ErrnoMessage (STRING): Errno message from the connect failure.

secd.nis.noServers

Deprecated

Deprecated as of version 9.5 since this EMS is no longer needed.

Severity

EMERGENCY

Description

This message occurs when none of the configured Network Information Service (NIS) servers are accepting connections.

Corrective Action

From a UNIX® workstation, make sure that all configured NIS servers are responding to requests. Ensure that there are no networking issues stopping the cluster from communicating with the configured NIS servers. Also, ensure that the portmapper running on the NIS server is working correctly.

Syslog Message

None of the NIS servers configured for Vserver (%s) are currently accessible via the network.

Parameters

vserverName (STRING): vserver associated with this operation.

secd.nis.slowServer

Deprecated

Deprecated as of version 9.5 since this EMS is no longer needed.

Severity

ERROR

Description

This message indicates that the Network Information Service (NIS) server is not responding to requests in the expected time frame.

Corrective Action

Make sure that there are no networking issues creating intermittent communication problems with the NIS server. Make sure that the machine running NIS is responsive and not overloaded. From a UNIX ® workstation, run YP commands to verify long response times.

Syslog Message

From CIFS Server(%s) calls to NIS server (%s) at address (%s) is executing slowly enough to adversely impact the performance of your server.

Parameters

vserverName (STRING): vserver associated with this operation.
serverName (STRING): Name of the NIS server that was not responding fast enough.
serverAddress (STRING): Address of the NIS server that was not responding fast enough.

secd.nonetgroupfile events

secd.noNetgroupFile

Severity

ALERT

Description

This message occurs when trying to process a netgroup in an export policy while the Vserver "ns-switch" option is set exclusively to "file" but no netgroup file is loaded. Client requests cannot be processed until a netgroup file is loaded or another name service is added to the Vserver "ns-switch" option.

Corrective Action

Load a netgroup file for the Vserver by using the "netgroup load" command, or add another name service to the Vserver "ns-switch" option.

Syslog Message

Cannot evaluate a netgroup in an export policy without a properly configured "ns-switch" option for Vserver "%s". It is set exclusively to "file" but no netgroup file is loaded.

Parameters

vserverName (STRING): Vserver associated with this operation.

secd.quark events

secd.quark.ddns.updt.failure

Severity

ERROR

Description

This message occurs when the server can not a send dynamic DNS (DDNS) update to the DNS server.

Corrective Action

For "NOTIMP" errors, enable DDNS on the DNS server. For "REFUSED" errors, verify the DDNS settings on the DNS server. For all other errors, Contact NetApp technical support..

Syslog Message

DDNS update failed with error %s.

Parameters

cmdError (STRING): Error from the attempted DDNS update.

secd.quark.sid.lookup.failed

Severity

ERROR

Description

This message occurs when the Active Directory server cannot find the Security Identifier (SID) for a given account name.

Corrective Action

Provide a valid account name.

Syslog Message

Failed to lookup the SID for account name "%s" with error "%s".

Parameters

accountName (STRING): Name of the account whose SID is looked up in the server.
errorMsg (STRING): Error received from the server while doing a SID lookup for the given account name.

secd.rpc events

secd.rpc.authRequest.blocked

Severity

ALERT

Description

This message occurs when a user with the same domain and same client IP address is blocked due to continuous authentication requests with an invalid login password.

Corrective Action

Check if there is an unexpected increase in the number of authentication requests with an invalid login password from a particular CIFS client. Use "statistics show -raw -object secd -instance secd -counter num_rpcs_blocked_due_to_wrong_password" command to check the number of clients blocked due to an invalid password.

Syslog Message

Too many CIFS authentication attempts with an invalid password from a client with IP "%s", user name "%s" and domain "%s" on SVM "%s".

Parameters

clientIP (STRING): IP address of the client that has been blocked.
userName (STRING): User who is trying to mount with an invalid password.
domain (STRING): Domain to which the user belongs.
vserverName (STRING): Storage virtual machine(SVM) associated with this operation.

secd.rpc.server.ready

Severity

INFORMATIONAL

Description

This message occurs when SecD successfully loads the configuration and is ready to serve all RPCs.

Corrective Action

(None).

Syslog Message

SecD is ready to serve all RPCs.

Parameters

(None).

secd.rpc.server.request.dropped

Severity

ERROR

Description

This message occurs when a remote procedure call(RPC) is dropped by SecD due to a lack of memory space. It might occur either when SecD receives too many requests than it can handle or when a number of requests have accumulated due to server connectivity issues.

Corrective Action

Check whether there is an unexpected increase in the number of authentication requests from NFS/CIFS clients. Verify that there are no connectivity issues to the external servers like DNS, LDAP, and DC.

Syslog Message

RPC "%s" that was sent from "%s" was dropped by SecD due to a lack of memory space.

Parameters

rpcName (STRING): Name of the RPC that has been dropped.
callerName (STRING): Caller of the RPC that has been dropped.

secd.single events

secd.single.label.domain

Severity

ERROR

Description

This message occurs when the trusted domains for the CIFS home domain of a Vserver contains a single-label domain (SLD). An SLD configuration is not supported because it can cause CIFS access issues.

Corrective Action

Examine and remove any SLDs configured for the CIFS domain associated with the corresponding Vserver on your domain controller. Additionally, examine and revoke any account's access to the CIFS server where the account is from the trusted SLD.

Syslog Message

Single-label domain (SLD) "%s" was found in the CIFS trusted domains for Vserver %s.

Parameters

domainName (STRING): Trusted SLD.
vserverName (STRING): Vserver associated with this operation.

secd.strong events

secd.strong.auth.required

Severity

ALERT

Description

This message occurs when the external LDAP server configured for a Vserver is enforcing stronger authentication than what the ONTAP® LDAP client is configured for.

Corrective Action

Configure stronger LDAP session security using the following commands: 1. vserver services name-service ldap client modify -session-security 2. vserver cifs security modify -session-security-for-ad-ldap

Syslog Message

Stronger authentication enforced by LDAP server for Vserver %s.

Parameters

vserverName (STRING): Vserver associated with this operation.

secd.unexpectedfailure events

secd.unexpectedFailure

Severity

ERROR

Description

This message occurs when the security daemon captures an unexpected failure.

Corrective Action

Examine the failure details to determine corrective action.

Syslog Message

Unexpected SecD failure in Vserver "%s". Details: %s

Parameters

vserverName (STRING): Vserver associated with this operation.
failureDetail (STRING): The error journal documents the events leading up to the failure. This failure is likely to impact many (if not all) users, and it might indicate a misconfiguration or environmental problem.

secd.unixlookupfailure events

secd.unixLookupFailure

Severity

ERROR

Description

This message occurs when an UNIXi® user or group lookup fails. This failure is likely to impact many or all users, and might indicate a misconfiguration or environmental problem.

Corrective Action

Examine the error journal in the /mroot/etc/mlog/secd.log file to learn more about why the LOOKUP failed. The error journal is a collection of events leading up to a failure. Common failures include the wrong user name or ID and the inability to communicate with the NIS or LDAP servers due to connectivity or configuration problems. If the vserver's NSSWITCH is set to "file", verify that the user or group that is being looked up has been created using the cluster's ngshell interface. If the vserver's NSSWITCH is set to "NIS", run 'yp' commands from an NIS client workstation to verify that the UNIX lookup works on the configured NIS server. If the vserver's NSSWITCH is set to "LDAP", run 'ldap' commands from an LDAP client workstation to verify that the UNIX lookup works on the configured LDAP server. Verify that the cluster can communicate with the configured NIS or LDAP servers.

Syslog Message

UNIX lookup failure on Vserver (%s) for client with IP address (%s). %s

Parameters

vserverName (STRING): vserver associated with this operation.
clientIP (STRING): IP Address of the client.
failureDetail (STRING): Reason for the failure.

sectrace events

sectrace.warning events

sectrace.warning.aboutperf

Severity

ALERT

Description

This message occurs when a security tracing filter is enabled. It can cause a significant performance degradation and should be disabled as soon as it is no longer needed.

Corrective Action

Consider disabling the Security tracing filters as soon as it is no longer needed. 'sectrace filter modify -vserver [id] -index [index] -enabled disabled'

Syslog Message

Security tracing is enabled on Vserver %s for the next %d minutes.

Parameters

vservername (STRING): Name of the vserver on which file/directory tracing is enabled.
duration (INT): Duration of the sectrace filter that is enabled.

securepurge events

securepurge.aborted events

securepurge.aborted

Severity

ERROR

Description

This message occurs when a secure purge operation is aborted in a flexible volume.

Corrective Action

Correct the cause of the error, and then retry the operation.

Syslog Message

Secure purge operation is aborted on the volume '%s' in Vserver '%s'. Error: '%s'.

Parameters

volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.
desc (STRING): Reason for the failure.

securepurge.completed events

securepurge.completed

Severity

NOTICE

Description

This message occurs when a secure purge operation is completed in a flexible volume.

Corrective Action

(None).

Syslog Message

Secure purge operation is completed on the volume '%s' in Vserver '%s'.

Parameters

volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.

securepurge.started events

securepurge.started

Severity

NOTICE

Description

This message occurs when a secure purge operation is started in a flexible volume.

Corrective Action

(None).

Syslog Message

Secure purge operation is started on the volume '%s' in Vserver '%s'.

Parameters

volumename (STRING): Name of the volume.
vservername (STRING): Name of the Vserver.

security events

security.invalid events

security.invalid.login

Severity

ALERT

Description

This message occurs when an attempt is made to access the appliance by using invalid authentication credentials.

Corrective Action

Verify that the user made a genuine attempt to access the system. If not, use the "security login delete" command to either remove the account or use the "security login lock" command to lock the account to disallow access to the system using that user account. Also, strengthen the authentication credentials of the user account by updating it. More detail regarding the authentication failure is available in audit.log file.

Syslog Message

Failed to authenticate login attempt to Vserver: %s, username: %s, application: %s.

Parameters

vserver (STRING): The name of the Vserver to which the access was attempted.
userName (STRING): The user name used to gain access to the Vserver.
application (STRING): The name of the application used to gain access to the Vserver.

service events

ses events

ses.access events

ses.access.noEnclServ

Severity

ALERT

Description

This message occurs when Enclosure Services in the storage system cannot establish contact with the enclosure monitoring process in any disk shelf on the channel. Enclosure Services in the storage system tries periodically to reestablish contact with the disk shelf.

Corrective Action

If the error persists for more than an hour, then reboot the controller.

Syslog Message

No Enclosure Services detected through channel %s.

Parameters

channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".

ses.access.noMoreValidPaths

Severity

ALERT

Description

This message occurs when Enclosure Services in the storage system loses access to the enclosure monitoring process in the disk shelf I/O module.

Corrective Action

Enclosure Services in the storage system tries periodically to reestablish contact with the disk shelf. If the error persists for more than an hour, then halt the storage system, power-cycle the disk shelf, and reboot. If the error still persists, then the shelf I/O module might need to be replaced.

Syslog Message

No more valid paths to Enclosure Services in shelf %d on channel %s.

Parameters

shelf (INT): Disk shelf number on the channel with which access has been lost.
channelName (STRING): Name of the adapter port or switch port associated with the shelf; for example, "7a" or "myswitch:5".

ses.access.noShelfSES

Severity

ERROR

Description

This message occurs when Enclosure Services in the storage system cannot establish contact with the Enclosure Services process in the indicated disk shelf. The system tries periodically to reestablish contact with the disk shelf.

Corrective Action

If the error persists for more than an hour, then the disk shelf module must be power-cycled. If the module is a system CPU module (such as IOM6E), or if the system is attached in a single path to the module, then halt the system, reseat the module, and reboot. In a multipath system, remove the shelf module, wait 30 seconds, and then reinsert the module. If the error persists, then replace the shelf module.

Syslog Message

No SCSI-3 Enclosure Services on channel %s shelf %d.

Parameters

channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".
shelf (INT): Disk shelf number on the channel with which contact has been lost.

ses.access.sesUnavailable

Severity

ALERT

Description

This message occurs when Enclosure Services in the storage system cannot establish contact with the enclosure monitoring process in one or more disk shelves on the channel. The system tries periodically to reestablish contact with the disk shelves.

Corrective Action

If the error persists for more than an hour, then reboot the controller.

Syslog Message

Enclosure Services unavailable for one or more shelves on channel %s.

Parameters

channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".

ses.badsharestorageconfigerr events

ses.badShareStorageConfigErr

Severity

EMERGENCY

Description

This message occurs when a disk shelf module that is not supported in a Shared Storage system, such as an LRC module, is detected in a Shared Storage system.

Corrective Action

Replace the unsupported module with one that is supported.

Syslog Message

Disk shelf %d on adapter %s has an unsupported module for a Shared Storage configuration.

Parameters

shelf_num (INT): Disk shelf number the unsupported module is on.
ha_name (STRING): Host adapter on which the disk shelf resides.

ses.bridge events

ses.bridge.fw.getFailWarn

Severity

ERROR

Description

This message occurs when the bridge firmware revision cannot be obtained.

Corrective Action

Check the connection to the bank of Maxtor drives.

Syslog Message

On channel %s, the bridge firmware revision could not be obtained using disk IDs %d-%d.

Parameters

ChannelName (STRING): Name of the adapter or switch port that the system tried to get the revision number of.
DiskID (INT): Starting ID of the bank of Maxtor disks that was used to obtain the bridge firmware.
DiskRange (INT): Number of drives in that bank of Maxtor disks.

ses.bridge.fw.mmErr

Severity

ERROR

Description

This message occurs when the bridge firmware revision is inconsistent.

Corrective Action

Check the firmware revision number and make sure that they are consistent. You might have to update the firmware.

Syslog Message

On channel %s, the bridge firmware revision appears to be inconsistent : %8.8s and %8.8s.

Parameters

ChannelName (STRING): Name of the channel that contains the inconsistent firmware revision.
PrevRev (STRING): Previous firmware revision.
CurRev (STRING): Current firmware revision.

ses.channel events

ses.channel.rescanInitiated

Severity

INFORMATIONAL

Description

This message occurs when a rescan for enclosure services devices is initiated.

Corrective Action

(None).

Syslog Message

Initiating rescan on channel %s.

Parameters

channelName (STRING): Name of the adapter port or switch port being rescanned; for example, "7a" or "myswitch:5".

ses.config events

ses.config.diskStackMaxError

Severity

ERROR

Description

This message occurs when a stack of shelves contains more disk bays than the maximum number that are allowed.

Corrective Action

Remove shelves from the storage stack until the the number of disk bays do not exceed the maximum number.

Syslog Message

There are a total of %d disk bays on shelves attached to channel "%s", which exceeds the maximum number of disk bays (%d).

Parameters

numDiskBays (INT): Number of disk bays on the storage stack.
channelName (STRING): Name of the adapter port or switch port connected to the storage stack associated with the error (for example, "7a" or "myswitch:5").
maxDiskBays (INT): Maximum number of disk bays that are allowed on the storage stack.

ses.config.drivePopError

Severity

ERROR

Description

This message occurs when the channel has more disk drives on it than are allowed. Systems using synchronous mirroring allow more disk drives per channel than other systems.

Corrective Action

If synchronous mirroring is intended to be used, ensure that the license is installed. Otherwise, reduce the number of disk drives on the channel to no more than the maximum allowed.

Syslog Message

Disk drive population is greater than %d in channel %s; this is an illegal configuration. Synchronous mirroring %s is enabled.

Parameters

fcalTenancy (INT): Maximum number of disk drives allowed on this loop.
channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".
isIsNot (STRING): Whether synchronous mirroring is enabled.

ses.config.IllegalEsh270

Severity

EMERGENCY

Description

This message occurs when ONTAP® software detects one or more Embedded Switched Hub (ESH) disk shelf modules in a disk shelf that is attached to a FAS270. This is not a supported configuration.

Corrective Action

Replace the ESH modules with ESH2 modules.

Syslog Message

One or more ESH modules are attached to a FAS270. This is not a supported configuration. Replace the ESH modules with ESH2 modules.

Parameters

(None).

ses.config.shelfMixError

Severity

EMERGENCY

Description

This message occurs when the channel has a mixture of ATA and Fibre Channel disk shelves; this is not a supported configuration.

Corrective Action

Mixed-mode operation of ATA and Fibre Channel disks on the system is only supported on separate loops. Move all Fibre Channel-based disk shelves to one loop and place all Fibre Channel-to-ATA-based disk shelves on another loop.

Syslog Message

Disk shelves present on channel %s are of different drive types; this is not a supported configuration.

Parameters

channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".

ses.config.shelfPopError

Severity

ERROR

Description

This message occurs when the channel has more disk shelves on it than are allowed.

Corrective Action

Reduce the number of disk shelves on the channel to the number specified.

Syslog Message

Disk shelf population on channel %s is %d. Reduce the number of disk shelves on this channel to %d or fewer.

Parameters

channelName (STRING): Name of the adapter port or switch port associated with the error; for example, "7a" or "myswitch:5".
numShelves (INT): Number of disk shelves on the port.
maxShelves (INT): Maximum number of disk shelves on a port.

ses.disk events

ses.disk.configOk

Severity

INFORMATIONAL

Description

This message occurs when there are no longer any drives in a FAS2050 system's slots 20 through 23.

Corrective Action

(None).

Syslog Message

Disk configuration errors have been cleared.

Parameters

(None).

ses.disk.illegalConfigWarn

Severity

ERROR

Description

This message occurs when disk drives are inserted into the bottom row of a FAS2050 storage appliance. Disk drives are not supported in those slots.

Corrective Action

Remove the disk drives.

Syslog Message

Disk drives are inserted into unsupported drive slots in the bottom row of the storage appliance.

Parameters

(None).

ses.download events

ses.download.powerCyclingChannel

Severity

INFORMATIONAL

Description

This message occurs when the power cycling channel event is issued after a disk shelf firmware download to disk shelves that require a power-cycle to activate the new code.

Corrective Action

(None).

Syslog Message

Power cycling channel %s.

Parameters

channelName (STRING): Name of the adapter port or switch port on which the disk shelf is being power-cycled.

ses.download.shelfToReboot

Severity

INFORMATIONAL

Description

This message occurs after the completion of shelf firmware transfer to the DS14-Mk2-AT (R200) disk shelf, at which point the disk shelf requires about another five minutes to transfer the new firmware to its nonvolatile program memory, whereupon it reboots to begin to execute the new firmware. During this

reboot, a Fibre Channel loop reinitialization occurs, temporarily interrupting the loop.

Corrective Action

(None).

Syslog Message

The DS14-Mk2-AT shelves will be rebooted shortly to run the new firmware. The firmware download process should take about three minutes per shelf.

Parameters

(None).

ses.download.suspendIOForPowerCycle

Severity

INFORMATIONAL

Description

This message occurs when the suspending I/O event signals that the storage subsystem is temporarily stopping I/O to disks while one or more disk shelves have their power cycled after a download, if required by the disk shelf design.

Corrective Action

(None).

Syslog Message

Suspending disk I/O prior to shelf power cycle.

Parameters

(None).

ses.drive events

ses.drive.badPlacement

Severity

ALERT

Description

This message occurs when disk drives are placed in locations that do not provide for proper signal integrity. In some older shelf types only, circuitry in the disk drives conditions the signals on their way through the disk shelves. If the disk drives are not in certain locations, the signal might degrade and cause errors. Disk drives must be kept in the proper locations even if one or more disk drives are removed for maintenance reasons.

Corrective Action

If only loop A is used, always keep at least one disk drive in bays 0-2 and at least one disk drive in bays 3-6. If loop B is also used, always keep at least one disk drive in bays 0-2 and at least one disk drive in bays 4-6. The integrity requirement of both loops is satisfied if disk drives are placed as required for loop B. Remember that bays 3 and 4 are used for enclosure services access in XL400/XL500 disk shelves.

Syslog Message

Improper disk drive placement in channel %s disk shelf %d. Loop integrity requires certain disk shelf bays to be populated.

Parameters

ChannelName (STRING): Name of the affected adapter port or switch port loop.
ShelfID (INT): ID of the disk shelf.

ses.drive.missingFromLoopMap

Severity

ALERT

Description

This message occurs when a disk shelf detects a disk but the storage adapter cannot detect the disk. (Note: If the message "ses.drive.possShelfAddr" subsequently appears, follow the corrective actions in that message.)

Corrective Action

Monitor the storage system for approximately 15 minutes. If a "monitor.shelf.accessError.ok" event appears, then the condition has cleared, and no corrective action is needed. If the problem occurs to multiple disks on the same loop or is not resolved in 15 minutes, check the I/O modules at the back of the disk shelves on that loop for errors.

Syslog Message

The following device attached through adapter %s have not taken expected addresses: %s

Parameters

ChannelName (STRING): Channel the disk shelf is on.
DiskList (STRING): List of disks missing from Loop Map.

ses.drive.missingFromSESMap

Severity

ALERT

Description

This message occurs when the storage adapter detects a disk on the Fibre Channel loop or the SAS domain, but enclosure services in the disk shelf does not report a disk with that address. This error indicates that the disk took an address other than what the disk shelf should have provided, or that enclosure services in the disk shelf cannot be contacted for address information. (Note: If the message "ses.drive.possShelfAddr" subsequently appears, follow the corrective actions in that message.) In this condition, the SCSI Enclosure Services (SES) process in the system might be unable to perform certain operations on the disk, such as setting failure LEDs or detecting disk swaps.

Corrective Action

If the disk is not part of an active aggregate or volume, pull out the disk and push it back into the slot to ensure that the disk is in place. If the problem persists, insert a spare disk into the slot. If the problem is then gone, replace the original disk with the spare one. If the problem occurs to multiple disks on the same loop, check the I/O modules at the back of the disk shelves on that loop for errors. SAS domain disk shelves, DS14mk2 AT disk shelves, and SAS/SATA disk shelves do not rely on disk placement for enclosure services, since they have dedicated SES devices.

Syslog Message

On adapter %s, the device(s) with the following IDs are detected but are not reported as present by the shelf which should have supplied the IDs: %s

Parameters

ChannelName (STRING): Channel the disk shelf is on.
LoopIds (STRING): Loop or SCSI/SAS IDs of the missing disks.

ses.drive.PossShelfAddr

Severity

ERROR

Description

This message occurs in conjunction with the messages ses.drive.missingFromSESmap or ses.drive.missingFromLoopMap when there are devices that have apparently taken a wrong address; the adapter shows device addresses that SCSI Enclosure Services (SES) indicates should not exist, and vice versa. This error is not a fatal condition. It means that SES cannot perform certain operations on the affected disk drives, such as setting failure LEDs, because it is not certain which disk shelf the affected disk drive is in.

Corrective Action

If the problem is throughout the disk shelf, replace the disk shelf. If the error is only one disk drive per disk shelf, the drive might have taken an incorrect address at power-on. Arrange to make this disk drive a spare, and then reseat it to cause it to take its address again. If the problem persists, insert a different spare disk drive into the slot. If the error then clears, replace the original disk drive. If the problem still persists, there is a hardware problem with the individual disk bay. Replace the disk shelf.

Syslog Message

Possible actual locations for devices with unexpected addresses: %s.

Parameters

Msg (STRING): Physical locations of disks that do not have expected addresses in the adapter's map of disks.

ses.fw events

ses.fw.emptyFile

Severity

ERROR

Description

This message occurs when a firmware file is found to be empty during a disk shelf firmware update.

Corrective Action

Obtain the correct firmware file from NetApp and place it in the /etc/shelf_fw directory. You can download the firmware file from the NetApp Support Site at http://support.netapp.com.

Syslog Message

Shelf firmware file %s was empty.

Parameters

fileName (STRING): Name of the empty file.

ses.fw.resourceNotAvailable

Severity

ERROR

Description

This message occurs when there is not enough contiguous memory available to download disk shelf firmware.

Corrective Action

Reduce the amount of system activities before performing a manual disk shelf firmware update. If this does not resolve the issue, reboot the system.

Syslog Message

Not enough memory available to download disk shelf firmware %s.

Parameters

fileName (STRING): Name of the firmware file.

ses.giveback events

ses.giveback.restartAfter

Severity

INFORMATIONAL

Description

This message occurs when SCSI Enclosure Services (SES) is restarted after giveback.

Corrective Action

(None).

Syslog Message

Enclosure Services restarting after release of reservations.

Parameters

(None).

ses.giveback.wait

Severity

INFORMATIONAL

Description

This message occurs when SCSI Enclosure Services (SES) information is not available because the system is waiting for giveback.

Corrective Action

(None).

Syslog Message

Enclosure Services will be unavailable while waiting for giveback.

Parameters

(None).

ses.inconsistent events

ses.inconsistent.config

Severity

ALERT

Description

This message occurs when the system detects an inconsistent configuration of shelf-to-channel connections. One or more shelves on the reported channel are connected to a different set of channels (adapter ports or switch ports) than other shelves in the stack.

Corrective Action

Verify that all cables are fully inserted on the storage shelves connected to the channel. Verify that the shelves are cabled so that all shelves in a stack are connected to the same channels.

Syslog Message

Inconsistent configuration detected for shelf connected to adapter %s.

Parameters

channelName (STRING): Name of the adapter port or switch port where shelf connection inconsistencies are found.

ses.loop events

ses.loop.configErr

Severity

ALERT

Description

This message occurs when the system finds a disk shelf with a Loop Resiliency Circuit (LRC) module before a disk shelf with an Electronically Switched Hub (ESH) module in the loop map.

Corrective Action

Reorder the disk shelves so that the LRC disk shelf is found after the ESH disk shelf.

Syslog Message

Unsupported loop configuration for disk shelves attached to channel %s: A %s (ID %d) was found ahead of a %s (ID %d).

Parameters

channelName (STRING): Name of the channel the disk shelves are attached to.
prodChannel1 (STRING): Disk shelf identity (channel, product, and disk shelf number).
shelfId1 (INT): Disk shelf ID of the disk shelf on the unsupported loop.
prodChannel2 (STRING): Disk shelf identity (channel, product, and disk shelf number).
shelfId2 (INT): Disk shelf ID of the disk shelf on the unsupported loop.

ses.loop.configOk

Severity

INFORMATIONAL

Description

This message occurs when an unsupported Fibre Channel loop configuration error is corrected.

Corrective Action

(None).

Syslog Message

Unsupported loop configuration for disk shelves attached to channel %s was corrected.

Parameters

channelName (STRING): Name of the channel on which the unsupported loop configuration error was corrected.

ses.loop.loopMapUnavailable

Severity

INFORMATIONAL

Description

This message occurs when ONTAP® software cannot contact the disk shelf module on a disk shelf and, therefore, cannot resolve the loop map for a disk shelf.

Corrective Action

For Fibre Channel disk shelves, check whether disk drives are connected to slots 0 and 1 of the disk shelf module and that the disk drives are functional. If not, replace the disk drives. For all other disk shelf types, or if the preceding actions do not correct the error for Fiber Channel disk shelves, reseat the disk shelf module and check if the error is corrected. If not, replace the shelf module.

Syslog Message

Loop map unavailable for loop on channel %s. Could not check for unsupported disk shelf configurations.

Parameters

channelName (STRING): Name of the channel on which the loop map was unavailable.

ses.mismatch events

ses.mismatch.fw.version

Severity

ERROR

Description

This message occurs when the two disk shelf modules within the same disk shelf are running different versions of the firmware.

Corrective Action

Download the latest disk shelf firmware to the disk shelf module that is not up-to-date.

Syslog Message

The disk shelf modules on disk shelf %s.%d are running two different firmware versions. Disk shelf module A is running %s, and disk shelf module B is running %s.

Parameters

channelName (STRING): Name of the adapter port or switch port.
shelfID (INT): ID of the disk shelf.
revision_str (STRING): Revision number for disk shelf module A, the top disk shelf module.
revision_str2 (STRING): Revision number for disk shelf module B, the bottom disk shelf module.

ses.multipath events

ses.multipath.notSupported

Severity

NOTICE

Description

This message occurs when the AT-FCX disk shelf module does not support the multipath high-availability (Multipath HA) configuration.

Corrective Action

Replace this disk shelf module with one that supports the high-availability multipath configuration.

Syslog Message

AT-FCX disk shelf module %s on disk shelf %d on channel %s does not support the-high availability multipath configuration. Replace the module with one that supports the-high availability multipath configuration.

Parameters

shelfSlot (STRING): Slot position the disk shelf module is in, either A for the top slot or B for the bottom slot.
shelfId (INT): Disk shelf identification number of the disk shelf.
channelName (STRING): Name of the channel of the disk shelf.

ses.multipath.ReqError

Severity

ALERT

Description

This message occurs when the system detects that a SAS disk shelf is in a single-path cabling configuration.

Corrective Action

Check for SAS disk shelf enclosures with only a single path by using the 'sasadmin expander_map' command. Physically inspect all SAS cables on the attached storage for secure and correct connection.

Syslog Message

SAS disk shelf detected without a multipath configuration.

Parameters

(None).

ses.psu events

ses.psu.comboError

Severity

ALERT

Description

This message occurs when the power supplies that are installed in a disk shelf are not compatible with each other. Prolonged use of incompatible power supplies can result in failures of power supply units (PSUs).

Corrective Action

Replace one PSU immediately with a compatible model. Use the "storage shelf show -psu-part-number" command to locate all power supplies on the disk shelf, using the part numbers provided in the message as the required command parameter. Consult the NetApp Hardware Universe for compatible part number information.

Syslog Message

Incompatible power supplies were found on disk shelf "%d", serial number: %s, product ID: %s, PSU part numbers: %s, %s.

Parameters

ShelfId (INT): ID of the disk shelf.
serialNumber (STRING): Serial number of the storage shelf enclosure.
ProdId (STRING): Product identification of the shelf.
partNumber1 (STRING): Part number of PSU 1 on the shelf.
partNumber2 (STRING): Part number of PSU 2 on the shelf.

ses.psu.coolingReqError

Severity

ALERT

Description

This message occurs when the installed power supplies are placed so that air flow requirements of the disk shelf are not met. Placement of power supplies and their integrated fans is part of the disk shelf cooling and air flow design.

Corrective Action

Install power supplies in the indicated slots, cable to a power source, and turn them on. If the ses.psu.powerReqError is not presently posted for the system, an existing supply in the shelf can be moved to fill the required slot. A new instance of the error can be ignored while the supply is moved, but it should clear within a few minutes. If it does not, the condition must be corrected.

Syslog Message

Improper power supply placement in channel %s disk shelf %d. Power supplies must be present in power supply bays %s to satisfy air flow requirements.

Parameters

ChannelName (STRING): Name of the affected adapter port or switch port.
ShelfID (INT): ID of the disk shelf.
CoolBays (STRING): PSU bays where PSUs must be installed.

ses.psu.powerReqError

Severity

EMERGENCY

Description

This message occurs when too few power supplies are installed to redundantly satisfy the current-draw requirements of the shelf modules and disk drives in the shelf configuration. The number and type of disk modules and disk drives installed affect the requirements.

Corrective Action

Install the required number of power supplies in the disk shelf. Ensure that they are fully inserted, cabled to a power source, and turned on.

Syslog Message

Not enough power supplies are present in channel %s disk shelf %d to satisfy disk drive and shelf power requirements. The shelf requires %d supplies, but only %d are present.

Parameters

ChannelName (STRING): Name of the affected adapter port or switch port.
ShelfID (INT): ID of the disk shelf.
NumReqd (INT): Number of power supplies required.
NumPresent (INT): Number of PSUs present.

ses.shelf events

ses.shelf.bay.populate

Severity

INFORMATIONAL

Description

This message occurs when one of the drive in bay 1 or 2 is missing.

Corrective Action

(None).

Syslog Message

Disk shelf %s is recommended to have slot 1 and slot 2 populated at all times.

Parameters

shelfName (STRING): Disk shelf name.

ses.shelf.changedId

Severity

ERROR

Description

This message occurs on a SAS disk shelf when the disk shelf ID changed after power is applied to the disk shelf.

Corrective Action

Verify that the disk shelf ID displayed in this message is the same as the disk shelf ID shown on the disk shelf. If they are different and the disk shelf ID displayed in this message is the one you want, reset the disk shelf number to match it. If you want the new disk shelf ID instead of the disk shelf ID displayed in the message, verify that the disk shelf ID you want does not conflict with other disk shelves in the domain. Then power-cycle the disk shelf chassis. You can wait to perform this procedure until your next maintenance window. If the warning persists on both disk shelf modules after you completed the procedure, replace the disk shelf chassis. If it persists on only one disk shelf module, replace the disk shelf module.

Syslog Message

Disk shelf module %d on disk shelf %s.%d indicates that the disk shelf ID has been changed since the disk shelf module was powered on. %s.

Parameters

moduleNumber (INT): Element number of this module: either 1 for Module A or 2 for Module B.
channelName (STRING): Name of the adapter port or switch port associated with the disk shelf; for example, "7a" or "myswitch:5".
shelfNumber (INT): Disk shelf ID reported by the disk shelf before the ID change on the thumbwheel switch.
locationText (STRING): Location of the disk shelf module on the disk shelf.

ses.shelf.ctrlFailErr

Severity

ALERT

Description

This message occurs when SCSI Enclosure Services' (SES) control to a disk shelf fails.

Corrective Action

Check the LEDs on the disk shelf and the disk shelf modules on the back of the disk shelf to see whether there are any abnormalities. If the modules appear to be problematic, replace the applicable module. If the SES target is a disk drive, check to see whether the disk drive failed. If it failed, replace the disk drive.

Syslog Message

Enclosure control failed via %s (disk shelf %d). Alternate path will be used if available.

Parameters

SESTarget (STRING): Address of the SES target for which the SES control failed.
shelfID (INT): Disk shelf ID of the disk shelf that failed.

ses.shelf.disable.block.request

Severity

ALERT

Description

This message is generated when there is a failure while disabling the auto power cycle feature for all shelves that support auto power cycle feature on the system.

Corrective Action

(None).

Syslog Message

Fail while disabling shelf auto power cycle capability during %s (%d).

Parameters

requestOwner (STRING): Name of the requestor who requests to disable the auto power cycle feature.
status (INT): Failure status.

ses.shelf.drawer.min.drives

Severity

INFORMATIONAL

Description

This message occurs when one of the first 4 drives are missing in a drawer.

Corrective Action

Please insert a disk in one of the first 4 bays of the indicated drawer.

Syslog Message

Disk shelf %d, drawer %d, bay %d missing, drawer needs first 4 drives installed.

Parameters

shelfID (INT): Disk shelf ID.
drawerNum (INT): Disk drawer number.

bayNum (INT): Disk bay number.

ses.shelf.drawer.open

Severity

INFORMATIONAL

Description

This message occurs when one of the drawers of a disk shelf has been left open.

Corrective Action

Please close the drawer of the indicated drawer. If a drawer has been left open for an extended period of time, this can affect the cooling of components within the disk shelf.

Syslog Message

Disk shelf %d has drawer %d open.

Parameters

shelfID (INT): Disk shelf ID.
drawerNum (INT): Disk drawer number.

ses.shelf.drwr.phy.rateunkwn

Severity

ALERT

Description

This message occurs when one of the PHY ports of a shelf drawer is reporting an unknown link rate. The PHY port is a physical port in the drawer of the storage shelf that resides on the shelf side. This message indicates an internal error might have occurred in the shelf firmware or software. Communication between the PHY ports and the disk drives in the shelf might have failed or be in degraded states.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Drive shelf "%d", module "%s", drawer "%d", PHY "%d" is reporting an unknown link rate.

Parameters

shelfID (INT): Drive shelf ID.
module (STRING): Drive shelf module.
drawerNum (INT): Shelf drawer number.
phyNum (INT): Shelf drawer PHY number.

ses.shelf.em.ctrlFailErr

Severity

EMERGENCY

Description

This message occurs when SCSI Enclosure Services' (SES) control to the internal disk drives of a system

fails.

Corrective Action

Run the "storage shelf show" command to see whether that disk shelf is still being actively monitored. If the command indicates a failure, there is a hardware failure in the system's internal disk shelf.

Syslog Message

Enclosure control failed via embedded disk shelf %d.

Parameters

shelfID (INT): Disk shelf ID of the embedded disk shelf that failed.

ses.shelf.fw.disrUpdFW

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update operation causes temporary but noticeable interruption of disk I/O. Current disk shelf firware levels do not support nondisruptive upgrade (NDU).

Corrective Action

(None).

Syslog Message

SCSI Enclosure Services (SES) disk shelf firmware update disrupts disk I/O. The current shelf firmware (product revision level %.4s) does not support nondisruptive upgrade (NDU).

Parameters

ProductRev (STRING): Product revision level.

ses.shelf.fw.disrUpdPath

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update operation causes temporary but noticeable interruption of disk I/O. Redundant paths to the disk shelf are required for nondisruptive upgrade (NDU).

Corrective Action

(None).

Syslog Message

SCSI Enclosure Services (SES) disk shelf firmware update disrupts disk I/O. Redundant paths to the disk shelf are needed for nondisruptive upgrade (NDU) to be used.

Parameters

(None).

ses.shelf.fw.update.ndu

Severity

INFORMATIONAL

Description

This message occurs when a shelf firmware update is performed using the nondisruptive upgrade (NDU) procedure.

Corrective Action

(None).

Syslog Message

SCSI Enclosure Services (SES) shelf firmware update will be performed using nondisruptive upgrade (NDU).

Parameters

(None).

ses.shelf.fw.update.pfu.nrdnt

Severity

INFORMATIONAL

Description

This message occurs when a shelf firmware update is performed using the Package Firmware Update (PFU) process because redundant paths to the shelf are not present.

Corrective Action

(None).

Syslog Message

SCSI Enclosure Services (SES) shelf firmware update will be performed using Package Firmware Update (PFU) because redundant paths are not present.

Parameters

(None).

ses.shelf.ldBasedAddr

Severity

ERROR

Description

This message occurs on a serial attached SCSI (SAS) disk shelf when the SAS address of the devices are based on the disk shelf ID instead of the disk shelf backplane serial number. This indicates problems communicating with the disk shelf backplane.

Corrective Action

Reseat the master disk shelf module as indicated by the output of the "storage shelf show" command. If the problem persists, reseat the slave disk shelf module. If the problem persists, find the new master disk shelf module, and replace it. If the problem persists, replace the other disk shelf module. If the problem persists,

replace the disk shelf enclosure.

Syslog Message

Disk shelf module %d on disk shelf %s.%d indicates that its SAS addresses are based on the disk shelf ID, instead of on the disk shelf backplane serial number. %s.

Parameters

moduleNumber (INT): Element number of this module: either 1 for Module A or 2 for Module B.
channelName (STRING): Name of the adapter port or switch port associated with the disk shelf; for example, "7a" or "myswitch:5".
shelfNumber (INT): Disk shelf ID.
locationText (STRING): Location of the disk shelf module on the disk shelf.

ses.shelf.invalNum

Severity

ERROR

Description

This message occurs when ONTAP® software detects that an SAS disk shelf connected to the system has an invalid disk shelf number.

Corrective Action

Power-cycle the disk shelf. If the problem persists, replace the disk shelf modules. If the problem still persists, replace the disk shelf.

Syslog Message

A disk shelf on adapter %s has an invalid disk shelf number of %d. %s.

Parameters

channelName (STRING): Name of the channel the disk shelf is on that is reporting an error.
shelfNumber (INT): Invalid Disk shelf ID.
softId (STRING): String indicating whether a soft disk shelf number is assigned to the disk shelf.

ses.shelf.maxExceeded

Severity

ERROR

Description

This message occurs when more disk shelves are attached than the controller can monitor. The controller cannot detect or identify abnormal conditions in excess shelves, nor can it download firmware to unmonitored shelves. The reported device address is one instance of a device in an unmonitored disk shelf. There might be multiple unmonitored shelves.

Corrective Action

Consult system documentation for the maximum number of supported disk shelves, which might be lower than the number reported here. Reduce the number of attached disk shelves to no more than the documented number. Consolidating disk drives into sparsely populated shelves and removing excess shelves is one way to reduce shelf count.

Syslog Message

More than %d disk shelves are attached. Shelf containing %s and possibly other shelves are not monitored.

Parameters

max_enclosures (INT): Maximum number of disk shelves this system can monitor and control.
device (STRING): Address of the device.

ses.shelf.mmErr

Severity

ALERT

Description

This message occurs when a disk shelf is not supported by the platform it was booted on.

Corrective Action

Check whether the current version of ONTAP® software supports the disk shelf. If not, install an ONTAP version that supports the disk shelf. If the disk shelf is supported, the error might be cleared by hourly attempts by ONTAP to establish proper contact with the disk shelf.

Syslog Message

SCSI Enclosure Services (SES) device accessed by %s (product revision level [%.4s]) (enclosure vendor ID [%.8s]) (enclosure product ID [%.16s]) is not supported on this platform.

Parameters

DeviceName (STRING): Address of the unqualified Enclosure Services device.
ProductRev (STRING): Product revision level.
EnclosureVendorID (STRING): Enclosure Vendor Identification.
EnclosureProductID (STRING): Enclosure Product Identification.

ses.shelf.OSmmErr

Severity

ALERT

Description

This message occurs when there are incompatible ONTAP® software versions in a Shared Storage configuration that would cause SCSI Enclosure Services (SES) not to function properly.

Corrective Action

Update the system that has an earlier ONTAP version to match the one that has the latest ONTAP version.

Syslog Message

Incompatible versions of ONTAP are running on the different systems in a Shared Storage Configuration.

Parameters

(None).

ses.shelf.powercycle.done

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf power-cycle finishes.

Corrective Action

(None).

Syslog Message

Disk shelf power-cycled; resuming disk I/O.

Parameters

(None).

ses.shelf.powercycle.start

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf is power-cycled and SCSI Enclosure Services (SES) needs to wait for it to finish.

Corrective Action

(None).

Syslog Message

Waiting for disk shelf power-cycle to be complete.

Parameters

(None).

ses.shelf.RAS.suggestion

Severity

INFORMATIONAL

Description

This event is generated when various different supported combinations of ESHx type storage controller I/O modules are used in the various different ESHx type storage enclosures. Though this could be a supported configuration, to make the best of the power cycle features it is recommended to keep the FC loops as homogenous as possible.

Corrective Action

For best practices, use only the ESH4 controller modules in the DS14-Mk4-FC enclosures.

Syslog Message

ses.shelf.RAS.suggestion INFO Channel %s, Mixing %s I/O modules is fully supported on a FC loop. However, for improved reliability migration to homogeneous ESH4 configurations is recommended.

Parameters

    channelName (STRING): Name of the adapter port or switch port of the disk shelf.
    supportedControllerModules (STRING): ESHx enclosure modules, ESH/ESH2/ESH4

ses.shelf.reset.auto.fail

Severity

    ERROR

Description

    This event is generated when the automated power cycle attempt in the shelf enclosure - identified by the channel.shelf_id - had failed. The trigger condition for the automated reset is also reported.

Corrective Action

    Try the 'storage power_cycle shelf' on the same shelf. If it still fails, please refer to the "Trouble Shooting Section" of the NDR documentation.

Syslog Message

    %s disk shelf %s.%d [%s] failed to perform an automatic reset (0x%x)

Parameters

    shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.
    channelName (STRING): Name of the adapter port or switch port of the disk shelf that was attempted to be power cycled.
    shelfId (INT): ID of the disk shelf that was attempted to be power cycled.
    serialNumber (STRING): Serial number of the storage shelf enclosure.
    triggerCondition (INT): Trigger reason for the automated reset, as reported by the shelf enclosure.

ses.shelf.reset.auto.good

Severity

    INFORMATIONAL

Description

    This event is generated when the automated power cycle attempt in the shelf enclosure - identified by the channel.shelf_id - had succeeded. The trigger for the automated reset is also reported.

Corrective Action

    (None).

Syslog Message

    %s disk shelf %s.%d [%s] has recovered from an automatic reset (0x%x)

Parameters

    shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.
    channelName (STRING): Name of the adapter port or switch port of the disk shelf that was power cycled.
    shelfId (INT): ID of the disk shelf that was power cycled.
    serialNumber (STRING): Serial number of the storage shelf enclosure.
    triggerCondition (INT): Trigger reason for the automated reset, as reported by the shelf enclosure.

ses.shelf.reset.capability

Severity

INFORMATIONAL

Description

This event is generated when the periodic storage enclosure services monitor detects some of the DS14-Mk4-FC,DS14-Mk2-FC and DS14-Mk2-AT storage enclosures are not being upgraded to the correct requirements, to avail the enhanced power cycle features. This is just an informational message only, not an error. The idea is to make the admin follow the suggested best practices, so that the Filer could make use of the advanced features provided.

Corrective Action

Check the power supply unit information on all the DS14-Mk4-FC, DS14-Mk2-FC and the DS14-Mk2-AT shelf enclosure modules by executing the 'environment shelf' command. Plan to replace the power supply units that are not "Type:HRE capable".

Syslog Message

Some %s disk shelves on this system are capable of automatic power reset, but some do not have appropriate firmware or PSU model. For improved system RAS, consider upgrading shelves to have this capability. The environ shelf command shows this feature's status.

Parameters

shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.

ses.shelf.reset.request

Severity

INFORMATIONAL

Description

This event is generated when the command 'storage power_cycle shelf start' is successfully sent to the shelf - identified by the channel.shelf_id, and is of type DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.

Corrective Action

(None).

Syslog Message

Reset requested on %s disk shelf %s.%d [%s].

Parameters

shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.
channelName (STRING): Name of the adapter port or switch port of the disk shelf to be power cycled.
shelfId (INT): ID of the disk shelf that is to be power cycled.
serialNumber (STRING): Serial number of the storage shelf enclosure.

ses.shelf.reset.request.fail

Severity

ERROR

Description

This event is generated when the command 'storage power_cycle shelf start' sent to the shelf enclosure - identified by the channel.shelf_id - could not power cycle the shelf enclosure successfully.

Corrective Action

Try the 'storage power_cycle shelf start' on the same shelf again. If it still fails, please refer to the "Trouble Shooting Section" of the NDR documentation.

Syslog Message

%s disk shelf %s.%d [%s] failed to reset when requested.

Parameters

shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.
channelName (STRING): Name of the adapter port or switch port of the disk shelf that was attempted to be power cycled.
shelfId (INT): ID of the disk shelf that was attempted to be power cycled.
serialNumber (STRING): Serial number of the storage shelf enclosure.

ses.shelf.reset.request.good

Severity

INFORMATIONAL

Description

This event is generated when the command 'storage power_cycle shelf start' sent to the shelf - identified by the channel.shelf_id, and is of type DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT - has successfully recovered.

Corrective Action

(None).

Syslog Message

%s disk shelf %s.%d [%s] has recovered from a requested reset.

Parameters

shelfType (STRING): Shelf enclosure type, DS14-Mk4-FC, DS14-Mk2-FC or DS14-Mk2-AT.
channelName (STRING): Name of the adapter port or switch port of the disk shelf that was power cycled.
shelfId (INT): ID of the disk shelf that was power cycled.
serialNumber (STRING): Serial number of the storage shelf enclosure.

ses.shelf.reset.unsup.drives

Severity

ERROR

Description

This message occurs when Nondisruptive Recovery (NDR) functionality is disabled due to the presence of Parallel ATA (PATA) disk drives on the disk loop.

Corrective Action

Replace all X266_MTOMC320PSX or X262_MCALY250PSX disk drives and then turn on the automatic reset capability.

Syslog Message

NDR functionality is disabled due to the presence of X266_MTOMC320PSX or X262_MCALY250PSX disk drives on the disk loop.

Parameters

(None).

ses.shelf.sameNumReassign

Severity

ERROR

Description

This message occurs when ONTAP® software detects more than one SAS shelf connected to the same adapter has the same disk shelf number.

Corrective Action

Change the disk shelf number on the disk shelf to one that does not conflict with other disk shelves attached to the same adapter. Then halt the system and reboot the disk shelf.

Syslog Message

Multiple disk shelves with disk shelf number %d are found on channel %s. Disk shelf with serial number %s has been assigned the soft disk shelf number of %d.

Parameters

prevId (INT): Conflicting disk shelf number.
channelName (STRING): Name of the channel the disk shelf is on that is reporting an error.
serialNum (STRING): Serial number of the disk shelf that is being assigned the soft ID.
softId (INT): Newly assigned soft disk shelf number.

ses.shelf.unsupportAllowErr

Severity

ALERT

Description

This message occurs when a disk shelf is not supported by ONTAP® software. ONTAP will continue to use the disk shelf, but environmental monitoring of the disk shelf is not possible.

Corrective Action

Check whether the current version of ONTAP supports this disk shelf. If not, install an appropriate version. If ONTAP does support this disk shelf, this error might be cleared on hourly attempts by ONTAP to establish proper contact with the disk shelf.

Syslog Message

Unsupported disk shelf found on channel %s.

Parameters

ChannelName (STRING): Name of the channel that contains the disk shelf.

ses.shelf.unsupportedErr

Severity

ALERT

Description

This message occurs when a disk shelf is not supported by ONTAP® software.

Corrective Action

Check whether the current version of ONTAP supports this disk shelf. If not, install an appropriate version.

Syslog Message

Unsupported disk shelf found. Taking channel %s offline.

Parameters

ChannelName (STRING): Name of the channel that contains the disk shelf. This channel will be taken offline.

ses.status events

ses.status.ACPError

Severity

ALERT

Description

This message occurs when a failure has been detected in ACP processor that provides alternate control path capability.

Corrective Action

Replace the module. In some disk shelf types, this function is integrated into the SAS interface modules.

Syslog Message

%s ACP Processor error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.ACPInfo

Severity

INFORMATIONAL

Description

This message occurs when a problem previously reported about the ACP Processor has been corrected or when other information about the ACP Processor that does not necessarily require customer action is

reported.

Corrective Action

(None).

Syslog Message

%s ACP Processor information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
infoMsg (STRING): Generic SES information.

ses.status.ACPWarn

Severity

ERROR

Description

This message occurs when a non-fatal condition has been detected in the ACP Processor that provides alternate control path capability.

Corrective Action

Replace the module. In some disk shelf types, this function is integrated into the SAS interface modules.

Syslog Message

%s ACP Processor warning for %s %d: %s. %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
warningMsg (STRING): Generic SES Warning.
warningText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.ATFCXError

Severity

ALERT

Description

This message occurs when the reporting disk shelf detects an error in the indicated AT-FCX module. The module might not be able to perform I/O to disks within the disk shelf.

Corrective Action

Verify that the AT-FCX module is fully seated and secured. If the problem persists, replace the AT-FCX module.

Syslog Message

%s error for %s SES controller module %s: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SES type descriptor text for this AT-FCX module.
module (STRING): Module A is the upper module in the enclosure on the back side. Module B is the lower module in the enclosure on the back side.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the exact warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.ATFCXInfo

Severity

INFORMATIONAL

Description

This message occurs when a previously reported error in the AT-FCX module is corrected, or the system reports other information that does not necessarily require customer action.

Corrective Action

(None).

Syslog Message

%s information for %s SES controller module %s: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SES type descriptor text for this element.
module (STRING): Module A is the upper module in the enclosure on the back side. Module B is the lower module in the enclosure on the back side.
infoMsg (STRING): Generic SES information.

ses.status.battery.error

Severity

ERROR

Description

This message occurs when a storage shelf reports a generic "battery error detected" error. The error could be due to an inability to read the A/D convertor or because the intermodule connections are down.

Corrective Action

If the intermodule connection is down on one or both of the PCIe Switch Modules (PSMs), bring the intermodule connection up (by rebooting the affected module). If the intermodule connection is up on both of the PSMs (there are no errors on both PSMs), replace the coin cell battery. If the issue persists, a module might need to be replaced. Contact NetApp technical support.

Syslog Message

%s battery failure error for %s %d: %s%s. %s.

Parameters

   prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
   typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the battery.
   batteryNumber (INT): SES element number of the battery.
   errorMsg (STRING): Generic SES error.
   errorText (STRING): Description of the error.
   locationText (STRING): Location of the element on the storage shelf.

ses.status.battery.info

Severity

   NOTICE

Description

   This message occurs when a condition that was previously reported about a storage shelf battery has been corrected or when other information about the battery that might not require customer action is reported.

Corrective Action

   (None).

Syslog Message

   %s battery information for %s %d: %s.

Parameters

   prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
   typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the battery.
   batteryNumber (INT): SES element number of the battery.
   infoMsg (STRING): Generic SES information.

ses.status.battery.missing

Severity

   ERROR

Description

   This message occurs when a storage shelf reports that a battery is not installed.

Corrective Action

   Install the battery. If the problem persists, contact NetApp technical support.

Syslog Message

   %s battery warning for %s %d: %s%s. %s.

Parameters

   prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
   typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the battery.
   batteryNumber (INT): SES element number of the battery.
   errorMsg (STRING): Generic SES error.
   errorText (STRING): Exact wording of the warning.
   locationText (STRING): Location of the battery on the storage shelf.

ses.status.battery.threshErr

Severity

ALERT

Description

This message occurs when the element threshold of a battery on a storage shelf is outside the threshold limits.

Corrective Action

Install a new battery. If the problem persists, this indicate a hardware failure. Contact NetApp technical support.

Syslog Message

%s battery failure error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the battery.
batteryNumber (INT): SES element number of the failing battery.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact description of the error.
locationText (STRING): Location of the battery on the storage shelf.

ses.status.bootDv.error

Severity

ERROR

Description

This message occurs when a storage shelf reports a boot device SMART error on a PCIe Switch Module (PSM)

Corrective Action

Replace the boot device. If the issue persists, contact NetApp technical support.

Syslog Message

%s boot device failure for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the boot device.
bootDvNumber (INT): SES element number of the boot device.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the error.
locationText (STRING): Location of the boot device on the storage shelf.

ses.status.bootDv.info

Severity

NOTICE

Description

This message occurs when a condition that was previously reported about a storage shelf boot device has been corrected or when other information about the boot device that might not require customer action is reported.

Corrective Action

(None).

Syslog Message

%s boot device notification for %s %d: %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the boot device.
bootDvNumber (INT): SES element number of the boot device.
infoMsg (STRING): Generic SES information.

ses.status.bootDv.missing

Severity

ERROR

Description

This message occurs when the PCIe Switch Module (PSM) of a storage shelf reports that a partner PSM boot device is not installed.

Corrective Action

Install the boot device on the partner PSM. If the problem persists, contact NetApp technical support.

Syslog Message

%s partner %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the boot device.
bootDvNumber (INT): SES element number of the boot device.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the error.
locationText (STRING): Location of the boot device on the storage shelf.

ses.status.connectorInfo

Severity

INFORMATIONAL

Description

This message occurs when a problem previously reported about the SAS connector has been corrected.

Corrective Action

(None).

%s SAS connector information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
infoMsg (STRING): Generic SES information.

ses.status.connectorWarn

Severity

ERROR

Description

This message occurs when a non-fatal condition has been detected in communication with the SAS connector or its EEPROM. This error does not necessarily mean that the data path through the connector is faulty.

Corrective Action

Ensure that the connector is completely installed. If the error persists, replace the cable first, then the disk shelf I/O module.

Syslog Message

%s SAS connector warning for %s %d: %s. %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
warningMsg (STRING): Generic SES Warning.
warningText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.currentError

Severity

ERROR

Description

This message occurs when a critical condition is detected in the indicated disk shelf current sensor. The disk shelf might be able to continue operation.

Corrective Action

Verify that the PSU and the AC line are supplying power. Monitor the power grid for abnormalities. If all seems to be normal, replace the PSU. If the problem persists, contact NetApp technical support.

Syslog Message

%s current error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this power supply.
psNumber (INT): SES element number of the power supply.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the exact warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.currentInfo

Severity

INFORMATIONAL

Description

This message occurs when an error or warning condition previously reported by or about the disk shelf current sensor is corrected, or the system reports other information about the current in the disk shelf that does not necessarily require customer action.

Corrective Action

(None).

Syslog Message

%s current information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this sensor.
sensorNumber (INT): SES element number of the reporting sensor.
infoMsg (STRING): Generic SES information.

ses.status.currentWarning

Severity

ERROR

Description

This message occurs when a warning condition is detected in the indicated disk shelf current sensor. The disk shelf might be able to continue operation.

Corrective Action

Verify that the PSU and the AC line are supplying power. Monitor the power grid for abnormalities. If all seems to be normal, replace the PSU. If the problem persists, contact NetApp technical support.

Syslog Message

%s current warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this power supply.
psNumber (INT): SES element number of the power supply.
errorMsg (STRING): generic SES error.
errorText (STRING): Description of the exact warning.

locationText (STRING): Location of the module on the shelf.

ses.status.dimm.error

Severity

ERROR

Description

This message occurs when a storage shelf reports a generic "DIMM error detected" error on a PCIe Switch Module (PSM). The error could be because intermodule connections are down.

Corrective Action

If the intermodule connection is down on one or both of the PCIe Switch Modules (PSMs), bring the intermodule connection up (by rebooting the affected module). If the intermodule connection is up on both of the PSMs (there are no errors on both PSMs), replace the DIMM. If the issue persists, a module might need to be replaced. Contact NetApp technical support.

Syslog Message

%s DIMM failure for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the DIMM.
dimmNumber (INT): SES element number of the DIMM.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the error.
locationText (STRING): Location of the DIMM on the storage shelf.

ses.status.dimm.info

Severity

NOTICE

Description

This message occurs when a condition that was previously reported about a storage shelf DIMM has been corrected or when other information about the DIMM that might not require customer action is reported.

Corrective Action

(None).

Syslog Message

%s DIMM notification for %s %d: %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the DIMM.
dimmNumber (INT): SES element number of the DIMM.
infoMsg (STRING): Generic SES information.

ses.status.dimm.missing

Severity

ERROR

Description

This message occurs when the PCIe Switch Module (PSM) of a storage shelf reports that a DIMM is not installed.

Corrective Action

Install the DIMM. If the problem persists, contact NetApp technical support.

Syslog Message

%s %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the DIMM.
dimmNumber (INT): SES element number of the DIMM.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the error.
locationText (STRING): Location of the DIMM on the storage shelf.

ses.status.dimm.threshErr

Severity

ALERT

Description

This message occurs when the element threshold of a DIMM is outside the threshold limits in the indicated PCIe Switch Module (PSM) of a storage shelf.

Corrective Action

Install a new DIMM. If the problem persists, this indicates a hardware failure. Contact NetApp technical support.

Syslog Message

%s DIMM threshold failure error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the DIMM.
dimmNumber (INT): SES element number of the failing DIMM.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the error.
locationText (STRING): Location of the DIMM on the storage shelf.

ses.status.displayInfo

Severity

INFORMATIONAL

Description

This message occurs when a previous condition in the display panel has been corrected.

Corrective Action

(None).

Syslog Message

%s display information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this display panel.
displayNumber (INT): SES element number of this display panel.
infoMsg (STRING): Generic SES information.

ses.status.displayWarning

Severity

ERROR

Description

This message occurs when the enclosure services module has detected a warning condition for the disk shelf display panel. The disk shelf might be unable to provide correct addresses to its disks.

Corrective Action

If possible, verify that the connection between the disk shelf and the display is secure. Verify that the Enclosure Services module or modules are fully seated; replacing them might solve the problem. If the problem persists, the Enclosure Services module that detected the warning condition might be faulty. If the problem persists after the module or modules are replaced, replace the disk shelf. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

%s display warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this display panel.
displayNumber (INT): SES element number of the this display panel.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.driveError

Severity

ERROR

Description

This message occurs when a critical condition has been detected for the disk drive in the shelf. The drive might fail.

Corrective Action

Make sure that the drive is not running on a degraded volume. If it is, then add as many spares as necessary into the system, up to the specifed level. After the volume is no longer in degraded mode, replace the drive that is failing.

Syslog Message

Error on drive %d on %s shelf %s.%d%s.

Parameters

driveNumber (INT): SES element number of the failing drive.
shelfType (STRING): Type of the disk shelf that is experiencing the problem.
channel (STRING): Channel the shelf is on.
shelfNumber (INT): Number of the disk shelf the drive is on.
ErrorText (STRING): Exact error description.

ses.status.driveOk

Severity

INFORMATIONAL

Description

This message occurs when a disk drive that was previously experiencing problem returns to normal operation.

Corrective Action

(None).

Syslog Message

The error on drive %d on %s shelf %s.%d has been corrected.

Parameters

driveNumber (INT): SES element number of the drive.
shelfType (STRING): Type of the disk shelf that contains the drive.
channel (STRING): Channel the shelf is on.
shelfNumber (INT): Number of the disk shelf the drive is on.

ses.status.driveWarning

Severity

ERROR

Description

This message occurs when a non-critical condition has been detected for the disk drive in the shelf. The drive might fail.

Corrective Action

Make sure that the drive is not running on a degraded volume. If it is, then add as many spares as necessary into the system, up to the specified level. After the volume is no longer in degraded mode, replace the drive that is failing.

Syslog Message

Error on drive %d on %s shelf %s.%d%s.

Parameters

driveNumber (INT): SES element number of the failing drive.
shelfType (STRING): Type of the disk shelf that is experiencing the problem.
channel (STRING): Channel the shelf is on.
shelfNumber (INT): Number of the disk shelf the drive is on.
warningText (STRING): Exact warning description.

ses.status.electronicsError

Severity

ALERT

Description

This message occurs when a failure is detected in a module that provides disk enclosure services monitoring capability.

Corrective Action

Replace the shelf module.

Syslog Message

%s environmental monitoring error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.electronicsInfo

Severity

INFORMATIONAL

Description

This message occurs when a problem previously reported about the disk shelf enclosure services electronics has been corrected or when other information about the enclosure electronics that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s environmental monitoring information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).

typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this element.
electrNumber (INT): SES element number of this element.
infoMsg (STRING): Generic SES information.

ses.status.electronicsWarn

Severity

ERROR

Description

This message occurs when a non-fatal condition is detected in a module that provides disk enclosure services monitoring capability.

Corrective Action

Replace the module. In most disk shelf types, this function is integrated into the FC, SCSI, or SAS interface modules.

Syslog Message

%s environmental monitoring warning for %s %d: %s. %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
warningMsg (STRING): Generic SES Warning.
warningText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.enclError

Severity

EMERGENCY

Description

This message occurs when a failure is detected in the disk enclosure (shelf) internal hardware.

Corrective Action

Contact NetApp technical support for assistance with shelf or shelf midplane replacement.

Syslog Message

%s environmental monitoring error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the failed component on the disk shelf.

ses.status.enclInfo

Severity

INFORMATIONAL

Description

This message occurs when a problem previously reported about the disk shelf hardware has been corrected.

Corrective Action

(None).

Syslog Message

%s disk inclosure information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this element.
electrNumber (INT): SES element number of this element.
infoMsg (STRING): Generic SES information.

ses.status.enclWarn

Severity

ERROR

Description

This message occurs when an error condition is present in the disk shelf that causes the shelf fault LED to be lit, including faults in shelf components or disks marked as failed by ONTAP® software.

Corrective Action

Correct error conditions in the disk shelf. Check that the power supplies are in the proper locations, that there are the required number of them, and that they are powered on. Remove failed disk drives. If multiple shelf modules are expected, install a missing module, and ensure that the firmware revisions are at the same level, preferably the latest revision available. If the error persists, contact NetApp technical support for assistance.

Syslog Message

%s disk enclosure warning for %s %d: %s. %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
warningMsg (STRING): Generic SES Warning.
warningText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.etherConn.info

Severity

NOTICE

Description

This message occurs when a problem previously reported about a PCIe switch module (PSM) port's Ethernet connector has been corrected.

Corrective Action

(None).

Syslog Message

%s Ethernet connector information for port %s: %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
connName (STRING): SES element name of this Ethernet connector.
infoMsg (STRING): Generic SES information.

ses.status.etherConn.warn

Severity

ERROR

Description

This message occurs when a non-fatal condition has been detected in communication with a PCIe switch module (PSM) port's external Ethernet connector or its EEPROM. This error does not necessarily mean that the data path through the connector is faulty.

Corrective Action

Verify that the Ethernet cable or transceiver is correctly installed. If the error persists, replace the cable. If necessary,replace the PSM.

Syslog Message

%s Ethernet connector warning for port %s: %s. %s %s.

Parameters

prodChannel (STRING): Storage shelf identity (channel, product, and shelf number).
connName (STRING): SES element name of this Ethernet connector.
warningMsg (STRING): Generic SES warning.
warningText (STRING): Warning text.
locationText (STRING): Location of the module on the storage shelf.

ses.status.fanError

Severity

EMERGENCY

Description

This message occurs when the indicated disk shelf cooling fan or fan module has failed, and the shelf or its components are not receiving required cooling airflow.

Corrective Action

Verify that the fan module is fully seated and secured (the fan is integrated into the power supply module in some disk shelves). If the problem persists, replace the fan module. If the problem still persists, contact NetApp technical support for assistance.

Syslog Message

%s cooling fan error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this fan.
fanNumber (INT): SES element number of this fan.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the error.
locationText (STRING): Location of the module on the disk shelf.

ses.status.fanInfo

Severity

INFORMATIONAL

Description

This message occurs when a condition previously reported about the disk shelf cooling fan or fan module has been corrected or when other information about the fans that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s cooling fan information for %s %d: %s.

Parameters

prodChannel (STRING): Shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this fan.
fanNumber (INT): SES element number of this fan.
infoMsg (STRING): Generic SES information.

ses.status.fanWarning

Severity

NOTICE

Description

This message occurs when a disk shelf cooling fan is not operating to specification, or a component of a fan module has stopped functioning. The disk shelf components continue to receive cooling airflow but might eventually reach temperatures that are out of specification.

Corrective Action

Verify that the fan or fan module is fully seated and secured (fans are integrated into the power supply module in some shelves). If the problem persists, replace the fan module. If the problem still persists, contact NetApp technical support for assistance.

Syslog Message

%s cooling fan warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this fan.
fanNumber (INT): SES element number of this fan.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.inputPowerError

Severity

ALERT

Description

This message occurs when the system detects a failure in the Input Power Monitor. The Input Power Monitor monitors power to the Power Supply Units (PSU).

Corrective Action

Check that the PSU is receiving sufficient power from an AC source.

Syslog Message

%s Input Power Monitor error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the error.
locationText (STRING): Location of the PSU on the disk shelf.

ses.status.inputPowerInfo

Severity

INFORMATIONAL

Description

This message occurs when a previously reported Input Power Monitor problem of a disk shelf is corrected, or when the system is reporting information about the Input Power Monitor that does not necessarily require customer action.

Corrective Action

(None).

Syslog Message

%s Input Power Monitor information for %s %d: %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **typeText** (STRING): SES type descriptor text for this element.
> **electrNumber** (INT): SES element number of this element.
> **infoMsg** (STRING): Generic SES information.

ses.status.inputPowerWarn

Severity

> ERROR

Description

> This message occurs when the system detects a non-fatal condition in the Input Power Monitor of a disk shelf. The Input Power Monitor monitors power to the Power Supply Units (PSU).

Corrective Action

> Check that the PSU is receiving sufficient power from an AC source.

Syslog Message

> %s Input Power Monitor warning for %s %d: %s. %s %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **typeText** (STRING): SES type descriptor text for this element.
> **electrNumber** (INT): SES element number of this element.
> **warningMsg** (STRING): Generic SES warning.
> **warningText** (STRING): Exact wording of the warning.
> **locationText** (STRING): Location of the PSU on the disk shelf.

ses.status.ModuleError

Severity

> ALERT

Description

> This message occurs when the reporting disk shelf has detected an error in the indicated disk shelf module.

Corrective Action

> Verify that the shelf module is fully seated and secure. If the problem persists, replace the disk shelf module.

Syslog Message

> %s %s error for %s %d: %s%s. %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **moduleType** (STRING): Type of this module.
> **typeText** (STRING): SES type descriptor text for this module.
> **ModuleNumber** (INT): Element number of this module: either 1 for Module A or 2 for Module B.
> **errorMsg** (STRING): Generic SES error.
> **errorText** (STRING): Exact wording of the warning.
> **locationText** (STRING): Location of the module on the disk shelf.

ses.status.ModuleInfo

Severity

INFORMATIONAL

Description

This message occurs when a previously reported error in the shelf module has been corrected or when other information that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s %s information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
moduleType (STRING): Type of this module.
typeText (STRING): SES type descriptor text for this module.
ModuleNumber (INT): Element number of this module: either 1 for Module A or 2 for Module B.
infoMsg (STRING): Generic SES information.

ses.status.ModuleWarn

Severity

ALERT

Description

This message occurs when the reporting disk shelf detects a warning condition in the indicated disk shelf module.

Corrective Action

Verify that the shelf module is fully seated and secure. If the problem persists, replace the disk shelf module.

Syslog Message

%s %s warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
moduleType (STRING): Type of this module.
typeText (STRING): SES type descriptor text for this module.
moduleNumber (INT): Element number of this module: either 1 for Module A or 2 for Module B.
warningMsg (STRING): Generic SES warning.
warnText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.powerCrestError

Severity

ALERT

Description

This message occurs when the system detects a failure in the Power Crest Factor Monitor for a disk shelf PSU. The Power Crest Factor Monitor will detect issues with the disk shelf power supply unit (PSU).

Corrective Action

If an abnormal power crest factor is indicated, replace the corresponding PSU.

Syslog Message

%s Power Crest Factor Monitor error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the PSU on the disk shelf.

ses.status.powerCrestInfo

Severity

INFORMATIONAL

Description

This message occurs when a previously reported Power Crest Factor Monitor problem of a disk shelf is corrected, or when the system is reporting information about the Power Crest Factor Monitor that does not necessarily require customer action.

Corrective Action

(None).

Syslog Message

%s Power Crest Factor Monitor information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
infoMsg (STRING): Generic SES information.

ses.status.powerCrestWarn

Severity

ERROR

Description

This message occurs when the system detects a non-fatal condition in the Power Crest Factor Monitor of a power supply unit (PSU) of a disk shelf.

Corrective Action

Replace the PSU of the disk shelf.

Syslog Message

%s Power Crest Factor Monitor warning for %s %d: %s. %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
warningMsg (STRING): Generic SES warning.
warningText (STRING): Exact wording of the warning.
locationText (STRING): Location of the PSU on the disk shelf.

ses.status.procCplxError

Severity

ALERT

Description

This message occurs when the system detects a failure in the Processor Complex. The Processor Complex is the set of electronic hardware, including the CPU, memory, and so on, that runs ONTAP® software.

Corrective Action

If insufficient power or abnormal voltage is indicated, check the power supply configuration; otherwise, replace the module. In some disk shelf types, this function is integrated into the SAS interface modules.

Syslog Message

%s Processor Complex error for %s %d: %s %s %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this element.
electrNumber (INT): SES element number of this element.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.procCplxInfo

Severity

INFORMATIONAL

Description

This message occurs when a previously reported Processor Complex problem is corrected, or when the system is reporting information about the Processor Complex that does not necessarily require customer action. The Processor Complex is the set of electronic hardware, including the CPU, memory, and so on, that runs ONTAP® software.

Corrective Action

(None).

Syslog Message

%s Processor Complex information for %s %d: %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **typeText** (STRING): SES type descriptor text for this element.
> **electrNumber** (INT): SES element number of this element.
> **infoMsg** (STRING): Generic SES information.

ses.status.procCplxWarn

Severity

> ERROR

Description

> This message occurs when the system detects a non-fatal condition in the Processor Complex. The Processor Complex is the set of electronic hardware, including the CPU, memory, and so on, that runs ONTAP® software.

Corrective Action

> Replace the module. In some disk shelf types, this function is integrated into the SAS interface modules.

Syslog Message

> %s Processor Complex warning for %s %d: %s. %s %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **typeText** (STRING): SES type descriptor text for this element.
> **electrNumber** (INT): SES element number of this element.
> **warningMsg** (STRING): Generic SES warning.
> **warningText** (STRING): Exact wording of the warning.
> **locationText** (STRING): Location of the module on the disk shelf.

ses.status.psError

Severity

> ALERT

Description

> This message occurs when a critical condition is detected in the indicated storage shelf power supply. The power supply might fail.

Corrective Action

> Verify that input power to the shelf is working correctly. If separate events of this type are reported simultaneously, then the common power distribution point might be at fault. Make sure that the shelf power cords are fully inserted and secured, the supply is fully seated and secured, and the supply is switched on. Verify that power supply fans, if any, are functioning. If the problem persists, replace the power supply. If the problem still persists, contact NetApp technical support.

Syslog Message

> %s power error for %s %d: %s%s. %s.

Parameters

> **prodChannel** (STRING): Disk shelf identity (channel, product, and shelf number).
> **typeText** (STRING): SES type descriptor text for this power supply.

psNumber (INT): SES element number of the failing power supply.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact description of the error.
locationText (STRING): Location of the module on the disk shelf.

ses.status.psInfo

Severity

INFORMATIONAL

Description

This message occurs when a condition previously reported about the disk shelf power supply has been corrected or when other information about the power supply that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s power supply information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this supply.
psNumber (INT): SES element number of the reporting supply.
infoMsg (STRING): Generic SES information.

ses.status.psWarning

Severity

ERROR

Description

This message occurs when a warning condition has been detected in the indicated storage shelf power supply. The power supply might be able to continue operation.

Corrective Action

Verify that the disk shelf is receiving power. If separate events of this type are reported simultaneously, then the common power distribution point might be at fault. Make sure that the disk shelf power cords are fully inserted and secured, the supply is fully seated and secured, and the supply is switched on. If the problem persists, replace the power supply. If the problem still persists, contact NetApp technical support.

Syslog Message

%s power warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this supply.
psNumber (INT): SES element number of the erring supply.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.shelfCount.info

Severity

NOTICE

Description

This message occurs when the shelf count changes due to shelf removal, insertion or the controller was rebooted.

Corrective Action

(None).

Syslog Message

The new shelf count is %d, the old shelf count was %d.

Parameters

currentShelfCount (INT): New shelf count.
oldShelfCount (INT): Previous shelf count.

ses.status.temperatureError

Severity

ERROR

Description

This message occurs when the indicated disk shelf temperature sensor reports a temperature that exceeds the specifications for the disk shelf or its components.

Corrective Action

Verify that the ambient temperature where the shelf is installed is within NetApp equipment specifications using the "storage shelf show" command and that airflow clearances are maintained. If the same disk shelf also reports fan or fan module failures, correct that problem now. If the problem is reported by the ambient temperature sensor (located on the operator panel), verify that the connection between the disk shelf and the panel is secure, if possible. If the problem persists, and if the shelf has multiple temperature sensors of which only one exhibits the problem, replace the module that contains the sensor that reports the error. If problem still persists, contact NetApp technical support for assistance. The temperature thresholds for each shelf can be displayed by using the "storage shelf show" command. command.

Syslog Message

%s temperature error for %s %d: %s%s. Current temperature: %s C (%s F). %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this sensor.
thermNumber (INT): SES element number of this sensor.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the error.
currentCTemp (STRING): Temperature reported by the sensor, in Celsius, if available.
currentFTemp (STRING): Temperature reported by the sensor, in Fahrenheit, if available.
locationText (STRING): Location of the module on the disk shelf.

ses.status.temperatureInfo

Severity

INFORMATIONAL

Description

This message occurs when an error or warning condition previously reported by or about the disk shelf temperature sensor has been corrected or when other information about the temperature in the disk shelf that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s temperature information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this sensor.
thermNumber (INT): SES element number of this sensor.
infoMsg (STRING): Generic SES information.

ses.status.temperatureWarning

Severity

ALERT

Description

This message occurs when the indicated disk shelf temperature sensor reports a temperature that is close to exceeding the specifications for the disk shelf or its components.

Corrective Action

Verify that the ambient temperature where the disk shelf is installed is within NetApp equipment specifications by using the "storage shelf show" command, and that airflow clearances are maintained. If this disk shelf also reports fan or fan module errors or warnings, correct those problems now. If the problem persists, and the shelf has multiple temperature sensors of which only one exhibits the problem, replace the module that contains the sensor. If the problem persists, contact NetApp technical support for assistance. The temperature thresholds for each shelf can also be displayed by using the "storage shelf show" command.

Syslog Message

%s temperature warning for %s %d: %s%s. Current temperature: %s C (%s F). %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this sensor.
thermNumber (INT): SES element number of this sensor.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
currentCTemp (STRING): Temperature reported by the sensor, in Celsius, if available.
currentFTemp (STRING): Temperature reported by the sensor, in Fahrenheit, if available.
locationText (STRING): Location of the module on the disk shelf.

ses.status.upsError

Severity

ALERT

Description

This message occurs when the disk shelf has detected a failure in the uninterruptible power supply (UPS) attached to it. This might occur, for example, if power to the UPS has been lost.

Corrective Action

Restore power to the UPS. Verify that the connection from the UPS to the disk shelf is in place and secured, and that the UPS is enabled. If the problem persists, contact NetApp technical support.

Syslog Message

%s uninterruptible power error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this UPS
upsNumber (INT): SES element number of the UPS
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the error.
locationText (STRING): Location of the module on the disk shelf.

ses.status.upsInfo

Severity

INFORMATIONAL

Description

This message occurs when a condition previously reported about the uninterruptible power supply (UPS) attached to the disk shelf has been corrected or when other information about the UPS that does not necessarily require customer action is reported.

Corrective Action

(None).

Syslog Message

%s uninterruptible power information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this UPS.
upsNumber (INT): SES element number of the reporting UPS.
infoMsg (STRING): Generic SES information.

ses.status.upsWarning

Severity

ALERT

Description

This message occurs when the disk shelf has detected a warning condition in the uninterruptible power supply (UPS) attached to it. This might occur, for example, if power to the UPS has been lost.

Corrective Action

Restore power to the UPS. Verify that the connection from the UPS to the disk shelf is attached and secured, and that the UPS is enabled. If the problem persists, contact NetApp technical support.

Syslog Message

%s uninterruptible power warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and shelf number).
typeText (STRING): SES type descriptor text for this UPS.
upsNumber (INT): SES element number of the UPS.
errorMsg (STRING): Generic SES error.
errorText (STRING): Exact wording of the warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.volError

Severity

EMERGENCY

Description

This message occurs when a critical condition is detected in the indicated disk shelf voltage sensor. The disk shelf might be able to continue operation.

Corrective Action

Verify that the power supply unit (PSU) and the AC line are supplying power. Monitor the power grid for abnormalities. If all seems to be normal, replace the PSU. If the problem persists, contact technical support.

Syslog Message

%s voltage error for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this power supply.
psNumber (INT): SES element number of the power supply.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the exact warning.
locationText (STRING): Location of the module on the disk shelf.

ses.status.volInfo

Severity

INFORMATIONAL

Description

This message occurs when an error or warning condition previously reported by or about the disk shelf voltage sensor is corrected, or the system reports other information about the voltage in the disk shelf that does not necessarily require customer action.

Corrective Action

(None).

Syslog Message

%s voltage information for %s %d: %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for this sensor.
sensorNumber (INT): SES element number of the reporting sensor.
infoMsg (STRING): Generic SES information.

ses.status.volWarning

Severity

ERROR

Description

This message occurs when a warning condition is detected in the indicated disk shelf voltage sensor. The shelf might be able to continue operation.

Corrective Action

Verify that the power supply and the AC line are supplying power. Monitor the power grid for abnormalities. If all seems to be normal, replace the power supply. If the problem persists, contact NetApp technical support.

Syslog Message

%s voltage warning for %s %d: %s%s. %s.

Parameters

prodChannel (STRING): Disk shelf identity (channel, product, and disk shelf number).
typeText (STRING): SCSI Enclosure Services (SES) type descriptor text for the power supply.
psNumber (INT): SES element number of the power supply.
errorMsg (STRING): Generic SES error.
errorText (STRING): Description of the exact warning.
locationText (STRING): Location of the module on the disk shelf.

ses.system events

ses.system.em.mmErr

Severity

EMERGENCY

Description

This message occurs when ONTAP® software does not support internal disk drives in this platform.

Corrective Action

Check with NetApp technical support whether the combination of this platform type with internal disks is sopported on a later version of ONTAP. If so, upgrade to the appropriate ONTAP version.

Syslog Message

Disk shelf %d containing a %.8s system with internal drives (product ID %.16s) is not a supported combination.

Parameters

ShelfID (INT): ID of the disk shelf.
VendorID (STRING): Vendor ID of the disk shelf.
ProductID (STRING): Product ID of the disk shelf.

ses.unsupported events

ses.unsupported.shelf.psu

Severity

EMERGENCY

Description

This message occurs when a disk shelf has one unsupported power supply unit installed in it. The unsupported power fits correctly in the shelf, but its functional characteristics are incompatible with the supported power supply.

Corrective Action

Replace all unsupported power supplies immediately. Use the "storage shelf show -psu-part-number" command to locate all unsupported power supplies on the disk shelf, using the part number provided in the message as the required command parameter. Contact NetApp technical support for assistance and part number for replacement power supplies.

Syslog Message

Shelf id %d serial number %s Part number %s not supported on Product ID %s. %s: power supply %d. %s.

Parameters

ShelfId (INT): ID of the disk shelf.
serialNumber (STRING): Serial number of the storage shelf enclosure.
partNumber (STRING): Part number of the unsupported power supply.
ProdId (STRING): Product identification of the shelf with the unsupported power supply.
prodChannel (STRING): Disk shelf identity (channel and shelf number).
psNumber (INT): SES element number of the failing power supply.
locationText (STRING): Location of the unsupported power supply on the disk shelf.

ses.unsupported.shelf.psus

Severity

ERROR

Description

This message occurs when a shelf has one or more unsupported power supplies installed in it. The unsupported power fits correctly in the shelf, but its functional characteristics are incompatible with the supported power supply.

Corrective Action

Replace all unsupported power supplies immediately. Use the "storage shelf show -fields psu-part-number" command to and locate all unsupported power supplies on the disk shelf. Unsupported power supplies can be identified by the part number provided in the message. Contact NetApp technical support for assistance and part number for replacement power supplies.

Syslog Message

Part number %s not supported on Product ID %s. %s: %d unsupported power supplies.

Parameters

partNumber (STRING): Part number of the unsupported power supply.
ProdId (STRING): Product identification of the shelf with unsupported power supply.
prodChannel (STRING): Disk shelf identity (channel and shelf number).
psCount (INT): Number of unsupported power supplies on the shelf.

ses.unsupported.shelves.psus

Severity

EMERGENCY

Description

This message occurs when two or more shelves have unsupported power supply installed in it. The unsupported power fits correctly in the shelf, but its functional characteristics are incompatible with the supported power supply.

Corrective Action

Replace all unsupported power supplies immediately. Use the "storage shelf show -fields psu-part-number" command to locate all unsupported power supplies on the disk shelf. Unsupported power supplies can be identified by the part number provided in the message. Contact NetApp technical support for assistance and part number for replacement power supplies.

Syslog Message

Part number %s not supported on Product ID %s. %s and other shelves: %d unsupported power supplies.

Parameters

partNumber (STRING): Part number of the unsupported power supply.
ProdId (STRING): Product identification of the shelf with unsupported power supply.
prodChannel (STRING): Disk shelf identity (channel and shelf number).
psCount (INT): Number of unsupported power supplies on the shelf.

sfo events

sfo.aggr events

sfo.aggr.relocated.cu

Severity

INFORMATIONAL

Description

This message occurs when a storage failover aggregate is relocated from one node to another during a nondisruptive controller upgrade.

Corrective Action

(None).

Syslog Message

Aggregate %s was relocated from source node %s to destination node %s in %llu milliseconds during a nondisruptive controller upgrade. The source node has system ID %llu and the destination node has system ID %llu.

Parameters

aggr_name (STRING): Name of the aggregate that was relocated.
src_name (STRING): Name of the source node.
dest_name (STRING): Name of the destination node.
time (LONGINT): Time, in milliseconds, taken to relocate the aggregate.
src_system_id (LONGINT): System ID of the source node.
dest_system_id (LONGINT): System ID of the destination node.

sfo.aggr.relocated.perm

Severity

INFORMATIONAL

Description

This message occurs when an SFO aggregate is "permanently" relocated from one node to another. However, even though the aggregate relocation is considered "permanent," you can still reverse or undo it.

Corrective Action

(None).

Syslog Message

Aggregate %s was permanently relocated from source node %s to destination node %s.

Parameters

aggr_name (STRING): Name of the SFO aggregate that was relocated.
src_name (STRING): Name of the source node.
dest_name (STRING): Name of the destination node.
time (LONGINT): Time, in milliseconds, taken to relocate the aggregate.

sfo.aggr.relocated.temp

Severity

INFORMATIONAL

Description

This message occurs when a storage failover aggregate is temporarily relocated from one node to another. This usually happens when the aggregate is relocated during a performance optimized negotiated takeover.

Corrective Action

(None).

Syslog Message

Aggregate %s was temporarily relocated from source node %s to destination node %s in %llu milliseconds.

Parameters

aggr_name (STRING): Name of the aggregate that was relocated.
src_name (STRING): Name of the source node.
dest_name (STRING): Name of the destination node.
time (LONGINT): Time, in milliseconds, taken to relocate the aggregate.

sfo.arl events

sfo.arl.gb.failed.conversion

Severity

ERROR

Description

This message occurs when ARL/giveback of the Storage Failover (SFO) aggregate fails because of active volume conversion operations against one or more volumes on this aggregate while acquiring the RAID lock.

Corrective Action

When volume conversion is complete, re-run the command 'storage failover takeover/giveback'.

Syslog Message

%s %s.

Parameters

msg (STRING): Error that prevented ARL/GB.
aggr (STRING): Name of the aggregate that was not TO/GB.

sfo.arl.notAllowed

Severity

NOTICE

Description

This message occurs when a requested Storage Failover (SFO) aggregate relocation operation is refused because the destination node is not the high-availability (HA) partner of the source node.

Corrective Action

Verify that the destination node of the aggregate relocation is the source node's high-availability (HA) partner by using the "storage failover show" command. Retry the aggregate relocation with the correct source and destination node.

Syslog Message

SFO aggregate relocation refused for aggregate %s because the destination is not an HA partner. Source node: %s (NVRAM ID: %llu), destination node: %s (NVRAM ID: %llu).

Parameters

aggr_name (STRING): Name of the aggregate.
src_name (STRING): Name of the source node.
src_nvram_id (LONGINT): NVRAM ID of the source node.
dest_name (STRING): Name of the destination node.
dest_nvram_id (LONGINT): NVRAM ID of the destination node.

sfo.arl.recvdBadSignal

Severity

INFORMATIONAL

Description

This message occurs when the aggregate relocation worker thread receives an unexpected signal from the kernel subsystem.

Corrective Action

(None).

Syslog Message

(None).

Parameters

signal_info (STRING): Additional information on the signal received, indicating if it was a bad message type or a bad signal mask.
signal_value (INT): Value of the unexpected signal.

sfo.giveback events

sfo.giveback.aborted.bdfu

Severity

ERROR

Description

This message occurs when giveback of storage failover (SFO) aggregates is aborted because the background disk firmware update either on the source node or destination node took more than 120 seconds to finish.

Corrective Action

Rerun the "storage failover giveback" command.

Giveback is aborted: %s took more than 120 seconds to finish the background disk firmware update.

Parameters

nodename (STRING): Node where the background firmware update took more than 120 seconds to finish.

sfo.giveback.aggregatesAbort

Severity

INFORMATIONAL

Description

This message occurs when a giveback of non-root aggregates is aborted by either another takeover or other conflicting operation.

Corrective Action

(None).

Syslog Message

Giveback of non-root aggregates to node %s was aborted due to another takeover or other conflicting operation. "override-vetoes" was set to %s, "require-partner-waiting" was set to %s, and "only_newly_acquired" was set to %s.

Parameters

partnerName (STRING): Partner name.
override_vetoes (STRING): Flag that indicates whether the system overrides veto checks during a giveback operation. This flag corresponds to the "-override-vetoes" parameter of the "storage failover giveback" command. When set to true, it might result in some veto checks made by subsystems on the source node getting overridden.
require_partner_waiting (STRING): Flag that indicates whether, during a giveback, the storage is given back regardless of whether the partner node is available to take back the storage. This flag corresponds to the "-require-partner-waiting" parameter of the "storage failover giveback" command. When set to true, it might result in the giveback proceeding even if the destination node is not ready to receive the aggregate being migrated.
only_newly_acquired (STRING): Flag that indicates whether, during a giveback, only aggregates acquired during the last takeover will be given back.

sfo.giveback.attemptExceeded

Severity

ALERT

Description

This message occurs when the number of attempts for automatic giveback of storage failover (SFO) aggregates exceeds the maximum allowed.

Corrective Action

Use the "storage failover show-giveback" command to identify the subsystems that failed the giveback. Follow the corrective action specified in the EMS message displayed by those subsystems. For ASA r2, use the "storage failover show" command instead of the "storage failover show-giveback" command. Then retry giveback by using the "storage failover giveback" command.

Syslog Message

Attempts for automatic giveback of SFO aggregates exceeded the maximum number (%d) of allowed attempts.

Parameters

attempts (INT): Maximum number of automatic giveback attempts allowed.

sfo.giveback.complete

Severity

INFORMATIONAL

Description

This message occurs when a giveback of storage failover (SFO) aggregates to the SFO partner controller finishes.

Corrective Action

(None).

Syslog Message

Giveback of SFO aggregates to partner (%s) is complete. override-vetoes: %s, require-partner-waiting: %s, and only_newly_acquired: %s.

Parameters

partnerName (STRING): Partner's name.
override_vetoes (STRING): Flag that indicates whether the system overrides vetoes during a giveback operation. This flag corresponds to the "-override-vetoes" parameter of the "storage failover giveback" command. When set to true, it might result in some veto checks made by subsystems on the source node getting overridden.
require_partner_waiting (STRING): Flag that indicates whether, during a giveback, the storage is given back regardless of whether the partner node is available to take back the storage or not. This flag corresponds to the "-require-partner-waiting" parameter of the "storage failover giveback" command. When set to true, it might result in the giveback proceeding even if the destination node is not ready to receive the aggregate being migrated.
only_newly_acquired (STRING): Flag that indicates whether, during a giveback, only aggregates acquired during the last takeover will be given back.

sfo.giveback.delayed.bdfu

Severity

INFORMATIONAL

Description

This message occurs when giveback of storage failover (SFO) aggregates is delayed because a background disk firmware update is in progress either on the source node or destination node. If the update does not finish within 120 seconds, giveback will be aborted.

Corrective Action

(None).

Syslog Message

(None).

Parameters

nodename (STRING): Node where the background firmware update is in progress.

sfo.giveback.failed

Severity

ALERT

Description

This message occurs when giveback of the partner's Storage Failover (SFO) aggregate fails.

Corrective Action

Other error messages indicate the exact cause of failure along with the corrective action.

Syslog Message

Giveback of aggregate %s failed due to %s.

Parameters

aggr (STRING): Name of the aggregate that was not given back.
msg (STRING): Error that prevented giveback.

sfo.giveback.OpFailed

Severity

ALERT

Description

This message occurs when the Storage Failover (SFO) phase of giveback fails.

Corrective Action

Refer to other generated error messages to identify the exact cause of failure and the corrective action.

Syslog Message

SFO phase of giveback failed by node %s because %s.

Parameters

node (STRING): Name of the node that failed giveback.
msg (STRING): Error that prevented giveback.

sfo.giveback.postMigrNotOk

Severity

ALERT

Description

This message occurs when the specified subsystem encounters an error during the post-migration phase of the giveback operation.

Corrective Action

Check the event log for a subsystem-specific reason as to why the subsystem failed the post-migration phase of the giveback operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by that message.

Syslog Message

The giveback operation of '%s' encountered an error during post-migration processing. The error was encountered by the subsystem '%s'.

Parameters

aggr (STRING): Name of the aggregate on which the subsystem attempted the giveback operation.
subsystem (STRING): Name of the subsystem that failed the post-migration phase of the giveback operation.

sfo.giveback.spares.failed

Severity

ALERT

Description

This message occurs when giveback of the partner's storage failover (SFO) spares fails.

Corrective Action

Try the SFO giveback again.

Syslog Message

Giveback of spares failed due to %s.

Parameters

msg (STRING): Error that prevented giveback of SFO spares.

sfo.ignoretakeover events

sfo.ignoretakeover.envVarClearFailed

Severity

ERROR

Description

This message occurs when the environment indicating that mailbox takeover state should be rewritten could not be removed.

Corrective Action

Boot into the firmware monitor and remove the ign-tkover environment variable.

Syslog Message

Mailbox takeover state rewritten due to previous bringhome operation.

Parameters

(None).

sfo.ignoretakeover.rewritingMailbox

Severity

INFORMATIONAL

Description

This message occurs when mailbox takeover state is rewritten due to a previous bringhome operation.

Corrective Action

None.

Syslog Message

Mailbox takeover state rewritten due to previous bringhome operation.

Parameters

(None).

sfo.partialgiveback events

sfo.PartialGiveback

Severity

INFORMATIONAL

Description

This message occurs when a node is in partial giveback state because only some aggregates were given back during the giveback operation.

Corrective Action

Use the "storage failover show-giveback" command to check the giveback status of the aggregates. This command displays the cause of giveback failure and suggests corrective actions. For ASA r2, use the "storage failover show" command instead of the "storage failover show-giveback" command. Then retry giveback by using the "storage failover giveback" command. the "storage failover giveback" command.

Syslog Message

Node is in partial giveback state.

Parameters

(None).

sfo.reassignfailed events

sfo.reassignFailed

Severity

EMERGENCY

Description

This message occurs during the Storage Failover takeover process, when the disks from the failed node cannot be reassigned due to the failure listed. Access to the failed node's volumes will be unavailable until

this situation is fixed.

Corrective Action

Use the "storage disk show -owner" command to verify that the surviving node can access the failed node's disks. Use the "storage disk show -owner" command to verify that the node can access the partner disks. Investigate and remedy the error listed. Use the "storage failover takeover" command to retry the takeover.

Syslog Message

The takeover disk reassignment failed due to %s.

Parameters

msg (STRING): Information about the error that prevented the reassignment.

sfo.reassignnopartner events

sfo.reassignNoPartner

Severity

ERROR

Description

This message occurs during the Storage Failover takeover process, when the disks from the failed node cannot be reassigned because they are unaccessible to the surviving node. Access to the failed node's volumes will be unavailable until this situation is fixed.

Corrective Action

Use the "storage disk show -owner" command to verify that the surviving node can access the failed node's disks. If the disks are still unavailable, check cabling and connectivity to the partner disks. If the disks are available, use the "storage failover takeover" command to reinitiate the takeover. Use the "storage disk show -owner" command to verify that the node can access the partner disks. When the node can access the partner disks, use the "storage failover takeover" command.

Syslog Message

The takeover disk reassignment failed because the partner disks were not accessible.

Parameters

(None).

sfo.retry events

sfo.retry.autoGiveback

Severity

INFORMATIONAL

Description

This message occurs when automatic giveback of one or more SFO aggregates fails. Giveback of these SFO aggregates will be retried after the specified time.

Corrective Action

(None).

Syslog Message

Automatic giveback of SFO aggregates will be retried after %d minutes.

Parameters

minutes (INT): Time until giveback is retried, in minutes.

sfo.retrying events

sfo.retrying.autoGiveback

Severity

INFORMATIONAL

Description

This message occurs when automatic giveback of SFO aggregates is retried.

Corrective Action

(None).

Syslog Message

Automatic giveback of SFO aggregates is being retried.

Parameters

(None).

sfo.sendhome events

sfo.sendhome.NoPartnerDisks

Severity

INFORMATIONAL

Description

This message occurs when the giveback request fails because there are no disks that belong to the partner.

Corrective Action

Use the "storage disk show" command to validate that home information is set correctly on the disks that should belong to the partner.

Syslog Message

Giveback request failed because there are no disks to return to the partner.

Parameters

(None).

sfo.sendhome.partnerNoBoot

Severity

ERROR

Description

This message occurs when the Storage Failover giveback process cannot proceed because the partner node did not boot successfully after its root aggregate was sent home. Volumes in the root aggregate are unavailable until you remedy this situation. Other aggregates belonging to the partner remain assigned to this node until you run another "storage failover giveback" command following a successful boot of the partner node.

Corrective Action

Look at the partner logs and console output to determine why the node is not booting. Fix the problem, and then reboot the node. After the partner node boots successfully, run the "storage failover giveback" command again to return the remaining aggregates.

Syslog Message

The giveback terminated because the partner node (%s) did not boot successfully.

Parameters

partner_name (STRING): Name of the partner node.

sfo.sendhome.subsystemAbort

Severity

ALERT

Description

This message occurs when the specified subsystem aborts the Storage Failover giveback operation for the aggregate.

Corrective Action

Check the syslog/EMS output for a subsystem-specific reason for aborting the giveback operation. The corrective action is subsystem-specific and is detailed in the corrective action portion of the message. Follow the corrective action specified by the subsystem and then reissue the 'giveback' command. If you cannot perform the corrective action, then use the 'override-vetoes' option in the 'giveback' command to force the giveback.

Syslog Message

The giveback operation of '%s' was aborted by '%s'.

Parameters

aggr (STRING): Name of the aggregate on which the subsystem attempted the giveback operation.
subsystem (STRING): Name of the subsystem that aborted the giveback operation.

sfo.takenover events

sfo.takenOver.aborted

Severity

ERROR

Description

This message occurs when an attempted optimized negotiated takeover is aborted by the node about to be taken over.

Corrective Action

1. Use the "storage failover show" command to verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local and partner nodes are up. If they are not up, correct any network issues that could be preventing it. 3. Check whether any operation is running on the partner that might have slowed it down. If so, either abort the operation or wait until it is over. 4. (Optional) Use the "-bypass-optimization" parameter in the "storage failover takeover" command to bypass the optimized takeover by the partner node. 5. Use the "storage aggregate plex show" command to check mirror degraded aggregates, if the remote plex is offline, bring it online using the "storage aggregate plex online" command.

Syslog Message

The local node has aborted an optimized negotiated takeover that was initiated by the partner. Reason: %s

Parameters

reason (STRING): Reason for the failure, which might be as follows: 1. Conflicting takeover/giveback/relocation operation. 2. High-availability (HA) partner not being eligible for takeover. 3. Communication failure with the partner over the cluster network. 4. Local node has mirror degraded aggregates with remote plex inactive or unmirrored aggregates.

sfo.takenOver.commFailed

Severity

ALERT

Description

This message occurs when the local node cannot communicate over the cluster network with its high-availability (HA) partner during an optimized negotiated takeover initiated by the HA partner node.

Corrective Action

1. Use the "storage failover show" command to verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local and partner nodes are up. If they are not up, address any network issues that could be preventing it. 3. (Optional) Use the "-bypass-optimization" parameter in the "storage failover takeover" command to bypass the optimized takeover by the partner node.

Syslog Message

The local node could not communicate with its HA partner, %s, (partner's D-blade ID: %s) during an optimized negotiated takeover initiated by the partner node. The communication request returned a status of %d. The level %d returned a status of %lld.

Parameters

partner_name (STRING): Name of the partner node.
partner_dbladeid (STRING): D-blade ID of the partner node.
status (INT): Status returned by the hamsg message layer.
scope (INT): Specific module level where the message did not succeed.

scope_status (LONGINT): Module-level specific reason the message did not succeed.

sfo.takenOver.relocDone

Severity
INFORMATIONAL

Description
This message occurs during optimized negotiated takeover, when the high-availability (HA) partner notifies the local node that it has completed the relocation of all aggregates to the local node.

Corrective Action
(None).

Syslog Message
(None).

Parameters
partner_name (STRING): Name of the partner node.
partner_sysid (LONGINT): System ID of the partner node.
relocation_status (INT): Status of the "relocation done" response received from the HA partner.

sfo.takeover events

sfo.takeover.aborted

Severity
ERROR

Description
This message occurs when the taking over node cannot complete an attempted optimized negotiated takeover. Any data LIFs that were migrated as part of the failed takeover operation will not be auto-reverted back.

Corrective Action
1. Use the "storage failover show" command to verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local and partner nodes are up. If they are not up, correct any network issues that could be preventing it. 3. Check whether any operation is running on the partner that might have slowed it down. If so, either abort the operation or wait until it is over. 4. (Optional) Use the "-bypass-optimization" parameter in the "storage failover takeover" command to bypass the optimized takeover by the local node.

Syslog Message
An optimized negotiated takeover of the HA partner node by the local node has been aborted. Reason: %s

Parameters
reason (STRING): Reason for the failure, which might be as follows: 1. Conflicting takeover/giveback/relocation operation. 2. High-availability (HA) partner not being eligible for takeover. 3. Communication failure with the partner over the cluster network.

sfo.takeover.aggrProcessTime

Severity

NOTICE

Description

This message occurs during the planned negotiated takeover of an aggregate, to indicate the time taken by a particular process during that takeover.

Corrective Action

(None).

Syslog Message

Time taken for '%s' during takeover of the aggregate '%s' was %llu milliseconds.

Parameters

process (STRING): Description of the process.
aggr (STRING): Name of the aggregate being taken over.
time (LONGINT): Time taken by the specified process in milliseconds.

sfo.takeover.aggrSubsysTime

Severity

NOTICE

Description

This message occurs during the planned negotiated takeover of an aggregate, to indicate the time taken by a subsystem to perform a particular process during that takeover.

Corrective Action

(None).

Syslog Message

Subsystem %s took %llu milliseconds to complete %s during planned negotiated takeover of the aggregate %s.

Parameters

subsystem (STRING): Name of the subsystem performing the takeover operation.
time (LONGINT): Time taken by the subsystem, in milliseconds, to complete the specified process.
process (STRING): Description of the process.
aggr (STRING): Name of the aggregate being taken over.

sfo.takeover.bypassed

Severity

INFORMATIONAL

Description

This message occurs when a negotiated takeover bypasses the negotiated takeover optimization.

Corrective Action

(None).

Syslog Message

Negotiated takeover of node %s with system-ID %u has bypassed the negotiated takeover optimization. Reason: %s

Parameters

partner_name (STRING): Name of the partner node.
partner_sysid (LONGINT): System ID of the partner node.
reason (STRING): Reason that negotiated takeover optimization was bypassed.

sfo.takeover.commExpired

Severity

ERROR

Description

This message occurs during optimized negotiated takeover, when the local node does not receive a response within a designated time period, while communicating over the cluster network with its high-availability (HA) partner.

Corrective Action

1. Check whether any operation is running on the partner node that might have slowed it down, such as another aggregate relocation. Also check for conflicting operations, such as another takeover, giveback, or shutdown. If so, either abort the operation or wait until it is over. 2. (Optional) Use the "-bypass-optimization" parameter in the "storage failover takeover" command to bypass the optimized takeover by the local node.

Syslog Message

The local node timed out while waiting for a response from its HA partner, %s, over the cluster network.

Parameters

partner_name (STRING): Name of the partner node.
partner_dbladeid (STRING): D-blade ID of the partner node.

sfo.takeover.commFailed

Severity

ALERT

Description

This message occurs when the local node cannot communicate over the cluster network with its high-availability (HA) partner during an optimized negotiated takeover initiated by the local node.

Corrective Action

1. Use the "storage failover show" command to verify that the partner node is up. 2. Use the "network interface show" command to verify that the cluster network interfaces on the local and partner nodes are up. If they are not up, address any network issues that could be preventing it. 3. (Optional) Use the "-bypass-optimization" parameter in the "storage failover takeover" command to bypass the optimized takeover by the local node.

Syslog Message

The local node could not communicate with its HA partner, %s, (partner's D-blade ID: %s) during an optimized negotiated takeover initiated by the local node. The communication request returned a status of %d. The level %d returned a status of %lld.

Parameters

partner_name (STRING): Name of the partner node.
partner_dbladeid (STRING): D-blade ID of the partner node.
status (INT): Status returned by the hamsg message layer.
scope (INT): Specific module level where the message did not succeed.
scope_status (LONGINT): Module-level specific reason the message did not succeed.

sfo.takeover.noAggrReloc

Severity

INFORMATIONAL

Description

This message occurs when no SFO aggregate was relocated by the high-availability (HA) partner during optimized negotiated takeover.

Corrective Action

(None).

Syslog Message

(None).

Parameters

partner_name (STRING): Name of the partner node.
partner_sysid (LONGINT): System ID of the partner node.

sfo.takeover.relocDone

Severity

INFORMATIONAL

Description

This message occurs during optimized negotiated takeover, when the local node receives a notification from its high-availability (HA) partner node stating that the partner has completed the relocation of all aggregates to the local node.

Corrective Action

(None).

Syslog Message

(None).

Parameters

partner_name (STRING): Name of the partner node.
partner_sysid (LONGINT): System ID of the partner node.
relocation_status (INT): Status of the "relocation done" response received from the HA partner.

sfo.takeover.sfoStart

Severity

INFORMATIONAL

Description

This message occurs when the node doing the takeover starts the SFO phase of the optimized negotiated takeover.

Corrective Action

(None).

Syslog Message

The local node has initiated optimized negotiated takeover of its partner (%s).

Parameters

partner_name (STRING): Name of the partner node.
partner_sysid (LONGINT): System ID of the partner node.

sfo.tkabort events

sfo.tkAbort.ca.check.failed

Severity

ERROR

Description

This message occurs when the destination node cannot contact the object stores during the planned takeover of a FabricPool aggregate.

Corrective Action

Verify that the intercluster LIF is online and functional by using the "network interface show" command. Also, check network connectivity to the object store server by using the "ping" command over the destination node intercluster LIF. Additionally, verify that the configuration of the object store has not changed, and that login and connectivity information is still accurate by using the "aggregate object-store config show" command.

Syslog Message

Planned SFO takeover of aggregate '%s' (uuid: %s) failed due to %s.

Parameters

vol (STRING): Name of the aggregate.
aggr_uuid (STRING): UUID of the aggregate.
reason (STRING): Reason for the prevention of the planned takeover operation.

sfo.tkovertoclusterwait events

sfo.tkoverToClusterwait

Severity

NOTICE

Description

This message occurs when a node whose M-host applications have not fully stabilized initiates a takeover followed by a giveback to its high-availability (HA) partner. After the giveback, this node's Failover Monitor state indicates that M-host stabilization is not yet complete.

Corrective Action

Contact NetApp technical support to diagnose the issue further.

Syslog Message

(None).

Parameters

(None).

sfu events

sfu.adaptersuspendio events

sfu.adapterSuspendIO

Severity

INFORMATIONAL

Description

This message occurs during a disk shelf firmware update on a disk shelf that cannot perform I/O while updating firmware. Typically, the shelves involved are bridge-based.

Corrective Action

I/O resumes automatically after the firmware update is complete.

Syslog Message

Suspending I/O to %s adapter %s for %d seconds while shelf firmware is updated.

Parameters

adapterType (STRING): Type of adapter that is updating firmware.
channelName (STRING): Name of the adapter on which shelves will be updating firmware.
minutes (INT): Amount of time that I/O will be suspended on the adapter.

sfu.adapterSuspendIO.ndu

Severity

INFORMATIONAL

Description

This message occurs during a disk shelf firmware update on a disk shelf that can perform I/O, but might have to suspend management requests while updating firmware. Typically, the shelves involved are DS12-ESAS, DS20-ESAS, DS4243.

Corrective Action

Suspended data traffic resumes automatically after the firmware update is complete.

Syslog Message

Suspending %s to %s adapter %s for %d seconds while shelf firmware is updated.

Parameters

dataTrafficType (STRING): Type of data traffic: SMP.
adapterType (STRING): Type of adapter that is updating firmware.
channelName (STRING): Name of the adapter on which shelves will be updating firmware.
minutes (INT): Amount of time that specified data traffic will be suspended on the adapter.

sfu.auto events

sfu.auto.update.off.impact

Severity

ERROR

Description

This message occurs when ONTAP® software cannot automatically upgrade the firmware on a disk shelf because the hidden 'shelf.fw.auto.update' option is set to off.

Corrective Action

Set the hidden option 'shelf.fw.auto.update' to "on", or update the firmware manually.

Syslog Message

Firmware could not be updated on I/O module %s with firmware version %s on %s disk shelf %s.shelf%d. Update the firmware manually.

Parameters

moduleType (STRING): I/O controller module type, for example, AT-FCX/ESH4/SAS/IOM3.
productRev (STRING): Firmware revision level.
shelfType (STRING): Disk shelf enclosure type, for example, DS14-Mk4-FC, DS14-Mk2-FC, or DS14-Mk2-AT.
channelName (STRING): Name of the adapter port or switch port of the disk shelf enclosure.
shelfId (INT): ID of the disk shelf enclosure.

sfu.badbridgeshelfconfig events

sfu.badBridgeShelfConfig

Severity

ALERT

Description

This message occurs when the disk shelf firmware update aborts because it cannot contact the two peer FC-to-SAS bridges.

Corrective Action

Make sure that the storage controller is correctly cabled to the two peer FC-to-SAS bridges and that the bridges are correctly cabled to the SAS disk shelves. Then retry the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

Firmware update aborted on disk shelf %s.shelf%d module %s. Unable to contact two peer FC-to-SAS bridges.

Parameters

channelName (STRING): Name of the adapter port or switch port of the disk shelf that aborted the firmware update.
shelfId (INT): ID of the disk shelf that aborted the firmware update.
module (STRING): Module that aborted the firmware update.

sfu.ctrllerelmntspershelf events

sfu.ctrllerElmntsPerShelf

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware download determines the number of controller elements per shelf that can be downloaded.

Corrective Action

(None).

Syslog Message

%s: %d ES controller %s can be updated on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
count (INT): Number of ES controller elements on this shelf that can be downloaded.
pluralElement (STRING): Element or Elements.
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware can be downloaded.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware can be downloaded.

sfu.download events

sfu.download.details

Deprecated

Deprecated as of ONTAP® version 9.6. A new EMS message is added.

Severity

NOTICE

Description

This message occurs when a disk shelf firmware update completes download firmware to a disk shelf or shelves in the system.

Corrective Action

Shelf firmware update will be attempted again in the next background shelf firmware update.

Syslog Message

%s: Download of firmware file %s on %s.shelf%d might not have completed on one module as %s. An attempt to download again will be done in the next cycle.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware download error occurred.

shelfId (INT): ID of the disk shelf on which the disk shelf firmware download error occurred.
ErrorReason (STRING): More information about the reason for download error.

sfu.download.done.details

Severity

NOTICE

Description

This message occurs when a shelf firmware update finishes downloading firmware to a shelf or shelves in the system.

Corrective Action

Shelf firmware update will be attempted again in the next background shelf firmware update.

Syslog Message

%s: Download of firmware file on %s.shelf%d might not have been completed on one module because %s. An attempt to download again will be done in the next cycle.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware download error occurred.
shelfId (INT): ID of the shelf on which the shelf firmware download error occurred.
ErrorReason (STRING): More information about the reason for download error.

sfu.downloadctrllerbridge events

sfu.downloadCtrllerBridge

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware download starts on a particular disk shelf.

Corrective Action

(None).

Syslog Message

%s: Downloading %s on ES controller module %s via SES device %s.%d on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
module (STRING): Either Module A or Module B, in which Module A is the upper module in the enclosure on the back side and Module B is the lower module in the enclosure on the back side.
channelNameSES (STRING): Name of the adapter port or switch port on the SES services device on which the disk shelf firmware download is occurring.
scsiId (INT): SCSI ID of the SES services device used to download disk shelf firmware.
channelNameShelf (STRING): Name of the adapter port or switch port on which the disk shelf firmware

download is occurring.

shelfId (INT): ID of the disk disk shelf on which the disk shelf firmware download is occurring.

sfu.downloaderror events

sfu.downloadError

Severity

ERROR

Description

This message occurs when a disk shelf firmware update fails to successfully download firmware to a disk shelf or shelves in the system.

Corrective Action

Redownload the latest disk shelf firmware from the NetApp Support Site at http://support.netapp.com/NOW/download/tools/diskshelf/ and attempt to download disk shelf firmware again, using the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

%s: Error downloading firmware file %s on %s.shelf%d.%s

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware download error occurred.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download. error occurred.
ErrorReason (STRING): More information about the reason for download error.

sfu.downloadingcontroller events

sfu.downloadingController

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware download starts on a specific disk shelf.

Corrective Action

(None).

Syslog Message

%s: Downloading %s on disk shelf controller module %s on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
module (STRING): Module on which the disk shelf firmware download is occurring.
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware

download is occurring.

shelfId (INT): ID of the disk shelf on which the disk shelf firmware download is occurring.

sfu.downloadingctrllerr1xx events

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware download starts on a particular disk shelf.

Corrective Action

(None).

Syslog Message

%s: Downloading %s on ES controller on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware download is occurring.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download is occurring.

sfu.downloadstarted events

sfu.downloadStarted

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update starts to download disk shelf firmware.

Corrective Action

(None).

Syslog Message

Update of disk shelf firmware started on %d %s.

Parameters

count (INT): Number of shelves that are starting disk shelf firmware download.
pluralShelf (STRING): Shelf or Shelves.

sfu.downloadsuccess events

sfu.downloadSuccess

Severity

INFORMATIONAL

Description

This message occurs when disk shelf firmware updates successfully.

Corrective Action

(None).

Syslog Message

%s: Firmware file %s downloaded on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
channelName (STRING): Name of the adapter port or switch port on which the shelf firmware download occurred.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download occurred.

sfu.downloadsummary events

sfu.downloadSummary

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update completes successfully.

Corrective Action

(None).

Syslog Message

Shelf firmware updated on %d %s.

Parameters

shelfCount (INT): Number of shelves that successfully updated.
pluralShelf (STRING): Shelf or Shelves.

sfu.downloadsummaryerrors events

sfu.downloadSummaryErrors

Severity

ERROR

Description

This message occurs when a disk shelf firmware update completes without successfully downloading to all shelves it attempted.

Corrective Action

Issue the (advanced privilege) "storage shelf firmware update" command again.

Syslog Message

Shelf firmware updated on %d %s, failed to update on %d %s.

Parameters

successCount (INT): Number of shelves successfully updated.
pluralShelf (STRING): Shelf or Shelves.
failedCount (INT): Number of shelves that failed to update.
pluralShelfFailed (STRING): Shelf or Shelves.

sfu.fcdownloadfailed events

sfu.FCDownloadFailed

Severity

ERROR

Description

This message occurs when a disk shelf firmware update fails to download shelf firmware to an FC or an ATA shelf successfully.

Corrective Action

Redownload the latest disk shelf firmware from the NetApp Support Site at http://support.netapp.com/NOW/ download/tools/diskshelf/ and attempt to download disk shelf firmware again by using the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

%s: Download failed on %s on ES controller module %s via SES device %s.%d on %s.shelf%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of file in /etc/shelf_fw that was being downloaded.
module (STRING): Module A is the upper module in the enclosure on the back side. Module B is the lower module in the enclosure on the back side.
channelNameSES (STRING): Name of the adapter port or switch port on the SES services device on which the disk shelf firmware download failed.
scsiId (INT): SCSI ID of the SES services device used to download disk shelf firmware.
channelNameShelf (STRING): Name of the adapter port or switch port on which the disk shelf firmware download failed.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download failed.

sfu.firmwaredownrev events

sfu.firmwareDownrev

Severity

ERROR

Description

This message occurs when disk shelf firmware is downrev and therefore cannot be updated automatically. Before updating the disk shelf firmware, always check the NetApp Support Site for the latest disk shelf firmware available: http://support.netapp.com/NOW/download/tools/diskshelf/.

Corrective Action

Copy updated disk shelf firmware into the /etc/shelf_fw directory on the storage appliance and then manually issue the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

Disk shelf firmware needs to be updated on %d disk %s.

Parameters

downrevShelves (INT): Number of shelves in the system that are downrev.
pluralShelf (STRING): Shelf or Shelves.

sfu.firmwareDownrev.shelf

Severity

ERROR

Description

This message occurs when the disk shelf is running downrev firmware, and a later version is available in the /etc/shelf_fw directory. The shelf cannot be updated automatically, possibly because automatic shelf firmware update is disabled.

Corrective Action

Use the "options shelf.fw.auto.update" command to check whether automatic shelf firmware update is off. Manually issue the (advanced privilege) "storage shelf firmware update" command if background update is disabled.

Syslog Message

Shelf %s has downrev firmware.

Parameters

ShelfId (STRING): Shelf that is running downrev firmware.

sfu.firmwareuptodate events

sfu.firmwareUpToDate

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update is requested but all shelves are determined to be updated already to the latest version of firmware available on the system. Before updating the disk shelf firmware, always check the NetApp Support Site for the latest disk shelf firmware available: http://support.netapp.com/NOW/download/tools/diskshelf/.

Corrective Action

(None).

Syslog Message

Firmware is up-to-date on all disk shelves.

Parameters

(None).

sfu.nsmdownloadfailed events

sfu.NSMDownloadFailed

Severity

ERROR

Description

This message occurs when a disk shelf firmware update fails to download disk shelf firmware to a disk shelf successfully.

Corrective Action

Go to the NetApp Support Site at http://support.netapp.com/NOW/download/tools/diskshelf/ and try downloading the disk shelf firmware again by using the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

%s: Download failed on %s on disk shelf controller module %s on disk shelf %s.%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
module (STRING): Module on which the disk shelf firmware download failed.
channelNameSES (STRING): Name of the adapter port or switch port on the SCSI enclosure services (SES) device on which the disk shelf firmware download failed.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download failed.

sfu.partnerinaccessible events

sfu.partnerInaccessible

Severity

ALERT

Description

This message occurs in a high-availability (HA) configuration in which communication between partner nodes cannot be established.

Corrective Action

Verify that the HA interconnect is operational. Retry the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

HA partner is inaccessible. Shelf firmware update canceled.

Parameters

(None).

sfu.partnernotresponding events

sfu.partnerNotResponding

Severity

ALERT

Description

This message occurs when one node in a high-availability (HA) configuration does not respond to firmware download requests from another node, in which case the other node cannot download disk shelf firmware.

Corrective Action

Make certain that the HA interconnect is up and running on both nodes of the HA pair and then attempt to re-download disk shelf firmware, using the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

Partner either responded in the negative, or did not respond in %d seconds. Aborting shelf firmware update.

Parameters

timeout (INT): Number of seconds the timeout is set for.

sfu.partnerrefusedupdate events

sfu.partnerRefusedUpdate

Severity

ALERT

Description

This message occurs in a high-availability (HA) configuration in which one node refuses firmware download requests from its partner node, in which case the partner node cannot download disk shelf firmware.

Corrective Action

Make certain that the HA partners are both running the same version of ONTAP® software and that the HA interconnect is up and running. Attempt the (advanced privilege) "storage shelf firmware update" command again.

Syslog Message

Partner node refused permission to update shelf firmware.

Parameters

(None).

sfu.partnerupdatecomplete events

sfu.partnerUpdateComplete

Severity

INFORMATIONAL

Description

This message occurs in a high-availability (HA) configuration in which an HA partner was downloading disk shelf firmware and the download was completed, at which point this notification is sent and enclosure services are resumed by the partner.

Corrective Action

(None).

Syslog Message

Partner is no longer updating disk shelf firmware. Resuming enclosure services.

Parameters

(None).

sfu.partnerupdatetimeout events

sfu.partnerUpdateTimeout

Severity

INFORMATIONAL

Description

This message occurs in a high-availability (HA) configuration in which an HA partner was downloading disk shelf firmware and the download has timed out. The system resumes enclosure services monitoring.

Corrective Action

Verify that the HA interconnect is operational and then retry the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

Waited %d minutes for partner shelf firmware update. Resuming enclosure services.

Parameters

minutes (INT): Duration of the partner update timeout, in minutes.

sfu.rebootrequest events

sfu.rebootRequest

Severity

INFORMATIONAL

Description

This message occurs when the disk shelf firmware update is complete and the disk shelf will be rebooted to run the new code.

Corrective Action

(None).

Syslog Message

Issuing a request to reboot disk shelf %s.shelf%d module %s.

Parameters

channelName (STRING): Name of the adapter port or switch port of the disk shelf to be rebooted.
shelfId (INT): ID of the disk shelf to be rebooted.
module (STRING): Module to be rebooted.

sfu.rebootrequestfailure events

sfu.rebootRequestFailure

Severity

ERROR

Description

This message occurs when an attempt to issue a reboot request after downloading disk shelf firmware fails, indicating a software error.

Corrective Action

Retry the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

Could not issue the request to reboot disk shelf %s.shelf%d module %s.

Parameters

channelName (STRING): Name of the adapter port or switch port of the disk shelf to be rebooted.
shelfId (INT): ID of the disk shelf to be rebooted.
module (STRING): Module to be rebooted.

sfu.resumediskio events

sfu.resumeDiskIO

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update is completed and disk I/O is resumed.

Corrective Action

(None).

Syslog Message

Resuming disk I/O after shelf firmware update.

Parameters

(None).

sfu.sasdownloadfailed events

sfu.SASDownloadFailed

Severity

ERROR

Description

This message occurs when a disk shelf firmware update fails to download disk shelf firmware to a disk shelf successfully.

Corrective Action

Go to the NetApp Support Site at http://support.netapp.com/NOW/download/tools/diskshelf/ and try downloading the disk shelf firmware again by using the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

%s: Download failed on %s on disk shelf controller module %s on disk shelf %s.%d.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
fileName (STRING): Name of the file in /etc/shelf_fw that was being downloaded.
module (STRING): Module on which the disk shelf firmware download failed.
channelNameSES (STRING): Name of the adapter port or switch port on the SCSI enclosure services (SES) device on which the disk shelf firmware download failed.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware download failed.

sfu.statuscheckfailure events

sfu.statusCheckFailure

Severity

ERROR

Description

This message occurs when the (advanced privilege) "storage shelf firmware update" command encounters a failure while attempting to read the status of the firmware update in progress.

Corrective Action

Retry the (advanced privilege) "storage shelf firmware update" command.

Syslog Message

%s: failed status check of f/w update on %s.shelf%d [%x] %s, retry_count = %d, %s.

Parameters

cmdName (STRING): Name of the command issued, such as "storage shelf firmware update".
channelName (STRING): Name of the adapter port or switch port on which the disk shelf firmware is to be downloaded.
shelfId (INT): ID of the disk shelf on which the disk shelf firmware is to be downloaded.
outStatusFlags (INTHEX): Output status flags value of the I/O operation (ONTAP® software internal value).
ModuleType (STRING): Module type, such as AT-FCX, AT-FC, ESH, LRC, and so on.
retryCount (INT): Number of times the status read has been retried.
DeviceStatus (STRING): Whether the SES target device status is OK or MISSING.

sfu.suspenddiskio events

sfu.suspendDiskIO

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update is started and disk I/O is suspended.

Corrective Action

(None).

Syslog Message

Suspending disk I/O to reboot shelf modules for shelf firmware update.

Parameters

(None).

sfu.suspendses events

sfu.suspendSES

Severity

INFORMATIONAL

Description

This message occurs when a disk shelf firmware update is requested in a high-availability (HA) environment. One partner node updates the firmware on the disk shelf module while the HA partner node

temporarily disables enclosure services while the firmware update is in process.

Corrective Action

(None).

Syslog Message

Suspending enclosure services—partner is updating disk shelf firmware.

Parameters

(None).

shelf events

(None).

Syslog Message

Disk shelf %s has entered Identify mode (Shelf Attention Code: %s)

Parameters

shelfName (STRING): Disk shelf name.
panelCode (STRING): Code displayed on the disk shelf's 7-segment LED OPS panel.

shelf.identify.stop

Severity

INFORMATIONAL

Description

This message occurs when the user turns off a disk shelf's Identify mode.

Corrective Action

(None).

Syslog Message

Disk shelf %s has exited Identify mode.

Parameters

shelfName (STRING): Disk shelf name.

shelf.io events

shelf.IO.in.progress

Severity

NOTICE

Description

This message occurs when a request cannot be performed because I/O is still in progress.

Corrective Action

(None).

Syslog Message

Could not perform the request; I/O to disk shelf is still in progress.

Parameters

(None).

shelf.module events

shelf.module.configuration.failure

Severity

ERROR

Description

This message occurs when the system cannot complete the configuration of a disk shelf module with the desired parameters.

Corrective Action

Contact NetApp technical support.

Syslog Message

Could not complete the configuration of disk shelf module %s on channels %s, disk shelf ID %d.

Parameters

element (STRING): Disk shelf module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availibility partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID of the disk shelf.

shelf.module.element.missing

Severity

ALERT

Description

This message occurs when an element is missing, unused, or disconnected.

Corrective Action

Verify that both disk shelf modules are fully seated and locked in place. Also make sure that they are of the same product family.

Syslog Message

Disk shelf module %s is MISSING on channels %s disk shelf ID %d.

Parameters

element (STRING): Disk shelf module designator (A is the upper module, B is the lower module).
channels (STRING): Channels that have the error if local, PARTNER for high-availability partner, UNUSED if unconnected.
shelfID (INT): Disk shelf ID of the disk shelf reporting the error.

shelf.reset events

shelf.reset.counters

Severity

INFORMATIONAL

Description

This message occurs when ONTAP® software resets the error counters on a disk shelf module.

Corrective Action

(None).

Syslog Message

Resetting error counters for module %s in disk shelf %s.%d.

Parameters

element (STRING): Disk shelf module designator (A is the upper module, B is the lower module).
channel (STRING): Channel the disk shelf module is on.
shelfID (INT): ID of the disk shelf the module is in.

shelf.test events

shelf.test.in.progress

Severity

INFORMATIONAL

Description

This message occurs when a TEST request is now in progress.

Corrective Action

(None).

Syslog Message

Test request in progress.

Parameters

(None).

shelf.test.request.error

Severity

ERROR

Description

This message occurs when a TEST request cannot be performed because the disk shelf does not exist.

Corrective Action

Run the test against a shelf that exists.

Syslog Message

Could not perform TEST request; the disk shelf does not exist.

Parameters

(None).

shm events

shm.bypassed events

shm.bypassed.disk.fail

Deprecated

Deprecated as of Data ONTAP 9.3 because bypass code has been removed.

Severity

ERROR

Description

This message occurs when the system recommends that a disk be failed because it has been bypassed.

Corrective Action

(None).

Syslog Message

shm: Disk %s has been recommended for failure due to being bypassed by the shelf.

Parameters

diskName (STRING): Name of the disk.

shm.bypassed.disk.fail.disabled

Deprecated

Deprecated as of Data ONTAP 9.3 because bypass code has been removed.

Severity

ALERT

Description

This message occurs when three or more disks have been bypassed on a port.

Corrective Action

(None).

Syslog Message

shm: Disk bypass check has been disabled due to multiple bypassed disks on host bus adapter %s, shelf %d.

Parameters

hba (STRING): Name of the host bus adapter.
shelf (INT): Shelf ID.

shm.bypassed.disk.fail.enabled

Severity

NOTICE

Description

This message occurs when the bypass disabled state is cleared.

Corrective Action

(None).

Syslog Message

shm: Disk bypass check has been enabled for host bus adapter %s.

Parameters

hba (STRING): Name of the host bus adapter.

shm.disk events

shm.disk.lostWriteError

Severity

ERROR

Description

This message occurs when the system detects a lost write error.

Corrective Action

(None).

Syslog Message

shm: Disk %s has detected and recovered from a lost write error; the system will fail the disk if possible.

Parameters

diskName (STRING): Name of the disk.

shm.fab events

shm.fab.writeError

Severity

NOTICE

Description

This message occurs when an error is received while writing the failure bytes.

Corrective Action

(None).

Syslog Message

shm: Unable to write failure bytes to disk %s due to error %x.

Parameters

diskName (STRING): Name of the disk.
error_code (INTHEX): Error code returned.

shm.fab.writeSenseError

Severity

NOTICE

Description

This message occurs when an error is received while writing the failure bytes.

Corrective Action

(None).

Syslog Message

shm: Unable to write failure bytes to disk %s due to error %x/%x/%x/%x.

Parameters

diskName (STRING): Name of the disk.
sense_key (INTHEX): Actual sense key.
sense_code (INTHEX): Actual sense code.
qualifier (INTHEX): Actual sense code qualifier.
fru_failed (INTHEX): Actual FRU code.

shm.failurebytes events

shm.failureBytes.fullError

Severity

NOTICE

Description

This message occurs when writing the failure byte area returns an error due to being full.

Corrective Action

(None).

Syslog Message

shm: Disk %s failure area has reached capacity; to clear, reload drive firmware.

Parameters

diskName (STRING): Name of the disk.

shm.nvme events

shm.NVME.critical.warning

Severity

ERROR

Description

This message occurs when the NVMe drive returns a critical warning to the health monitor.

Corrective Action

(None).

Syslog Message

Disk %s returned a critical warning 0x%x and will be recommended for failure.

Parameters

disk_name (STRING): Name of the disk.
warning_code (INTHEX): Warning code returned.

shm.pulllogwarning events

shm.pullLogWarning

Severity

NOTICE

Description

This message occurs when the disk dongle requests the system to retrieve the error log.

Corrective Action

(None).

Syslog Message

shm: Disk %s has returned %d warnings and the log will be saved.

Parameters

diskName (STRING): Name of the disk.
count (INT): Count of warnings received.

shm.reformat events

shm.reformat.diskError

Severity

ERROR

Description

This message occurs when the system tries to reformat a disk, but an error is returned.

Corrective Action

(None).

Syslog Message

shm: Unable to format disk %s as it is not supported.

Parameters

diskName (STRING): Name of the disk.

shm.reformat.partnerDisk

Severity

NOTICE

Description

This message occurs when the system detects a drive that started formatting during a sanitization, but did not finish.

Corrective Action

Reboot the partner node to clear the formatting condition. Rerun the original sanitize operation.

Syslog Message

shm: Disk %s on the partner has possibly not completed format. To reformat the disk, the partner must be rebooted.

Parameters

diskName (STRING): Name of the disk.

shm.reformat.startMsg

Severity

NOTICE

Description

This message occurs when the system has begun to reformat a disk that was not completed during sanitization.

Corrective Action

(None).

Syslog Message

shm: Disk %s is being reformatted due to an error during disk sanitize.

Parameters

diskName (STRING): Name of the disk.

shm.ssd events

shm.ssd.threshold.ioLatency

Severity

NOTICE

Description

This message occurs when ONTAP® detects that a solid-state drive (SSD) has an average block latency during a five-minute timeframe that is greater than expected. ONTAP will continue to monitor the SSD latency and might fail the SSD if it exceeds latency thresholds.

Corrective Action

(None).

Syslog Message

SSD %s has exceeded the expected block latency in the current timeframe with an average latency of %d us and an average utilization of %d percent. The next highest SSD latency: %d us. %s

Parameters

disk_name (STRING): Name of the disk.
latency_avg (INT): Average block latency in the current timeframe in microseconds (us).
util_avg (INT): Average drive utilization percent in the current timeframe.
next_hi_latency_avg (INT): Average block latency for the SSD with the next highest block latency in the current timeframe.
disk_information (STRING): Formatted information about the disk. This includes the disk's vendor, model, firmware revision, and serial number.

shm.threshold events

shm.threshold.agrsvIOCount

Deprecated

This event is removed as it is a test message not intended for customers.

Severity

NOTICE

Description

This message occurs when the system detects a disk that exceeds the threshold count of high aggressive IO latencies.

Corrective Action

(None).

Syslog Message

Disk %s has exceeded %d IOs which have latencies greater than the threshold.

Parameters

disk_name (STRING): Name of the disk.
agrsv_IO_count (INT): Count of aggressive timeout IOs.

shm.threshold.allMediaErrors

Severity

ERROR

Description

This message occurs when the system detect more than 25 medium and/or recovered errors in a 10-minute window.

Corrective Action

(None).

Syslog Message

shm: Disk %s has crossed the combination media error threshold in a 10 minute window.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.checksumErrors

Severity

ERROR

Description

This message occurs when a disk exceeds the threshold of checksum errors on the same block.

Corrective Action

(None).

Syslog Message

shm: Disk %s has exceeded the threshold for checksum errors on the same block; the system will fail the disk.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.consecutiveAborts

Severity

ERROR

Description

This message occurs when a disk exceeds the threshold of consecutive abort errors on one drive.

Corrective Action

(None).

Syslog Message

shm: Disk %s has exceeded the threshold of %d consecutive abort errors; the system will fail the disk if possible.

Parameters

diskName (STRING): Name of the disk.
count (INT): Count of errors.

shm.threshold.consecutiveTimeouts

Severity

ERROR

Description

This message occurs when a disk exceeds the threshold of consecutive timeouts on one drive.

Corrective Action

(None).

Syslog Message

shm: Disk %s has exceeded the threshold of %d consecutive timeouts; the system will fail the disk if possible.

Parameters

diskName (STRING): Name of the disk.
count (INT): Count of errors.

shm.threshold.disk.pcycle

Severity

ERROR

Description

This message occurs when a disk exceeds the threshold of power-cycle error recovery tries.

Corrective Action

(None).

Syslog Message

shm: Disk %s has exceeded the threshold for power-cycle error recovery events; the system will fail the disk if possible.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.disk.poh

Severity

NOTICE

Description

This message occurs when the storage system contains drives that exceed five years of cumulative power-on hours. This five-year period represents the expected reliable lifespan of the drive. The likelihood that a drive will fail increases significantly the longer the drive stays in use beyond its warranty period.

Corrective Action

For additional guidance, search for Support Bulletin SU464 on the NetApp Support Site.

There are "%d" drives that have exceeded five years of life. To view them, use the "storage disk show -power-on-hours >=43800 -fields power-on-hours" command.

Parameters

count (INT): Count of drives that have exceeded the five year threshold.

shm.threshold.highIOLatency

Severity

ERROR

Description

This message occurs when the system detects a disk that has an average IO latency during the current window that is significantly greater than all other drives of the same class.

Corrective Action

(None).

Syslog Message

Disk %s exceeds the average IO latency threshold and will be recommended for failure.

Parameters

disk_name (STRING): Name of the disk.

shm.threshold.lipStormReset

Severity

ERROR

Description

This message occurs when the system detects more than one instance of a disk resetting itself because of a large number of Loop Initialization Procedure requests (a LIP storm). The disk will be failed.

Corrective Action

Replace the disk.

Syslog Message

shm: The system has detected more than one LIP storm reset on disk %s.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.mediaErrorsLba

Severity

ERROR

Description

This message occurs when the system detects more than three media (recovered or medium) errors on the same block.

Corrective Action

(None).

Syslog Message

shm: Disk %s has had multiple media errors on sector %llu.

Parameters

diskName (STRING): Name of the disk.
block_num (LONGINT): Block number.

shm.threshold.mediaErrorsReassign

Severity

ERROR

Description

This message occurs when the system detects more than three medium and/or recovered errors in a 10-minute window on the same disk sector. The bad sector will be reassigned.

Corrective Action

(None).

Syslog Message

shm: Disk %s has had multiple media errors on the same sector in the last 10 minutes, and is reassigning the sector.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.mediumErrors

Severity

ERROR

Description

This message occurs when the system detects more than 25 medium errors in a 10-minute window.

Corrective Action

(None).

Syslog Message

shm: Disk %s has crossed the medium error threshold in a 10 minute window.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.mediumErrors7days

Severity

ERROR

Description

This message occurs when the system detects more than 100 medium errors in a seven-day window.

Corrective Action

(None).

Syslog Message

shm: Disk %s has crossed the medium error threshold in a seven-day window.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.ratedLife

Severity

NOTICE

Description

This message occurs when the rated life used by a solid state drive (SSD) exceeds 90%. When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

Corrective Action

The number of weeks of rated life remaining indicated for each SSD is an estimate based on past usage. If the SSD is expected to remain in service beyond the estimated remaining time, initiate planning for SSD replacement when the rated life reaches 100%. Use the "storage disk show -ssd-wear" command to monitor the current rated life used by your SSDs.

Syslog Message

shm: There are %d drives that have consumed at least 90 percent of their rated life: %s.

Parameters

count (INT): Count of drives that have exceeded the threshold.
disk_names (STRING): Name, percentage of rated life and estimated remaining time before reaching 100% rated life of each SSD that has exceeded the threshold.

shm.threshold.ratedLife2

Severity

ERROR

Description

This message occurs when the rated life used by a solid state drive (SSD) exceeds 95%. When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

Corrective Action

The number of weeks of rated life remaining indicated for each SSD is an estimate based on past usage. If the SSD is expected to remain in service beyond the estimated remaining time, initiate planning for SSD replacement when the rated life reaches 100%. Use the "storage disk show -ssd-wear" command to monitor the current rated life used by your SSDs.

Syslog Message

shm: There are %d drives that have consumed at least 95 percent of their rated life: %s.

Parameters

count (INT): Count of drives that have exceeded the threshold.
disk_names (STRING): Name, percentage of rated life and estimated remaining time before reaching 100% rated life of each SSD that has exceeded the threshold.

shm.threshold.ratedLifeMax

Severity

ALERT

Description

This message occurs when the rated life used value exceeds 100% on a solid state drive (SSD). When an SSD reaches 100% of rated life, it might not be able to retain data while powered off for long periods of time.

Corrective Action

Replace the SSDs that have reached the end of their rated life.

Syslog Message

shm: There are %d drives that have reached the end of their rated life: %s

Parameters

count (INT): Count of drives that have exceeded the threshold.
disk_names (STRING): Name and percentage of rated life of each SSD that has exceeded the threshold.

shm.threshold.recoveredErrors

Severity

ERROR

Description

This message occurs when the system detects more than 25 recovered errors in a 10-minute window.

Corrective Action

(None).

Syslog Message

shm: Disk %s has crossed the recovered error threshold in a 10 minute window.

Parameters

diskName (STRING): Name of the disk.

shm.threshold.sensekey

Severity

ERROR

Description

This message occurs when a disk exceeds the threshold of a particular sense key error.

Corrective Action

(None).

Syslog Message

shm: Disk %s has exceeded the threshold for sense key %d errors; the system will fail the disk if possible.

Parameters

diskName (STRING): Name of the disk.
senseKey (INT): Sense key value.

shm.threshold.spareBlocksConsumed

Severity

NOTICE

Description

This message occurs when the spare blocks consumed value exceeds the first threshold on an SSD drive.

Corrective Action

(None).

Syslog Message

shm: There are %d disks that have consumed at least 60 percent of their use-based internal spare capacity. The affected disks are: %s.

Parameters

count (INT): Count of disks which have exceeded the threshold.
disk_names (STRING): Names of the disk drives.

shm.threshold.spareBlocksConsumedMax

Severity

NOTICE

Description

This message occurs when the spare blocks consumed value exceeds the second threshold on an SSD drive.

Corrective Action

(None).

Syslog Message

shm: There are %d disks that have consumed at least 80 percent of their use-based internal spare capacity. The affected disks are: %s.

Parameters

count (INT): Count of disks which have exceeded the second threshold.
disk_names (STRING): Names of the disk drives.

showmount events

showmount.update events

showmount.update.failed

Severity

ERROR

Description

This message occurs when the showmount job fails to update the "exports.data" file. This file provides a list of exported volumes and qtrees on the NFS server to any clients running the "showmount -e" command.

Corrective Action

Verify that the root volume of the Vserver is online and not full. After the Vserver is online and space is available, run the following command: "export-policy cache flush -vserver <vserver-name> -cache showmount".

Syslog Message

Flushing to exports.data file failed on Vserver "%s".

Parameters

vserver (STRING): Name of the Vserver where the problem is occurring.

sis events

sis.aggr events

sis.aggr.cvs.undo.abort

Severity

NOTICE

Description

This message occurs when undo of cross volume savings on aggregate has to abort due to some error conditions.

Corrective Action

(None).

Syslog Message

Undo of cross volume savings on aggregate %s aborted. Volume %s encountered error: %s

Parameters

aggr_name (STRING): Aggregate name.
vvol_name (STRING): Flex volume name.
error (STRING): Error code for the abort.

sis.aggr.metadir.create.failed

Severity

ERROR

Description

This message occurs when the creation of SIS metafiles in the aggregate containing the SIS volume fails. Change logging will be turned off on the volume.

Corrective Action

Ensure that space is available in the aggregate containing the volume. Use the 'sis on' command to turn on change logging on the volume, which attempts to re-create SIS metafiles in the aggregate. If enough space is available, start wafliron on the aggregate containing the indicated flexible volume.

Syslog Message

Creation of aggregate metadir failed for SIS volume %s%s. Change logging will be turned off on the volume: %s.

Parameters

volname (STRING): SIS volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
reason (STRING): Reason for the failure.

sis.auto events

sis.auto.session.change

Severity

NOTICE

Description

This message occurs whenever the number of background deduplication sessions change on a node because of throttling based on system load for the volumes with efficiency policy type as auto.

Corrective Action

(None).

Syslog Message

ADS: Number of auto sessions changed from %d to %d

Parameters

old_sessions (INT): prev sessions count.
new_sessions (INT): new sessions count.

sis.autosched events

sis.autoSched.failed

Severity

ERROR

Description

This event is issued when a SIS volume operation could not be auto scheduled due to unexpected conditions.

Corrective Action

(None).

Syslog Message

SIS operation for %s%s could not be auto scheduled: %s

Parameters

vol (STRING): Path to a SIS volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Error message

sis.c2c events

sis.c2c.start.fail

Severity

ERROR

Description

This event is issued when dense scanner could not start on c2c restore volume during restore operation.

Corrective Action

Run "sis start" command to manually start the SIS scanner.

Syslog Message

SIS scanner on C2C restore volume %s%s could not be started: %s.

Parameters

vol (STRING): The name of the volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Error message

sis.cfg events

sis.cfg.deleted

Severity

ERROR

Description

This message occurs when the configuration file for a Single Instance Storage (SIS) volume is deleted. This leads to the loss of deduplication configuration for the volume and statistics of deduplication operations.

Corrective Action

Remount the volume, enable deduplication using the "sis on" command, configure the volume using the "sis config" command, and then run the "sis start -s -m" command to start building deduplication metadata.

Syslog Message

SIS configuration for volume %s%s was deleted: %s. Remount the volume, then enable SIS and reconfigure the volume to resume deduplication.

Parameters

path (STRING): Path to a SIS volume.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
reason (STRING): Reason for deletion.

sis.cfg.invalidEntry

Severity

ERROR

Description

This event is issued when a SIS volume operation found an invalid configuration for the volume.

Corrective Action

Automatically checks and creates default configuration after detection. Please use 'sis' command to change default settings.

Syslog Message

SIS volume configuration: found invalid SIS configuration file %s%s: %s

Parameters

path (STRING): Path to a SIS volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
reason (STRING): Reason why SIS operation considered it as wrong.

sis.cfg.setFailed

Severity

ERROR

Description

This message occurs when a Single Instance Storage (SIS) volume operation fails to write in the configuration file. This might lead to incorrect reporting of statistics. If the error occured during a Data ONTAP® version upgrade, it might also lead to the upgraded configuration not being loaded. The volume might not appear in the 'sis status' command output as a result. Also, the system might not allow changing the configuration for that volume.

Corrective Action

Ensure that space is available in the indicated volume. If this error occured during a Data ONTAP version upgrade and the volume does not appear in the 'sis status' command output, remount the volume after correcting the underlying condition. If enough space is available, start wafliron on the aggregate containing the indicated flexible volume.

Syslog Message

Saving SIS volume configuration for volume %s%s : %s

Parameters

path (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
reason (STRING): Reason for the failure.

sis.changelog events

sis.changelog.full

Severity

ERROR

Description

This message occurs when the Single Instance Storage (SIS) change logging metafile is full. Change logging is stopped. New writes to the volume will not be change logged until the next SIS operation.

Corrective Action

Issue the 'sis start' command on the volume to process existing changelogs. To process changelog files more frequently before they reach full, adjust the SIS operation schedule with the 'sis config -s' command. If there is significant loss of savings, then run the 'sis start -s' command, allowing it to run to completion.

Syslog Message

SIS change logging metafile for volume %s%s%s is full.

Parameters

host (STRING): Owning host of the volume.
vol (STRING): Name of the volume.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

sis.changelog.noinit

Severity

ERROR

Description

This event is issued when the change logging operation could not be initialized on a SIS volume.

Corrective Action

Run "sis on" command to reinitialzie the change logging operation.

Syslog Message

Change logging operation on volume %s%s could not be initialized: %s.

Parameters

vol (STRING): The name of the volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Error message

sis.changelog.noload

Severity

NOTICE

Description

This event is issued when prior change logging metafiles could not be reused during the initialization. New metafiles will be created for the operation.

Corrective Action

(None).

Syslog Message

Prior Change logging metafiles on volume %s%s could not be reused.

Parameters

vol (STRING): The name of the volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.changelog.truncate

Severity

NOTICE

Description

This message occurs when the Single Instance Storage (SIS) change logging metafile is truncated as part of ADS session.

Corrective Action

(None).

Syslog Message

Prior Change logging metafiles on volume %s%s are truncated.

Parameters

host (STRING): Owning host of the volume.
vol (STRING): Name of the volume.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

sis.chkpoint events

sis.chkpoint.delete

Severity

INFORMATIONAL

Description

This message occurs when a Single Instance Storage (SIS) checkpoint is deleted. The current SIS operation is restarted from the beginning.

Corrective Action

(None).

Syslog Message

SIS checkpoint on the volume '%s%s' is deleted. Starting current SIS operation from the beginning.

Parameters

volume (STRING): Volume path.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.chkpoint.restore.failed

Severity

ERROR

Description

This message occurs when a Single Instance Storage (SIS) operation fails to restore from a previous checkpoint. The SIS operation is restarted from the beginning.

Corrective Action

(None).

Syslog Message

SIS operation on the volume '%s%s' failed to restore from a previous checkpoint. Starting SIS operation from the beginning.

Parameters

> **volume** (STRING): Volume name.
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.clog events

sis.clog.disabled

Severity

> ERROR

Description

> This message occurs while mounting a volume, when an error with the SIS metafile operation results in the change logging function being disabled to avoid inconsistencies.

Corrective Action

> Reinitialize the change logging operation by using the 'sis on' command.

Syslog Message

> Change logging has been disabled for %s%s due to an error that occurred while mounting the volume during the SIS metafile operation: %s.

Parameters

> **path** (STRING): Path to the SIS volume.
> **volident** (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
> **reason** (STRING): Reason for the failure.

sis.compress events

sis.compress.skip

Severity

> INFORMATIONAL

Description

> This message occurs when postprocess compression is skipped during a deduplication operation, even though postprocess compression is enabled on the volume. Post process compression is not supported on a node configured with the All-Flash Optimized personality.

Corrective Action

> (None).

Syslog Message

> Skipped postprocess compression on volume %s%s because the node is All-Flash Optimized.

Parameters

> **path** (STRING): Path to the deduplicated volume.
> **volident** (STRING): Unique volume identifier.

sis.corrupt events

sis.corrupt.metafile.deleted

Severity

NOTICE

Description

This message occurs when a Single Instance Storage (SIS) metafile is deleted because there are Disk/Media errors affecting the file.

Corrective Action

The deleted metafile might be recovered automatically the next time you run the 'sis start' command. If you have not previously run the 'sis start' command on this volume, run the 'sis start -s' command to generate metafiles and obtain efficient deduplication. Contact NetApp technical support for guidance.

Syslog Message

SIS metafile on volume '%s%s' is deleted.

Parameters

volume (STRING): Volume path.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.default events

sis.default.auto.se.enable

Severity

NOTICE

Description

This message occurs whenever volume move is done from a non All Flash Optimized node to an All Flash Optimized node and we attempt to enable storage efficiency features and automatic offline volume efficiency.

Corrective Action

(None).

Syslog Message

Volume efficiency features will be enabled for volume %s on aggregate %s.

Parameters

vvol_name (STRING): Flex volume name.
aggr_name (STRING): Aggregate name.

sis.default.auto.se.enable.fail

Severity

NOTICE

Description

This message occurs whenever volume move is done from a non All Flash Optimized node to an All Flash Optimized node and the attempt to enable automatic offline volume efficiency failed.

Corrective Action

(None).

Syslog Message

Failed to enable automatic offline volume efficiency features for volume %s on aggregate %s.

Parameters

vvol_name (STRING): Flex volume name.
aggr_name (STRING): Aggregate name.
reason (STRING): Reason for the failure.

sis.enable events

sis.enable.post.sm.break

Severity

NOTICE

Description

This message occurs when the "storage efficiency" feature is enabled on a destination volume due to a broken SnapMirror® relationship on an All Flash Optimized system. When the relationship breaks, the DP volume is converted to RW, and all RW volumes have the "storage efficiency" feature enabled.

Corrective Action

(None).

Syslog Message

"Storage efficiency" feature has been enabled on the destination volume %s due to a SnapMirror break operation.

Parameters

volume (STRING): Destination FlexVol® volume name on which the "storage efficiency" feature is enabled.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.enable.post.ssm.init

Severity

NOTICE

Description

This message occurs when the "storage efficiency" feature is enabled on a destination volume with Synchronous SnapMirror® on an All Flash Optimized system.

Corrective Action

(None).

Syslog Message

"Storage efficiency" feature has been enabled on the destination volume %s after Asynchronous Snapmirror converted to Synchronous Snapmirror.

Parameters

volume (STRING): Destination FlexVol® volume name on which the "storage efficiency" feature is enabled.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.fingerprint events

sis.fingerprint.notify.lost

Severity

NOTICE

Description

This message occurs when a bad block is encountered while reading SIS metafiles. As a result, some of the fingerprint records used to identify blocks for use in deduplication might have been lost. The only impact from this is lower efficiency in deduplication.

Corrective Action

(None).

Syslog Message

Bad block found while reading SIS metafiles for volume %s%s. As a result some fingerprint data might have been lost and could result in lower space savings.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.idedup events

sis.idedup.disable

Severity

NOTICE

Description

This message occurs when inline deduplication is disabled if aggregate is not hybrid or not part of All-Flash Optimized node since inline deduplication is not supported on them.

Corrective Action

(None).

Syslog Message

Disabled inline deduplication on volume %s%s because the aggregate is not hybrid or not part of All-Flash Optimized node.

Parameters

path (STRING): Path to the deduplicated volume.
volident (STRING): Unique volume identifier.

sis.incorrect events

sis.incorrect.duration.notify

Severity

ERROR

Description

This message occurs when a Single Instance Storage (SIS) volume repeatedly can not finish SIS operation within user-given 'duration' settings.

Corrective Action

Change duration settings appropriately, based on SIS completion time history and total amount data that needs to be processed.

Syslog Message

SIS operation repeatedly can not finish within duration limits specified by user.

Parameters

volname (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.logical events

sis.logical.limit.near

Severity

NOTICE

Description

This message occurs when the deduplication engine's logical data limit is nearly reached on a volume. Logical data is the summation of used blocks, saved blocks, and compressed blocks in the volume.

Corrective Action

Move data to another volume or delete unwanted data from the volume.

Syslog Message

Deduplication engine's logical data limit is nearly reached on volume %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.logical.limit.reached

Severity

NOTICE

Description

This message occurs when the deduplication engine's logical data limit is reached on the volume. Deduplication operations might not run on the volume. Logical data is the summation of used blocks, saved blocks, and compressed blocks in the volume.

Corrective Action

Move data to another volume or delete unwanted data from the volume.

Syslog Message

Deduplication engine's logical data limit was reached on volume %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.max events

sis.max.saving.near

Severity

NOTICE

Description

This message occurs when Single Instance Storage (SIS) savings on the volume is nearing its maximum limit. No further savings can be realized on the volume after the limit is reached.

Corrective Action

(None).

Syslog Message

Maximum savings limit nearly reached on volume %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.max.saving.reached

Severity

NOTICE

Description

This message occurs when Single Instance Storage (SIS) savings on the volume reaches its maximum limit. No further savings can be realized on the volume.

Corrective Action

(None).

Syslog Message

Maximum savings limit reached on volume %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.metadata events

sis.metadata.inconsistent

Severity

ERROR

Description

This message occurs when inconsistencies are found in deduplication metadata. This might be due to a failed metadata upgrade. The impact will be very low deduplication savings.

Corrective Action

Run the 'sis start -s -m -vserver vserver_name -volume volume_name' command. This rebuilds the deduplication metadata. If the command fails or if subsequent deduplication runs do not provide adequate space savings, contact NetApp technical support.

Syslog Message

Deduplication metadata is inconsistent in volume: %s%s.

Parameters

volume (STRING): Volume name.
volident (STRING): Unique volume identifier for cases when the volume name alone is insufficient.

sis.op events

sis.op.aborted

Severity

ERROR

Description

This event is issued when a SIS volume operation is aborted due to unexpected conditions.

Corrective Action

(None).

Syslog Message

SIS operation for %s%s has aborted: %s

Parameters

path (STRING): Path to a SIS volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Error message

sis.op.idle

Severity

NOTICE

Description

This message occurs when deduplication is enabled on the volume and deduplication process has not been run for more than configured idle threshold time set(default 7 days).

Corrective Action

Run the "sis start" command.

Syslog Message

SIS operation is idle on volume "%s" since %d weeks %d days.

Parameters

volpath (STRING): Volume name.
last_dedup_time (INT): Last Successful Deduplication operation on volume in weeks.
last_dedup_time_days (INT): Last Successful Deduplication operation on volume in days.

sis.op.stopped

Severity

INFORMATIONAL

Description

This event is issued when a SIS volume operation is stopped by user.

Corrective Action

(None).

Syslog Message

SIS operation for %s%s has stopped

Parameters

path (STRING): Path to a SIS volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.policy events

sis.policy.predef.create.upgradeError

Severity

NOTICE

Description

This message occurs during system software upgrade to Data ONTAP® 8.1 or later, while creating predefined policies. There is a user policy with the same name as a predefined policy prior to upgrade, and it cannot be renamed.Therefore, the predefined policy cannot be created.

Corrective Action

Rename pre-existing user policy and run system software upgrade again.

Syslog Message

Policy upgrade failed because the user policy %s could not be renamed to %s.

Parameters

old_user_policy (STRING): Name of the preexisting user policy.
renamed_user_policy (STRING): New name for the preexisting user policy.

sis.policy.rename.upgrade

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 8.1 or later, while creating predefined efficiency policies. The user policy was renamed because of the creation of predefined policies.

Corrective Action

(None).

Syslog Message

During upgrade, user policy name %s is changed to %s.

Parameters

old_user_policy (STRING): Name of the preexisting user policy.
renamed_user_policy (STRING): New name for the preexisting user policy.

sis.reg events

sis.reg.invalidEntry

Severity

ERROR

Description

This event is issued when a SIS volume operation found an invalid registry entry.

Corrective Action

(None).

Syslog Message

SIS volume registry: found invalid SIS registry entry for %s%s: %s

Parameters

> **path** (STRING): Path to a SIS volume
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
> **regval** (STRING): Registry value

sis.revert events

sis.revert.to.has.Aborted

Severity

> NOTICE

Description

> This message occurs when the Single Instance Storage (SIS) volume command 'sis revert_to' has failed.
> This might prevent running generic Data ONTAP® 'revert_to' command successfully

Corrective Action

> (None).

Syslog Message

> sis 'revert_to' command has failed on volume %s%s :%s

Parameters

> **path** (STRING): Path to the SIS volume
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
> **reason** (STRING): Reason for the failure.

sis.revert.to.has.Succeeded

Severity

> NOTICE

Description

> This message occurs when the Single Instance Storage (SIS) volume command 'sis revert_to' has
> succeeded.

Corrective Action

> (None).

Syslog Message

> 'sis revert_to' command has succeeded on volume %s%s

Parameters

> **path** (STRING): Path to the SIS volume
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.revert.to.large.vol

Severity

> ERROR

Description

This message occurs when the Single Instance Storage (SIS) volume command 'sis revert_to' fails because the logical data exceeded the maximum allowed for SIS in the target release. This is to prevent growing deduplication metadata beyond the size that is supported in the target release. Logical data is the summation of used blocks, saved blocks, and compressed blocks in the volume. This might prevent running the generic Data ONTAP® 'revert_to' command successfully.

Corrective Action

Shrink the volume or run 'sis revert_to -delete vol_path' to delete deduplication metadata from this volume.

Syslog Message

'sis revert_to' command has failed on volume %s%s. Volume exceeded the maximum allowed logical data limit of %d TB for SIS in the target release.

Parameters

path (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
maxVolSize (INT): Maximum size of the SIS volume in the target release.

sis.revert.to.space.warning

Severity

INFORMATIONAL

Description

This message occurs when a Single Instance Storage (SIS) volume command 'sis revert_to' is run. This message indicates that adding more data during this command execution might abort that operation due to insufficient space.

Corrective Action

(None).

Syslog Message

Adding data to volume %s%s while the 'sis revert_to' command is running might lead to insufficient free space and failure of that operation.

Parameters

path (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

sis.revert.to.write.Failed

Severity

ERROR

Description

This message occurs when the Single Instance Storage (SIS) volume command 'sis revert_to' fails to write to a file or create a file related to a revert_to operation. This might prevent running generic Data ONTAP® 'revert_to' command successfully

Corrective Action

Ensure that space is available in the indicated volume or in the aggregate it belongs to. After space is is available, rerun the 'sis revert_to' command.

Syslog Message

'sis revert_to' command failed on volume %s%s :%s.

Parameters

path (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
reason (STRING): Reason for the failure.

sis.revertmetacreate events

sis.revertmetacreate.failed

Severity

ERROR

Description

This message occurs when Single Instance Storage (SIS) metafiles cannot be created in the flexible volume metadir during a reversion to an earlier version of Data ONTAP®.

Corrective Action

Following this error, SIS is disabled for the volume. After correcting the underlying issue indicated by the error message, enable SIS again using the 'sis on' command. SIS then resumes normally.

Syslog Message

Could not create the metafiles for the volume %s%s in the volume metadir: %s SIS is turned off for this volume.

Parameters

vol (STRING): Path to the volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Reason for the failure.

sis.schedule events

sis.schedule.notify.change

Severity

NOTICE

Description

This message occurs when the Single Instance Storage (SIS) schedule of a volume is changed to the default schedule (sun-san@0) because the node's clusterid does not match with the SIS config clusterid. This can happen when a volume is replicated to a node belonging to another cluster.

Corrective Action

Use the sis config command to set a SIS policy on the volume.

Syslog Message

SIS policy for volume %s%s is no longer valid because of the clusterid mismatch. SIS schedule is set to the default schedule sun-sat@0.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.schedule.notify.change.compression

Severity

NOTICE

Description

This message occurs when a volume with background compression has an auto type policy. The policy is replaced with a default schedule (sun-sat@0). This can happen when a volume is being re-mounted during which efficiency policy type is changed to auto.

Corrective Action

Use the volume efficiency modify command to set a efficiency policy on the volume. For example: volume efficiency modify -volume volume-name -policy policy-name

Syslog Message

Efficiency policy for volume %s%s is auto type and is not supported with background compression. The schedule is set to the default schedule sun-sat@0.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.schedule.notify.change.snapmirror

Severity

NOTICE

Description

This message occurs when a SnapMirror® relationship spanning across Vservers breaks. In such cases, the efficiency policy on the destination is no longer valid; it is replaced with the default schedule (sun-sat@0).

Corrective Action

Use the 'volume efficiency modify' command to set a efficiency policy on the volume. For example: volume efficiency modify -volume volume-name -policy policy-name

Syslog Message

Efficiency policy for volume %s%s is not valid and has been replaced with default schedule (sun-sat@0).

Parameters

    volume (STRING): Volume name.
    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.undo events

sis.undo.aborted

Severity

    ERROR

Description

    This messages occurs when a SIS volume 'undo' operation is aborted due to unexpected conditions.

Corrective Action

    (None).

Syslog Message

    SIS undo operation for '%s%s' has aborted: '%s'.

Parameters

    path (STRING): Path to a SIS volume.
    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
    err (STRING): Error message.

sis.undo.aborted.inconsistent

Severity

    ALERT

Description

    This message occurs when a SIS volume 'undo' operation is aborted due to volume inconsistency.

Corrective Action

    Run wafliron to remove inconsistencies in the volume, then retry the operation.

Syslog Message

    SIS 'undo' operation for '%s%s' has aborted due to volume inconsistencies.

Parameters

    path (STRING): Path to a SIS volume.
    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.undo.done

Severity

    NOTICE

Description

This message occurs when 'sis undo -t wrong' command removes the sharing on improperly shared inodes.

Corrective Action

(None).

Syslog Message

The 'sis undo -t wrong' command removed sharings on improperly shared inodes in the volume '%s%s'. Details about cleaned inodes are available at '%s'.

Parameters

volume (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
log_location (STRING): SIS undo log location.

sis.undo.nospace

Severity

ERROR

Description

This event is issued to indicate that there is not enough free space to undo the shared blocks on a SIS volume. The undo operation will be aborted. Data blocks that were still shared at the time the undo operation stopped will remain shared. Blocks already processed by the undo operation are no longer shared.

Corrective Action

Free disk space in the volume, or increase the size of the volume, then retry the operation.

Syslog Message

Undoing shared blocks on volume %s%s has aborted because there is insufficient free space. Data blocks that were still shared at the time the undo operation stopped will remain shared. Blocks already processed by the undo operation are no longer shared.

Parameters

vol (STRING): Path to a SIS volume
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.undo.required

Severity

NOTICE

Description

This message occurs when 'sis undo -t wrong -d' command finds improperly shared inodes.

Corrective Action

Run the 'sis undo -t wrong' or 'sis undo -i' command to remove improperly shared inodes.

Syslog Message

The 'sis undo -t wrong -d' command detected improperly shared inodes in the volume '%s%s'. Run the 'sis

undo -t wrong' or 'sis undo -i' command to remove improperly shared inodes. Details about improperly shared inodes are available at '%s'.

Parameters

> **volume** (STRING): Volume name.
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
> **log_location** (STRING): SIS undo log location.

sis.undo.started

Severity

> INFORMATIONAL

Description

> This message occurs when a SIS undo operation is started.

Corrective Action

> (None).

Syslog Message

> SIS undo operation for %s%s has started.

Parameters

> **path** (STRING): Path to a SIS volume.
> **volident** (STRING): Uniquely identifies the volume when the volume name alone is insufficient.

sis.undo.stopped

Severity

> ERROR

Description

> This event is issued when a SIS volume undo operation is stopped by user.

Corrective Action

> (None).

Syslog Message

> SIS undo operation for %s%s has stopped.

Parameters

> **path** (STRING): Path to a SIS volume
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.upgrade events

sis.upgrade.aggr.metafile.failed

Severity

> ERROR

Description

This message occurs when Single Instance Storage (SIS) metafiles cannot be created in the aggregate containing the volume, during a Data ONTAP® upgrade. The aggregate might be full. The 'sis status' command will not display this volume. SIS operations cannot be triggered manually or according to a schedule for the volume.

Corrective Action

Ensure that space is available in the aggregate containing the volume. After correcting the underlying issue indicated by the error message, remount the volume for the SIS upgrade to be triggered again. If the upgrade succeeds, SIS then resumes normally.

Syslog Message

Could not create the metafiles for the volume %s%s : %s.

Parameters

volname (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Reason for the failure.

sis.upgrade.feature.enable

Severity

NOTICE

Description

This message occurs during upgrade to Data ONTAP® 9.2 or later, when we start enabling Volume Efficiency features on the existing compatible volumes on All-Flash Optimized nodes in the background.

Corrective Action

(None).

Syslog Message

Volume efficiency features will be enabled on Volumes of All-Flash Optimized nodes in the Cluster.

Parameters

(None).

sis.upgrade.feature.enable.done

Severity

NOTICE

Description

This message occurs during upgrade to Data ONTAP® 9.2 or later, when we have completed enabling the Volume Efficiency features on the existing compatible volumes.

Corrective Action

(None).

Syslog Message

Volume efficiency features were enabled on Volumes of All-Flash Optimized nodes in the Cluster.

Parameters

(None).

sis.upgrade.feature.enable.fail

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.2 or later, when we fail to enable Volume Efficiency features on the existing compatible volume on All-Flash Optimized nodes.

Corrective Action

Manually try enabling the Volume Efficiency features on the volume using the "volume efficiency modify" command.

Syslog Message

Could not enable Volume Efficiency features for Volume %s of vserver %s.%s

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.
reason (STRING): Reason for failure.

sis.upgrade.feature.enabled

Severity

INFORMATIONAL

Description

This message occurs during upgrade to Data ONTAP® 9.2 or later, when we enable Volume Efficiency features on the existing compatible volume on All-Flash Optimized nodes.

Corrective Action

(None).

Syslog Message

Volume Efficiency features enabled on Volume %s of Vserver %s.

Parameters

volume (STRING): Volume name.
vserver (STRING): Vserver name.

sis.upgrademetafile events

sis.upgrademetafile.failed

Severity

ERROR

Description

This message occurs when Single Instance Storage (SIS) metafiles cannot be created during a Data ONTAP® upgrade. The 'sis status' command will not display this volume. SIS operations cannot be triggered manually or according to a schedule for the volume.

Corrective Action

Correct the underlying issue indicated by the error message, and then run 'sis on' command to trigger the SIS upgrade again. If the upgrade succeeds, SIS then resumes normally.

Syslog Message

Could not create the metafiles for the volume %s%s: %s.

Parameters

vol (STRING): Path to the volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
err (STRING): Reason for the failure.

sis.verify events

sis.verify.suspended

Severity

NOTICE

Description

This message occurs when the system suspends a Single Instance Storage (SIS) volume checking operation to to run a queued SIS operation.

Corrective Action

(None).

Syslog Message

(None).

Parameters

path (STRING): Path to the SIS volume.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

sis.vol events

sis.vol.auto.promote

Severity

NOTICE

Description

This message occurs when deprioritized volume gets auto promoted.

Corrective Action

(None).

Syslog Message

Volume "%s" is auto promoted: Percentage of writes happened in this window (%d%%) and percentage of dedupe savings (%d%%).

Parameters

vvol_name (STRING): Volume name.
inline_process_pct (INT): Percentage of writes happened after one window.
inline_saving_pct (INT): Percentage of inline dedupe savings in each window.

sis.vol.overwrite.depri

Severity

NOTICE

Description

This message occurs when automatic deduplication deprioritizes a volume due to a large number of overwrites in the block fingerprint log file.

Corrective Action

(None).

Syslog Message

Automatic deduplication on volume "%s" is deprioritized: percentage of overwrites in the fingerprint log file is %d%%.

Parameters

vvol_name (STRING): Volume name.
stale_pct (INT): Percentage of cumulative stale fingerprints after the fifth iteration of automatic deduplication runs.

sis.vol.savings.depri

Severity

NOTICE

Description

This message occurs when automatic deduplication deprioritizes a volume due to potentially low storage efficiency savings.

Corrective Action

(None).

Syslog Message

Automatic deduplication on volume "%s" is deprioritized: low background savings (%d%%), low cross volume deduplication savings (%d%%) and low inline savings (%d%%) when compared total with minimum required (%d%%) .

Parameters

vvol_name (STRING): Volume name.
bkg_savings (INT): Background deduplication savings realized after the fifth iteration of automatic deduplication runs.
cvbd_savings (INT): Cross Volume deduplication savings realized on the volume.
inline_savings (INT): Inline deduplication savings realized on the volume.
min_savings_req (INT): Min Savings required

sis.vol.verify.depri

Severity

NOTICE

Description

This message occurs when automatic deduplication deprioritizes a volume due to a large number of stale fingerprint removal operations on the volume.

Corrective Action

(None).

Syslog Message

Automatic deduplication on volume "%s" is deprioritized: significant percentage of stale fingerprint removal operations (%d%%).

Parameters

vvol_name (STRING): Volume name.
high_verify_pct (INT): Percentage of cumulative stale fingerprint removal operations after the fifth iteration of automatic deduplication runs.

sis.wafliron events

sis.wafliron.required

Severity

ALERT

Description

This message occurs when a requested SIS volume 'undo' operation fails to correct on-disk corruption and requires wafliron to be run.

Corrective Action

Start wafliron (Command Line: 'aggr wafliron start'. See 'aggr help wafliron' for help) to correct on-disk corruptions after completion of current 'sis undo' operation on the volume.

Syslog Message

SIS 'undo' command detected on-disk corruption while working on unshare request. Run wafliron for volume '%s%s' of aggregate '%s' after completion of current 'sis undo' operation on the volume. See 'aggr help wafliron' for options on running wafliron.

Parameters

    volume (STRING): Name of the affected volume.

    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

    aggregate (STRING): Aggregate name containing the affected volume.

siw events

siw.cpubindingfailed events

siw.cpuBindingFailed

Severity

ERROR

Description

This message occurs when the system fails to bind a SW-iWARP thread to a CPU during the boot-up. If this happens, SW-iWARP cannot support polling and will be running in a degraded state.

Corrective Action

Try a takeover and giveback of both of the nodes. If it still fails, contact NetApp technical support.

Syslog Message

SW-iWARP thread could not be bound to a CPU because: "%s".

Parameters

reason (STRING): Reason for the CPU binding failure

siw.mpaverrelaxed events

siw.mpaVerRelaxed

Severity

ERROR

Description

This message occurs when there is a mismatch in SW-iWARP versions, but due to negotiation or enhanced connect being enabled. The SW-iWARP booted up with reduced functionality and performance capabilities.

Corrective Action

Upgrade the ONTAP® release on the local node and the partner node to the same version of SW-iWARP to run with full functionality and performance capabilities.

Syslog Message

SIW Version mismatch between the local node and partner node. Local IRD: %d ORD: %d Partner IRD: %d ORD: %d

Parameters

localIRD (INT): Local IRD value.
localORD (INT): Local ORD value.
partnerIRD (INT): Partner IRD value.
partnerORD (INT): Partner ORD value.

siw.mpaversionmismatch events

siw.mpaVersionMismatch

Severity

ALERT

Description

This message occurs when there is SW-iWARP Version mismatch between the HA nodes. SW-iWARP cannot start up and nodes are not connected.

Corrective Action

Upgrade the ONTAP® release on the nodes to the same version of SW-iWARP to bring up the SW-iWARP and connect the nodes.

Syslog Message

SW-iWARP version mismatch between the local node and the partner node.

Parameters

(None).

siw.pollingenablefailed events

siw.pollingEnableFailed

Severity

ERROR

Description

This message occurs when SW-iWARP device polling cannot be enabled during the boot-up and SW-iWARP will be running in a degraded state.

Corrective Action

Try a takeover and giveback of the local node. If it still fails, contact NetApp technical support.

Syslog Message

SW-iWARP polling could not be enabled because the polling device was not ready.

Parameters

(None).

sk events

sk.hog events

sk.hog.runtime

Severity
NOTICE

Description
This event is issued when a process runs too long.

Corrective Action
(None).

Syslog Message
Process %s ran for %d milliseconds

Parameters
procname (STRING): The name of the process which ran too long
runtime (INT): Number of milliseconds process ran

sk.kt events

sk.kt.rtc

Severity
INFORMATIONAL

Description
This is the output of debugging command that prints the time of day held in the real-time clock chip.

Corrective Action
(None).

Syslog Message
RTC time: %s

Parameters
rtc_time (STRING): The time held in the real-time clock chip.

sk.panic events

sk.panic

Severity
ALERT

Description

This event is issued when a panic occurs.

Corrective Action

(None).

Syslog Message

Panic String: %s

Parameters

reason (STRING): (None).

sk.ring events

sk.ring.buffer.saved

Severity

INFORMATIONAL

Description

This message indicates that a module detected a condition that warranted dumping the internal tracing buffer to a file.

Corrective Action

(None).

Syslog Message

(None).

Parameters

module (STRING): Module requesting the dump.
filename (STRING): Filename-extension of the dump file created. The filename-base is accessible by running the 'sysctl ntap.sktrace.filename' command at a shell prompt.
description (STRING): Description of the state that caused the dump and when the dumped file should be examined. For example, if the buffers are dumped during replication and the system is experiencing replication errors, then the dumped file might hold information important for debugging.

sla events

sla.shelf events

sla.shelf.mod.reboot

Severity

NOTICE

Description

This message occurs when a shelf firmware module is rebooted administratively, or when a reboot occurs normally when the system powers up, the firmware is updated, or the alternate control path (ACP) is reset.

Corrective Action

(None).

Syslog Message

Reboot event reported by module %s in shelf: %s, log: %s

Parameters

module (STRING): Module designator (A or B).
shelf (STRING): Shelf identifier.
log (STRING): Reboot event log from the shelf module.

sla.shelf.mod.reboot.unexp

Severity

ERROR

Description

This message occurs when a shelf firmware module reboots unexpectedly (not due to powering up, a firmware update, an alternate control path (ACP) reset, nor an administrative reboot).

Corrective Action

Check the cabling to the shelf. Check the status LED on the shelf, making sure that the fault LEDs are not on. Clear any fault condition, if possible.

Syslog Message

Unexpected reboot event reported by module %s in shelf: %s, log: %s

Parameters

module (STRING): Module designator (A or B).
shelf (STRING): Shelf identifier.
log (STRING): Reboot event log from the shelf module.

sm events

sm.break events

sm.break.enable.se

Deprecated

Deprecated as of version 9.14.1.

Severity

NOTICE

Description

This message occurs when the "storage efficiency" feature is enabled on a destination volume due to a broken SnapMirror® relationship on an All Flash Optimized system. When the relationship breaks, the DP volume is converted to RW, and all RW volumes have the "storage efficiency" feature enabled.

Corrective Action

(None).

Syslog Message

"Storage efficiency" feature has been enabled on the destination volume %s due to a SnapMirror break operation.

Parameters

dst_path (STRING): Destination FlexVol® volume name on which the "storage efficiency" feature is enabled.

sm.c2c events

sm.c2c.rebaseline.xfer

Severity

INFORMATIONAL

Description

This message occurs when SnapMirror® performs a SnapMirror Cloud rebaseline transfer because certain conditions for an incremental transfer haven't been met between the source volume and the object-store destination endpoint of the transfer.

Corrective Action

(None).

Syslog Message

This will be a rebaseline transfer because certain conditions for an incremental transfer haven't been met between the source volume '%s' and the destination object-store endpoint '%s', with endpoint uuid '%s', and relationship uuid '%s'. Refer to the sktrace logs for additional details on which conditions haven't been met.

Parameters

src_path (STRING): Path name of the source volume of the SnapMirror relationship.
dst_ep_path (STRING): Path name of the destination object-store endpoint of the SnapMirror relationship.
dst_ep_uuid (STRING): UUID of the destination object-store endpoint of the SnapMirror relationship.
rel_uuid (STRING): UUID of the SnapMirror relationship.

sm.c2c.xfer.fail.no.com.snap

Severity

ERROR

Description

This message occurs when a SnapMirror® Cloud transfer fails because there is no common snapshot between the source volume and the object-store destination endpoint of the transfer.

Corrective Action

Retry the transfer by passing a specific snapshot name using the "-s" option. Note that once you choose to go ahead with that option, you will not be able to transfer snapshots older than the specified snapshot. So it is suggested to select a snapshot that is older than the snapshots that you would like to be backed up per schedule.

Syslog Message

There is no common snapshot between the source volume '%s' and the destination object-store endpoint '%s', with endpoint uuid '%s', and relationship uuid '%s'.

Parameters

src_path (STRING): Path name of the source volume of the SnapMirror relationship.
dst_ep_path (STRING): Path name of the destination object-store endpoint of the SnapMirror relationship.
dst_ep_uuid (STRING): UUID of the destination object-store endpoint of the SnapMirror relationship.
rel_uuid (STRING): UUID of the SnapMirror relationship.

sm.cascade events

SM.cascade.concurrency.unsupported

Severity

NOTICE

Description

This message occurs when concurrent SnapMirror® transfers are attempted while in a cascaded scenario, which is not supported. For example, in a relationship A→B→C, when an A→B SnapMirror update is occurring, a B→C SnapMirror update/initialize or a B→C SMTape backup cannot happen at the same time..

Corrective Action

(None).

Syslog Message

%s cascade concurrency is not supported for volume %s until the current transfer has ended.

Parameters

product (STRING): Either VSM-SMTape cascade or VSM-VSM/SMTape cascade
dstpath (STRING): Replication destination system.

sm.disable events

sm.disable.se

Severity

NOTICE

Description

This message occurs when the "storage efficiency" feature on a destination volume is automatically disabled successfully by the SnapMirror® resync or update operation.

Corrective Action

(None).

Syslog Message

Disabled the "storage efficiency" feature for volume %s during a %s.

Parameters

dst_path (STRING): Destination FlexVol® volume path on which the "storage efficiency" feature is disabled.
workflow_type (STRING): Workflow that disabled the "storage efficiency feature".

sm.disable.se.fail

Severity

ERROR

Description

This message occurs when the "storage efficiency" feature fails to disable on a destination volume during a SnapMirror® resync or update operation.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Disable storage efficiency manually by using the "volume efficiency off "volume_name" " command. If the failure persists, contact NetApp technical support.

Syslog Message

Failed to disable the "storage efficiency" feature for volume %s during a %s. Reason: %s.

Parameters

dst_path (STRING): Destination FlexVol® volume path on which the "storage efficiency" feature fails to disable.
workflow_type (STRING): Workflow that fails to disable the "storage efficiency" feature.
reason (STRING): Reason for the failure.

sm.dst events

sm.dst.vol.no.tag.metadata

Severity

ALERT

Description

This message occurs when the SnapMirror® labels are lost for all Snapshot copies on the vault destination. This happens when the snapshot tag's metafile of a volume has an inconsistent header. As a result, SnapMirror cannot automatically delete existing snapshots from the SnapVault® destination and can reach the maximum supported snapshot limit. New snapshots are not affected.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Delete the snapshots that are missing the SnapMirror label. Use "volume snapshot show -snapmirror-label -" command to list snapshots then delete the snapshots that are missing the SnapMirror label.

Syslog Message

The volume '%s' has lost SnapMirror label for all snapshots. SnapMirror will use the snapshot's name prefix to automatically delete snapshots based on SnapMirror policy "%s".

Parameters

dst_path (STRING): Destination volume of the SnapVault relationship.
policy_name (STRING): SnapMirror policy name.

sm.fgmirror events

sm.fgmirror.stale.grp.wkflw

Severity

ERROR

Description

This message occurs when improper group workflow cleanup caused the subsequent SnapMirror® operation to fail.

Corrective Action

Run the "snapmirror abort -h {-relationship-id <relationshipID>}" command, and then retry the SnapMirror operation.

Syslog Message

SnapMirror operation on relationship with relationshipID %s failed because of an existing stale group workflow.

Parameters

relationshipID (STRING): UUID of the SnapMirror relationship.

sm.keepcnt events

sm.keepcnt.reached

Severity

NOTICE

Description

This message occurs when new snapshots on the source volume cannot be transferred because the snapshot retention count (keep count) for snapshots with a given snapmirror-label has been reached on the destination volume and the 'preserve' flag is set to 'true'.

Corrective Action

See "Working with FlexVol volume SnapVault backups" in the Clustered Data ONTAP Data Protection Guide for details about managing SnapVault relationships.

Syslog Message

No new snapshots with snapmirror-label(s) %s can be transferred to destination volume %s because the keep count has been reached and the preserve value is set to 'true'.

Parameters

snap_label (STRING): Comma-separated list of snapmirror-labels for the snapshots that cannot be transferred.
dst_path (STRING): Destination volume of the SnapMirror® relationship.

sm.log events

sm.log.write.fail

Severity

ERROR

Description

This message occurs when writing SnapMirror® data to a log file fails. The most likely cause is insufficient space on the root volume.

Corrective Action

If the failure is due to lack of space, increase the root volume size or identify any SnapMirror logs that might not be needed, verify that backups exist for them, and then remove them. To check for available space across the cluster, use the 'df' command. If the condition persists, contact NetApp technical support.

Syslog Message

Writing log data of size %d bytes to SnapMirror log file '%s' failed with error '%s'.

Parameters

size (INT): Data size in bytes.
filepath (STRING): Log file path.
error (STRING): Error string.

sm.mediator events

sm.mediator.added

Severity

NOTICE

Description

This message occurs when ONTAP® Mediator is added successfully on a cluster.

Corrective Action

(None).

Syslog Message

ONTAP Mediator (version %s) is added on cluster '%s' having peer cluster '%s' and mediator IP address '%s'.

Parameters

version (STRING): ONTAP Mediator version.
cluster (STRING): Cluster name on which ONTAP Mediator was added.
peerCluster (STRING): Peer cluster name.
ipAddress (STRING): ONTAP Mediator IP address.

sm.mediator.cacert.expired

Severity

EMERGENCY

Description

This message occurs when the ONTAP® Mediator certificate authority (CA) certificate has expired. As a result, all further communication to the ONTAP Mediator will not be possible.

Corrective Action

Remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Update a new CA certificate on the ONTAP Mediator server. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

CA certificate of the ONTAP Mediator (IP: %s) expired on %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
expiryDate (STRING): Expiry date of the ONTAP Mediator CA certificate.

sm.mediator.cacert.expiring

Severity

ALERT

Description

This message occurs when the ONTAP® Mediator certificate authority (CA) certificate is due to expire within the next 30 days.

Corrective Action

Before this certificate expires, remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Update a new CA certificate on the ONTAP Mediator server. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

CA certificate for the ONTAP Mediator (IP: %s) will expire in %d days. Expiry: %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
daysToExpire (INT): Number of days remaining until the certificate expires.
expiryDate (STRING): Expiry date of the ONTAP Mediator CA certificate.

sm.mediator.clientc.expired

Severity

EMERGENCY

Description

This message occurs when the ONTAP® Mediator client certificate has expired. As a result, all further communication to the ONTAP Mediator will not be possible.

Corrective Action

Remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

Client certificate of the ONTAP Mediator (IP: %s) expired on %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
expiryDate (STRING): Expiry date of the ONTAP Mediator client certificate.

sm.mediator.clientc.expiring

Severity

ALERT

Description

This message occurs when the ONTAP® Mediator client certificate is due to expire within the next 30 days.

Corrective Action

Before this certificate expires, remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

Client certificate for the ONTAP Mediator (IP: %s) will expire in %d days. Expiry: %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
daysToExpire (INT): Number of days remaining until the certificate expires.
expiryDate (STRING): Expiry date of the ONTAP Mediator client certificate.

sm.mediator.in.quorum

Severity

NOTICE

Description

This message occurs when the ONTAP® Mediator connectivity is reestablished, its records are resynchronized and it is ready to participate in SnapMirror® active sync quorum activities.

Corrective Action

(None).

Syslog Message

The ONTAP Mediator (IP: %s) connectivity is reestablished, its records are resynchronized and it is ready to participate in SnapMirror® active sync quorum activities. Peer cluster: %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
peerCluster (STRING): Peer cluster name.

sm.mediator.misconfigured

Severity

ALERT

Description

This message occurs when either the ONTAP® Mediator is repurposed or the Mediator package is no longer installed on the Mediator server. As a result, SnapMirror® failover is not possible.

Corrective Action

Remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

ONTAP Mediator is not accessible on cluster "%s" with Mediator IP address "%s".

Parameters

cluster (STRING): Name of the cluster that is attempting to access the ONTAP Mediator.
ipAddress (STRING): IP address of the ONTAP Mediator.

sm.mediator.removed

Severity

NOTICE

Description

This message occurs when ONTAP® Mediator is removed successfully from a cluster.

Corrective Action

(None).

Syslog Message

ONTAP Mediator (version %s) was removed on cluster '%s' having peer cluster '%s' and mediator IP address '%s'.

Parameters

version (STRING): ONTAP Mediator version.
cluster (STRING): Cluster name on which ONTAP Mediator was removed.
peerCluster (STRING): Peer cluster name.
ipAddress (STRING): ONTAP Mediator IP address.

sm.mediator.removed.force

Severity

ERROR

Description

This message occurs when ONTAP® Mediator is removed from a cluster using the "force" option. As a result, the ONTAP Mediator configuration might still be present on the peer cluster. This results in a partial configuration that could lead to the failure of a SnapMirror® failover operation.

Corrective Action

Check whether the current ONTAP Mediator is configured on the peer cluster. If so, remove the ONTAP Mediator by using the (diagnostic privilege) "snapmirror mediator remove -force true" command. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

ONTAP Mediator (IP: %s, version: %s) was removed using the "force" option on cluster %s. Peer cluster %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
version (STRING): ONTAP Mediator version.
cluster (STRING): Cluster name on which ONTAP Mediator was removed.
peerCluster (STRING): Peer cluster name.

sm.mediator.resumed

Severity

NOTICE

Description

This message occurs when ONTAP® Mediator is resumed successfully on a cluster.

Corrective Action

(None).

Syslog Message

ONTAP Mediator was resumed on cluster '%s' having mediator IP address '%s'.

Parameters

cluster (STRING): Cluster name on which ONTAP Mediator was resumed.
ipAddress (STRING): ONTAP Mediator IP address.

sm.mediator.serverc.expired

Severity

EMERGENCY

Description

This message occurs when the ONTAP® Mediator server certificate has expired. As a result, all further communication to the ONTAP Mediator will not be possible.

Corrective Action

Remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Update a new server certificate on the ONTAP Mediator server. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

Server certificate of the ONTAP Mediator (IP: %s) expired on %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
expiryDate (STRING): Expiry date of the ONTAP Mediator server certificate.

sm.mediator.serverc.expiring

Severity

ALERT

Description

This message occurs when the ONTAP® Mediator server certificate is due to expire within the next 30 days.

Corrective Action

Before this certificate expires, remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Update a new server certificate on the ONTAP Mediator server. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message

Server certificate for the ONTAP Mediator (IP: %s) will expire in %d days. Expiry: %s.

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
daysToExpire (INT): Number of days remaining until the certificate expires.

expiryDate (STRING): Expiry date of the ONTAP Mediator server certificate.

sm.mediator.suspended

Severity
NOTICE

Description
This message occurs when ONTAP® Mediator is suspended successfully on a cluster.

Corrective Action
(None).

Syslog Message
ONTAP Mediator was suspended on cluster '%s' having mediator IP address '%s'.

Parameters
cluster (STRING): Cluster name on which ONTAP Mediator was suspended.
ipAddress (STRING): ONTAP Mediator IP address.

sm.mediator.unreachable

Severity
ALERT

Description
This message occurs when the ONTAP® Mediator is unreachable on a cluster. As a result, SnapMirror® failover is not possible.

Corrective Action
Check the network connectivity to the ONTAP Mediator by using the "network ping" and "network traceroute" commands. If the issue persists, remove the configuration of the current ONTAP Mediator by using the "snapmirror mediator remove" command. Reconfigure access to the ONTAP Mediator by using the "snapmirror mediator add" command.

Syslog Message
ONTAP Mediator (IP: %s) is unreachable from cluster %s.

Parameters
ipAddress (STRING): IP address of the ONTAP Mediator.
cluster (STRING): Name of the cluster that is attempting to access the ONTAP Mediator.

sm.mediator.unusable

Severity
ERROR

Description
This message occurs when ONTAP® Mediator is unusable due to a corrupted mediator server database. If ONTAP Mediator is in this state, SnapMirror® failover will not be possible.

Corrective Action

Remove ONTAP Mediator by using the "snapmirror mediator remove" command, and then add it again by using the "snapmirror mediator add" command.

Syslog Message

ONTAP Mediator is unusable on cluster '%s' having mediator IP address '%s'.

Parameters

cluster (STRING): Cluster name on which ONTAP Mediator is unusable.
ipAddress (STRING): ONTAP Mediator IP address.

sm.no events

sm.no.metadata.objstore

Severity

ALERT

Description

This message occurs when a SnapMirror® catalog metadata transfer is attempted and a SnapMirror object store configuration with "usage" of "metadata" is not configured on the system. Catalog metadata transfers will fail until an appropriate object store is configured.

Corrective Action

Either add "usage" of "metadata" to an existing SnapMirror object store configuration or create a new SnapMirror object store configuration with "usage" of "metadata". Use the "snapmirror object-store config modify -usage" command or the "snapmirror object-store config create" command to modify or create an object store configuration.

Syslog Message

No SnapMirror object store configuration with "usage" of "metadata" found for catalog metadata transfer to destination '%s'. Catalog metadata transfers will fail until an appropriate object store is configured.

Parameters

dst_path (STRING): Destination of the SnapMirror relationship.

sm.slc events

sm.slc.async.resync.preserve

Severity

NOTICE

Description

This message occurs when a SnapMirror® resync operation detects data divergence between the common snapshot and the AFS on a resync destination volume where the destination volume is a SnapLock Compliance volume and the SnapMirror relationship is of "async-mirror" policy type. The resync operation preserves the data changes in a locked snapshot for the duration of the current volume expiry time. If the volume expiry time is in the past or has not been set, then the snapshot is locked for a duration of 30 days. The common snapshot is also locked for the same duration.

Corrective Action

(None).

Syslog Message

SnapMirror resync operation created a new snapshot '%s' to preserve the data changes in the AFS with reference to common snapshot '%s' at destination SnapLock Compliance volume '%s'. Both snapshots are locked for the duration of the current volume expiry time '%s'. If the volume expiry time is in the past or has not been set, then the snapshots are locked for a duration of 30 days.

Parameters

new_snap_name (STRING): Name of the new snapshot; where the data changes are preserved.
common_snap_name (STRING): Name of the common snapshot on the destination volume.
dst_path (STRING): Destination volume of the SnapMirror relationship.
dst_vol_expiry (STRING): Expiry time of the destination volume.
relationship_id (STRING): UUID of the SnapMirror relationship.

sm.syncmirror events

sm.syncmirror.out.of.sync

Severity

ALERT

Description

This message occurs when a sync granular CG relationship transitions from in-sync status to out-of-sync status.

Corrective Action

Verify network connections between the primary cluster and the secondary cluster. Check for error information in the "snapmirror show" command output for the relationship. Quiesce the relationship if the condition cannot be addressed immediately.

Syslog Message

Sync granular CG relationship with source path %s and destination path %s has transitioned from in-sync to out-of-sync for the follow reason: %s.

Parameters

src_path (STRING): Source path of the sync granular CG relationship that transitioned from in-sync to out-of-sync.
dst_path (STRING): Destination path of the sync granular CG relationship that transitioned from in-sync to out-of-sync.
reason (STRING): Reason that the relationship went out-of-sync.

sm.vfiler events

SM.vfiler.config.move.warn

Severity

NOTICE

Description

This message occurs when movement of the SnapMirror® status configuration from 'from' vFiler to 'to' vFiler fails. The SnapMirror or SnapVault® status might show the wrong status entries because the status entries are not copied.

Corrective Action

(None).

Syslog Message

Movement of SnapMirror status configuration failed while moving volumes between vFiler %s to vFiler %s. SnapMirror or SnapVault status might show the wrong status entries.

Parameters

from_vfiler (STRING): vFiler(tm) from which resources are being moved.
to_vfiler (STRING): vFiler to which resources are being moved.

sm.xfer events

sm.xfer.fail.del.snap

Severity

ERROR

Description

This message occurs when deletion of a snapshot on the destination volume fails, and therefore a subsequent transfer exceeds the maximum supported snapshot count for the vault destination.

Corrective Action

Manually delete the snapshots from the destination volume and reissue the failed SnapMirror command.

Syslog Message

Unable to delete snapshot '%s' from destination volume '%s' of the relationship with relationship UUID '%s' to make space for for newer snapshots.

Parameters

snap_name (STRING): Snapshot that was not deleted.
dst_path (STRING): Destination volume of the relationship.
relationship_id (STRING): UUID of the snapmirror relationship.

sm.xfer.fail.maxlim.snap

Severity

ALERT

Description

This message occurs when a SnapMirror® transfer fails because the maximum supported snapshot limit for a SnapMirror destination is reached and there is no space for a new, incoming snapshot.

Corrective Action

Reduce the "keep" count by using the "snapmirror policy modify-rule -policy [policy_name] -keep [keep_count]" command, or by manually deleting snapshots from the SnapMirror® destination.

Syslog Message

The number of snapshots on destination volume '%s' of the relationship with relationship UUID '%s' and policy '%s' has reached the maximum supported.

Parameters

dst_path (STRING): Destination volume of the relationship.
relationship_id (STRING): UUID of the snapmirror relationship.
policy_name (STRING): SnapMirror policy name.

sm.xfer.incr.snap.rename

Severity

ERROR

Description

This message occurs when an incomplete SnapMirror® operation is detected for an incremental snapshot that no longer exists on the SnapMirror® source volume. As a result, SnapMirror creates a snapshot with the name "snapmirror_vlt_xfer_recovery" and requires a SnapMirror Resync operation to be performed on the SnapVault relationship to resume data protection.

Corrective Action

Resume data protection either by retaining or deleting the snapshot Use the 'snapmirror resync -preserve' to retain it or use the 'snapmirror resync' command to delete it.

Syslog Message

An incomplete SnapMirror operation was detected for an incremental snapshot that no longer exists on the source volume '%s'. The data transfer for the incremental snapshot was completed but the snapshot on the vault destination '%s' was not created. Instead, a snapshot with the name "snapmirror_vlt_xfer_recovery" was created.

Parameters

src_path (STRING): Source volume of the relationship.
dst_path (STRING): Destination volume of the relationship.

sm.xfer.no.new.snap

Severity

INFORMATIONAL

Description

This message occurs when a SnapMirror® update does not find any new snapshots to transfer. This can happen when none of the newer snapshots on the source has a SnapMirror® label that matches a SnapMirror policy.

Corrective Action

Check that the SnapMirror label from the snapshot policy matches SnapMirror policy rules.

Syslog Message

SnapMirror update did not find any new snapshots to transfer from the source volume '%s' of the relationship with relationship UUID '%s'.

Parameters

src_path (STRING): Source volume of the SnapMirror relationship.
relationship_id (STRING): UUID of the snapmirror relationship.

sm.xfer.same.name.snap.dst

Severity

ERROR

Description

This message occurs when a snapshot was not transferred from the source volume to the destination volume during a snapmirror transfer because a snapshot with the same name already exists in the destination volume.

Corrective Action

Rename the snapshot in the source volume to a name that does not match the name of any snapshot in the destination volume. Then, wait for the next scheduled update or trigger a manual snapmirror update.

Syslog Message

Snapshot "%s" was not transferred from the source volume "%s" to the destination volume "%s" because the destination volume has a snapshot with the same name.

Parameters

snap_name (STRING): Name of the snapshot that was not transferred.
src_path (STRING): Source volume of the relationship.
dst_path (STRING): Destination volume of the relationship.

sm.xfer.warn.limit

Severity

ERROR

Description

This message occurs when a SnapMirror® transfer receives a warning when it is approaching the "keep" count of a particular SnapMirror® relationship.

Corrective Action

Increase the "keep" count to transfer more snapshots with the same label using the following command: snapmirror policy modify-rule -policy [policy_name] -keep [keep_count]

Syslog Message

Warnings issued for SnapMirror relationship with source volume '%s' and destination volume '%s' with relationship UUID '%s' : %s

Parameters

src_path (STRING): Source volume of the relationship.
dst_path (STRING): Destination volume of the relationship.
relationship_id (STRING): UUID of the snapmirror relationship.
warn_str (STRING): SnapMirror transfer warning.

sm.xfer.warn.snapshot.count.limit

Severity

ERROR

Description

This message occurs during a SnapMirror® transfer, when the snapshot count limit is reached for the SnapMirror relationship between the indicated source and destination volumes.

Corrective Action

Delete some snapshots from the destination volume to create space for new snapshots to be transferred to it.

Syslog Message

Snapshot count limit for SnapMirror relationship with source volume '%s' and destination volume '%s' with relationship UUID '%s' has been reached : %s

Parameters

src_path (STRING): Source volume of the SnapMirror relationship.
dst_path (STRING): Destination volume of the SnapMirror relationship.
relationship_id (STRING): UUID of the snapmirror relationship.
warn_str (STRING): SnapMirror transfer warning.

smbc events

smbc.aufo events

smbc.aufo.completed

Severity

NOTICE

Description

This message occurs when the SnapMirror® active sync automatic unplanned failover operation completes.

Corrective Action

(None).

Syslog Message

SnapMirror automatic failover completed. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.aufo.during.expand

Severity

NOTICE

Description

This message occurs when a SnapMirror® active sync automatic unplanned failover operation starts while a SnapMirror® active sync expand operation is in progress. The new volumes of the consistency group that are going through the expand operation do not participate in the failover and remain as data protection (DP) after completion of failover.

Corrective Action

(None).

Syslog Message

Automatic unplanned failover has started on the SnapMirror® active sync relationship while the relationship is expanding. The new volumes of the consistency group that are going through the expand operation do not participate in the failover and remain as DP after completion of failover.

Parameters

dstpath (STRING): Path name for the destination consistency group of SnapMirror® active sync relationship.

smbc.aufo.failed

Severity

ERROR

Description

This message occurs when the SnapMirror® active sync automatic unplanned failover operation fails.

Corrective Action

Perform "snapmirror delete -destination-path destination_path" followed by "snapmirror break" on the volumes.

Syslog Message

SnapMirror automatic failover failed. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.aufo.failover.incapable

Severity

ERROR

Description

This message occurs when the SnapMirror® active sync automatic unplanned failover operation fails because the destination site is not failover capable.

Corrective Action

Before applying corrective action, the User must ensure that the primary/master copy is unavailable, otherwise the assumption is that Master copy is actively being used by the Application workload. Perform "snapmirror delete -destination-path destination_path" followed by "snapmirror break" on the volumes.

Syslog Message

SnapMirror automatic failover encountered a failure because the site with destination path "%s" is not failover-capable.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.aufo.io.outage.complete

Severity

NOTICE

Description

This message occurs when I/O can resume after an automatic unplanned failover of a SnapMirror® active sync relationship.

Corrective Action

(None).

Syslog Message

In the automatic unplanned failover of the SnapMirror® active sync relationship with destination path %s and relationship-ID %s, I/O disruption started at %s and lasted for %u msecs. Mediator Agent processing started at %s and lasted for %u msecs.

Parameters

dstpath (STRING): Destination path of the SnapMirror® active sync relationship.
cg_rel_id (STRING): ID of the SnapMirror® active sync relationship.
io_outage_start_time (STRING): I/O disruption start time.
io_outage_latency (LONGINT): I/O disruption window (msecs).
tba_trigger_start_time (STRING): Mediator Agent processing start time.
tba_trigger_latency (LONGINT): Mediator Agent processing window (msecs).

smbc.aufo.queued

Severity

NOTICE

Description

This message occurs when the SnapMirror® active sync relationship automatic unplanned failover operation is queued.

Corrective Action

(None).

Syslog Message

SnapMirror® active sync automatic unplanned operation failover queued. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.aufo.start

Severity

NOTICE

Description

This message occurs when the SnapMirror® active sync automatic unplanned failover operation starts.

Corrective Action

(None).

Syslog Message

SnapMirror automatic failover started. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.avail events

smbc.avail.aufoDisabled

Severity

ERROR

Description

This message occurs when the primary-bias state is set for the secondary endpoints of the SnapMirror® active sync relationships because both of the SnapMirror® active sync clusters lose connectivity to the ONTAP Mediator. It prevents an automatic unplanned failover operation on the secondary endpoints.

Corrective Action

Check the network connection and restore the access to the ONTAP Mediator.

Syslog Message

Primary-bias state is set for the secondary endpoints of the SnapMirror® active sync relationships. ONTAP Mediator IP: "%s", Peer cluster: "%s".

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
peerCluster (STRING): Peer cluster name.

smbc.avail.aufoEnabled

Severity

NOTICE

Description

This message occurs when the primary-bias state is cleared for the secondary endpoints of the SnapMirror® active sync relationships. It resumes the ONTAP Mediator assisted automatic unplanned failover operation on secondary endpoints.

Corrective Action

(None).

Syslog Message

Primary-bias state is cleared for the secondary endpoints of the SnapMirror® active sync relationships. ONTAP Mediator IP: "%s", Peer cluster: "%s".

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
peerCluster (STRING): Peer cluster name.

smbc.avail.primaryBias

Severity

ERROR

Description

This message occurs when the primary-bias state is set for the primary endpoints of the SnapMirror® active sync relationships because both of the SnapMirror® active sync clusters lose connectivity to the ONTAP Mediator. It allows primary endpoints to drive the consensus locally without depending on the ONTAP Mediator.

Corrective Action

Check the network connection and restore the access to the ONTAP Mediator.

Syslog Message

Primary-bias state is set for the primary endpoints of the SnapMirror® active sync relationships. ONTAP Mediator IP: "%s", Peer cluster: "%s".

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
peerCluster (STRING): Peer cluster name.

smbc.avail.primaryBiasNoMed

Severity

NOTICE

Description

This message occurs when the primary-bias state is set for the endpoints of the SnapMirror active sync relationships because the ONTAP Mediator is not configured between the cluster pair. It allows the primary endpoints of the SnapMirror active sync relationships to drive the I/O serving consensus without depending on the peer cluster when there is a network partition between the cluster pair.

Corrective Action

(None).

Syslog Message

Primary-bias state is set for the endpoints of the SnapMirror active sync relationships. Peer cluster: %s.

Parameters

peerCluster (STRING): Peer cluster name.

smbc.avail.primaryBiasRemove

Severity

NOTICE

Description

This message occurs when the primary-bias state is removed for the endpoints of the SnapMirror active sync relationships because the ONTAP Mediator is not configured between the cluster pair, and one or both of the clusters are running an ONTAP version older than 9.15.1. The primary endpoints are required to communicate to the peer cluster to establish the I/O serving consensus when there is a network partition between the cluster pair.

Corrective Action

(None).

Syslog Message

Primary-bias state is removed for the endpoints of the SnapMirror active sync relationships. Peer cluster: %s.

Parameters

peerCluster (STRING): Peer cluster name.

smbc.avail.primaryBiasReset

Severity

NOTICE

Description

This message occurs when the primary-bias state is cleared for the primary endpoints of the SnapMirror® active sync relationships. It resumes the three-way quorum involving the ONTAP Mediator and peer cluster to derive consensus.

Corrective Action

(None).

Syslog Message

Primary-bias state is cleared for the primary endpoints of the SnapMirror® active sync relationships. ONTAP Mediator IP: "%s", Peer cluster: "%s".

Parameters

ipAddress (STRING): ONTAP Mediator IP address.
peerCluster (STRING): Peer cluster name.

smbc.cg events

smbc.cg.info.read.failed

Severity

ERROR

Description

This message occurs when read of Consistency Group aggregate information entry fails for the SnapMirror® active sync volume which results into IO disruption.

Corrective Action

To recover from this situation, perform below steps : Run wafliron on the aggregate hosting the SnapMirror® active sync volume which failed during mount time. Run resync on all the SnapMirror® active sync CG relationships present in the aggregate on which wafliron executed.

Syslog Message

Read of Consistency Group aggregate information entry failed for source volume DSID: "%llu" during "%s" because Consistency Group aggregate information file is corrupted.

Parameters

source_volume_dsid (LONGINT): Source Volume DSID
operation (STRING): Name of operation

smbc.cg.info.update.failed

Severity

ERROR

Description

This message occurs when add or delete of Consistency Group aggregate information entry fails for the SnapMirror® active sync volume which results into IO disruption.

Corrective Action

To recover from this situation, perform below steps : Run wafliron on the aggregate hosting the SnapMirror® active sync volume which failed during mount time. Run resync on all the SnapMirror® active sync CG relationships present in the aggregate on which wafliron executed.

Syslog Message

"%s" of Consistency Group aggregate information entry failed for source volume DSID: "%llu" because Consistency Group aggregate information file is corrupted.

Parameters

metafile_update_type (STRING): Name of aggregate metafile update type
volume_dsid (LONGINT): Volume DSID

smbc.fanout events

smbc.fanout.svms.not.peered

Severity

ERROR

Description

This message occurs when ONTAP® detects that source volumes of SnapMirror® active sync relationships are involved in an async fanout protection, but the two destination storage virtual machine (SVM)s are not peered with each other. This prevents an automatic reconfiguration of the async protection when the source volumes failover.

Corrective Action

1. Use the "cluster peer show" command to verfiy that the SnapMirror fanout destination and SnapMirror active sync destination clusters are peered. 2. Use the "cluster peer create" command on both clusters to peer the clusters together. 3. Use the "vserver peer show" command to verify that the SnapMirror fanout destination and SnapMirror active sync destination SVMs are peered. 4. Use the "vserver peer create" and "vserver peer accept" commands to peer the SVMs together.

Syslog Message

SnapMirror fanout destination SVM "%s" and SnapMirror active sync destination SVM "%s" are not peered. Use command "cluster peer show" to verify if SnapMirror fanout destination cluster "%s" and SnapMirror active sync destination cluster "%s" are peered.

Parameters

asyncDstSvmName (STRING): SnapMirror fanout destination SVM name.
syncDstSvmName (STRING): SnapMirror active sync destination SVM name.
asyncDstClusterName (STRING): SnapMirror fanout destination cluster name.
syncDstClusterName (STRING): SnapMirror active sync destination cluster name.

smbc.pfo events

smbc.pfo.completed

Severity

NOTICE

Description

This message occurs when the SnapMirror® active sync planned failover operation completes.

Corrective Action

(None).

Syslog Message

SnapMirror® active sync planned failover operation completed. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.pfo.failed

Severity

ERROR

Description

This message occurs when the SnapMirror® active sync planned failover operation fails.

Corrective Action

Determine the cause of the failure by using the "snapmirror failover show -fields error-reason" command. After addressing the cause, retry the "snapmirror failover start -destination-path destination_path" command.

Syslog Message

SnapMirror® active sync planned failover operation failed. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.pfo.io.outage.compl.dst

Severity

NOTICE

Description

This message occurs when the secondary (erstwhile) side conversion completes after a planned failover operation of a SnapMirror® active sync relationship.

Corrective Action

(None).

Syslog Message

In the planned failover of the SnapMirror® active sync relationship with destination path %s and relationship-ID %s, the destination side I/O disruption started at %s and lasted for %u msecs.

Parameters

dstpath (STRING): Destination path of the SnapMirror® active sync relationship.
cg_rel_id (STRING): ID of the SnapMirror® active sync relationship.
start_time (STRING): I/O disruption start time.
latency (LONGINT): I/O disruption window (msecs).

smbc.pfo.io.outage.compl.src

Severity

NOTICE

Description

This message occurs when the primary (erstwhile) side conversion completes after a planned failover operation of a SnapMirror® active sync relationship and IO outage completes as the Report Target Port Group(RTPG) is consistent.

Corrective Action

(None).

Syslog Message

In the planned failover of the SnapMirror® active sync relationship with destination path %s and relationship-ID %s, the source side I/O disruption started at %s and lasted for %u msecs.

Parameters

dstpath (STRING): Destination path of the SnapMirror® active sync relationship.
cg_rel_id (STRING): ID of the SnapMirror® active sync relationship.
start_time (STRING): I/O disruption start time.
latency (LONGINT): I/O disruption window (msecs).

smbc.pfo.start

Severity

NOTICE

Description

This message occurs when the SnapMirror® active sync planned failover operation starts.

Corrective Action

(None).

Syslog Message

SnapMirror® active sync planned failover operation started. Destination path: %s.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smbc.policy events

smbc.policy.reassign

Severity

NOTICE

Description

This message occurs when the system detects during a flip on a SnapMirror® Sync relationship that the custom policy has been deleted from the source cluster and automatically falls back to the system policy of type "automated-failover".

Corrective Action

(None).

Syslog Message

The custom policy has been deleted from the source cluster so the SnapMirror Sync relationship with destination path: %s has been assigned "AutomatedFailover" policy.

Parameters

dstpath (STRING): Path name of the destination group of the SnapMirror® active sync relationship.

smc events

smc.cg events

smc.cg.snap.ren.revert.fail

Severity

ERROR

Description

This message occurs when a FlexGroup® snapshot rename fails and the revert to the original snapshot name also fails.

Corrective Action

Manually rename the snapshot by issuing the "snapshot rename" command.

Syslog Message

Unable to revert snapshot name from the new name, "%s" to oldname "%s" in volume "%s".

Parameters

newsnapname (STRING): New snapshot name.
origsnapname (STRING): Original snapshot name.
dstpath (STRING): Path name of the destination volume to which the snapshot rename was issued.
error (INT): Error code of the failure.

smc.dst events

smc.dst.snapshot.op

Severity

NOTICE

Description

This message occurs when SnapMirror creates or deletes a snapshot with a SnapMirror label on a FlexVol destination volume of a SnapMirror® relationship.

Corrective Action

(None).

Syslog Message

SnapMirror snapshot %s %s on destination volume %s, label %s, instance UUID %s, version UUID %s, relationship UUID %s.

Parameters

operation (STRING): Snapshot operation either "create" or "delete".
snapname (STRING): Snapshot name.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
snaplabel (STRING): SnapMirror label of the snapshot.
instance_uuid (STRING): Instance UUID of the snapshot.
version_uuid (STRING): Version UUID of the snapshot.

relationshipID (STRING): UUID of the SnapMirror relationship.

smc.frest events

smc.frest.snap.delete.fail

Severity

ERROR

Description

This message occurs when a SnapMirror file restore operation fails to delete a local file restore snapshot on the destination volume.

Corrective Action

Manually delete snapshot by issuing snapshot delete command.

Syslog Message

Unable to delete snapshot '%s' from volume '%s'.

Parameters

snapname (STRING): Snapshot that was not deleted.
dstpath (STRING): Path name of the destination volume to which restore was issued.

smc.restore events

smc.restore.src.cleanup.fail

Severity

ERROR

Description

This message occurs when a SnapMirror restore operation or a SnapMirror restore cleanup operation fails to cleanup a SnapMirror restore source relationship information. This issue can happen regardless of the success or failure of the SnapMirror operation.

Corrective Action

If the SnapMirror restore operation or the SnapMirror restore cleanup operation has failed, check the reason for the error, take action accordingly, and then run the command again. If the operation has succeeded, run the "snapmirror list-destinations -type RST" command on the cluster containing the source information for the SnapMirror restore relationship, and identify the corresponding relationship. Then remove the stale entry by running the "snapmirror release -destination-path <dst_path> -source-path <src_path>" command.

Syslog Message

Restore of volume '%s' from volume '%s' with relationship UUID '%s' failed to remove source information for the relationship.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror restore relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror restore relationship.
relationshipID (STRING): Relationship UUID.

smc.snap events

smc.snap.upd.retention.fail

Severity

ERROR

Description

This message occurs when a SnapMirror operation fails to copy the retention period of a snapshot from the source endpoint to the destination endpoint because the ONTAP® version of the destination cluster does not support copying the retention period. This issue can happen regardless of the success or failure of the SnapMirror operation.

Corrective Action

Check the ONTAP version of the destination cluster using the command "system image show -node <node_name> -iscurrent true -fields version". If the ONTAP version of the destination cluster is earlier than ONTAP 9.12.1 then copying the retention period is not supported on the destination cluster. The destination cluster should be upgraded to ONTAP 9.12.1 or later to copy the retention period of snapshots from the source to the destination.

Syslog Message

The SnapMirror relationship with relationship UUID "%s" will not copy the retention period of a snapshot from the source volume "%s" to the destination volume "%s" because the ONTAP version of the destination cluster does not support copying the retention period.

Parameters

relationshipID (STRING): Relationship UUID.
srcpath (STRING): Path name of the source endpoint of the SnapMirror relationship.
dstpath (STRING): Path name of the destination endpoint of the SnapMirror relationship.

smc.snapmir events

smc.snapmir.dst.invalidType

Severity

ERROR

Description

This message occurs when the destination volume of a SnapMirror® relationship is not a Data Protection (DP) type and a snapmirror initialize operation is attempted. A volume must be of a DP type to accept a snapmirror initialize operation.

Corrective Action

For ASA r2 systems, contact NetApp technical support for assistance to resolve this internal error. For all other systems: Use a different volume of type DP, or use the "volume create" command to create a new volume of type DP to use as a destination of the SnapMirror relationship. You cannot modify the type of a volume using the 'volume modify' command.

Syslog Message

Destination volume '%s' of a SnapMirror relationship is not a DP type. Relationship UUID "%s".

Parameters

> **dstpath** (STRING): Path name of the destination volume of the SnapMirror relationship.
> **relationshipID** (STRING): Universal unique identifier(UUID) of the SnapMirror relationship.

smc.snapmir.frest.clean.fail

Severity

> ERROR

Description

> This message occurs when SnapMirror® fails to clean up fenced files and file restore restartability information on a volume and no more retries will be attempted.

Corrective Action

> Check the reason for the error, take action accordingly and issue 'snapmirror restore -file-restore-clean-up true' on the volume in diagnostic mode.

Syslog Message

> File restore clean up on volume '%s' failed with error '%s'.

Parameters

> **dstpath** (STRING): Path name of the volume.
> **error** (STRING): Error message.

smc.snapmir.init.fail

Severity

> ERROR

Description

> This message occurs when a SnapMirror® 'initialize' command fails and no more retries will be attempted.

Corrective Action

> Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

> Initialize from source volume '%s' to destination volume '%s' failed with error '%s'. Relationship UUID '%s'.

Parameters

> **srcpath** (STRING): Path name of the source volume of the SnapMirror relationship.
> **dstpath** (STRING): Path name of the destination volume to which the initialize failed.
> **error** (STRING): Error message.
> **relationshipID** (STRING): Relationship UUID.

smc.snapmir.lrb.auto.resync

Severity

> INFORMATIONAL

Description

This message occurs when the latest snapshot on the SnapMirror® or SnapVault® destination is not the base snapshot and the source volume is read-only. Generally this is a rare event and a local-rollback-based SnapMirror resync will be attempted to automatically recover from this situation. If this event occurs frequently, it is likely that the snapshot policy on the primary volume in the cascade is deleting snapshots too soon.

Corrective Action

Check the snapshot policy on the primary (read-write) volume and increase the retention count of the snapshots that must be backed up all the way to the destination.

Syslog Message

Latest snapshot %s on the destination %s is not the base snapshot. Attempting a local rollback based SnapMirror resync to correct this issue.

Parameters

snap_name (STRING): Name of the latest snapshot on the SnapMirror or SnapVault destination.
dst_path (STRING): Destination volume of the SnapMirror/SnapVault relationship.

smc.snapmir.partnr.noconnect

Severity

ERROR

Description

This message occurs when a SnapMirror® Sync relationship cannot detect the heartbeat signal from the partner node.

Corrective Action

Check the network connection between the source and destination volumes by using the "net interface show -role intercluster -status-admin up" command.

Syslog Message

Source volume "%s" and destination volume "%s" with relationship UUID "%s" lost heartbeat to partner node.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

smc.snapmir.release.fail

Severity

ERROR

Description

This message occurs when a SnapMirror® 'release' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Release on the source volume '%s' for destination volume '%s' failed with error '%s'. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the resync failed.
error (STRING): Error message.
relationshipID (STRING): Relationship UUID.

smc.snapmir.restore.fail

Severity

ERROR

Description

This message occurs when a SnapMirror® 'restore' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Restore of volume '%s' from volume '%s' failed with error '%s'. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the resync failed.
error (STRING): Error message.
relationshipID (STRING): Relationship UUID.

smc.snapmir.resync.fail

Severity

ERROR

Description

This message occurs when a SnapMirror® 'resync' command fails and no more retries will be attempted.

Corrective Action

Check the reason for the error, take action accordingly, and issue the command again.

Syslog Message

Resync from source volume '%s' to destination volume '%s' failed with error '%s'. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the resync failed.
error (STRING): Error message.
relationshipID (STRING): Relationship UUID.

smc.snapmir.schd.trans.overrun

Severity

ERROR

Description

This message occurs when a scheduled SnapMirror® transfer overruns the schedule window.

Corrective Action

Check the reason for the schedule overrun and take action accordingly.

Syslog Message

Scheduled transfer from source volume '%s' to destination volume '%s' is taking longer than the schedule window. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the scheduled transfer.
relationshipID (STRING): Relationship UUID.

smc.snapmir.suspending.io

Severity

ALERT

Description

This message occurs when SnapMirror® I/O has been suspended, due either to a loss of connectivity between the SnapMirror Mediator software and partner, or to a denial of network access by the Mediator software.

Corrective Action

Check the status of the connection to the Mediator software by using the "net interface show -role intercluster -status-admin up" command.

Syslog Message

Suspending I/O as with relationship UUID "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.
error_msg (STRING): Description of the error responsible for the suspension.

smc.snapmir.tb.noconnect

Severity

ERROR

Description

This message occurs when an ONTAP® node is not reachable from the SnapMirror® Mediator software.

Corrective Action

Check the network connection between the source and destination volumes, by using the "network ping -node node_name" command.

Syslog Message

Connection lost to the Mediator software from node: %s, with relationship UUID "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.
node (STRING): Node name.
mediator_id (STRING): IP of the Mediator.

smc.snapmir.unexpected.err

Severity

ERROR

Description

This message occurs when a SnapMirror® operation encounters an unexpected error.

Corrective Action

Retry the SnapMirror operation. If the problem persists, contact NetApp technical support.

Syslog Message

SnapMirror unexpected error '%s'. Relationship UUID '%s'. Operation UUID '%s'.

Parameters

error (STRING): Error message.
relationshipID (STRING): Relationship UUID.
operationID (STRING): Operation UUID.

smc.snapmir.unsupp.nvmf

Severity

ERROR

Description

This message occurs when a SnapMirror® operation encounters an NVMe Namespace that is unsupported on the destination side.

Corrective Action

Upgrade the destination to a version that supports NVMe Namespace objects.

Syslog Message

SnapMirror unsupported NVMe Namespace. Relationship UUID '%s'.

Parameters

relationshipID (STRING): Relationship UUID.

smc.snapmir.unsupp.nvmf.ns

Severity

ERROR

Description

This message occurs when a SnapMirror® operation encounters a 512-byte block size NVMe namespace that is unsupported on the destination.

Corrective Action

Upgrade the destination to a version that supports 512-byte block size NVMe namespace objects.

Syslog Message

SnapMirror unsupported 512-byte block size NVMe namespace. Relationship UUID '%s'.

Parameters

relationshipID (STRING): Relationship UUID.

smc.snapmir.update.fail

Severity

ERROR

Description

This message occurs when a scheduled SnapMirror® transfer fails.

Corrective Action

Check the snapmirror_error log in the destination filer and take action accordingly.

Syslog Message

Snapmirror update from source volume '%s' to destination volume '%s' failed with error '%s'. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the snapmirror transfer failed.
error (STRING): Error message.
relationshipID (STRING): Relationship UUID.

smc.snapmirror events

smc.snapmirror.xfer.complete

Severity

INFORMATIONAL

Description

This message occurs when a SnapMirror® transfer completes successfully.

Corrective Action

(None).

Syslog Message

Snapmirror transfer from source volume '%s' to destination volume '%s' is successful. '%s'. Relationship UUID '%s'.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume to which the snapmirror transfer failed.
info (STRING): Transfer information.
relationshipID (STRING): Relationship UUID.

smc.tot events

smc.tot.bytes.write.fail

Severity

NOTICE

Description

This message occurs when SnapMirror is unable to update the latest total transfer bytes value of the SnapMirror relationship. The total transfer bytes for the relationship might be incorrect.

Corrective Action

(None).

Syslog Message

SnapMirror is unable to update the latest total transfer bytes value for the relationship with relationship UUID "%s" and destination "%s".

Parameters

relationshipID (STRING): Relationship UUID.
dstPath (STRING): Path name of the destination endpoint of the SnapMirror relationship.

smc.vlt events

smc.vlt.cascade.xfer.fail

Severity

ERROR

Description

This message occurs when the transfer for the SnapVault® relationship replicating the read-only source volume fails because the SnapMirror® policy prevents it from transferring the exported snapshot from the source. Generally this happens when the "keep" value of the rule associated with the SnapMirror label of the exported snapshot is reached and the "preserve" flag is set to "true".

Corrective Action

Modify the rule for the SnapMirror policy associated with the SnapMirror label of the exported snapshot on the source volume and either set the "preserve" flag to "false" or increase the "keep" count.

Syslog Message

Unable to transfer any snapshots to %s because the exported snapshot %s with snapmirror-label %s has a rule whose "keep" value has been reached and the "preserve" flag is set to "true".

Parameters

dst_path (STRING): Destination volume of the SnapVault relationship.
snap_name (STRING): Name of the exported snapshot on the source volume.
snapmirror_label (STRING): SnapMirror label associated with the exported snapshot.

sms events

sms.cg events

sms.cg.cascade.not.supported

Severity

ERROR

Description

This message occurs when a SnapMirror® Synchronous Automated Failover relationship is part of a cascade configuration. Cascade configuration is not supported for SnapMirror® Synchronous Automated Failover relationships.

Corrective Action

Delete the Asynchronous cascade leg from the destination of the SnapMirror® Synchronous Consistency Group relationship. Attach the cascade Leg to the source of SnapMirror® Synchronous Consistency Group relationship to re-establish the 3 site DR.

Syslog Message

The source of the relationship %s (msid:%llu and vserver_uuid:%s) is part of of SnapMirror® Synchronous Automated Failover destination relationship. Since cascade is not supported for SnapMirror® Synchronous Automated Failover relationship, failing the operation on the cascade leg.

Parameters

RelationshipId (STRING): UUID of the SnapMirror Relationship.
volumeMSID (LONGINT): Volume MSID.
vserverUUID (STRING): vserver instance UUID.

sms.clone events

sms.clone.request.disallow

Severity

NOTICE

Description

This message occurs when SnapMirror® Synchronous fails a clone request because the relation is temporarily in a state that does not permit clone replication.

Corrective Action

(None).

Syslog Message

Clone replication not permitted while in transitioning state.

Parameters

(None).

sms.common events

sms.common.snapshot.failed

Severity

ERROR

Description

This message occurs when there is a failure in creating a common snapshot. The SnapMirror® Sync relationship continues to be in "in-sync" status. The latest common snapshot is used for recovery in case the relationship status changes to "out-of-sync." The common snapshot should be created at scheduled intervals to decrease the recovery time of "out-of-sync" relationships.

Corrective Action

Create a common snapshot manually by using the "snapmirror update" command at the destination volume.

Syslog Message

Creating a common snapshot for source volume "%s" and destination volume "%s" with relationship UUID "%s" has failed due to the following reason: "%s". Elapsed time since the latest successful common snapshot is %s.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.
error_msg (STRING): Error that prevented the common snapshot from being created.
css_fail_interval (STRING): Interval between the last successful common snapshot creation and recent failure to create a common snapshot.

sms.failed events

sms.failed.precheck

Severity

ERROR

Description

This message occurs when a SnapMirror® Sync relationship cannot be established due to precheck failures.

Corrective Action

Monitor the status of the SnapMirror Sync relationship by using the "snapmirror show" command. Retry the SnapMirror Sync operation after resolving the issue that caused the precheck failure.

Syslog Message

SnapMirror Sync operation failed for source volume "%s" and destination volume "%s" with relationship UUID "%s" due to the following reason: "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.

relationship_id (STRING): Relationship UUID.
error_msg (STRING): Reason for the failure.

sms.fanout events

sms.fanout.comm.snap.deleted

Severity

ALERT

Description

This message occurs when an older snapshot is deleted as part of a SnapMirror® Synchronous resynchronize or update (common snapshot) operation, which could lead to a "no common snapshot scenario" between the synchronous and asynchronous disaster recovery (DR) copies that share the same source volume. If there is no common snapshot between the synchronous and asynchronous DR copies, then a re-baseline will need to be performed during a disaster recovery.

Corrective Action

You can ignore this message if there is no asynchronous relationship configured for the synchronous source volume. If there is an asynchronous relationship configured, then update the asynchronous relationship by using the "snapmirror update" command. The SnapMirror update operation will transfer the snapshots that will act as common snapshots between the synchronous and asynchronous destinations.

Syslog Message

SnapMirror Synchronous operation '%s' for relationship '%s' has cleaned up some of the old base snapshots between the synchronous source and synchronous destination, which could result in no common snapshot existing between the synchronous and asynchronous destinations.

Parameters

sm_operation (STRING): SnapMirror Synchronous operation.
relationship_id (STRING): Relationship UUID.

sms.giveback events

sms.giveback.veto.override

Severity

NOTICE

Description

This message occurs during an SFO aggregate giveback, when the SnapMirror® subsystem indicates that giveback should be vetoed but the veto was overridden by the automated nondisruptive update procedure. The automated nondisruptive update procedure verifies the expected state of the aggregate.

Corrective Action

(None).

Syslog Message

snapmirror subsystem veto was overridden during giveback operation of "%s" aggregate.

Parameters

    aggregate (STRING): Name of the aggregate.

sms.operation events

sms.operation.blacklisted

Severity

    ERROR

Description

    This message occurs when a blacklisted operation is performed on the primary volume of a SnapMirror® Sync relationship when the relationship status is "Transitioning".

Corrective Action

    Auto-resync will attempt to bring the SnapMirror Sync relationship status to "InSync". You can also use the "snapmirror resync" command to change the relationship status. Avoid issuing blacklisted operations while the relationship status is "Transitioning".

Syslog Message

    SnapMirror Sync operation encountered a failure while the relationship status is "Transitioning" for relationship UUID "%s" because blacklisted operation "%s" was performed in the "%s" state.

Parameters

    relationship_id (STRING): Relationship UUID.
    operation (STRING): Blacklisted operation that was executed during the transitioning state.
    state (STRING): Transitioning phase during which blacklisted operations are performed.

sms.qr events

sms.qr.mem.alloc.issue

Severity

    ERROR

Description

    This message occurs when wafl fails to allocate required memory for storing streams attributes information or asked buffer memory length is too less to hold all the streams attributes info, in both the cases the status of Snapmirror Synchronous relationship changes to "OutOfSync".

Corrective Action

    Monitor the SnapMirror® Synchronous relationship status using the "snapmirror show" command. If the relationship status is not "InSync", resynchronize the relationship using "snapmirror resync" command.

Syslog Message

    Wafl failed to allocate sufficient memory to hold all the streams attributes information for Snapmirror Synchronous relationship UUID: "%s" and File ID: "%s". The status of the Snapmirror Synchronous relationship will be changed to "OutOfSync".

Parameters

relationship_id (STRING): Snapmirror Relationship UUID
file_id (STRING): File id for which the wafl operation failed.

sms.qr.ops.limit.exceed

Severity

ERROR

Description

This message occurs when SnapMirror® Synchronous detects that the number of write failures on the source volume of a SnapMirror® Synchronous relationship has exceeded the threshold. This can lead to change of the relationship status from "InSync" to "OutOfSync".

Corrective Action

To recover from this situation, turn on sequential splitting in the Snapmirror® Synchronous relationship. For further information about correcting the problem, search the knowledgebase of the NetApp technical support web site for the "sms.qr.ops.limit.exceed" keyword.

Syslog Message

The number of write failures on the source volume with Dsid: "%s" of the SnapMirror® Synchronous relationship UUID: "%s" has exceeded the threshold. This may lead to change of the relationship status from "InSync" to "OutOfSync".

Parameters

source_volume_dsid (STRING): Source Volume DSID
relationship_id (STRING): Snapmirror Relationship UUID

sms.qr.streams.limit.exceed

Severity

ERROR

Description

This message occurs when the number of streams associated with a file exceeds the maximum supported number of streams by SnapMirror® Synchronous. This will change the status of the Snapmirror Synchronous relationship to "OutOfSync".

Corrective Action

Turn on sequential splitting in the SnapMirror Synchronous relationship. For further information about correcting the problem, search the knowledgebase of the NetApp technical support web site for the "sms.qr.streams.limit.exceed" keyword.

Syslog Message

Maximum number of streams for a file supported by SnapMirror Synchronous relationship exceeded for relationship UUID: "%s" and file ID: "%s". Status of the relationship will be changed to "OutOfSync".

Parameters

relationship_id (STRING): SnapMirror relationship UUID.
file_id (STRING): File ID of the file for which the number of streams exceeded the maximum.

sms.resync events

sms.resync.attempt.failed

Severity

ERROR

Description

This message occurs when a resynchronize operation between the source volume and destination volume fails. The SnapMirror® Sync relationship is in "out-of-sync" status. Data protection is impacted.

Corrective Action

Monitor SnapMirror Sync status using the "snapmirror show" command. If the auto-resync attempts fail, bring the relationship back to "in-sync" status manually by using the "snapmirror resync" command.

Syslog Message

Resynchronize operation between source volume "%s" and destination volume "%s" with relationship UUID "%s" has failed. The next auto-resync will be attempted after "%d" mins.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.
next_resync_interval (INT): Interval after which the next resync will be attempted.

sms.snap events

sms.snap.not.replicated

Severity

NOTICE

Description

This message occurs when a snapshot for SnapMirror® Synchronous relationship is not successfully replicated.

Corrective Action

(None).

Syslog Message

Snapshot '%s' is not sucessfully replicated for the relationship '%s' with source volume DSID '%llu' and path '%s'. Reason: %s.

Parameters

snapshot (STRING): Name of the snapshot to be replicated.
transferId (STRING): UUID of the SnapMirror transfer.
volumeDSID (LONGINT): Volume data set ID (DSID).
volumePath (STRING): Path of the volume.
failureReason (STRING): Reason for the failure.

sms.src events

sms.src.clear.fence.complete

Severity

NOTICE

Description

This message occurs when a SnapMirror® Synchronous operation has successfully cleared the persistent fence (read/write I/O has resumed) on the source volume.

Corrective Action

(None).

Syslog Message

Cleared persistent fence (read/write I/O has resumed) on the source volume for relationship UUID "%s" with source volume "%s" and destination volume "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

sms.src.set.fence.complete

Severity

NOTICE

Description

This message occurs when a SnapMirror® Synchronous operation has successfully set the persistent fence (prevent read/write I/O) on the source volume.

Corrective Action

(None).

Syslog Message

Set persistent fence (prevent read/write I/O) on the source volume for relationship UUID "%s" with source volume "%s" and destination volume "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

sms.status events

sms.status.in.sync

Severity

NOTICE

Description

This message occurs when a SnapMirror® Sync initialize or resynchronize operation is completed successfully, and the source volume and destination volume are in "in-sync" status.

Corrective Action

(None).

Syslog Message

Initialize or resynchronize operation was successful. Source volume "%s" and destination volume "%s" with relationship UUID "%s" are in "in-sync" status.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

sms.status.out.of.sync

Severity

ERROR

Description

This message occurs when a SnapMirror® Sync relationship changes status from "in-sync" to "out-of-sync". I/O restrictions are imposed on the source volume based on the mode of replication. For relationships with policy type "strict-sync-mirror", client read or write access to volume is prevented. Data protection is impacted.

Corrective Action

Check network connection between the source and destination volumes. Monitor the SnapMirror Sync relationship status by using the "snapmirror show" command. Auto-resync will attempt to bring the relationship back to "in-sync" status.

Syslog Message

Source volume "%s" and destination volume "%s" with relationship UUID "%s" is in "out-of-sync" status due to the following reason: "%s".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.
error_msg (STRING): Error that caused the relationship to change to "out-of-sync" status.

sms.status.out.of.sync.cg

Severity

ERROR

Description

This message occurs when a SnapMirror® active sync relationship changes status from "in-sync" to "out-of-sync". Due to this RPO=0 data protection will be disrupted.

Corrective Action

Check the network connection between the source and destination volumes. Monitor the SnapMirror® active sync relationship status by using the "snapmirror show" command on the destination, and by using the "snapmirror list-destinations" command on the source. Auto-resync will attempt to bring the relationship back to "in-sync" status. If the resync fails, verify that all the nodes in the cluster are in quorum and are healthy.

Syslog Message

Source CG "%s" and destination CG "%s" with relationship UUID "%s" is in "out-of-sync" status. Reason: "%s".

Parameters

srccgpath (STRING): Source Consistency Group (CG) path.
dstcgpath (STRING): Destination CG path.
cg_relationship_id (STRING): CG relationship UUID.
error_msg (STRING): Error that caused the relationship to change to "out-of-sync" status.

sms.transition events

sms.transition.retry

Severity

NOTICE

Description

This message occurs when a SnapMirror® initialize or resynchronize operation takes a long time to bring the relationship "in-sync" due to intermittent failure. This is not an error yet so retry has triggered. If it fails on retry, the EMS "sms.resync.attempt.failed" will be raised.

Corrective Action

(None).

Syslog Message

Initialize/Resynchronize operation between source volume "%s" and destination volume "%s" with relationship UUID "%s" is taking a long time to bring the relationship InSync due to intermittent failure causing a retry.

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

smtape events

smtape.bkp events

smtape.bkp.abort.write.err

Severity

ERROR

Description

This message occurs when an SMTape backup operation is aborted because a write to tape device fails.

Corrective Action

Make sure that the tape device does not have media errors and is writable. Check for error details in the log file at /mroot/etc/log/backup.

Syslog Message

SMTape backup session %d from %s to %s was aborted because write to output failed.

Parameters

sessionid (INT): Session ID of the SMTape operation.
srcvolpath (STRING): SMTape source volume.
tapepath (STRING): Current destination device to which backup was performed.

smtape.bkp.fail

Severity

ERROR

Description

This message occurs when an SMTape backup operation to tape fails.

Corrective Action

Check for error details in the log file at /mroot/etc/log/backup. Retry the command after resolving the error reported.

Syslog Message

SMTape backup session %d from %s to %s failed with error %s.

Parameters

sessionid (INT): Session ID of the SMTape operation.
srcvolpath (STRING): SMTape source volume.
tapepath (STRING): Current destination device to which backup was performed.
errorstring (STRING): Error string returned by SMTape.

smtape.bkp.success

Severity

NOTICE

Description

This message occurs when an SMTape backup operation to tape succeeds.

Corrective Action

(None).

Syslog Message

SMTape backup session %d from %s to tape was successful. %s, %d tape(s) written.

Parameters

sessionid (INT): Session ID of the SMTape operation.
srcvolpath (STRING): SMTape source volume.
stats (STRING): Statistics for the SMTape backup.
numtapes (INT): Number of tapes used.

smtape.bkp.tape.busy

Severity

ERROR

Description

This message occurs when an SMTape backup to tape fails because the tape device is busy.

Corrective Action

Make sure that the tape device is not being used by another application and retry the operation when it is free. Otherwise, issue the command using a tape device that is not currently in use.

Syslog Message

Tape device is busy, aborting SMTape backup session %d from %s to %s.

Parameters

sessionid (INT): Session ID of the SMTape operation.
srcvolpath (STRING): SMTape source volume.
tapepath (STRING): SMTape destination tape device.

smtape.bkp.tape.change

Severity

NOTICE

Description

This message occurs when a CLI-based SMTape backup operation to tape reaches end of tape.

Corrective Action

Load the next tape media onto a drive and position it correctly, and then issue the 'system smtape continue -session-id [session-id] -tape [tapepath]' command with the new tape path.

Syslog Message

SMTape backup session %d from %s to %s is waiting for a tape change.

Parameters

> **sessionid** (INT): Session ID of the SMTape operation.
> **srcvolpath** (STRING): SMTape source volume.
> **tapepath** (STRING): Current destination tape device to which backup was performed.

smtape.rst events

smtape.rst.abort.chksum.err

Severity

> ERROR

Description

> This message occurs when an SMTape restore operation from tape is aborted due to checksum error.

Corrective Action

> Make sure that the correct tape is loaded and the tape is positioned correctly. If the tape is corrupted, contact NetApp technical support for the best effort recovery mechanisms.

Syslog Message

> SMTape restore session %d to %s from %s was aborted due to checksum error.

Parameters

> **sessionid** (INT): Session ID of the SMTape operation.
> **dstvolpath** (STRING): SMTape destination volume.
> **tapepath** (STRING): Current source device from which restore was performed.

smtape.rst.abort.read.err

Severity

> ERROR

Description

> This messages occurs when an SMTape restore operation is aborted because a read from the tape device fails.

Corrective Action

> Make sure that the input tape device and media are readable. Check for error details in the log file at /mroot/etc/log/backup.

Syslog Message

> SMTape restore session %d to %s from %s was aborted because read from input failed.

Parameters

> **sessionid** (INT): Session ID of the SMTape operation.
> **dstvolpath** (STRING): SMTape destination volume.
> **tapepath** (STRING): Current source device from which restore was performed.

smtape.rst.fail

Severity
ERROR

Description
This message occurs when an SMTape restore operation fails.

Corrective Action
Check for error details in the log file at /mroot/etc/log/backup. Retry the command after resolving the error reported.

Syslog Message
SMTape restore session %d to %s from %s failed with error %s.

Parameters
sessionid (INT): Session ID of the SMTape operation.
dstvolpath (STRING): SMTape destination volume.
tapepath (STRING): Current source device from which restore was performed.
errorstring (STRING): Error string returned by SMTape.

smtape.rst.success

Severity
NOTICE

Description
This message occurs when an SMTape restore operation from tape succeeds.

Corrective Action
(None).

Syslog Message
SMTape restore session %d from tape to %s was successful. %s.

Parameters
sessionid (INT): Session ID of the SMTape operation.
dstvolpath (STRING): SMTape destination volume.
stats (STRING): Statistics for the SMTape restore.

smtape.rst.tape.change

Severity
NOTICE

Description
This message occurs when a CLI-based SMTape restore operation from tape reaches end of tape.

Corrective Action
Load the next tape media onto a drive and position it correctly, and then issue the 'system smtape continue -session-id [session-id] -tape [tapepath]' command with the new tape path.

Syslog Message

SMTape restore session %d from %s to %s is waiting for a tape change.

Parameters

sessionid (INT): Session ID of the SMTape operation.
tapepath (STRING): Current source tape device from which restore was performed.
dstvolpath (STRING): SMTape destination volume.

snapdiff events

snapdiff.rebl events

snapdiff.rebl.absent.allocated.block

Severity

INFORMATIONAL

Description

This message occurs when SnapDiff®, the snapshot copy differencing engine, encounters an absent allocated block. The absent allocated block is replicated to destination as raid error and Replication is unaffected by this issue.

Corrective Action

None. Zombie count of 0 is expected even when zombie processing is ongoing.

Syslog Message

Encountered an absent allocated block on inode %u in snapshot copy ID %u of volume %u Zombie processing: %u.

Parameters

inode_num (INT): Identifier of the affected file.
snap_id (INT): Identifier of the snapshot.
fsid (INT): Identifier of the volume.
zombie_processing (INT): Ongoing zombie processing.

snapdiff.rebl.BadAccessTime

Severity

NOTICE

Description

This message occurs when SnapDiff®, the snapshot copy differencing engine, encounters an invalid access time for an inode. Future accesses of the inode should not only succeed, but also reset its access time to a valid value. Replication is also unaffected by this issue.

Corrective Action

Run the (privilege: advanced) "inodepath -v volume_name inode_number" command to find the path of the affected file from the inode number, and modify the file within the Active File System. Note that file attributes captured in a snapshot copy cannot be changed.

Syslog Message

Encountered invalid access time on inode %u in snapshot ID %u of volume %u.

Parameters

inode_num (INT): Identifier of the affected file.
snap_id (INT): Identifier of the snapshot.
fsid (INT): Identifier of the volume.

snapdiff.rebl.BadModifyTime

Severity

NOTICE

Description

This message occurs when SnapDiff®, the snapshot copy differencing engine, encounters an invalid modification time for an inode. Future accesses of the inode should not only succeed, but also reset its modification time to a valid value. Replication is also unaffected by this issue.

Corrective Action

Run the (privilege: advanced) "inodepath -v volume_name inode_number" command to find the path of the affected file from the inode number, and modify the file within the Active File System. Note that file attributes captured in a snapshot copy cannot be changed.

Syslog Message

Encountered invalid modify time on inode %u in snapshot ID %u of volume %u.

Parameters

inode_num (INT): Identifier of the affected file.
snap_id (INT): Identifier of the snapshot.
fsid (INT): Identifier of the volume.

snapdiff.spinnp events

snapdiff.spinnp.abort.mgwd

Severity

NOTICE

Description

This message occurs when the system encounters an unexpected condition while computing differences between snapshots using the SnapDiff v2 API.

Corrective Action

(None).

Syslog Message

Encountered unexpected Data ONTAP error while computing differences between snapshots using the SnapDiff v2 API. SnapDiff session ID %s, FlexGroup %s, in vserver %s, with MSID %lu, diff snapshot %s, diff snapshot ID %lu, base snapshot %s, base snapshot ID %lu, current constituent DSID %lu. Error: %s

Parameters

sessionId (STRING): SnapDiff v2 session ID.
fgName (STRING): FlexGroup name.
vsName (STRING): Vserver name.
fgMsid (LONGINT): FlexGroup MSID.
diffSnapName (STRING): Diff snapshot name.
diffSnapId (LONGINT): Diff snapshot logical ID.
baseSnapName (STRING): Base snapshot name.
baseSnapId (LONGINT): Base snapshot logical ID.

curDsid (LONGINT): Current constituent DSID.
error (STRING): Error message.

snapdiff.zapi events

snapdiff.zapi.filenameUnavailable

Severity

ERROR

Description

This message occurs when the snapshot differencing engine, SnapDiff, fails to obtain an appropriate file name for the requested file access protocol. The SnapDiff session is aborted and future attempts will fail until the problem is resolved.

Corrective Action

(Call support).

Syslog Message

Failed to get an appropriate file name for the requested file access protocol for directory entry with inode %u in directory with inode %u in snapshot %u of volume %u.

Parameters

inode_num (INT): Identifier of the directory entry.
parent_inode_num (INT): Identifier of the directory.
incr_snap_id (INT): Identifier of the incremental snapshot.
fsid (INT): Identifier of the volume.
base_snap_id (INT): Identifier of the base snapshot.

snaplock events

snaplock.disk events

snaplock.disk.import.7mode

Severity

ERROR

Description

This message occurs when the configuration management detects that an older(7-Mode) version of a SnapLock® disk is attached to a system running a Data ONTAP® release that cannot support it.

Corrective Action

Remove the SnapLock® disks from the system.

Syslog Message

File system %s has SnapLock® disks. This version of Data ONTAP® does not support older(7-Mode) SnapLock® versions

Parameters

disk_info (STRING): Formatted information about the disk.
shelf (STRING): Shelf identifier where the disk is located.
bay (STRING): Disk bay within the shelf where disk is located.
vendor (STRING): Name of the vendor of the disk.
model (STRING): Model string of the disk drive.
firmware_revision (STRING): Firmware revision number of the disk.
serialno (STRING): Serial number of the disk.
disk_type (INT): Type of disk drive.
disk_rpm (STRING): Rotational speed of disk in RPM.
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk drive is installed.
site (STRING): For a MetroCluster® configuration, indicates the site ("Local" or "Remote") where the disk is located. For non-MetroCluster configurations, the site is "Local".

snaplock.disk.on.unsupported.version

Severity

ERROR

Description

This event is issued when configuration management detects that a SnapLock® disk is attached to a system running ONTAP® release which doesn't support SnapLock®.

Corrective Action

Install a version of Data ONTAP that supports SnapLock, or remove the SnapLock disks.

Syslog Message

File system %s has SnapLock disks. This version of Data ONTAP does not support SnapLock.

Parameters

disk_info (STRING): Formatted information of the disk
shelf (STRING): Shelf identifier where the disk is located
bay (STRING): Disk bay within the shelf where disk is located
vendor (STRING): Name of the vendor of the disk
model (STRING): Model string of the disk drive
firmware_revision (STRING): Firmware revision number of the disk
serialno (STRING): Serial number of the disk
disk_type (INT): Type of disk drive
disk_rpm (STRING): Rotational speed of disk in RPM
failure_reason (STRING): A text description of storage error leading to disk failure.
carrier (STRING): Unique ID of the carrier in which the disk drive is installed.
site (STRING): For a MetroCluster configuration(tm), indicates the site {Local|Remote} where the disk is located. For non-MetroCluster configurations, site is 'Local'.

snaplock.event events

snaplock.event.based.retention.op.status

Severity

NOTICE

Description

This message occurs on completion of a event based retention apply operation on a SnapLock® volume.

Corrective Action

(None).

Syslog Message

An %s operation with ID %lu ended for policy "%s" and retention period "%s" on path %s in volume %s:%s with status: "%s", details: "%s". The operation passed on %lu files, failed on %lu files, skipped %lu files and ignored %lu inodes.

Parameters

operation_type (STRING): Type of the event based retention operation.
operation_id (LONGINT): Operation ID of the event based retention operation.
policy_name (STRING): Name of the event based retention policy.
retention_period (STRING): Retention period of the event based retention policy.
path (STRING): Path of the form '/(directory path)' relative to volume root.
vserver (STRING): Name of the vserver.
volume (STRING): Name of the SnapLock volume, on which event based retention operation is running.
operation_status (STRING): Status of the event based retention operation.
status_details (STRING): Completion string of the event based retention operation.
num_files_processed (LONGINT): Total count of files for which event based retention operation was performed.
num_files_failed (LONGINT): Total count of files for which event based retention operation failed.
num_files_skipped (LONGINT): Total count of files for which event based retention operation was skipped.
num_inodes_ignored (LONGINT): Total count of inodes which were ignored by event based retention operation because they are not regular files.

snaplock.invalid events

snaplock.invalid.autocommit

Severity

ERROR

Description

This message occurs when an invalid autocommit period value is found on a SnapLock® volume. ONTAP® 9.4 software and later releases have a maximum autocommit period value of 10 years. If this maximum is exceeded, autocommit is disabled on the volume.

Corrective Action

Correct the autocommit period on the SnapLock volume by using the "volume snaplock modify" command or the "volume-set-snaplock-attrs" Zephyr API.

Syslog Message

Disabling autocommit on SnapLock volume %s%s on the Vserver with ID %s because the autocommit period exceeded the maximum of 10 years.

Parameters

volume (STRING): Name of the SnapLock volume with invalid autocommit period value.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.legal events

snaplock.legal.hold.dump.files.op.status

Severity

NOTICE

Description

This message occurs on completion of a legal-hold dump-files operation on a SnapLock® compliance volume.

Corrective Action

(None).

Syslog Message

A legal-hold dump-files operation with ID %lu ended for litigation %s on volume %s:%s and output path: "%s", with status: "%s", details: "%s". The operation passed on %lu files, failed on %lu files, skipped %lu files and ignored %lu inodes.

Parameters

operation_id (LONGINT): Operation ID of the legal-hold dump-files operation.
litigation_name (STRING): Name of the litigation.
vserver (STRING): Name of the vserver.
volume (STRING): Name of the SnapLock compliance volume, on which legal-hold dump-files operation is running.
output_path (STRING): Output path of legal-hold dump-files operation.

operation_status (STRING): Status of the legal-hold dump-files operation.
status_details (STRING): Completion string of the legal-hold dump-files operation.
num_files_processed (LONGINT): Total count of files for which legal-hold dump-files operation was performed.
num_files_failed (LONGINT): Total count of files for which legal-hold dump-files operation failed.
num_files_skipped (LONGINT): Total count of files for which legal-hold dump-files operation was skipped.
num_inodes_ignored (LONGINT): Total count of inodes which were ignored by legal-hold dump-files operation because they are not regular files.

snaplock.legal.hold.dump.litigations.job.status

Severity

NOTICE

Description

This message occurs on completion of a legal-hold dump-litigations operation.

Corrective Action

(None).

Syslog Message

A legal-hold dump-litigations operation with ID %s ended for %s with status: "%s", details: "%s".

Parameters

job_id (STRING): Job ID of the legal-hold operation.
vserver_and_volume (STRING): Name of the vserver and volume (if any).
job_status (STRING): Status of the legal-hold dump-litigations job.
status_details (STRING): Completion string of the legal-hold dump-litigations job.

snaplock.legal.hold.op.status

Severity

NOTICE

Description

This message occurs on completion of a legal-hold begin or end operation on a SnapLock® compliance volume.

Corrective Action

(None).

Syslog Message

A legal-hold %s operation with ID %lu ended for litigation %s on path %s in volume %s:%s with status: "%s", details: "%s". The operation passed on %lu files, failed on %lu files, skipped %lu files and ignored %lu inodes.

Parameters

operation_type (STRING): Type of the legal-hold operation.
operation_id (LONGINT): Operation ID of the legal-hold operation.
litigation_name (STRING): Name of the litigation.
path (STRING): Path of the form '/(directory path)' relative to volume root.
vserver (STRING): Name of the vserver.

volume (STRING): Name of the SnapLock compliance volume, on which legal-hold operation is running.
operation_status (STRING): Status of the legal-hold operation.
status_details (STRING): Completion string of the legal-hold operation.
num_files_processed (LONGINT): Total count of files for which legal-hold operation was performed.
num_files_failed (LONGINT): Total count of files for which legal-hold operation failed.
num_files_skipped (LONGINT): Total count of files for which legal-hold operation was skipped.
num_inodes_ignored (LONGINT): Total count of inodes which were ignored by legal-hold operation because they are not regular files.

snaplock.mcc events

snaplock.mcc.veto.worm

Severity

ERROR

Description

This message occurs when SnapLock legal-hold or event based retention operations are aborted during a MetroCluster Switchback or a MetroCluster Switchover operation.

Corrective Action

(None).

Syslog Message

All SnapLock legal-hold and event based retention operations were aborted because a %s is in progress.

Parameters

mcc_op (STRING): Describes the operation i.e. a MetroCluster Switchback or a MetroCluster Switchover.

snaplock.nse events

snaplock.NSE.conflict

Severity

NOTICE

Description

This message occurs when any of the following commands could not be run against a SnapLock Compliance disk, since doing so could risk the destruction of compliance data: "storage encryption disk sanitize", "storage encryption disk destroy", "storage encryption disk revert-to-original-state".

Corrective Action

(None).

Syslog Message

"storage encryption disk sanitize/destroy/revert-to-original-state" command could not be run on SnapLock Compliance disk '%s' as it could risk the destruction of compliance data.

Parameters

disk (STRING): Name of the SnapLock Compliance disk.

snaplock.sfo events

snaplock.sfo.veto.worm

Severity

ERROR

Description

This message occurs when SnapLock legal-hold or event-retention operations are aborted during an aggregate relocation or a sendhome operation.

Corrective Action

(None).

Syslog Message

All SnapLock legal-hold and event based retention operations were aborted for aggregate %s because %s is in progress.

Parameters

aggr_name (STRING): Name of the aggregate for which operations were aborted.
arl_or_sendhome (STRING): Describes the operation i.e. an aggregate relocation or a sendhome.

snaplock.ss events

snaplock.ss.lockBadVolume

Severity

ALERT

Description

This event is generated if an attempt is made to lock a snapshot on a SnapLock volume that has previously failed to find or load its SnapLock snapshot state.

Corrective Action

Run wafliron on the volume.

Syslog Message

A snapshot on SnapLock volume '%s%s' on the Vserver with ID '%s', could not be locked because the SnapLock snapshot state could not be found or loaded for the volume.

Parameters

volume (STRING): The name of the SnapLock volume on which the snapshot could not be locked.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.badMagic

Severity

ALERT

Description

This event is generated if the SnapLock snapshot state on a SnapLock volume is corrupt with an invalid magic file identifier. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

The SnapLock snapshot state is corrupt with an invalid magic file identifier on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state is corrupt with an invalid magic file identifier.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.badSize

Severity

ALERT

Description

This event is generated if the SnapLock snapshot state on a SnapLock volume is corrupt with an incorrect size. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

The SnapLock snapshot state is corrupt with an incorrect size on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state is corrupt with an incorrect size.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.badState

Severity

ERROR

Description

This message occurs when SnapLock® Snapshot® copies on the volume are corrupted, which prevents updates on the lockvault from succeeding until this is corrected.

Corrective Action

Run the "snapshot fix-snaplock-state" command on this volume.

Syslog Message

The SnapLock snapshot state is corrupt on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): Name of the SnapLock volume on which the SnapLock Snapshot state is corrupt.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.badVersion

Severity

ALERT

Description

This event is generated if the SnapLock snapshot state on a SnapLock volume has an invalid version number. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

The SnapLock snapshot state has an invalid version number on SnapLock volume '%s%s' on the Vserver with ID '%s'. The bad version number found was %d and the expected version was %d.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state has an invalid version number.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.
bad_version (INT): The invalid version number of the SnapLock snapshot state.
expected_version (INT): The expected version number of the SnapLock snapshot state.

snaplock.ss.state.createFail

Severity

ALERT

Description

This event is generated if SnapLock is unable to create the state for the SnapLock snapshot state on a SnapLock volume. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

Failed to create the SnapLock snapshot state on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state could not be created.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.dir.createFail

Severity

ALERT

Description

This event is generated if SnapLock is unable to create the SnapLock state directory for storage of SnapLock state on a SnapLock volume.

Corrective Action

Run wafliron on this volume.

Syslog Message

Failed to create the SnapLock state directory for storage of SnapLock state on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock state directory could not be created.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.loadFail

Severity

ALERT

Description

This event is generated if the SnapLock snapshot state on a SnapLock volume failed to load. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

The SnapLock snapshot state could not be loaded from SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume from which the SnapLock snapshot state could not be loaded.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.notFound

Severity

ALERT

Description

This event is generated if the SnapLock snapshot state cannot be found on a SnapLock volume. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

The SnapLock snapshot state could not be found on SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state could not be found.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.upgradeFail

Severity

ALERT

Description

This event is generated if SnapLock is unable to upgrade the the SnapLock snapshot state on a SnapLock volume. This volume will not allow SnapLock locking or unlocking of any further snapshots until this erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

Failed to upgrade the SnapLock snapshot state to SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state could not be written.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.ss.state.writeFail

Severity

ALERT

Description

This event is generated if SnapLock is unable to write the the SnapLock snapshot state on a SnapLock volume. This volume will not allow SnapLock locking or unlocking of any further snapshots until this

erroneous volume state is corrected.

Corrective Action

Run wafliron on this volume.

Syslog Message

Failed to write the SnapLock snapshot state to SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock snapshot state could not be written.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.state events

snaplock.state.dir.destroyFail

Severity

NOTICE

Description

This event is generated if SnapLock is unable to destroy the SnapLock state for a SnapLock volume. This will not affect the operation of the reverted volume and does not require any corrective action.

Corrective Action

(None).

Syslog Message

Failed to destroy the SnapLock state for SnapLock volume '%s%s' on the Vserver with ID '%s'.

Parameters

volume (STRING): The name of the SnapLock volume on which the SnapLock state could not be destroyed.
app (STRING): Application Name.
volident (STRING): Unique identifier of the volume when the volume name itself is insufficient.

snaplock.sys events

snaplock.sys.compclock.set

Severity

NOTICE

Description

This message occurs when the system's compliance clock time and date is set.

Corrective Action

(None).

Syslog Message

The compliance clock time of the system has been set to %s. Reason: %s.

Parameters

date (STRING): Human-readable compliance clock date and time.
reason (STRING): Reason for initialization of the system's compliance clock.

snaplock.sys.compclock.skew.fixed

Severity

NOTICE

Description

This message occurs when the SnapLock® system compliance clock time is skewed from the storage system's system clock by more than one day and skew is subsequently fixed.

Corrective Action

(None).

Syslog Message

The system compliance clock time (%s) was skewed from the system clock (%s) by more than one day. The system compliance clock time has been reset to the system clock time.

Parameters

system_compliance_clock_time (STRING): Human readable system compliance clock time.
system_time (STRING): Human readable system time.

snaplock.trans events

snaplock.trans.autocommit

Severity

NOTICE

Description

This message occurs when autocommit period is adjusted on a Snaplock volume upon transition. When a 7 mode SnapLock volume is transitioned to Data ONTAP® 9.4 and later, if we find the autocommit period to be greater than 10 years, we change it to 10 years, which is the maximum supported value for autocommit period in Data ONTAP® 9.4.

Corrective Action

(None).

Syslog Message

Autocommit period on SnapLock volume %s%s on the Vserver with ID %s is changed from %s to 10 years upon transition.

Parameters

volume (STRING): Name of the SnapLock volume on which autocommit period was adjusted upon transition.
app (STRING): Application Name.

volident (STRING): Unique identifier the volume in cases where the volume name itself is insufficient.
old_autocommit_period (STRING): Autocommit period of the SnapLock volume in 7 mode.

snaplock.user events

snaplock.user

Severity

NOTICE

Description

This message occurs when the SnapLock® logging system fails to securely log either the addition or deletion of the compliance admin role to or from a user account. The actual operation might have succeeded.

Corrective Action

No corrective action is necessary. However, a secure log of the request might not exist and the SnapLock log volume should be checked for correct operation.

Syslog Message

There was a problem securely logging the %s of the "%s" role %s the user "%s" by "%s". Reason: %s

Parameters

event (STRING): Identifies whether the role was added or deleted.
role (STRING): Name of the compliance admin role.
tofrom (STRING): Describes whether the role is being added to or deleted from the user account.
username (STRING): User name to or from which the role is being added or deleted.
whodidit (STRING): Name of the user performing the operation.
reason (STRING): Reason for the logging failure.

snaplock.vcc events

snaplock.vcc.assoc.mismatch

Severity

INFORMATIONAL

Description

This message occurs when the system detects mismatch in the SnapLock® volume compliance clock association with the system compliance clock. This can happen when the volume compliance clock's node ID is different from system's node ID or when volume compliance clock's scc ID is different from system compliance clock's ID or when both differ from each other.

Corrective Action

(None).

Syslog Message

Volume compliance clock association on volume %s does not match the system compliance clock at %s and its compliance clock is now reassociated with the system compliance clock.

Parameters

volume (STRING): Name of the volume that had the compliance clock association mismatch.
date (STRING): Human readable system compliance clock time at which the VCC-SCC association mismatch is detected.

snaplock.vol events

snaplock.vol.compclock.skewed

Severity

NOTICE

Description

This event is generated when the SnapLock® volume compliance clock time is skewed from the SnapLock system compliance clock by more than one day.

Corrective Action

(None).

Syslog Message

The compliance clock time (%s) of volume '%s' is skewed from the system compliance clock (%s) by more than one day.

Parameters

volume_compliance_clock_time (STRING): Human readable volume compliance clock time.
volume_name (STRING): Volume name.
system_compliance_clock_time (STRING): Human readable system compliance clock time.

snaplock.volume events

snaplock.volume.repair

Severity

NOTICE

Description

This message occurs when wafliron is run on a SnapLock® volume. If inconsistency is detected, wafliron will repair SnapLock volume. File system data before inconsistency occurred and the file system data after repair, may be different. WORM protected data may be changed. Administrator must ensure that the data on the volume is verified and restored, if needed, from backup copy or replica.

Corrective Action

(None).

Syslog Message

%s repair such as wafliron has been issued on SnapLock %s '%s'. %s data may be changed.

Parameters

vtype1 (STRING): type of volume.
vtype2 (STRING): type of volume.

volume (STRING): The name of the SnapLock volume on which volume repair is issued.
vtype3 (STRING): type of volume.

snapmirror events

snapmirror.block events

snapmirror.block.on.reconstruct

Severity

NOTICE

Description

This message occurs when a SnapMirror® operation needs to reconstruct the block type bits. The SnapMirror transfer is paused, resuming only after the block type bits for the data to be transferred have been reconstructed.

Corrective Action

If you do not want the SnapMirror transfer to pause until the block type bit reconstuction is complete, abort the transfer, allow the reconstruction to finish, and then try the SnapMirror transfer again.

Syslog Message

Starting reconstruction on %s. SnapMirror transfer from %s to %s:%s is blocked until the reconstruction is complete. If you do not want the SnapMirror transfer to be paused until the block type bit reconstuction is complete, abort the transfer, allow the reconstruction to finish, and then try the SnapMirror transfer again.

Parameters

volume (STRING): SnapMirror volume.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.

snapmirror.block.reconstructErr

Severity

ERROR

Description

This event is issued when a SnapMirror operation needs to reconstruct block type bits, but this operation cannot be started.

Corrective Action

Please check for any other error message returned.

Syslog Message

Unable to start block type bits reconstruction on %s, %s

Parameters

volume (STRING): The snapmirror volume
error (STRING): Description of the error.

snapmirror.conf events

snapmirror.conf.depre.cpsync

Severity

ERROR

Description

This message occurs when there an entry in the snapmirror.conf file is configured to use the outstanding value of greater than or equal to 10 seconds. This method of specifying cp-sync mode for the SnapMirror®, is being deprecated in ONTAP 7.3. You should use the new keyword "semi-sync" to configure cp-sync mode. See the na_snapmirror.conf man page for details.

Corrective Action

Edit the /etc/snapmirror.conf file to convert the relationship to use the "semi-sync" keyword. See the man page for details about usage.

Syslog Message

Entry for SnapMirror relationship %s:%s to %s:%s in the /etc/snapmirror.conf is using a deprecated format to specify cp-sync mode. See the na_snapmirror.conf man page for the new format.

Parameters

src_filer (STRING): Source system.
src_path (STRING): Source path.
dst_filer (STRING): Destination system.
dst_path (STRING): Destination path.

snapmirror.conf.full

Severity

ERROR

Description

This message occurs when the /etc/snapmirror.conf file in the SnapMirror® destination has more than the maximum allowed SnapMirror relationships.

Corrective Action

Reduce the number of SnapMirror relationships in the /etc/snapmirror.conf file to the maximum allowed limit.

Syslog Message

Warning from the SnapMirror configuration parser, error in line number '%d' of snapmirror.conf file, '%s'

Parameters

lineno (INT): Line number in the /etc/snapmirror.conf file.
msg (STRING): Reason for the error.

snapmirror.conf.invalidStr

Severity

ERROR

Description

This message occurs on a replication destination appliance when ONTAP encounters invalid string while collecting replication statistics.

Corrective Action

Check snapmirror.conf file for any typing mistakes. In case of a relationship line, path names are typically specified as "filer:volume" or "filer:/vol/volume/qtree". In case of a connection line check for an equal sign. Check snapmirror.conf man page for discussion of path specifications.

Syslog Message

Illegal string: %s.

Parameters

snapconfstr (STRING): The relationship or connection line.

snapmirror.conf.obsolete.nvsync

Severity

ERROR

Description

This message occurs when there exists an entry in the snapmirror.conf file that is configured to use the outstanding value of greater than 0 seconds and fewer than 10 seconds. This mode (nvlog semi-sync) is obsolete in ONTAP 7.3. When it is configured in this mode, the relationship is converted automatically to a fully synchronous relationship.

Corrective Action

Edit the /etc/snapmirror.conf file to convert the relationship to either a fully synchronous relationship with "sync" parameter or a cp semi-synchronous relationship with "semi-sync" parameter.

Syslog Message

SnapMirror relationship %s:%s to %s:%s is being converted to a fully synchronous relationship since the functionality provided by setting the outstanding parameter to a value greater than 0 and less than 10s in the snapmirror.conf file is obsolete.

Parameters

src_filer (STRING): Source system.
src_path (STRING): Source path.
dst_filer (STRING): Destination system.
dst_path (STRING): Destination path.

snapmirror.copy events

snapmirror.copy.baseLine.done

Severity

INFORMATIONAL

Description

This message occurs when the baseline transfer of a SnapMirror® copy for a volume is completed and the volume comes online.

Corrective Action

(None).

Syslog Message

Baseline transfer for volume %s completed.

Parameters

dstpath (STRING): Destination volume.

snapmirror.copy.completed

Severity

INFORMATIONAL

Description

This message occurs when the final update of a SnapMirror® copy for a volume is successfully completed and the volume is ready for transition.

Corrective Action

(None).

Syslog Message

Volume %s is now ready for transition.

Parameters

dstpath (STRING): Destination volume.

snapmirror.copy.FailedErr

Severity

ERROR

Description

This message occurs when a SnapMirror® copy relation gets an error notitication from the SnapMirror engine.

Corrective Action

(None).

Syslog Message

SnapMirror copy for volume %s failed. Reason for failure: %s.

Parameters

dstpath (STRING): Destination volume.
reason (STRING): Reason of failure.

snapmirror.copy.pause.srcNoNewData

Severity

INFORMATIONAL

Description

This message occurs when the source volume of a SnapMirror® copy relation is typed 'replica read only' and has no new data to transfer. Transfer to its destiantion is paused.

Corrective Action

If new data has been populated on the source volume by a SnapMirror schedule or manual update, run the 'snapmirror copy resume' command to restart the paused transfer. If no new data is expected on source volume,run the 'snapmirror copy complete'command to complete the volume transition.

Syslog Message

The source contains no new data; transfer to destination %s is paused.

Parameters

dstpath (STRING): Destination volume.

snapmirror.copy.readyFinal

Severity

INFORMATIONAL

Description

This message occurs when the update time taken by the latest transfer is smaller than the delta time. The volume is now ready for final update.

Corrective Action

(None).

Syslog Message

Destination volume %s is ready for final update.

Parameters

dstpath (STRING): Destination volume.

snapmirror.corrupted events

snapmirror.corrupted.replay

Severity

ALERT

Description

This message occurs when metadata replay fails in the process of making a Synchronous SnapMirror® destination flexible volume writable. This failure occurs because the filesystem on disk is corrupt.

Corrective Action

This error will not allow the destination volume to be made writable. Wafliron must be run on the destination to correct the filesystem consistency. Once the inconsistency is fixed, snapmirror break can be attempted again.

Syslog Message

Synchronous SnapMirror cannot proceed with snapmirror break for volume '%s' in containing aggregate '%s' because the filesystem on disk is corrupt.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume
dst_aggr (STRING): The name of the aggregate containing the destination volume

snapmirror.dst events

snapmirror.dst.abortOps

Severity

ERROR

Description

This event is issued when a SnapMirror incremental transfer to a destination volume is nearing completion and has to abort any dump, vol copy, snapmirror or snapvault operations from that volume.

Corrective Action

(None).

Syslog Message

Aborting any dump, vol copy, aggr copy, snapmirror or snapvault operations from %s; snapmirror incremental transfer to it is nearing completion.

Parameters

dst (STRING): SnapMirror destination volume

snapmirror.dst.autoRestrictMsg

Severity

NOTICE

Description

This event is issued when a SnapMirror initialize is issued on a volume or aggregate which is offline.

Corrective Action

SnapMirror initialize is issued on a restricted volume, use "vol/aggr restrict" to restrict the destination volume/aggregate.

Syslog Message

SnapMirror automatically restricting destination %s %s (currently offline).

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination volume

snapmirror.dst.cannotFind

Severity

ERROR

Description

This event is issued when a SnapMirror incremental transfer is issued on a volume which is offline, restricted or does not exist.

Corrective Action

Please make sure you entered the destination volume name correctly.

Syslog Message

Destination %s %s is offline, is restricted, or does not exist, SnapMirror operation terminated.

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination

snapmirror.dst.chk.stats

Severity

INFORMATIONAL

Description

Statistical information reported by "snapmirror check".

Corrective Action

(None).

Syslog Message

(None).

Parameters

dstpath (STRING): The destination volume.
statistics (STRING): Statistical information in the format: block_no - offset : src_val, dst_val block_no denotes whether it is vbn1 or 2. offset is the byte from the start of the block. src_val is the value of that offset at the src, while dst_val is at the destination.

snapmirror.dst.chkDegradedMirrorErr

Severity

ERROR

Description

This message occurs when a replication 'check' operation is issued on a SnapMirror® destination volume that is smgr-mirrored and its smgr-mirror state is mirror-degraded or resyncing.

Corrective Action

Restore the smgr-mirror state to normal or break the existing smgr-mirror relationship and try again. If available, see the diagnostic man pages and the 'aggr' command man pages for details.

Syslog Message

Destination volume '%s' is smgr-mirrored and mirror-degraded or resyncing. Cannot execute a replication 'check' operation.

Parameters

dstpath (STRING): The destination volume.

snapmirror.dst.chkDone

Severity

NOTICE

Description

This event is issued when the destination in a SnapMirror®/SnapVault(tm) relationship has finished a replication 'check' operation and no mismatches were found on the destination volume or qtree.

Corrective Action

(None).

Syslog Message

Replication 'check' from %s:%s to %s completed and no mismatches were found.

Parameters

srcfiler (STRING): The source appliance.
srcpath (STRING): The source path.
dstpath (STRING): The destination path.

snapmirror.dst.chkDoneErr

Severity

ERROR

Description

This event is issued when the destination in a SnapMirror®/SnapVault(tm) relationship has finished a replication 'check' operation and mismatches were found on the destination volume or qtree.

Corrective Action

Run replication fix ('check -F') to fix the mismatches in the relationship.

Syslog Message

Replication 'check' from %s:%s to %s found mismatches. Please run replication fix ('check -F') to fix these mismatches.

Parameters

srcfiler (STRING): The source appliance.
srcpath (STRING): The source path.
dstpath (STRING): The destination path.

snapmirror.dst.chkSnapInfo

Severity

INFORMATIONAL

Description

This message occurs at the destination appliance of a SnapMirror® 'check' operation to notify the appliance about which base snapshot will be used for the operation.

Corrective Action

(None).

Syslog Message

Snapmirror 'check' from '%s':'%s' to '%s' will use '%s' as the base snapshot. All snapshots older than and including the base snapshot on the source volume will be used.

Parameters

srcfiler (STRING): Source appliance.
srcpath (STRING): Source path.
dstpath (STRING): Destination path.
snapname (STRING): Name of the base snapshot.

snapmirror.dst.chkSyncErr

Severity

ERROR

Description

This message occurs on the destination system when a SnapMirror® 'check' operation is run on a Synchronous SnapMirror destination volume that has not been quiesced.

Corrective Action

Quiesce the destination volume by running the 'snapmirror quiesce' command before starting the SnapMirror 'check' operation.

Syslog Message

Could not run a SnapMirror 'check' operation on destination volume '%s', a Synchronous SnapMirror destination volume that has not been quiesced.

Parameters

dstpath (STRING): Destination volume.

snapmirror.dst.chkVersionErr

Severity

ERROR

Description

This message occurs on the destination system of a SnapMirror® 'check' operation when the source system's ONTAP version does not support SnapMirror 'check' on FlexVol® volumes.

Corrective Action

(None).

Syslog Message

ONTAP version at source '%s' does not support SnapMirror 'check' on flexible volumes. Cannot execute a SnapMirror 'check' operation.

Parameters

srcfiler (STRING): Source system.

snapmirror.dst.directoryOperationFailASCII

Severity

ERROR

Description

This event is issued when a SnapVault or Qtree SnapMirror destination encounters an error in a directory operation - typically creating an entry, or trying to move an entry to purgatory (for rename or delete), and the name entry consists only of ASCII characters.

Corrective Action

It may be necessary to break and reinitialize the relationship. Contact NetApp technical support.

Syslog Message

Logical replication destination directory operation failed: source inode %d, name="%s%s%s".

Parameters

srcInum (INT): The inode number of the file (or directory, link, etc.) on the source system.
n1 (STRING): The first of three name components. When combined, these will either be the path to the file on the destination system (usual case), or the NFS name and NFS alternate name of the directory entry (in those cases where we run into trouble building the full path).
n2 (STRING): The second of three name components.
n3 (STRING): The last of three name components.

snapmirror.dst.directoryOperationFailIntl

Severity

ERROR

Description

This event is issued when a SnapVault or Qtree SnapMirror destination encounters an error in a directory operation - trying to create, rename, or delete an entry. This event can occur as a result of the conditions that cause burts 106216 and 110298.

Corrective Action

If the destination volume's "vol lang" was changed after the baseline transfer, then the relationship may need to be broken and reinitialized. Please be aware that "vol lang" does not take effect on the volume until the filer is rebooted; thus, if a baseline transfer occurs after the setting was changed but before the filer was rebooted, then the "vol lang" actually changes after the baseline transfer takes place. If no change in the destination volume's "vol lang" has occurred, you may need to change the source volume's language to match that on the destination volume. For guidelines on this procedure, please contact NetApp technical support.

Logical replication destination directory operation failed: source inode %d, name="%s%s%s". If the destination volume's "vol lang" was changed after the baseline transfer, then the relationship may need to be broken and reinitialized.

Parameters

srcInum (INT): The inode number of the file (or directory, link, etc.) on the source system.
n1 (STRING): The first of three name components. When combined, these will either be the path to the file on the destination system (usual case), or the NFS name and NFS alternate name of the directory entry (in those cases where we run into trouble building the full path).
n2 (STRING): The second of three name components.
n3 (STRING): The last of three name components.

snapmirror.dst.fixDone

Severity

NOTICE

Description

This event is issued when the destination in a SnapMirror®/SnapVault(tm) relationship has successfully finished a replication fix ('check -F') operation.

Corrective Action

(None).

Syslog Message

Replication fix ('check -F') from %s:%s to %s completed successfully.

Parameters

srcfiler (STRING): The source appliance.
srcpath (STRING): The source path.
dstpath (STRING): The destination path.

snapmirror.dst.fixUsingPriorChk

Severity

NOTICE

Description

This event is issued when a relationship fix ('check -F') operation issued on a SnapMirror® destination volume is leveraging a previously executed replication 'check' operation and thus does not require to recompute the mismatches.

Corrective Action

(None).

Syslog Message

Replication fix ('check -F') from %s:%s to %s is leveraging a previously executed replication 'check' operation and does not require re-computation of the mismatches for the relationship.

Parameters

> **srcfiler** (STRING): The source appliance.
> **srcpath** (STRING): The source path.
> **dstpath** (STRING): The destination path.

snapmirror.dst.multipath.connErr

Severity

> ERROR

Description

> This event is issued when the SnapMirror destination filer is unable to setup a multipath connection with the source filer. This can happen in case of a network connection failure or due to the lack of resources on the destination filer.

Corrective Action

> Check network connectivity and also make sure that a maximum number of SnapMirror transfers are not going on.

Syslog Message

> SnapMirror is unable to setup a multipath connection to %s, resorting to the standard single TCP connection.

Parameters

> **dstpath** (STRING): SnapMirror destination

snapmirror.dst.multipath.maxConnErr

Severity

> NOTICE

Description

> This event is issued when the SnapMirror destination filer has reached the maximum number of active SnapMirror multipath connections that it can support.

Corrective Action

> Wait for some active SnapMirror transfers to complete and free up the necessary resources; then retry this transfer.

Syslog Message

> SnapMirror has reached the maximum number of active multipath connections, unable to allocate resources for a multipath transfer to %s.

Parameters

> **dstpath** (STRING): SnapMirror destination

snapmirror.dst.noBuffers

Severity

> ERROR

Description

This event is issued when no buffers are available on the SnapMirror destination.

Corrective Action

(None).

Syslog Message

No buffers available on SnapMirror destination.

Parameters

(None).

snapmirror.dst.noSnapshots

Severity

ERROR

Description

SnapMirror requires the presence of a common base snapshot on the source and the destination for doing an incremental transfer. This event is issued when a SnapMirror incremental transfer is issued on a volume or aggregate which has no snapshots, as such the transfer is aborted.

Corrective Action

Since there are no snapshots on the destination volume/aggregate, the only way to establish a SnapMirror is by doing a SnapMirror initialize.

Syslog Message

SnapMirror found no snapshots in destination %s %s, aborting transfer.

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination

snapmirror.dst.OnlineCompres

Severity

ERROR

Description

This message occurs when SnapMirror® cannot bring the destination online after a transfer because compression is not supported in this version of ONTAP.

Corrective Action

Install a version of ONTAP that supports compression, available from your vendor.

Syslog Message

SnapMirror could not bring destination volume %s online. Compression is not supported in this version of ONTAP.

Parameters

dst (STRING): SnapMirror destination.

snapmirror.dst.OnlineErr

Severity

ERROR

Description

This event is issued when SnapMirror is not able to bring the destination online after a transfer.

Corrective Action

(None).

Syslog Message

SnapMirror not able to bring destination %s %s online, %s.

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): SnapMirror destination
error (STRING): The error message

snapmirror.dst.onlineFailed

Severity

ERROR

Description

This event is issued when after SnapMirror transfer it is not able to bring the destination online.

Corrective Action

(None).

Syslog Message

Failed to bring destination %s %s online (%d,%d).

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination
errcode1 (INT): Error code 1
errcode2 (INT): Error code 2

snapmirror.dst.OnlineNotComp

Severity

ERROR

Description

This message occurs when SnapMirror® cannot bring the destination online after a transfer because SnapLock® is not supported on this version of ONTAP.

Corrective Action

Install a version of ONTAP that is supported with SnapLock, available from your vendor.

Syslog Message

SnapMirror could not bring destination %s %s online. SnapLock is not supported on this version of ONTAP.

Parameters

type (STRING): Type of object (volume or aggregate).
dst (STRING): SnapMirror destination.

snapmirror.dst.requestDenied

Severity

ERROR

Description

This event is issued when the destination filer requesting a SnapMirror transfer from the source filer is denied the transfer request.

Corrective Action

Please check the error message on source.

Syslog Message

SnapMirror transfer request for %s from %s denied, %s.

Parameters

dstpath (STRING): The SnapMirror destination, can be volume or qtree
srcfiler (STRING): The SnapMirror source filer
error (STRING): The error message

snapmirror.dst.restart.createErr

Severity

ERROR

Description

This event is issued when SnapMirror is not able to create files required for a restart

Corrective Action

(None).

Syslog Message

SnapMirror not able to create %s which is needed for restart.

Parameters

filepath (STRING): The file SnapMirror is not able to create

snapmirror.dst.restart.failed

Severity

NOTICE

Description

This event is issued when SnapMirror restart negotiation fails.

Corrective Action

(None).

Syslog Message

SnapMirror restart negotiation failed.

Parameters

(None).

snapmirror.dst.restart.invalidChkpt

Severity

NOTICE

Description

This event is issued when an invalid restart checkpoint is detected on the destination.

Corrective Action

(None).

Syslog Message

Restart checkpoint for destination volume %s is no longer valid, removing checkpoint.

Parameters

dst (STRING): The SnapMirror destination volume

snapmirror.dst.restart.invalidSnaps

Severity

ERROR

Description

This very rare message occurs on a replication destination appliance, when SnapMirror® detects that a transfer restarted from a checkpoint is attempting to transfer additional snapshots that were not recorded in the checkpoint. In this case, SnapMirror aborts the transfer and clears the checkpoint to prevent corruption on the destination appliance.

Corrective Action

No action is required for a scheduled SnapMirror transfer. The next scheduled transfer starts from the beginning. If you manually initiated this transfer, manually start a new transfer.

Syslog Message

SnapMirror cannot restart the transfer from %s:%s to %s due to a change in the state of snapshots on the source appliance. The checkpoint has been cleared, and the next transfer will start from beginning.

Parameters

srcfiler (STRING): Source appliance.
srcpath (STRING): SnapMirror source volume.

dstpath (STRING): SnapMirror destination volume.

snapmirror.dst.restart.noRootVol

Severity
ERROR

Description
This event is issued when SnapMirror destination is not able to find the root volume.

Corrective Action
(None).

Syslog Message
Cannot find root volume.

Parameters
(None).

snapmirror.dst.restart.readErr

Severity
ERROR

Description
This event is issued when SnapMirror is not able to read files which were created for a restart.

Corrective Action
(None).

Syslog Message
SnapMirror not able to read %s which is needed for restart.

Parameters
filepath (STRING): The file SnapMirror is not able to read

snapmirror.dst.restart.writeErr

Severity
ERROR

Description
This event is issued when SnapMirror is not able to write to files which were created for a restart.

Corrective Action
(None).

Syslog Message
SnapMirror not able to write to %s which is needed for restart.

Parameters

> **filepath** (STRING): The file SnapMirror is not able to write to

snapmirror.dst.resync.info

Severity

> NOTICE

Description

> This event is issued when a SnapMirror resync operation is successful and tells the base snapshot being used.

Corrective Action

> (None).

Syslog Message

> SnapMirror resync of %s to %s:%s is using %s as the base snapshot.

Parameters

> **dstpath** (STRING): SnapMirror destination volume or qtree
> **srcfiler** (STRING): SnapMirror source filer
> **srcpath** (STRING): SnapMirror source volume or qtree
> **basesnapname** (STRING): The base snapshot being used.

snapmirror.dst.resync.noAction

Severity

> NOTICE

Description

> This event is issued when a SnapMirror resync -n is executed.

Corrective Action

> (None).

Syslog Message

> SnapMirror resync of %s not performed because -n(ot really) option set.

Parameters

> **dstpath** (STRING): SnapMirror destination

snapmirror.dst.revertAggr

Severity

> NOTICE

Description

> This event is issued when a SnapMirror initialize operation has to revert the checksum state of the destination aggregate because the source and destination aggregate have differing checksum states.

Corrective Action

No corrective action required.

Syslog Message

A SnapMirror transfer to destination aggregate %s has found that the source and destination aggregates have differing checksum states. Data ONTAP is aborting the transfer and reverting the checksum state for the destination aggregate. After ONTAP displays a message showing the revert is complete, you will need to retry the operation. You can use the "aggr status -c" command to see the progress of the reversion.

Parameters

dst (STRING): The SnapMirror destination aggregate

snapmirror.dst.revertErr

Severity

ERROR

Description

This event is issued when a SnapMirror initialize operation is not able to revert the checksum state of the destination volume.

Corrective Action

(None).

Syslog Message

ONTAP cannot revert the checksum state of destination %s %s.

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination

snapmirror.dst.reverting

Severity

ERROR

Description

This event is issued when a SnapMirror initialize operation is issued on a volume/aggregate which is reverting its checksum state.

Corrective Action

(None).

Syslog Message

Aborting SnapMirror transfer to %s %s because it is reverting its checksum state.

Parameters

volaggr (STRING): Whether volume or aggregate
dst (STRING): The SnapMirror destination volume

snapmirror.dst.revertVol

Severity

ERROR

Description

This event is issued when a SnapMirror initialize operation has to revert the checksum state of the destination volume because the source and destination have differing checksum states.

Corrective Action

No corrective action required.

Syslog Message

A SnapMirror transfer to destination volume %s has found that the source and destination volumes have differing checksum states. Data ONTAP is aborting the transfer and reverting the checksum state for the destination volume. After ONTAP displays a message showing the revert is complete, you will need to retry the operation. You can use the "vol status -c" command to see the progress of the reversion.

Parameters

dst (STRING): The SnapMirror destination

snapmirror.dst.snapCreateWarning

Severity

NOTICE

Description

This event is issued when a named snapshot creation at the end of a qtree SnapMirror transfer fails. Since the transfer succeeded, only the snap create in the end failed, we just issue a warning.

Corrective Action

(None).

Syslog Message

SnapMirror transfer from %s:%s to %s : creation of named snapshot "%s" failed.

Parameters

srcfiler (STRING): The SnapMirror source filer
srcpath (STRING): The SnapMirror source qtree
dstpath (STRING): The SnapMirror destination qtree
snapname (STRING): The snapshot which was supposed to be created on the destination volume

snapmirror.dst.snapDelErr

Severity

ERROR

Description

This event is issued when on a SnapMirror incremental the snapshot that SnapMirror tries to delete in the destination volume is softlocked.

Corrective Action

(None).

Syslog Message

Snapshot %s in destination volume %s is in use, cannot delete.

Parameters

snapname (STRING): The snapshot which is locked
dst (STRING): The SnapMirror destination volume

snapmirror.dst.sync.chkErr

Severity

ERROR

Description

This message occurs when a SnapMirror® destination volume tries to go into sync while an active SnapMirror 'check' operation is in progress.

Corrective Action

The mirror gets back into sync after the SnapMirror 'check' operation is complete. To expedite this process, abort the ongoing SnapMirror 'check' operation by running the 'snapmirror check abort' command on the destination system.

Syslog Message

The destination volume '%s' has an active SnapMirror 'check' operation in progress. Could not go into sync.

Parameters

dstpath (STRING): Destination volume.

snapmirror.dst.sync.mm.nvlog

Severity

ERROR

Description

This message occurs when NVLOG version mismatch between the source and destination appliance prevents the use of synchronous SnapMirror®. The source and destination appliances must use the same version of NVLOG to mirror synchronously. ONTAP will use periodic updates to mirror the volume until the mismatch is resolved.

Corrective Action

Upgrade the source or destination appliance so that they both use the same NVLOG version. It is also recommended that both appliances run the same version of ONTAP.

Syslog Message

NVLOG version mismatch for Synchronous SnapMirror from %s:%s to %s. The source and destination appliances must use the same NVLOG version to mirror synchronously. Reverting to periodic updates to mirror the volume.

Parameters

    srcfiler (STRING): Name of the SnapMirror source appliance.
    srcpath (STRING): Name of the SnapMirror source volume.
    dstpath (STRING): Name of the SnapMirror destination volume.

snapmirror.dst.sync.mm.proto

Severity

    ERROR

Description

    This message occurs when a protocol version mismatch between the source and destination appliance prevents the use of synchronous SnapMirror®. The source and destination appliances must use the same version of protocol to mirror synchronously. ONTAP will use periodic updates to mirror the volume until the mismatch is resolved.

Corrective Action

    Upgrade the source or destination appliance so that they both use the same protocol version. It is also recommended that both appliances run the same version of ONTAP.

Syslog Message

    Protocol version mismatch for Synchronous SnapMirror from %s:%s to %s. The source and destination appliances must use the same protocol version to mirror synchronously. Reverting to periodic updates to mirror the volume.

Parameters

    srcfiler (STRING): Name of the SnapMirror source appliance.
    srcpath (STRING): Name of the SnapMirror source volume.
    dstpath (STRING): Name of the SnapMirror destination volume.

snapmirror.dst.updateDelayed

Severity

    NOTICE

Description

    This event is issued when an update request is received on a destination qtree, which is being used as the source for another transfer.

Corrective Action

    (None).

Syslog Message

    Transfer from %s to %s:%s is in progress, SnapMirror transfer from %s:%s delayed.

Parameters

    dstpath (STRING): The SnapMirror destination
    dstfiler2 (STRING): The destination filer for dstpath
    dstpath2 (STRING): The destination for dstpath
    srcfiler (STRING): The source filer for dstpath
    srcpath (STRING): The source for dstpath

snapmirror.flextotraderr events

snapmirror.flexToTradErr

Severity

ERROR

Description

This message occurs when the user tries to copy a flexible volume into a traditional volume using SnapMirror®.

Corrective Action

Retry the operation with a flexible volume as the destination.

Syslog Message

snapmirror: A flexible volume cannot be copied into a traditional volume.

Parameters

(None).

snapmirror.log events

snapmirror.log.openErr

Severity

ERROR

Description

This event is issued when an error is encountered when opening the SnapMirror log file for writing.

Corrective Action

(None).

Syslog Message

Failed to open SnapMirror log file: %s.

Parameters

error (STRING): The error encountered while opening the SnapMirror log file for writing.

snapmirror.log.unknownEvent

Severity

ERROR

Description

This event is issued when an unknown event is sent to be logged in the SnapMirror log file.

Corrective Action

(None).

SnapMirror log encountered unknown event : %d.

Parameters

event (INT): The unknown event

snapmirror.log.writeErr

Severity

ERROR

Description

This event is issued when an error is encountered when writing to the SnapMirror log file.

Corrective Action

(None).

Syslog Message

Failed to write to SnapMirror log file: %s.

Parameters

error (STRING): The error encountered while writing to the SnapMirror log file.

snapmirror.lrs events

snapmirror.lrs.FiletypeMod

Severity

ALERT

Description

This message occurs when SnapMirror encounters mismatched file types between two snapshots that it is comparing. The transfer is aborted and future attempts fail until the problem is resolved.

Corrective Action

Contact NetApp technical support.

Syslog Message

SnapMirror encountered mismatched file types for inode %u in volume %u. It has file type %u in snapshot %u and a file type %u in snapshot %u.

Parameters

inode_num (INT): Identifier of the affected file.
fsid (INT): FSID of the volume.
base_filetype (INT): File type of the file in the base snapshot.
base_snap_id (INT): Identifier of the base snapshot.
incr_filetype (INT): File type of the file in the incremental snapshot.
incr_snap_id (INT): Identifier of the incremental snapshot.

snapmirror.metadata events

snapmirror.metadata.create.fail

Severity

ERROR

Description

This message occurs when a Synchronous SnapMirror® destination flexible volume is unable to enter synchronous replication mode because the containing aggregate does not have enough space left to allow the update to proceed.

Corrective Action

This error can be fixed by creating more space in the containing aggregate. This can be done by adding additional disks to the containing aggregate.

Syslog Message

Synchronous SnapMirror failed to update volume '%s' because there is not enough space in containing aggregate '%s'.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume
dst_aggr (STRING): The name of the aggregate containing the destination volume

snapmirror.metadata.definite.loss

Severity

ERROR

Description

This message occurs when a Synchronous SnapMirror® destination flexible volume has lost metadata while entering synchronous replication mode.

Corrective Action

This error becomes obsolete if the destination volume successfully goes into sync. If the destination volume is made writable before it goes into sync, then it will come online with a recovery point (a snapshot) that's behind the on-disk recovery point that the destination had when it fell out of sync. Wafliron and Snapmirror Checker must be run on the destination after it is made writable to verify filesystem consistency.

Syslog Message

Synchronous SnapMirror has lost metadata for volume '%s' in containing aggregate '%s' when going into sync.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume
dst_aggr (STRING): The name of the aggregate containing the destination volume

snapmirror.metadata.possible.loss

Severity

ERROR

Description

This message occurs when a Synchronous SnapMirror® destination flexible volume may or may not have lost metadata while entering synchronous replication mode.

Corrective Action

This warning becomes obsolete if the destination volume successfully goes into sync. If the destination volume is made writable before it goes into sync, then there are two possible outcomes. If the destination comes online with a recovery point (a snapshot) that's behind the on-disk recovery point that the destination had when it fell out of sync, then the system has lost the recovery point. If however the destination comes online with a recovery point (a snapshot) that's better than before then there are no problems. In either case, wafliron and Snapmirror Checker must be run on the destination after it is made writable to check for any possible errors.

Syslog Message

Synchronous SnapMirror may or may not have lost metadata for volume '%s' in containing aggregate '%s' when going into sync.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume
dst_aggr (STRING): The name of the aggregate containing the destination volume

snapmirror.migrate events

snapmirror.migrate.complete

Severity

NOTICE

Description

This event is issued when a migrate completes successfully.

Corrective Action

(None).

Syslog Message

SnapMirror migrate from %s:%s to %s:%s complete.

Parameters

srcfiler (STRING): SnapMirror source system.
srcpath (STRING): SnapMirror source volume.
dstfiler (STRING): SnapMirror destination system.
dstpath (STRING): SnapMirror destination volume.

snapmirror.migrate.dstErr

Severity

ERROR

Description

This event is issued when a migrate request encounters an error on the SnapMirror® destination.

Corrective Action

(None).

Syslog Message

SnapMirror migration from %s:%s to %s:%s reports error: %s.

Parameters

srcfiler (STRING): SnapMirror source system.
srcpath (STRING): SnapMirror source volume.
dstfiler (STRING): SnapMirror destination system.
dstpath (STRING): SnapMirror destination volume.
error (STRING): Error encountered on the SnapMirror destination.

snapmirror.migrate.entryFound

Severity

ERROR

Description

This event is issued when partially completed SnapMirror migrate entry is encountered while parsing the registry at boot time looking for SnapMirror migrate entries.

Corrective Action

(None).

Syslog Message

SnapMirror found %s in mid-migration state : %s.

Parameters

volume (STRING): The volume whose migrate entry is found
error (STRING): The error string

snapmirror.migrate.fsidErr

Severity

ERROR

Description

This message occurs when a migrate request encounters an error after rewriting the File System IDentifier (FSID) of a volume. During the migration process, the FSIDs of both source and destination sides are rewritten. When this process encounters an error, the migration process must roll back both volumes to their original states. This message notifies you that it cannot restore their FSIDs back to their orignalFSIDs.

Corrective Action

Set the privilege level to advanced. Rewrite the FSID of the volume to its original FSID using the 'vol rewrite_fsid' command.

Syslog Message

Cannot rewrite volume %s FSID to its original FSID after migration failure: to 0x%x

Parameters

volume (STRING): Volume name where the problem is detected.
toFSID (INT): Original FSID of the volume.

snapmirror.migrate.incorrectEntry

Severity

ERROR

Description

This event is issued when an incorrect migrate entry is encountered while parsing the registry at boot time trying to find out partially completed SnapMirror migrate operations.

Corrective Action

(None).

Syslog Message

%s has an unrecognizable SnapMirror migrate state entry associated with it : %s.

Parameters

volume (STRING): The volume whose migrate entry is found
error (STRING): The error string

snapmirror.migrate.registryErr

Severity

ERROR

Description

This event is issued when an error is encountered parsing the registry at boot time when trying to find out partially completed SnapMirror migrate operations.

Corrective Action

(None).

Syslog Message

Unable to find SnapMirror migrate entries in the registry, registry parsing error : %s.

Parameters

error (STRING): The error encountered while parsing the registry looking for partially completed migrate operations.

snapmirror.migrate.srcErr

Severity

ERROR

Description

This event is issued when a migrate request encounters an error on the SnapMirror® source.

Corrective Action

(None).

Syslog Message

SnapMirror migration from %s:%s to %s:%s reports error: %s.

Parameters

srcfiler (STRING): SnapMirror source system.
srcpath (STRING): SnapMirror source volume.
dstfiler (STRING): SnapMirror destination system.
dstpath (STRING): SnapMirror destination volume.
error (STRING): Error encountered on the SnapMirror source.

snapmirror.migrate.srcNotReady

Severity

ERROR

Description

This event is issued when a migrate request is received for a source volume which is not yet ready.

Corrective Action

(None).

Syslog Message

SnapMirror migrate request for volume %s, which is not in migrating state.

Parameters

src (STRING): SnapMirror source volume

snapmirror.migrate.unknownState

Severity

NOTICE

Description

This event is issued when an unknown state for a volume in migration is encountered.

Corrective Action

(None).

Syslog Message

SnapMirror found volume in illegal migration state : %d.

Parameters

state (INT): Migration state of the volume

snapmirror.multipath events

snapmirror.multipath.initErr

Severity

ERROR

Description

This event is issued during boot or during takeover when the filer is unable to setup the necessary infrastructure required for SnapMirror multipathing support.

Corrective Action

Check the network connectivity on the source and the destination side. If the problem persists then, contact NetApp technical support

Syslog Message

SnapMirror is unable to setup multipath connection support on %s host.

Parameters

host (STRING): The host, local or partner

snapmirror.reconstruct events

snapmirror.reconstruct.complete

Severity

NOTICE

Description

This message occurs when the SnapMirror® requested reconstruction of a per-volume meta file used for labeling block information is complete.

Corrective Action

No corrective action.

Syslog Message

Reconstruction %s for data to be transferred by SnapMirror from %s to %s:%s was completed successfully in %u secs.

Parameters

volume (STRING): SnapMirror volume.
srcpath (STRING): Replication source path.
dstfiler (STRING): Replication destination system.
dstpath (STRING): Replication destination path.
time (INT): Time it took for the reconstruction to be complete.

snapmirror.registry events

snapmirror.registry.cleanup

Severity

INFORMATIONAL

Description

This message occurs when the system cleans up an invalid value in SnapMirror® registry.

Corrective Action

(None).

Syslog Message

Cleanup invalid registry %s: %s.

Parameters

type (STRING): SnapMirror registry key or value .
invalid (STRING): Invalid SnapMirror registry key or value.

snapmirror.replay events

snapmirror.replay.failed

Severity

EMERGENCY

Description

This message occurs when metadata replay fails in the process of making a Synchronous SnapMirror® destination flexible volume writable. This will result in the destination volume coming online with the view of the last snapshot successfully transferred instead of the view of the active filesystem up until the last consistency point..

Corrective Action

There is no way to recover from this data loss.

Syslog Message

Synchronous SnapMirror failed to replay metadata up until the last consistency point during snapmirror break for volume '%s'.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume

snapmirror.resync events

snapmirror.resync.blkRclmtn

Severity

ERROR

Description

This message occurs when a flexible volume restored from a snapshot might not be able to relinquish free

blocks to its containing aggregate. As a result, the containing aggregate might run out of space if this condition continues past the next incremental SnapMirror® transfer.

Corrective Action

Monitor the state after the next incremental SnapMirror update for this volume to verify that space is available in the containing aggregate. Free up space in the containing aggregate if the condition persists.

Syslog Message

Flexible volume '%s' cannot release free blocks to its containing aggregate '%s'.

Parameters

vol (STRING): Volume name.
aggr (STRING): Aggregate name.

snapmirror.retry events

snapmirror.retry.replay

Severity

ERROR

Description

This message occurs when metadata replay fails in the process of making a Synchronous SnapMirror® destination flexible volume writable. This failure occurs because sufficient space was not available in the containing aggregate.

Corrective Action

This error will not allow the destination volume to be made writable until additional space is made available in the containing aggregate. The snapmirror break command should be issued again after additional disks have been added to the aggregate.

Syslog Message

Synchronous SnapMirror cannot proceed with snapmirror break for volume '%s' in containing aggregate '%s' because sufficient space was not available.

Parameters

dst_volume (STRING): The name of the Synchronous SnapMirror® destination volume
dst_aggr (STRING): The name of the aggregate containing the destination volume

snapmirror.sockreaderr events

snapmirror.sockReadErr

Severity

ERROR

Description

This event is issued when SnapMirror tries to read a very large chunk from the network.

Corrective Action

(None).

Syslog Message

Attempted illegal network read of %d bytes.

Parameters

bytes (INT): Bytes SnapMirror tried to read from socket.

snapmirror.sockstrreaderr events

snapmirror.sockStrReadErr

Severity

ERROR

Description

This event is issued when SnapMirror tries to read a large string from the socket.

Corrective Action

(None).

Syslog Message

Attempted read of a large string of length %d.

Parameters

len (INT): String length SnapMirror tried to read from socket.

snapmirror.sockstrwriteerr events

snapmirror.sockStrWriteErr

Severity

ERROR

Description

This event is issued when SnapMirror tries to write a large string to the socket.

Corrective Action

(None).

Syslog Message

Write string too large %d.

Parameters

len (INT): String length SnapMirror tried to write to socket.

snapmirror.src events

snapmirror.src.cannotFind

Severity

ERROR

Description

This event is issued when a SnapMirror is issued from a source volume which is offline, restricted or does not exist.

Corrective Action

(None).

Syslog Message

SnapMirror : source %s %s is offline, is restricted, or does not exist.

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source

snapmirror.src.chkDone

Severity

NOTICE

Description

This event is issued when the source in a SnapMirror®/SnapVault(tm) relationship has finished a replication 'check' operation. The user should review the destination appliance's SnapMirror log file to make sure that no mismatches were found.

Corrective Action

Please review destination appliance's SnapMirror log file to make sure that no mismatches were found in the relationship.

Syslog Message

Replication 'check' from %s to %s:%s completed: Please review destination appliance's SnapMirror log file for more information.

Parameters

srcpath (STRING): The source path.
dstfiler (STRING): The destination appliance.
dstpath (STRING): The destination path.

snapmirror.src.chkSnapInfo

Severity

INFORMATIONAL

Description

This message occurs at the source appliance of a SnapMirror® 'check' operation to notify the appliance about which base snapshot will be used for the operation.

Corrective Action

(None).

Syslog Message

Snapmirror 'check' from '%s' to '%s':'%s' will use '%s' as the base snapshot. All snapshots older than and including the base snapshot on the source volume will be used.

Parameters

srcpath (STRING): Source path.
dstfiler (STRING): Destination appliance.
dstpath (STRING): Destination path.
snapname (STRING): Name of the base snapshot.

snapmirror.src.connDropped

Severity

ERROR

Description

This event is issued when SnapMirror source gets an error reading/writing to the network when communicating with the destination at the beginning of a SnapMirror transfer.

Corrective Action

(None).

Syslog Message

Error reading/writing to network, connection dropped.

Parameters

(None).

snapmirror.src.diffSnap

Severity

ERROR

Description

This event is issued when SnapMirror destination requests for a different snapshot than expected.

Corrective Action

(None).

Syslog Message

SnapMirror transfer from %s to %s:%s : snapshot %s confusion, aborting transfer.

Parameters

srcpath (STRING): The SnapMirror source volume or qtree

dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination volume or qtree
snapname (STRING): The snapshot requested by the destination

snapmirror.src.fixDone

Severity

NOTICE

Description

This event is issued when the source in a SnapMirror®/SnapVault(tm) relationship has finished a replication fix ('check -F') operation. The user should check the destination appliance's SnapMirror log file to make sure that all fixes were applied successfully.

Corrective Action

Please review destination appliance's SnapMirror log file to make sure that all mismatches were fixed for the relationship.

Syslog Message

Replication fix ('check -F') from %s to %s:%s completed: Please review destination storage appliance's SnapMirror log file for more information.

Parameters

srcpath (STRING): The source path.
dstfiler (STRING): The destination appliance.
dstpath (STRING): The destination path.

snapmirror.src.inCutOver

Severity

ERROR

Description

This message occurs under two conditions: 1) When a new SnapMirror® command is issued on the destination volume of a volume being moved using the 'vol move'command. 2) When a new SnapMirror command is issued on the source volume of a volume being moved using the 'vol move' that is in the cutover phase. The new SnapMirror operation will abort.

Corrective Action

Retry the new SnapMirror operation after the current 'vol move' operation is complete.

Syslog Message

SnapMirror: source volume %s is part of a 'vol move' operation.

Parameters

src (STRING): SnapMirror source volume.

snapmirror.src.inopick.abort

Severity

INFORMATIONAL

Description

This message occurs when the SnapMirror® source appliance aborts a qtree transfer it was doing because the producer thread aborted, usually due to lack of memory.

Corrective Action

(None).

Syslog Message

(None).

Parameters

srcpath (STRING): SnapMirror source path.
dstfiler (STRING): SnapMirror destination appliance.
dstpath (STRING): SnapMirror destination path.

snapmirror.src.markedCorrupt

Severity

ALERT

Description

This event is issued when a SnapMirror is issued from a source volume or aggregate which is offline, restricted or does not exist.

Corrective Action

(None).

Syslog Message

Source %s %s is marked as corrupt, transfer not done.

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source

snapmirror.src.multipath.connErr

Severity

ERROR

Description

This event is issued when the SnapMirror source filer is unable to setup a multipath connection with the destination filer. This can happen in case of a network connection failure.

Corrective Action

Check network connectivity. SnapMirror uses ports 10565 and 10566. Please make sure they are open in the firewall configuration.

Syslog Message

SnapMirror is unable to set up a multipath/failover connection from %s to %s:%s, SnapMirror is resorting to a single TCP connection. Please ensure ports 10565 and 10566 are open in the firewall configuration.

Parameters

srcpath (STRING): SnapMirror source
dstfiler (STRING): SnapMirror destination filer
dstpath (STRING): SnapMirror destination

snapmirror.src.noNewData

Severity

NOTICE

Description

This generic event is issued when the SnapMirror source volume/aggregate itself is a SnapMirror destination and has no new data to send to its SnapMirror destination.

Corrective Action

Please do a SnapMirror transfer to the source first.

Syslog Message

SnapMirror source %s %s has no new data for %s:%s.

Parameters

volaggr (STRING): Whether volume or aggregate
srcpath (STRING): The SnapMirror source
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination

snapmirror.src.notLicensed

Severity

NOTICE

Description

This event is issued when a SnapMirror source filer receives a request for transfer when SnapMirror is not even licensed on it.

Corrective Action

Please license SnapMirror.

Syslog Message

Command request while SnapMirror not licensed on this filer.

Parameters

(None).

snapmirror.src.notOn

Severity

NOTICE

Description

This message occurs when a SnapMirror® source system receives a request for transfer when SnapMirror is off on the system.

Corrective Action

Issue the 'snapmirror on' command.

Syslog Message

Command request while SnapMirror is off on this filer.

Parameters

(None).

snapmirror.src.notReady

Severity

ERROR

Description

This event is issued when the SnapMirror source volume is not yet ready for a SnapMirror transfer.

Corrective Action

Please try again.

Syslog Message

Source %s %s not ready for SnapMirror transfer, please try again.

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source

snapmirror.src.offline

Severity

ERROR

Description

This event is issued when the SnapMirror source volume or aggregate is taken offline.

Corrective Action

(None).

Syslog Message

Source %s %s requested offline.

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source

snapmirror.src.phaseI

Severity

NOTICE

Description

This event is issued when the SnapMirror source doing a qtree transfer enters phase I of the transfer.

Corrective Action

No corrective action required.

Syslog Message

[SnapMirror source transfer %s -→ %s:%s] starting phase I.

Parameters

srcpath (STRING): The SnapMirror source path
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination path

snapmirror.src.phaseII

Severity

NOTICE

Description

This event is issued when the SnapMirror source doing a qtree transfer enters phase II of the transfer.

Corrective Action

No corrective action required.

Syslog Message

[SnapMirror source transfer %s -→ %s:%s] starting phase II.

Parameters

srcpath (STRING): The SnapMirror source path
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination path

snapmirror.src.requestDenied

Severity

ERROR

Description

This event is issued when the destination filer requesting a SnapMirror transfer from the source filer is denied the transfer request.

Corrective Action

(None).

SnapMirror transfer request from %s to host %s at IP address %s denied: %s.

Parameters

srcpath (STRING): The SnapMirror source, can be volume or qtree
hostname (STRING): The hostname of the destination filer
ipaddress (STRING): The IP address of the destination filer
error (STRING): The reason why the request was denied.

snapmirror.src.restart.chkptFailed

Severity

NOTICE

Description

This event is issued when we are not able to set a restart checkpoint on the qtree SnapMirror source.

Corrective Action

(None).

Syslog Message

SnapMirror transfer to %s:%s : restart checkpoint setup failed.

Parameters

dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination qtree

snapmirror.src.restart.noSnap

Severity

ERROR

Description

This event is issued when SnapMirror source is not able to find the latest snapshot needed for restart.

Corrective Action

(None).

Syslog Message

Could not find the latest snapshot needed for restart.

Parameters

(None).

snapmirror.src.resync.snapNotFound

Severity

ERROR

Description

This event is issued on the source when the resync base snapshot is not found on the source.

Corrective Action

(None).

Syslog Message

Could not find base snapshot to resync %s %s:%s to %s.

Parameters

volaggr (STRING): Whether volume or aggregate
dstfiler (STRING): SnapMirror destination filer
dstpath (STRING): SnapMirror destination
srcpath (STRING): SnapMirror source

snapmirror.src.resync.toSelf

Severity

ERROR

Description

This event is issued when SnapMirror source detects and attempt to resync a volume to itself.

Corrective Action

(None).

Syslog Message

SnapMirror cannot resync %s %s to itself, operation not permitted.

Parameters

volaggr (STRING): Where source volume or aggregate
srcpath (STRING): SnapMirror source

snapmirror.src.revertPending

Severity

NOTICE

Description

This message indicates the source is being reverted by WAFL and cannot currently be used for a snapmirror operation.

Corrective Action

This message indicates the source is being reverted. After the revert completes the operation should be retried.

Syslog Message

snapmirror copy: The source is being reverted by WAFL.

Parameters

(None).

snapmirror.src.snapGotDeleted

Severity

ERROR

Description

This event is issued when the base snapshot on the SnapMirror source got deleted.

Corrective Action

(None).

Syslog Message

SnapMirror snapshot %s was deleted or renamed, transfer from %s to %s:%s aborted.

Parameters

snapname (STRING): The SnapMirror base snapshot
srcpath (STRING): The SnapMirror source, can be a volume or qtree
dstfiler (STRING): The SnapMirror destination filer
dstpath (STRING): The SnapMirror destination, can be a volume or qtree

snapmirror.src.snapshotErr

Severity

ERROR

Description

This event is issued when we are not able to obtain all the snapshot information, from the SnapMirror source volume, required for a SnapMirror transfer.

Corrective Action

(None).

Syslog Message

SnapMirror not able to obtain snapshot information from source %s %s

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source volume

snapmirror.src.sockErr

Severity

ERROR

Description

This event is issued when SnapMirror on the source filer has problems opening a socket.

Corrective Action

(None).

Syslog Message

Cannot accept SnapMirror destination requests: %s.

Parameters

error (STRING): The error message

snapmirror.src.sockOk

Severity

NOTICE

Description

This event is issued when SnapMirror on the source filer had problems opening a socket, but is fine now.

Corrective Action

No corrective action required.

Syslog Message

SnapMirror now accepting destination requests.

Parameters

(None).

snapmirror.src.sync.compressedVol

Severity

ERROR

Description

This event is issued when a Synchronous SnapMirror source attempts to go into fully synchronous mode when compression is enabled on the source volume.

Corrective Action

SnapMirror currently does not support a compressed volume as a synchronous volume source. In order to synchronously mirror the volume, the compression feature must be disabled on the volume.

Syslog Message

Synchronous SnapMirror source volume %s has compression enabled, which is not supported.

Parameters

src (STRING): Name of the source volume.

snapmirror.src.sync.flexSameFilerOrHA

Severity

ERROR

Description

This event is issued when a SnapMirror request for going synchronous is received for two flexible volumes that reside on the same filer or belong to the same HA pair.

Corrective Action

Synchronous SnapMirror cannot operate on two flexible volumes on the same filer or on the same HA pair. Please move one of the volumes off the filer or HA pair.

Syslog Message

Synchronous SnapMirror cannot run between two flexible volumes on the same filer or HA pair; this mode is not allowed from %s to %s.

Parameters

src (STRING): The source volume name
dst (STRING): The destination volume name

snapmirror.src.sync.FvolSyncTooSmall

Severity

ERROR

Description

This event is issued when a source side SnapMirror request attempts to go into fully synchronous mode on a flexible volume and it is smaller than the supported size.

Corrective Action

SnapMirror currently does not support a filer having a synchronous flexible volume source that is smaller than the minimum supported size. Increase the size of the flexible volume source and destination to at least the minimum supported size.

Syslog Message

The flexible volume Synchronous SnapMirror source %s is %llu MB, which is smaller than the minimum supported size of %llu MB.

Parameters

src (STRING): Name of the source flexible volume.
size (LONGINT): Size of the source flexible volume (MB).
minsize (LONGINT): Minimum supported volume size (MB) for flexible volume synchronous snapmirror transfers.

snapmirror.src.sync.license

Severity

NOTICE

Description

This event is issued when a SnapMirror request for going synchronous is received when the feature is not licensed.

Corrective Action

Please license synchronous SnapMirror on the source filer.

Syslog Message

Synchronous SnapMirror is not licensed. Synchronous mode from %s to %s:%s is not allowed.

Parameters

srcvol (STRING): The source volume name
dstfiler (STRING): The SnapMirror destination filer
dstvol (STRING): The destination volume name

snapmirror.src.sync.platform

Severity

ERROR

Description

This event is issued when a SnapMirror request for going synchronous is received when an inappropriate platform is used.

Corrective Action

(None).

Syslog Message

Synchronous SnapMirror is not supported on this platform. Synchronous mode from %s to %s:%s is not allowed.

Parameters

srcvol (STRING): The source volume name
dstfiler (STRING): The SnapMirror destination filer
dstvol (STRING): The destination volume name

snapmirror.src.sync.rootFullSync

Severity

ERROR

Description

This event is issued when a SnapMirror request for going fully synchronous is received for the root volume or aggregate.

Corrective Action

(None).

Syslog Message

Root %s %s not allowed as a fully sync source.

Parameters

volaggr (STRING): Whether volume or aggregate
src (STRING): The SnapMirror source

snapmirror.src.sync.sanitization

Severity

NOTICE

Description

This event is issued when a SnapMirror request for going synchronous is received when SnapMirror features are only enabled due to a sanitization license.

Corrective Action

The sanitization feature only enables certain pieces of SnapMirror functionality. Please license synchronous SnapMirror in order to use synchronous mode.

Syslog Message

The sanitization feature does not allow synchronous SnapMirror to be run from volume %s to volume %s.

Parameters

src (STRING): The source volume name
dst (STRING): The destination volume name

snapmirror.src.sync.tradSameFilerOrHA

Severity

ERROR

Description

This event is issued when a SnapMirror request for going into fully synchronous mode is received for two traditional volumes that reside on the same filer or belong to the same HA pair.

Corrective Action

Fully synchronous SnapMirror does not operate on two traditional volumes on the same filer or on the same HA pair. The volumes can be put into semi-synchronous (i.e. cpsync) mode, or one of the volumes can be moved off the filer or HA pair.

Syslog Message

Fully synchronous SnapMirror cannot run between two traditional volumes on the same filer or HA pair; this mode is not allowed from %s to %s.

Parameters

src (STRING): The source volume name
dst (STRING): The destination volume name

snapmirror.src.threadErr

Severity

ERROR

Description

This event is issued when we are not able to allocate a thread to do SnapMirror source side operations.

Corrective Action

(None).

Concurrent operation resource limit reached, SnapMirror source delayed.

Parameters

(None).

snapmirror.src.versionMismatch

Severity

ERROR

Description

This event is issued when there is SnapMirror version mismatch between the source and destination.

Corrective Action

(None).

Syslog Message

Received SnapMirror request with incompatible version.

Parameters

(None).

snapmirror.src.vfiler.migrating

Severity

ERROR

Description

This message occurs when a SnapMirror® transfer involves a source volume that is a member of a migrating vFiler(tm) unit. In such a case, the SnapMirror transfer aborts.

Corrective Action

Wait for the vFiler migration to be completed, then retry the transfer.

Syslog Message

SnapMirror source volume %s is member of a migrating vFiler unit.

Parameters

src (STRING): SnapMirror source volume

snapmirror.src.vfilerAccess

Severity

ERROR

Description

This event occurs when a SnapMirror source running on a vfiler tries to access a volume that it does not own.

Corrective Action

For a non-default vfiler to act as a SnapMirror source it must own the target volume. Do one of the following: a) use the 'vfiler move' command to make the given vfiler the owner of the volume, b) connect to the default vfiler that has access to all volumes, or c) connect to the vfiler that currently owns the specified SnapMirror source volume. See the na_vfiler man page and MultiStore® documentation for details.

Syslog Message

SnapMirror : vfiler %s tried to use volume %s as a SnapMirror source volume, but the vfiler is not the owner of that volume.

Parameters

vfiler (STRING): The current vfiler's name
src (STRING): The SnapMirror source volume

snapmirror.status events

snapmirror.status.dstUpdateSnapErr

Severity

ERROR

Description

This event is generated when ONTAP cannot update the latest base snapshot for the replication destination. Insufficient disk space on the root volume is the most common reason for this failure.

Corrective Action

Check if the root volume is out of disk space.

Syslog Message

ONTAP could not update the registry with latest snapshot for the destination %s.

Parameters

dstPath (STRING): The destination path

snapmirror.status.illegalSrcPath

Severity

ERROR

Description

This message occurs on a replication source appliance, when ONTAP encounters invalid source path specification while collecting replication statistics.

Corrective Action

Check snapmirror.conf file for any typing mistakes. Typically path names are specified as "filer:volume" or "filer:/vol/volume/qtree". Check snapmirror.conf man page for discussion of path specifications.

Syslog Message

Illegal source path: %s.

Parameters

srcPath (STRING): The Source path.

snapmirror.status.noBaseSnapshot

Severity

ERROR

Description

This message occurs on replication destination appliance when ONTAP can not find the base snapshot used by a replication relation. ONTAP may run into this situation while updating replication statistics at the end of a successful transfer.

Corrective Action

This is most likely a temporary error. Please try the operation again. Check status of the destination volume.

Syslog Message

Can not find base snapshot for %s.

Parameters

dstPath (STRING): The destination path.

snapmirror.status.updateStatusErr

Severity

ERROR

Description

This event is generated when ONTAP cannot update the ONTAP system registry with upgraded snapmirror status information. Insufficient disk space on the root volume is the most common reason for this failure.

Corrective Action

Check if the root volume is out of disk space by issuing the 'df' command from the appliance CLI. If the root volume is full, either free up space or add more disks on the volume.

Syslog Message

ONTAP could not update the ONTAP system registry with upgraded snapmirror status keys.

Parameters

(None).

snapmirror.tradtoflexerr events

snapmirror.tradToFlexErr

Severity

ERROR

Description

This message occurs when the user tries to copy a traditional volume into a flexible volume using SnapMirror®.

Corrective Action

Retry the operation with a traditional volume as the destination.

Syslog Message

snapmirror : A traditional volume cannot be copied into a flexible volume.

Parameters

(None).

snapmirror.unsupportedchksumtype events

snapmirror.unsupportedChksumType

Severity

NOTICE

Description

This message occurs when checksum type crc32c_header_only is configured for a SnapMirror® relationship and the source for the relationship is not compatible with this checksum type.

Corrective Action

(None).

Syslog Message

%s: destination transfer from %s:%s to %s : %s

Parameters

rtype (STRING): Replication type (SnapMirror).
srcfiler (STRING): Replication source system.
srcpath (STRING): Replication source volume.
dstpath (STRING): Replication destination volume.
message (STRING): Specific message.

snapmirror_copy events

snapmirror_copy.updatetimeincreased events

snapmirror_copy.UpdateTimeIncreased

Severity

NOTICE

Description

This message occurs when the update time taken by the latest transfer is 5 minutes more than the previous three transfer times.

Corrective Action

(None).

Syslog Message

Update time for volume %s has increased.

Parameters

dstpath (STRING): Destination volume.

snaprestore events

snaprestore.fail events

snaprestore.fail.volume.size

Severity

ALERT

Description

This message occurs when a SnapRestore® operation on a volume fails due to insufficient space in the target volume to hold the data present in the snapshot.

Corrective Action

Resize the target volume to the recommended minimum size.

Syslog Message

SnapRestore operation failed: volume %s is too small to hold the data present in the snapshot. Minimum size of the target volume required is %s.

Parameters

volume (STRING): Volume name.
volsize (STRING): Recommended minimum size of the target volume.

snaprestore.log events

snaprestore.log.overalloc

Severity

EMERGENCY

Description

This message occurs during a SnapRestore™ operation, of a volume when the logical used space in the volume is greater than the total size of the volume and the Logical Space View enforcement feature was turned ON on the volume after creating the snapshot. This maight cause client modify operations to fail on the volume.

Corrective Action

Create space by increasing the volumei size, or by deleting data or deleting snapshots. To increase a volume's size, use the "volume size" command. To delete a volume's snapshots, use the "volume snapshot delete" command.

Syslog Message

During SnapRestore operation, volume %s in aggregate %s was logically overallocated during snap restore operation. It may impact client modify operations.

Parameters

volume (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.

snaptags events

snaptags.file events

snaptags.file.inconsist

Severity

NOTICE

Description

This message occurs when the system detects an inconsistency in the header of a snapshot tag's metafile of a volume. The snapshot tags for all of the snapshots on the volume are considered lost. The next snapshot tag update starts from a clean metafile.

Corrective Action

(None).

Syslog Message

An inconsistency was detected in the snapshot tag's metafile on volume '%s'. The snapshot tags for all of the snapshots on the volume are lost.

Parameters

vol (STRING): Name of the volume.

snaptags.snap events

snaptags.snap.inconsist

Severity

NOTICE

Description

This message occurs when the system detects inconsistency of snapshot-specific information in the snapshot tag's metafile on a volume. The tags for the snapshot are considered lost. The next tag update for the snapshot starts without any existing tag.

Corrective Action

(None).

Syslog Message

An inconsistency of snapshot tags was detected for snapshot ID '%d' on volume '%s'. The tags for the snapshot are lost.

Parameters

snapid (INT): Physical snapshot ID on the volume.
vol (STRING): Name of the volume.

snapvault events

snapvault.dst events

snapvault.dst.bkpSnapCreate

Severity

INFORMATIONAL

Description

This message occurs when SnapVault® creates a backup snapshot for a given backup schedule.

Corrective Action

(None).

Syslog Message

A backup snapshot was created on volume %s by backup schedule %s (%d of %d allocated snapshot copies consumed).

Parameters

vol_name (STRING): Name of the SnapVault secondary volume on which the backup snapshot is created.
target_name (STRING): Base name of the backup schedule for which the given backup snapshot is created.
snap_cnt (INT): Total number of backup snapshots created for the given backup schedule.
alloc_cnt (INT): Total number of backup snapshots allocated for the given backup schedule.

snapvault.dst.bliDataRepaired

Severity

NOTICE

Description

This message is issued when SnapVault may have repaired data that had previously been made incorrect/incomplete by Bug #137685 which has now been fixed. Under some conditions this message may be issued when, in fact, the data was not previously incorrect or incomplete. Under some conditions, the SnapVault code cannot determine whether the previous version of the data was correct or not, but it does know that after the current transfer completes that the data is correct. This message will only be issued if the hidden snapvault option, repair_bug137685_stats is enabled.

Corrective Action

(None).

Syslog Message

ONTAP changed data in %d data chunk(s) in %s which may have been missing or incorrect.

Parameters

chunks_repaired (INT): The number of of chunks which may have been repaired. Up to 2MB of data may be sent in a chunk in the QSM/SnapVault data format. This count is incremented for each chunk in which one or more 4K blocks may have been repaired.
dst_path (STRING): Destination qtree path.

snapvault.dst.bliWarning

Severity

ERROR

Description

This event is issued when SnapVault has detected that OSSV secondary data may be incomplete or incorrect.

Corrective Action

See the public reports for Bug #137685 and Bug #140930 for corrective action.

Syslog Message

ONTAP has detected a condition in which OSSV secondary data for %s may be incomplete or incorrect. See the public reports for Bug #137685 and Bug #140930 for corrective action.

Parameters

dst_path (STRING): Destination qtree path.

snapvault.dst.lowSnapWarn

Severity

ERROR

Description

This message occurs when the remaining number of snapshots allocated for a given SnapVault® backup schedule on the given volume reaches or falls below the preset warning level. This event occurs on every failed attempt by SnapVault to create a backup snapshot on the given backup schedule, until you resolve the condition.

Corrective Action

Consider deleting some backup snapshots from the given backup target to create some free slots. For more information and other solutions, see the Online Backup Recovery Guide.

Syslog Message

Remaining number of snapshots on the volume %s for the backup schedule %s is below the set warning level (%d of allocated %d).

Parameters

vol_name (STRING): Name of the SnapVault secondary volume on which the backup snapshot is created.
target_name (STRING): Base name of the backup schedule for which the given backup snapshot is created.
snap_cnt (INT): Total number of backup snapshots created for the given backup schedule.
alloc_cnt (INT): Total number of backup snapshots allocated to the given backup schedule.

snapvault.dst.opNotComplete

Severity

NOTICE

Description

This message occurs when SnapVault® cannot complete a transfer normally, due to resource unavailability or SnapVault being off.

Corrective Action

None needed. SnapVault periodically attempts to complete this transfer.

Syslog Message

(None).

Parameters

dst_path (STRING): Destination qtree path.
snapvault_on (INT): SnapVault enabled? - on(1) or off(0)

snapvault.dst.updateDelayed

Severity

INFORMATIONAL

Description

This message occurs when an update request is received on a destination qtree that is being used as the source for another transfer.

Corrective Action

(None).

Syslog Message

%s: Update from %s:%s to %s:%s is delayed because another update, %s:%s to %s:%s, is already in progress.

Parameters

type (STRING): SnapVault® transfer type.
srcfiler1 (STRING): SnapVault source system.
srcpath1 (STRING): SnapVault source qtree.
dstfiler1 (STRING): SnapVault destination system for first transfer (in progress). Source for second transfer (delayed).
dstpath1 (STRING): SnapVault destination qtree for first transfer. Source for second transfer.
srcfiler2 (STRING): SnapVault destination system for first transfer. Source for second transfer.
srcpath2 (STRING): SnapVault destination qtree for first transfer. Source for second transfer.
dstfiler2 (STRING): Destination system for second transfer.
dstpath2 (STRING): Destination qtree for second transfer.

snapvault.qtree events

snapvault.qtree.initiate

Severity

NOTICE

Description

This message occurs when SnapVault® cannot start a volume-wide snapshot target to complete a manually invoked baseline transfer or resynchronizing transfer. As a result, the changes to the qtree in that operation will not yet be made visible. SnapVault attempts to repair this condition.

Corrective Action

(None).

Syslog Message

Could not coalesce %s: %s.

Parameters

qtpath (STRING): Path of the qtree in the operation.
reason (STRING): Reason why SnapVault could not start the snapshot target.

snapvault.qtree.notCoalesced

Severity

ERROR

Description

This message occurs when SnapVault® fails to initiate a qtree into a SnapVault coalescing cycle.

Corrective Action

If the error is transient, the next SnapVault coalescing cycle tries to initiate the qtree into the coalescing cycle. Otherwise, see the error message for details.

Syslog Message

Could not initiate %s into SnapVault coalescing cycle: %s.

Parameters

qtpath (STRING): Path of the qtree in the operation.
errstr (STRING): Error string.

snapvault.qtree.upgradeStatus

Severity

NOTICE

Description

During initialization, SnapVault will attempt to update the qtree metadata flag if necessary. This message is generated if the qtree has been converted but an error occurs in updating the status entry.

Corrective Action

(None).

Syslog Message

Could not update the status entry for %s. Entry will be updated during the next transfer.

Parameters

srcpath (STRING): The pathname for the qtree.

snapvault.reg events

snapvault.reg.unknownOpt

Severity

NOTICE

Description

This message occurs when you downgrade from a kernel with newer version to one with an older version and the system attempts to read a registry entry that is supported only in the newer version of the kernel.

Corrective Action

(None).

Syslog Message

Unsupported registry entry: (%s).

Parameters

regopt (STRING): Unrecognized registry entry for the older version of the kernel.

snapvault.src events

snapvault.src.notEnabled

Severity

ERROR

Description

This message occurs when a SnapVault® source appliance receives a transfer request when the service is not enabled. The license needed depends on the transfer type. For SnapVault restore transfers, the appliance must have a secondary license. For other transfers, the appliance must have a primary license.

Corrective Action

Enable the service by issuing the command 'options snapvault.enable on'. You might need to license the service before you enable it.

Syslog Message

Command request (%d) from host %s while SnapVault is not enabled.

Parameters

cmd (INT): Protocol command number for the type of transfer being requested.
dst_ip (STRING): IP address of the destination issuing the transfer request.

snapvault.src.volume.migrating

Severity

ERROR

Description

This message occurs when a SnapVault® snapshot target is initiated on a SnapVault primary volume while the volume is being migrated. The target might have been scheduled or manually invoked (through the 'snapvault snap create' command or programmatic interfaces).

Corrective Action

Wait for the volume migration to be completed.

Syslog Message

SnapVault primary volume %s is currently being migrated.

Parameters

volname (STRING): Name of the SnapVault primary volume, on which the target is invoked.

snapvault.sys events

snapvault.sys.internal

Severity

ERROR

Description

This message occurs when SnapVault® encounters an internal error.

Corrective Action

Turn off SnapVault and restart it.

Syslog Message

An internal error occurred in SnapVault®: %s.

Parameters

reason (STRING): Reason for the internal error.

snapvault.sys.upgrade

Severity

ERROR

Description

During initialization, SnapVault will attempt to update all the qtree metadata flags if necessary. This message is generated if there is insufficient memory to perform this operation.

Corrective Action

Convert the qtrees manually or contact NetApp technical support to help.

Syslog Message

Low on memory. Can't automatically convert snapvault qtrees right now, so backups will fail. Convert the qtrees manually or contact NetApp technical support to help.

Parameters

(None).

snapvault.sys.vfilerOn

Severity

INFORMATIONAL

Description

This message occurs when SnapVault® is enabled on a vfiler during shutdown, where it is expected to be disabled.

Corrective Action

None needed. This is for information only.

Syslog Message

(None).

Parameters

vfiler (STRING): Name of the vfiler.

snapvault.tgt events

snapvault.tgt.dupCoalesced

Severity

NOTICE

Description

This message occurs when SnapVault® detects more than one coalesced snapshot of a specific type in a SnapVault secondary volume. SnapVault attempts to repair this condition.

Corrective Action

(None).

Syslog Message

Detected multiple coalesced %s snapshots in volume %s.

Parameters

snaptype (STRING): Type of coalesced snapshot that has duplicates.
volume (STRING): Name of the SnapVault secondary volume on which the target was invoked.

snapvault.tgt.failure

Severity

ERROR

Description

This message occurs when a SnapVault® snapshot target fails, either because it could not start or because it encountered an error while processing. The target could have been scheduled or manually invoked

(through the 'snapvault snap create' command or programmatic interfaces).

Corrective Action

The corrective action depends on the cited reason regarding why the snapshot target could not start or why it failed. After you correct the situation, invoke the snapshot target again, or wait for the next scheduled invocation. If the volume could not be found, make sure that it is online, check the spelling of the volume name, and correct the SnapVault snapshot schedule if it is misspelled. If the target could not start due to a temporary lack of resources (such as threads or memory), no corrective action might be necessary, because SnapVault periodically retries the operation. If the problem persists, you might need to schedule SnapVault and/or other services to run less frequently. If the target could not create a snapshot, or could not create or write either data or metadata to the volume, check whether the volume has any available space, inodes, and snapshots. If any of these have been exhausted, free some up for SnapVault use. If the target didn't run because it is not a create target, install a SnapVault secondary license or unconfigure the target. If the target didn't run because some other service is actively using the volume and would interfere with SnapVault, either stop that service or wait for it to be completed.

Syslog Message

Could not create snapshot target "%s" on volume %s: %s.

Parameters

snapname (STRING): Base name of the snapshot that the target was meant to create.
volume (STRING): Name of the SnapVault secondary volume on which the target was invoked.
reason (STRING): Reason why the target could not start, or the specific error encountered during processing.

snapvault.tgt.NBUfailure

Severity

ERROR

Description

This event occurs when a snapshot creation on the destination volume used to back up primary qtrees using SnapVault(tm) managed by VERITAS® NetBackup® fails. Because the snapshot creation failure also causes the NetBackup backup request to fail, this is considered an error. This failure occurs when the number of snapshots in the volume exceeds the maximum limit, there is insufficient disk space in the destination volume, or the destination volume is offline or restricted.

Corrective Action

Use the 'snap list volname' command to list the snapshots in the volume and to see whether there are close to 255 snapshots (the maximum). Use the 'df -k' command to check the amount of disk space available in the volume. If either of these conditions is the cause of the failure, contact the NetBackup Administrator and ask for some old backups stored on this volume to be deleted. This results in both the number of snapshots being reduced and disk space getting freed. Also check the status of the volume by using the 'vol status' command to confirm that the volume is offline or restricted. If it is, use the 'vol online volname' command to bring the volume online.

Syslog Message

SnapVault snapshot creation for volume (%s) failed.

Parameters

volume (STRING): The name of the destination volume for which the snapshot creation failed.

snapvault.tgt.qtreeIgnore

Severity

ERROR

Description

This message occurs when SnapVault® intentionally ignores a configuration entry for a secondary qtree. After ignoring it once, SnapVault continues ignoring the qtree (silently) until you update the qtree manually, until you restart the SnapVault service, or until the next boot.

Corrective Action

The corrective action depends on the cited reason regarding why the qtree configuration was ignored. Frequently, the qtree simply doesn't exist, in which case the configuration entry is stale and should be removed (through the 'snapvault stop' command). If the qtree was ignored due to some transient reason, you need to manually update the qtree, or disabled and reenable SnapVault to begin operating on the qtree again.

Syslog Message

Ignoring configuration entry for %s in volume %s: %s.

Parameters

qtpath (STRING): Path to the qtree whose configuration entry was ignored.
volume (STRING): Name of the SnapVault secondary volume with the ignored configuration entry.
reason (STRING): Reason why the qtree configuration was ignored.

snapvault.tgt.unstableSnap

Severity

ERROR

Description

This message occurs when SnapVault® detects a coalesced snapshot with transitioning qtree replicas. If this event occurs, it suggests that archive snapshots might have captured some SnapVault secondary qtrees in a transitioning state, which you can verify by running the 'snap list -q' command. SnapVault attempts to recover from this situation, but that only affects new archive snapshots created after the event, and not any existing snapshots.

Corrective Action

(None).

Syslog Message

Recovery detected %s snapshot with transitioning qtrees in volume %s.

Parameters

snaptype (STRING): Type of coalesced snapshot that contains transitioning SnapVault qtree replicas.
volume (STRING): Name of the SnapVault secondary volume on which the target was invoked.

snmp events

snmp.authentication events

snmp.authentication.failure

Severity

ERROR

Description

This message occurs when there is an authentication failure during an SNMP query. This trap is generated for all SNMP versions.

Corrective Action

In case of SNMPv1/v2c check whether the SNMP community string is configured. In case of SNMPv3, check whether SNMPv3 authentication credentials are correctly configured. The SNMPv3 credentials include username, password, authentication protocol, authentication protocol password, privacy protocol and privacy protocol password.

Syslog Message

Authentication failure for SNMP query from port: %d.

Parameters

interface (INT): Port on which the SNMP authentication failed.

snmp.coldstart events

snmp.coldstart.trap

Severity

INFORMATIONAL

Description

This message occurs when the SNMP daemon is reinitializing itself with a coldStart. A coldStart(0) trap signifies that configuration changes are made to the agent or the protocol entity implementation during the reinitialization.

Corrective Action

(None).

Syslog Message

SNMP daemon was reinitialized with configuration changes.

Parameters

(None).

snmp.fips events

snmp.fips.objs.del.failed

Severity

ERROR

Description

This message occurs when the system fails to delete SNMP traphosts and users that are not FIPS compliant. The system tries to automatically delete them when FIPS is configured in the cluster. The SNMP traphosts and users that are left become inoperable.

Corrective Action

Delete remaining noncompliant SNMP traphosts first by using the "system snmp traphost delete" command. Then delete the remaining noncompliant SNMP users by using the "security login delete" command. The following SNMP users and traphosts are not FIPS compliant: 1. SNMPv1 users, SNMPv2c users, and SNMPv3 users having "none" or "MD5" as the authentication method or having "none" or "DES" as the encryption protocol. 2. SNMPv1 traphosts and SNMPv3 traphosts configured with a user that is not FIPS compliant.

Syslog Message

Failed to delete SNMP traphosts and users that are not FIPS compliant.

Parameters

(None).

snmp.fips.support

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP is operating in FIPS compliant mode but SNMPv3 is configured with non-compliant/weaker ciphers or hash algorithms. Hence SNMPv3 is disabled.

Corrective Action

(None).

Syslog Message

Data ONTAP is operating in FIPS compliant mode and SNMPv3 is configured with non-compliant ciphers or hash algorithms. Hence SNMPv3 is disabled.

Parameters

(None).

snmp.link events

snmp.link.down

Severity

INFORMATIONAL

Description

This message occurs when a network interface is down.

Corrective Action

If this message is not followed by a LinkUp message, the cluster administrator should manually check the link state with the "network port show" command, verifying that the port is administratively up. If the link state is still down and the port is not intentionally disabled, there might be a physical network problem: 1. Verify the switch has the corresponding port administratively and operationally up. 2. Verify that the network cable between the storage controller port and the corresponding switch is connected to the correct port and is not damaged. 3. Verify the integrity of the network cable with a cable tester, or swap in another cable known to be in good condition. 4. For further information or assistance contact NetApp technical support

Syslog Message

Interface %d is down.

Parameters

interface (INT): Number of the interface.

snmp.link.up

Severity

INFORMATIONAL

Description

This message occurs when a network interface is up.

Corrective Action

(None).

Syslog Message

Interface %d is up

Parameters

interface (INT): The number of the interface

snmp.raid events

snmp.raid.iterator.failure

Severity

ERROR

Description

This event is generated when a RAID group iterator was not able to be created.

Corrective Action

Check for other resource related issues.

Syslog Message

SNMP failed to create RAID group iterator

Parameters

(None).

snmp.server events

snmp.server.busy

Severity

ERROR

Description

This message occurs when the SNMP daemon is busy serving a high rate of incoming SNMP queries. This might be caused by multiple SNMP clients querying the cluster or a malicious client attempting a denial-of-service attack. SNMP clients might experience delays or timeouts.

Corrective Action

Run "tcpdump" on cluster to determine: If multiple SNMP clients querying the cluster, then reduce the rate of SNMP queries to the cluster or stop them entirely for a period of time (~15 minutes). If a malicious SNMP client is trying a denial-of-service attack, then update the firewall policy to block the client from querying the cluster by using the "firewall policy modify -policy mgmt -service snmp -action deny -ip-list IP_address" command.

Syslog Message

SNMP daemon is busy serving a high rate of incoming SNMP queries.

Parameters

(None).

snmp.snmpv3 events

snmp.snmpv3.enable

Severity

ERROR

Description

This message occurs when SNMPv3 is disabled due to a cluster in FIPS mode being upgraded to a version of ONTAP® software supporting the SNMPv3 FIPS feature. FIPS compliance adds more stringent limitations on SNMP users and SNMP traphosts, so SNMPv3 access has been disabled to allow the current SNMP users and SNMP traphosts to be reevaluated. If SNMPv3 functionality is required, you can reenable it; if cluster is still in FIPS mode at that time, any existing SNMP users and SNMP traphosts that are noncompliant to FIPS will be deleted. Until SNMPv3 is reenabled, SNMPv3 users cannot be created, SNMPv3 traphosts cannot be added and SNMPv3 packets will not be processed.

Corrective Action

Enable SNMPv3 in the cluster by using the 'system snmp enable-snmpv3' command.

Syslog Message

SNMPv3 is disabled due to a cluster in FIPS mode being upgraded to a version of ONTAP® software supporting the SNMPv3 FIPS feature.

Parameters

(None).

snmp.traphost events

snmp.traphost.resolve.failed

Severity

ERROR

Description

The snmp daemon could not resolve (find an IP address via DNS for) a traphost. The appliance will try again in an hour to resolve the traphost.

Corrective Action

Make sure that the network, including the domain server and traphost, are connected, running, and configured correctly. If you fix this problem, wait until the next retry or run 'snmp init 1' to force a resolve. If you don't fix this problem, you may want to remove this traphost from the list. Attempting to resolve traphosts may take time because of network timeouts.

Syslog Message

snmp: cannot send traps to '%s' because it could not be resolved via DNS. Retries occur hourly.

Parameters

host (STRING): The host that could not be resolved via a DNS lookup.

snmp.warmstart events

snmp.warmstart.trap

Severity

INFORMATIONAL

Description

This message occurs when the SNMP daemon is reinitializing itself with a warmStart. A warmStart(1) trap signifies that no configuration changes are made to the agent or the protocol entity implementation during the reinitialization.

Corrective Action

(None).

Syslog Message

SNMP daemon was reinitialized with no configuration changes.

Parameters

(None).

socket events

socket.limit events

socket.limit.exceeded

Severity

NOTICE

Description

This message occurs when the operating system is unable to allocate a new socket because that would exceed the maximum open sockets.

Corrective Action

(None).

Syslog Message

The operating system was unable to allocate a socket. The number of open sockets is %d and the limit is %d.

Parameters

num_open_sockets (INT): The number of open sockets.
max_sockets (INT): The maximum allowed number of open sockets.

socket.sndbuflimit events

socket.sndbuflimit.exceeded

Severity

ERROR

Description

This message occurs when an overflow is detected in the TCP socket send buffer. The TCP socket send buffer can hold a maximum of INT_MAX (2147483647) bytes.

Corrective Action

Excessive unacknowledged data in the socket send buffer is commonly due to an overloaded client that is extremely slow to send TCP acknowledgments or completely stops doing so. Examine the client and take actions to address the client behavior.

Syslog Message

The system (%s:%d) could not send data to client %s due to an overflow in the TCP socket send buffer. The buffer can hold a maximum of %d bytes.

Parameters

server_address (STRING): IP address of the server.
port (INT): Local port bound to the socket.
client_address (STRING): IP address of the client.
socket_buffer_limit (INT): Maximum allowed number of bytes in socket buffer.

sp events

sp.auth events

sp.auth.loginDenied

Severity

NOTICE

Description

This message occurs when a login is attempted on the node's Service Processor (SP) or baseboard management controller (BMC) and the login is denied.

Corrective Action

(None).

Syslog Message

BMC or SP login authentication failure for user "%s" from %s.

Parameters

user (STRING): User the login was attempted with.
fromhost (STRING): Where the login was attempted from.

sp.authlog events

sp.authlog.failure

Severity

ERROR

Description

This message occurs when the Service Processor (SP) or baseboard management controller (BMC) fails to log an authentication event in the system event log (SEL).

Corrective Action

1. Use the "system service-processor reboot-sp" command to reboot the SP or BMC. 2. If the failure persists, contact NetApp technical support

Syslog Message

BMC or SP failed to log an authentication event in the SEL.

Parameters

(None).

sp.autoconfig events

sp.autoconfig.out.of.address

Severity

ERROR

Description

This message occurs when the system cannot automatically obtain IP configuration because the subnet associated with the Service Processor does not have any available IP addresses.

Corrective Action

Expand the subnet range to include more IP addresses with command "network subnet add-ranges". If failures persist, contact NetApp technical support.

Syslog Message

(None).

Parameters

subnet (STRING): Name of the subnet associated with the Service Processor.

sp.autoupd events

sp.autoupd.partner.offline

Severity

ERROR

Description

This message occurs when a Service Processor (SP) or baseboard management controller (BMC) firmware automatic update is cancelled because the high-availability (HA) partner node is offline.

Corrective Action

Ensure that the HA partner node is online for SP or BMC firmware autoupdate to occur. Use the "cluster show" and "storage failover show" command output to evaluate the state of the HA partner node.

Syslog Message

SP autoupdate cancelled because the HA partner node is offline.

Parameters

(None).

sp.autoupdate events

sp.autoupdate.toggle

Severity

INFORMATIONAL

Description

This message occurs when the Service Processor (SP) AutoUpdate option is enabled or disabled.

Corrective Action

(None).

Syslog Message

%s.

Parameters

reason (STRING): SP AutoUpdate feature has changed state.

sp.device events

sp.device.fw.mismatch

Severity

ERROR

Description

This message occurs when the service processor (SP) detects a firmware version mismatch among the devices managed by the SP.

Corrective Action

Contact NetApp technical support to update the firmware.

Syslog Message

Device firmware version mismatch detected: %s

Parameters

mismatch (STRING): Description of the device names, current device firmware versions, and expected versions.

sp.dhcp events

sp.dhcp.failure

Severity

ERROR

Description

This message occurs when the Service Processor (SP) cannot obtain network configuration data through DHCP. The SP cannot be reached from the network.

Corrective Action

Verify that DHCP services are available, or configure the SP with a static address. If failures persist, contact NetApp technical support.

Syslog Message

Service Processor cannot obtain network configuration using DHCP.

Parameters

(None).

sp.dup events

sp.dup.ip

Severity

ERROR

Description

This message occurs when another system has been detected to be using the same IP address as the one configured on the Service Processor (SP).

Corrective Action

If the network in question has been configured to use this address as a static address, change the configured IP address on at least one system to ensure that only one system is using this address. If the network is configured to use DHCP, ensure that this address is not a static IP address that falls within the range being used by the DHCP server.

Syslog Message

SP IP address %s in use by another system.

Parameters

ipaddr (STRING): IP address.

sp.eth events

sp.eth.switch.upd.failed

Severity

ERROR

Description

This message occurs when Service Processor (SP) or Baseboard Management Controller (BMC) fails to auto-update the internal Ethernet switch.

Corrective Action

1. Perform a manual Ethernet Switch update from SP or BMC CLI. 2. If the failures persist, contact NetApp technical support.

Syslog Message

%s Ethernet switch auto-update failed.

Parameters

sp_type (STRING): SP type

sp.eth.switch.upd.start

Severity

NOTICE

Description

This message occurs when the Service Processor (SP) or Baseboard Management Controller (BMC) starts an internal Ethernet switch auto-update. During the Ethernet switch update, SP or BMC and e0M network connections might be temporarily affected.

Corrective Action

(None).

Syslog Message

%s is starting Ethernet switch auto-update %s.

Parameters

sp_type (STRING): SP type
switch_ver (STRING): Current and bundled switch version.

sp.eth.switch.upd.success

Severity

NOTICE

Description

This message occurs when the Service Processor (SP) or Baseboard Management Controller (BMC) completes an internal Ethernet switch auto-update.

Corrective Action

(None).

Syslog Message

%s Ethernet switch version updated %s.

Parameters

sp_type (STRING): SP type
switch_ver (STRING): Previous and updated switch version.

sp.firmware events

sp.firmware.corruption

Severity

ALERT

Description

This message occurs when neither of the firmware images of the node's Service Processor (SP) or Baseboard Management Controller (BMC) on the primary flash chip can be booted. The SP or BMC is now running from the image on the spare flash storage. The SP or BMC spare image does not have all the features of the primary image, and it does not support updating the primary flash images.

Corrective Action

Contact NetApp technical support to recover the primary flash chip.

Syslog Message

"%s" is running from the spare recovery flash storage.

Parameters

sp_type (STRING): Service processor type (SP or BMC).

sp.firmware.incompatible

Severity

ALERT

Description

This message occurs when the firmware on the Service Processor (SP) is not compatible with this version of Data ONTAP®.

Corrective Action

Update the SP firmware to a version supported by this version of Data ONTAP. Contact NetApp technical support to obtain SP firmware files and update instructions, and for further assistance if the error persists after SP firmware is updated. Additional support might be available from the vendor's support site or knowledge base.

Syslog Message

The SP firmware version %s is not compatible with this version of Data ONTAP.

Parameters

current_sp_fw_version (STRING): Current firmware version on the SP.

sp.firmware.upgrade.reqd

Severity

ALERT

Description

This message occurs when the Service Processor (SP) firmware version and the Data ONTAP® software version are incompatible and cannot communicate correctly about a particular capability.

Corrective Action

Update the firmware version of the SP to the version recommended for your version of Data ONTAP. Contact NetApp technical support to get a copy of the appropriate SP firmware and SP firmware update instructions. For more information about downloading and installing updated firmware, check your support provider's support web site or knowledgebase. If you need further assistance, contact NetApp technical support. After you update the firmware, this message should no longer occur. If the message occurs again, contact NetApp technical support and explain that you already updated the firmware to the recommended version.

Syslog Message

The SP firmware %s is incompatible with Data ONTAP for %s.

Parameters

> **current_sp_fw_version** (STRING): Current firmware version on the SP.
> **capability** (STRING): SP capability needed by Data ONTAP.

sp.firmware.version.unsupported

Severity

> ALERT

Description

> This message occurs when the firmware on the Service Processor (SP) is not an official release and must be updated.

Corrective Action

> Contact NetApp technical support to get a copy of the recommended version of SP firmware and SP firmware update instructions. For more information about downloading and installing updated firmware, check your support provider's web site or knowledgebase. If you need further assistance, contact NetApp technical support. After the SP is running the new firmware, this message should no longer occur. If the message occurs again, contact NetApp technical support and explain that you already updated the firmware to the recommended version.

Syslog Message

> The SP firmware version %s is not an official release.

Parameters

> **current_sp_fw_version** (STRING): Current firmware version on the SP.

sp.heartbeat events

sp.heartbeat.resumed

Severity

> INFORMATIONAL

Description

> This event is generated when the appliance detects resumption of Service Processor (SP) heartbeat notifications indicating that the Service Processor is now available. The earlier issue indicated by the sp.heartbeat.stopped event has been resolved.

Corrective Action

> (None).

Syslog Message

> Received %s heartbeat from the Service Processor (SP).

Parameters

> **type** (STRING): Heartbeat from Service Processor can be of the following types: 1. IPMI Heartbeat 2. Packetized heartbeat. This parameter specifies which type of heartbeat this event corresponds to.

sp.heartbeat.stopped

Severity

INFORMATIONAL

Description

This event is generated when Data ONTAP does not receive Service Processor (SP) heartbeat notifications. The Service Processor and Data ONTAP exchange heartbeat messages so that they can detect when one or the other is unavailable. This event is generated when Data ONTAP has not received an expected heartbeat message from the Service Processor.

Corrective Action

1. Connect to the SP CLI and issue: 1.1. sp version 1.2. priv set advanced 1.3. sp log debug 1.4. sp log messages 2. Run SP system diagnostics. 3. Consult Service Processor Troubleshooting Guide.

Syslog Message

Have not received a %s heartbeat from the Service Processor (SP) in last %d seconds.

Parameters

type (STRING): Heartbeat from Service Processor can be of the following types: 1. IPMI Heartbeat 2. Packetized heartbeat. This parameter specifies which type of heartbeat this event corresponds to.
time (INT): Heartbeats have not been received from the Service Processor (SP) for this period of time in seconds.

sp.ipmi events

sp.ipmi.lost.shutdown

Severity

EMERGENCY

Description

This message occurs when Data ONTAP® is no longer receiving the heartbeats from the Service Processor (SP) after all the SP recovery actions have been taken. Without the SP, Data ONTAP cannot monitor the health of the hardware. To prevent hardware damage and data loss, the system will shut down.

Corrective Action

Power-cycle the sytem by pulling the controller out from the chassis, pushing it back in, then powering it on. If the problem persists, replace the controller module.

Syslog Message

SP heartbeat stopped and cannot be recovered. To prevent hardware damage and data loss, the system will shut down in %d minutes.

Parameters

num_minutes (INT): Number of minutes until the system shuts down.
object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

sp.log events

sp.log.partition.full

Severity

ERROR

Description

This message occurs when the available memory of the log partition in the Service Processor (SP) or the Baseboard Management Controller (BMC) is low. If the log partition is full, it might lead to unexpected configuration issues.

Corrective Action

1. Run the "system autosupport invoke -node <node-name> -type all" command from the ONTAP CLI to collect the SP or BMC logs before they can be cleared. Verify from the command output that the logs were transferred. 2. During the next maintenance cycle, execute the following commands from the SP or BMC CLI to clear the log partition: a. "priv set diag" b. "bmc wipeclean" for BMC or "sp wipeclean" for SP c. "bmc reboot" for BMC or "sp reboot" for SP The SP or BMC "wipeclean" command clears all the configuration and logs from the SP or BMC. After you reboot, wait for 10 minutes to allow ONTAP to resync the configuration before performing any action.

Syslog Message

%s Log partition is almost full.

Parameters

sp_type (STRING): Service processor type (SP or BMC)

sp.log.partition.readonly

Severity

ALERT

Description

This message occurs when the node's Service Processor (SP) or Baseboard Management Controller (BMC) log partition is mounted as read-only. Recovery steps already have been tried automatically by the firmware, but the recovery efforts were not successful. If the log partition is mounted as read-only, the BMC or SP will not be able to record logs, configuration updates from ONTAP will fail, and ONTAP might not display the current BMC or SP status.

Corrective Action

Search the support site knowledgebase for this event ID.

Syslog Message

Log partition "%s" could not be recovered and is mounted as read-only.

Parameters

sp_type (STRING): Service processor type (SP or BMC)

sp.log.partition.readwrite

Severity

NOTICE

Description

This message occurs when the node's Service Processor (SP) or Baseboard Management Controller (BMC) log partition is remounted as read-write after a SP or BMC reboot to recover from a log partition in a read-only state.

Corrective Action

(None).

Syslog Message

Log partition "%s" has been remounted as read-write after recovery from a read-only state.

Parameters

sp_type (STRING): Service processor type (SP or BMC)

sp.network events

sp.network.ipv6.disable

Severity

ERROR

Description

This message occurs when either a user or the system disables the network IPv6 option and the service processor (SP) is configured only with an IPv6 address.

Corrective Action

Ensure that the service processor (SP) is configured with an IPv4 address prior to disabling the network IPv6 option.

Syslog Message

The IPv6 address can be disabled only if the IPv4 address is enabled.

Parameters

(None).

sp.network.ipv6.notifdisable

Severity

NOTICE

Description

This message occurs when the IPv6 address of Service Processor (SP) is disabled as network IPv6 option of the system is disabled either by user or by cluster configuration.

Corrective Action

If IPv6 usage is desired, enable network IPv6 option of the system and assign IPv6 address to SP.

The IPv6 address of service processor SP is disabled.

Parameters

(None).

sp.network.link.down

Severity

ERROR

Description

This message occurs when the Service Processor (SP) detects a link error on the SP network port. This can happen if a network cable is not plugged into the SP network port. It can also happen if the network that the SP is connected to cannot run at 10/100 Mbps.

Corrective Action

1. Check whether the network cable is correctly plugged into the SP network port. 2. Check the link status LED on the SP. 3. Verify that the network that the SP is connected to supports autonegotiation to 10/100 Mbps or is running at one of those speeds; otherwise, SP network connectivity does not work.

Syslog Message

Service Processor (SP) network port link down due to cable or network errors.

Parameters

(None).

sp.notconfigured events

sp.notConfigured

Severity

ERROR

Description

This message occurs weekly to remind you to configure the Service Processor (SP). The SP is a physical device that is incorporated into your system to provide remote access and remote management capabilities. To use the full functionality of the SP, you need to configure it first.

Corrective Action

1. Use the 'system service-processor network modify' command to configure the SP. If necessary, use the 'system service-processor network show' command to obtain its MAC address. 2. Use the 'system service-processor network show' command to verify the SP network configuration. 3. Use the 'system service-processor autosupport invoke' command to verify that the SP can send AutoSupport email. Note that AutoSupport mailhosts and recipients must be properly configured in Data ONTAP® before issuing this command.

Syslog Message

The system's Service Processor (SP) is not configured. Use the 'system service-processor network modify' command to configure it.

Parameters

object_type (STRING): Type of resource object under notification. For this EMS, the object_type will always be NODE.
object_uuid (STRING): UUID of the resource object. For this EMS, the UUID will be of the node.

sp.orftp events

sp.orftp.failed

Severity

NOTICE

Description

This message occurs when there is a communication error while sending information to or receiving information from the Service Processor (SP). This error could be due to a communication error while the information is being sent or received, or the SP might not be operational.

Corrective Action

1. Run the 'system service-processor show' command at the Data ONTAP prompt to check whether the SP is operational. 2. If the SP is operational and this message persists, run the 'system service-processor reboot-sp' command at the Data ONTAP prompt to reboot the SP. 3. If this message persists after the SP has been rebooted, contact NetApp technical support.

Syslog Message

SP communication error, %s.

Parameters

reason (STRING): Reason for the failure.

sp.postupd events

sp.postupd.ck.unexpt.sp.rev

Severity

ERROR

Description

This message occurs after a scheduled firmware update, when the servprocd daemon detects that the Service Processor(SP) firmware version changed to an unexpected value.

Corrective Action

Check whether the SP firmware has been updated through the SP CLI. If not: 1. Manually update the SP firmware. 2. If the failures persist, contact NetApp technical support.

Syslog Message

%s.

Parameters

reason (STRING): Reason for the failure: %s.

sp.reboot events

sp.reboot.ro.partition

Severity

NOTICE

Description

This message occurs when the node's Service Processor (SP) or Baseboard Management Controller (BMC) log partition is mounted as read-only after an internal error has occurred. The system automatically reboots the SP or BMC to attempt to remount the log partition as read-write.

Corrective Action

(None).

Syslog Message

Rebooting the %s because the log partition is in a read-only state.

Parameters

sp_type (STRING): Service processor type (SP or BMC)

sp.reboot.sensor.unreadable

Severity

NOTICE

Description

This message occurs when one or more sensors are unreadable from Service Processor (SP) or Baseboard Management Controller (BMC).SP or BMC is rebooted in attempt to recover the sensor reading.

Corrective Action

No user action is required.

Syslog Message

Rebooting %s because one or more sensors are unreadable.

Parameters

sp_type (STRING): Service processor type (SP or BMC).

sp.servprocd events

sp.servprocd.upd.error

Severity

ERROR

Description

This message occurs in the following cases: 1. Scheduling of Service Processor (SP) firmware update failed. 2. SP firmware update failed after it has been scheduled. 3. Post-update checks have failed.

Corrective Action

1. Perform a manual SP firmware update. 2. If the failures persist, contact NetApp technical support.

Syslog Message

SP update error: %s.

Parameters

reason (STRING): SP update error: %s.

sp.snmp events

sp.snmp.traps.off

Severity

INFORMATIONAL

Description

This message occurs each time a system boots, if the advanced privilege level in Data ONTAP® was used to disable the SNMP Trap feature of the Service Processor (SP). This message also occurs when the SNMP Trap capability is disabled and a user invokes a Data ONTAP command to use the SP to send an SNMP trap.

Corrective Action

SP SNMP Trap support is currently disabled. To enable this feature, set the 'sp.snmp.traps' option to On.

Syslog Message

SP's SNMP Trap support is currently disabled. Set option 'sp.snmp.traps' to 'On' to enable this feature.

Parameters

(None).

sp.ssh events

sp.ssh.access.resetup

Severity

ERROR

Description

This message occurs when the SSH access list of the service processor needs to be reconfigured.

Corrective Action

Use the "system service-processor ssh add-allowed-addresses" command to reconfigure the service processor SSH access list.

Syslog Message

Service Processor SSH access list needs to be reconfigured.

Parameters

(None).

sp.upd events

sp.upd.bad.fw.package

Severity

ERROR

Description

This message occurs when the Service Processor (SP) daemon cannot extract the SP firmware version from the metadata file. Either the file cannot be opened, or the number cannot be found within the file.

Corrective Action

Use the "system node image package delete" command to remove the corrupted package. If failures persist, contact NetApp technical support.

Syslog Message

Service Processor daemon failed to read metadata from the image package.

Parameters

Package_Name (STRING): Name of the SP firmware package being processed.

sp.upd.fw.depot.full

Severity

ERROR

Description

This message occurs when a user downloads more than the supported number of Service Processor (SP) firmware packages to the local node.

Corrective Action

Use the "system node image package delete" command to remove older packages. If failures persist, contact NetApp technical support.

Syslog Message

Repository for SP image is full.

Parameters

available_sp_pkg_count (INT): Number of SP firmware packages existing in the local node.
max_num_of_sp_pkgs (INT): Maximum number of supported SP packages in the local node.

sp.upd.unzip.event

Severity

ERROR

Description

This message occurs when the Service Processor (SP) daemon cannot expand the compressed SP firmware packages for the local node. The expected package could either not be found, or it could not be expanded.

Corrective Action

Use the "system node image package delete" command to remove the corrupted package. If failures persist, contact NetApp technical support.

Syslog Message

Service Processor failed to decompress the image package.

Parameters

package_name (STRING): SP firmware package name.
sp_fw_update_type (STRING): Type of SP firmware update being performed when the error was encountered.

sp.userlist events

sp.userlist.update.failed

Severity

ERROR

Description

This message occurs when there is an error updating user information for the Service Processor (SP). When user information is updated on Data ONTAP®, the SP is also updated with the new changes. This enables users to log in to the SP. User information update for the SP might have failed due to a communication error with the SP or the SP might not be operational.

Corrective Action

1. Run the 'system service-processor show' command at the Data ONTAP prompt to check whether the SP is operational. 2. If the SP is operational and this message persists, run the 'system service-processor reboot-sp' command at the Data ONTAP prompt to reboot the SP. 3. Retry the operation that caused the error message. 4. If this message persists after the SP has been rebooted, contact NetApp technical support.

Syslog Message

Error updating SP user information, %s.

Parameters

reason (STRING): Reason for the failure.

sp.wdog events

sp.wdog.set.fail

Severity

ERROR

Description

This message occurs when ONTAP® software fails to disable or enable the service-processor' (SP or BMC) watchdog timer. This might occur due to an intermittent SP or BMC firmware failure.

Corrective Action

If the system continues to run normally, you can ignore this message. If a system disruption occurs after this failure, reboot the SP or BMC or power-cycle the system before starting ONTAP or performing a giveback. If system disruptions continue to occur, contact NetApp technical support for assistance.

Syslog Message

Unable to %s service-processor's watchdog timer. Error code: 0x%x.

Parameters

op (STRING): Whether the failure was to enable or disable the timer.
errcode (INT): Error code for debugging.

space events

space.ratchet events

space.ratchet.failure

Severity

ERROR

Description

This event is generated if the space ratchet catches a space-check error.

Corrective Action

(None).

Syslog Message

%s %s %s %s %s %s %s %s %s %s %s

Parameters

f2 (STRING): Third frame of backtrace.
f3 (STRING): Fourth frame of backtrace.
f4 (STRING): Fifth frame of backtrace.
f5 (STRING): Sixth frame of backtrace.
f6 (STRING): Seventh frame of backtrace.
f7 (STRING): Eighth frame of backtrace.
f8 (STRING): Ninth frame of backtrace.
f9 (STRING): Tenth frame of backtrace.
f10 (STRING): Eleventh frame of backtrace.
f11 (STRING): Twelfth frame of backtrace.
f12 (STRING): Thirteenth frame of backtrace.

space.ratchet.failure.detail

Severity

ERROR

Description

This event is generated if the space ratchet catches a space-check error.

Corrective Action

(None).

Syslog Message

%s %s

Parameters

description (STRING): Description of failure.
buffers (STRING): Details of buffers that were predirtied.

spider events

spider.message events

spider.message.fail

Severity

ERROR

Description

This message occurs when a directory traversal task cannot finish because of an unexpected error.

Corrective Action

Ensure all nodes in the cluster are online and healthy, and that all volumes needed for the directory traversal are online. Then retry the operation.

Syslog Message

Volume %llu failed to perform directory task %s because of %s.

Parameters

volume_dsid (LONGINT): DSID of the volume that encountered the error.
task (STRING): Description of the task that could not be performed.
error (STRING): Description of the error that occurred.

splitter events

splitter.owm events

splitter.owm.recycle.start

Severity

NOTICE

Description

This message occurs when ovelapping write manager recycling is activated as the allocation exceeds the threshold. This event is dependent on workload and resource mangagement. It is resolved automatically internally.

Corrective Action

(None).

Syslog Message

Overlapping write manager recycling is activated as the allocation exceeds the threshold for relationship with UUID %s.

Parameters

relationship_id (STRING): SnapMirror relationship universal unique identifier (UUID).

splog events

splog.failed events

splog.failed.to.transfer.log

Severity

NOTICE

Description

This message occurs when the system fails to transfer the SP log file from the remote Service Processor (SP). This prevents abnormal status of the system from being diagnosed by using the SP log files.

Corrective Action

1. Check whether you can transfer SP log files from the remote SP manually. From the clustershell prompt: a. Enter the 'system node autosupport invoke-splog -remote-node "nodename"' command. b. Check the output message of the command to determine whether the command succeeded. 2. If you cannot tranfer SP log files from the remote SP manually, then restart the SP. From the clustershell prompt, run the 'set diag' and 'system node run-service-processor -node "down_node_name"' commands to log in to the remote SP. From the SP prompt, run the 'sp reboot' command. Example: splog-cmode::> set diag splog-cmode::*> system node run-service-processor -node splog-cmode-01 SP splog-cmode> sp reboot 3. After the SP finishes rebooting, if you still cannot transfer SP log files from the remote SP manually, then contact NetApp technical support for further assistance.

Syslog Message

Failed to transfer log from Service Processor (SP) on the remote node (%s) because of %s.

Parameters

node_name (STRING): Name of the remote node that is down and whose SP the log file cannot be transferred from.
reason (STRING): Reason for the warning.

splog.running events

splog.running.normally

Severity

INFORMATIONAL

Description

This message occurs when the Data ONTAP® process (splogd) that monitors the Service Processor (SP) for available SP logs starts successfully or when it returns to normal operation from degraded mode.

Corrective Action

(None).

Syslog Message

Process splogd is operating normally.

Parameters

(None).

splog.sp events

splog.sp.not.accessible

Severity

ERROR

Description

This message occurs when the local or remote node Service Processor (SP) cannot be accessed. This prevents the SP log collection job from communicating with the SP and transferring SP log files when new log files are available. SP log files are usually used for diagnosing abnormal status of the system, for example, abnormal shutdown.

Corrective Action

1. Check whether the SP is pingable by using the 'ping sp-ip-address' command at the clustershell prompt. 2. If the remote node SP is not pingable: a) Check whether the network cable is connected with the remote SP. b) If the remote node network cable is connected, check whether the IP address of the remote SP and the e0M port are in the same subnet. From the clustershell prompt, run the 'set diag' and 'system node run-service-processor -node node_name' commands to log in to the remote SP. From the SP prompt, run the 'sp status' command. From the clustershell prompt, run the 'network interface show' command to get e0M port details. c) If the IP address of the remote down node SP and the e0M port are in the same subnet and the remote SP is not pingable, then restart the SP. From the clustershell prompt, run the 'set diag' and 'system node run-service-processor -node node_name' commands to log in to the remote SP. From the SP prompt, run the 'sp reboot' command. 3. If the local node SP is not pingable: a) Check whether the IP address of the local SP and the e0M port are in the same subnet. From the clustershell prompt, press Ctrl-g to log in to the local SP. From the SP prompt, run the 'sp status' command. From the clustershell prompt, run the 'network interface show' command to get e0M port details. b) If the address of local node SP and the e0M port are in the same subnet and the SP is not pingable, then restart the SP. From the clustershell prompt, run the 'system service-processor reboot-sp -image primary' command. 4. After the SP finishes rebooting, if you still cannot ping the SP, then contact NetApp technical support for further assistance.

Syslog Message

The SP on the remote node (%s) is not accessible because of %s.

Parameters

node_name (STRING): Name of the node whose SP is not accessible.
reason (STRING): Reason for the warning.

splog.sp.not.configured

Severity

ERROR

Description

This message occurs when the IP address of the Service Processor (SP) is not configured properly. This prevents the SP log collection job from communicating with the SP and transferring SP log files when new log files are available. SP log files are usually used for diagnosing abnormal status of the system, for example, abnormal shutdown.

Corrective Action

1. Check the IP address of the SP. Remote node SP case: From the clustershell prompt, run the 'set diag' and 'system node run-service-processor -node node_name' commands to log in to the remote SP. From the SP prompt, run the 'sp status' command. Local node SP case: From the clustershell prompt, press 'Ctrl-g' and log into SP. From the SP prompt, run the 'sp status' command. 2. If there is no IP address for the SP, or if the IP address is invalid, then restart the node. The IP address of the SP will be configured by the host software. 3. If there is still no IP address for the SP after step 2, then contact NetApp technical support for further assistance.

Syslog Message

The SP on the node (%s) is not configured properly.

Parameters

node_name (STRING): Name of the node whose SP has its IP address configured incorrectly.

splog.unsupported events

splog.unsupported

Severity

INFORMATIONAL

Description

This message occurs when the current firmware of the Service Processor (SP) does not support the log collection function.

Corrective Action

Check the firmware version from the SP CLI using the 'version' command and compare it to the most current supported version for your storage system. If necessary, download and update the SP firmware to the latest supported version.

Syslog Message

The firmware on the SP does not support the log collection function.

Parameters

(None).

splog.warnings events

splog.warnings

Severity

ERROR

Description

This message occurs when the ONTAP® splogd process has been unable to retrieve a log from the Service Processor (SP) or baseboard management controller (BMC) for at least 24 hours.

Corrective Action

1. Use the "system service-processor show -node <node-name>" command to query the status of the SP

or BMC. Contact NetApp technical support for further assistance if the SP or BMC is not operational. 2. If the status of the SP or BMC is "online," then attempt to restart log monitoring by using the "system node autosupport invoke-splog -remote-node <node-name>" command. Verify from the command output that the logs were transferred successfully. (This command might require up to three attempts.) 3. If every attempt has failed, then restart the SP or BMC with the "system service-processor reboot-sp -node <node-name>" command. 4. After the SP or BMC has finished rebooting, repeat Step 2. 5. If the SP or BMC is still not transferring logs properly, run the "sp status -d" command from the SP CLI prompt or the "bmc status -d" command from the BMC CLI prompt, and include the resulting output when contacting NetApp technical support for further assistance.

Syslog Message

Could not retrieve logs from the %s for 24 hours: %s

Parameters

sp_type (STRING): SP type
reason (STRING): Reason for the warning.

spm events

spm.avs events

spm.avs.process.exit

Severity

ERROR

Description

This message occurs when the antivirus service stops running due to repeated failures. This can be the result of a bad or corrupted update in the scan engine library or virus definition files, or due to an internal failure. The failure of this subsystem can affect client access if mandatory scanning is enabled. It could also result in files not being scanned.

Corrective Action

Disable and then reenable the antivirus engine. If the issue persists, contact NetApp technical support.

Syslog Message

Antivirus server with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.bgpd events

spm.bgpd.process.exit

Severity

NOTICE

Description

This message occurs when the Border Gateway Protocol daemon (bgpd) involuntarily terminates. This daemon is responsible for communicating route information between a storage system and gateway for the virtual IP (VIP) feature. This failure will be automatically addressed by spmctl restarting bgpd. However, if bgpd fails to restart for any reason, the VIP feature will not function correctly.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport® message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Border Gateway Protocol daemon (bgpd) with ID %d exited as a result of signal: %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Cause of the process exit.

spm.coresegd events

spm.coresegd.process.exit

Severity

ALERT

Description

This message occurs when the core segment server (coresegd) involuntarily terminates. The termination of this server impacts all core segmenting services provided by the node.

Corrective Action

The system attempts to recover by restarting the node connectivity "process server". If the process does not restart within the threshold number of retries, then an AutoSupport(tm) message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

The core segment server (coresegd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process terminated.

spm.cphmd events

spm.cphmd.process.exit

Severity

ALERT

Description

This message occurs when the Chassis Health Monitor process (cphmd) involuntarily terminates. The termination of this process can affect monitoring of the subsystems of CPHM .

Corrective Action

The system attempts to recover by restarting the chassis HM process. server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

Controller Health Monitor process (cphmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.crs events

spm.crs.process.exit

Severity

ALERT

Description

This message occurs when the configuration replication server (crs) involuntarily terminates.

Corrective Action

The system attempts to recover by restarting the configuration replication process server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

The configuration replication server (crs) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.cshmd events

spm.cshmd.process.exit

Severity

ALERT

Description

This message occurs when the Cluster Switch Health Monitor process (cshmd) involuntarily terminates. The termination of this process can affect monitoring of the subsystems of CSHM .

Corrective Action

The system attempts to recover by restarting the cluster switch HM process. server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

Cluster Switch Health Monitor process (cshmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.enclmgmtd events

spm.enclmgmtd.process.exit

Severity

NOTICE

Description

This message occurs when the Enclosure Management Daemon (enclmgmtd) involuntarily terminates. This daemon is responsible for enclosure monitoring for this platform. This failure does not affect client access. However, enclosure monitoring might be in a degraded state if the service fails to restart.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport® message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Enclosure Management Daemon (enclmgmtd) with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.envmgr events

spm.envmgr.process.exit

Severity

ERROR

Description

This message occurs when the environmental monitoring daemon (env_mgr) involuntarily terminates. This daemon is responsible for environmental monitoring for this platform. This failure does not affect client access; however, environmental monitoring might be in a degraded state if the service fails to restart, which could result in an unpredicted shutdown if an adverse environmental condition or hardware failure occurs.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, call technical support.

Syslog Message

Environmental monitoring daemon (env_mgr) with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.fpolicy events

spm.fpolicy.process.exit

Severity

ALERT

Description

This message occurs when the fpolicy involuntarily terminates. This can be due to one or more causes and might be related to some recent or previous operations. This subsystem is responsible for sending notification to external fpolicy servers and failure of this subsystem can affect client access.

Corrective Action

While this problem persists, consider migrating the Logical Interfaces (LIFs) hosted on the current node to another node in the cluster and ensure that the auto-revert and DNS load-balancing features do not migrate the LIFs back to the current node. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Fpolicy Service Manager process with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.hashd events

spm.hashd.process.exit

Severity

ALERT

Description

This message occurs when the hashd server (hashd) involuntarily terminates.

Corrective Action

The system attempts to recover by restarting the hashd process server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

The hashd server (hashd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.httpd events

spm.httpd.process.exit

Severity

ALERT

Description

This message occurs when the web server (httpd) involuntarily terminates. The termination of this server will impact all HTTP/HTTPs services provided by the node.

Corrective Action

The system attempts to recover by restarting the node connectivity process. server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

The web server (httpd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.ktlsd events

spm.ktlsd.process.exit

Severity

ALERT

Description

This message occurs when the Kernel Transport Layer Security Daemon support process (ktlsd) involuntarily terminates. The termination of this process can affect monitoring of the subsystems of KTLS.

Corrective Action

The system attempts to recover by restarting the KTLS Daemon process. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

Kernel TLS support process (ktlsd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.mes events

spm.mes.process.exit

Severity

ERROR

Description

This message occurs when the SPD MES daemon (spd) involuntarily terminates. This daemon is responsible for updating DIMM SPDs with correctable error statistics. This failure doesn't affect client access.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, call technical support.

Syslog Message

SPD MES daemon (spd) with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.mgwd events

spm.mgwd.process.exit

Severity

EMERGENCY

Description

This message occurs when the Management Gateway (mgwd) subsystem involuntarily exits. The subsystem provides administration services to manage the cluster and current node. This failure can disrupt administrative tasks that are being performed on the current node. The system attempts to recover by restarting the subsystem. While this situation persists, if a Cluster Management Logical Interface (LIF) is hosted on the current node, migrate it to another node in the cluster using another node management LIF or console access to another node. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent.

Corrective Action

In the rare event that the Management Gateway (mgwd) subsystem has terminated unexpectedly, the automatic restart of the process will often stabilize the situation. While this situation persists, if a Cluster Management Logical Interface (LIF) is hosted on the current node, migrate it to another node in the cluster using another node management LIF or console access to another node. In some cases, there is a systemic issue that can be cleared up by rebooting the node when multiple restarts do not stabilize mgwd. This might be done automatically by the Node Watchdog service for persistent issues within a short window of time. In other cases, recent changes in logging, configuration or external management activities can be contributing factors to the unexpected terminations. Consider reverting one or more of these changes. If the issue persists, contact NetApp technical support.

Syslog Message

Management Gateway (mgwd) subsystem with ID %d exited as a result of signal %s. The subsystem will attempt to restart.

Parameters

> **id** (INT): Process identifier.
> **cause** (STRING): Plain text description of why the process exited.

spm.mntsvc events

spm.mntsvc.process.exit

Severity

> ALERT

Description

> This message occurs when the Node Root Mount Service (mntsvc) involuntarily terminates. The termination of this service affects all Remote Support Agent services provided by the node.

Corrective Action

> The system attempts to recover by restarting the process. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

> The Node Root Mount Service (mntsvc) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

> **id** (INT): Process identifier.
> **cause** (STRING): Plain text description of why the process exited.

spm.named events

spm.named.process.exit

Severity

> ERROR

Description

> This message occurs when the Domain Name Service (DNS) name resolution daemon 'named' involuntarily exits. This error can have one or more causes and might be related to some recent or previous operations. The failure of this daemon can affect DNS zone-based access. In particular, the cluster might no longer be able to resolve DNS zone names to IP addresses and clients that connect to the zone using zone names.

Corrective Action

> While this problem persists, ensure that any new mounts use an IP address instead of a zone name. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

> DNS name resolution daemon 'named' with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

    id (INT): Process identifier.
    cause (STRING): Plain text description of why the process exited.

spm.nchmd events

spm.nchmd.process.exit

Severity

    ALERT

Description

    This message occurs when the Node Connectivity Health Monitor process (nchmd) involuntarily terminates. The termination of this process can affect node connectivity monitoring for SAS subsystem.

Corrective Action

    The system attempts to recover by restarting the node connectivity process. server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

    Node Connectivity Health Monitor process (nchmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

    id (INT): Process identifier.
    cause (STRING): Plain text description of why the process exited.

spm.ndmpd events

spm.ndmpd.process.exit

Severity

    ALERT

Description

    This message occurs when the Network Data Management Protocol (NDMP) server (ndmpd) involuntarily terminates. The termination of this server can affect NDMP client access.

Corrective Action

    The system attempts to recover by restarting the NDMP server. If the NDMP server does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

    Network Data Management Protocol server (ndmpd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

    id (INT): Process identifier.

cause (STRING): Plain text description of why the process exited.

spm.nphmd events

spm.nphmd.process.exit

Severity

ALERT

Description

This message occurs when the Controller Health Monitor process (nphmd) involuntarily terminates. The termination of this process can affect monitoring of the subsystems of NPHM .

Corrective Action

The system attempts to recover by restarting the controller HM process. server. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

Controller Health Monitor process (nphmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.ntpd events

spm.ntpd.process.exit

Severity

ERROR

Description

This message occurs when the Network Time Protocol Daemon process (ntpd) involuntarily terminates. The termination of this process can affect synchronization of system time with network time servers.

Corrective Action

The system attempts to recover by restarting the ntpd process. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

The ntpd with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Reason the process exited.

spm.perfstatd events

spm.perfstatd.process.exit

Severity

ALERT

Description

This message occurs when the perfstat daemon (perfstatd) involuntarily terminates.

Corrective Action

The system attempts to recover by restarting the perfstat daemon. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

The perfstat daemon(perfstatd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.pipd events

spm.pipd.process.exit

Deprecated

Deprecated as of Data ONTAP 9.7 because the pipd process no longer exists.

Severity

ALERT

Description

This message occurs when the post-ingest processing daemon (pipd) involuntarily terminates. The termination of this service prevents data policies and constituent balancing from being applied to Infinite Volume data owned by the node in question.

Corrective Action

The system attempts to recover by restarting the pipd. If the process does not restart within the threshold number of retries, then an AutoSupport(tm) message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

The pipd with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.schmd events

spm.schmd.process.exit

Severity

ALERT

Description

This message occurs when the System Connectivity Health Monitor process (schmd) involuntarily terminates. The termination of this process can affect system connectivity monitoring for HA pair in SAS subsystem.

Corrective Action

The system attempts to recover by restarting the system connectivity process. If the process does not restart within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact technical support.

Syslog Message

System Connectivity Health Monitor process (schmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.secd events

spm.secd.process.exit

Severity

EMERGENCY

Description

This message occurs when the Security daemon (secd) involuntarily terminates. This can be due to one or more causes and might be related to some recent or previous operations. This subsystem is responsible for client authentication and failure of this subsystem can affect client access.

Corrective Action

While this problem persists, consider migrating the Logical Interfaces (LIFs) hosted on the current node to another node in the cluster and ensure that the auto-revert and DNS load-balancing features do not migrate the LIFs back to the current node. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Security daemon with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.servprocd events

spm.servprocd.process.exit

Severity

ALERT

Description

This message occurs when the Service processor daemon process (servprocd) involuntarily terminates.

Corrective Action

The system attempts to recover by restarting the web server. If the server does not restart within the threshold number of retries, then an AutoSupport(tm) message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Service processor daemon (servprocd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.shmd events

spm.shmd.process.exit

Severity

ALERT

Description

This message occurs when the System Health Monitor process (shmd) involuntarily terminates. The termination of this process can affect the system health management and diagnosis feature.

Corrective Action

The system attempts to recover by restarting the shmd process. If the server does not restart within the threshold number of retries, then an AutoSupport(tm) message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

System Health Monitor process (shmd) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.timestate events

spm.timeState.process.exit

Deprecated

This event is removed since time_state server was removed in 8.3.

Severity

ERROR

Description

This message occurs when the subsystem managing timekeeping parameters (time_state) stops running. The failure of this subsystem can cause Network Time Protocol (NTP) settings and the time zone to be inconsistent among subsystems. This might also have an effect on time displayed in log messages.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Subsystem managing timekeeping parameters (time_state) with ID %d exited as a result of signal %s. The subsystem will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process stopped running.

spm.ucoreman events

spm.ucoreman.process.exit

Severity

NOTICE

Description

This message occurs when the Usercore Manager (ucoreman) daemon involuntarily terminates. This daemon is responsible for generating a crash report when an application crashes and dumps core. The crash report helps technical support to diagnose issues with the application. This failure does not affect client access.

Corrective Action

The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, call technical support.

Syslog Message

Usercore Manager (ucoreman) with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.upgrademgr events

spm.upgrademgr.process.exit

Severity

ERROR

Description

This message occurs when the upgrade manager server (upgrademgr) involuntarily terminates.

Corrective Action

The system attempts to recover by restarting the upgrademgr process server. If the process does not restart within the threshold number of retries, then an AutoSupport® message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

The upgrade manager server (upgrademgr) with ID %d exited as a result of %s. This server will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.vifmgr events

spm.vifmgr.process.exit

Severity

EMERGENCY

Description

This message occurs when the Logical Interface Manager (VIFMgr) subsystem aborts. This error can have one or more causes and might be related to recent or previous operations. The failure of this subsystem can result in logical interfaces (LIFs) on the current node migrating to another node within the same cluster.

Corrective Action

Ensure that the LIFs on the current node are hosted on another node in the cluster; if they are not, migrate them to another node. While this problem persists, you should also ensure that the auto-revert and DNS load-balancing features do not migrate the LIFs back to the current node. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Logical Interface Manager(VifMgr) with ID %d aborted as a result of signal %s. The subsystem will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process aborted.

spm.vldb events

spm.vldb.process.exit

Severity

EMERGENCY

Description

This message occurs when Volume Location Database (VLDB) subsystem stops running. This can be due to one or more causes and might be related to some recent or previous operations. The failure of this subsystem can affect client access.

Corrective Action

Ensure that none of the volume/aggregate operations are performed on the current node. While this problem persists, you might want to migrate the Logical Interfaces (LIFs) to another node in the cluster and ensure that auto-revert and DNS load-balancing features do not migrate the LIFs back to the current node. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

Volume Location Database(VLDB) subsystem with ID %d exited as a result of signal %s. The subsystem will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.vserverdr events

spm.vserverdr.process.exit

Severity

ALERT

Description

This message occurs when the Vserver DR process involuntarily terminates. This might cause interruptions in the automatic or scheduled configuration backup of the Vserver's data and configuration.

Corrective Action

The system attempts to recover by restarting the Vserver DR process. Use the "debug process show -process-name vserverdr" command in the diagnostic privilege level to check whether the Vserver DR process has successfully restarted. If the process does not restart within the threshold number of retries, an AutoSupport(tm) message will be sent. If your system is not configured to send AutoSupport messages and the process has not automatically recovered, contact NetApp technical support.

Syslog Message

The Vserver DR process with ID %d exited as a result of %s. The system will attempt to restart it.

Parameters

id (INT): Process identifier.
cause (STRING): Plain text description of why the process exited.

spm.ypbind events

spm.ypbind.process.exit

Severity

ALERT

Description

This message occurs when the NIS client binding daemon 'ypbind' involuntarily exits. This error can have one or more causes and might be related to some recent or previous operations. The termination of this daemon will affect all NIS-based services provided by the controller. In particular, it will no longer be possible to use NIS as a name service source for name lookups.

Corrective Action

While this problem persists, unconfigure NIS as a name service source in the name service switch database. For passwd, group, or netgroup lookups, use an alternative name service source, such as LDAP or files. The system attempts to recover by restarting the subsystem. If the subsystem does not recover within the threshold number of retries, then an AutoSupport(tm) message is sent. If your system is not configured to send AutoSupport messages and the issue persists, contact NetApp technical support.

Syslog Message

NIS client binding daemon 'ypbind' with ID %d exited as a result of signal %s. The service will attempt to restart.

Parameters

id (INT): Process identifier.
cause (STRING): Reason the process exited.

spmgmt events

spmgmt.driver events

spmgmt.driver.hourly.stats

Severity

ERROR

Description

This message occurs when the system encounters an error while trying to get hourly statistics from the Service Processor (SP). The error could be due a communication error with the SP or the SP might not be operational.

Corrective Action

1. Run the 'system service-processor show' command at the Data ONTAP® prompt to check whether the SP is online. 2. If the SP is online and this message persists, run the 'system service-processor reboot-sp' command at the Data ONTAP prompt to reboot the SP.

Syslog Message

The software driver for the Service Processor (SP) detected a problem: %s.

Parameters

reason (STRING): Reason for this failure.

spmgmt.driver.mailhost

Severity

ERROR

Description

This message occurs when the Service Processor (SP) setup cannot connect to the mailhost specified in Data ONTAP®.

Corrective Action

1. Check the system AutoSupport configuration to verify that a valid mailhost is configured in Data ONTAP. 2. Ensure that Data ONTAP can successfully connect to the specified mailhost by running a test command to invoke AutoSupport.

Syslog Message

SP setup could not access the mailhost specified in Data ONTAP.

Parameters

(None).

spmgmt.driver.network.failure

Severity

ERROR

Description

This message occurs when the system encounters a failure during network configuration of the Service Processor (SP). The system cannot assign the SP a DHCP (Dynamic Host Configuration Protocol) or fixed IP address.

Corrective Action

1. Check whether the network cable is correctly plugged into the SP network port. 2. Check the link status LED on the SP. 3. Verify that the network that the SP is connected to has autonegotiation enabled.

Syslog Message

The network configuration of the Service Processor (SP) failed due to cable or network errors.

Parameters

(None).

spmgmt.driver.timeout

Severity

ERROR

Description

This message occurs when there is a failure during communication with the Service Processor (SP) firmware. The failure could be due to a communication error with the SP or the SP might not be operational.

Corrective Action

1. Issue the 'system service-processor show' command at the Data ONTAP® prompt to check whether the SP is online. 2. If the SP is operational and this message persists, run the 'system service-processor reboot-sp' command at the Data ONTAP prompt to reboot the SP. After the reboot, this message should no longer occur. If the message occurs again, contact NetApp technical support and explain that you already performed the preceding steps.

Syslog Message

The software driver for the Service Processor (SP) detected a problem: %s.

Parameters

reason (STRING): Reason for the failure.

sshd events

sshd.auth events

sshd.auth.loginDenied

Severity

NOTICE

Description

This event is issued when sshd refuses a login attempt due to authentication failure.

Corrective Action

Use a valid username/password combination to login.

Syslog Message

(None).

Parameters

message (STRING): Details about the failed login attempt.

sshd.logingracetime events

sshd.loginGraceTime.expired

Severity

ERROR

Description

This message occurs when a user tries to establish a Secure Shell (SSH) connection to a storage system and does not provide the password within the allotted timeout period. Many such connection attempts could potentially disallow other users from logging in to the storage system, causing a Denial of Service (DOS) attack.

Corrective Action

If the remote host is retrying the SSH connection repeatedly, block the remote host by adding its IP address to the deny list using the "firewall policy" command.

Syslog Message

Timeout before password authentication for remote host %s.

Parameters

ipaddress (STRING): IP address of the remote host that was trying to establish an SSH connection.

stackmon events

stackmon.stack events

stackmon.stack.id.conflict

Severity

ERROR

Description

This message occurs when the system cannot determine the stack ID for a disk shelf. The system has exceeded the maximum number of times it can change the stack ID of the shelf. The cause of this issue is a misconfiguration in the system.

Corrective Action

Run the 'system health alert show' command and resolve all of the issues reported by following the corrective actions provided.

Syslog Message

Stack ID of the Shelf %d (S/N %s) on channel %s cannot be agreed on by all the nodes in the cluster.

Parameters

shelfIdent (INT): ID number displayed on the disk shelf OPS panel.
serialNumber (STRING): Serial number of disk shelf.
channelName (STRING): Channel connected to the disk shelf.

storage events

storage.cmd events

storage.cmd.balanceRequest

Severity

INFORMATIONAL

Description

Indicates a user request to balance I/O across initiator ports has been issued.

Corrective Action

(None).

Syslog Message

Storage related I/O has been balanced across available initiator ports.

Parameters

(None).

storage.cmd.logPortIO

Severity

INFORMATIONAL

Description

Logs the mix of I/O bound to a specific initiator port prior to balancing. Issued for all initiator ports when a user requests a balancing of I/O.

Corrective Action

(None).

Syslog Message

Initiator Port %s had %d percent of all storage bound I/O traffic routed through it.

Parameters

portName (STRING): The name of the initiator port
ioPct (INT): The percentage of overall backend I/O routed through this port

storencr events

storencr.disk events

storencr.disk.opDone

Severity

INFORMATIONAL

Description

This message occurs when a Storage Encryption disk command operation that modifies encrypting drive parameters is completed successfully.

Corrective Action

(None).

Syslog Message

Storage Encryption disk %s operation was completed successfully.

Parameters

operation (STRING): Name of the operation.

storvsc events

storvsc.srb events

storvsc.srb.status

Severity

ALERT

Description

This message occurs when ONTAP® software receives an unexpected hypervisor I/O adapter driver response code to an I/O request. The I/O request is retried.

Corrective Action

If the condition persists, contact the hypervisor provider for the corrective action.

Syslog Message

%s. The I/O request will be retried.

Parameters

Descriptor (STRING): Hypervisor's I/O adapter driver received response code.

suspend events

suspend.zapi events

suspend.zapi

Severity

ALERT

Description

This message occurs when ONTAPI (ZAPI) has been suspended due to a lack of use.

Corrective Action

Ensure that all ONTAP data storage management functions using ONTAPI (ZAPI) have transitioned to ONTAP REST API. To unsuspend ONTAPI (ZAPI), run the "system services web ontapi modify -suspended false" command.

Syslog Message

ONTAPI (ZAPI) was suspended on "%s" due to a lack of use.

Parameters

date (STRING): Date ONTAPI (ZAPI) was suspended.

sv events

sv.vfiler events

SV.vfiler.config.move.error

Severity

ERROR

Description

This message occurs when movement of SnapVault® configuration from 'from' vFiler to 'to' vFiler fails. Subsequent SnapVault transfer on the vFiler might fail.

Corrective Action

Move the volume back to 'from' vFiler and then again perform a vFiler move from 'from' vFiler to 'to' vFiler. Please use 'vfiler move' command to move the volume between the vfilers.

Syslog Message

Movement of SnapVault configuration failed while moving volumes between vFiler %s to vFiler %s. Move the volume back to %s vFiler and perform the vFiler move operation again.

Parameters

from_vfiler1 (STRING): vFiler(tm) from which resources are being moved.
to_vfiler (STRING): vFiler to which resources are being moved.
from_vfiler2 (STRING): vFiler to which resources are being moved.

sv.vol events

SV.vol.snapshot.rename.error

Severity

ERROR

Description

This message occurs when the renaming operation of SnapVault® snapshots belonging to a certain volume fails, even though the "vFiler rename" or "vFiler move" operation was successful. The problem might be that the volume was offline during the "vFiler rename" or "vFiler move" operation, and it might cause SnapVault to have an extra snapshot on the destination. To avoid this scenario, volumes need to be online during a "vFiler rename" or "vFiler move".

Corrective Action

If necessary, delete the extra snapshot manually after the next SnapVault update.

Syslog Message

Rename of SnapVault snapshots for volume %s failed. This might cause SnapVault to have an extra snapshot on destination. If necessary, delete the extra snapshot manually after the next SnapVault update.

Parameters

vol_name (STRING): Volume whose snapshots created by SnapVault® could not be renamed.

sync events

sync.snapmirror events

sync.snapmirror.arl.veto

Severity

ALERT

Description

This message occurs when a storage failover (SFO) operation is vetoed because the aggregate is hosting volumes that are in a SnapMirror® Synchronous relationship with StrictSync policy.

Corrective Action

Either convert all SnapMirror Synchronous relationships with StrictSync Policy to Sync Policy for the volumes in the aggregate and then retry the operation, or retry the operation with the "override-vetoes true" parameter. Note: Using this option can cause an I/O disruption.

Syslog Message

SnapMirror vetoed storage failover operation because aggregate "%s" is hosting volumes that are in a SnapMirror Synchronous relationship with StrictSync policy.

Parameters

aggrname (STRING): Name of the aggregate.

sync.snapmirror.oos.frequent

Severity

ERROR

Description

This message occurs when a SnapMirror® Sync relationship frequently changes status from "in-sync" to "out-of-sync". This behaviour impacts data protection. I/O restrictions are imposed on the source volume based on the mode of replication. For relationships with policy type "strict-sync-mirror", both client read AND write access are disallowed.

Corrective Action

Check network connection between the source and destination volumes. Monitor the SnapMirror® Sync relationship status by using the "snapmirror show" command and observe field "last-transfer-error" to identify the reasons for frequent status change of the SnapMirror® Sync relationship to "out-of-sync".

Syslog Message

Source volume "%s" and destination volume "%s" with relationship UUID "%s" is frequently undergoing change in status from "in-sync" to "out-of-sync".

Parameters

srcpath (STRING): Path name of the source volume of the SnapMirror relationship.
dstpath (STRING): Path name of the destination volume of the SnapMirror relationship.
relationship_id (STRING): Relationship UUID.

sysconfig events

sysconfig.sysconfigtab events

sysconfig.sysconfigtab.openFailed

Severity

    NOTICE

Description

    This event is issued when the sysconfigtab file cannot be opened.

Corrective Action

    (None).

Syslog Message

    sysconfig: %s

Parameters

    reason (STRING): Reason why it can't be opened.

sysmgr events

sysmgr.ecv events

sysmgr.ecv.fetch

Severity

ERROR

Description

This message occurs when acquiring the desired Effective Cluster Version (ECV) of System Manager was not accomplished within the time limit. This node will provide the last version of System Manager instead of the desired ECV. Any operations being blocked are unblocked, such as storage giveback and cluster management logical interface (LIF) migration.

Corrective Action

Use the diagnostic level "system manager version show" command to see the status of the node. If this behavior persists, contact NetApp technical support.

Syslog Message

ECV version %s of System Manager was not acquired within %d seconds.

Parameters

ecv (STRING): Current ECV determined by the capability management (CAPM) system.
timeout (INT): Timeout in seconds.

sysmgr.gb events

sysmgr.gb.ecv

Severity

NOTICE

Description

This message occurs when acquiring the desired Effective Cluster Version (ECV) of System Manager was not accomplished within the time limit during the first storage giveback phase. This node will provide the last version of System Manager instead of the desired ECV. This node might acquire the desired version later.

Corrective Action

Use the diagnostic level "system manager version show" command to see the status of the node. If this behavior persists, contact NetApp technical support.

Syslog Message

ECV version of System Manager was not acquired within %d seconds during the first phase of storage giveback.

Parameters

timeout (INT): Timeout in seconds.

sysmgr.upload events

sysmgr.upload.bad.method

Severity

ERROR

Description

This message occurs when an attempt to upload a file through the System Manager web service fails because the HTTP method is not POST.

Corrective Action

Retry the upload using the System Manager web interface.

Syslog Message

Failed to upload a file because the HTTP method "%s" is not allowed. The method must be POST.

Parameters

method (STRING): HTTP method.

sysmgr.upload.bad.type

Severity

ERROR

Description

This message occurs when a file upload through the System Manager web service fails because the file name has an unsupported extension.

Corrective Action

Upload a file with one of the allowed file name extensions using the System Manager web interface.

Syslog Message

Failed to upload file "%s" because the extension must be one of: %s.

Parameters

file (STRING): File name.
allowed_types (STRING): Allowed extensions for the file name.

sysmgr.upload.exists

Severity

NOTICE

Description

This message occurs when a file upload through the System Manager web service fails because the file already exists. System Manager automatically deletes the existing file and retries the upload.

Corrective Action

(None).

Syslog Message

Failed to upload file "%s" because it already exists.

Parameters

file (STRING): File name.

sysmgr.upload.internal

Severity

ERROR

Description

This message occurs when a file upload through the System Manager web service fails because of an internal error.

Corrective Action

Retry the upload using the System Manager web interface.

Syslog Message

Failed to upload file "%s" because of an internal error.

Parameters

file (STRING): File name.

sysmgr.upload.no.file

Severity

ERROR

Description

This message occurs when an attempt to upload a file through the System Manager web service fails because the file is not received. This might happen if the file is larger than the limit or space is consumed by other uploads.

Corrective Action

If the file is larger than the maximum allowed size, then it cannot be uploaded. If other uploads are in progress, allow time for those uploads to finish, and then try again. Otherwise, contact NetApp technical support.

Syslog Message

Failed to upload file "%s" due to exceeding size limit %s or insufficient space.

Parameters

file (STRING): File name.
max_filesize (STRING): Maximum allowed size for the uploaded file.

sysmgr.upload.no.form

Severity

ERROR

Description

This message occurs when an attempt to upload a file through the System Manager web service fails because there is a problem with the request format. This might happen if the Content-Type HTTP header is not "multipart/form-data" or there is not a form field named "file" containing the file to upload.

Corrective Action

Retry the upload using the System Manager web interface.

Syslog Message

Failed to upload a file because a form field named "file" was not found in the HTTP request, or the Content-Type HTTP header is not "multipart/form-data".

Parameters

(None).

sysmgr.upload.success

Severity

NOTICE

Description

This message occurs when a file is successfully uploaded through the System Manager web service.

Corrective Action

(None).

Syslog Message

File "%s" has been uploaded.

Parameters

file (STRING): File name.

sysmgr.upload.unauthorized

Severity

ERROR

Description

This message occurs when an attempt to upload a file through the System Manager web service fails because the user is unauthorized. This could be due to a failure to authenticate the user, e.g., the password or user name was wrong, or if the user's role is not granted access to the System Manager web service.

Corrective Action

Verify that the user name and password used to log in in to System Manager are correct. Verify that the user exists in the "security login show" table with application "http" and authentication method "password". Verify that the user's role, as shown in "security login show", is granted access to the "sysmgr" web service in "vserver services web access show sysmgr".

Syslog Message

Failed to upload file "%s" because the user is unauthorized.

Parameters

    file (STRING): File name.

tape events

tape.cmd events

tape.cmd.chkCondErr

Severity

ERROR

Description

This message occurs when a Check Condition status from the tape drive reports an informational condition or status to the controller. The condition that generated this event is an error that occurred during execution of the command and was not cleared by retrying the request, if retries were attempted.

Corrective Action

This Check Condition case is an error that might be caused by an intermittent error in device hardware or a flaw in the tape media. Media errors might also suggest that the tape drive head should be cleaned following the manufacturer's directions. In cases of repeated events, evaluate the device for proper operation and possible repair or replacement. Consult vendor documentation for additional information.

Syslog Message

%s device %s: Check Condition: SCSI opcode %s (CDB %s): %s - %s (0x%x - 0x%x 0x%x 0x%x).

Parameters

deviceType (STRING): Type of device on which the condition occurred.
deviceName (STRING): Electrical path name of the device on which the command failed.
opcode (STRING): Definition of the SCSI opcode (command) that encountered the check condition.
cdb (STRING): Opcode byte of the command block that encountered the check condition.
sSenseKey (STRING): String containing a description of the sense key returned by the device for the failed command.
sSenseCode (STRING): String containing a description of the additional sense code and sense code qualifier key returned by the device for the failed command.
iSenseKey (INTHEX): Integer value of the sense key for the failed command.
iASC (INTHEX): Integer value of the sense code for the failed command.
iASCQ (INTHEX): Integer value of the sense code qualifier for the failed command.
iFRU (INTHEX): Integer value of the field-replaceable unit(FRU) for the failed command.

tape.cmd.chkCondNullSenseDbg

Severity

ERROR

Description

This message occurs when the command to the tape device fails with a status of Check Condition, but the adapter received no sense bytes containing details about the failure. Sense bytes typically accompany command failure reports, unless bus or loop stability problems, or target device or adapter errors have interfered with the sense byte transfer. This is a diagnostic message. See the "mt diag" command (from the nodeshell in clustered environments) for the control of tape diagnostic messages.

Corrective Action

Ensure that the cables are securely attached, and perform other maintenance typically required for SCSI or FC stability. If the error persists, contact NetApp technical support for assistance.

Syslog Message

%s device %s reports Check Condition status on command opcode 0x%x. No sense bytes accompany the status.

Parameters

deviceType (STRING): Device type.
deviceName (STRING): Electrical path name of the device on which the command failed.
opcode (INTHEX): Opcode of the failed SCSI command.

tape.cmd.cmdFail

Severity

ERROR

Description

This message occurs when a tape command fails with an error detected by the adapter. This is not an error reported by the tape drive. The adapter status values reported under this message indicate that the adapter suffered an internal error, or that the bus or loop is unstable, or that the adapter has no path to the requested device.

Corrective Action

Verify that the loop or bus cabling is correctly installed. If the error occurs only on this device and not on others on the same interface, ensure that the external and internal cabling, if any, of this device are securely connected. If the error occurs on more than one device, then a more general debug of the cabling infrastructure might be required.

Syslog Message

Tape device %s: command failed, ha_status 0x%x.

Parameters

deviceName (STRING): Electrical path name of the device on which the command failed.
adapterError (INTHEX): Internal adapter error that was detected.

tape.cmd.scsiErrNullSense

Severity

ERROR

Description

This message occurs when the device reports that the command failed, but the adapter received no sense bytes containing detail about the failure. Sense bytes typically accompany command failure reports, unless bus or loop stability problems, or target device or adapter errors have interfered with the sense byte transfer.

Corrective Action

Ensure that the cables are securely attached, and perform other maintenance typically required for SCSI or FC stability. If the error persists, contact NetApp technical support for assistance.

Syslog Message

%s device %s reports %s status on command opcode 0x%x. No sense bytes accompany the status.

Parameters

deviceType (STRING): Device type.
deviceName (STRING): Electrical path name of the device on which the command failed.
scsiStatus (STRING): Status returned by the device.
opcode (INTHEX): Opcode of the failed SCSI command.

tape.config events

tape.config.badKey

Severity

ERROR

Description

This message occurs when the tape configuration file has a format error in a required parameter or is missing a required parameter. The error prevents the file from being used to specify parameters for the tape drive. Data ONTAP® examines tape configuration files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image. This error can occur if a configuration file is altered, an action that is not recommended.

Corrective Action

Recover the original file from a backup file or Snapshot(tm) copy, if possible. A copy of the file might be available from NetApp Support, although not all tape configuration files are made available there.

Syslog Message

Required key (%s) is missing or badly formatted in tape configuration file %s.

Parameters

badKey (STRING): Required parameter.
configFile (STRING): Name of the file with the error.

tape.config.badOpt

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP® detects an incorrect format on an option key in a tape configuration file. Data ONTAP will use a default setting for this key. This message can occur if a configuration file is altered, an action that is not recommended. This condition does not prevent the use of the specified tape device. Data ONTAP examines tape configuration files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image.

Corrective Action

Recover the original file from a backup file or Snapshot(tm) copy, if possible. A copy of the file might be available from NetApp Support, although not all tape configuration files are made available there.

Syslog Message

Option key %s is absent or badly formatted in tape configuration file %s. Default %s will be used.

Parameters

badOptKey (STRING): Absent or badly formatted option keys.
configFile (STRING): Name of the file with the incorrect or absent option key.
defaultOpt (STRING): Default values used in place of the option keys.

tape.config.fmtChkFail

Severity

ERROR

Description

This message occurs when a tape configuration file has a format error in a parameter that prevents use of the tape drive that the file specifies. This error can occur if a configuration file is altered, an action that is not recommended. Additional messages detail the missing or badly formatted keys. Data ONTAP® examines tape configuration files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image.

Corrective Action

Recover the original file from a backup file or Snapshot(tm) copy, if possible. A copy of the file might be available from NetApp Support, although not all tape configuration files are made available there.

Syslog Message

Tape configuration file %s has missing or badly formatted required keys. Format check has failed.

Parameters

configFile (STRING): Name of the file with the error.

tape.config.fmtErrKey

Severity

ERROR

Description

This message occurs when the file has a parameter format error in a tape configuration file that prevents the file from being used to specify tape drive parameters. Data ONTAP® examines tape configuration files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image. This error can occur if a configuration file is altered, an action that is not recommended.

Corrective Action

Recover the original file from a backup file or Snapshot(tm) copy, if possible. A copy of the file might be available from NetApp Support, although not all tape configuration files are made available there.

Syslog Message

Tape configuration file %s has a format error in the information appended to key %s.

Parameters

configFile (STRING): Name of the file with the error.
line (STRING): Line containing the error.

tape.config.infoExist

Severity

ERROR

Description

This message occurs when the information in a tape configuration file specifies a tape drive that Data ONTAP® already has parameters for. This error can occur if duplicate or multiple files for the same device are in the /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory. Data ONTAP examines files in the storage controller's tape_config directory to dynamically qualify devices that are not part of the Data ONTAP image.

Corrective Action

Remove any duplicates. If the device appears in the output of the "storage show tape supported" (7-Mode or Cluster-Mode nodeshell) command without the notation "(Dynamically qualified)", then Data ONTAP contains this information internally, and the file should be removed from the directory. This file might have been left over from a previous Data ONTAP release that did not have internal information for the device.

Syslog Message

Tape device information already exists. Dynamic tape configuration file %s not used. Tape product ID already qualified.

Parameters

configFile (STRING): Name of the file with the extra or duplicate information.

tape.config.maxFilesExceeded

Severity

ERROR

Description

This message occurs when the maximum number of tape configuration files that Data ONTAP® will examine has been exceeded. Data ONTAP examines files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image. This error might be caused by the addition of tape configuration files retrieved from the NetApp Support site, or by user attempts to create configuration files.

Corrective Action

Remove any files that might be duplicates, and remove any user-created files.

Syslog Message

The maximum number of Dynamic Tape Qualification configuration files (%d) has been exceeded.

Parameters

maxFiles (INT): Maximum number of dynamic qualification files allowed.

tape.config.openFail

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot open a file in the tape configuration directory. Data ONTAP examines files in the storage controller's /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory to dynamically qualify devices that are not part of the Data ONTAP image.

Corrective Action

This error might be a temporary condition. If any files in the /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode) directory are opened by an editor or viewer, close them. Data ONTAP will try to open the file again for qualification when a tape operation is attempted.

Syslog Message

Failed to open tape configuration input file %s.

Parameters

configFile (STRING): File that could not be opened.

tape.device events

tape.device.adapterErr

Severity

ERROR

Description

This message occurs when an adapter error occurs that Data ONTAP® does not recognize.

Corrective Action

If the error persists, contact NetApp technical support for assistance if the error persists.

Syslog Message

Tape device %s: Unexpected adapter error 0x%x.

Parameters

deviceName (STRING): Electrical path name of the device on which the command failed.
adapterError (INT): Internal adapter error that was detected.

tape.device.cmdAbort

Severity

ERROR

Description

This message occurs when a tape command fails with an error detected by the adapter. This is not an error reported by the tape drive. The adapter status values reported under this message indicate that a timeout in the transport of the command has occurred, or that other devices on the bus or loop have induced an error in the communication with this device, which might not be at fault. These errors might be of a transient nature.

Corrective Action

Verify that the loop or bus cabling is correctly installed, and retry the operation. If the error occurs only on this device and not on others on the same interface, ensure that the external and internal cabling, if any, of

this device are securely connected. If this error occurs on more than one device, then a more general debug of the cabling infrastructure might be required. If errors of other types occur on other devices on the same bus or loop, attend to those first, because they could be the cause of this error.

Syslog Message

Tape device %s: command aborted by host, ha_status 0x%x.

Parameters

deviceName (STRING): Electrical path name of the device on which the command failed.
adapterError (INT): Internal adapter error that was detected.

tape.device.noCompress

Severity

ERROR

Description

This message occurs when the tape device does not support the compression mode that Data ONTAP® attempted to set it to. This error indicates a mismatch in expectations between Data ONTAP and the tape drive over whether compression is supported. This error can occur if the the tape drive is qualified with a tape configuration file in /etc/tape_config (7-Mode) or /mroot/etc/tape_config (Cluster-Mode), and the file has been modified from its released condition, an action that is not recommended.

Corrective Action

Verify whether the device documentation indicates that it supports compression. If support is indicated, then the device might need to be power-cycled to clear an abnormal condition, or it might need to be repaired. If Data ONTAP employs a tape configuration file to enable support of this drive and the file has been modified, the file should be returned to its original condition. Support using the configuration file is indicated if the device appears in the output of the "storage show tape supported" (7-Mode or Cluster-Mode nodeshell) command with the notation "(Dynamically Qualified)". Revert to a previous configuration file version, or retrieve a new version from NetApp Support, if one is available.

Syslog Message

Tape device %s does not support compression %s.

Parameters

devAddr (STRING): Device address.
modifier (STRING): The SCSI component that is not supported; the Mode Select Compression Page or compression capability represented in that page.

tape.device.notSupported

Severity

ERROR

Description

This message occurs when Data ONTAP® does not recognize this tape drive as a supported device.

Corrective Action

Go to support.netapp.com/NOW/download/tools/tape_config/index.shtml to determine whether NetApp has qualified this tape drive, and download the appropriate configuration file, if necessary. If this tape drive emulates a qualified tape drive, see na_cloned_tapes(5) for more information.

Syslog Message

Data ONTAP does not recognize this tape drive: %s: %.8s%.16s%.4s

Parameters

address (STRING): Address identifier of the tape device.
vendorID (STRING): Tape device vendor, as found in the SCSI Inquiry data field "VENDOR IDENTIFICATION".
productID (STRING): Product name, as found in the SCSI Inquiry data field "PRODUCT IDENTIFICATION".
revision (STRING): Product revision, as found in the SCSI Inquiry data field "PRODUCT REVISION LEVEL".

tape.device.selectTimeout

Severity

ERROR

Description

This message occurs when the adapter cannot select the tape drive. This can be caused by the failure of the device, or by unstable loop or bus conditions that corrupt the selection signals so that the device does not detect selection request, or the adapter does not recognize the device response. This is not an error reported by the tape drive. This error might be of a transient nature.

Corrective Action

Verify that the loop or bus cabling is correctly installed, and retry the operation. If this error occurs on more than one device, then a more general debug of the cabling infrastructure might be required. For SCSI devices, carefully examine the bus pins for damage, especially if cables have been moved since the last time this device functioned correctly. If the error persists, power-cycling the drive might clear a hang condition in the device.

Syslog Message

Tape %s: selection timeout, ha_status 0x%x.

Parameters

deviceName (STRING): Electrical path name of the device on which the command failed.
adapterError (INT): Internal adapter error that was detected.

tape.diagmsg events

tape.diagMsg

Severity

INFORMATIONAL

Description

This message occurs when there is a new state of the tape diagnostic message flag. Data ONTAP® is more or less verbose in reporting SCSI check conditions depending on the flag. Using a valid tape drive address [tape], diagnostic messages can be enabled using the "mt -f [tape] diag 1" (7-Mode or Cluster-Mode nodeshell) command. You can disable the extra message using the "mt -f [tape] diag 0" command. The default value is 0.

Corrective Action

There is no corrective action for this message. However, enabling diagnostic messages might cause other error messages to be generated that are usually suppressed by Data ONTAP, particularly reports of tape position. No corrective action is needed if the reports are normal. Normal reports include check conditions at the beginning or end of tape, and filemarks. It is important to understand the format of the tape data to determine whether the additional messages indicate an error.

Syslog Message

Tape driver diagnostic messages %s.

Parameters

diagState (STRING): New condition of "diag" message enable.

tapemc events

tapemc.alias events

tapemc.alias.addFail

Severity

ERROR

Description

This message occurs when the automatic addition of a tape or medium changer alias fails. Data ONTAP® might attempt to add aliases automatically at boot or when devices are added, if it determines that the devices have no existing aliases.

Corrective Action

Check the tape and medium changer aliases to ensure that they specify the desired devices. You can view, add, or delete aliases using the "storage alias/unalias" (7-Mode or Cluster-Mode nodeshell) commands.

Syslog Message

Unable to retrieve and add alias for %s device %s.

Parameters

deviceType (STRING): Type of device for which an alias addition failed.
deviceAddr (STRING): Address of the device for which an alias addition failed.

tapemc.alias.addOK

Severity

NOTICE

Description

This message occurs when a tape or medium changer alias is added successfully. Data ONTAP® might add aliases automatically at boot or when devices are added, if it determines that devices have no existing aliases.

Corrective Action

(None).

Syslog Message

Alias %s automatically added for %s device %s.

Parameters

alias (STRING): New alias of the device.
deviceType (STRING): Type of device.
deviceAddr (STRING): Address of the device.

tapemc.alias.max

Severity

ERROR

Description

This message occurs when Data ONTAP® automatically adds a tape or media changer alias, and the new number of aliases exceeds the maximum number of aliases allowed. Automatic alias addition can occur when new devices are discovered, or when device connections are changed.

Corrective Action

Delete any unused aliases with 'storage tape alias clear'.

Syslog Message

Could not add alias for %s device %s. The alias count exceeds the maximum of %d aliases.

Parameters

deviceType (STRING): Type of device.
deviceAddr (STRING): Address of the device.
max (INT): Maximum number of tape and media changer aliases allowed.

tapemc.alias.threshold

Severity

ERROR

Description

This message occurs when Data ONTAP® automatically adds a tape or media changer alias, and the new number of aliases exceeds an internal threshold. The alias is added, but additional aliases might not be added until other aliases are deleted. Automatic alias addition can occur when new devices are discovered, or when device connections are changed.

Corrective Action

Delete any unused aliases with 'storage tape alias clear'.

Syslog Message

Addition of alias %s for %s device %s totals %d aliases which exceeds threshold of %d tape/media changer aliases. The maximum number of aliases allowed is %d.

Parameters

alias (STRING): New alias of the device.
deviceType (STRING): Type of device.
deviceAddr (STRING): Address of the device.
count (INT): Current count of tape and media changer aliases.
threshold (INT): Internal threshold for number of tape and media changer aliases.
max (INT): Maximum number of tape and media changer aliases allowed.

tapemc.device events

tapemc.device.cmdAllocFail

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot obtain a command block for sending operations to the device.

Corrective Action

This problem is probably a temporary resource shortage within Data ONTAP. Retry the operation.

Syslog Message

Failed to allocate SCSI command block for %s device %s.

Parameters

deviceType (STRING): Type of device on which the command allocation failed.
deviceName (STRING): Name of the device.

tapemc.device.lunNotConn

Severity

ERROR

Description

This message occurs when the tape drive, media changer, or bridge device is reported as not being connected to its dependent LUN even though it indicated that the LUN device exists. Data ONTAP® cannot initialize the dependent device.

Corrective Action

Consult the vendor documentation for the attached device to ensure that the device is configured correctly.

Syslog Message

Aborting initialization of device %s at address L%d. The attached hardware indicates that no device is available at that LUN address.

Parameters

devName (STRING): Name of the device.
lun (INT): LUN number of this device.

tapemc.device.maxExceed

Severity

ERROR

Description

This message occurs when more than the maximum supported number of devices of the reported type are attached to the controller.

Corrective Action

The reported device cannot be accessed. If other devices of the same type are attached but unused, removing them can allow the named device to be reattached and used. For FC devices, unplug the devices and wait for the messages that indicate the devices have been removed. For SCSI devices, use the

"storage adapter disable [name]" (7-Mode or Cluster-Mode nodeshell) command.

Syslog Message

Maximum number of %s devices exceeded. Device %s cannot be accessed. The maximum is %d.

Parameters

deviceType (STRING): Type of device that exceeded the maximum number allowed.
deviceName (STRING): Name of the device.
deviceMax (INT): Maximum number of devices of this device type.

tapemc.device.multipath

Severity

ERROR

Description

This message occurs when a tape drive or media changer is reported as having a multipath connection when alias mapping is WWNN-based. WWNN-based aliasing does not support multipath connections.

Corrective Action

Remove the multipath connection to the device. If multipathing is required: 1. Reboot or takeover the node and enter the boot menu (LOADER>) by pressing Ctrl+C when prompted. 2. Enter "unsetenv bootar.tape_mc.wwnn_alias?". 3. Enter "boot_ontap" to reboot the node. Aliasing will now be serial number-based.

Syslog Message

%s device "%s" has a multipath connection with WWNN-based alias mapping. Multipath configurations are only supported with serial number-based aliases.

Parameters

deviceType (STRING): Type of device.
deviceName (STRING): Name of the device.

tapemc.device.noSerial

Severity

ERROR

Description

This message occurs when the device can not return a serial number when requested to do so. The device can still be used, but the serial number will not be available for output.

Corrective Action

This condition might be normal, especially with older device types, because SCSI-2 does not require serial numbers. If the vendor documentation indicates that the serial number should be available (look for a serial number request as an option of the Inquiry command), the device might need to be repaired.

Syslog Message

Serial number not available for %s device %s, product ID %s.

Parameters

> **devType** (STRING): SCSI device type.
> **devAddr** (STRING): Device address.
> **prodID** (STRING): Vendor product ID of the device.

tapemc.device.notExpected

Severity

> ERROR

Description

> This message occurs when Data ONTAP® expects a media changer, tape device or bridgerouter but encounters an unexpected or unknown device type.

Corrective Action

> Consult the vendor documentation for the attached device to ensure that the device is configured correctly.

Syslog Message

> Aborting device initialization for %s. Expecting a %s device but discovered an unexpected %s device type.

Parameters

> **devName** (STRING): Name of the device.
> **expectedDevType** (STRING): Expected SCSI device type.
> **actualDevType** (STRING): Actual SCSI device type discovered.

tapemc.device.notSCSI2

Severity

> ERROR

Description

> This message occurs when Data ONTAP® requires that parallel SCSI and FC devices support, at a minimum, the SCSI-2 protocol. This device does not have the minimum support, and cannot be used with Data ONTAP unless it is upgraded.

Corrective Action

> Verify with vendor documentation that the device supports at least the SCSI-2 protocol. If it does, then the device might need to be power-cycled or repaired. Check with the vendor whether an upgrade to SCSI-2 is possible.

Syslog Message

> %s device %s not configured to support SCSI-2.

Parameters

> **devType** (STRING): SCSI device type.
> **devAddr** (STRING): Name of the device.

tapemc.device.releaseFail

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot remove a SCSI Persistent Reservation from this device.

Corrective Action

Attempt the manual release of the reservation using the "storage release [tape|mc]" command (from the nodeshell in clustered environments) at the advanced privilege level. If the error persists, the device might need to be power-cycled.

Syslog Message

Device reservation release failed on %s device %s.

Parameters

deviceType (STRING): Type of device on which the reservation release failed.
deviceName (STRING): Name of the device.

tapemc.device.resvConfl

Severity

ERROR

Description

This message occurs when Data ONTAP® detects a SCSI reservation conflict while accessing this device. Data ONTAP routinely places reservations on devices to prevent multiple simultaneous accesses by more than one storage controller. A reservation conflict indicates that an existing reservation for another host system has been detected. Conflicts might occur in some error conditions where a reservation has been left on the device inadvertently, or if a device has been moved from one system to another without a power-cycle.

Corrective Action

If another system is using the device, then this error is normal and no corrective action should be taken to release the reservation. If the reporting system is the only user, then the reservation is likely an error. Attempt manual release of the reservation using via the "storage release [tape|mc]" (from the nodeshell) command at the advanced privilege level. If the error persists, the device might need to be power-cycled.

Syslog Message

Reservation conflict on %s device %s.

Parameters

deviceType (STRING): Type of device on which the reservation release failed.
deviceName (STRING): Name of the device.

tapemc.iopending events

tapemc.iopending.exceeded

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP® detects that multiple I/Os were sent to a device that supports only one I/O at a time.

Corrective Action

(None).

Syslog Message

%s device %s has more than one I/O pending, but the device supports only one I/O at a time.

Parameters

deviceType (STRING): Type of device that multiple I/Os were sent to.
deviceName (STRING): Name of the device.

tapemc.passthru events

tapemc.passthru.negUnderrun

Severity

ERROR

Description

This message occurs when a data underrun (less data is transferred than requested) happens on a read operation to the device, and the number of data bytes reported as not transferred is unexpectedly larger than the number of bytes requested. Any data involved in the transfer might not be correct. Underruns themselves can be normal if the amount of date available to transfer can be smaller than the requested amount.

Corrective Action

Retry the operation. If the command was expected to fail, or if the failure is inconsequential, then you can ignore this condition. Otherwise, ensure that the cables and terminators (if any) are fully seated and tightened snugly. If the error persists, consider replacing the cable/terminator, host adapter or device.

Syslog Message

%s %s inbound data transfer ended with an underrun, but the reported residue %d (bytes not transferred) exceeds the request size %d.

Parameters

deviceType (STRING): Type of device.
deviceName (STRING): Path name of the device.
resideBytes (INT): Number of bytes reported as not transferred.
requestedBytes (INT): Number of bytes requested.

tapemc.sas events

tapemc.SAS.dedicatedPort

Severity

ERROR

Description

This message occurs when Data ONTAP® detects a SAS device that is connected to a port that is dedicated for SAS disk storage attachment, but is not a disk shelf or a bridge device.

Corrective Action

Connect the device using another available port.

Syslog Message

"%s" device type should not be connected to port %s, which is dedicated to disk storage attachment. Connect it using another available port.

Parameters

deviceType (STRING): Type of device connected to the port.
connectionPort (STRING): Connection port for the device.

tapemc.SAS.not.supported

Severity

ERROR

Description

This message occurs when a serial attached SCSI (SAS) tape or media changer is detected that is not allowed to be attached to this system. This is likely due to the SAS connections being reserved for disk shelf attachment. Tape drives and media changers cannot reliably share a SAS interface with disk drives.

Corrective Action

Remove the SAS tape or media changer device.

Syslog Message

Attaching a SAS tape or media changer device on adapter "%s" is not supported on this system.

Parameters

AdapterName (STRING): Adapter name to which the tape device is attached.

tapemc.unsupported events

tapemc.unsupported.allow

Severity

ERROR

Description

This message occurs when a tape or media changer is detected that is not supported on this system, but its usage is not blocked. Use at your own risk.

Corrective Action

Remove the tape or media changer device, or use at your own risk.

Syslog Message

Attaching a tape or media changer device on adapter %s is not supported on this system.

Parameters

    AdapterName (STRING): Adapter name to which the tape device is attached.

tar events

tar.csum events

tar.csum.csumUnsuccessful

Severity

NOTICE

Description

This message occurs when the system accesses a TAR archive and compares the calculated checksum of this archive to a stored checksum, but the checksum calculation does not succeed.

Corrective Action

(None).

Syslog Message

Checksum of %s could not be calculated.

Parameters

tgz_path (STRING): Path to the archive for which the checksum calculation failed.

tar.csum.extractFailed

Severity

ERROR

Description

This message occurs when the system accesses a TAR archive and compares the calculated checksum of the archive to a stored checksum, but the extraction of such an archive fails.

Corrective Action

(None).

Syslog Message

TAR extraction of %s failed with rc=%d.

Parameters

tgz_path (STRING): Path to the archive for which extraction failed.
rc (INT): Error code clarifying why the extraction of the archive failed.

tar.csum.match

Severity

INFORMATIONAL

Description

This message occurs when the system accesses a TAR archive and compares the calculated checksum of the archive to a stored checksum. In this case, the calculated and stored checksums for the archive match.

Corrective Action

(None).

Syslog Message

Stored checksum matches, not extracting %s.

Parameters

tgz_path (STRING): Path to the archive for which the calculated and stored checksums match.

tar.csum.mismatch

Severity

NOTICE

Description

This message occurs when the system accesses a TAR archive and compares the calculated checksum of the archive to a stored checksum. In this case, the calculated and stored checksums for the TAR archive do not match.

Corrective Action

(None).

Syslog Message

Stored checksum %u does not match calculated checksum %u, extracting %s.

Parameters

stored_csum (INTHEX): Value of the stored checksum.
calculated_csum (INTHEX): Value of the calculated checksum.
tgz_path (STRING): Path to the archive for which the calculated and stored checksums do not match.

tar.csum.notFound

Severity

NOTICE

Description

This message occurs when the system accesses a TAR archive and compares the calculated checksum of the archive to a stored checksum. In this case, the file containing the stored checksum does not exist, necessitating the extraction of the archive.

Corrective Action

(None).

Syslog Message

Stored checksum file does not exist, extracting %s.

Parameters

tgz_path (STRING): Path to the archive for which a corresponding stored checksum file does not exist.

tar.extract events

tar.extract.failure

Severity

ERROR

Description

This message occurs during the process of extracting a TAR archive, when an error while processing a particular entry causes the extraction of the archive to fail.

Corrective Action

(None).

Syslog Message

Failure while extracting file (%d): '%s' %s.

Parameters

type (INT): Type identifier of the TAR archive entry being processed when the error was encountered. Type identifiers and corresponding file types are as follows: 48 = Regular file, 49 = Hard link, 50 = Symbolic link, 51 = Character device, 52 = Block device, 53 = Directory, 54 = FIFO special file, 55 = Reserved.
path (STRING): Relative path of the TAR archive entry being processed when the error was encountered.
errstr (STRING): Error string providing more information about the error that caused the extraction process to fail.

tar.extract.success

Severity

INFORMATIONAL

Description

This message occurs when a TAR archive has been successfully extracted.

Corrective Action

(None).

Syslog Message

Completed extracting %s.

Parameters

path (STRING): Path to the TAR archive that has been successfully extracted.

tar.extract.unhandledType

Severity

ERROR

Description

This message occurs during the process of extracting a TAR archive, when the system discovers an entry that has an unsupported type identifier.

Corrective Action

(None).

Syslog Message

File: %s has unhandled file type: %d.

Parameters

path (STRING): Relative path of this entry of the TAR archive.
type (INT): Type code of this entry of the TAR archive. Type identifiers and corresponding file types are as follows: 48 = Regular file, 49 = Hard link, 50 = Symbolic link, 51 = Character device, 52 = Block device, 53 = Directory, 54 = FIFO special file, 55 = Reserved.

tcp events

tcp.cc events

tcp.cc.NewRenoInUpgrade

Severity

ERROR

Description

This message occurs when the system is configured to use the TCP NewReno congestion control algorithm. The TCP CUBIC algorithm is the recommended algorithm.

Corrective Action

The TCP NewReno congestion control algorithm is selected for the Default IPspace in 9.8 based on the system's previous configuration. Confirm that TCP NewReno is the desired algorithm. NetApp recommends the CUBIC TCP congestion control algorithm in most cases. Use the "network options congestion-control modify" command to change the congestion control algorithm.

Syslog Message

The system is configured to use the NewReno congestion control algorithm, which is not recommended.

Parameters

(None).

tcp.change events

tcp.change.cc.algorithm

Severity

ERROR

Description

This message occurs when an attempt to change the TCP congestion control algorithm fails.

Corrective Action

Check the node health, address any issues found, and then try the command again.

Syslog Message

An error (out of memory) occurred while changing the TCP congestion control algorithm of existing connection(s) to %s. The NewReno (RFC6582) will be used as the congestion control algorithm for those connections.

Parameters

cc_algo (STRING): Name of the congestion control algorithm to which the change was attempted.

tcpip events

tcpip.conn events

tcpip.conn.leaked

Severity

INFORMATIONAL

Description

This message occurs when a connection is leaked because it can't be closed.

Corrective Action

Many leaked connections could lead to degraded system performance. A power cycle will fix this.

Syslog Message

Connection %u to remote IP %s on vif %u using service %u over %s leaked because it could not be closed.

Parameters

CID (INT): Connection ID that was leaked.
remoteIPAddr (STRING): The remote IP to which the leaked connection was connected.
VIF (INT): The VIF on which this connection was located.
serviceType (INT): The service being used on the leaked connection.
protocol (STRING): The protocol being used on the leaked connection.

tcpip.duplicate events

tcpip.duplicate.ip

Severity

ERROR

Description

This message occurs when the local node detects that it and some other device are using the same IP address.

Corrective Action

Check the IP address configuration on both the local node and the device using the Ethernet MAC address. Modify or remove the IP address on whichever device is misconfigured.

Syslog Message

Duplicate IP address %s sent from link address %s.

Parameters

ipAddress (STRING): IP address under contention.
macAddress (STRING): Ethernet MAC address of the other device.

telnet events

telnet.enabled events

telnet.enabled

Severity

NOTICE

Description

This message occurs when telnet is enabled in the cluster using the (privilege: advanced) "security protocol" command.

Corrective Action

(None).

Syslog Message

Insecure protocol service telnet has been enabled in the cluster.

Parameters

(None).

telnet.firewall events

telnet.firewall.remove

Severity

NOTICE

Description

This message occurs when telnet is automatically removed from firewall policies during a revert operation from Data ONTAP® 9.0 to 8.3. Telnet is removed because it is an insecure protocol and it is by default disabled in Data ONTAP 9.0. In Data ONTAP 8.3, the presence of telnet in firewall policies after a revert operation enables telnet. To prevent this, the telnet firewall policy is removed during the operation.

Corrective Action

Use the "system services firewall policy create" command to reenable telnet.

Syslog Message

Telnet removed from firewall policy because of Data ONTAP revert operations. Telnet is now disabled.

Parameters

(None).

telnet.setsockopt events

telnet.setsockopt.failure

Severity

ERROR

Description

This message occurs when setsockopt on telnet socket fails

Corrective Action

Use the error code contained in this message to determine the problem.

Syslog Message

Telnet setsockopt error: option %s, option value %s, error code %d (%s).

Parameters

socketlevel (STRING): This is the socket option level parameter
socketoption (STRING): This is the socket option value parameter
errorcode (INT): This is the error code returned from setsockopt
reason (STRING): Reason why setsockopt failed on telnet socket.

telnet.socket events

telnet.socket.failure

Severity

ERROR

Description

This message occurs when telnet could not create a socket.

Corrective Action

Change the option 'telnet.port', to try to create another socket.

Syslog Message

Telnet socket error: %s.

Parameters

reason (STRING): Reason why telnet could not create a socket.

telnet.socket.timeout

Severity

ERROR

Description

This message occurs when a telnet daemon socket was not able to send data to the telnet or ssh client after multiple attempts. This message can also occur when the client window size is set to zero by the telnet or ssh client.

Corrective Action

Check the window size of the telnet/ssh client by typing "netstat" on the storage system. If it is zero, close the client and restart that session. Otherwise check for any network problem between telnet/ssh client and storage system and correct it.

Syslog Message

Telnet daemon socket timed out for the %s connection.

Parameters

conntype (STRING): The type of connection that timed out. The connection type can be an interactive SSH connection or a telnet connection.

telnet.threadcreate events

telnet.threadCreate.failure

Severity

ERROR

Description

This message occurs when creation of telnet daemon threads or telnet session threads fails because required virtual memory is unavailable. This happens when the system is overloaded.

Corrective Action

Reduce the number of applications running on the storage system, then retry the operation.

Syslog Message

Creation of %s thread failed.

Parameters

threadName (STRING): Name of the thread that cannot be created.

tls events

tls.insecure events

tls.insecure.cipher

Severity

ERROR

Description

This message occurs when during the TLS handshake a peer negotiates a cipher suite that is no longer considered sufficiently secure to be enabled in the default configuration. TLS connections with this peer should be be presumed insecure, and could be disrupted.

Corrective Action

The issue primarily needs to be resolved on the peer side. Typically, the problem is that the SSL/TLS libraries on the peer are outdated and don't support more modern cipher suites. Once all peers identified by this event have been resolved and the event is no longer being observed, it is advised to disable the cipher suite in question on this system via the "security config modify" command.

Syslog Message

A TLS peer with IP %s has been connected with using the insecure cipher suite %s.

Parameters

ip (STRING): IP address of the offending peer.
cipher_suite (STRING): Cipher suite used by the offending peer.

tls.insecure.protocol

Severity

ERROR

Description

This message occurs when during the TLS handshake a peer negotiates a protocol level that is no longer considered sufficiently secure to be enabled in the default configuration. TLS connections with this peer should be be presumed insecure, and could be disrupted.

Corrective Action

The issue primarily needs to be resolved on the peer side. Typically, the problem is that the SSL/TLS libraries on the peer are outdated and don't support more modern protocol levels. Once all peers identified by this event have been resolved and the event is no longer being observed, it is advised to disable the protocol level in question on this system via the "security config modify" command.

Syslog Message

A TLS peer with IP %s has been connected with using the insecure protocol level %s.

Parameters

ip (STRING): IP address of the offending peer.
protocol_level (STRING): Protocol level used by the offending peer.

tls.unused events

tls.unused.cipher

Severity

INFORMATIONAL

Description

This message occurs when a cipher suite that is enabled in the configuration has not been used in any TLS handshakes for a user-specified duration of time.

Corrective Action

Confirm that all known TLS peers have connected to the system within the specified duration of time. If this is not the case, consider increasing the used-age-threshold parameter of the "security config modify" command. Otherwise, consider disabling the unused cipher suite using the supported-cipher-suites parameter of the same command, as this will increase the security of the system with respect to TLS.

Syslog Message

The TLS cipher suite %s has not been used for at least %s.

Parameters

cipher_suite (STRING): Cipher suite that is unused.
duration (STRING): Length of time (D/H/M/S) that the cipher suite has been unused.

tls.unused.protocol

Severity

INFORMATIONAL

Description

This message occurs when a protocol level that is enabled in the configuration has not been used in any TLS handshakes for a user-specified duration of time.

Corrective Action

Confirm that all known TLS peers have connected to the system within the specified duration of time. If this is not the case, consider increasing the used-age-threshold parameter of the "security config modify" command. Otherwise, consider disabling the unused protocol level using the supported-protocols parameter of the same command, as this will increase the security of the system with respect to TLS. For example, if only TLSv1.2 is in use, disabling TLSv1.1 (and lower) is advised.

Syslog Message

The TLS protocol level %s has not been used for at least %s.

Parameters

protocol_level (STRING): Protocol level that is unused.
duration (STRING): Length of time (D/H/M/S) that the protocol level has been unused.

token events

token.copy events

token.copy.complete.info

Severity

NOTICE

Description

This message occurs when a 'copy complete' request fails to free the reference on a remote node.

Corrective Action

(None).

Syslog Message

A 'copy complete' request on node %s and volume DSID %d failed - %s.

Parameters

blade_id (STRING): Blade ID of the node to which the 'copy complete' request was sent.
dsid (LONGINT): DSID of the source volume where the token was created.
reason (STRING): Reason for the failure.

token.inactive events

token.inactive.ref.deleted

Severity

NOTICE

Description

This message occurs when a reference is deleted on a token that has existed for longer than the timeout window. The reference is deleted to clear stale entries in the cache.

Corrective Action

(None).

Syslog Message

Reference %s of token %d in volume %s was deleted.

Parameters

blade_id (STRING): Blade ID of the token reference that was deleted.
index (INT): Index of the token whose reference was deleted.
volume_name (STRING): Name of the volume whose token's reference was deleted.

token.max events

token.max.count.in.volume

Severity

INFORMATIONAL

Description

This message occurs when the maximum number of tokens that can be created in a volume is determined.

Corrective Action

(None).

Syslog Message

Volume %s can contain up to %d tokens.

Parameters

volume_name (STRING): Name of the volume in which tokens can be created.
max (INT): Maximum number of tokens in the volume.

token.node events

token.node.max.count.reached

Severity

NOTICE

Description

This message occurs when the maximum number of tokens per node is reached. Tokens cannot be created in the node unless some existing tokens expire.

Corrective Action

(None).

Syslog Message

Tokens cannot be created on this node because the maximum number of tokens per node has been reached.

Parameters

(None).

token.node.out.of.quorum

Severity

NOTICE

Description

This message occurs when a node goes out of quorum. Any references on a token by that node will be dropped.

Corrective Action

(None).

Syslog Message

All token references from node (ID - %s) are dropped because the node went out of quorum.

Parameters

blade_id (STRING): Blade ID of the node that went out of quorum.

token.pit events

token.pit.file.create.info

Severity

NOTICE

Description

This message occurs when the token manager cannot create a PIT file in a volume. This can happen for the following reasons: insufficient space in the volume, unable to create the directory, or unable to set attributes.

Corrective Action

(None).

Syslog Message

PIT file creation in volume %s failed - %s.

Parameters

volume_name (STRING): Name of the volume in which PIT file creation failed.
reason (STRING): Reason for the failure.

token.pit.file.deleted

Severity

NOTICE

Description

This message occurs when the PIT file of a volume is deleted. A new PIT file will be created automatically during the first 'token create' request for this volume.

Corrective Action

(None).

Syslog Message

PIT file in volume %s was deleted.

Parameters

volume_name (STRING): Name of the volume in which the PIT file was deleted.

token.vol events

token.vol.cache.cleared

Severity

NOTICE

Description

This message occurs when a 'volume offline' operation results in clearing the token cache for that volume.

Corrective Action

(None).

Syslog Message

Token cache for volume %s was cleared because the volume went offline.

Parameters

volume_name (STRING): Name of the volume whose token cache was cleared.

token.vol.is.compressed

Severity

NOTICE

Description

This message occurs when a 'token create' request fails because the container is a compressed volume.

Corrective Action

(None).

Syslog Message

A 'token create' request in volume %s failed because the volume is compressed.

Parameters

volume_name (STRING): Name of the volume for which the 'token create' request failed.

token.vol.is.sparse

Severity

NOTICE

Description

This message occurs when a 'token create' request fails because the container is a sparse volume.

Corrective Action

(None).

Syslog Message

A 'token create' request in volume %s failed because the volume is sparse.

Parameters

volume_name (STRING): Name of the volume for which the 'token create' request failed.

token.vol.max.count.reached

Severity

NOTICE

Description

This message occurs when the maximum number of tokens per volume is reached. Tokens cannot be created in the volume unless some existing tokens expire.

Corrective Action

(None).

Syslog Message

Tokens cannot be created in volume %s because the maximum number of tokens per volume has been reached.

Parameters

volume_name (STRING): Name of the volume in which the maximum number of tokens has been reached.

tsse events

tsse.scan events

tsse.scan.catalog.failed

Deprecated

Deprecated as of version 9.13.1.

Severity

ERROR

Description

This message occurs when inactive data compression scan related information failed to be updated on the catalog file.

Corrective Action

(None).

Syslog Message

Cold Data Scan catalog update failed on '%s' - %s.

Parameters

vol (STRING): Volume name.
fail_message (STRING): Update failure reason.

tsse.scan.catalog.updated

Deprecated

Deprecated as of version 9.13.1.

Severity

NOTICE

Description

This message occurs when inactive data compression scan related information updated on the catalog file.

Corrective Action

(None).

Syslog Message

Cold Data Scan catalog updated on '%s' (SE ratio local: %s, SE ratio migrate: %s, Incompressible: %llu%%, Hot data: %llu%%, Mode: %d, SE ratio cold migrate: %s).

Parameters

vol (STRING): Volume name.
se_ratio_local (STRING): SE Ratio for local reporting.
se_ratio_migrate (STRING): SE Ratio for migrate reporting.
incomp_data_pct (LONGINT): Incompressible data percentage.
hot_data_pct (LONGINT): Hot data percentage.

scan_mode (INT): Scan mode.
se_ratio_cold_migrate (STRING): SE Ratio for Cold migrate reporting.

tsse.scan.start.failed

Severity

NOTICE

Description

This message occurs when either inactive data compression or garbage collect or garbage collect reclamation Scan fails to start.

Corrective Action

(None).

Syslog Message

'%s' failed to start on '%s' - %s.

Parameters

scan_type (STRING): Scan type.
vol (STRING): Volume or aggregate name.
fail_message (STRING): Scan failure reason.

ucm events

ucm.disabled events

ucm.disabled.slot

Severity

ERROR

Description

This message occurs when the Unified Target Adapter reads an invalid mode from flash memory. The valid supported modes are FC (0x1) or CNA (0x2). The adapter's flash memory has failed or has been corrupted. The adapter will be disabled.

Corrective Action

Contact NetApp technical support.

Syslog Message

Disabling adapter %s because invalid mode %d was read from nonvolatile memory.

Parameters

adapter (STRING): Name of the affected adapter.
faultyMode (INT): Value of the mode read from flash memory.

ucm.mode events

ucm.mode.autoReboot

Severity

INFORMATIONAL

Description

This message occurs when the FC adapter or converged networking adapter is reconfigured from a backup. The reconfiguration requires a reboot to enable correct adapter operation. The reboot occurs automatically.

Corrective Action

A change in the FC adapter or converged networking adapter mode configuration has occurred. The system is being rebooted to enable the new adapter configuration.

Syslog Message

Rebooting for adapters %s to become available.

Parameters

adapters (STRING): Affected adapters.

ucm.mode.changed

Severity

INFORMATIONAL

Description

This message occurs when the user changes the personality mode on a configurable adapter. The new mode will take effect on the next controller reboot.

Corrective Action

(None).

Syslog Message

Personality mode has changed to %s on adapter %s. Reboot the controller for the changes to take effect.

Parameters

mode (STRING): Current adapter mode.
adapter (STRING): Name of the associated adapter.

ucm.mode.needsReboot

Severity

ERROR

Description

This message occurs when the FC adapter or converged networking adapter is unable to automatically initiate a reboot after it reconfigures from a backup. The reconfiguration requires a reboot to enable correct adapter operation.

Corrective Action

Perform a planned takeover and giveback on this controller node to enable the new adapter configuration.

Syslog Message

The adapter %s was unable to automatically initiate a reboot after reconfiguration from the backup.

Parameters

adapters (STRING): Affected adapter or adapters.

ucm.type events

ucm.type.changed

Severity

INFORMATIONAL

Description

This message occurs when the user changes the FC-4 type on a configurable adapter. The new type will take effect on the next controller reboot.

Corrective Action

(None).

Syslog Message

FC-4 type has changed to %s on adapter %s. Reboot the controller for the changes to take effect.

Parameters

type (STRING): Current adapter type.
adapter (STRING): Name of the associated adapter.

ucore events

ucore.error events

ucore.error

Severity

ERROR

Description

This message occurs when there is an error while processing a user space core dump.

Corrective Action

Contact NetApp technical support.

Syslog Message

Could not dump core for process ID %d (%s). Reason: %s.

Parameters

process_id (INT): Process ID of the process.
process_name (STRING): Name of the process.
reason (STRING): Error condition encountered.

ucore.limit events

ucore.limit.exceeded

Severity

ERROR

Description

This message occurs when a userspace core is not dumped because the limit for the directory has been exceeded. This happens before the mroot is mounted, and the CompactFlash® card is used as a temporary dump location.

Corrective Action

Move the core off the /cfcard directory if the system has not done so automatically.

Syslog Message

'Exceeded limit for directory %s.'

Parameters

directory_name (STRING): Current coredump directory.

ucore.limits events

ucore.limits.reached

Severity

ERROR

Description

This message occurs when a userspace core is not dumped because system limits for this process are reached.

Corrective Action

Contact NetApp technical support.

Syslog Message

Process ID %d (%s) cannot be dumped because system limits for this process are reached.

Parameters

process_id (INT): Process ID of the process.
process_name (STRING): Name of the process.

ucore.not events

ucore.not.enabled

Severity

ERROR

Description

This message occurs when a userspace core cannot be dumped either because coredumps are not enabled or because the process called setuid, and coredump is disabled for processes that have changed their user credentials.

Corrective Action

Contact NetApp technical support.

Syslog Message

'Process ID %d (%s) cannot be dumped because coredumps are not enabled.'

Parameters

process_id (INT): Process ID of the process.
process_name (STRING): The name of the process.

ucore.panicstring events

ucore.panicString

Severity

ERROR

Description

This event occurs when a userspace application crashes, and we manage to obtain a panic string indicating the cause of the crash.

Corrective Action

Contact customer support, and if necessary upload the core and/or the core report.

Syslog Message

'%s'

Parameters

panic_string (STRING): The panic string of the crashed process.
process_name (STRING): The name of the crashed process.
fault_type (STRING): The type of fault we encountered (eg SIGSEGV, SIGHUP).

ucore.ulimit0 events

ucore.ulimit0

Deprecated

This event is deprecated as of ONTAP 9.2.

Severity

ERROR

Description

This message occurs when a userspace core is not dumped because the core size limit is set to 0.

Corrective Action

Contact NetApp technical support.

Syslog Message

'Process ID %d (%s) cannot be dumped because the coredump ulimit is set to 0.'

Parameters

process_id (INT): Process ID of the process.
process_name (STRING): Name of the process.

unowned events

unowned.disk events

unowned.disk.reminder

Severity

INFORMATIONAL

Description

This message occurs when the system has unowned/unassigned disks. Use the "disk assign" command to assign the disks to the systems so that they can be used.

Corrective Action

Use 'disk show -n' to determine which disks are unowned. Use 'disk assign' to assign ownership of the disks to a system.

Syslog Message

%d disks are currently unowned. Use the "disk assign" command to assign the disks to a system.

Parameters

count (INT): Number of unowned disks.

upgrademgr events

upgrademgr.cmd events

upgrademgr.cmd.invoke.done

Severity

NOTICE

Description

This message occurs when the execution of the commands listed in the support file has completed.

Corrective Action

(None).

Syslog Message

The commands are invoked from the support file: %s

Parameters

command (STRING): Commands that are invoked from the support file when the automated nondisruptive upgrade (ANDU) has completed.

upgrademgr.cmd.invoke.start

Severity

NOTICE

Description

This message occurs when the support file is invoked by an automated nondisruptive upgrade (ANDU).

Corrective Action

(None).

Syslog Message

The commands are invoked from the support file: %s

Parameters

command (STRING): Commands that are invoked from the support file when the ANDU has started.

upgrademgr.fw events

upgrademgr.fw.monitor.end

Severity

NOTICE

Description

This message occurs when an automated nondisruptive upgrade (ANDU) completes the firmware update monitoring job.

Corrective Action

    (None).

Syslog Message

    ANDU firmware update monitoring job completed. Status: %s.

Parameters

    status (STRING): Status of overall firmware monitoring job.

upgrademgr.fw.monitor.start

Severity

    NOTICE

Description

    This message occurs when an automated nondisruptive upgrade (ANDU) starts a firmware update monitoring job.

Corrective Action

    (None).

Syslog Message

    ANDU firmware update monitoring job started.

Parameters

    (None).

upgrademgr.fw.unsupported

Severity

    NOTICE

Description

    This message occurs when an automated nondisruptive upgrade (ANDU) runs on a platform that does not have SP/BMC API support.

Corrective Action

    (None).

Syslog Message

    ANDU firmware update monitoring job skipped because "%s"

Parameters

    reason (STRING): ANDU firmware monitoring is not supported on this platform.

upgrademgr.fw.update.fail

Severity

    ERROR

Description

This message occurs when a firmware update has failed for any of the firmware components.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

ANDU firmware update failed for firmware component: %s. Status: %s.

Parameters

firmware_name (STRING): Firmware component whose update has failed.
status (STRING): Category of failure for the firmware component whose update has failed.

upgrademgr.lifmigrate events

upgrademgr.LIFmigrate.end

Severity

NOTICE

Description

This message occurs when an ONTAP automated nondisruptive upgrade (ANDU) of ONTAP finishes the data LIF migration or failover stage.

Corrective Action

(None).

Syslog Message

ANDU in "%s" mode finishes the LIF migration. Result: %s.

Parameters

mode (STRING): ONTAP ANDU is selecting nodes based on the "batch" or "rolling" upgrade mode.
result (STRING): Result of the LIF migrations - "Success" or "Failure".

upgrademgr.LIFmigrate.sfo

Severity

NOTICE

Description

This message occurs during an ONTAP automated nondisruptive upgrade (ANDU) of ONTAP in batch mode when a LIF migrated to the storage failover (SFO) partner rather than a destination node in another batch. This migration occurs because the selected destination node does not have network ports in the required broadcast domains.

Corrective Action

(None).

Syslog Message

LIF "%s" from node "%s" is migrated to SFO partner node "%s".

Parameters

lif_name (STRING): LIF being migrated.
source_node (STRING): Starting node of the LIF being migrated.
target_node (STRING): Target node of the LIF being migrated.

upgrademgr.LIFmigrate.start

Severity

NOTICE

Description

This message occurs when an ONTAP automated nondisruptive upgrade (ANDU) of ONTAP starts the data LIF migration or failover stage.

Corrective Action

(None).

Syslog Message

ANDU in "%s" mode starts data LIF migrations.

Parameters

mode (STRING): ONTAP ANDU selects nodes to migrate or failover data LIFs based on the "batch" or "rolling" upgrade mode.

upgrademgr.node events

upgrademgr.node.updateDone

Severity

INFORMATIONAL

Description

This message occurs when an update of node is completed successfully.

Corrective Action

(None).

Syslog Message

(None).

Parameters

node (STRING): Node that successfully completed the update.

upgrademgr.package events

upgrademgr.package.imported

Severity

INFORMATIONAL

Description

This message occurs when a Data ONTAP® package is successfully imported into the cluster and processed by the upgrade manager's package handler.

Corrective Action

(None).

Syslog Message

A Data ONTAP package "%s" with version "%s" was successfully imported into the package repository.

Parameters

package (STRING): Name of the imported package.
version (STRING): Version of the imported package.

upgrademgr.two events

upgrademgr.two.stage.started

Severity

NOTICE

Description

This message occurs when a two-stage version update starts on the cluster where the target release is two versions later than the current version. The cluster is upgraded to intermediate version first, and then upgraded to the target version.

Corrective Action

(None).

Syslog Message

Started two-stage Data ONTAP upgrade to target version "%s". Intermediate version: "%s".

Parameters

targetversion (STRING): Target Data ONTAP release version.
intermediateversion (STRING): Intermediate Data ONTAP release version.

upgrademgr.update events

upgrademgr.update.cancelled

Severity

INFORMATIONAL

Description

This message occurs when the automated update of the cluster is canceled by the operator.

Corrective Action

(None).

Syslog Message

The automated update of the cluster has been canceled by the operator.

Parameters

(None).

upgrademgr.update.completed

Severity

INFORMATIONAL

Description

This message occurs when the automated update of the cluster is complete.

Corrective Action

(None).

Syslog Message

The automated update of the cluster is complete.

Parameters

(None).

upgrademgr.update.pausedErr

Severity

ERROR

Description

This message occurs when the automated update of the cluster is paused as a result of an error.

Corrective Action

The automated update of the cluster has been paused due to the following reason: %s. Correct the cause of the error, and then issue the "cluster image resume-update" command to continue the automated update of the cluster.

Syslog Message

The automated update of the cluster has been paused due to the following reason: %s

Parameters

pausedSummary (STRING): Summary of the event causing the paused update.

upgrademgr.update.pausedUser

Severity

INFORMATIONAL

Description

This message occurs when the automated update of the cluster is paused as a result of an operator request.

Corrective Action

Issue the "cluster image resume-update" command to continue the automated update of the cluster.

Syslog Message

The automated update of the cluster has been paused due to a request by the operator.

Parameters

(None).

upgrademgr.update.resumed

Severity

INFORMATIONAL

Description

This message occurs when the automated update of the cluster is resumed from the paused state.

Corrective Action

(None).

Syslog Message

The automated update of the cluster has been resumed by the operator.

Parameters

(None).

upgrademgr.update.started

Severity

NOTICE

Description

This message occurs when the upgrade manager begins an automated update of the cluster. By default, nodes that are already upgraded to the target version are skipped, except for MetroCluster configurations.

Corrective Action

(None).

Syslog Message

An automated update of the cluster has been started on nodes:%s. Skipped nodes:%s.

Parameters

nodestoUpgrade (STRING): Nodes that will be upgraded
nodesSkipped (STRING): Nodes that will be skipped, or "none" if all nodes need an upgrade, or "disabled - MetroCluster" if the cluster is a MetroCluster configuration, or "disabled" if the "-skip-nodes-at-target-version" parameter is set to false.

usb events

usb.device events

usb.device.failed

Severity

ERROR

Description

This message occurs when multiple consecutive commands to the specified universal serial bus (USB) device are not completed within the allotted time. All recovery actions have been taken and the device cannot be used anymore.

Corrective Action

Ensure that all attached devices are supported devices and that they are seated correctly. If the problem persists, replace the attach devices. If the problem still persists, contact NetApp technical support for assistance in diagnosing a USB issue.

Syslog Message

Device %s attached to adapter %s has become unresponsive. Taking the device offline.

Parameters

deviceName (STRING): Name of the failed USB device.
adapterName (STRING): Name of the associated USB adapter.

usb.device.initialize.failed

Severity

ERROR

Description

This message occurs when the Data ONTAP® universal serial bus (USB) adapter driver fails to initialize the device attached to the associated port in the associated adapter for one of the following reasons: Cannot set a unique address for the device; device descriptor is invalid or contains incorrect data; cannot set an active configuration for the device or the device had multiple interfaces. Note that the Data ONTAP® USB driver only supports USB 2.0 bulk-only mass storage devices.

Corrective Action

If the device is connected to an external USB port, try reinserting the device. If that fails, try replacing the device with a device from a different product family. If the device is connected to the mother board and the problem persists, contact NetApp technical support for assistance in diagnosing a USB issue.

Syslog Message

Device attached to adapter %s, in port %d failed initialization, %s.

Parameters

adapterName (STRING): Name of the associated USB adapter.
port (INT): Associated port number.
error (STRING): Reason the device initialization failed.

usb.device.timeout

Severity

ERROR

Description

This message occurs when an outstanding command to the specified universal serial bus (USB) device is not completed within the allotted time. As part of the standard error handling sequence managed by the Data ONTAP® USB adapter driver, this command to the device is aborted and reissued.

Corrective Action

Device level timeouts are a common indication of a USB link stability problem. In some cases, the link is operating normally and the specified device is having internal trouble processing I/O requests in a timely manner. In such cases, evaluate the specified device for possible replacement. Quite often the problem results from the partial failure of a component involved in the USB transport. The most common thing to check is the seating of the USB device into the USB port or the header.

Syslog Message

Adapter %s encountered a device timeout on USB device %s.

Parameters

adapterName (STRING): Name of the associated USB adapter.
deviceName (STRING): Name of the USB device where the timeout occurred.

usb.device.unsupported.speed

Severity

ERROR

Description

This message occurs when the Data ONTAP® universal serial bus (USB) adapter driver detects a non high-speed device in the associated port.

Corrective Action

Remove all non high speed devices attached to the system because the Data ONTAP USB adapter driver does not support non high-speed devices.

Syslog Message

Ignoring non high-speed device detected in adapter %s on port %d.

Parameters

adapterName (STRING): Name of the associated USB adapter.
port (INT): Port number within the adapter to which the non high-speed device is connected.

usb.port events

usb.port.error

Severity

ERROR

Description

This message occurs when the Data ONTAP® universal serial bus (USB) adapter driver detects an unrecoverable error on the associated port.

Corrective Action

If a device is attached to the associated port, try reinserting the device. If that fails, try replacing the device. If the problem persists, contact NetApp technical support for assistance in diagnosing a USB issue.

Syslog Message

In adapter %s, unrecoverable error detected for port %d. Ignoring attached device.

Parameters

adapterName (STRING): Name of the associated USB adapter.
port (INT): Associated port number.

usbmon events

usbmon.boot events

usbmon.boot.device.failed

Severity

ERROR

Description

This message occurs when the Data ONTAP® module that is responsible for monitoring the health of the Universal Serial Bus (USB) boot devices determines that the associated boot device will fail all writes to the media.

Corrective Action

Replace the device.

Syslog Message

Boot device %s has become read-only.

Parameters

device (STRING): Name of the device.

usbmon.boot.device.pfa

Severity

ERROR

Description

This message occurs when the Data ONTAP® Universal Serial Bus (USB) boot device health monitor PFA (predictive failure analysis) determines that failure is forthcoming for the associated boot device.

Corrective Action

Replace the device.

Syslog Message

Failure predicted for boot device %s.

Parameters

device (STRING): Name of the device.

usbmon.unable events

usbmon.unable.to.monitor

Severity

ERROR

Description

This message occurs when the Data ONTAP® module that is responsible for monitoring the health of the Universal Serial Bus (USB) boot devices cannot extract health information from the monitored device.

Corrective Action

Replace the device. If the problem persists, contact NetApp technical support.

Syslog Message

Data ONTAP could not monitor device %s.

Parameters

device (STRING): Name of the device.

user events

user.group events

user.group.limit.reached

Severity

ERROR

Description

This message occurs when the number of UNIX users or groups in the cluster reaches or exceeds system limits. After the limit is reached, it will not be possible to add any new users, groups, or group members.

Corrective Action

Reduce the number of local users and groups stored in the cluster. Consider using directory services, such as NIS and LDAP. Alternatively, use the "vserver services limits modify" command to increase the system-wide limit.

Syslog Message

Total number of %s exceeds the system limit: %d.

Parameters

configuration (STRING): Name of the configuration table that is at the system limit.
maxAllowableEntries (INT): Maximum allowable number of local users or local group and group-members.

user.group.reaching.limit

Severity

ERROR

Description

This message occurs when the number of UNIX users or groups in the cluster reaches various percentage thresholds of the system limit.

Corrective Action

Reduce the number of local users and groups stored in the cluster. Consider using directory services, such as NIS and LDAP.

Syslog Message

Total number of %s has reached %s of the system limit: %d.

Parameters

configuration (STRING): Name of the configuration table with the system limit.
pct_of_limit (STRING): Percentage of the configuration table's system limit reached.
maxAllowableEntries (INT): Maximum allowable number of local users or local group and group-members.

useradmin events

useradmin.added events

useradmin.added.deleted

Severity

INFORMATIONAL

Description

A user, group, or role has been added, deleted, or modified.

Corrective Action

(None).

Syslog Message

The %s '%s' has been %s.

Parameters

type (STRING): The type of the affected useradmin name. This can be one of the following values: "user", "group", or "role".
name (STRING): The name of the affected user, group, or role.
action (STRING): The action that occurred to the subject. This can be one of the following values: "added", "deleted", or "modified".

useradmin.lockedout events

useradmin.lockedout.user

Severity

ERROR

Description

The user tried to log into the appliance using an invalid password and the account has been disabled. The amount of attempts a user has before being disabled is controled by the security.passwd.lockout.numtries option.

Corrective Action

Another administrator must change the password of the disabled user's account.

Syslog Message

User '%s' is locked out of the appliance for failing authentication '%d' times.

Parameters

username (STRING): The name of the user that is now locked out from the appliance
attempts (INT): The number of failed attempts that caused the lockout.

useradmin.name events

useradmin.name.too.long

Severity

ERROR

Description

This message occurs when an administrative name in the cluster is longer than the maximum allowed 255 characters.

Corrective Action

Assign administrative names that are no more than 255 characters.

Syslog Message

%s name : %s.. is too long

Parameters

type (STRING): Type of the name, which can be group, role or capability.
invalidname (STRING): Invalid name.

useradmin.registry events

useradmin.registry

Severity

ERROR

Description

This message occurs when the system encounters an internal registry error while reading the useradmin entries.

Corrective Action

If the error persists, contact NetApp technical support for further assistance.

Syslog Message

A general registry error occurred when %s.

Parameters

operation (STRING): Operation in execution when the registry error occurred.

useradmin.registry.specific

Severity

ERROR

Description

This message occurs when the system encounters an internal registry error while reading/writing a specific useradmin entry for a specific user.

Corrective Action

Try to delete and re-create the user/group/role. If this is does not work, then you may have to modify the registry directly.

Syslog Message

A general registry error occurred during a %s for %s: '%s'.

Parameters

operation (STRING): Operation in execution when the registry error occurred.
type (STRING): The type of name which is the source of the error. This can be one of the following values: "user", "group", "role", or "capability".
name (STRING): The name of the subject which is the source of the error.

useradmin.rootaccess events

useradmin.rootaccess.enabled

Severity

INFORMATIONAL

Description

The root account has been enabled or disabled because of the option security.rootaccess.enable. If this option is off, then the message appears on reboots and any time root tries to authenticate. A boot without etc/rc will not check this option, so root is temporarily enabled until the next boot.

Corrective Action

This event is informational-only. No action by the system administrator is necessary.

Syslog Message

root is %s due to a %s. Review option security.passwd.rootaccess.enable.

Parameters

status (STRING): This can be one of the following values: "enabled" or "disabled". If disabled, then root access is disabled.
location (STRING): Where the informational message appears. This can be in the authentication check (someone is checking root's password), reboot check (root is being disabled during a normal boot) manual change (someone changed the option manually)

vdisk events

vdisk.clonelogfull events

vdisk.clonelogFull

Severity

NOTICE

Description

LUN clone creation has failed because the limit on the maximum supported entries(32705) has been exceeded.

Corrective Action

Retry upon the completition of the pending clone operations for this volume.

Syslog Message

Logging the LUN clone creation has failed because the limit on the maximum supported clone log entries in the volume %s has been exceeded.

Parameters

vol_name (STRING): Name of the volume for which the LUN clone creation has failed.

vdom events

vdom.aggr events

vdom.aggr.bulkmount.timeout

Severity

INFORMATIONAL

Description

This message occurs when an internal timeout has been reached while processing volumes for an aggregate coming online during a takeover, giveback, or aggregate relocation event.

Corrective Action

(None).

Syslog Message

Bulk mount timed out for aggregate fsid %llu (start_time %llu, current_time %llu, volumes online %d, volumes expected %d).

Parameters

fsid (LONGINT): Fsid of the aggregate.
start_time (LONGINT): Time in milliseconds when the bulk mount timer started for the aggregate.
current_time (LONGINT): Time in milliseconds when the bulk mount timeout was reached.
vols_online (INT): Number of volume mounts that have been received for the aggregate.
vols_expected (INT): Number of volume mounts expected for the aggregate.

vdom.aggr.move.internal

Severity

INFORMATIONAL

Description

This message occurs when an individual mounted volume becomes unavailable through the source node after an aggregate relocation or giveback event.

Corrective Action

The destination node receives a notification that the volume has been mounted locally and updates the cluster accordingly.

Syslog Message

Availability of a volume in aggregate %s has been lost to the source node temporarily following aggregate relocation or giveback.

Parameters

aggr (STRING): Name of the aggregate that contains the volume.

vdom.unmapped events

VDOM.unmapped.event

Severity

NOTICE

Description

This message occurs for Virtual Disk Object Manager (VDOM) errors that do not currently map to specific VDOM EMS events.

Corrective Action

(None).

Syslog Message

VDOM error code %u occurred without a specific EMS event mapping, file: %s, line %u.

Parameters

vdom_error (INT): VDOM error code.
filename (STRING): Name of file containing error.
linenum (INT): Line number in file containing error.

vf events

vf.cleanup events

vf.cleanup.error

Severity

ERROR

Description

This event occurs when some subsystems are unable to cleanup properly when a local host vfiler is destroyed or when a partner vfiler is being shutdown during giveback.

Corrective Action

Log a support case with NetApp technical support. Try starting the vfiler, stopping and destroying it again.

Syslog Message

vfiler %s: %s subsystem could not cleanup properly.

Parameters

vfName (STRING): The vfiler being shutdown or destroyed.
module (STRING): The module which could not cleanup vfiler specific information properly.

vfiler events

vfiler.unable events

vFiler.unable.initModules

Severity

ERROR

Description

This message occurs during vFiler(tm) unit discovery, if one of the vFiler(tm) unit module initialization functions fails.

Corrective Action

(None).

Syslog Message

Could not initialize modules for vFiler unit "%s".

Parameters

vfName (STRING): The vFiler unit on the source.

vfilermigrate events

vfilermigrate.diskownershipmismatch events

vfilermigrate.diskOwnershipMismatch

Severity

ERROR

Description

The SnapMover feature is licensed but the disk ownership model is not using the software-based disk ownership model.

Corrective Action

Boot the filer into maintenance mode and use the 'disk assign' or 'disk upgrade_ownership' command to assign disk ownership.

Syslog Message

SnapMover is licensed but the system is not using software-based disk ownership.

Parameters

(None).

vifmgr events

vifmgr.bcastdomain events

vifmgr.bcastdomain.portadd

Severity

NOTICE

Description

This message occurs when a network port is added to a broadcast domain.

Corrective Action

(None).

Syslog Message

Network port %s on node %s was added to broadcast domain %s in IPspace %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
broadcastDomain (STRING): Name of the broadcast domain associated with the port.
ipspace (STRING): Name of the IPspace associated with the port.

vifmgr.bcastdomain.portrem

Severity

NOTICE

Description

This message occurs when a network port is removed from a broadcast domain.

Corrective Action

(None).

Syslog Message

Network port %s on node %s was removed from broadcast domain %s in IPspace %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
broadcastDomain (STRING): Name of the broadcast domain associated with the port.
ipspace (STRING): Name of the IPspace associated with the port.

vifmgr.bd events

vifmgr.bd.badmtu

Severity

ERROR

Description

This message occurs when an MTU is entered on a Broadcast Domain that its member ports cannot support. The ports that failed will continue using their present values.

Corrective Action

Change the MTU of the Broadcast Domain to a value supported by all member ports.

Syslog Message

In IPspace %s, Broadcast Domain %s has an MTU of %d, which is not supported by the following ports: %s.

Parameters

ipspace (STRING): Name of the IPspace in which the Broadcast Domain resides.
broadcast_domain (STRING): Name of the Broadcast Domain.
mtu (INT): MTU of the Broadcast Domain.
port_names (STRING): Ports in the Broadcast Domain that are failing.

vifmgr.bd.conflicts

Severity

ERROR

Description

This message occurs when the administrator modifies properties of a node management LIF while the node is out of quorum, and the broadcast domain of the home port, current port, and subnet are not all the same.

Corrective Action

The node management LIF's configuration before the node went out of quorum was automatically applied. You can change this configuration now that the node is online.

Syslog Message

LIF %s had mismatching broadcast domains. The previous values were: home-port (%s), current-port (%s), and subnet (%s).

Parameters

LIF (STRING): Name of the LIF.
home_port_bd (STRING): Broadcast domain name of this LIF's home port prior to going out of quorum.
current_port_bd (STRING): Broadcast domain name of this LIF's current port prior to going out of quorum.
sub_bd (STRING): Broadcast domain name of this LIF's subnet prior to going out of quorum.

vifmgr.bgp events

vifmgr.bgp.connected

Severity

NOTICE

Description

This message occurs when Logical Interface Manager (VifMgr) connects to BGP daemon.

Corrective Action

(None).

Syslog Message

VifMgr connected to BGP daemon on the node.

Parameters

(None).

vifmgr.bgp.defaults.upgrade

Severity

NOTICE

Description

This message occurs when the Autonomous System Number (ASN) in "bgp defaults" changes from the reserved number to the default number (65501).

Corrective Action

(None).

Syslog Message

Autonomous System Number (ASN) in "bgp defaults" was changed from the reserved number (%d) to the default number (65501).

Parameters

old_asn (INT): Reserved Autonomous System Number (ASN) in "bgp defaults" before it is changed.

vifmgr.bgp.disconnected

Severity

ERROR

Description

This message occurs when the connection between the Logical Interface Manager (VifMgr) and the BGP daemon is broken. The connection is automatically reestablished. In case the connection is not reestablished, any Virtual IP LIFs might fail over to another node.

Corrective Action

Verify that the BGP daemon restarted by looking for the "vifmgr.bgp.connected" event. If the BGP daemon fails to restart, or if the condition persists, contact NetApp technical support.

Syslog Message

The connection between VifMgr and the BGP daemon on the node is broken.

Parameters

(None).

vifmgr.bgp.peerGroupDown

Severity

NOTICE

Description

This message occurs when a Border Gateway Protocol (BGP) peer group goes down on a given IPspace. If this is the last active BGP session on this IPspace, vifmgr.bgp.vserverDown message gets generated and any virtual IP (VIP) LIF or LIFs in the data Vserver or data Vservers of this IPspace cannot be hosted on this node without an active BGP session.

Corrective Action

(None).

Syslog Message

The BGP peer group %s on IPspace %s is down.

Parameters

peer_group (STRING): Name of the BGP peer group.
peer_ipspace (STRING): IPspace of the BGP peer group.

vifmgr.bgp.peerGroupUp

Severity

NOTICE

Description

This message occurs when a BGP peer group goes up on a given IPspace. If this is the first active BGP session on this IPspace, vifmgr.bgp.vserverUp message gets generated and any VIP LIF or LIFs in the data Vserver or data Vservers of this IPspace can now be hosted on this node.

Corrective Action

(None).

Syslog Message

The BGP peer group %s on IPspace %s is up.

Parameters

peer_group (STRING): Name of the BGP peer group.
peer_ipspace (STRING): IPspace of the BGP peer group.

vifmgr.bgp.vserverDown

Severity

NOTICE

Description

This message occurs when a BGP down event is received for a system Vserver. Any VIP LIFs in the associated data Vservers can no longer handle network traffic.

Corrective Action

(None).

Syslog Message

VifMgr received a Vserver BGP down event for Vserver %s in IPspace %s.

Parameters

vserver (STRING): Name of the Vserver.
ipspace (STRING): Name of the IPspace where the Vserver resides.

vifmgr.bgp.vserverUp

Severity

NOTICE

Description

This message occurs when a BGP up event is received for a system Vserver. Any VIP LIFs in the associated data Vservers can now handle network traffic.

Corrective Action

(None).

Syslog Message

VifMgr received a Vserver BGP up event for Vserver %s in IPspace %s.

Parameters

vserver (STRING): Name of the Vserver.
ipspace (STRING): Name of the IPspace where the Vserver resides.

vifmgr.cdb events

vifmgr.cdb.merge.dupip

Severity

ALERT

Description

This message occurs when attempting to merge a LIF from the configuration database (CDB) to the replicated database (RDB), and the LIF from the CDB is found to have the same address as an existing LIF in the RDB.

Corrective Action

Modify the IP address of the conflicting LIF configured in the database.

Syslog Message

IP address %s is in use by multiple LIFs: local LIF %s (on node %s) and LIF %s (in IPspace %s) configured in the cluster database.

Parameters

vifip (STRING): IP address of the affected LIF.
locallif (STRING): Name of the local LIF.

node (STRING): Name of the node on which the local LIF resides.
dblif (STRING): Name of the conflicting LIF configured in the database.
ipspace (STRING): Name of the IPspace.

vifmgr.cdb.unavail

Severity

NOTICE

Description

This message occurs when the configuration database (CDB) for a node is not accessible. The node will continue without the CDB.

Corrective Action

(None).

Syslog Message

The CDB for node %s is not accessible.

Parameters

node (STRING): Name of the node.

vifmgr.clntdev events

vifmgr.clntdev.removed

Severity

NOTICE

Description

This message occurs when a remote device is removed from the cluster or storage network.

Corrective Action

(None).

Syslog Message

Remote device %s (model: %s) was removed from the %s network.

Parameters

device (STRING): Device name of the connected switch or node.
model (STRING): Model name of the remote device.
network (STRING): Network where the device was detected.

vifmgr.clntdev.updated

Severity

NOTICE

Description

This message occurs when a new remote device is detected on the cluster or storage network.

Corrective Action

(None).

Syslog Message

Remote device %s (model: %s, version: %s, IP address: %s) has been detected on the %s network.

Parameters

device (STRING): Device name of the connected switch or node.
model (STRING): Model name of the remote device.
version (STRING): Software version of the remote device.
address (STRING): IP address of the remote device.
network (STRING): Network where the device was detected.

vifmgr.clus events

vifmgr.clus.linkdown

Severity

EMERGENCY

Description

This message occurs when a cluster link goes down unexpectedly.

Corrective Action

Verify that the cable is plugged in properly to both the NIC and the switch, and that the switch is powered on. If these conditions are met and the cluster link remains down, search the knowledgebase of the NetApp support web site for the "cluster network degraded" keyword.

Syslog Message

The cluster port %s on node %s has gone down unexpectedly.

Parameters

portname (STRING): Name of the affected port.
nodename (STRING): Name of the node on which the affected port resides.

vifmgr.cluscheck events

vifmgr.cluscheck.assigned

Severity

NOTICE

Description

This message occurs when the named cluster logical interface (LIF) was not assigned to any network port and is now assigned to a port.

Corrective Action

(None).

Syslog Message

Cluster LIF %s (node %s) is now assigned to port %s.

Parameters

lif_name (STRING): Name of cluster LIF that was not assigned to a network port but now is.
node_name (STRING): Name of the node on which the cluster LIF that was not assigned to a port now resides.
port_name (STRING): Name of the port to which the LIF is now assigned.

vifmgr.cluscheck.badping

Severity

NOTICE

Description

This message occurs when the ping test for cluster logical interface (LIF) interconnnectivity displays unexpected results.

Corrective Action

Ensure connectivity amoung the cluster LIFs. Several issues that can cause this problem. Some things to check include the following: - Port connectivity to the correct network or switch - Link connectivity - Proper switch configuration - Proper LIF configuration

Syslog Message

Cluster check ping command (%s) failed: %d, %s.

Parameters

cmd_line (STRING): Ping test command line.
exit_status (INT): Ping test result.
cmd_output (STRING): Ping test command output.

vifmgr.cluscheck.crcerrors

Deprecated

Deprecated as of version 9.8.0 and replaced by vifmgr.cluscheck.hwerrors.

Severity

ALERT

Description

This message occurs when a network device reports a high number of observed hardware errors, such as CRC errors, length errors, alignment errors, or dropped frames.

Corrective Action

The errors could be originating from the specified port, a remote port, or a port on another component of the network. Check the statistics for both the port and the switch. Contact NetApp technical support for assistance and specific instructions.

Syslog Message

Port %s on node %s is reporting a high number of observed hardware errors, possibly CRC errors.

Parameters

portname (STRING): Name of the device that is reporting a high number of hardware errors.
nodename (STRING): Name of the node on which the port resides.

vifmgr.cluscheck.ctdpktloss

Severity

ALERT

Description

This message occurs when continued packet loss during the ping test is observed. Continued packet loss means multiple failures of the ping test persisted over several iterations of the test. The ping test tests the connectivity of a cluster logical interface (LIF) to all other cluster logical interfaces (LIFs).

Corrective Action

Ensure connectivity of the cluster LIFs. There are a number of issues that can cause this problem. Some things to check: - is the port connected to the correct network/switch - link light - switch configuration

Syslog Message

Continued packet loss when pinging from cluster lif %s (node %s) to cluster lif %s (node %s).

Parameters

src_vif (STRING): Name of the source cluster LIF.
src_node (STRING): Node name of the source cluster LIF.
dst_vif (STRING): Name of the desination cluster LIF.
dst_node (STRING): Node name of the destination cluster LIF.

vifmgr.cluscheck.droppedall

Severity

ALERT

Description

This message occurs when all packets of the ping test are dropped. The ping test tests the connectivity of a cluster logical interface (LIF) to all other cluster logical interfaces (LIFs).

Corrective Action

Ensure connectivity of the cluster LIFs. There are a number of issues that can cause this problem. Some things to check: - is the port connected to the correct network/switch - link light - switch configuration

Syslog Message

Total packet loss when pinging from cluster lif %s (node %s) to cluster lif %s (node %s).

Parameters

src_vif (STRING): Name of the source cluster LIF.
src_node (STRING): Node name of the source cluster LIF.
dst_vif (STRING): Name of the desination cluster LIF.
dst_node (STRING): Node name of the destination cluster LIF.

vifmgr.cluscheck.droppedlarge

Severity

ALERT

Description

This message occurs when all of the packets in the large packet ping test are dropped. This most likely suggests an MTU misconfiguration. The ping test tests the connectivity of a cluster logical interface (LIF) to all other cluster logical interfaces (LIFs).

Corrective Action

First, resolve any outstanding instances of vifmgr.cluscheck.mtumismatch. Second, verify that the cluster switches themselves are configured to support the same MTU as configured for the cluster LIFs.

Syslog Message

Partial packet loss when pinging from cluster lif %s (node %s) to cluster lif %s (node %s).

Parameters

src_vif (STRING): Name of the source cluster LIF.
src_node (STRING): Node name of the source cluster LIF.
dst_vif (STRING): Name of the desination cluster LIF.
dst_node (STRING): Node name of the destination cluster LIF.

vifmgr.cluscheck.droppednone

Severity

NOTICE

Description

This message occurs when where was some ping test failure that is now no longer occuring.

Corrective Action

(None).

Syslog Message

No packet loss when pinging from cluster lif %s (node %s) to cluster lif %s (node %s).

Parameters

src_vif (STRING): Name of the source cluster LIF.
src_node (STRING): Node name of the source cluster LIF.
dst_vif (STRING): Name of the desination cluster LIF.
dst_node (STRING): Node name of the destination cluster LIF.

vifmgr.cluscheck.hwerrors

Severity

ALERT

Description

This message occurs when a network device reports a high number of observed hardware errors, such as CRC errors, length errors, alignment errors, or dropped frames.

2652

Corrective Action

The errors could be originating from the specified port, a remote port, or a port on another component of the network. Check the statistics for both the port and the switch. Contact NetApp technical support for assistance and specific instructions.

Syslog Message

Port %s on node %s is reporting a high number (at least 1 per %d packets) of observed hardware errors (CRC, length, alignment, dropped).

Parameters

portname (STRING): Name of the device that is reporting a high number of hardware errors.
nodename (STRING): Name of the node on which the port resides.
threshold (INT): Threshold at which this message is logged, at least 1 error per threshold.

vifmgr.cluscheck.hwerrors.ifgrp

Severity

NOTICE

Description

This message occurs when a network device that is part of an interface group reports a high number of observed hardware errors, such as CRC errors (cyclic redundancy check), length errors, alignment errors, or dropped frames, and those errors are limited to a single network interface card (NIC) slot.

Corrective Action

The errors could be originating from the specified port, a remote port, or a port on another component of the network. Check the statistics for both the port and the switch. Contact NetApp technical support for assistance and specific instructions.

Syslog Message

Ifgrp member port %s on node %s is reporting a high number (at least one per %d packets) of hardware errors. No other NIC slot in the ifgrp is over threshold.

Parameters

portname (STRING): Name of the device that is reporting a high number of hardware errors.
nodename (STRING): Name of the node on which the port resides.
threshold (INT): An event is emitted when one or more errors occur for this number of packets.

vifmgr.cluscheck.l2ping

Severity

EMERGENCY

Description

This message occurs when the l2ping test fails. This test verifies L2 reachability between cluster ports. This condition typically results in loss of communication between the two nodes.

Corrective Action

Verify that the cable is plugged in properly to both the NIC and the switch, and that the switch is powered on. If these conditions are met and the cluster link remains down, contact NetApp technical support to investigate further.

Syslog Message

l2ping failure when pinging from cluster port %s (node %s) to cluster port %s (node %s).

Parameters

src_prt (STRING): Name of the source cluster port.
src_node (STRING): Node name of the source cluster port.
dst_port (STRING): Name of the desination cluster port.
dst_node (STRING): Node name of the destination cluster port.

vifmgr.cluscheck.lifdown

Severity

NOTICE

Description

This message occurs when the named cluster logical interface (LIF) is configured administratively "down".

Corrective Action

Use the "network interface modify" command to change the status-admin value of the LIF to "up".

Syslog Message

Cluster LIF %s is administratively "down".

Parameters

lif_name (STRING): Name of the LIF that is currently inactive.

vifmgr.cluscheck.lifup

Severity

NOTICE

Description

This message occurs when a cluster logical interface (LIF) was configured administratively "down" and is now configured administratively "up".

Corrective Action

(None).

Syslog Message

Cluster LIF %s is administratively "up".

Parameters

lif_name (STRING): Name of the LIF that is currently active.

vifmgr.cluscheck.mtumatch

Severity

ALERT

Description

This message occurs when the Maximum Transmition Unit (MTU) of a port assigned to a cluster logical interface (LIF) did not match the MTU of a port assigned to a different cluster logical interface but now does match.

Corrective Action

(None).

Syslog Message

MTU %s on cluster port %s (node %s) now matchs MTU %s on cluster port %s (node %s).

Parameters

src_mtu (STRING): MTU of the source cluster LIF port.
src_port (STRING): Name of the source cluster LIF port.
src_node (STRING): Name of the source node on which source cluster LIF port resides.
dst_mtu (STRING): MTU of the destination cluster LIF port.
dst_port (STRING): Name of the destination cluster LIF port.
dst_node (STRING): Name of the node on which destination cluster LIF port resides.

vifmgr.cluscheck.mtumismatch

Severity

ALERT

Description

This message occurs when the Maximum Transmition Unit (MTU) of a port assigned to a cluster logical interface (LIF) does not match the MTU of a port assigned to a different cluster logical interface. This condition may cause loss of packets between these two LIFs.

Corrective Action

Ensure the that MTUs of the LIFs are identical. The "network port show" command will display the port MTU settings. Any mismatched MTUs can modified from the "network port" subcommand.

Syslog Message

MTU %s on cluster port %s (node %s) does not match MTU %s on cluster port %s (node %s).

Parameters

src_mtu (STRING): MTU of the source cluster LIF port.
src_port (STRING): Name of the source cluster LIF port.
src_node (STRING): Name of the source node on which source cluster LIF port resides.
dst_mtu (STRING): MTU of the destination cluster LIF port.
dst_port (STRING): Name of the destination cluster LIF port.
dst_node (STRING): Name of the node on which destination cluster LIF port resides.

vifmgr.cluscheck.notassigned

Severity

ALERT

Description

This message occurs when the named cluster logical interface (LIF) is not assigned to any network port.

Corrective Action

Verify that the LIF's current port is configured administratively "up". Use the "network interface show" command to determine the current port of the LIF. Use the "network port show -fields up-admin" command to show the port's administrative state. Ensure that the network cabling connecting the remote network port is in place and secure. Ensure that the remote network port is configured administratively "up". If the port's link state is "up", attempt to migrate the cluster LIF to another cluster port. Use the "network port show" command to view the port's link state. If the current port is "up", use the "network interface migrate" command to migrate the LIF to another port.

Syslog Message

Cluster LIF %s (node %s) is not assigned to any port.

Parameters

lif_name (STRING): Name of the cluster LIF.
node_name (STRING): Name of the node on which the cluster LIF resides.

vifmgr.cluscheck.sameRmtDev

Severity

ERROR

Description

This message occurs when the home ports of the two cluster LIFs used for internal cluster replicated database (RDB) operations are connected to the same cluster switch. These LIFs should be connected to different cluster switches for optimal cluster resiliency.

Corrective Action

Use the "network port show -ipspace Cluster -fields remote-device-id" command to verify that the home ports of the specified cluster LIFs are connected to different cluster switches. If necessary, re-home one of the cluster LIFs to a port that is connected to the other switch. For help, search the NetApp knowledge base for "ONTAP Cluster interconnect management communication is improperly configured".

Syslog Message

Cluster LIFs "%s" and "%s" on node "%s" are used for RDB operations. The home ports of these LIFs are connected to the same cluster switch: "%s".

Parameters

clus1_lif (STRING): Name of a cluster LIF.
clus2_lif (STRING): Name of a cluster LIF.
node (STRING): Node name of the cluster LIFs.
remote_device (STRING): Name of the cluster switch.

vifmgr.clusterbd events

vifmgr.clusterBD.Partition

Severity

ERROR

Description

This message occurs when ONTAP detects that the cluster broadcast domain is partitioned; some local ports in the cluster broadcast domain do not have layer-2 connectivity to one another. Cluster LIFs could be at risk of connectivity issues.

Corrective Action

Check the network cabling of the ports in this broadcast domain to the network switch. Check the broadcast domain configuration on the storage system and the network port configuration on the switch for any misconfigurations. Run the "network port reachability show -detail" command to view which ports are unreachable. To view information about broadcast domains and ports on the cluster, run the "network port broadcast-domain show -instance" and "network port show -instance" commands.

Syslog Message

The cluster broadcast domain is partitioned on node "%s". LIFs hosted on the ports in this broadcast domain might be at risk of seeing connectivity issues.

Parameters

nodeName (STRING): Name of the node for which the local ports in the given broadcast domain are partitioned.

vifmgr.clusterlfoconf events

vifmgr.clusterLFOConf

Severity

NOTICE

Description

This message occurs when the failover policy and failover group for a cluster LIF are restored to their default values. It is necessary to restore the default values for these settings to ensure non-disruptive operation.

Corrective Action

(None).

Syslog Message

Setting failover settings for cluster LIF %s to avoid disruption.

Parameters

LIF (STRING): Name of the Cluster LIF that was modified.

vifmgr.dbase events

vifmgr.dbase.checkerror

Severity

ALERT

Description

This message occurs when the logical interface manager (VIFMgr) experiences an error while verifying

cluster database consistency. Some configured objects, such as logical interfaces (LIFs) might not be hosted properly as a result.

Corrective Action

Contact NetApp technical support and reference the "vifmgr.dbase.checkerror" error.

Syslog Message

VIFMgr experienced an error verifying cluster database consistency. Some LIFs might not be hosted properly as a result.

Parameters

(None).

vifmgr.displaced events

vifmgr.displaced.lifHomed

Severity

NOTICE

Description

This message occurs when the home port of a displaced logical interface (LIF) has been restored to its original home port.

Corrective Action

(None).

Syslog Message

Home port of displaced LIF %s (Vserver: %s, IP: %s) restored to node %s, port %s.

Parameters

vifName (STRING): Name of the LIF on which the home port is being updated.
vsrvId (STRING): ID of the Vserver on which the LIF resides.
vifIp (STRING): IP address of the LIF on which the home port is being updated.
toNode (STRING): Name of the node to which the LIF's home port is being updated.
toPort (STRING): Name of the port to which the LIF's home port is being updated.

vifmgr.extroute events

vifmgr.extRoute.addTable

Severity

NOTICE

Description

This message occurs when a new external route table is added successfully.

Corrective Action

(None).

Syslog Message

External route table %s was added successfully.

Parameters

table (STRING): Route table name.

vifmgr.extRoute.ipCreate

Severity

NOTICE

Description

This message occurs when a LIF was successfully added to or updated in external route tables.

Corrective Action

(None).

Syslog Message

LIF with IP address %s is mapped to external port ID %s in external route tables.

Parameters

vifip (STRING): IP address of the logical interface.
extportid (STRING): External port ID on which this LIF was created.

vifmgr.extRoute.ipDelete

Severity

NOTICE

Description

This message occurs when a LIF was successfully deleted from external route tables.

Corrective Action

(None).

Syslog Message

LIF with IP address %s was removed from external route tables.

Parameters

vifip (STRING): IP address of the logical interface.

vifmgr.extRoute.ipMove

Severity

NOTICE

Description

This message occurs when a LIF was successfully moved to a new external port ID in external route tables.

Corrective Action

(None).

Syslog Message

LIF with IP address %s was moved to external port ID %s in external route tables.

Parameters

vifip (STRING): IP address of the logical interface.
extportid (STRING): External port ID to which this LIF was moved.

vifmgr.extRoute.noAddTable

Severity

ERROR

Description

This message occurs when ONTAP fails to add a new external route table to the cloud network. As a result, IP packets routed to the subnet associated with the external route table will not be possible.

Corrective Action

1. Add the external route table manually using the tools provided by the cloud provider. 2. Check for cloud authorization and resource permission issues.

Syslog Message

Failed to add external route table %s (error %s).

Parameters

table (STRING): Route table name.
error (STRING): Error that is reported.

vifmgr.extRoute.noConn

Severity

ERROR

Description

This message occurs when the system cannot verify connectivity to the external mediator server.

Corrective Action

Use the "network route show -vserver Cluster" command to verify that a suitable route exists to the mediator. Ensure that the external network security configuration enables communication between all nodes and the mediator.

Syslog Message

Failed to verify connectivity with the mediator server, IP %s (error %s).

Parameters

mediatorip (STRING): IP address of the mediator.
error (STRING): Error that is reported.

vifmgr.extRoute.noIpCreate

Severity

ERROR

Description

This message occurs when a LIF cannot be added to or updated in external route tables.

Corrective Action

If an entry is found in the external route tables for the given IP address and external port ID, remove that entry from the tables using the tools provided by the cloud provider. Note that any subsequent LIF created with the same IP address will replace any entry remaining in the external route table.

Syslog Message

Failed to successfully map LIF with IP address %s to external port ID %s in external route tables (error %s).

Parameters

vifip (STRING): IP address of the logical interface.
extportid (STRING): External port ID on which this LIF was to be created.
error (STRING): Error that is reported.

vifmgr.extRoute.noIpDelete

Severity

ERROR

Description

This message occurs when ONTAP fails to update the external route tables maintained by the cloud provider to reflect a LIF removal. As a result, IP packets to the IP address might still be routed to the deleted external port ID.

Corrective Action

1. Remove the entry from the tables using the tools provided by the cloud provider if an entry is found in the external route tables for the given IP address and external port ID. 2. Verify connectivity, authentication, and permissions to the cloud endpoint using the tools provided by the cloud provider.

Syslog Message

Failed to remove LIF with IP address %s from external route tables (error %s).

Parameters

vifip (STRING): IP address of the logical interface.
error (STRING): Error that is reported.

vifmgr.extRoute.noIpMove

Severity

ERROR

Description

This message occurs when ONTAP fails to update the external route tables maintained by the cloud provider to reflect a LIF move. As a result, IP packets to the IP address might still be routed to the previously assigned external port ID.

Corrective Action

1. Remove the entry from the tables using the tools provided by the cloud provider if an entry is found in the external route tables for the given IP address and external port ID. 2. Verify connectivity, authentication and permissions to the cloud endpoint using the tools provided by the cloud provider. 3. Admin the status of the LIF associated with the IP down and up to force the IP movement. "network interface modify -vserver [x] -lif [xx] -status-admin down" "network interface modify -vserver [x] -lif [xx] -status-admin up"

Syslog Message

Failed to move LIF. Error: %s

Parameters

error (STRING): Error that is reported.

vifmgr.extRoute.noRmTable

Severity

NOTICE

Description

This message occurs when ONTAP fails to remove the external route table from the cloud network. As a result, IP packets routed to the subnet associated with the external route table might still be valid in the virtual private cloud.

Corrective Action

1. Remove the external route table manually using the tools provided by the cloud provider. 2. Check for cloud authorization and resource permission issues.

Syslog Message

Failed to remove external route table %s (error %s).

Parameters

table (STRING): Route table name.
error (STRING): Error that is reported.

vifmgr.extRoute.rmTable

Severity

NOTICE

Description

This message occurs when an external route table is removed.

Corrective Action

(None).

Syslog Message

External route table %s was removed successfully.

Parameters

table (STRING): Route table name.

vifmgr.gcp events

vifmgr.gcp.NlbdDown

Severity

ERROR

Description

This message occurs when the network load balancing listener becomes unresponsive. This event causes data LIFs to be moved to a healthier node.

Corrective Action

Reboot the node.

Syslog Message

The network load balancing listener is unresponsive.

Parameters

(None).

vifmgr.gcp.NlbdUp

Severity

NOTICE

Description

This message occurs when the network load balancing listener recovers after a period of unresponsiveness. If data LIFs assigned to this node have been configured to automatically revert to their home port, this will cause them to return to their home port.

Corrective Action

(None).

Syslog Message

The network load balancing listener has recovered after a period of unresponsiveness.

Parameters

(None).

vifmgr.hm events

vifmgr.hm.promoted

Severity

NOTICE

Description

This message occurs when a health monitor has been fully activated for an IPspace. A fully activated health monitor marks ports as unhealthy if the port fails the monitor's health check.

Corrective Action

(None).

Syslog Message

The %s has been promoted on IPspace %s.

Parameters

monitor (STRING): Health monitor name.
ipspace (STRING): IPspace name for which the health monitor has been promoted.

vifmgr.hv events

vifmgr.hv.nohostconfig

Severity

ALERT

Description

This message occurs when no Hypervisor host configuration is available. This is required by ONTAP®
software to monitor the health of the hypervisor uplinks.

Corrective Action

Verify the Hypervisor host configuration. Without it, ONTAP cannot monitor the health of the hypervisor
uplinks, preventing data LIFs from failing over if the uplink were to go down.

Syslog Message

The %s health monitor cannot access the Hypervisor host configuration.

Parameters

monitor (STRING): Health monitor name.

vifmgr.hv.nosnmpconfig

Severity

ALERT

Description

This message occurs when no Hypervisor SNMP configuration is available. This is required by ONTAP®
software to monitor the health of the hypervisor uplinks.

Corrective Action

Verify the Hypervisor SNMP configuration. Without it, ONTAP cannot monitor the health of the hypervisor
uplinks, preventing data LIFs from failing over if the uplink were to go down.

Syslog Message

The %s health monitor cannot access the required Hypervisor SNMP configuration.

Parameters

monitor (STRING): Health monitor name.

vifmgr.hv.nouplinkmapping

Severity

ALERT

Description

This message occurs when no Hypervisor uplink mapping is available for the specified port. This is required by ONTAP® software to monitor the health of the hypervisor uplinks.

Corrective Action

Verify the Hypervisor uplink mapping configuration. Without it, ONTAP cannot monitor the health of the hypervisor uplinks, preventing data LIFs from failing over if the uplink were to go down.

Syslog Message

The %s health monitor cannot access the Hypervisor uplink mapping configuration for node %s port %s.

Parameters

monitor (STRING): Health monitor name.
node (STRING): Name of the node.
port (STRING): Name of the port.

vifmgr.hv.nouplinkstatus

Severity

ERROR

Description

This message occurs when there is an error obtaining the Hypervisor uplink status for the specified port.

Corrective Action

Verify the Hypervisor's host and SNMP configuration.

Syslog Message

Unable to obtain the hypervisor uplink status for port %s with hypervisor uplinks %s.

Parameters

port (STRING): Name of the port.
uplinks (STRING): List of hypervisor uplinks associated with the port.

vifmgr.ifgrp events

vifmgr.ifgrp.invalidname

Severity

ERROR

Description

This message occurs when an interface group (ifgrp) is configured with an unsupported name. This ifgrp cannot be modified or destroyed using clustershell or Data ONTAP® management APIs.

Corrective Action

Special corrective action is necessary to remove this ifgrp; contact NetApp technical support for assistance.

Syslog Message

Ifgrp %s has an invalid name and cannot be modified or destroyed.

Parameters

ifgrp (STRING): Invalid name of the ifgrp.

vifmgr.ipspace events

vifmgr.ipspace.tooMany

Severity

EMERGENCY

Description

This message occurs when the system is over-provisioned with IPspaces, exceeding the maximum number allowed.The over-provisioned IPspaces might not be configured successfully in the stack. Any ports assigned to the unconfigured IPspace will fail to host IP addresses and support traffic. This limitation is checked whenever the node comes into quorum.

Corrective Action

Use the "network ipspace delete" command to remove unused IPspaces.

Syslog Message

There are %d custom IPspaces configured on the cluster, exceeding the maximum limit of %d.

Parameters

configNum (INT): Number of custom IPspaces configured.
maxNum (INT): Maximum number of custom IPspaces supported.

vifmgr.lif events

vifmgr.lif.foPolicyMod

Severity

NOTICE

Description

This message occurs when a LIF's failover policy has been modified.

Corrective Action

(None).

Syslog Message

LIF %s on Vserver %s (numeric ID: %d, IP address: %s) has been updated to use failover policy %s."

Parameters

lif_name (STRING): Name of the affected LIF.
vserver_name (STRING): Vserver associated with the affected LIF.
lif_id (INT): Numeric identifier for the affected LIF.
lif_address (STRING): IP address for the affected LIF.
new_policy (STRING): Failover policy that is now associated with this LIF.
old_policy (STRING): Failover policy that was previously associated with this LIF.

vifmgr.lif.fwpolicy.update

Severity

NOTICE

Description

This message occurs when a LIF (logical interface) firewall policy value is deprecated and automatically assigned a new value based on its role.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), firewall policy "%s" is deprecated and updated to a new value "%s" based on the LIF's role.

Parameters

vifname (STRING): Name of the LIF whose firewall policy value is updated.
vsrvid (STRING): Identifier of the Vserver on which this LIF resides.
oldpolicy (STRING): LIF firewall policy value before change.
newpolicy (STRING): LIF firewall policy value after change.

vifmgr.lif.invalidPort

Severity

ERROR

Description

This message occurs when a LIF's current or home port are not present in RDB.

Corrective Action

Use the command in advanced mode "network interface show" making sure to specify the parameter -numeric-id with the identifier specified in the message. With the LIF name and vserver from the output of the previous command, use the "network interface modify" command to set the home port and current port to ports that are displayed by the "network ports show" command.

Syslog Message

LIF %d has a home port identifer or current port identifier that is not present in RDB.

Parameters

lif (INT): Identifier of LIF with invalid port.

vifmgr.lif.invalidSubnet

Severity

ERROR

Description

This message occurs when a LIF's configuration conflicts with that of its subnet. It is caused by an inconsistency in the configuration of the LIF.

Corrective Action

To identify the LIF, use the advanced mode command "network interface show" setting the numeric-id parameter to that of the LIF in the message. If the subnet is not set correctly, assign the subnet with the "network interface modify" command specifying an existing subnet that contains the ranges for the LIF's address. If the subnet does not include a range with the address of the LIF, add a range with the "network modify subnet" command making sure to specify the LIF and the force-update-lif-associations parameters.

Syslog Message

LIF %d has a configuration that does not match its subnet.

Parameters

lif (INT): Identifier of LIF with invalid subnet.

vifmgr.lif.invFailoverGroup

Severity

ERROR

Description

This message occurs when a LIF has a failover group with the wrong virtual server or ipspace. If an event occurs where the LIF needs to fail off the current port the LIF might not be hosted.

Corrective Action

To identify the LIF, use the advanced mode command "network interface show" setting the numeric-id parameter to that of the LIF in the message. Next, use the "network interface modify" command to associate the LIF with an existing failover group or a new failover group consisting of the desired ports.

Syslog Message

The failover group %s for LIF %d is invalid.

Parameters

failovergroup (STRING): Invalid failover group name.
lif (INT): Identifier of the LIF with an invalid failover group.

vifmgr.lif.invPortIPs

Severity

ERROR

Description

This message occurs when a port and a LIF currently on that port are in different IPspaces. It is caused by an inconsistency in the configuration of the LIF.

Corrective Action

Use the command in advanced mode "network interface show" making sure to specify the paramter -numeric-id with the identifier specified in the message. If the ipspace assigned to the port is correct, modify the LIF to use a home port in the same ipspace as its containing virtual server. If the ipspace of the port is incorrect, change it to match the LIF. If both are correct the LIF's home port, current port, and failover group have to be reassigned to ones sharing the LIF's ipspace.

Syslog Message

LIF %d and Port %s:%s are in different IPspaces.

Parameters

lif (INT): Identifier of LIF with mismatched Ipspace.
node (STRING): Name of node that port resides on.
port (STRING): Name of port with mismatched Ipspace.

vifmgr.lif.orphanedFwPolicy

Severity

ERROR

Description

This message occurs when the virtual server for a firewall policy does not exist.

Corrective Action

Use the command in advanced mode "network interface show" making sure to specify the paramter -numeric-id with the identifier specified in the message. Then use the command "network interface modify" to assign a new firewall policy with the information from the show command.

Syslog Message

The firewall policy %s assigned to LIF %d does not exist or has a different virtual server identifier than the LIF.

Parameters

policy (STRING): Firewall policy identifier which has an invalid virtual server.
lif (INT): Firewall policy identifier which has an invalid virtual server.

vifmgr.lif.protocolMod

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) is temporarily brought offline to add or remove data protocols. Data service will be briefly interrupted while this change is applied, and any existing network connection will be reset.

Corrective Action

(None).

Syslog Message

LIF %s on Vserver %s (numeric ID: %d, IP address: %s) is being temporarily brought offline to add or remove data protocols.

Parameters

    lif_name (STRING): Name of the affected LIF.
    vserver_name (STRING): Vserver associated with the affected LIF.
    lif_id (INT): Numeric identifier for the affected LIF.
    lif_address (STRING): IP address for the affected LIF.

vifmgr.lif.sp.conflict

Severity

    ALERT

Description

    This message occurs when a logical interface (LIF) in the default IPspace is configured with an address that conflicts with the Service Processor (SP) or the Baseboard Management Controller (BMC).

Corrective Action

    Use the "network interface modify" command to assign a different IP address to the affected logical network interface (LIF). Be sure to assign a new address that does not conflict with other hosts in the default IPspace.

Syslog Message

    LIF "%s" on Vserver "%s" with IP address "%s" in the default IPspace is in use by the SP/BMC.

Parameters

    vifName (STRING): Name of the LIF that is being moved.
    vsrvName (STRING): ID of the virtual server on which the LIF resides.
    vifip (STRING): IP address of the affected LIF.

vifmgr.lif.subnetMisconfig

Severity

    ERROR

Description

    This message occurs when LIFs in the same subnet are configured on ports in multiple broadcast domains. This can cause routing issues due to reachability to and beyond the gateway.

Corrective Action

    To identify the misconfigured LIFs use the command "network interface show -address -netmask -fields broadcast-domain". LIFs in the same subnet should be configured on ports that are in the same broadcast domain.

Syslog Message

    LIFs in subnet %s of IPspace "%s" are configured on ports in multiple broadcast domains: %s

Parameters

    subnetname (STRING): Subnet name.
    ipspacename (STRING): IPspace name.
    bdname (STRING): List of broadcast domains.

vifmgr.lif.svcPolicyMod

Severity

NOTICE

Description

This message occurs when a LIF's service policy has been modified.

Corrective Action

(None).

Syslog Message

LIF %s on Vserver %s (numeric ID: %d, IP address: %s) has been updated to use service policy %s."

Parameters

lif_name (STRING): Name of the affected LIF.
vserver_name (STRING): Vserver associated with the affected LIF.
lif_id (INT): Numeric identifier for the affected LIF.
lif_address (STRING): IP address for the affected LIF.
new_policy (STRING): Service policy that is now associated with this LIF.
old_policy (STRING): Service policy that was previously associated with this LIF.

vifmgr.lifadded events

vifmgr.lifadded.byadmin

Severity

NOTICE

Description

This message occurs when an administrator action causes a logical interface (LIF) IP address to be added.

Corrective Action

(None).

Syslog Message

LIF %s with ID %s (on virtual server %s), IP address %s, was added.

Parameters

vifname (STRING): Name of the LIF that was added.
vifid (STRING): Unique ID assigned to the LIF.
vsrvid (STRING): Name of the virtual server identifier on which the LIF resides.
vifip (STRING): LIF IP address that was added.

vifmgr.lifbeinghosted events

vifmgr.lifbeinghosted

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) IP address that was previously marked as down because no eligible ports could host this LIF is now being hosted. Data access through this LIF is again up.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, previously marked as down, is now up and serving data on node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that is now being hosted.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is now being hosted.
tonode (STRING): Name of the node where the LIF is currently being hosted.
toport (STRING): Name of the port where the LIF is currently being hosted.

vifmgr.lifbeingremoved events

vifmgr.lifBeingRemoved

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) IP address is being removed or moved from the node. Data access through this LIF will be temporarily down until the LIF is re-hosted on another node.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being removed from node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that is being removed.
vsrvid (STRING): Virtual server identifier on which this LIF resides.
vifip (STRING): The IP address that is being removed.
tonode (STRING): Name of the node on which the LIF had been hosted.
toport (STRING): Name of the port on which the LIF had been hosted.

vifmgr.lifcapacity events

vifmgr.lifCapacity

Severity

NOTICE

Description

This message occurs when the system informs the administrator of the number of Logical Interfaces (LIFs) supported by the node.

Corrective Action

(None).

Syslog Message

Node %s is capable of hosting %s data LIFs.

Parameters

nodeName (STRING): Name of the node.
numLifs (STRING): Number of data LIFs that can be configured on the node.

vifmgr.lifdeleted events

vifmgr.lifdeleted.byadmin

Severity

NOTICE

Description

This message occurs when an administrator action causes a logical interface (LIF) IP address to be deleted.

Corrective Action

(None).

Syslog Message

LIF %s with ID %s (on virtual server %s), IP address %s, was deleted.

Parameters

vifname (STRING): Name of the LIF that was deleted.
vifid (STRING): Unique ID assigned to the LIF.
vsrvid (STRING): Name of the virtual server identifier on which the LIF resided.
vifip (STRING): LIF IP address that was deleted.

vifmgr.lifdown events

vifmgr.lifdown.noports

Severity

ALERT

Description

This message occurs when a logical interface (LIF) IP address cannot serve data because there are no eligible ports on which to host the LIF. Thus, this LIF is being marked as down. This means that data access through this LIF will be down until the system can rehost this LIF on an eligible port that becomes available.

Corrective Action

This LIF IP address is down because there are no eligible ports capable of serving data for this LIF. To bring this LIF up so that it can serve data, enable one or more eligible ports that can host this LIF. To find the list of eligible ports for this LIF, examine the failover rules for this LIF. In addition to the ports found there, you could add a new port to the failover rule for that LIF.

Syslog Message

LIF %s (on virtual server %s), IP address %s, currently cannot be hosted on node %s, port %s, or any of its failover targets, and is being marked as down.

Parameters

vifname (STRING): Name of the LIF that is marked as down.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is marked as down.
tonode (STRING): Name of the node to which the LIF currently cannot be hosted.
toport (STRING): Name of the port to which the LIF currently cannot be hosted.

vifmgr.lifidoutofsync events

vifmgr.lifIdOutOfSync

Severity

ERROR

Description

This message occurs when a Logical Interface (LIF) is configured in the Logical Interface manager (VIFMgr) but is not visible in the user interface."

Corrective Action

Using information from the message, use the "network interface ids create" diag privilege command to create the ID.

Syslog Message

LIF %s with ID %s (on virtual server %s), IP address %s, is configured in the VIFMgr but is not visible in the user interface.

Parameters

vifname (STRING): Name of the invisible LIF as it exists in the VIFMgr.
vifid (STRING): Unique ID of the invisible LIF as it exists in VIFMgr.
vsrvid (STRING): ID of the virtual server on which the LIF resides.
vifip (STRING): IP address of the invisible LIF as it exists in the VIFMgr.

vifmgr.lifmove events

vifmgr.lifmove.blocked

Severity

NOTICE

2674

Description

This message occurs when an attempt to move a logical interface (LIF) IP address to another node/port due to a load-balance event has failed because the LIF has active connections which can not be safely migrated.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, was blocked when being moved to node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that is being moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is being moved.
tonode (STRING): Name of the node to where the LIF is moving.
toport (STRING): Name of the port to where the LIF is moving.

vifmgr.lifmoved events

vifmgr.lifmoved.byadmin

Severity

NOTICE

Description

This message occurs when an administrator action causes a logical interface (LIF) IP address to move to another node/port.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being moved to node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that is being moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is being moved.
tonode (STRING): Name of the node to where the LIF is moving.
toport (STRING): Name of the port to where the LIF is moving.

vifmgr.lifmoved.bylb

Severity

NOTICE

Description

This message occurs when an attempt is made to move a logical interface (LIF) IP address to another node/port due to a load-balance event.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being moved to node %s, port %s due to an LB event.

Parameters

vifname (STRING): Name of the LIF that is being moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is being moved.
tonode (STRING): Name of the node to where the LIF is moving.
toport (STRING): Name of the port to where the LIF is moving.

vifmgr.lifmoved.linkdown

Severity

NOTICE

Description

This message occurs when an attempt was made to move a logical interface (LIF) IP address to another node/port due to a link down event.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being moved to node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that is being moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is being moved.
tonode (STRING): Name of the node to where the LIF is moving.
toport (STRING): Name of the port to where the LIF is moving.

vifmgr.lifmoved.nodedown

Severity

NOTICE

Description

This message occurs when an attempt was made to move a logical interface (LIF) IP address to another node/port due to a node down event.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being moved to node %s, port %s.

2676

Parameters

> **vifname** (STRING): Name of the LIF that is being moved.
> **vsrvid** (STRING): Name of the virtual server identifier on which this LIF resides.
> **vifip** (STRING): The logical interface's IP address that is being moved.
> **tonode** (STRING): Name of the node to where the LIF is moving.
> **toport** (STRING): Name of the port to where the LIF is moving.

vifmgr.lifondegport events

vifmgr.lifOnDegPort.noPorts

Severity

> ALERT

Description

> This message occurs when an attempt to move a logical interface (LIF) currently hosted on a port with degraded health status to a healthy port fails because there are no healthy ports in the LIF's failover group.

Corrective Action

> Add ports to the broadcast domain or failover group used by the affected LIF. Use the "network interface show -failover" command to review the currently assigned failover targets for each LIF.

Syslog Message

> LIF %s (on virtual server %s), IP address %s, is currently hosted on node %s, port %s, whose health status is degraded.

Parameters

> **vifName** (STRING): Name of the LIF that is hosted on the port with degraded health status.
> **vsrvId** (STRING): ID of the virtual server on which the LIF resides.
> **vifIp** (STRING): IP address of the LIF that is hosted on the port with degraded health status.
> **node** (STRING): Name of the node on which the degraded port resides.
> **port** (STRING): Name of the port with degraded health status.

vifmgr.lifs events

vifmgr.lifs.clusterlimit

Severity

> ERROR

Description

> This message occurs when the total number of logical interfaces (LIFs) exceeds the supported per-cluster limit. To ensure system stability, the total number of IP data LIFs should be kept at or below this limit.

Corrective Action

> Use the "network interface show -role data" command to review existing LIFs, and use the "network interface delete" command to remove enough LIFs to meet the cluster maximum. To facilitate this process, you can display the current number of LIFs by using the "network interface capacity show" command.

Syslog Message

The total number of data LIFs in this cluster (%u) exceeds the supported limit of %u.

Parameters

numLifs (INT): The number of IP data LIFs present in this cluster.
lifLimit (INT): The maximum number of supported LIFs for this cluster.

vifmgr.lifs.lowredundancy

Severity

ALERT

Description

This message occurs when one or more logical interfaces (LIFs) are configured to use a failover policy that implies failover to a specific set of nodes but does not have available failover targets on enough of those nodes. If the specified home node is offline or unavailable, all affected LIFs will be operationally down and unable to serve any data.

Corrective Action

Add additional ports to the broadcast domains or failover groups used by the affected LIFs, or modify each LIF's failover policy to include one or more nodes with available failover targets. For example, the "broadcast-domain-wide" failover policy will consider all failover targets in a LIF's failover group. Use the "network interface show -failover" command to review the currently assigned failover targets for each LIF.

Syslog Message

Insufficient redundancy in the failover configuration for %u LIFs assigned to node "%s". LIFs: %s

Parameters

lifcount (INT): Number of affected LIFs.
homenode (STRING): Home node of the affected LIFs.
liflist (STRING): List of the first several affected LIFs.

vifmgr.lifs.noredundancy

Severity

ALERT

Description

This message occurs when one or more logical interfaces (LIFs) are configured to use a failover policy that implies failover to one or more ports but have no failover targets beyond their home ports. If any affected home port or home node is offline or unavailable, the corresponding LIFs will be operationally down and unable to serve data.

Corrective Action

Add additional ports to the broadcast domains or failover groups used by the affected LIFs, or modify each LIF's failover policy to include one or more nodes with available failover targets. For example, the "broadcast-domain-wide" failover policy will consider all failover targets in a LIF's failover group. Use the "network interface show -failover" command to review the currently assigned failover targets for each LIF. If the intent is to never fail over the LIF to any other failover targets, set the failover-policy for the LIF to 'disabled' to prevent this alert in the future. For additional information about configuring LIF failover targets, search the NetApp® support site for TR-4182.

Syslog Message

No redundancy in the failover configuration for %u LIFs assigned to node "%s". LIFs: %s

Parameters

lifcount (INT): Number of affected LIFs.
homenode (STRING): Home node of the affected LIFs.
liflist (STRING): List of the first several affected LIFs.

vifmgr.lifs.overcapacity

Severity

ALERT

Description

This message occurs when logical interfaces (LIFs) have been over-provisioned. As a result, some LIFs might report a status of "down" during a node outage, even if the LIF is configured to have a remote failover target.

Corrective Action

Removing LIFs from the system, adjusting the failover settings of some LIFs, and reconfiguring failover groups are all possible options for correcting the situation. Use the "network interface check failover show" command to gather more detailed information about the over-provisioning.

Syslog Message

Node with failover targets over-provisioned: %u LIFs could be marked "down" during node outage.

Parameters

overamount (INT): Number of LIFs that might be displayed as "down".

vifmgr.lifsuccessfullymoved events

vifmgr.lifsuccessfullymoved

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) IP address was successfully moved to another node/port.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is now hosted on node %s, port %s.

Parameters

vifname (STRING): Name of the LIF that was moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that was moved.
tonode (STRING): Name of the node to which the LIF was moved.

toport (STRING): Name of the port to which the LIF was moved.

vifmgr.migratelifs events

vifmgr.migrateLifs.nlbdDown

Severity

ERROR

Description

This message occurs when the network load balancing listener is not responding to probes over a node management LIF, and cluster-scoped LIFs with the same current port have been migrated elsewhere.

Corrective Action

Use the "network interface show" command to verify that the node managment LIF in question is operational. If the LIF is operational, contact NetApp technical support for specific instructions.

Syslog Message

The network load balancing listener is not responding via LIF "%s" on Vserver "%s" with current port "%s". As a result, the load balancing LIFs have been migrated elsewhere.

Parameters

lif (STRING): LIF name.
vserver_name (STRING): Vserver name.
port (STRING): Network port name

vifmgr.migrateLifs.nlbdUp

Severity

NOTICE

Description

This message occurs when the network load balancing listener starts responding to probes over a node management LIF. The network port where the node management LIF is located is now available for use by load-balanced LIFs.

Corrective Action

(None).

Syslog Message

The network load balancing listener has started responding via LIF "%s" on Vserver "%s" with current port "%s".

Parameters

lif (STRING): LIF name.
vserver_name (STRING): Vserver name.
port (STRING): Network port name.

vifmgr.port events

vifmgr.port.discovered

Severity

NOTICE

Description

This message occurs when a physical network port has been discovered.

Corrective Action

(None).

Syslog Message

Physical network port %s (node %s) has been discovered.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.

vifmgr.port.ifgrpAddPort

Severity

NOTICE

Description

This message occurs when an administrative action adds a port to an interface group.

Corrective Action

(None).

Syslog Message

Port %s, node %s has been added to ifgrp %s.

Parameters

portName (STRING): Name of the port that was added to an interface group.
nodeName (STRING): Name of the node on which the port resides.
ifgrpName (STRING): Name of the interface group to which the port was added.

vifmgr.port.ifgrpCreated

Severity

NOTICE

Description

This message occurs when an administrative action creates an interface group.

Corrective Action

(None).

Syslog Message

Ifgrp %s, node %s has been created.

Parameters

ifgrpName (STRING): Name of the interface group that was created.
nodeName (STRING): Name of the node on which the interface group resides.

vifmgr.port.ifgrpDeleted

Severity

NOTICE

Description

This message occurs when an administrative action deletes an interface group.

Corrective Action

(None).

Syslog Message

Ifgrp %s, on node %s has been deleted.

Parameters

ifgrpName (STRING): Name of the interface group that was deleted.
nodeName (STRING): Name of the node on which the ifgrp was deleted.

vifmgr.port.ifgrpRemovePort

Severity

NOTICE

Description

This message occurs when an administrative action removes a port from an interface group.

Corrective Action

(None).

Syslog Message

Port %s, node %s has been removed from ifgrp %s.

Parameters

portName (STRING): Name of the port that was removed from an interface group.
nodeName (STRING): Name of the node on which the port resides.
ifgrpName (STRING): Name of the interface group from which the port was removed.

vifmgr.port.mismatchState

Severity

ERROR

Description

This message occurs when an administratively down port is not operationally down.

Corrective Action

The operational state of the port does not match the state in the ports configuration. Use the advanced mode command "network port modify" command specifying the desired state by setting the paramter -up -admin" to true if the desired state is up and to false if the desired state is down.

Syslog Message

port %s is administratively down and operationally up.

Parameters

port (STRING): Name of port that should be operationally down.

vifmgr.port.monitor.failed

Severity

ERROR

Description

This message occurs when a port fails a health check.

Corrective Action

Check the network cables that are connected to the specified port for any loose connections. Ensure that the physical Ethernet NIC is functioning properly.

Syslog Message

The "%s" health check for port %s (node %s) has failed. The port is operating in a degraded state.

Parameters

healthCheckType (STRING): The type of health check that this port failed. The possible health checks are Frequent Link Flapping and Insufficient L2 Reachability.
portName (STRING): Name of the port that failed the health check.
nodeName (STRING): Name of the node on which the port resides.

vifmgr.port.monitor.passed

Severity

NOTICE

Description

This message occurs when a port successfully passes a health check.

Corrective Action

(None).

Syslog Message

The "%s" health check for port %s (node %s) has passed.

Parameters

healthCheckType (STRING): The type of health check that this port passed. The possible health checks

are Frequent Link Flapping and Insufficient L2 Reachability.
portName (STRING): Name of the port that passed the health check.
nodeName (STRING): Name of the node on which the port resides.

vifmgr.port.mtumismatch

Severity

ERROR

Description

This message occurs when the administrator modifies a cluster port's MTU while the node is out of quorum to a value other than the broadcast domain MTU, and then the node rejoins quorum.

Corrective Action

Change the port's MTU by using the "network port modify" command, or change the broadcast domain's MTU by using the "network port broadcast-domain modify" command.

Syslog Message

The MTU of port %s (%d) does not match the MTU of broadcast domain %s (%d).

Parameters

port (STRING): Name of the port.
portmtu (INT): MTU of the port.
broadcast_domain (STRING): Name of the broadcast domain.
bdmtu (INT): MTU of the broadcast domain.

vifmgr.port.restored

Severity

NOTICE

Description

This message occurs when configuration data for a network port is restored, typically for a network port that no longer exists or was partially removed previously. No action is required unless you were intentionally intending to remove the network port.

Corrective Action

If you intentionally intended to remove the port, use the (privilege: advanced) "cluster ring show -unitname vifmgr" command to confirm that the network management component is online. If the component is online, use either the "network port ifgrp delete" or "network port vlan delete" command to remove the port again.

Syslog Message

Configuration data for port %s in IPspace "%s" has been restored.

Parameters

port (STRING): Name of the affected port.
ipspace (STRING): Name of the IPspace to which the port is assigned.

vifmgr.port.shareBd

Severity

ERROR

Description

This message occurs when an administrator attempts to move a network port out of IPspace "Cluster", and that port is being used by the back-end HA or DR interconnect. Ports used for either the HA or DR interconnect must remain in IPspace "Cluster" and must be wired to either the cluster switch or directly to the associated HA partner, for two-node switchless clusters.

Corrective Action

If the port has been added to a new broadcast domain, use the "network port broadcast-domain remove-ports" command to remove the port's broadcast domain association. When the port is no longer assigned to a broadcast domain, use the "network port broadcast-domain add-ports" command to add it to broadcast domain "Cluster" in IPspace "Cluster".

Syslog Message

Port %s is shared with the HA or DR interconnect but has been moved from broadcast domain "Cluster" to broadcast domain "%s" of IPspace "%s".

Parameters

port (STRING): Name of the affected port.
broadcast_domain (STRING): Name of the broadcast domain to which the port is assigned.
ipspace (STRING): Name of the IPspace to which the port is assigned.

vifmgr.port.shareIpspace

Severity

ERROR

Description

This message occurs when a cluster port that is shared with either the back-end HA or DR interconnect is assigned to an IPspace other than "Cluster", which is required for all shared ports. This condition can be encountered when a hardware refresh introduces a new platform that includes ports shared with either the HA or DR interconnect.

Corrective Action

If necessary, use the "network port broadcast-domain remove-ports" command to remove the broadcast domain association from the port. After the port is no longer assigned to a broadcast domain, use the "network port broadcast-domain add-ports" command to add the port to broadcast domain "Cluster" in IPspace "Cluster".

Syslog Message

Port %s in broadcast domain "%s" of IPspace "%s" is shared with the HA or DR interconnect, but is not assigned to IPspace "Cluster".

Parameters

port (STRING): Name of the affected port.
broadcast_domain (STRING): Name of the broadcast domain to which the port is assigned.
ipspace (STRING): Name of the IPspace to which the port is assigned.

vifmgr.port.shareMtu

Severity

ERROR

Description

This message occurs when a cluster port shared with either the back-end HA or DR interconnect is found to be using an MTU other than 9000 bytes. For optimal performance, ports shared with the back-end interconnect should use an MTU of 9000 bytes. This condition can occur when a platform using network ports shared with either the back-end HA or DR interconnect is used in a mixed-version cluster, where one or more nodes still allows changes to the MTU setting for broadcast domain "Cluster".

Corrective Action

If the port is currently assigned to broadcast domain "Cluster", use the "network port broadcast-domain modify" command to update broadcast domain "Cluster" to use an MTU of 9000 bytes.

Syslog Message

Port %s in broadcast domain "%s" of IPspace "%s" is shared with the HA or DR interconnect, but has an MTU of %d bytes instead of 9000 bytes.

Parameters

port (STRING): Name of the affected port.
broadcast_domain (STRING): Name of the broadcast domain to which the port is assigned.
ipspace (STRING): Name of the IPspace to which the port is assigned.
mtu (INT): MTU setting of the port.

vifmgr.port.sharingDisabled

Severity

NOTICE

Description

This message occurs when port sharing is disabled for a network port. This transition occurs when a network port is no longer available to be shared with the back-end HA or DR interconnect.

Corrective Action

(None).

Syslog Message

Sharing is disabled for port %s.

Parameters

port (STRING): Name of the affected port.

vifmgr.port.sharingEnabled

Severity

NOTICE

Description

This message occurs when port sharing is enabled for a network port. Enabling port sharing facilitates bandwidth sharing with the back-end (high availability) HA and DR interconnect, which use the same

physical port.

Corrective Action

(None).

Syslog Message

Sharing is enabled for port %s.

Parameters

port (STRING): Name of the affected port.

vifmgr.port.sharingError

Severity

ERROR

Description

This message occurs when an error is encountered while attempting to enable or disable sharing of a network port. If the port is being shared with the back-end HA or DR interconnect on this platform, those components might not be safely isolated from LIFs configured on the port. High utilization by either HA or DR traffic might negatively impact latency and bandwidth available to the cluster network.

Corrective Action

Use the "network port show" command to display the current link status of the affected network port. If the port is down, check any associated cabling and the status of the network switch it is connected to. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Port "%s" could not be updated to the requested sharing state. Error: %s.

Parameters

port (STRING): Name of the affected port.
error (STRING): Description of the error.

vifmgr.port.vipCreated

Severity

NOTICE

Description

This message occurs when an administrative action causes a VIP port to be created.

Corrective Action

(None).

Syslog Message

VIP port %s on node %s in IPspace %s has been created.

Parameters

vipPortName (STRING): Name of the VIP port that was created.
nodeName (STRING): Name of the node on which the VIP port resides.
ipspace (STRING): Name of the IPspace where the VIP port resides.

vifmgr.port.vipDeleted

Severity

NOTICE

Description

This message occurs when an administrative action causes a VIP port to be deleted.

Corrective Action

(None).

Syslog Message

VIP port %s on node %s in IPspace %s has been deleted.

Parameters

vipPortName (STRING): Name of the VIP port that was deleted.
nodeName (STRING): Name of the node from which the VIP port was deleted.
ipspace (STRING): Name of the IPspace where the VIP port resides.

vifmgr.port.vlanCreated

Severity

NOTICE

Description

This message occurs when an administrative action creates a VLAN on a port.

Corrective Action

(None).

Syslog Message

Vlan %s is created on port %s, node %s.

Parameters

vlanName (STRING): Name of the VLAN created on the port.
portName (STRING): Name of the port on which the VLAN was created.
nodeName (STRING): Name of the node on which the port resides.

vifmgr.port.vlanDeleted

Severity

NOTICE

Description

This message occurs when an administrative action deletes a VLAN from a port.

Corrective Action

(None).

Syslog Message

Vlan %s is deleted from port %s, node %s.

Parameters

    vlanName (STRING): Name of the VLAN deleted from the port.
    portName (STRING): Name of the port from which the VLAN was deleted.
    nodeName (STRING): Name of the node on which the port resides.

vifmgr.portdeg events

vifmgr.portDeg.ifgrpAdded

Severity

    NOTICE

Description

    This message occurs when an administrative action adds a port with a degraded health status to an interface group.

Corrective Action

    (None).

Syslog Message

    Port %s, node %s whose health-status is degraded has been added to ifgrp %s.

Parameters

    portName (STRING): Name of the degraded port that was added to an interface group.
    nodeName (STRING): Name of the node on which the degraded port resides.
    ifgrpName (STRING): Name of the interface group to which the degraded port was added.

vifmgr.portDeg.lifHosted

Severity

    NOTICE

Description

    This message occurs when an administrative action hosts a logical interface (LIF) on a port with a degraded health status.

Corrective Action

    (None).

Syslog Message

    LIF %s (on virtual server %s) is hosted on a degraded port %s, node %s.

Parameters

    vifName (STRING): Name of the hosted LIF.
    vsrvid (STRING): Name of the virtual server identifier that uses the LIF.
    portName (STRING): Name of the degraded port that hosts the LIF.
    nodeName (STRING): Name of the node on which the degraded port resides.

vifmgr.portDeg.lifMoved

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) is moved from a port with degraded health status to a healthy port.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, is being moved to node %s, port %s from node %s, port %s because the port's health status is in a degraded state.

Parameters

vifName (STRING): Name of the LIF that is being moved.
vsrvId (STRING): ID of the virtual server on which the LIF resides.
vifIp (STRING): The IP address of the LIF that is being moved.
toNode (STRING): Name of the node to which the LIF is moving.
toPort (STRING): Name of the port to which the LIF is moving.
fromNode (STRING): Name of the node on which the LIF is currently hosted.
fromPort (STRING): Name of the port on which the LIF is currently hosted.

vifmgr.portDeg.vlanCreated

Severity

NOTICE

Description

This message occurs when an administrative action creates a VLAN on a port with a degraded health status.

Corrective Action

(None).

Syslog Message

Vlan %s is created on a degraded port %s, node %s.

Parameters

vlanName (STRING): Name of the VLAN created on the degraded port.
portName (STRING): Name of the degraded port on which the VLAN was created.
nodeName (STRING): Name of the node on which the degraded port resides.

vifmgr.portdown events

vifmgr.portdown

Severity

NOTICE

Description

This message occurs when a link down event was received on a network port. Data access through this physical port is down.

Corrective Action

(None).

Syslog Message

A link down event was received on node %s, port %s.

Parameters

nodename (STRING): Name of the node on which the affected port resides.
portname (STRING): Name of the affected port.

vifmgr.porthealthy events

vifmgr.portHealthy

Severity

NOTICE

Description

This message occurs when port health status changes from degraded to healthy.

Corrective Action

(None).

Syslog Message

The health status of port %s (node %s) has changed from degraded to healthy. This port can now be used for hosting LIFs.

Parameters

portName (STRING): Name of the port whose health status changed from degraded to healthy.
nodeName (STRING): Name of the node on which the port resides.

vifmgr.portowner events

vifmgr.portowner.err

Severity

ERROR

Description

This message occurs when a port receives a configuration error.

Corrective Action

Remove any ports from the bootarg.bsdportname LOADER variable that are of a role other than node-mgmt by resetting the bootarg.bsdportname under the LOADER prompt: LOADER> setenv bootarg.bsdportname "port-name (node-mgmt port only)" Then reboot the node.

Syslog Message

Node %s port %s has an invalid port role type. Only node-mgmt network ports can be assigned to use a different driver.

Parameters

nodename (STRING): Name of the node on which the affected port resides.
portname (STRING): Name of the affected port.

vifmgr.portremoved events

vifmgr.portRemoved

Severity

NOTICE

Description

This message occurs when a port is removed because it no longer exists.

Corrective Action

(None).

Syslog Message

Port %s on node %s has been removed because it no longer exists.

Parameters

port (STRING): Name of the nonexistent port.
node (STRING): Name of the node on which the nonexistent port used to reside.

vifmgr.portRemoved.lifHomed

Severity

NOTICE

Description

This message occurs when a logical interface's (LIF's) home port is updated because its previous home port has been removed from its broadcast domain.

Corrective Action

(None).

Syslog Message

Home port of LIF %s (Vserver %s), IP addr %s updated to node %s port %s from node %s port %s: port removed from broadcast domain.

Parameters

vifName (STRING): Name of the LIF on which the home port is being updated.
vsrvId (STRING): ID of the virtual server on which the LIF resides.
vifIp (STRING): IP address of the LIF on which the home port is being updated.
toNode (STRING): Name of the node to which the LIF's home port is being updated.
toPort (STRING): Name of the port to which the LIF's home port is being updated.
fromNode (STRING): Name of the node from which the LIF's home port is being updated.
fromPort (STRING): Name of the port from which the LIF's home port is being updated.

vifmgr.portRemoved.lifMoved

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) is moved from a port that has been removed from its broadcast domain.

Corrective Action

(None).

Syslog Message

LIF %s (Vserver %s), IP addr %s moving to node %s port %s from node %s port %s: port removed from broadcast domain.

Parameters

vifName (STRING): Name of the LIF that is being moved.
vsrvId (STRING): ID of the virtual server on which the LIF resides.
vifIp (STRING): IP address of the LIF that is being moved.
toNode (STRING): Name of the node to which the LIF is moving.
toPort (STRING): Name of the port to which the LIF is moving.
fromNode (STRING): Name of the node from which the LIF is moving.
fromPort (STRING): Name of the port from which the LIF is moving.

vifmgr.portspeed events

vifmgr.portspeed.err

Severity

ERROR

Description

This message occurs when a port is connected to a switch utilizing a link speed that is not qualified. This might lead to unexpected system behaviors.

Corrective Action

Ensure that the affected network port is connected to a switch that uses a link speed supported by this node. If necessary, adjust the switch configuration to assign a lower speed.

Syslog Message

Node %s port %s is reporting a speed %s that is not supported.

Parameters

nodename (STRING): Name of the node on which the affected port resides.
portname (STRING): Name of the affected port.
portspeed (STRING): Operational speed of the affected port.

vifmgr.portup events

vifmgr.portup

Severity

NOTICE

Description

This message occurs when a link up event was received on a network port. Data access through this physical port is now available.

Corrective Action

(None).

Syslog Message

A link up event was received on node %s, port %s.

Parameters

nodename (STRING): Name of the node on which the affected port resides.
portname (STRING): Name of the affected port.

vifmgr.rdma events

vifmgr.RDMA.lifMoved

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) is moved from a port that does not support the required remote direct memory access (RDMA) protocols of the LIF.

Corrective Action

(None).

Syslog Message

LIF "%s" (on virtual server "%s"), with IP address "%s", is being moved to node "%s", port "%s", from node "%s", port "%s", because the port does not support the LIF's RDMA protocols.

Parameters

vifName (STRING): Name of the LIF that is being moved.
vsrvId (STRING): ID of the virtual server on which the LIF resides.

vifIp (STRING): IP address of the LIF that is being moved.
toNode (STRING): Name of the node to which the LIF is being moved.
toPort (STRING): Name of the port to which the LIF is being moved.
fromNode (STRING): Name of the node on which the LIF is currently hosted.
fromPort (STRING): Name of the port on which the LIF is currently hosted.

vifmgr.reach events

vifmgr.reach.avail

Severity

NOTICE

Description

This message occurs when the node has completed its initial scan of reachability for all ports.

Corrective Action

(None).

Syslog Message

Node %s has completed its initial scan of reachability for all ports.

Parameters

node (STRING): Name of the node on which the network port resides.

vifmgr.reach.err

Severity

ERROR

Description

This message occurs when a network port encountered errors while scanning for reachability.

Corrective Action

Verify the network port's physical connectivity and switch configuration. A network port should have reachability only to its expected broadcast domain.

Syslog Message

Network port %s on node %s encountered errors while scanning for reachability. Reachability was detected to the following broadcast domains: %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
reachableBroadcastDomains (STRING): Names of the broadcast domains that are reachable from the port.

vifmgr.reach.miscfg

Severity

ERROR

Description

This message occurs when a network port cannot reach its expected broadcast domain but has reachability to another broadcast domain.

Corrective Action

Verify the network port's physical connectivity and switch configuration. A network port should have reachability only to its expected broadcast domain.

Syslog Message

Network port %s on node %s cannot reach its expected broadcast domain %s, but reachability was detected to broadcast domain %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
broadcastDomain (STRING): Name of the broadcast domain associated with the port.
reachableBroadcastDomains (STRING): Names of the broadcast domains that are reachable from the port.

vifmgr.reach.miscfg.unassn

Severity

NOTICE

Description

This message occurs when a network port is not assigned to a broadcast domain but has reachability to a broadcast domain.

Corrective Action

Verify the network port's physical connectivity and switch configuration. A network port should have reachability only to its expected broadcast domain.

Syslog Message

Network port %s on node %s is not assigned to a broadcast domain, but reachability was detected to broadcast domain %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
reachableBroadcastDomains (STRING): Names of the broadcast domains that are reachable from the port.

vifmgr.reach.multireach

Severity

ERROR

Description

This message occurs when a network port is determined to have reachability to multiple broadcast domains.

Corrective Action

Verify the network port's physical connectivity and switch configuration. A network port should have reachability only to its expected broadcast domain.

Syslog Message

Network port %s on node %s can reach the following broadcast domains: %s.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
reachableBroadcastDomains (STRING): Names of the broadcast domains that are reachable from the port.

vifmgr.reach.noreach

Severity

NOTICE

Description

This message occurs when a network port cannot reach its expected broadcast domain or any other broadcast domain.

Corrective Action

Verify the network port's physical connectivity and switch configuration. A network port should have reachability only to its expected broadcast domain.

Syslog Message

Network port %s on node %s cannot reach its expected broadcast domain %s. No other broadcast domains appear to be reachable from this port.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
broadcastDomain (STRING): Name of the broadcast domain associated with the port.

vifmgr.reach.ok

Severity

NOTICE

Description

This message occurs when a network port's actual broadcast domain reachability matches its expected reachability, and no other broadcast domains appear to be reachable from the port.

Corrective Action

(None).

Syslog Message

Network port %s on node %s can reach its expected broadcast domain %s. No other broadcast domains appear to be reachable from this port.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.
broadcastDomain (STRING): Name of the broadcast domain associated with the port.

vifmgr.reach.skipped

Severity

NOTICE

Description

This message occurs when a network port was not scanned for reachability because it was administratively or operationally down at the time of the scan.

Corrective Action

(None).

Syslog Message

Network port %s on node %s was not scanned for reachability because it was administratively or operationally down at the time of the scan.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.

vifmgr.reach.unassn

Severity

NOTICE

Description

This message occurs when a network port is not assigned to a broadcast domain, and has no reachability to any broadcast domains.

Corrective Action

(None).

Syslog Message

Network port %s on node %s is not assigned to any broadcast domain. No broadcast domains appear to be reachable from this port.

Parameters

port (STRING): Name of the network port.
node (STRING): Name of the node on which the network port resides.

vifmgr.rpc events

vifmgr.rpc.nblade.timeouts

Severity

ERROR

Description

This message occurs when the virtual interface manager (vifmgr) is having trouble communicating with the packet and connection processing module of the network component. If this problem persists, interface failover might not occur as intended, resulting in a disruption.

Corrective Action

If the node is experiencing heavy load, the condition might clear up automatically after a few minutes. If the condition persists, contact NetApp technical support.

Syslog Message

The virtual interface manager is not receiving responses from the node's networking component.

Parameters

(None).

vifmgr.secondaryoffline events

vifmgr.secondaryOffline

Severity

NOTICE

Description

This message occurs when the system determines that a remote node has been offline for more than a minute and assigns logical network interfaces (LIFs) from that node to other available nodes in the cluster.

Corrective Action

(None).

Syslog Message

LIFs from offline node "%s" are being assigned to other available nodes in the cluster.

Parameters

offlineNode (STRING): Name of the offline node.

vifmgr.skippingl2pingtest events

vifmgr.skippingL2PingTest

Severity

NOTICE

Description

This message occurs when the number of local ports in the given broadcast domain exceeds the threshold for a node and, as a result, the l2_reachability health monitor has omitted checking ports in that broadcast domain. If any local ports in this broadcast domain experience Layer 2 connectivity problems, they are not marked as degraded and no EMS messages related to the Layer 2 connectivity health of those ports is generated. LIFs hosted on those port are not automatically migrated to healthy ports because of Layer 2 connectivity issues.

Corrective Action

This is not a misconfiguration; however, including fewer than the specified threshold ports in the broadcast domain enables the l2_reachability health monitor to check the health of the ports in that broadcast domain.

Syslog Message

Skipping l2_reachability health monitor check for ports belonging to broadcast domain %s on node %s as the number of local ports (%u) belonging to this broadcast domain exceeds the threshold (%u) for which l2_reachability health monitor check can efficiently run.

Parameters

bcDomainName (STRING): Name of the broadcast domain for which the l2_reachability health monitor check is being skipped.
nodeName (STRING): Name of the node for which the number of local ports in the given broadcast domain exceeds the threshhold.
numLocalPorts (INT): Number of local ports in the specified broadcast domain.
maxLocalPorts (INT): Threshold value for the maximum number of local ports in a broadcast domain for which the l2_reachability health monitor check can run.

vifmgr.started events

vifmgr.started

Severity

NOTICE

Description

This message occurs to notify you that the Logical Interface Manager (VIFMgr) started.

Corrective Action

(None).

Syslog Message

The Logical Interface Manager (VIFMgr) has started.

Parameters

(None).

vifmgr.startup events

vifmgr.startup.failover.err

Severity

ALERT

Description

This message occurs when the logical interface manager (VIFMgr) encounters an error while initializing the structures required for logical interface (LIF) failover. As a result of this error, the node is now running in a degraded state.

Corrective Action

Contact NetApp technical support and reference the "vifmgr.startup.failover.err" error.

Syslog Message

VIFMgr encountered errors during startup.

Parameters

(None).

vifmgr.startup.merge.err

Severity

ERROR

Description

This message occurs to notify you that the Logical Interface Manager (VIFMgr) encountered an error while merging the local node's network configuration with the configuration stored in the cluster database. As a result of this error, the node is now running in a degraded state.

Corrective Action

Contact NetApp technical support.

Syslog Message

The Logical Interface Manager (VIFMgr) encountered errors during startup.

Parameters

(None).

vifmgr.staticroute events

vifmgr.staticRoute.add

Severity

NOTICE

Description

This message occurs when a static route is added to a Vserver.

Corrective Action

(None).

Syslog Message

Static route created on Vserver %s: dest %s, gw %s, metric %u.

Parameters

vserverName (STRING): Name of the Vserver on which the static route was added.
destination (STRING): The IP subnet to which the route applies.
gateway (STRING): The IP address of the gateway.
metric (INT): The metric of the route, used to determine its priority relative to other routes for the Vserver.

vifmgr.staticRoute.del

Severity

NOTICE

Description

This message occurs when a static route is deleted from a Vserver.

Corrective Action

(None).

Syslog Message

Static route deleted from Vserver %s: dest %s, gw %s, metric %u.

Parameters

vserverName (STRING): Name of the Vserver from which the static route was deleted.
destination (STRING): The IP subnet to which the route applies.
gateway (STRING): The IP address of the gateway.
metric (INT): The metric of the route, used to determine its priority relative to other routes for the Vserver.

vifmgr.staticRoute.netadd

Severity

NOTICE

Description

This message occurs when a static route is added to the network routing table of a storage virtual machine (SVM).

Corrective Action

(None).

Syslog Message

Static route added to the network routing table for SVM %u: dest %s, gw %s, metric %u.

Parameters

SVM (INT): ID of the SVM on which the static route was added.
destination (STRING): IP subnet to which the route applies.
gateway (STRING): IP address of the gateway.
metric (INT): Metric of the route, used to determine its priority relative to other routes for the SVM.

vifmgr.staticRoute.netremove

Severity

NOTICE

Description

This message occurs when a static route is removed from the network routing table of a istorage virtual machine (SVM).

Corrective Action

(None).

Syslog Message

Static route removed from the routing table for SVM %u: dest %s, gw %s.

Parameters

SVM (INT): ID of the SVM from which the static route was deleted.
destination (STRING): IP subnet to which the route applies.
gateway (STRING): The IP address of the gateway.

vifmgr.subnet events

vifmgr.subnet.addr.acquired

Severity

NOTICE

Description

This message occurs when an address is successfully acquired from a subnet's available-ranges list.

Corrective Action

(None).

Syslog Message

Address %s has been successfully acquired from subnet %s (ipspace %s).

Parameters

address (STRING): Address acquired.
subnet (STRING): Name of the subnet.
ipspace (STRING): Name of the subnet's IPspace.

vifmgr.subnet.addr.released

Severity

NOTICE

Description

This message occurs when an address is successfully released back to a subnet's available-ranges list.

Corrective Action

(None).

Syslog Message

Address %s has been successfully released back to subnet %s (ipspace %s).

Parameters

address (STRING): Address released.
subnet (STRING): Name of the subnet.
ipspace (STRING): Name of the subnet's IPspace.

vifmgr.subnet.usedAddr

Severity

ERROR

Description

This message occurs when a LIF's address conflicts with a subnet's list of used and available addresses due to an inconsistency in the configuration of the subnet or LIF.

Corrective Action

Either the address of the LIF, the address ranges, or the available addresses in the subnet need to be adjusted. To identify the LIF, use the advanced-priviledge command "network interface show" setting the "numeric-id" parameter to that of the LIF in the message. To change the address of the LIF, use the "network interface modify" command, specifying the address and netmask. To remove the address from the subnet, use the "network subnet remove-ranges" command.

Syslog Message

LIF %d has an address %s that is in Subnet's %s unused pool.

Parameters

lif (INT): Identifier of the LIF with the address conflict.
address (STRING): Address owned by both LIF and subnet.
subnet (STRING): Name of the subnet.

vifmgr.svcpolicy events

vifmgr.svcPolicy.addSvc

Severity

NOTICE

Description

This message occurs when a service is added to a network interface service policy.

Corrective Action

(None).

Syslog Message

Service %s has been added to network interface service policy %s on Vserver %s.

Parameters

>**service** (STRING): Name of the service that has been added.
>**policy** (STRING): Name of the affected service policy.
>**vserver** (STRING): Name of the Vserver associated with this policy.
>**allowed_addresses** (STRING): List of allowed address masks for this service.

vifmgr.svcPolicy.deprecated

Severity

>NOTICE

Description

>This message occurs when a network interface (LIF) is configured to use a deprecated service policy.

Corrective Action

>Use the recommended service policy to replace the deprecated service policy.

Syslog Message

>LIF "%s" on Vserver "%s" is using deprecated service policy: %s. Recommended service policy: %s.

Parameters

>**lif_name** (STRING): LIF name.
>**vserver** (STRING): Vserver name.
>**deprecated_service_policy** (STRING): Deprecated service policy name.
>**service_policy** (STRING): Recommended service policy.

vifmgr.svcPolicy.remSvc

Severity

>NOTICE

Description

>This message occurs when a service is removed from a network interface service policy.

Corrective Action

>(None).

Syslog Message

>Service %s has been removed from network interface service policy %s on Vserver %s.

Parameters

>**service** (STRING): Name of the service that has been removed.
>**policy** (STRING): Name of the affected service policy.
>**vserver** (STRING): Name of the Vserver associated with this policy.

vifmgr.unabletohostmovedlif events

vifmgr.unabletohostmovedlif

Severity

NOTICE

Description

This message occurs when an attempt to move a logical interface (LIF) IP address to a specific node/port failed, and a subsequent attempt was made to move that LIF to another location.

Corrective Action

(None).

Syslog Message

LIF %s (on virtual server %s), IP address %s, could not be hosted and is being moved to node %s, port %s (error %s).

Parameters

vifname (STRING): Name of the LIF that is being moved.
vsrvid (STRING): Name of the virtual server identifier on which this LIF resides.
vifip (STRING): The logical interface's IP address that is being moved.
tonode (STRING): Name of the node to where the LIF is moving.
toport (STRING): Name of the port to where the LIF is moving.
error (STRING): Error that was reported.

vifmgr.viplifwithoutbgp events

vifmgr.vipLifWithoutBgp

Severity

ERROR

Description

This message occurs when a logical interface (LIF) associated with the Virtual IP (VIP) feature does not have a BGP peer group.

Corrective Action

Use the "network bgp peer-group create" command to create a BGP peer group with the same IPspace and node as the affected LIF.

Syslog Message

VIP lif %s on Vserver %s does not have BGP peer group in IPspace %s on node %s.

Parameters

lif (STRING): LIF name.
vserver_name (STRING): Vserver name.
ipspace_name (STRING): IPspace name.
node_name (STRING): Name of the node to which LIFs could not be replicated.

vifmgr.vs events

vifmgr.vs.cache.updateFailed

Severity

ALERT

Description

This message occurs when Logical Interface Manager (VIFMgr) is unable to retrieve the list of Vservers from the management gateway Vserver cache in the allotted time. VIFMgr attempts to recover from this issue. If unsuccessful, clients might not be able to access data through this node.

Corrective Action

If the problem persists, contact Contact NetApp technical support. for assistance.

Syslog Message

VIFMgr is unable to receive a Vserver cache update from the management gateway.

Parameters

(None).

virtual events

virtual.limits events

virtual.limits.disabled

Severity

INFORMATIONAL

Description

This message occurs when the process virtual memory limit calculations are disabled on a given node. The virtual memory calculations are explicitly disabled by setting the boot argument "bootarg.engage_vss_limit=false".

Corrective Action

(None).

Syslog Message

Virtual memory limit calculations are disabled on node %s.

Parameters

node (STRING): Name of the node where the calculations are disabled.

virtual.limits.proc

Severity

INFORMATIONAL

Description

This message occurs when the process virtual limit is overridden by the /mroot/etc/cluster_config/vsz_override file. An entry in this file indicates that the default virtual size of a process needed to be overridden.

Corrective Action

(None).

Syslog Message

Virtual memory limit for process %s on node %s overridden to %llu.

Parameters

process (STRING): Process that required the override
node (STRING): Node name where the file was updated.
size (LONGINT): New virtual size, in bytes.

vldb events

vldb.adtcons events

vldb.adtcons.rpcfailure

Severity

ERROR

Description

This message occurs when the Remote Procedure Call (RPC) from the Volume Location Database (VLDB) to the Management Gateway (MGWD) fails. This RPC updates the audit resource database when a volume belonging to a Vserver on a specific aggregate is deleted or moved from that aggregate and that volume is the last volume belonging to that Vserver residing on that aggregate.

Corrective Action

Update the audit resource database by creating a temporary volume belonging to the applicable Vserver and aggregate. The temporary volume can take the defaults for the following commands and does not need to be exported to clients for data access: 'volume create -volume volume_name -aggregate aggr_name -vserver vserverid' After creating the temporary volume, delete it manually by using the following command: 'volume delete -volume volume_name -vserver vserverid' This process updates the audit resource database in the cluster and recovers from this error condition. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

RPC failure linked with the consolidation job for auditing on Vserver ID '%d', and aggregate '%s'.

Parameters

vserverid (INT): ID of the Vserver that owned the last volume deleted or moved from the aggregate.
aggruuid (STRING): UUID of the aggregate that owned the moved or deleted volume.

vldb.aggrbladeid events

vldb.aggrBladeID.missing

Severity

NOTICE

Description

This message occurs when the system discovers an inconsistency in the volume location database (VLDB). The VLDB contains information about volumes that are owned by a node with an unknown unique universal ID (UUID). This condition might arise if an aggregate is not owned by any of the nodes in the cluster, as in the case of aggregates at a MetroCluster® destination site.

Corrective Action

(None).

Syslog Message

The volume '%s' is located on the aggregate with UUID '%s' whose owning dblade UUID '%s' does not exist in the Volume Location Database.

Parameters

> **volume** (STRING): Name of the volume.
> **aggregateUUID** (STRING): UUID of the aggregate.
> **bladeUUID** (STRING): UUID of the owning node.

vldb.aggregatename events

vldb.aggregateName.mismatch

Severity

> INFORMATIONAL

Description

> This message occurs when an aggregate's name in the Volume Location Database (VLDB) does not match the aggregate's current name on the node. This could happen if the name of the aggregate was changed or if another aggregate in the cluster has it's UUID changed to another aggregate's UUID in the cluster, as reported to the VLDB.

Corrective Action

> (None).

Syslog Message

> The aggregate '%s' with name '%s' on node '%s' does not match with the name '%s' in the VLDB.

Parameters

> **aggregate** (STRING): UUID of the aggregate.
> **newName** (STRING): New name of the aggregate on the node.
> **node** (STRING): Name of the node.
> **existingName** (STRING): Existing name of the aggregate in the VLDB.

vldb.aggregateuuid events

vldb.aggregateUUID.mismatch

Severity

> INFORMATIONAL

Description

> This message occurs when an aggregate's Universally Unique Identifier (UUID) in the Volume Location Database does not match the aggregate's current UUID. This could happen if the UUID of the aggregate was changed or if another aggregate in the cluster with the same name is plugged in.

Corrective Action

> (None).

Syslog Message

> The aggregate '%s' with UUID '%s' on node '%s' was changed to '%s' in the Volume Location Database.

Parameters

> **aggregate** (STRING): Name of the aggregate.
> **existingUUID** (STRING): Existing Universally Unique Identifier (UUID) of the aggregate.
> **node** (STRING): Name of the node.
> **newUUID** (STRING): New Universally Unique Identifier (UUID) of the aggregate.

vldb.aggregateUUID.missing

Severity

> ERROR

Description

> This message occurs due to a Volume Location Database inconsistency. The Volume Location Database contains a volume that exists on a aggregate whose universal unique identifier (UUID) is not in the Volume Location Database. This might happen if an aggregate that contains volumes is deleted: for example, through the maintenance menu.

Corrective Action

> Contact technical support.

Syslog Message

> The volume '%s' is located on the aggregate with UUID '%s' which does not exist in the Volume Location Database.

Parameters

> **volume** (STRING): Name of the volume
> **aggregateUUID** (STRING): Universal Unique Identifier (UUID) of the aggregate

vldb.aggrupdate events

vldb.aggrUpdate.noRepl

Severity

> ERROR

Description

> This message occurs in a MetroCluster(tm) configuration, when the blade UUID (Universal Unique Identifier) is updated on the local cluster, but a failure prevents the aggregate ownership update from being replicated to the remote cluster.

Corrective Action

> Contact NetApp technical support for assistance.

Syslog Message

> The ownership update of aggregates on blade UUID '%s' was not replicated to the remote cluster.

Parameters

> **bladeUUID** (STRING): UUID of the Dblade owning the aggregate.

vldb.aggrvote events

vldb.aggrVote.noRepl

Severity

INFORMATIONAL

Description

This message occurs when a row of the aggr vote table is not replicated to the local table when an update is received from the remote cluster. Replication is skipped if the storage and NVRAM mirroring connectivity was indicated as down when the record was updated.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggrUUID (STRING): The UUID of the aggregate whose mirror vote was not replicated.
localNplexes (INT): The value of nplexes in the local table.
localPlex0 (INT): The value of plex0 id in the local table.
localPlex1 (INT): The value of plex1 id in the local table.
remoteNplexes (INT): The value of nplexes from the remote cluster update.
remotePlex0 (INT): The value of plex0 id from the remote cluster update.
remotePlex1 (INT): The value of plex1 id from the remote cluster update.

vldb.mccaggregate events

vldb.mccaggregate.rename

Severity

INFORMATIONAL

Description

This message occurs during MetroCluster(tm) configuration setup, when the aggregate at the destination site is renamed to handle a name collision. This can happen when an aggregate is renamed at the source site, which causes its mirror to be renamed at the destination site. It can also happen when an aggregate is created at the source site, which causes its mirror to be created at the destination site. In both cases, the issue is that an aggregate of the same name already exists on the destination site, resulting in a name collision. The aggregate at the destination is renamed to resolve the name collision.

Corrective Action

If desired, rename the aggregate at the source site to a name that does not collide with an existing name at the destination site. You can choose any new name that does not cause a name collision; the new name will be propagated to the destination site. If the old name is used in any scripts, you should also change those to the new name. If you choose not to rename the aggregate at the source site, the aggregate will have different names at the source and destination sites, but functionality is not affected.

Syslog Message

The aggregate with UUID '%s' and name '%s' is renamed at the MetroCluster configuration destination site as '%s'.

Parameters

uuid (STRING): Universally Unique Identifier (UUID) of the aggregate.
aggrNameStr (STRING): Name of the aggregate at the source site.
aggrRenameStr (STRING): Name of the aggregate at the destination site.

vldb.update events

vldb.update.duringsofail

Severity

EMERGENCY

Description

This message occurs when the aggregate ownership update fails during switchover. The update is initiated by the management gateway daemon (mgwd), to fetch aggregate information from all of the nodes in the cluster and to update the volume location database (VLDB).

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

Aggregate ownership update failed for node '%s'.

Parameters

hostname (STRING): Name of the node.

vldb.vldbaggr events

vldb.vldbAggr.missing

Severity

ERROR

Description

This message occurs when an aggregate is identified that does not exist in the Volume Location Database. This could happen if a disk shelf that constitutes an aggregate is plugged in or when an aggregate is created in Maintenance mode.

Corrective Action

If this is a new aggregate that must be added to the Volume Location Database, then use the (privilege: diag) "debug vreport" command to resolve the inconsistency in the VLDB: 1. Run "debug vreport show" to show the object name. 2. Run "debug vreport fix -type aggregate -object object-name". If this is a stale aggregate that must be removed, then contact support personnel.

Syslog Message

The aggregate "%s" with UUID "%s" on node "%s" does not exist in the Volume Location Database.

Parameters

> **aggregate** (STRING): Name of the aggregate.
> **uuid** (STRING): Universally Unique Identifier (UUID) of the aggregate.
> **node** (STRING): Name of the node.

vldb.vsrootvol events

vldb.vsRootVol.del

Severity

> INFORMATIONAL

Description

> This message occurs when the Vserver root volume is force deleted while non-root volumes for the Vserver still exist in the cluster. Under normal circumstances, the Vserver root volume cannot be deleted until all the other volumes for the Vserver are deleted. Although deleting the Vserver root volume does not change the operational state for the Vserver, volume operations that refer to the Vserver root volume for information will fail if the corrective action is not taken.

Corrective Action

> Assign an already existing data volume as the new root volume for the Vserver whose root volume was deleted by using the 'volume make-vsroot -vserver vserver_name -volume new_root_volume_name' command.

Syslog Message

> The root volume '%s' for the Vserver with Vserver ID '%d' was force deleted while non-root volumes for the Vserver still exist in the cluster.

Parameters

> **volume** (STRING): Root volume name that was deleted.
> **vserverid** (INT): ID for the Vserver that owned the deleted root volume.

vm events

vm.dev events

vm.dev.diskSlowIO

Severity

ERROR

Description

This message occurs when Data ONTAP® is running on a virtual platform, and slow I/O is detected.

Corrective Action

Collect virtual platform logs and trigger a performance archive AutoSupport® messsage with the "autosupport invoke-performance-archive" command, and then contact NetApp technical support for troubleshooting assistance.

Syslog Message

The %s request on disk %s took %u seconds (data size %u bytes, threshold %u seconds).

Parameters

op (STRING): Read/write operation.
disk (STRING): Disk name.
secUsed (INT): Seconds the I/O spent.
size (INT): Data size.
secLimit (INT): Threshold in seconds that triggers the warning.

vm.dev.writeprotected

Severity

ERROR

Description

This message occurs when ONTAP® software is running on a virtual platform, and a write-protected device is detected. The device is not presented to ONTAP.

Corrective Action

Detach the device, and then reattach the device as writable.

Syslog Message

The device %s is write-protected and is not presented to ONTAP.

Parameters

device (STRING): Device name.

vm.host events

vm.host.error

Severity

EMERGENCY

Description

This message occurs when a VM is paused by the hypervisor. The backing datastore might have been filled or connectivity to the datastore might have been lost. Corrective actions should be performed as soon as possible.

Corrective Action

Check the hypervisor logs to determine whether the backing datastore is full or connectivity to the datastore was lost, and then take the appropriate corrective action.

Syslog Message

The VM is paused possibly due to a full datastore or connectivity to the datastore might have been lost. Check the hypervisor logs for errors, and then perform any necessary corrective actions as soon as possible.

Parameters

(None).

vnm events

vnvram events

vnvram.dma events

vnvram.dma.long.wait

Severity

ALERT

Description

This message occurs when a vNVRAM flush operation on an ONTAP-v system is taking too much time. This can indicate back-end storage issues or an internal error. The system might also reboot.

Corrective Action

If the problem persists, check for back-end storage issues with the system disk.

Syslog Message

vNVRAM flush taking over %d seconds.

Parameters

vnvr_wait_sec (INT): Time in seconds for the vNVRAM flush operation.

vnvram.flush events

vnvram.flush.ems

Severity

NOTICE

Description

This message occurs when the write to the backing storage device for the EMS region of VNVRAM (virtual NVRAM) takes longer than 500 msec.

Corrective Action

(None).

Syslog Message

EMS region write to VNVRAM persistent storage took %d seconds.

Parameters

vnvr_write_time (LONGINT): Time in seconds taken for the EMS region write to persistent storage.

vnvram.flushed events

vnvram.flushed

Severity

NOTICE

Description

This message occurs when the VNVRAM contents of any ONTAP-based virtual appliance that is not using full-mode VNVRAM, are written to the backing storage device. The writes would have occurred during either a clean or dirty shutdown.

Corrective Action

(None).

Syslog Message

Write to VNVRAM persistent storage is complete (%s) elapsed %d ms.

Parameters

vnvr_reg (STRING): Section of NVRAM that was written to the backing device.
flush_time_ms (INT): Time taken to write the NVRAM section.

vol events

vol.clone events

vol.clone.split.optimized

Severity

NOTICE

Description

This message occurs when the clone split of a volume clone takes the optimized path which uses an Azure copy blob operation to copy objects from the parent volume to the clone.

Corrective Action

(None).

Syslog Message

Clone split of volume "%s" hosted on FabricPool "%s" takes the optimized path using Azure copy blob operation.

Parameters

volume_name (STRING): Volume clone.
aggregate_name (STRING): Aggregate which hosts the volume clone.

vol.duplicate events

vol.duplicate.msid

Severity

EMERGENCY

Description

This message occurs when a duplicate master set ID (MSID) has been detected. This situation might cause ONTAP to incorrectly group together the constituents of separate FlexGroup volumes. This might result in inconsistencies, as ONTAP creates directories and files across separate FlexGroup volumes. This might lead ONTAP to mark FlexGroup volume constituents as inconsistent and take them offline. ONTAP might even mark the entire aggregate as inconsistent and take it offline.

Corrective Action

Contact NetApp technical support immediately.

Syslog Message

Duplicate MSID "%lu" has been detected in SVM "%s". The duplicate MSID is used for volumes "%s" and "%s".

Parameters

volumeMsid (LONGINT): MSID of the volumes.
vserverName (STRING): Name of the storage virtual machine (SVM) on which the volumes reside.
firstVolName (STRING): Name of the first volume with the duplicate MSID.
secondVolName (STRING): Name of the second volume with the duplicate MSID.

vol.inconsistent events

vol.inconsistent.modify

Severity

INFORMATIONAL

Description

This message occurs when the "vol inconsistent" command is used to modify a volume's state.

Corrective Action

(None).

Syslog Message

Volume %s: 'vol inconsistent' command used to change inconsistent state to '%s'.

Parameters

vol (STRING): Name of the volume.
state (STRING): State of the action "set" or "clear".

vol.language events

vol.language.changed

Severity

INFORMATIONAL

Description

This event is issued when the language of an aggregate or a volume is changed.

Corrective Action

(None).

Syslog Message

Language on %s %s changed to %s

Parameters

vol_type (STRING): Whether this event is generated for an aggregate or a flexible volume.
vol (STRING): The name of the volume or aggregate
lang (STRING): The name of the changed language of the volume or aggregate.

vol.language.openFailed

Severity

ERROR

Description

This message occurs when an attempt to open the language file fails.

Corrective Action

Check whether the language file exists. Retry the command based on the reason for failure.

Syslog Message

Failed to open the language file %s, error message: %s

Parameters

file_name_location (STRING): Language file name and location.
error_str (STRING): Reason for the error.

vol.language.unspecified

Severity

INFORMATIONAL

Description

This event is issued when ONTAP detects that there is no language specified for the volume or aggregate. The referenced volume or aggregate language will default to "C" (POSIX). See the na_vol.1 man page for the list of supported languages.

Corrective Action

If the volume is not read-only, use the 'vol lang' command to correct the language of the volume. See the na_vol.1 man page for details about using the 'vol lang' command.

Syslog Message

Language not set on %s %s. Using language config "C". %s

Parameters

vol_type (STRING): Whether this error occurred for an aggregate or a flexible volume
vol (STRING): The name of the volume or aggregate
lang_command (STRING): If the volume is not read-only, this parameter contains an explanation of what you can do to set the language for the volume.

vol.log events

vol.log.overalloc

Severity

ALERT

Description

This message occurs when the volume or aggregate allocates more space than it can honor by way of reservations, or the aggregate has allocated more space than it can honor by way of guarantees. If the reserved or guaranteed space is consumed, there is insufficient physical space, which can cause the volume or aggregate to be taken offline.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume or aggregate size, deleting data, deleting Snapshot copies, or changing the provisioning from thick to thin. To increase a volume's size, use the "volume size" command. To delete a volume's Snapshot copies, use the "volume snapshot delete" command. To change provisioning in a volume, reserved files can be unreserved by using the "volume file

reservation" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate Snapshot copies are deleted automatically when the aggregate is full. To change provisioning of a volume in an aggregate, change the volume guarantee from "volume" to "none" by using the "space-guarantee" field of the "volume modify" command. For ASA r2 platforms, create space in the volume or aggregate. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

%s %s%s%s is logically overallocated, using %s%% logical space and %s%% physical space.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
name (STRING): Name of this object.
app (STRING): Application universal unique identifier(UUID).
vserver_uuid (STRING): UUID of the object's storage virtual machine (SVM), if the object is a volume. Otherwise, this string is empty.
percent_logically_full (STRING): Used capacity of the logical space of the object, as a percent. This value can be greater than 100 due to space reserved for metadata. The percentage is computed for the entire object, including Snapshot copy space, and is equivalent to the "Total Used" field in the output of the "volume show-space" or "aggregate show-space" commands.
percent_physically_full (STRING): Used capacity of the physical space of the object, as a percent. This value can be greater than 100 due to space reserved for metadata. The percentage is computed for the entire object, including Snapshot copy space, and is equivalent to the "Total Physical Used" field in the output of the "volume show-space" or "aggregate show-space" commands.

vol.log.overalloc.inc.sav

Severity

ALERT

Description

This message occurs when the volume allocates more space than it can honor. Allocated space is based on all of the physical used blocks, reservations, and space saved by storage efficiency features.

Corrective Action

Create space by increasing the volume size, deleting data or their reservations, or deleting snapshots. To increase volume size, use the "volume size" command. To delete snapshots, use the "volume snapshot delete" command.

Syslog Message

%s %s%s%s (UUID %s) is logically overallocated using %s%% space, which considers space saved by storage efficiency features as well as physically used blocks and reservations.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies. This event should be applicable only to volumes with logical space enforcement enabled.
name (STRING): Name of this object.
app (STRING): Application Universally Unique ID (UUID).
vserver_uuid (STRING): UUID of the object's or volume's Vserver.
object_uuid (STRING): UUID of the object or volume.
percent_full (STRING): Used capacity of the logical space of the object, along with reservations and space saved by the storage efficiency features, as a percentage. This value can be greater than 100 due to space

reserved for metadata. The percentage is computed for the entire object, including snapshot space, and is equivalent to the "logical-used" field in the output of the "volume show-space" command.

vol.max events

vol.max.size.increased

Severity

INFORMATIONAL

Description

This message occurs as a reminder that the maximum volume size limit is increased from the default value defined in the Platform Specific Module (PSM) table.

Corrective Action

(None).

Syslog Message

Maximum volume size limit is increased from %ld TB to %ld TB.

Parameters

old_limit (LONGINT): Original volume size limit as defined in the PSM table.
new_limit (LONGINT): New maximum volume size limit.

vol.mount events

vol.mount.readOnly

Severity

INFORMATIONAL

Description

This message occurs when a volume or aggregate is mounted as read-only.

Corrective Action

(None).

Syslog Message

Mounting vol/aggr '%s' readonly due to 'online -ro' command.

Parameters

name (STRING): Name of the volume or aggregate.

vol.phy events

vol.phy.overalloc.inc.sav

Severity

EMERGENCY

Description

This message occurs when the volume is running dangerously low on free blocks to write to. Free blocks are estimated based on the space saved by the storage efficiency features as well as with physically used blocks.

Corrective Action

Create space by increasing the volume size, deleting data, or deleting snapshots. To increase volume size, use the "volume size" command. To delete snapshots, use the "volume snapshot delete" command.

Syslog Message

%s %s%s%s (UUID %s) is physically overallocated using %s%% space, which considers space saved by storage efficiency features as well as physically used blocks.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies. This event should be applicable only to volumes with logical space enforcement turned on.
name (STRING): Name of this object.
app (STRING): Application Universally Unique ID (UUID).
vserver_uuid (STRING): UUID of the object's or volume's Vserver.
object_uuid (STRING): UUID of the object or volume.
percent_full (STRING): Used capacity of the physical space of the object, along with space saved by the storage efficiency features, as a percentage. This value can be greater than 100 due to efficiency features and space reserved for metadata. The percentage is computed for the entire object, including snapshot space.

vol.phys events

vol.phys.overalloc

Severity

EMERGENCY

Description

This message occurs when the volume or aggregate is running dangerously low on free blocks to write to.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume or aggregate sizes, or by deleting data or deleting Snapshot copies. To increase a volume's size, use the "volume size" command. To delete a volume's Snapshot copies, use the "volume snapshot delete" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate Snapshot copies are deleted automatically when the aggregate is full. For ASA r2 platforms, create space in the volume or aggregate. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

%s %s%s%s is physically overallocated, using %s%% logical space and %s%% physical space.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
name (STRING): Name of this object.
app (STRING): Application universal unique identifier(UUID).

vserver_uuid (STRING): UUID of the object's storage virtual machine (SVM), if the object is a volume. Otherwise, this string is empty.

percent_logically_full (STRING): Used capacity of the logical space of the object, as a percent. This value can be greater than 100 due to space reserved for metadata. The percentage is computed for the entire object, including Snapshot copy space, and is equivalent to the "Total Used" field in the output of the "volume show-space" or "aggregate show-space" commands.

percent_physically_full (STRING): Used capacity of the physical space of the object, as a percent. This value can be greater than 100 due to space reserved for metadata. The percentage is computed for the entire object, including Snapshot copy space, and is equivalent to the "Total Physical Used" field in the output of the "volume show-space" or "aggregate show-space" commands.

vol.registryget events

vol.registryGet.no512520BPS

Severity

NOTICE

Description

This message occurs when a registry request finds no 512 or 520 BPS (bytes per sector) disks.

Corrective Action

(None).

Syslog Message

No disk has 512 or 520 BPS.

Parameters

(None).

vol.registryGet.nonDefBPS

Severity

NOTICE

Description

This message occurs when a registry request finds disks whose BPS (bytes per sector) is other than the default 512 or 520.

Corrective Action

(None).

Syslog Message

Disk had %d BPS; system expected 512 or 520 BPS.

Parameters

cad_bps (INT): Disk configuration attribute of bytes per sector.

vol.registryGet.noZoneCksum

Severity

NOTICE

Description

This message occurs when a registry request for zoned or block checksum volumes finds no such volumes.

Corrective Action

(None).

Syslog Message

No volume has zoned or block checksums.

Parameters

(None).

vol.reserve events

vol.reserve.grew

Severity

ERROR

Description

This message occurs when WAFL® grows the reserve of a flexible volume that is running dangerously low on blocks for writing.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume size, deleting data, or changing the provisioning from thick to thin. To increase a volume's size, use the "volume size" command. To change provisioning in a volume reserved files can be unreserved by using the "volume file reservation" command. For ASA r2 platforms, create space by deleting data or by deleting Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

WAFL grew reserve of volume %s%s%s because the volume was running low on blocks.

Parameters

name (STRING): Name of the volume.
app (STRING): Application universal unique identifier(UUID).
vserver_uuid (STRING): Name of the associated storage virtual machine (SVM)'s UUID.

volaggr events

volaggr.offline events

volaggr.offline

Severity

ALERT

Description

Some aggregates are forced offline. volume creation could cause duplicate FSIDs.

Corrective Action

Bring all offline aggregates online.

Syslog Message

Some aggregates are offline. Volume creation could cause duplicate FSIDs.

Parameters

(None).

volcmd events

volcmd.snapmirror events

volcmd.snapmirror.removed

Severity

ERROR

Description

This mesage occurs to advise you that the 'vol snapmirror' set of commands has been removed.

Corrective Action

Use the 'snapmirror' command instead.

Syslog Message

The 'vol snapmirror' set of commands has been removed; use the 'snapmirror' command instead.

Parameters

(None).

volcopy events

volcopy.dst events

volcopy.dst.autoRestrictMsg

Severity

NOTICE

Description

This event is issued when a vol copy start is issued on a volume which is offline.

Corrective Action

Vol copy start is issued on a restricted volume, use "vol restrict" to restrict the destination volume.

Syslog Message

Vol copy automatically restricting destination volume %s (currently offline).

Parameters

dst (STRING): The vol copy destination volume

volcopy.dst.metadataOnly

Severity

NOTICE

Description

This event is issued when a vol copy start operation is issued on a volume which is reverting its checksum state.

Corrective Action

(None).

Syslog Message

Metadata only vol copy from %s to %s.

Parameters

src (STRING): The vol copy source volume
dst (STRING): The vol copy destination volume

volcopy.dst.noMemory

Severity

ERROR

Description

This event is issued when there is insufficient memory on the vol copy destination for the transfer to continue.

Corrective Action

(None).

Syslog Message

System is low on memory, aborting vol copy destination transfer.

Parameters

(None).

volcopy.dst.revert

Severity

ERROR

Description

This event is issued when a vol copy start operation has to revert the checksum state of the destination volume because the source and destination volumes have differing checksum states.

Corrective Action

No corrective action required.

Syslog Message

A vol copy transfer to destination volume %s has found that the source and destination volumes have differing checksum states. Data ONTAP is aborting the transfer and reverting the checksum state for the destination volume. After ONTAP displays a message showing the revert is complete, you will need to retry the operation. You can use the "vol status -c" command to see the progress of the reversion.

Parameters

dst (STRING): The vol copy destination volume

volcopy.dst.reverting

Severity

ERROR

Description

This event is issued when a vol copy start operation is issued on a volume which is reverting its checksum state.

Corrective Action

(None).

Syslog Message

Aborting vol copy transfer to volume %s because it is reverting its checksum state.

Parameters

dst (STRING): The vol copy destination volume

volcopy.flextotraderr events

volcopy.flexToTradErr

Severity

ERROR

Description

This message occurs when the user tries to copy a flexible volume into a traditional volume using the command 'vol copy'.

Corrective Action

Retry the operation with a flexible volume as the destination.

Syslog Message

vol copy: A flexible volume cannot be copied into a traditional volume.

Parameters

(None).

volcopy.src events

volcopy.src.noMemory

Severity

ERROR

Description

This event is issued when there is insufficient memory on the vol copy source for the transfer to continue.

Corrective Action

(None).

Syslog Message

System is low on memory, aborting vol copy source.

Parameters

(None).

volcopy.src.revertPending

Severity

NOTICE

Description

This message indicates the source is being reverted by WAFL and cannot currently be used for a 'vol copy' operation.

Corrective Action

This message indicates the source is being reverted. After the revert completes the operation should be retried.

Syslog Message

vol copy: The source is being reverted by WAFL

Parameters

(None).

volcopy.src.snapshotErr

Severity

ERROR

Description

This event is issued when we are not able to obtain all the snapshot information, from the vol copy source volume, required for a vol copy transfer.

Corrective Action

(None).

Syslog Message

Vol copy not able to obtain snapshot information from source volume %s

Parameters

src (STRING): The vol copy source volume

volcopy.tradtoflexerr events

volcopy.tradToFlexErr

Severity

ERROR

Description

This message occurs when the user tries to copy a traditional volume into a flexible volume using the command 'vol copy'.

Corrective Action

Retry the operation with a traditional volume as the destination.

Syslog Message

vol copy: A traditional volume cannot be copied into a flexible volume.

Parameters

(None).

volcreate events

volcreate.fsid events

volcreate.fsid.dup

Severity

ERROR

Description

Flexible volumes were created with file system identifiers (FSIDs) which conflict with existing volumes. This can happen when aggregates are forced offline.

Corrective Action

1. run 'aggr online' on all offlined aggregates. some of the old vvols will be forced offline due to the FSID conflict. 2. run 'vol restrict' and 'vol rewrite_fsid' on the new vvol 3. run 'vol online' on each flexible volume that was forced offline in step 1 above.

Syslog Message

Volume %s's fsid 0x%x conflicts with a volume owned by vfiler %s.

Parameters

volName (STRING): Name of the volume created
FSID (INT): FSID of the volume
vfiler_name (STRING): The vfiler which owns the existing offlined volume with the same FSID.

volcreate.name events

volcreate.name.dup

Severity

ERROR

Description

Flexible volumes were created with names which conflict with existing volume names. This can happen when aggregates are forced offline.

Corrective Action

if this is not the root volume of the vfiler: 1. run 'vfiler remove' on the vfiler and the new vvol 2. run 'vol rename' on the new vvol 3. resolve FSID conflicts if any 4. add the old vvol back to the vfiler if this is the root of volume of the vfiler: 1. run 'vfiler destroy' on the vfiler 2. run 'vol rename' on the new vvol 3. resolve FSID conflicts if any 4. run 'vfiler create -r' on the vfiler

Syslog Message

Volume '%s' has a name which conflicts with a volume owned by vfiler '%s'.

Parameters

volName (STRING): Volume being created
vfiler_name (STRING): This vfiler owns an existing volume with the same name.

volmigrate events

volmigrate.error events

volmigrate.error

Severity

INFORMATIONAL

Description

Description of the reason a volume migrate failed or was not attempted.

Corrective Action

(None).

Syslog Message

(None).

Parameters

volName (STRING): Volume being migrated
recipientFiler (STRING): Name of the filer to which the volume was being migrated
error (STRING): The specific error string that details why migrate failed.

volmigrate.migrating events

volmigrate.migrating

Severity

INFORMATIONAL

Description

A volume is being migrated from the filer by means of a SAN ownership change.

Corrective Action

(None).

Syslog Message

Migrating volume %s to %s (ID %s).

Parameters

volName (STRING): Volume being migrated
recipientFiler (STRING): Name of the filer to which the volume is being migrated
recipientSysID (STRING): System ID of the filer to which the volume is being migrated

volmigrate.result events

volmigrate.result

Severity

INFORMATIONAL

Description

Description of the result of a volume migration.

Corrective Action

(None).

Syslog Message

Migration of volume %s to %s %s.

Parameters

volName (STRING): Volume being migrated
recipientFiler (STRING): Name of the filer to which the volume is being migrated
result (STRING): A string describing the result of the migration: either 'was successful' or 'failed'.

volume events

volume.check events

Volume.Check.Completed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

NOTICE

Description

This message occurs when a 'volume check' scan successfully runs to completion.

Corrective Action

(None).

Syslog Message

The 'volume check' scan was completed for volume [%s] on Vserver [%s].

Parameters

volume (STRING): Name of the constituent volume.
vserver (STRING): Vserver hosting the volume.

Volume.Check.Failed

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

ERROR

Description

This message occurs when a 'volume check' scan fails to run to completion.

Corrective Action

Correct the reported error and reissue the 'volume check' command. If error persists, contact NetApp technical support.

Syslog Message

The 'volume check' scan failed for volume [%s] on Vserver [%s] with error [%s].

Parameters

volume (STRING): Name of the constituent volume.
vserver (STRING): Vserver hosting the volume.
error (STRING): Error string.

Volume.Check.Report

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when volume check completes the scan. The report contains information about the following inconsistencies detected and the corrective action taken: 1) Corruption/loss of redirector content. 2) Valid redirector content file, but data file being pointed to did not exist in the Data Constituents. 3) Create Dongle files. 4) NLINKS inconsistency. 5) ACL mismatch. 6) Corrupt data file name. 7) Data file does not have a corresponding redirector file. 8) Corruption/loss of stream redirector content. 9) Valid redirector stream content, but stream data being pointed to did not exist in the Data Constituents. 10) Corrupt stream data file name. 11) Stream data does not have a corresponding redirector stream.

Corrective Action

(None).

Syslog Message

Volume Check Report for Constituent Volume [%s] in Vserver [%s] - Inconsistency - (Issues Found/Issues Fixed); Corrupt Redirector - (%d/%d); Dangling Redirector - (%d/%d); Temporary Files - (%d/%d); NLinks - (%d/%d); ACL mistatch - (%d/%d); Dangling Data File - (%d/%d); Corrupt Data File - (%d/%d); Corrupt Stream Redirector - (%d/%d); Dangling Stream Redirector - (%d/%d); Dangling Stream Data - (%d/%d); Corrupt Stream Data - (%d/%d);

Parameters

volume (STRING): Constituent volume.
vserver (STRING): Vserver hosting the volume.
numOfCorruptRedirectorsFound (INT): Number of corrupt or lost redirectors found.
numOfCorruptRedirectorsFixed (INT): Number of corrupt or lost redirectors fixed.
numOfDanglingRedirectorsFound (INT): Number of dangling redirectors found.
numOfDanglingRedirectorsFixed (INT): Number of dangling redirectors fixed.
numOfTempFilesFound (INT): Number of hidden temporary files remaining after failed creates.
numOfTempFilesRemoved (INT): Number of hidden temporary files removed.
numOfNlinkMisMatchesFound (INT): Number of NLINKS mismatches found.
numOfNlinkMisMatchesFixed (INT): Number of NLINKS mismatches fixed.
numOfACLMisMatchesFound (INT): Number of ACL mismatches found.
numOfACLMisMatchesFixed (INT): Number of ACL mismatches fixed.
numOfDanglingDataFilesFound (INT): Number of dangling data files found.
numOfDanglingDataFilesFixed (INT): Number of dangling data files fixed.
numOfCorruptDataFilesFound (INT): Number of corrupt or lost data files found.
numOfCorruptDataFilesFixed (INT): Number of corrupt or lost data files fixed.
numOfCorruptStreamRedirectorsFound (INT): Number of corrupt stream redirectors found.
numOfCorruptStreamRedirectorsFixed (INT): Number of corrupt stream redirectors fixed.
numOfDanglingStreamRedirectorsFound (INT): Number of dangling stream redirectors found.
numOfDanglingStreamRedirectorsFixed (INT): Number of dangling stream redirectors fixed.
numOfDanglingStreamDataFound (INT): Number of dangling stream data instances found.
numOfDanglingStreamDataFixed (INT): Number of dangling stream data instances fixed.
numOfCorruptStreamDataFound (INT): Number of corrupt stream data instances found.
numOfCorruptStreamDataFixed (INT): Number of corrupt stream data instances fixed.

Volume.Check.Start.Job.Started

Deprecated

Deprecated as of Data ONTAP 9.6 because Infinite Volumes no longer exist.

Severity

INFORMATIONAL

Description

This message occurs when the 'volume check start' command starts the job, but fails to update the RDB(replicated database) table and the corresponding job is still running.

Corrective Action

Use the 'job stop' command to abort the reported job before starting another check.

Syslog Message

A 'volume check' command started job [ID: %s] for volume [%s] in Vserver [%s].

Parameters

jobid (STRING): Job ID of the scan.
volume (STRING): Name of the constituent volume for which the job was started.
vserver (STRING): Vserver hosting the volume.

volume.transition events

volume.transition.plugin.slow

Severity

INFORMATIONAL

Description

This message occurs when a volume transition plug-in is taking longer than expected.

Corrective Action

(None).

Syslog Message

Volume transition on volume %s, plug-in %s running %d ms (expected %d ms).

Parameters

voluuid (STRING): Unique identifier for this volume.
plugin (STRING): Name of the slow plug-in.
used (INT): Runtime for the plug-in, in milliseconds.
expected (INT): Expected runtime for the plug-in, in milliseconds.

vpeer events

vpeer.name events

vpeer.name.conflict

Severity

NOTICE

Description

This message occurs when system generated a new name for a Vserver because of a naming conflict with another Vserver in the local cluster.

Corrective Action

(None).

Syslog Message

Peer Vserver name conflict in local cluster with existing local or peer Vserver %s. Name conflict solved using system generated name %s.

Parameters

peer_vserver (STRING): Vserver name in conflict.
unique_peer_vserver (STRING): Replacement Vserver name generated by the system to resolve the name conflict.

vpeer.request events

vpeer.request.diff.ipspace

Severity

NOTICE

Description

This message occurs when the Vserver peer request is received and Vserver peer permission exists for the Vserver and peer-cluster, but the Vserver belongs to an ipspace that is different from the cluster peer relationship ipspace. The Vserver peer request will remain in the pending state unless explicitly accepted.

Corrective Action

Use the "vserver peer accept" command in the destination cluster to explicitly accept the Vserver peer request, and use the "vserver peer show" command to verify that the Vserver peer goes to peered state.

Syslog Message

"Vserver peer request for the peer-Vserver '%s' and the peer-cluster '%s' needs to be explicitly accepted, because the local Vserver '%s' ipspace: '%s' is different from the cluster peer relationship ipspace: '%s'."

Parameters

peer_vserver (STRING): Peer Vserver name.
peer_cluster (STRING): Peer cluster name.
local_vserver (STRING): Local Vserver name.
vserver_ipspace (STRING): Ipspace of the local Vserver.

cluster_peer_ipspace (STRING): Ipspace of the cluster peer relationship.

vs events

vs.migrate events

vs.migrate.cleanup.completed

Severity

NOTICE

Description

This message occurs when the source Vserver cleanup operation has completed.

Corrective Action

(None).

Syslog Message

Migrate source Vserver cleanup completed for Vserver: %s.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.complete

Severity

NOTICE

Description

This message occurs when migrate operation completed.

Corrective Action

(None).

Syslog Message

Migrate of Vserver:%s has completed.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.cutover.commit.started

Severity

NOTICE

Description

This message occurs when migrate cutover commit started successfully.

Corrective Action

(None).

Syslog Message

Migrate cutover has started for Vserver:%s.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.cutover.completed

Severity

NOTICE

Description

This message occurs when migrate cutover operation completed.

Corrective Action

(None).

Syslog Message

Migrate cutover has completed for Vserver:%s.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.cutover.precommit.started

Severity

NOTICE

Description

This message occurs when the migrate operation has started the precommit for cutover.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.cutover.triggered

Severity

NOTICE

Description

This message occurs when cutover is triggered on a Vserver that is migrating.

Corrective Action

(None).

Syslog Message

Cutover was triggered on a migrating Vserver:%s.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.dst.ponr.updated

Severity

NOTICE

Description

This message occurs when the vserver migrate cutover workflow has reached and updated the point of no return (PONR) on the destination cluster.

Corrective Action

(None).

Syslog Message

Point of no return on destination Vserver %s has been updated successfully.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.failed

Severity

ERROR

Description

This message occurs when the Vserver migrate operation fails.This can occur before/during cutover or during post cutover activity. If failure is before/during cutover then source Vserver is in still operational and if migrate fails during post cutover activity then destination vserver is up. Once migrate issues are fixed, migrate can be resumed back to its origional state.

Corrective Action

Run the "vserver migrate show -fields status-details" to view the error and follow the corrective action recommended.

Syslog Message

Migration of Vserver "%s" Failed.

Parameters

> **vserver_name** (STRING): Vserver name.
> **err_status** (STRING): Reason for the migrate operation failure and the corrective action to fix the problem.
> **migration_uuid** (STRING): Migration UUID.

vs.migrate.pause.complete

Severity

> NOTICE

Description

> This message occurs when the migrate operation for a Vserver is paused.

Corrective Action

> (None).

Syslog Message

> Migrate of Vserver:%s was paused.

Parameters

> **vserver_name** (STRING): Name of the Vserver.
> **migration_uuid** (STRING): Migration UUID.

vs.migrate.precheck.completed

Severity

> NOTICE

Description

> This message occurs when the migrate operation has completed the prechecks.

Corrective Action

> (None).

Syslog Message

> (None).

Parameters

> **vserver_name** (STRING): Name of the Vserver.
> **sourceCluster** (STRING): Name of the source cluster.
> **destinationCluster** (STRING): Name of the destination cluster.

vs.migrate.precheck.failed

Severity

> ERROR

Description

> This message occurs when the migrate operation has failed the prechecks.

Corrective Action

Run the "vserver migrate show" command to view the description of the error and the corrective action.

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
err_status (STRING): Reason for the precheck operation failure and the corrective action to fix the problem.
sourceCluster (STRING): Name of the source cluster.
destinationCluster (STRING): Name of the destination cluster.

vs.migrate.precheck.started

Severity

NOTICE

Description

This message occurs when the migrate operation has started the prechecks.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
sourceCluster (STRING): Name of the source cluster.
destinationCluster (STRING): Name of the destination cluster.

vs.migrate.readyforcutover

Severity

NOTICE

Description

This message occurs when the migrate operation has reached the ready-for-cutover state.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.resume

Severity

NOTICE

Description

This message occurs when the migrate operation for a Vserver is resumed after an abort or a failure.

Corrective Action

(None).

Syslog Message

Migrate of Vserver:%s was resumed.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.rolledback

Severity

NOTICE

Description

This message occurs when Vserver migrate operation moves back from ready-to-cutover to transferring state after cutover was triggerred. This can be due to high transfer duration or due to some failure that might have occured when cutover was triggered on destination cluster.

Corrective Action

(None).

Syslog Message

Migrate state for Vserver %s was rolled back to transferring. Run "vserver migrate show -fields status-details" to see the reason for rollback. If the rollback is due to high transfer duration, reduce the I/O operations at the migrate source cluster to a lower rate.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.abort.completed

Severity

NOTICE

Description

This message occurs when the Vserver migrate abort operation on the source cluster has completed.

Corrective Action

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.abort.failed

Severity

ERROR

Description

This message occurs when the Vserver abort operation on the source cluster has failed.

Corrective Action

Run the "vserver migrate show -fields status-details" command to view the description of the error and the corrective action.

Syslog Message

Vserver migrate abort operation failed for Vserver: %s. Error: %s

Parameters

vserver_name (STRING): Name of the Vserver.
err_status (STRING): Reason for the abort operation failure and the corrective action to fix the problem.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.cleanup.failed

Severity

ERROR

Description

This message occurs when the source Vserver cleanup operation fails.

Corrective Action

Run the "vserver migrate show -fields status-details" command to view the description of the error and the corrective action.

Syslog Message

Migrate source Vserver cleanup failed for Vserver: %s.

Parameters

vserver_name (STRING): Name of the Vserver.
err_status (STRING): Reason for the source cleanup operation failure and the corrective action to fix the problem.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.cleanup.started

Severity

NOTICE

Description

This message occurs when the source Vserver cleanup operation starts. This operation starts only after the Vserver user data and configuration metadata have been replicated to the destination cluster, and the destination Vserver is serving data. This cleanup operation eventually deletes the source Vserver.

Corrective Action

(None).

Syslog Message

Migrate source Vserver cleanup started for Vserver: %s.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.ponr.failed

Severity

ERROR

Description

This message occurs when the vserver migrate cutover workflow has failed to reach and update the point of no return (PONR).

Corrective Action

Run "vserver migrate show -instance" at the source cluster. If the point of no return is set to true, run "vserver migrate restart" command at the migrate destination cluster to start the destination Vserver. If the point of no return is set to false and the source Vserver is in a stopped state, run "Vserver start" at the source cluster to start the Vserver.

Syslog Message

Failed to update point of no return for Vserver %s.

Parameters

vserver_name (STRING): Vserver Name.
err_status (STRING): Reason for the ponr operation failure and the corrective action to fix the problem.
migration_uuid (STRING): Migration UUID.

vs.migrate.src.ponr.updated

Severity

NOTICE

Description

This message occurs when the vserver migrate cutover workflow has reached and updated the point of no return (PONR) on the source cluster.

Corrective Action

(None).

Syslog Message

Point of no return on source Vserver %s has been updated successfully.

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.start

Severity

NOTICE

Description

This message occurs when the migrate operation for Vserver from source cluster to destination cluster starts.

Corrective Action

(None).

Syslog Message

Migrate of Vserver:%s started from source cluster:%s to destination cluster:%s.

Parameters

vserver_name (STRING): Name of the Vserver.
sourceCluster (STRING): Name of the source cluster.
destinationCluster (STRING): Name of the destination cluster.
migration_uuid (STRING): Migration UUID.

vs.migrate.sync.reached

Severity

NOTICE

Description

This message occurs when the migrate operation has reached sync.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.transferring.completed

Severity

NOTICE

Description

This message occurs when the migrate operation has completed the transferring operation.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.migrate.transferring.started

Severity

NOTICE

Description

This message occurs when the migrate operation has started transferring successfully.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vserver_name (STRING): Name of the Vserver.
migration_uuid (STRING): Migration UUID.

vs.multiple events

vs.multiple.adtjobs

Severity

ERROR

Description

This message occurs when more than one Vserver audit consolidation jobs is found.

Corrective Action

Check Vserver audit configuration. If enabled, disable it using the following commands: cluster::> vserver audit show cluster::> vserver audit disable -vserver Check for Vserver audit consolidation jobs. If still present, delete the jobs using the following commands: cluster::> job show cluster::> job expunge -id Check for consolidation processes. If any still exist, kill the processes using the following commands from

systemshell: > ps -auxw | grep adtcons > sudo kill -9 "pid of the process" Enable the Vserver audit configuration by using the following command: cluster::> vserver audit enable

Syslog Message

More than one Vserver audit consolidation jobs found for Vserver %s.

Parameters

vserver (STRING): Name of the Vserver that has more than one consolidation job.

vsa events

vsa.azure events

vsa.azure.nlb.probeActive

Severity

NOTICE

Description

This message occurs when ONTAP® Cloud on Microsoft® Azure® receives a probe, indicating that a transition to the expected normal state has occurred. The port has gone to active state.

Corrective Action

(None).

Syslog Message

Received Load Balancer probe (%s) for %d ports (port range: %d to %d).

Parameters

detail (STRING): Azure Load Balancer probes were received on the ONTAP Network Load Balancer listener port.
activated_ports (INT): Number of ports that received the probe.
first_activated_port (INT): First (lowest) port that received a probe.
last_activated_port (INT): Last (highest) port that received a probe.

vsa.azure.nlb.probeInactive

Severity

ALERT

Description

This message occurs when ONTAP® Cloud on Microsoft® Azure® does not receive expected health probes from the Network Load Balancer service within the expected time limit. This might cause Azure to fail over traffic from the corresponding address. If Azure Load Balancer does not have an active address, all traffic might be blocked from reaching the configured address.

Corrective Action

Verify the configuration of the Azure Load Balancer and the ONTAP Network Load Balancer, as well as the status of the node management LIF. To show the state of the ONTAP Network Load Balancer, use the (privilege: diagnostic) "virtual-machine show-network-load-balancer" command. To show the inactive probes of the ONTAP Network Load Balancer, use the (privilege: diagnostic) "virtual-machine show-network-load-balancer -active false" command. In the above command check if the "Last Probe Time" is being regularly updated(approximately every 5 seconds) and the Cloud Load Balancer probe port matches the "Probe Port".

Syslog Message

Failed to receive Load Balancer probe (%s) for %d ports (port range: %d to %d), within %d seconds.

Parameters

detail (STRING): Azure Load Balancer Probes were not received in the expected timeframe on the ONTAP Network Load Balancer listener port.
missed_ports (INT): Number of ports that did not receive a probe.
first_missed_port (INT): First (lowest) port that did not receive a probe.
last_missed_port (INT): Last (highest) port that did not receive a probe.
timeout_in_seconds (LONGINT): Seconds before timeout occurs.

vsa.cloud events

vsa.cloud.aws.api.rtUpdt

Severity

NOTICE

Description

This message occurs when cluster LIF route update succeeds upon node switchover.

Corrective Action

(None).

Syslog Message

Command "%s" is successfully executed.

Parameters

action (STRING): Amazon Web Services (AWS) API command for route table updates or description.

vsa.cloud.aws.api.rtUpdtFail

Severity

ERROR

Description

This message occurs when cluster LIF route update fails upon node switchover.

Corrective Action

Verify that node has connectivity to Amazon Web Service(AWS) Elastic Cloud Computing(EC2) endpoint; check proxy and security group settings. Verify that node has permissions to access AWS EC2 endpoint, check Identity and Access Management (IAM) roles. Verify that any resource is properly specified; check any resource exists and is allowed to be used for specified purpose. Verify that resources have not reached capacity limits.

Syslog Message

Action: "%s" has failed. HTTP_Response: "%s"

Parameters

action (STRING): Amazon Web Services (AWS) API command for route table updates or description.
error (STRING): HTTP error response.

vsa.cloud.diskReadsThrottled

Severity

NOTICE

Description

This message occurs when Cloud Volumes ONTAP® detects disk I/O (Reads) throttling on its attached disks. Disk I/O throttling might be initiated by the underlying host or cloud provider when it detects that disk I/Os have reached a certain threshold level mandated per virtual machine instance.

Corrective Action

(None).

Syslog Message

Number of disks detected with read I/O throttling: %s. Interval: (%s) to (%s).

Parameters

start_interval (STRING): Start time of the interval during which disk I/Os were throttled.
end_interval (STRING): End time of the interval during which disk I/Os were throttled.
disk_list (STRING): List of disk device names that were detected with throttled disk I/Os (reads).

vsa.cloud.diskWritesThrottled

Severity

NOTICE

Description

This message occurs when Cloud Volumes ONTAP® detects disk I/O (writes) throttling on its attached disks. Disk I/O throttling might be initiated by the underlying host or cloud provider when it detects that disk I/Os have reached a certain threshold level mandated per virtual machine instance.

Corrective Action

(None).

Syslog Message

Number of disks detected with write I/O throttling: %s. Interval: (%s) to (%s).

Parameters

disk_list (STRING): List of disk device names that detected with throttled disk I/Os (writes).
start_interval (STRING): Start time of the interval during which disk I/Os were throttled.
end_interval (STRING): End time of the interval during which disk I/Os were throttled.

vsa.cloud.nlb.probeActive

Severity

NOTICE

Description

This message occurs when Cloud Volumes ONTAP® receives a probe from a Cloud Network Load Balancer, indicating that a transition to the expected normal state has occurred. The port has gone to active state.

Corrective Action

(None).

Syslog Message

Received Cloud Load Balancer probe (now active) for %d ports (port range: %d to %d).

Parameters

activated_ports (INT): Number of ports that received the probe.
first_activated_port (INT): First (lowest) port that received a probe.
last_activated_port (INT): Last (highest) port that received a probe.

vsa.cloud.nlb.probeInactive

Severity

ALERT

Description

This message occurs when Cloud Volumes ONTAP® does not receive expected health probes from the Cloud Network Load Balancer service within the expected time limit. This might cause the Cloud Network Load Balancer to fail over traffic from the corresponding address. If the Cloud Network Load Balancer does not have an active address, all traffic might be blocked from reaching the configured address.

Corrective Action

Verify the configuration of the Cloud Network Load Balancer, using the cloud provider's console. Verify the ONTAP status of the Cloud Network Load Balancer, as well as the configuration and status of the LIF. To show the ONTAP status for all Cloud Network Load Balancer probe ports, use the (privilege: diagnostic) "virtual-machine show-network-load-balancer" command. To show the ONTAP status for just the inactive Cloud Network Load Balancer probe ports, use the (privilege: diagnostic) "virtual-machine show-network-load-balancer -active false" command. In the above command check if the "Last Probe Time" is being regularly updated(approximately every 5 seconds) and the Cloud Load Balancer probe port matches the "Probe Port".

Syslog Message

Failed to receive Cloud Load Balancer probe (now inactive) for %d ports (port range: %d to %d), within %d seconds.

Parameters

missed_ports (INT): Number of ports that did not receive a probe.
first_missed_port (INT): First (lowest) port that did not receive a probe.
last_missed_port (INT): Last (highest) port that did not receive a probe.
timeout_in_seconds (LONGINT): Seconds before timeout occurs.

vsa.cloud.nlb.probeListening

Severity

NOTICE

Description

This message occurs when a Cloud Volumes ONTAP® probe port starts or stops listening for probes from a Cloud Network Load Balancer. The most common scenarios are when node boots up or shuts down.

Corrective Action

(None).

Syslog Message

ONTAP Load Balancer has %s listening for probes from a Cloud Network load Balancer on port %d.

Parameters

detail (STRING): Whether the Cloud Volumes ONTAP probe port has started or stopped listening for probes from the Cloud Load Balancer.
probe_port (INT): Port that the listening event occurred on.

vsa.device events

vsa.device.bad.config

Severity

ALERT

Description

This message occurs when the system detects that the kernel environment variables (kenvs) that are used to configure the core dump and NVRAM devices are missing or inconsistent. If the system is rebooted with a bad configuration, this may result in a failure to boot or incorrect operation of NVRAM or core dump.

Corrective Action

Correct the configuration as directed. Use the "kenv" systemshell command to set and verify the environment variables. Then reboot the system. If the node is not booting or is in a boot loop, use the Loader commands to set and verify the kernel environment variables before rebooting.

Syslog Message

Core dump or NVRAM device configuration problem: %s.

Parameters

detail (STRING): Detail about the misconfiguration and suggestions for correcting the problem.

vsa.diskobjectstore events

vsa.diskObjectStore.cfg.sync

Severity

ALERT

Description

This message occurs when the system detects that a disk object store configuration is not synchronized between both nodes in a shared-storage High-Availability (HA) pair.

Corrective Action

Use the "system node virtual-machine disk-object-store" commands to synchronize the object store configuration.

Syslog Message

Object store configuration %s synchronization issue. Object store "%s" on node "%s" is not synchronized. Details: %s.

Parameters

detail (STRING): The disk object store configuration for shared disks must be identical on both nodes in an HA pair. The system attempts to keep them synchronized when the object store configuration is created, deleted, or modified. However, under unusual circumstances, the synchronization may be unsuccessful. Manual intervention is required to synchronize the configuration.
object_store_name (STRING): Object store name.
partner (STRING): Partner node name.
synchronization_details (STRING): Synchronization state details. For example, the configuration that is missing on the partner, or a list of fields that do not have the same value.

vsa.ephemeral events

vsa.ephemeral.vnvram.reset

Severity

NOTICE

Description

This message occurs when a node is configured to use ephemeral vNVRAM and the virtual machine has been re-hosted, using new ephemeral disk for vNVRAM.

Corrective Action

(None).

Syslog Message

Ephemeral vNVRAM disk for node has changed, due to re-hosting of VM. New serial number: "%s".

Parameters

ephemeral_vnvram_serial_number (STRING): Value of the serial number of the updated ephemeral disk used for vNVRAM.

vsa.instancemetadata events

vsa.instanceMetadata.change

Severity

ALERT

Description

This message occurs when the system detects that a field in the virtual machine's instance metadata settings has changed. The virtual machine instance metadata holds configuration settings for the instance. Some virtual machine settings can be changed after deployment, and can be changed using cloud provider tools. These settings include some that can affect the performance or stability of the instance. One example is the instance type. If the instance type is changed to an unsupported value, this might result in hard-to-diagnose stability issues if that instance type does not have enough memory or CPU cores. This message is generated only for changes that might impact the performance or reliability of the instance.

Corrective Action

If the field is changed to an unsupported value, manual reconfiguration will be required.

Syslog Message

Virtual machine instance metadata setting %s. Field: %s. Previous value: "%s". New value: "%s".

Parameters

detail (STRING): Detail about how the change affects the instance.
field_name (STRING): Instance metadata field name.
previous_value (STRING): Previous value of field.
current_value (STRING): Current value of field.

vsa.mlx events

vsa.mlx.nic.detach

Deprecated

This event is replaced with vsa.sriov.nic.detach to rename the event and be generic.

Severity

NOTICE

Description

This message occurs when ONTAP® software is running as an instance in Azure and a NIC SR-IOV Mellanox (MLX) driver detach event is detected. ONTAP will continue to use the Hyper-V netsvc driver without the SR-IOV functionality for a short time. On HA configurations, unsynchronized logs might appear during this time, which will be resolved if a subsequent SR-IOV attach event occurs. If the SR-IOV attach event does not occur quickly, high-availability (HA) takeover might occur.

Corrective Action

(None).

Syslog Message

NIC SR-IOV driver detach event detected. On HA configurations, unsynchronized logs might result or an HA takeover might occur if SR-IOV remains detached.

Parameters

(None).

vsa.nodesernum events

vsa.nodeSerNum.change.failed

Severity

ALERT

Description

This message occurs when a node serial number change operation fails. The serial number might need to be reverted to the previous value, and the node might need to be rebooted.

Corrective Action

Check the node serial number and state of the node licensing. The serial number might need to be reverted to the previous value. If the reversion does not work, or if there are licensing issues reported by the system, reboot the node. After the node is online, check the serial number and licensing for any issues.

Syslog Message

Node serial number change operation failed. Error detail: %s. Previous value: "%s". New value: "%s".

Parameters

error_detail (STRING): Error details, if available.
previous_value (STRING): Previous value of the serial number.
new_value (STRING): New value of the serial number.

vsa.nodeSerNum.changed

Severity

INFORMATIONAL

Description

This message occurs when a node serial number change operation is completed successfully.

Corrective Action

(None).

Syslog Message

Node serial number change operation was completed successfully. Previous value: "%s". New value: "%s".

Parameters

previous_value (STRING): Previous value of the serial number.
new_value (STRING): New value of the serial number.

vsa.savecore events

vsa.savecore.nospace

Severity

ERROR

Description

This message occurs when the savecore tool determines that the space available is not sufficient for storing the core image from a dump device to a readable core file in the /etc/crash directory.

Corrective Action

Try performing the following steps to make sufficient room in root volume: Delete old or unneeded core files by using the "coredump delete" command. Delete old or unneeded core file segments by using the "coredump segment delete" command. Delete any Snapshot® copies that include the deleted files. Adjust minimum free space on the root file system by using "coredump config modify" command. Once there is sufficient room, take the following steps to save the cores: To save all core files using "coredump save-all" command, run the "coredump status -instance" command and ensure that "Space Available On Internal Filesystem" is greater than "Space Needed to Save All Unsaved Cores" plus "Minimum Free Bytes on Root Filesystem". To save a specific core file, run the "coredump save" command, when available space of

"Space Needed To Save Core" (from the "coredump show" command) plus "Minimum Free Bytes on Root Filesystem" is sufficient.

Syslog Message

Available space (%llu %dKB blocks) is not enough to save the core image (requires up to %llu blocks) and maintain the minimum free space of %llu blocks.

Parameters

avail (LONGINT): Number of blocks available for saving the core image.
blocksize (INT): Block size in kilobytes.
needed (LONGINT): Number of blocks needed for saving the core image.
minfree (LONGINT): Number of blocks reserved for normal system operation.

vsa.scheduledevent events

vsa.scheduledEvent.mlx.detch

Deprecated

This event is replaced with vsa.mlx.nic.detach which is the same, but with a new non-confusing name.

Severity

NOTICE

Description

This message occurs when ONTAP® software is running as an instance in Azure and a NIC SR-IOV driver detach event is detected. ONTAP will continue to use the Hyper-V netsvc driver without the SR-IOV functionality for a short time. On an HA configuration, unsynchronized logs might appear during this time, which will be resolved if a subsequent SR-IOV attach event occurs. If the SR-IOV attach event does not occur quickly, high-availability (HA) takeover might occur.

Corrective Action

(None).

Syslog Message

NIC SR-IOV driver detach event detected. On an HA configuration, unsynchronized logs might be seen or HA takeover might occur if SR-IOV driver remains detached.

Parameters

(None).

vsa.scheduledEvent.scheduled

Severity

ALERT

Description

This message occurs when the system detects that a cloud provider event has been scheduled that will result in a node rebooting or becoming unavailable. In a High-Availability (HA) configuration, only one partner will be affected.

Corrective Action

In a single-node configuration, a data-serving failure will occur for an event of type "reboot" or "rehost", and a data-serving failure or timeout might occur during a "freeze". Prepare client applications for the event. For an HA configuration, no action is required.

Syslog Message

Cloud provider event %s for node "%s". ID: %s. Type: %s. Not before: %s.

Parameters

detail (STRING): Cloud provider infrastructure might cause nodes to reboot or freeze. This happens when the provider needs to update the underlying infrastructure or move the node to a new host. Typically, the event will be detected before it happens, and information about when it might start is provided via a "not before" time. In an HA configuration, only one node in an HA pair will be affected by an event. During this time, the cluster will not be protected from a data-serving failure if the remaining HA partner goes down.
node (STRING): Node affected by the event.
event_id (STRING): Cloud-provider-specific event ID.
event_type (STRING): String "reboot", "rehost", or "freeze".
not_before_time (STRING): Timestamp in the general form: Mon, 19 Sep 2018 18:29:47 GMT If this string is empty, the event is in progress.

vsa.scheduledEvent.update

Severity

NOTICE

Description

This message occurs when the system detects that the status of a previously scheduled cloud provider maintenance event has been updated.

Corrective Action

Cloud provider infrastructure will restart the node after a "reboot" or "rehost" event, and during a "freeze" the node might restart. In any case, intervention might be required to be sure that the cluster is up and running normally.

Syslog Message

Cloud provider event %s for node "%s". ID: %s. Type: %s. Status: %s.

Parameters

detail (STRING): Cloud provider maintenance events have a lifecycle. When the event is scheduled, the "scheduled" event is raised. Subsequently, the status of the event will change state to "started" or "complete". When that is detected, this event is raised.
node (STRING): Node affected by the event.
event_id (STRING): Cloud-provider-specific event ID.
event_type (STRING): String "reboot", "rehost", or "freeze".
status (STRING): Current status of the event: "scheduled", "started", "complete".

vsa.sriov events

vsa.sriov.nic.detach

Severity

NOTICE

Description

This message occurs when ONTAP® software running in the guest virtual machine (VM) detects an SR-IOV NIC detach event. ONTAP will continue to use the Hyper-V netsvc driver without the SR-IOV functionality for a short time. On HA configurations, unsynchronized logs might appear during this time, which will be resolved if a subsequent SR-IOV attach event occurs. If the SR-IOV attach event does not occur quickly, a high-availability (HA) takeover might occur.

Corrective Action

(None).

Syslog Message

NIC SR-IOV driver detach event was detected. On HA configurations, unsynchronized logs might result, or an HA takeover might occur if SR-IOV remains detached.

Parameters

(None).

vsa.vsphere events

vsa.vsphere.connected

Severity

INFORMATIONAL

Description

This message occurs when Data ONTAP® on VMware® manages to reconnect and authenticate itself with the vSphere(tm) server.

Corrective Action

None.

Syslog Message

Authenticated connection (user %s) to vSphere server %s reestablished.

Parameters

user (STRING): vSphere "read-only" user name.
server (STRING): Host name of the vSphere server.

vsa.vsphere.noauth

Severity

ERROR

Description

This message occurs when Data ONTAP® on VMware® cannot authenticate itself to the vSphere(tm) server to gather host hardware information.

Corrective Action

Correct the vSphere server authentication information with the command 'vsphere modify'.

Syslog Message

Cannot authenticate with vSphere server: %s.

Parameters

detail (STRING): Details of how authentication failed.

vsa.vsphere.unreachable

Severity

ERROR

Description

This message occurs when Data ONTAP® on VMware® cannot connect to the vSphere(tm) server to gather host hardware information.

Corrective Action

Verify that the vSphere server is up and reachable through https: If necessary, correct vSphere server information using the command 'vsphere modify'.

Syslog Message

Cannot establish connection to vSphere server: %s.

Parameters

detail (STRING): Details of how the connection failed.

vscan events

vscan.disabled events

vscan.disabled

Severity

INFORMATIONAL

Description

This message occurs when a Vserver or cluster administrator disables Vscan on a Vserver. No subsequent client requests will trigger virus scanning.

Corrective Action

(None).

Syslog Message

Vscan is disabled on Vserver '%s'.

Parameters

vserverName (STRING): Name of the Vserver.

vscan.enabled events

vscan.enabled

Severity

INFORMATIONAL

Description

This message occurs when a Vserver or cluster administrator enables Vscan on a Vserver. Based on the configuration, subsequent client requests can trigger virus scanning.

Corrective Action

(None).

Syslog Message

Vscan is enabled on Vserver '%s'.

Parameters

vserverName (STRING): Name of the Vserver.

vscan.newversion events

vscan.newVersion.allocated

Severity

INFORMATIONAL

Description

This message occurs when the Vscan version mechanism allocates a new version-ID corresponding to the Vscan server version.

Corrective Action

(None).

Syslog Message

Vscan version mechanism added new version-ID for Vserver '%s' corresponding to vendor '%s', version '%s'.

Parameters

vserverName (STRING): Name of the Vserver.
vendor (STRING): Vscan server vendor name.
version (STRING): Vscan server version.

vscan.odjob events

vscan.odJob.delete.failed

Severity

ERROR

Description

This message occurs when the system fails to delete queued Vscan On-Demand job. The system tries to delete this job internally in a situation such as when Vserver is stopped or when a Vserver is failed over to some other cluster.

Corrective Action

Run the "vserver vscan on-demand-task unschedule" command to delete the job.

Syslog Message

System failed to delete Vscan On-Demand job for the task "%s" on Vserver "%s". Reason: "%s".

Parameters

taskName (STRING): Vscan On-Demand task name.
vserverName (STRING): Name of the Vserver.
failureReason (STRING): Reason for the failure.

vscan.odJob.running.deleted

Severity

NOTICE

Description

This message occurs when the system deletes a running On-Demand job internally.

Corrective Action

(None).

Syslog Message

System deleted a running Vscan On-Demand job. Job ID "%s".

Parameters

jobID (STRING): Job ID.

vscan.odJob.schedule.failed

Severity

ERROR

Description

This message occurs when the system fails to schedule a previously requested Vscan On-Demand job. The system tries to schedule this job internally in a situation such as when a Vserver is started or when a Vserver is failed over to some other cluster.

Corrective Action

Run the "vserver vscan on-demand-task schedule" command to schedule the job.

Syslog Message

System failed to schedule Vscan On-Demand job for the task "%s" on Vserver "%s". Reason: "%s".

Parameters

taskName (STRING): Vscan On-Demand task name.
vserverName (STRING): Name of the Vserver.
failureReason (STRING): Reason for the failure.

vscan.odreport events

vscan.odReport.create.failed

Severity

ERROR

Description

This message occurs when the On-Demand job fails to create report file.

Corrective Action

Ensure that the report directory exists and is accessible.

Syslog Message

On-Demand job for the task "%s" on Vserver "%s" could not create report file in the directory "%s". Reason: "%s".

Parameters

taskName (STRING): Vscan On-Demand task name.
vserverName (STRING): Name of the Vserver.
reportDirectory (STRING): Report directory.
failureReason (STRING): Reason for the failure.

vscan.odReport.write.failed

Severity

ERROR

Description

This message occurs when the On-Demand job fails to write to a report file.

Corrective Action

Ensure that the report file is accessible and the volume on which it resides has space.

Syslog Message

On-Demand job for the task "%s" on Vserver "%s" could not write to the report file "%s". Reason: "%s".

Parameters

taskName (STRING): Vscan On-Demand task name.
vserverName (STRING): Name of the Vserver.
reportFile (STRING): Path of the report file.
failureReason (STRING): Reason for the failure.

vscan.pool events

vscan.pool.autoActivated

Severity

INFORMATIONAL

Description

This message occurs when the Vscan scanner pool is automatically activated.

Corrective Action

(None).

Syslog Message

Vscan scanner pool '%s' is automatically activated on Vserver '%s'.

Parameters

scannerPool (STRING): Name of the scanner pool.
vserverName (STRING): Name of the Vserver.

vscan.pool.autoDeactivated

Severity

INFORMATIONAL

Description

This message occurs when the Vscan scanner pool is automatically deactivated.

Corrective Action

(None).

Syslog Message

Vscan scanner pool '%s' is automatically deactivated on Vserver '%s'.

Parameters

scannerPool (STRING): Name of the scanner pool.
vserverName (STRING): Name of the Vserver.

vscan.pool.largeReqTimeout

Severity

NOTICE

Description

This message occurs when the request timeout of a Vscan scanner pool is configured more than what can be honored for an On-Access policy whose scan-mandatory option is set to "off". The system internally adjusts the request timeout to the maximum allowed value.

Corrective Action

(None).

Syslog Message

For scanner-pool '%s' created on Vserver '%s', request-timeout is configured as %ds but that would internally be taken as %ds if the applicable On-Access policy has scan-mandatory set to "off". This ensures that the file-access is granted to the client for such policy.

Parameters

scannerPool (STRING): Name of the scanner pool.
vserverName (STRING): Name of the Vserver on which the scanner pool is configured.
requestTimeout (INT): Request timeout value configured by the user.
adjustedRequestTimeout (INT): Request timeout value that the system internally adjusts to.

vscan.privsharecreate events

vscan.privShareCreate.failed

Severity

ERROR

Description

This message occurs when the creation of privileged share ONTAP_ADMIN$ fails. Attempted connections to ONTAP_ADMIN$ share by the Vscan servers will fail.

Corrective Action

Check the reason for failure and take action accordingly. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Failed to create privileged share ONTAP_ADMIN$ for Vserver "%s". Reason: "%s".

Parameters

vserverName (STRING): Name of the Vserver.
reason (STRING): Reason for failure.

vscan.rdbupdregister events

vscan.rdbUpdRegister.failed

Severity

ERROR

Description

This message occurs when the Vscan configuration replication mechanism fails to register RDB update callback. Modifications made to the Vscan configuration might not be available to this node.

Corrective Action

Perform a takeover and giveback of the node or reboot the node. For additional options, contact NetApp technical support.

Syslog Message

Vscan configuration replication mechanism failed to register RDB update callback. Modifications made to the Vscan configuration might not be available to this node.

Parameters

(None).

vsdr events

vsdr.adtcreate events

vsdr.adtcreate.fail

Severity

ERROR

Description

This message occurs when an audit staging volume cannot be created at the destination cluster in Async-DR (asynchronous disaster recovery), either because there is not enough disk space on the aggregates or the aggregates are in offline state.

Corrective Action

If the aggregates are offline, bring them online. Ensure that each aggregate has at least 2GB of free space, adding disks, reducing volume size or moving volumes as needed, and then try the following commands: Then try the following commands: prompt> snapmirror initialize prompt> snapmirror resync

Syslog Message

Vserver audit create failed at the destination cluster with Async-DR.

Parameters

(None).

vsdr.app events

vsdr.app.cg.conflict

Severity

NOTICE

Description

This message occurs during the configuration replication phase of a Vserver DR transfer when the consistency group that the system is trying to replicate already exists in the cluster on a different Vserver.

Corrective Action

Remove the existing consistency group or make the Vserver that has the conflicting consistency group in it the destination in the Vserver DR relationship.

Syslog Message

Consistency group %s cannot be created in Vserver %s due to conflicting consistency group %s in Vserver %s.

Parameters

consistency_group (STRING): Name of the consistency group that the system is trying to replicate.
destination_vserver (STRING): Name of the destination Vserver into which the consistency group is being replicated.
conflicting_consistency_group (STRING): Name of the conflicting consistency group.
found_in_vserver (STRING): Name of the Vserver in which the conflicting consistency group was found.

vsdr.clone events

vsdr.clone.cleanup.fail

Severity

ERROR

Description

This message occurs when a clone create job fails prematurely. As result, there is a partially created clone in the cluster.

Corrective Action

Use the (privilege: diag) "debug vreport show -type volume" command to show the list of inconsistent volumes. For each of these inconsistent volumes, use the (privilege: diag) "debug vreport fix -type volume" command to resolve all of the issues. If this is a SnapMirror® or MetroCluster(tm) environment, run the "snapmirror resync" command or the "metrocluster vserver resync" command, respectively, after the inconsistencies are resolved.

Syslog Message

Clone create job failed prematurely for volume "%s" (Vserver Id %d). Reason:%s.

Parameters

volume (STRING): Name of the clone volume for which the create operation failed.
vserver_id (INT): ID of the Vserver that owns the volume.
errmsg (STRING): Error message string.

vsdr.clone.splitOnSource

Severity

ERROR

Description

This message occurs when a clone volume is split on the source Vserver in a Vserver DR setup, and a SnapMirror® transfer is initiated after this operation.

Corrective Action

Run the "volume clone split start" command to split the volume on the dp-destination Vserver. Then run the "volume delete" command to remove the volume from the dp-destination Vserver. Then run the "snapmirror resync" command on the VserverDR relationship.

Syslog Message

The volume "%s" of Vserver "%s" has been split on the source Vserver. Split the clone volume on the destination as well. After splitting, delete the volume and execute a "snapmirror resync" command.

Parameters

volume_name (STRING): Volume clone that needs to be split.
vserver_name (STRING): Vserver name for which the SnapMirror transfer has been initiated.

vsdr.clonetmp events

vsdr.clonetmp.msid.conflict

Severity

ERROR

Description

This message occurs during a SnapMirror® resync operation on a Storage Virtual Machine (SVM) disaster recovery (DR) relationship, when the MSID of a volume on the source SVM is the same as the MSID of a temporary volume on the destination SVM and the temporary volume is created for a clone parent volume. The resync operation fails to start.

Corrective Action

Split the clone volume by using the "volume clone split start" command or delete the clone volume by using the "volume delete" command, and then remove the temporary volume by using the "volume delete" command before executing another "snapmirror resync" command.

Syslog Message

The MSID of temporary clone parent volume "%s" on the destination SVM "%s" conflicts with the MSID of volume "%s" on the source".

Parameters

tmp_volume_name (STRING): Volume name of the temporary volume on the destination SVM that is a parent of a clone volume.
vserver_name (STRING): SVM name for which the SnapMirror resync was initiated.
src_volume_name (STRING): Volume name on the source SVM.

vsdr.cluster events

vsdr.cluster.sourceVersionIsHigherThanDestination

Severity

ERROR

Description

This message occurs when a source cluster of SVMDR relationship is at higher version than destination cluster.

Corrective Action

Upgrade source cluster and destination cluster to the same verion.

Syslog Message

Resync failed becuase source cluster version "%s" is higher than destination cluster version "%s"

Parameters

source_cluster_version (STRING): Version of source cluster of SVMDR relationship.
destination_cluster_version (STRING): Version of destination cluster of SVMDR relationship.

vsdr.fpvolallpolicy events

vsdr.FPVolAllPolicy

Severity

ALERT

Description

This message occurs when SnapMirror® transfer happens between the source volume of an SVM disaster recovery (SVMDR) relationship having a tiering policy of "all" residing on a FabricPool aggregate on the primary cluster and destination volume residing on a FabricPool aggregate at the secondary cluster. SnapMirror transfer will be slow and might cause recovery point objective (RPO) to be missed.

Corrective Action

Move the source volume of the SVMDR relationship from the FabricPool aggregate to a non-FabricPool aggregate at the primary cluster or modify the volume tiering policy of the source volume. To move the source volume, use the "volume move start -vserver <vserver-name> -volume <volume-name> -destination -aggregate <aggregate> command." To modify the volume tiering policy, use the "volume modify -volume <volume-name> -vserver <vserver-name> -tiering-policy <snapshot-only|none|auto>" command.

Syslog Message

SnapMirror® transfer between source volume "%s" on Vserver "%s" on a FabricPool aggregate having a tiering policy of "all" on the primary cluster and the destination volume on a FabricPool aggregate at the destination cluster will be slow.

Parameters

source_volume_name (STRING): Name of the source volume on FabricPool aggregate of SVMDR relationship.
src_vserver_name (STRING): Name of the source vserver name.

vsdr.fpvolallpolicyonfpaggr events

vsdr.FPVolAllPolicyOnFPAggr

Severity

ALERT

Description

This message occurs when source volume of an SVM disaster recovery (SVMDR) relationship having a volume tiering policy of "all" residing on FabricPool aggregate on the primary cluster is placed on a FabricPool aggregate at the destination cluster. SnapMirror® transfer will be slow and might cause recovery point objective(RPO) to be missed.

Corrective Action

Either move the source volume of the SVMDR relationship from the FabricPool aggregate to a non-FabricPool aggregate at the primary cluster or modify the volume tiering policy of the source volume. To move the source volume, use the "volume move start -vserver <vserver-name> -volume <volume-name> -destination-aggregate <aggregate> command." To modify the volume tiering policy, use the "volume modify -volume <volume-name> -vserver <vserver-name> -tiering-policy <snapshot-only|none|auto>" command.

Syslog Message

Source volume "%s" of the SVMDR relationship residing on a FabricPool aggregate having a tiering policy of "all" on the primary cluster is placed on FabricPool aggregate "%s" at the destination cluster.

Parameters

source_volume_name (STRING): Name of the source volume on the FabricPool aggregate of the SVMDR relationship.
dest_aggr_name (STRING): Name of the destination FabricPool aggregate at the secondary cluster.

vsdr.fpvoldropqospolicy events

vsdr.FPVolDropQosPolicy

Severity

NOTICE

Description

This message occurs when the system clears or drops an incompatible quality of service (QoS) policy group setting with minimum throughput value set on a destination volume having tiering policy other than "none" on a FabricPool aggregate at the destination cluster.

Corrective Action

(None).

Syslog Message

QoS policy group with minimum throughput setting cannot be set on the volume "%s" on storage virtual machine (SVM) "%s" on a FabricPool aggregate having a tiering policy other than "none".

Parameters

source_volume_name (STRING): Name of the source volume on FabricPool aggregate of SVM DR relationship.
src_vserver_name (STRING): Name of the source SVM.

vsdr.fpvolonnonfpaggr events

vsdr.FPVolOnNonFPAggr

Severity

NOTICE

Description

This message occurs when a source volume of an SVM disaster recovery (SVMDR) relationship residing on a FabricPool aggregate at the primary cluster is placed on a non-FabricPool aggregate at the secondary cluster.

Corrective Action

Move the source volume of SVMDR relationship from the FabricPool aggregate to a non-FabricPool aggregate at the primary cluster by using the "volume move start -vserver <vserver-name> -volume <volume-name> -destination-aggregate <aggregate>" command.

Syslog Message

Source volume "%s" of the SVMDR relationship residing on a FabricPool aggregate on the primary cluster is placed on a non-FabricPool aggregate "%s" at the destination cluster.

Parameters

source_volume_name (STRING): Name of the source volume on the FabricPool aggregate of the SVMDR relationship.
dest_aggr_name (STRING): Name of the destination non-FabricPool aggregate at the secondary cluster.

vsdr.invalid events

vsdr.invalid.license

Severity

ERROR

Description

This message occurs when a package is licensed at the primary site but not licensed at the secondary site in a MetroCluster(tm) configuration or Vserver DR setup.

Corrective Action

Install at the secondary site a license that is valid for the package. If this is a SnapMirror® or MetroCluster(tm) environment, run the "snapmirror resync" command or the "metrocluster vserver resync" command respectively to resynchronize the Vserver configuration.

Syslog Message

Configuration replication on vserver %s failed due to an invalid license for package %s.

Parameters

vserver_name (STRING): Name of the Vserver.
package_name (STRING): Name of the package for which the license is to be added.

vsdr.ip events

vsdr.ip.lif.auto.created

Severity

NOTICE

Description

This message occurs when a logical interface (LIF) is automatically created through configuration replication in a MetroCluster™ configuration.

Corrective Action

(None).

Syslog Message

LIF %s in Vserver %s was created on port %s on node %s.

Parameters

> **lif** (STRING): LIF name.
> **vserver_name** (STRING): Vserver name.
> **port_name** (STRING): Name of the home port of the LIF.
> **node_name** (STRING): Name of the home node of the LIF.

vsdr.ip.lif.home.changed

Severity

> NOTICE

Description

> This message occurs when the home port or node of an existing IP logical interface (LIF) is modified during LIF placement in a MetroCluster™ configuration.

Corrective Action

> (None).

Syslog Message

> Home port and node changed from %s, %s to %s, %s while placing LIF %s in Vserver %s.

Parameters

> **old_port_name** (STRING): Name of the previous home port of the existing IP LIF.
> **old_node_name** (STRING): Name of the previous home node of the existing IP LIF.
> **port_name** (STRING): Name of the current home port of the existing IP LIF.
> **node_name** (STRING): Name of the current home node of the existing IP LIF.
> **lif** (STRING): LIF name.
> **vserver_name** (STRING): Vserver name.

vsdr.missing events

vsdr.missing.clone.parent.volume

Severity

> ERROR

Description

> This message occurs when the clone parent volume does not exist during the Vserver SnapMirror®/MetroCluster(tm) baseline replication on the secondary site. Vserver SnapMirror/MetroCluster replication will be blocked until this problem is resolved, and delaying action on this problem will lead to inconsistent data on the primary and secondary sites.

Corrective Action

> Use the (privilege: diag) "debug vreport show -type volume" command on the primary site to show the list of inconsistent volumes. For each of these inconsistent volumes, use the (privilege: diag) "debug vreport fix -type volume" command to resolve all of the issues on the Vserver SnapMirror/MetroCluster primary site. After the above problem is resolved, run the "snapmirror resync/metrocluster vserver resync" command.

Syslog Message

> Parent volume for clone volume %s:%s is missing.

Parameters

vserver (STRING): Name of the Vserver.
volume (STRING): Name of the clone volume for which the corresponding parent volume is missing.

vsdr.net events

vsdr.net.IPInDiffVserver

Severity

ERROR

Description

This message occurs when the system tries to automatically replicate a logical interface (LIF) in a MetroCluster™ configuration or Vserver DR setup and the IP address of the LIF that is being created already exists in another Vserver.

Corrective Action

Change the IP address of the LIF in the other Vserver or remove the LIF so that creation of the LIF succeeds and configuration replication continues.

Syslog Message

Cannot create LIF %s with IP address %s in Vserver %s because another LIF with the same IP exists in another Vserver.

Parameters

lif (STRING): LIF name.
ipaddr (STRING): IP address of the LIF.
vserver_name (STRING): Vserver name.

vsdr.net.LifIpCollision

Severity

ERROR

Description

This message occurs in an ID-Preserve VserverDR configuration of clustered Data ONTAP®, when a non-SAN LIF created on the source Storage Virtual Machine(SVM) has the same IP address as an iSCSI LIF on the destination SVM.

Corrective Action

Assign a unique IP address for the iSCSI LIF on the destination SVM.

Syslog Message

An iSCSI LIF is configured in the destination SVM %s with the same IP address (%s) as the source LIF (%s). Assign a unique IP address to the iSCSI LIF (%s) by modifying the LIF on the destination SVM.

Parameters

vserver_name (STRING): SVM name.
ip_address (STRING): IP address of the iSCSI LIF on the destination SVM.
source_lif_name (STRING): Source LIF name.
destination_lif_name (STRING): Destination LIF name.

vsdr.net.LifNameCollision

Severity

ERROR

Description

This message occurs in an ID-Preserve VserverDR configuration of clustered Data ONTAP®, when a non-SAN LIF created on the source Storage Virtual Machine(SVM) has the same name as a SAN LIF on the destination SVM.

Corrective Action

Assign a unique LIF name for the SAN LIF on the destination SVM.

Syslog Message

A SAN LIF is configured in the destination SVM %s with the same name as the source LIF. Assign a unique name to the SAN LIF (%s) by modifying the LIF name on the destination SVM.

Parameters

vserver_name (STRING): SVM name.
lif_name (STRING): Source and Destination LIF name.

vsdr.net.LifNotReachable

Severity

ERROR

Description

This message occurs when a logical interface (LIF) modify operation is performed on the source cluster without changing the home node and home port, and the LIF placement fails when the configuration is being replicated.

Corrective Action

Ensure that the destination cluster has ports that have connectivity to the LIF on the source cluster.

Syslog Message

The LIF %s in DR partner Vserver of Vserver %s is not reachable from the local cluster.

Parameters

lif (STRING): The LIF name.
vserver_name (STRING): The Vserver name.

vsdr.net.NoPortsInBD

Severity

ERROR

Description

This message occurs when the system tries to automatically replicate a logical interface (LIF) in a MetroCluster™ configuration or Vserver DR setup, and it cannot find any ports in a broadcast domain in a cluster.

Corrective Action

Add at least one port to the broadcast domain in the IPspace using the "network port broadcast-domain add-ports" command and then resynchronize the Vserver configuration using the "metrocluster vserver resync" command.

Syslog Message

Cannot find ports in broadcast domain %s in IPspace %s for placing LIF %s in Vserver %s.

Parameters

broadcast_domain (STRING): The Broadcast domain.
ipspace_name (STRING): The IPspace name.
lif (STRING): The LIF name.
vserver_name (STRING): The Vserver name.

vsdr.net.NoPortsInIpsOnNode

Severity

ERROR

Description

This message occurs when the system tries to automatically replicate a logical interface (LIF) in a MetroCluster™ configuration or Vserver DR setup, and it cannot find any ports in an IPspace on a particular node.

Corrective Action

Add at least one port belonging to the node to the IPspace by using the "network port broadcast-domain add-ports" command and then resynchronize the Vserver configuration using the "metrocluster vserver resync" command.

Syslog Message

Cannot find ports in IPspace %s on node %s for placing LIF %s in Vserver %s.

Parameters

ipspace_name (STRING): The IPspace name.
node_name (STRING): Name of the node to which LIFs could not be replicated.
lif (STRING): The LIF name.
vserver_name (STRING): Vserver name.

vsdr.net.NoPortsInIpspace

Severity

ERROR

Description

This message occurs when the system tries to automatically replicate a logical interface (LIF) in a MetroCluster™ configuration or Vserver DR setup, and it cannot find any ports in an IPspace in a cluster.

Corrective Action

Add at least one port to the IPspace by using the "network port broadcast-domain add-ports" command and then resynchronize the Vserver configuration using the "metrocluster vserver resync" command.

Syslog Message

Cannot find ports in IPspace %s for placing LIF %s in Vserver %s.

Parameters

ipspace_name (STRING): The IPspace name.
lif (STRING): The LIF name.
vserver_name (STRING): The Vserver name.

vsdr.net.NoVipPortInIpsNode

Severity

ERROR

Description

This message occurs when the system attempts to replicate a logical interface (LIF) associated with the Virtual IP (VIP) feature to a node where no BGP peer group is available in the target IPspace. This configuration replication functionality is exercised by systems in a MetroCluster(tm).

Corrective Action

Use the "network bgp peer-group create" command to create a BGP peer group in the target IPspace on the affected node, and then use the "metrocluster vserver resync" command to recover from the failed replication.

Syslog Message

Cannot find a VIP port in IPspace %s on node %s for placing VIP LIF %s in Vserver %s.

Parameters

ipspace_name (STRING): IPspace name.
node_name (STRING): Name of the node to which VIP LIFs could not be replicated.
lif (STRING): VIP LIF name.
vserver_name (STRING): Vserver name.

vsdr.net.NoVipPortInIpspace

Severity

ERROR

Description

This message occurs when the system attempts to replicate a logical interface (LIF) associated with the Virtual IP (VIP) feature in a MetroCluster™ configuration or Vserver DR setup, and the Border Gateway Protocol (BGP) is not configured in the target IPspace.

Corrective Action

Use the "network bgp peer-group create" command to create a BGP peer group in the target IPspace, and then use the "metrocluster vserver resync" command to recover from the failed replication.

Syslog Message

Cannot find a VIP port in IPspace %s for placing VIP LIF %s in Vserver %s.

Parameters

ipspace_name (STRING): IPspace name.

lif (STRING): VIP LIF name.
vserver_name (STRING): Vserver name.

vsdr.net.v6optdisabled

Severity

ERROR

Description

This message occurs in a MetroCluster™ configuration when the system is trying to replicate an IPv6 LIF, but IPv6 is not enabled on the cluster.

Corrective Action

Enable IPv6 by using the "network options ipv6 modify -enabled true" command, and then run the "metrocluster vserver resync" command on the source cluster.

Syslog Message

Cannot create LIF %s in Vserver %s because IPv6 is not enabled in the cluster.

Parameters

lif (STRING): LIF name.
vserver_name (STRING): Vserver name.

vsdr.net.v6optdisabledroute

Severity

ERROR

Description

This message occurs when the system is trying to replicate an IPv6 route in a MetroCluster™ configuration, but IPv6 is not enabled on the cluster.

Corrective Action

Enable IPv6 by using the "network options ipv6 modify -enabled true" command, and then run the "metrocluster vserver resync" command on the source cluster.

Syslog Message

Cannot create route %s with gateway %s in Vserver %s because IPv6 is not enabled in the cluster.

Parameters

route (STRING): Route destination and mask.
gateway (STRING): Gateway of the route.
vserver_name (STRING): Vserver name.

vsdr.nonfpvolonfpaggr events

vsdr.nonFPVolOnFPAggr

Severity

NOTICE

Description

This message occurs when the source volume of an SVM disaster recovery (SVMDR) relationship residing on a non-FabricPool aggregate at the primary cluster is placed on a FabricPool aggregate at the secondary cluster.

Corrective Action

Move the source volume of the SVMDR relationship from the non-FabricPool aggregate to a FabricPool aggregate at the primary cluster by using the "volume move start -vserver <vserver-name> -volume <volume-name> -destination-aggregate <aggregate>" command.

Syslog Message

Source volume "%s" of the SVMDR relationship residing at a nonFabricPool aggregate at the primary cluster is placed on a FabricPool aggregate "%s" at the destination cluster.

Parameters

source_volume_name (STRING): Name of the source volume on the non-FabricPool aggregate of the SVMDR relationship.
dest_aggr_name (STRING): Name of the destination FabricPool aggregate at the secondary cluster.

vsdr.periodic events

vsdr.periodic.check.errors

Severity

ERROR

Description

This message occurs when the Vserver DR subsystem periodic check detects issues with the Vserver DR components. These issues could potentially result in a degraded Vserver DR relationship. So, some corrective action is required by the admin to resolve the issue.

Corrective Action

Contact NetApp technical support to identify and resolve the issues with Vserver DR components.

Syslog Message

Vserver DR check between source Vserver %s and destination Vserver %s found issues with the attribute %s.

Parameters

source_vserver (STRING): Name of the source Vserver of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.
attribute (STRING): Name of the attribute that is being checked.

vsdr.periodic.msid.preserve

Severity

ALERT

Description

Vserver DR subsystem has detected that volume MSIDs are not preserved. This would require remounting NFS clients after a DR fail-over. Such relationships may not be supported in future ONTAP releases.

Convert the relationship into an MSID preserving relationship. As part of conversion, the DR Vserver will be stopped and the volume MSIDs will be re-stamped.

Corrective Action

See the KB article https://kb.netapp.com/support/s/article/How-to-convert-DR-Relationship-into-MSID-preserving-relation for more information on how to convert the relationship into an MSID preserving one.

Syslog Message

Vserver DR: Possibly deprecated variant of Vserver DR relationship for the destination Vserver %s.

Parameters

destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.

vsdr.qos events

vsdr.QoS.MaxQoSPGs

Severity

ERROR

Description

This message occurs during QoS configuration replication in a MetroCluster(tm) setup when there are maximum number of QoS policy groups already existing on the destination cluster and the system attempts to create a new QoS policy group.

Corrective Action

Delete few QoS policy groups on the destination cluster using "qos policy-group delete" command and then resynchronize the configuration from the source cluster using "metrocluster vserver resync" command.

Syslog Message

Reached the maximum of %d QoS policy groups. Cannot create QoS policy group %s in Vserver %s.

Parameters

max_QoS_groups (INT): Maximum number of QoS policy groups.
QoS_policy_group (STRING): QoS policy group name.
vserver_name (STRING): Vserver name.

vsdr.qos.pg.conflict

Severity

NOTICE

Description

This message occurs during the configuration replication phase of a Vserver DR transfer when the Quality of Service (QoS) policy group that the system is trying to replicate already exists in the cluster on a different Vserver.

Corrective Action

Remove the existing QoS policy group or make the Vserver that already has the QoS policy group in it the destination in the Vserver DR relationship.

QoS policy group %s cannot be created in Vserver %s as the same QoS policy exists in Vserver %s.

Parameters

qos_policy_group (STRING): Name of the QoS policy group that the system is trying to replicate.
destination_vserver (STRING): Name of the destination Vserver into which the QoS policy group is being replicated.
found_in_vserver (STRING): Name of the Vserver in which the same QoS policy group was found.

vsdr.rootvol events

vsdr.rootvol.has.data

Severity

NOTICE

Description

This message occurs when the system detects that there is data in the Server Virtual Machine root volume during a disaster recovery (DR) transfer phase. Vserver DR does not protect root volumes.

Corrective Action

Move the data to a nonroot volume of the Vserver if it needs to be protected using DR.

Syslog Message

Vserver %s has data in the root volume. Vserver DR does not protect data in the root volume.

Parameters

vserver (STRING): Name of the Vserver.

vsdr.ruleaddedtosmpolicy events

vsdr.RuleAddedToSmPolicy

Severity

NOTICE

Description

This message occurs when a MAX Data® schedule update adds a new rule to a SnapMirror® policy with the "mirror-vault" type. The update is part of an SVM disaster recovery (SVMDR) relationship.

Corrective Action

(None).

Syslog Message

New rule with SnapMirror label "%s" is added to SnapMirror policy "%s" of Vserver "%s" used by the Vserver DR relationship.

Parameters

snapmirror_label (STRING): Name of the SnapMirror label.
sm_policy_name (STRING): Name of the SnapMirror policy.

vserver_name (STRING): Name of the Vserver of Vserver DR relationship.

vsdr.rulemodifiedofsmpolicy events

vsdr.RuleModifiedOfSmPolicy

Severity
ALERT

Description
This message occurs when a rule attached to a SnapMirror® policy with "mirror-vault" type must be modified, so that L2 scheduled snapshots can be reused during a MAX Data schedule update.

Corrective Action
Modify the SnapMirror policy rule by using the "snapmirror policy modify-rule -vserver <vserver-name> -policy <policy-name> -snapmirror-label<snapmirror-label-name> -preserve false" command.

Syslog Message
Rule with SnapMirror label "%s" present in SnapMirror policy "%s" on Vserver "%s" used by the Vserver DR relationship needs to be modified.

Parameters
snapmirror_label (STRING): Name of the SnapMirror label.
sm_policy_name (STRING): Name of the SnapMirror policy.
vserver_name (STRING): Name of the Vserver of Vserver DR relationship.

vsdr.schedule events

vsdr.schedule.unavailable

Severity
ERROR

Description
This message occurs when a schedule is not available on the secondary site for replication of policies for a Vserver in a MetroCluster(tm) configuration or Vserver DR setup.

Corrective Action
Create a new job schedule on the remote site that is identical to that on the source site by using the 'job schedule cron create' command. If this is a SnapMirror® or MetroCluster(tm) environment, run the "snapmirror resync" command or the "metrocluster vserver resync" command respectively to resynchronize the Vserver configuration.

Syslog Message
Configuration replication for policy "%s" in Vserver "%s" has failed because the schedule mentioned in the policy is not available.

Parameters
policy_name (STRING): Name of the policy that has a schedule that is unavailable on the secondary site.
vserver_name (STRING): Vserver name on which the policy was associated.

vsdr.vol events

vsdr.vol.aff.inline.dedup

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem does not enable inline deduplication on the destination volume. Inline deduplication is not enabled when the destination volume is on neither an AFF system nor a hybrid aggregate.

Corrective Action

If inline deduplication is required on the destination volume, move the volume to a hybrid aggregate, and then enable inline deduplication. For more information, refer to TR-4476.

Syslog Message

Vserver DR: The volume %s of the Vserver %s is on neither an AFF system nor a hybrid aggregate. Therefore, inline deduplication is not enabled on the volume.

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.

vsdr.vol.aggregateoffline

Severity

ALERT

Description

This message occurs during configuration replication, when the aggregate on which the volume needs to be created or modified is either offline or not in the cluster.

Corrective Action

Log in to the cluster and bring the aggregate online by using the "storage aggregate online" command. If the node that owns the aggregate is down, bring it back up.

Syslog Message

Configuration replication for volume "%s" in Vserver "%s" has failed because the aggregate "%s" is offline.

Parameters

volume_name (STRING): Volume on which this error occurred.
aggregate_name (STRING): Name of the aggregate.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.vol.clusterlifdown

Severity

ERROR

Description

This message occurs during configuration replication, when the the volume creation fails because the aggregate is not accessible because the cluster logical interface (LIF) is down.

Corrective Action

Log in to the source cluster and run the "network interface show" command to see the state of the cluster LIFs and to identify the down LIFs.Verify that port connectors, cabling, and cluster switch ports are correctly installed and configured.

Syslog Message

Configuration replication for volume "%s" in Vserver "%s" has failed because the cluster LIF is operationally down.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.vol.compr.mismatch

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem discovers a mismatch between the compression types of the source and destination volumes, and therefore do not apply the compression type setting of the source volume to the destination volume.

Corrective Action

Undo all off the compression savings on the destination volume, and then modify the compression type of the volume. For more information, refer to TR-4476.

Syslog Message

Vserver DR: Compression type of destination volume %s of Vserver %s is %s, which is different from the source volume compression type %s. Therefore, the compression type of the source volume was not applied on the destination volume.

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.
destination_compression_type (STRING): Compression type of the destination volume.
source_compression_type (STRING): Compression type of the source volume.

vsdr.vol.duplicate.mdv.name

Severity

ERROR

Description

This message occurs when the configuration of a metadata volume cannot be replicated because there exists another metadata volume with the same name on the destination cluster.

Corrective Action

Contact NetApp technical support to remove one of the duplicate metadata volumes.

Syslog Message

Configuration replication for metadata volume "%s" in Vserver "%s" has failed because there exists another metadata volume with the same name on the destination cluster.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Name of the Vserver for which configuration replication is happening.

vsdr.vol.encryptsrc.plaindst

Severity

ALERT

Description

This message occurs when an encrypted volume at the source of a Vserver-DR setup is replicated as a non-encrypted volume at the destination. This can happen if: 1) the key management capability is not enabled at the destination Vserver; 2) the destination Vserver does not have an aggregate that supports encrypted volumes; or 3) the volume of the source Vserver has undergone a conversion operation from non-encrypted to encrypted.

Corrective Action

If necessary, set up the key management capability at the destination by using the "security key-manager setup" command. Ensure that the destination Vserver contains an aggregate that supports encrypted volumes. Use the "snapmirror show" command to determine the type of relationship. If the displayed type is "XDP", encrypt the destination volume by performing a conversion operation from non-encrypted to encrypted using the "volume encryption conversion start" command. However, if the type is "DP", encrypt the destination volume by performing a volume move operation using the "volume move start -encrypt -destination true" command.

Syslog Message

Source volume for volume "%s" in Vserver "%s" is encrypted, but it is replicated as a non-encrypted volume at the destination.

Parameters

dest_volume_name (STRING): Name of the destination volume.
source_vserver_name (STRING): Name of the source Vserver.
dest_vserver_name (STRING): Name of the destination Vserver.

vsdr.vol.junction.clash

Severity

ERROR

Description

This message occurs when the system detects a conflict in the junction path between the volumes of a source and destination Vserver during a SnapMirror resync operation.

Corrective Action

Unmount the destination volume or mount it at a different path, and then try the operation again.

Syslog Message

Source Vserver "%s" has volume "%s" and junction path "%s" that conflicts with destination Vserver "%s", volume "%s" and the same junction path "%s". Reason: The destination volume is excluded from Vserver DR protection in the reverse direction.

Parameters

source_vserver_name (STRING): Name of the source Vserver.
src_volume_name (STRING): Name of the source volume.
src_volume_junction_path (STRING): Junction path of the source volume.
dest_vserver_name (STRING): Name of the destination Vserver.
dest_volume_name (STRING): Name of the destination volume.
dest_volume_junction_path (STRING): Junction path of the destination volume.

vsdr.vol.move.clone.child

Severity

ERROR

Description

This message occurs when a clone volume is moved in a Vserver DR setup. As a direct consequence, an implicit clone split occurs. The parent volume no longer has any relation with the child volume. Snapshots(tm) copies of the parent volume are unlocked and can get deleted, thereby affecting the SnapMirror® replication.

Corrective Action

Run "volume move" command to move the volume to the corresponding aggregate.

Syslog Message

The volume "%s" of Vserver "%s" has been moved. It is a clone volume. Move the clone volume as well.

Parameters

volume_name (STRING): Volume that has to be manually moved.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.vol.move.clone.parent

Severity

ERROR

Description

This message occurs when the parent of a clone volume is moved in a Vserver disaster-recovery (DR) configuration. If the moved volume is deleted or its Snapshot® copies are deleted, the SnapMirror® transfer fails.

Corrective Action

Run the "volume move" command to move the volume to an appropriate aggregate. If the volume was deleted at the source and the transfer failed, additionally run "snapmirror resync".

Syslog Message

The volume "%s" of Vserver "%s "has been moved. The mirroring of this volume is at risk as it is the parent of a clone volume.

Parameters

volume_name (STRING): Volume that has to be manually moved.
vserver_name (STRING): Name of the Vserver for which configuration replication is happening.

vsdr.vol.name.clash

Severity

ERROR

Description

This message occurs when the source Vserver contains a volume with the same name as one on the destination Vserver, and the volume at the destination is excluded from Vserver Disaster Recovery(DR) Protection in the reverse direction. Future resynchronization attempts might fail unless the problem is resolved.

Corrective Action

Rename the source or the destination volume, and then try the operation again.

Syslog Message

The source Vserver "%s" has a volume with name "%s" while the destination Vserver "%s" has a volume with the same name "%s" that is excluded from Vserver DR Protection in the reverse direction.

Parameters

source_vserver_name (STRING): Name of the source Vserver in a Vserver DR setup.
src_volume_name (STRING): Name of the volume on the source Vserver.
dest_vserver_name (STRING): Name of the destination Vserver in a Vserver DR setup.
dest_volume_name (STRING): Name of the volume on the destination Vserver.

vsdr.vol.noparentvolume

Severity

ERROR

Description

This message occurs when the volume that needs to be created on the destination cluster has a parent volume that did not get replicated. The possible types of volumes for which this error can occur are LS, FlexCache®, and FlexClone®.

Corrective Action

Log in to the cluster and unlock the Vserver by using "vserver unlock" command at a diag privilege level, and then create the parent volume by using the "volume create" command. Lock the Vserver by using the "vserver lock" command, and start the configuration replication with a resync.

Syslog Message

Configuration replication for volume "%s" of type %s in Vserver "%s" has failed because the parent volume for this volume has not been replicated.

Parameters

volume_name (STRING): Volume on which this error occurred.
volume_type (STRING): Type of volume. Possible values could be LS, FlexCache, or FlexClone.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.vol.nospaceinaggregate

Severity

ERROR

Description

This message occurs when there is no space left in the aggregate for new volumes to be created during configuration replication.

Corrective Action

Log in to the cluster and assign more disks to the aggregate.

Syslog Message

Configuration replication for volume "%s" in Vserver "%s" has failed because the aggregate "%s" does not have enough space.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Vserver name for which configuration replication is happening.
aggregate_name (STRING): Name of the aggregate.

vsdr.vol.nospaceinfabricpoolaggregate

Severity

ERROR

Description

This message occurs when there is no matching fabric pool aggregate found for composite source volume or not enough space left in the fabric pool aggregate for new volumes to be created during configuration replication.

Corrective Action

Log in to the cluster and assign more disks to the perf tier of fabric pool aggregate.

Syslog Message

Couldn't place volume "%s" of Vserver "%s" in fabric pool aggregate as there is no matching fabric pool aggregate found or there is not enough space left in perf tier.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.vol.protect.childmnt

Severity

ERROR

Description

This message occurs when a protected volume is mounted under an unprotected volume on the source of a Storage Virtual Machine (SVM) disaster recvoery (DR) relationship and a SnapMirror® transfer is subsequently initiated. Data continues to be served from this volume, but the volume is not protected by the DR relationship.

Corrective Action

Execute any of the following operations on the source cluster to ensure that parent and child volumes have matching protection types, and then invoke the "snapmirror resync" command. 1. Mount the volume under a protected volume. 2. Change the protection type of the parent volume in the junction-path to protected. 3. Change the protection type of the volume to unprotected. To change the protection type, use the command "volume modify -vserver vserver_name -volume volume_name -vserver-dr-protection".

Syslog Message

Unable to mount the volume %s:%s under an unprotected volume.

Parameters

vserver_name (STRING): Name of the SVM for which the SnapMirror transfer was initiated.
volume_name (STRING): Name of the volume that the system is trying to replicate on the destination SVM.

vsdr.vol.quota.off.fail

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem fails to disable quotas on the destination volume.

Corrective Action

Disable quotas on the volume by using the "volume quota off".

Syslog Message

Vserver DR: Failed to disable quotas on volume %s of Vserver %s. Reason: %s

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.
reason (STRING): Reason.

vsdr.vol.quota.on.fail

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem fails to enable quotas on the destination volume.

Corrective Action

Enable quotas on the volume by using the "volume quota on" command.

Syslog Message

Vserver DR: Failed to enable quotas on volume %s of Vserver %s. Reason: %s

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.
reason (STRING): Reason.

vsdr.vol.sg.data.compact

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem does not enable data compaction on the destination volume. Data compaction is not enabled when the destination volume space guarantee setting is not set to "none".

Corrective Action

Set the space guarantee of the volume to "none", and then enable data compaction. For more information, refer to TR-4476.

Syslog Message

Vserver DR: Volume space guarantee setting for volume %s of Vserver %s is not set to "none". Therefore, data compaction is not enabled on the volume.

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.

vsdr.vol.sg.inline.dedup

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem does not enable cross volume inline deduplication on the destination volume. Inline deduplication is not enabled when the destination volume space guarantee setting is not set to "none".

Corrective Action

Set the space guarantee of the volume to "none", and then enable cross volume inline deduplication. For more information, refer to TR-4476.

Syslog Message

Vserver DR: Volume space guarantee setting for volume %s of Vserver %s is not set to "none". Therefore, cross volume inline deduplication is not enabled on the volume.

Parameters

> **destination_volume** (STRING): Name of the destination volume of the Vserver DR relationship.
> **destination_vserver** (STRING): Name of the destination Vserver of the Vserver DR relationship.

vsdr.vol.sis.capture.fail

Severity

> ALERT

Description

> This message occurs when a Vserver DR subsystem fails to replicate the efficiency configuration from the source volume to the destination volume.

Corrective Action

> Manually enable the efficiency configuration on the destination volume. For more information, refer to TR-4476.

Syslog Message

> Vserver DR: Failed to replicate the efficiency configuration on volume %s of Vserver %s. Reason: %s

Parameters

> **source_volume** (STRING): Name of the source volume of the Vserver DR relationship.
> **source_vserver** (STRING): Name of the source Vserver of the Vserver DR relationship.
> **reason** (STRING): Reason for the failure.

vsdr.vol.sis.fail

Severity

> ALERT

Description

> This message occurs when a Vserver DR subsystem fails to apply the efficiency configuration on the destination volume.

Corrective Action

> Manually apply the efficiency configuration on the volume. For more information, refer to TR-4476.

Syslog Message

> Vserver DR: Failed to apply the efficiency configuration on volume %s of Vserver %s. Reason: %s

Parameters

> **destination_volume** (STRING): Name of the destination volume of the Vserver DR relationship.
> **destination_vserver** (STRING): Name of the destination Vserver of the Vserver DR relationship.
> **reason** (STRING): Reason.

vsdr.vol.vldboffline

Severity

> ALERT

Description

This message occurs when the volume location database (VLDB) goes offline during configuration replication. None of the volume services can commence without bringing it online.

Corrective Action

Retry the SnapMirror® operation by running the "snapmirror resync" command. If the problem persists, contact NetApp technical support.

Syslog Message

Configuration replication for volume "%s" in Vserver "%s" has failed because the VLDB is offline.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.volmov events

vsdr.volmov.msid.conflict

Severity

ERROR

Description

This message occurs during a SnapMirror® resync operation on a Storage Virtual Machine (SVM) disaster recovery (DR) relationship, when the MSID of a volume on the source SVM is the same as the MSID of a temporary volume on the destination SVM and the temporary volume is created for a volume move operation. The resync operation fails to start.

Corrective Action

Abort the volume move operation by using the "volume move abort" command, or wait for the volume move operation to finish before issuing another "snapmirror resync" command on the SVM DR relationship.

Syslog Message

The MSID of temporary volume "%s" on the destination SVM "%s" conflicts with the MSID of volume "%s" on the source.

Parameters

tmp_volume_name (STRING): Volume name of the temporary volume on the destination SVM.
vserver_name (STRING): SVM name for which the SnapMirror resync was initiated.
src_volume_name (STRING): Volume name on the source SVM.

vsdr.volmove events

vsdr.volmove.esrc.plaindst

Severity

ALERT

Description

This message occurs when a volume at the source of a Vserver-DR setup is encrypted, but the volume at

the destination is not configured to be encrypted.

Corrective Action

Verify that the intended destination aggregate supports encryption and Key Management capability is enabled. If so, make the destination volume encrypted by performing a volume move operation at the destination: "volume move start -vserver <vserver-name> -volume <volume-name> -destination-aggregate <aggregate> -encrypt-destination true".

Syslog Message

Source volume for volume "%s" in Vserver "%s" is encrypted, but the destination is not.

Parameters

dest_vserver_name (STRING): Name of the destination Vserver.
dest_volume_name (STRING): Name of the destination volume.

vsdr.volmovsrcfpnonfpaggr events

vsdr.volMovSrcFPNonFPAggr

Severity

NOTICE

Description

This message occurs when a volume move operation is executed between FabricPool and non-FabricPool aggregates on the source Vserver of an SVM disaster recovery (SVMDR) relationship.

Corrective Action

If the aggregate type hosting the volume differs at the primary and secondary clusters, move the destination Vserver of the SVMDR relationship at the secondary cluster by using the "volume move start -vserver <vserver-name> -volume <volume-name> -destination-aggregate <aggregate>" command.

Syslog Message

Source volume "%s" on Vserver "%s" of the SVMDR relationship is moved from "%s" aggregate "%s" to "%s" aggregate "%s".

Parameters

source_volume_name (STRING): Name of the source volume of the SVMDR relationship.
source_vserver_name (STRING): Name of the source Vserver of the SVMDR relationship.
src_aggr_type (STRING): Source aggregate type, either FabricPool or non-FabricPool.
source_aggr_name (STRING): Name of the source aggregate at the primary cluster.
dest_aggr_type (STRING): Destination aggregate type, either FabricPool or non-FabricPool.
dest_aggr_name (STRING): Name of the destination aggregate at the primary cluster.

vsdr.volume events

vsdr.volume.idconflict

Severity

ERROR

Description

This message occurs when the the volume to be created on the destination cluster fails because of an internal identity conflict with another volume in the system.

Corrective Action

Log in to the source cluster and delete the volume by using the "volume delete" command.

Syslog Message

Configuration replication for volume "%s" in Vserver "%s" has failed because of an internal ID conflict.

Parameters

volume_name (STRING): Volume on which this error occurred.
vserver_name (STRING): Vserver name for which configuration replication is happening.

vsdr.volume.name.conflict

Severity

ERROR

Description

This message occurs during a SnapMirror resync® operation on a Storage Virtual Machine (SVM) disaster recvoery (DR) relationship, when a new volume needs to be created on the destination SVM but another volume with the same name already exists on it, and it is also the destination of a volume-level SnapMirror relationship. The resync operation fails to start.

Corrective Action

Rename the volume on the destination SVM by using the "volume rename" command or delete it by using the "volume delete" command, and then execute another "snapmirror resync" command.

Syslog Message

The volume "%s" is already present in SVM "%s" and it is the destination of a volume-level SnapMirror relationship.

Parameters

volume_name (STRING): Name of the volume that the system is trying to replicate into the destination SVM.
vserver_name (STRING): SVM name for which the SnapMirror resync was initiated.

vsdr.volume.sis.on.fail

Severity

ALERT

Description

This message occurs when a Vserver DR subsystem fails to enable volume efficiency on the volume.

Corrective Action

Enable volume efficiency on the destination volume by using the "volume efficiency on" command. For more information, refer to TR-4476.

Syslog Message

Vserver DR: Volume efficiency configuration is not applied on volume %s of Vserver %s. Reason: %s

Parameters

destination_volume (STRING): Name of the destination volume of the Vserver DR relationship.
destination_vserver (STRING): Name of the destination Vserver of the Vserver DR relationship.
reason (STRING): Reason.

vserver events

vserver.config events

vserver.config.createDirectoryFailed

Severity

ERROR

Description

This message occurs when the Vserver create operation cannot create the Vserver-specific configuration directory.

Corrective Action

Ensure that, the root volume File System(FS) is available and has enough space to create Vserver-specific configuration directory.

Syslog Message

"Failed to create the Vserver-specific configuration directory for Vserver %s. Reason: The root volume is full or not available."

Parameters

vserver_name (STRING): Name of the Vserver.

vserver.config.nameService.createDirectoryFailed

Severity

ERROR

Description

This message occurs when Vserver-specific name-service configuration directory cannot be created.

Corrective Action

Ensure that, the root volume File System(FS) is available and has enough space to create Vserver-specific name-service configuration directory.

Syslog Message

Failed to create the Vserver-specific name-service configuration directory for Vserver %s. Reason: The root volume is full or not available.

Parameters

vserver_name (STRING): Name of the Vserver.

vserver.ipspace events

vserver.ipspace.lookupfailed

Severity

ALERT

Description

This message occurs in a MetroCluster® configuration when attempting to replicate a "vserver create" operation onto the destination cluster, but the configured IPspace cannot be found on the destination cluster. This error can occur due to networking subsystem issues on the destination cluster.

Corrective Action

The operation is retried several times. Use the "metrocluster vserver show" command to verify that the configuration state of the Vserver becomes healthy. If the configuration state does not become healthy after an hour, contact NetApp technical support for assistance.

Syslog Message

Vserver "%s" cannot be created because IPspace information related to the Vserver is not currently available.

Parameters

vserver_name (STRING): Name of the Vserver that is being replicated.

vserver.ipspace.notAvailable

Severity

ERROR

Description

This message occurs in a MetroCluster® configuration when attempting to replicate a "vserver create" operation onto the destination cluster, but the IPspace name for creation of the Vserver has not yet propagated to the destination cluster. This error can occur due to networking subsytem issues on the source cluster.

Corrective Action

The operation is retried several times. Use the "metrocluster vserver show" command to verify that the configuration state of the Vserver becomes healthy. If the configuration state does not become healthy after an hour, contact NetApp technical support for assistance.

Syslog Message

Vserver "%s" cannot be created because IPspace information related to the Vserver is not currently available.

Parameters

vserver_name (STRING): Name of the Vserver that is being replicated.

vserver.ipspace.notfound

Severity

ERROR

Description

This message occurs in a Metrocluster configuration when we are attempting to replicate a Vserver create operation on to the destination cluster and the Ipspace provided does not exist on the destination cluster.

Corrective Action

Create an Ipspace with the same name as that of the ipspace used for creating the Vserver on the source cluster.

Syslog Message

Vserver %s cannot be created as ipspace %s does not exist.

Parameters

vserver_name (STRING): Name of the vserver we are trying to replicate.
ipspace_name (STRING): Name of the ipspace on which we are trying to create the Vserver.

vserver.mcc events

vserver.mcc.repl.failed

Severity

ERROR

Description

This message occurs in a MetroCluster™ configuration when an attempt to create a Vserver on the partner cluster fails.

Corrective Action

Run the 'metrocluster vserver show' command, and follow the corrective action specified in the output.

Syslog Message

Vserver %s cannot be created on the partner cluster.

Parameters

vserver_name (STRING): Name of the Vserver.

vserver.mcc.start.failed

Deprecated

Deprecated as of version 9.2.0 as this EMS is not required.

Severity

ALERT

Description

This message occurs when a sync-destination Vserver fails to get started during a MetroCluster(tm) switchover operation or a sync-source Vserver fails to get started during a MetroCluster switchback operation.

Corrective Action

Start the Vserver which failed to get started during MetroCluster switchover/switchback.

Syslog Message

Failed to start the Vserver %s during Metrocluster switchover/switchback operation.

Parameters

vserver_name (STRING): Name of the vserver which failed to get started.

vserver.mcc.stop.failed

Deprecated

Deprecated as of version 9.2.0 as this EMS is not required.

Severity

ERROR

Description

This message occurs when a sync-destination Vserver fails to get stopped during a MetroCluster switchback operation.

Corrective Action

Stop the Vserver which failed to get stopped during MetroCluster switchback.

Syslog Message

Failed to stop the Vserver %s during MetroCluster switchback operation.

Parameters

vserver_name (STRING): Name of the vserver which failed to get stopped during MetroCluster switchback.

vserver.name events

vserver.name.conflict.local

Severity

NOTICE

Description

This message occurs when use of the "vserver rename" command creates a Vserver name conflict in the local cluster, and the local cluster resolves the name conflict by incorporating the Vserver Unique Identifier (UID) into the name. This creates a new and unique Vserver name, but that new name is not the name specified in the original rename command.

Corrective Action

None

Syslog Message

Vserver name conflict in local cluster with existing local or peer Vserver %s. Local cluster has assigned unique Vserver name %s

Parameters

vserver_name (STRING): Vserver name that caused the renaming conflict.
unique_vserver_name (STRING): Unique Vserver name that Local cluster has assigned.

vserver.name.conflict.peer

Severity

NOTICE

Description

This message occurs when use of the "vserver rename" command creates a Vserver name conflict in the peer cluster, and the peer cluster resolves the name conflict by incorporating the Vserver Unique Identifier (UID) into the name. This creates a new and unique Vserver name, but that new name is not the name specified in the original rename command.

Corrective Action

None

Syslog Message

Vserver name conflict occured in peer cluster %s with existing local or peer Vserver %s. Peer cluster has assigned unique Vserver name %s.

Parameters

peer_cluster (STRING): Peer cluster name.
vserver_name (STRING): Vserver name that caused the renaming conflict.
unique_vsname (STRING): Unique Vserver name that Peer cluster has assigned.

vserver.oper events

vserver.oper.state.down

Severity

ERROR

Description

This message occurs when the system detects a cluster reboot on a Disaster Recovery Source (MetroCluster(tm) configuration or Vserver DR). All Vservers that are a source of the disaster-recovery relationship are brought down operationally if the destination is activated. This is done to prevent an identity clash in case the Secondary site is brought up.

Corrective Action

If the destination Vservers or site are already brought up, nothing needs to be done. Otherwise, if the source is brought down, then unlock the Vservers by using the "vserver unlock" command, and then bring them up operationally by using the "vserver start" command.

Syslog Message

The Vservers on cluster %s that are in a DR relationship have been operationally brought down.

Parameters

cluster_name (STRING): Name of the source cluster.

vserver.peering events

vserver.peering.relCreated

Severity

NOTICE

Description

This message occurs when the Vserver peer relationship is established.

Corrective Action

(None).

Syslog Message

Vserver peer relationship between %s and %s is established having remote peer Vserver name %s.

Parameters

vserver (STRING): Name of the Vserver for which a peer is created.
peer_vserver_localname (STRING): Name locally used for the peer Vserver created.
peer_vserver_remotename (STRING): Actual name of the peer Vserver.

vserver.peering.relDeleted

Severity

INFORMATIONAL

Description

This message occurs when the Vserver peer relationship is deleted successfully.

Corrective Action

(None).

Syslog Message

"Vserver peer relationship between %s and %s is deleted."

Parameters

vserver (STRING): Name of the Vserver.
peer_vserver (STRING): Name of the peer Vserver.

vserver.peering.relRenamed

Severity

NOTICE

Description

This message occurs when the storage virtual machine (SVM) peer relationship is modified.

Corrective Action

(None).

Syslog Message

The SVM peer relationship between local SVM "%s" (UUID "%s") and peer SVM "%s" (UUID "%s") is modified. The peer cluster changed from "%s" (ID "%s") to "%s" (ID "%s").

Parameters

local_vserver_name (STRING): Local SVM name.
local_vserver_uuid (STRING): Local SVM universally unique identifier (UUID).
peer_vserver_name (STRING): Peer SVM name.

peer_vserver_uuid (STRING): Peer SVM UUID.
old_peer_cluster_name (STRING): Old peer cluster name.
old_peer_cluster_id (STRING): Old peer cluster ID.
new_peer_cluster_name (STRING): New peer cluster name.
new_peer_cluster_id (STRING): New peer cluster ID.

vserver.peering.relResumed

Severity

INFORMATIONAL

Description

This message occurs when the Vserver peer relationship is resumed successfully.

Corrective Action

(None).

Syslog Message

"Vserver peer relationship between %s and %s is resumed."

Parameters

vserver (STRING): Name of the Vserver.
peer_vserver (STRING): Name of the peer Vserver.

vserver.peering.relSuspended

Severity

INFORMATIONAL

Description

This message occurs when the Vserver peer relationship is suspended successfully.

Corrective Action

(None).

Syslog Message

"Vserver peer relationship between %s and %s is suspended."

Parameters

vserver (STRING): Name of the Vserver.
peer_vserver (STRING): Name of the peer Vserver.

vserver.peering.remCallFailed

Severity

ERROR

Description

This message occurs when any Vserver peering command fails because of a communication failure with a remote system.

Corrective Action

Use the "network interface show" command to verify that intercluster logical interfaces (LIFs) on both clusters are up. Use the "cluster peer health show -bypass-cache true" command to verify that cluster peering is healthy. If you want to retry a failed delete, suspend, or resume operation, consider using the "force" option, which bypasses network connectivity issues.

Syslog Message

"Vserver peering command '%s' failed. Reason: %s. Vserver peering states might be inconsistent."

Parameters

command (STRING): Vserver peering command.
reason (STRING): Reason for failure.

vserver.rbac events

vserver.rbac.alias.command

Deprecated

ONTAP now directly creates a role entry on the target of the alias.

Severity

ERROR

Description

This message occurs when a custom role associated with a Storage Virtual Machine (SVM) has an aliased command directory associated with it. SVM custom roles must be associated with actual command directories and commands, not aliases to them. The aliased commands associated with SVM custom roles will not be available under SVM context.

Corrective Action

Delete the role on the SVM, and then re-create it using the actual command.

Syslog Message

The custom role %s is associated with alias command - %s on SVM %s. Create role with actual command - %s.

Parameters

role_name (STRING): Name of the role for which creation failed.
alias_name (STRING): Name of the alias that is associated with the role.
vserver_name (STRING): Name of the SVM.
non_alias_name (STRING): Name of the actual command.

vserver.rbac.replicateRole

Severity

ERROR

Description

This message occurs when replication of a role is failed on a Vserver because the command directory associated with it is an alias.

Corrective Action

Delete the role on the source Vserver, and then re-create it using the non-alias target. Then retry the operation again.

Syslog Message

Failed to replicate the role %s associated with the alias %s on Vserver %s.

Parameters

role_name (STRING): Name of the role for which creation failed.
alias_name (STRING): Name of the alias that is associated with the role.
vserver_name (STRING): Name of the Vserver.

vserver.rename events

vserver.rename.fail.peer

Severity

ERROR

Description

This message occurs when the "vserver rename" command fails to update the peer Vserver name on the peer cluster in a Vserver peer relationship.

Corrective Action

Use the (privilege: advanced) "vserver peer repair-peer-name" command in the local cluster to update the peer Vserver name in the Vserver peer relationships present on the peer cluster.

Syslog Message

Failed to update new peer Vserver %s name on peer cluster %s.

Parameters

vserver_name (STRING): Vserver name that caused the update attempt to fail.
peer_cluster (STRING): Peer cluster name.

vserver.rootvolume events

vserver.rootVolume.full

Severity

ERROR

Description

This message occurs when there is no space left on Vserver root Volume.

Corrective Action

Increase the size of the root volume. To increase the size of the volume, run the 'volume modify' command.

Syslog Message

Vserver %s has its root volume full.

Parameters

    vserver_name (STRING): Name of the vserver with root volume full.

vserver.rootVolume.noInodes

Severity

    ERROR

Description

    This message occurs when there are no inodes are available on Vserver root volume.

Corrective Action

    Increase the size of the root volume. To increase the size of the volume, run the 'volume modify' command.

Syslog Message

    Vserver %s has no inodes in its root volume.

Parameters

    vserver_name (STRING): Name of the vserver with no inodes left in root volume.

vserver.rootVolume.offline

Severity

    ERROR

Description

    This message occurs when the Vserver root Volume is offline or not accessible for read/write operations.

Corrective Action

    Make the vserver root volume online.

Syslog Message

    Vserver %s has its root volume offline.

Parameters

    vserver_name (STRING): Name of the vserver for which the root volume is not accessible.

vserver.start events

vserver.start.failed

Severity

    ERROR

Description

    This message occurs when a 'vserver start' operation fails due to failure to start either a logical interface (LIF) or a protocol for the Vserver specified.

Corrective Action

    Ensure that the network configuration, LIF details, and protocol configurations are correct, then try to start

the Vserver again.

Syslog Message

Failed in Vserver start due to failure to start either a LIF or a protocol for the Vserver %s (UUID: %s).

Parameters

vserver_name (STRING): Name of the Vserver.
vserver_uuid (STRING): UUID of the Vserver.

vserver.start.succeeded

Severity

INFORMATIONAL

Description

This message occurs when a 'vserver start' operation succeeds.

Corrective Action

(None).

Syslog Message

Vserver %s (UUID: %s) started successfully.

Parameters

vserver_name (STRING): Name of the Vserver.
vserver_uuid (STRING): UUID of the Vserver.

vserver.stop events

vserver.stop.failed

Severity

ERROR

Description

This message occurs when a 'vserver stop' operation fails due to failure to stop either a logical interface (LIF) or a protocol for the Vserver specified.

Corrective Action

Ensure that the network configuration, LIF details, and protocol configurations are correct, then try to stop the Vserver again.

Syslog Message

Failed in Vserver stop due to failure to stop either a LIF or a protocol for the Vserver %s (UUID: %s).

Parameters

vserver_name (STRING): Name of the Vserver.
vserver_uuid (STRING): UUID of the Vserver.

vserver.stop.succeeded

Severity

INFORMATIONAL

Description

This message occurs when a 'vserver stop' operation succeeds.

Corrective Action

(None).

Syslog Message

Vserver %s (UUID: %s) stopped successfully.

Parameters

vserver_name (STRING): Name of the Vserver.
vserver_uuid (STRING): UUID of the Vserver.

vserver.storage events

vserver.storage.full

Severity

ERROR

Description

This message occurs when the Storage of Vserver is full.

Corrective Action

Increase the available size of Vserver either by raising storage-limit or by downsizing or deleting volumes.

Syslog Message

Vserver "%s" is full by consuming the storage limit "%s".

Parameters

vserver_name (STRING): Vserver name for which the storage is full.
storage_limit (STRING): The storage-limit for the Vserver.

vserver.storage.nearlyFull

Severity

ALERT

Description

This message occurs when the Vserver storage size exceeds 95% of the storage limit.

Corrective Action

Increase the available size of Vserver either by raising storage-limit or by downsizing or deleting volumes.

Syslog Message

Vserver "%s" with current storage size of "%s" has exceeded "95%%" of storage limit "%s".

Parameters

vserver_name (STRING): Vserver name for which the storage size has exceeded 95% of the storage limit.
storage_size (STRING): The storage used size of the Vserver.
storage_limit (STRING): The storage-limit for the Vserver.

vserver.storage.size.breached

Severity

NOTICE

Description

This message occurs when tenant has exceeded the capacity quota allotted to the Vserver. The checker automatically deselects this mismatch and attempts a fix. To see details including the updated size use "vserver show -fields storage-limit,storage-allocated,storage-reserved" command.

Corrective Action

(None).

Syslog Message

Vserver "%s" size "%s" has exceeded storage capacity quota of "%s".

Parameters

vserver_name (STRING): The Vserver whose size exceeded the capacity quota alloted to the tenant.
vserver_size (STRING): Vserver's size allotted up to a point to the tenant.
capacity_limit (STRING): Capacity limit allotted to the Vserver.

vserver.storage.size.mismatch

Severity

NOTICE

Description

This message occurs when the Vserver's size allotted to the tenant up to a point does not match sum of all the volume's provisioned size that can be used to enforce Vserver capacity quota. The checker automatically deselects this mismatch and attempts a fix. To see details including the updated size use "vserver show -fields storage-limit,storage-allocated,storage-reserved" command.

Corrective Action

(None).

Syslog Message

Vserver "%s" size allocated to the tenant up to a point "%s" does not match sum of all the volume's provisioned size "%s".

Parameters

vserver_name (STRING): Vserver for which the size allotted to the tenant up to a point does not match sum of all the volume's provisioned size.
vserver_size (STRING): Vserver's size allotted up to a point to the tenant.
provisioned_size (STRING): Sum of all the volume's provisioned size in Vserver.

vserver.storage.threshold

Severity

ALERT

Description

This message occurs when the Vserver storage size exceeds the storage-limit-threshold-alert value.

Corrective Action

Increase the available size of Vserver either by raising storage-limit or by downsizing or deleting volumes.

Syslog Message

Vserver "%s" with current storage size of "%s" has exceeded "%s%%" of storage limit "%s".

Parameters

vserver_name (STRING): Vserver name for which the storage size has exceeded the storage-limit-threshold-alert value.
storage_size (STRING): The storage used size of the Vserver.
storage_limit_threshold (STRING): The storage-limit-threshold-alert value of the Vserver.
storage_limit (STRING): The storage-limit for the Vserver.

vserver.volume events

vserver.volume.nonhomogen

Severity

NOTICE

Description

This message occurs when a volume is placed on nonhomogeneous aggregates, because of errors on homogeneous aggregates, such as max volumes is reached or aggregate is not home.

Corrective Action

(None).

Syslog Message

Volume "%s" in Vserver "%s" was placed on nonhomogeneous aggregate "%s".

Parameters

vserver_name (STRING): Name of the Vserver.
volume_name (STRING): Name of the Volume.
aggr_name (STRING): Name of the aggregate used for volume provisioning.

vserver.vsdr events

vserver.vsdr.adt.romode

Severity

ERROR

Description

This message occurs in Async Vserver-DR setup, when an auditing-configured Vserver is starting up in Read-Only (RO) mode.

Corrective Action

None.

Syslog Message

The Vserver %s is in Async Vserver-DR (RO) mode. Therefore, auditing cannot happen on this Vserver.

Parameters

vserver_name (STRING): Name of the Vserver that is in Async Vserver-DR (RO) mode.

vserver.vsdr.adt.supported

Severity

INFORMATIONAL

Description

This message occurs during asynchronous Vserver disaster recovery setup, when the status of Vserver-Disaster Recovery Read-Only mode of a Vserver configured for auditing is set to false when a SnapMirror® relationship breaks.

Corrective Action

None.

Syslog Message

Vserver %s is configured with auditing support in Async Vserver-Disaster Recovery setup.

Parameters

vserver_name (STRING): Name of the Vserver that is in Async Vserver-Disaster Recovery Read only mode.

wackiron events

wackiron.near events

wackiron.near.hour.limit

Severity

ERROR

Description

This message occurs when the number of hours since wafliron was last run on the specified volume is approaching its limit. If the limit is passed and the bootarg 'wackiron_enforce_panic' is true, the system will panic on the next boot.

Corrective Action

Run wafliron on the affected volume. From the boot menu, run 'wafliron'. From the dblade CLI, run 'aggr wafliron start [aggr-name]'.

Syslog Message

%s: Hours since wafliron was last run is approaching its limit. Hours remaining: %d.

Parameters

volname (STRING): Name of the aggregate.
remaining (INT): Number of hours remaining.

wackiron.near.kernel.limit

Severity

ERROR

Description

This message occurs when the number of different Data ONTAP® kernel versions used since wafliron was last run on the specified volume is approaching its limit. If the limit is passed and the bootarg 'wackiron_enforce_panic' is true, the system will panic on the next boot.

Corrective Action

Run wafliron on the affected volume. From the boot menu, run 'wafliron'. From the dblade CLI, run 'aggr wafliron start [aggr-name]'.

Syslog Message

%s: Number of different Data ONTAP kernel versions used since wafliron was last run is approaching its limit. Data ONTAP kernel version changes remaining: %d.

Parameters

volname (STRING): Name of the aggregate.
remaining (INT): Number of Data ONTAP kernel version changes remaining.

wackiron.panic events

wackiron.panic.warning

Severity

ERROR

Description

This message occurs when the bootarg 'wackiron_enforce_panic' will cause the system to panic after the next boot if you do not run wafliron on the affected volume before the completion of the next boot.

Corrective Action

Run wafliron on the affected volume. From the boot menu, run 'wafliron'. From the dblade CLI, run 'aggr wafliron start [aggr-name]'.

Syslog Message

Warning: System will panic if wafliron is not run on '%s' before the next boot is complete.

Parameters

volname (STRING): Name of the aggregate.

wackiron.past events

wackiron.past.hour.limit

Severity

ERROR

Description

This message occurs when the number of hours since wafliron was last run on the specified volume is past its limit. Because the limit was passed, if the bootarg 'wackiron_enforce_panic' is true, the system will panic on the next boot.

Corrective Action

Run wafliron on the affected volume. From the boot menu, run 'wafliron'. From the dblade CLI, run 'aggr wafliron start [aggr-name]'.

Syslog Message

%s: Number of hours since wafliron was last run on the specified volume is past its limit. Run 'wafliron' as soon as possible.

Parameters

volname (STRING): Name of the aggregate.

wackiron.past.kernel.limit

Severity

ERROR

Description

This message occurs when the number of Data ONTAP® kernel versions used since wafliron was last run on the specified volume is past its limit. Because the limit was passed, if the bootarg 'wackiron_enforce_panic' is true, the system will panic on the next boot.

Corrective Action

Run wafliron on the affected volume. From the boot menu, run 'wafliron'. From the dblade CLI, run 'aggr wafliron start [aggr-name]'.

Syslog Message

%s: Number of Data ONTAP kernel versions used since wafliron was last run on the specified volume is past its limit. Run 'wafliron' as soon as possible.

Parameters

volname (STRING): Name of the aggregate.

wafl events

wafl.32bit events

wafl.32bit.formatUnsupported

Severity

ERROR

Description

This message occurs when an aggregate or volume with a 32-bit or mixed format file system is found. These formats are unsupported in this version of Data ONTAP®, and the volume cannot be brought online.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s %s%s%s%s has an unsupported 32-bit or mixed format file system (snapshot ID %u).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot

wafl.8 events

wafl.8.0.mirror.upgrade.fail

Severity

ERROR

Description

This message occurs when WAFL® unexpectedly encounters a Data ONTAP® 8.0.x logical mirror volume during an upgrade. This logical mirror volume should have been deleted prior to the upgrade.

Corrective Action

Avoid this event by destroying all Data ONTAP 8.0.x logical mirror volumes prior to the upgrade. This event resulted in the volume being marked offline, corrupt, and unrecoverable. Because the current version of Data ONTAP does not support logical mirror volume, the volume cannot be recovered by file system repair mechanisms such as wafliron and cannot be brought online.

Syslog Message

Data ONTAP 8.0.x mirror (type %d) cannot be upgraded by the current version of Data ONTAP. Logical mirror volume '%s' was marked offline, corrupt, and unrecoverable. Read the upgrade notes for this release. Such volumes should be deleted prior to the upgrade.

Parameters

> **type** (INT): Mirror type in Data ONTAP 8.0.x.
> **vol** (STRING): Volume name.

wafl.access events

wafl.access.fenced.file

Severity

> NOTICE

Description

> This message occurs when the user attempts to access a fenced file. Depending on the type of fence, reads and/or writes will not be permitted for the file.

Corrective Action

> (None).

Syslog Message

> The file with inode %d on volume %s cannot be accessed because it is fenced by %s operation.

Parameters

> **fid** (INT): Inode number of the fenced file.
> **vol** (STRING): Name of the volume that contains the fenced file.
> **owner** (STRING): Name of the operation that fenced the file.

wafl.afs events

wafl.afs.first.disabled

Severity

> NOTICE

Description

> This message occurs when the deswizzle scanner fails to enable the wafl.deswizzle.afs.first feature on the aggregate because block reallocation redirection cannot be enabled on the aggregate. The deswizzle scanner will run without the wafl.deswizzle.afs.first feature for any volume in the aggregate.

Corrective Action

> (None).

Syslog Message

> afs.first option cannot be enabled on aggregate %s, for volume %s because it is not possible to enable block reallocation on the aggregate.

Parameters

> **aggr** (STRING): Aggregate name.
> **vol** (STRING): Volume name.

wafl.aggr events

wafl.aggr.addup.offline

Severity

ERROR

Description

This message occurs when an aggregate is taken offline due to the aggregate has savings because of aggregate deduplication and this version of ONTAP does not support aggregate level deduplication.

Corrective Action

Confirm that a version of Data ONTAP which supports aggregate level deduplication is in use.

Syslog Message

Aggregate name:'%s' has aggregate level deduplication enabled. It is not supported in current Data ONTAP version and was taken offline.

Parameters

name (STRING): Aggregate name.

wafl.aggr.arl.callbacks

Severity

NOTICE

Description

This message occurs during an aggregate relocation operation, when the system ignores outstanding oplock recalls so that the relocation can progress.

Corrective Action

(None).

Syslog Message

Ignoring %d locks during aggregate relocation of %s %s%s%s%s.

Parameters

count (INT): Number of ignored locks.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the aggregate.
aggr (STRING): Name of the aggregate.
app (STRING): Application UUID.
aggrident (STRING): Unique identifier of the aggregate in case the aggregate name itself is insufficient.

wafl.aggr.btiddb.build

Severity

INFORMATIONAL

Description

This message occurs at the completion of an aggregate buftreeid database construction. It records the time spent, inode scanned, msg restart count, and the result.

Corrective Action

(None).

Syslog Message

Buftreeid database for aggregate '%s' UUID '%s' was built in %llu msec, after scanning %d inodes and restarting %d times with a final result of %s.

Parameters

aggrName (STRING): Name of the aggregate.
uuid (STRING): UUID of the aggregate.
buildtime (LONGINT): Total time taken for buftreeid database construction.
inodes (INT): Total inodes seen for buftreeid database construction.
restarts (INT): Number of message restarts for buftreeid database construction.
success (STRING): Whether the constructino was a success or failure.

wafl.aggr.crt.offline

Severity

ERROR

Description

This message occurs when an aggregate is taken offline due to the aggregate was migrated from 7-Mode controller and this version of ONTAP does not support aggregate transition.

Corrective Action

Confirm that a version of Data ONTAP which supports 7-mode controller migration is in use.

Syslog Message

Aggregate name:'%s' UUID: '%s' was migrated from 7-Mode controller. It is not supported in current Data ONTAP version and was taken offline.

Parameters

name (STRING): Aggregate name.
UUID (STRING): Aggregate UUID.

wafl.aggr.dump.metadir.rm

Severity

INFORMATIONAL

Description

This message occurs when the system cannot remove the dump metadirectory, which was created by a backup job for a mirror. The dump metadirectory is created on the aggregate where the mirror resides, because mirrors are RO volumes. The metadirectory is per-session, which means that the metadirectory is removed at the end of every normal backup. Therefore, the metadirectory will be deleted the next time a backup of the same volume is completed normally.

Corrective Action

(None).

Syslog Message

Could not remove %s in aggregate %s for volume %s with UUID %s: %s

Parameters

path (STRING): Path of the dump metadirectory.
aggr (STRING): Aggregate where the dump metadirectory resides.
vol (STRING): Volume that the dump metadirectory was created for.
voluuid (STRING): UUID of the volume that the dump metadirectory was created for.
err (STRING): Error indicating why the deletion of the dump metadirectory failed.

wafl.aggr.giveback.callbacks

Severity

NOTICE

Description

This message occurs during a giveback operation, when the system ignores outstanding oplock recalls so that the giveback can progress.

Corrective Action

(None).

Syslog Message

Ignoring %d locks when giving back %s %s%s%s%s.

Parameters

count (INT): Number of ignored locks.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the aggregate.
aggr (STRING): Name of the aggregate.
app (STRING): Application UUID.
aggrident (STRING): Unique identifier of the aggregate in case the aggregate name itself is insufficient.

wafl.aggr.giveback.times

Severity

INFORMATIONAL

Description

Issued upon successful completion of giveback of an SFO HA-policy aggregate to record sub-phase timings for different phases of wafl giveback.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggrName (STRING): The name of the Aggregate.
timesString (STRING): Report of sub phase times in SHCommit_wafl routine.

wafl.aggr.hya.eviction.fail

Severity

ERROR

Description

This message occurs when Flash Pool (tm) eviction cannot remove or update a read-cached block due to the corruption of its metadata.

Corrective Action

Run wafliron on the containing aggregate to correct the Flash Pool metadata. For more information or assistance, contact NetApp technical support.

Syslog Message

Eviction for aggregate %s found mismatch for SSD pvbn %llu, HDD pvbn %llu, found SSD pvbn %llu.

Parameters

aggr (STRING): Aggregate name.
expected_ssd_pvbn (LONGINT): SSD block number expected in the cache metadata for the original block.
hdd_pvbn (LONGINT): HDD block number of the original block.
cachemap_ssd_pvbn (LONGINT): SSD block number found in the cache metadata for the original block.

wafl.aggr.hya.full.high

Severity

ERROR

Description

This message occurs when a hybrid aggregate unexpectedly runs low on SSD free space. Contact NetApp technical support.

Corrective Action

(Call support).

Syslog Message

Hybrid aggregate %s SSD free space unexpectedly ran critically low. Contact NetApp technical support.

Parameters

vol (STRING): Hybrid aggregate name.

wafl.aggr.hya.full.low

Severity

ERROR

Description

This message occurs when a hybrid aggregate unexpectedly runs low on SSD free space. Contact NetApp technical support.

Corrective Action

(Call support).

Syslog Message

Hybrid aggregate %s SSD free space unexpectedly ran low. Contact NetApp technical support.

Parameters

vol (STRING): Hybrid aggregate name.

wafl.aggr.mcc.callbacks

Severity

NOTICE

Description

This message occurs during a MetroCluster(tm) aggregate switchback operation, when the system ignores outstanding oplock recalls, which can take a long time. This is to allow the switchback operation to make progress.

Corrective Action

(None).

Syslog Message

Ignoring recalling %d locks for aggregate %s %s%s%s%s, so that the MetroCluster switchback can make progress.

Parameters

count (INT): Number of ignored locks.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the aggregate.
aggr (STRING): Name of the aggregate.
app (STRING): Application UUID.
aggrident (STRING): Unique identifier of the aggregate in case the aggregate name itself is insufficient.

wafl.aggr.nospc.del.snapshot

Severity

NOTICE

Description

This message occurs when snapshots of an aggregate are autodeleted to free up space for newer writes.

Corrective Action

(None).

Syslog Message

Autodeletion of snapshots for aggregate "%s" was triggered due to: %s. Available space: %d%%, space

used by snapshots: %d%%.

Parameters

aggr (STRING): Name of the aggregate.
reason (STRING): The reason why autodeletion of snapshots was triggered.
avail_pct (INT): Percentage of available space in the aggregate.
snap_used_pct (INT): Percentage of space used by snapshots in the aggregate.

wafl.aggr.overcommitted.vsm

Severity

ERROR

Description

This message occurs when there is not enough free space in the aggregate to guarantee free space in all the SnapMirror® destinations.

Corrective Action

Increase the free space in the aggregate by shrinking existing FlexVol(tm) volumes or adding more disk space.

Syslog Message

Not enough free space in aggregate %s to guarantee free space in all SnapMirror destinations.

Parameters

aggr_name (STRING): Aggregate name.

wafl.aggr.recompact.complete

Severity

INFORMATIONAL

Description

This message occurs when the "aggr recompact " scanner has finished.

Corrective Action

(None).

Syslog Message

%s scanner finished on %s %s%s%s%s. %s tried on %ld blocks.

Parameters

opname (STRING): Opname for the scanner.
voltype (STRING): Volume type on which scanner was run.
aggr_owner (STRING): Owner of the volume.
aggr_name (STRING): Volume name.
app (STRING): Application UUID.
uuid (STRING): Volume uuid .
opname1 (STRING): Opname for the scanner.
val (LONGINT): Number of vbns acted on.

wafl.aggr.recompact.estimate

Severity

INFORMATIONAL

Description

This message occurs when the "aggr recompact analyze" command has finished and anaylzed how many compacted blocks are worth recompacting.

Corrective Action

(None).

Syslog Message

Recompact analyze scan finished on aggregate %s%s. Block fragmentation distribution is [%ld%%, %ld%%, %ld%%, %ld%%] for %llu compacted blocks. Average compaction ratio for the aggregate is %lu.%02lu:1 approximately.

Parameters

aggr_owner (STRING): Owner of the aggregate.
aggr_name (STRING): Aggregate name.
val_low (LONGINT): Percentage of blocks less than 25% full.
val_mid (LONGINT): Percentage of blocks less than 50% full.
val_high (LONGINT): Percentage of blocks less than 75% full.
val_full (LONGINT): Percentage of blocks greater than 75% full.
val_total (LONGINT): Total number of compacted blocks.
avg_compaction (LONGINT): Average compaction ratio.
avg_compaction1 (LONGINT): Average compaction ratio.

wafl.aggr.relocation.times

Severity

INFORMATIONAL

Description

This message occurs when an aggregate relocation is complete to record timing information about the relocation process.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggrName (STRING): Name of the aggregate.
timesString (STRING): Report of aggregate relocation phase timing.

wafl.aggr.reserve.set

Severity

NOTICE

Description

This message occurs during mounting a volume, boot or takeover/giveback. This message indicates that the aggregate reserve was set to the saved value.

Corrective Action

(None).

Syslog Message

Aggregate reserve for aggregate %s was set to %d.

Parameters

aggr (STRING): Name of the aggregate.
value (INT): New aggregate reserve.

wafl.aggr.reserve.short

Severity

ERROR

Description

This message occurs when we try to set an aggregate reserve. This message indicates that there is not enough space to honor the saved value of aggregate reserve.

Corrective Action

Try creating space in the aggregate by shrinking or destroying volumes, adding disks or changing the guarantee type of volumes in the aggregate to NONE

Syslog Message

Aggregate reserve for aggregate %s could not be set as we are short by %s.

Parameters

aggr (STRING): Name of the aggregate.
short_by (STRING): How much disk space we are short by.

wafl.aggr.rsv.low.nomount

Severity

EMERGENCY

Description

This message occurs when an aggregate consumes almost all of its free space reserve and should not be brought back online without assistance from technical support to address the free space issue.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failing mount of aggregate %s. Free space reserve is too low. Contact NetApp technical support for assistance.

Parameters

    aggr (STRING): Aggregate name.

wafl.aggr.snapReserve

Severity

    NOTICE

Description

    This message occurs when the system boot process detects that the aggregate snapshot spill percentage has been modified by bootargs.

Corrective Action

    (None).

Syslog Message

    Aggregate snapshot spill percentage is set to %d%%.

Parameters

    aggr_snap_spill_pct (INT): Aggregate snapshot spill percentage.

wafl.aggr.uncompact.complete

Severity

    INFORMATIONAL

Description

    This message occurs when the "aggr uncompact " scanner has finished.

Corrective Action

    (None).

Syslog Message

    Uncompact scanner finished on %s %s%s%s%s. Uncompacted %ld blocks.

Parameters

    voltype (STRING): Volume type on which scanner was run.
    aggr_owner (STRING): Owner of the volume.
    aggr_name (STRING): Volume name.
    app (STRING): Application UUID.
    uuid (STRING): Volume uuid .
    val (LONGINT): Number of vbns acted on.

wafl.aggr.uncompact.rep.error

Severity

    ERROR

Description

    This message occurs when the "aggr uncompact scan" command fails to uncompact some blocks because of RAID errors. The system cannot be restored to the previous release until the problem is corrected.

Corrective Action

Uncompaction of blocks with RAID errors can be done safely only on flex volumes. Run the "vol efficiency undo -data-compaction" command on the flex volume that reported RAID errors.

Syslog Message

RAID errors found when uncompaction scan was run on aggregate %s%s. Run uncompaction scan on flex volume %s.

Parameters

aggr_owner (STRING): Owner of the aggregate.
aggr_name (STRING): Aggregate name.
vvol_name (STRING): Flex volume name.

wafl.aggr.uncompact.skipped

Severity

NOTICE

Description

This message occurs when uncompact scanner has to abort due to some error conditions.

Corrective Action

(None).

Syslog Message

Skipping uncompact scan on aggregate %s. Volume %s encountered error %d.

Parameters

aggr_name (STRING): Aggregate name.
vvol_name (STRING): Flex volume name.
error_code (INT): Error code for the abort.

wafl.aggregate events

wafl.aggregate.busy

Severity

NOTICE

Description

This message occurs when an operation is run on an aggregate while the aggregate or any volume of the aggregate is busy. The message prints the reason for aggregate or volume being busy.

Corrective Action

(None).

Syslog Message

%s: %s '%s' is busy. Reason: %s.

Parameters

> **operation** (STRING): Name of the operation.
> **voltype** (STRING): Aggregate or volume.
> **aggrname** (STRING): Aggregate or volume name.
> **reason** (STRING): Reason for the aggregate or volume being busy.

wafl.aggregate.online.phases

Severity

> INFORMATIONAL

Description

> Issued upon successful completion of aggregate online to record the sub-phase times for different phases of online.

Corrective Action

> (None).

Syslog Message

> (None).

Parameters

> **aggrName** (STRING): The name of the Aggregate.
> **uuid** (STRING): The UUID of the Aggregate.
> **phase1** (LONGINT): Total time taken for aggregate online phase1.
> **phase2** (LONGINT): Total time taken for aggregate online phase2.
> **phase3** (LONGINT): Total time taken for aggregate online phase3.

wafl.aggregate.online.replay

Severity

> INFORMATIONAL

Description

> Issued upon aggr online nvlog replay completion.

Corrective Action

> (None).

Syslog Message

> (None).

Parameters

> **aggrName** (STRING): The name of the Aggregate.
> **uuid** (STRING): The UUID of the Aggregate.
> **time** (LONGINT): Total time taken for nvlog replay.

wafl.aggrtrans events

wafl.aggrtrans.corrupted

Severity

ALERT

Description

This message occurs when an aggregate transition operation encounters a corrupted aggregate.

Corrective Action

Delete the corrupted aggregate in maintenance mode. Alternatively, return the disks to a 7-Mode environment to fix the corrupted aggregate.

Syslog Message

Aggregate transition encountered a corrupted aggregate %s.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.dirtyFS

Severity

NOTICE

Description

This message occurs when an aggregate transition operation fails because the aggregate was not cleanly shut down.

Corrective Action

Retry the aggregate transition to bypass this specific error. Alternatively, return the disks to a 7-Mode environment, cleanly shut down the system, and then try the transition again.

Syslog Message

Aggregate %s was not cleanly shut down and could not be transitioned.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.dirtyFS.cont

Severity

NOTICE

Description

This message occurs when an aggregate transition continues to operate on an aggregate that was not cleanly shut down.

Corrective Action

(None).

Syslog Message

Aggregate %s was not cleanly shut down and is continuing transition.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.outofspace.nodereboot

Severity

ALERT

Description

This message occurs when a transitioned aggregate reaches a space limitation during the precommit phase and cannot be taken offline. The node is automatically rebooted to ensure that data integrity is preserved. After the reboot, the aggregate is online and its FlexVol® volumes are offline.

Corrective Action

Add disks to the aggregate to ensure that enough free space is available. Alternatively, commit the current transition session.

Syslog Message

Transitioned aggregate %s is critically low on available space, initiating node reboot.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.outofspace.normal

Severity

NOTICE

Description

This message occurs when a previously full transitioned aggregate contains enough free space and is back to normal operation.

Corrective Action

(None).

Syslog Message

Transitioned aggregate %s now contains enough free space and is now back to normal.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.outofspace.offline

Severity

EMERGENCY

Description

This message occurs when a transitioned aggregate reaches a space limitation during the precommit phase and is taken offline.

Corrective Action

Add disks to the aggregate to ensure that enough free space is available. Alternatively, commit the current transition session.

Syslog Message

Transitioned aggregate %s is critically low on available space, going offline.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.outofspace.remount.needed

Severity

NOTICE

Description

This message occurs when a previously full transitioned aggregate is online and must be remounted to bring its volumes back online.

Corrective Action

Take offline the transitioned aggregate, and then bring online the aggregate again to bring its volumes back online.

Syslog Message

Transitioned aggregate %s must be remounted (offline and online) to bring its volumes back online.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.outofspace.warn

Severity

ERROR

Description

This message occurs when a transitioned aggregate is low on free space. The message is periodically displayed before the aggregate goes offline due to being out of space.

Corrective Action

Add disks to the aggregate to resume normal operations. Alternatively, commit the current transition session.

Syslog Message

Pre-commit transitioned aggregate %s is low on free space at about %d percent used.

Parameters

aggrname (STRING): Name of the aggregate.
percent (INT): Percentage of aggregate that is used.

wafl.aggrtrans.revert.to.snap

Severity

NOTICE

Description

This message occurs when an aggregate transition operation fails because the aggregate is set to revert to a snapshot.

Corrective Action

Return the disks to a 7-Mode environment, bring the aggregate online to finish restoring to the snapshot, and then try the transition again.

Syslog Message

Aggregate %s is reverting to a snapshot and cannot be transitioned.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.aggrtrans.snap.delErr

Severity

ERROR

Description

This message occurs when an aggregate transition commit operation fails to delete the pinned snapshot.

Corrective Action

Manually delete the pinned snapshot using the node scoped command "snap delete -A". If manual deletion fails, contact technical support.

Syslog Message

Aggregate transition commit operation fails to delete the pinned snapshot "%s" on aggregate %s. Error: %s.

Parameters

name (STRING): Name of the snapshot.
aggrname (STRING): Name of the aggregate.
err (STRING): Error description.

wafl.aggrtrans.snapshot.32b

Severity

ERROR

Description

This message occurs when an aggregate transition fails due to detection of a 32-bit snapshot on the transition aggregate.

Corrective Action

Retry aggregate transition using "-ignore-errors" parameter to automatically delete all the 32-bit snapshots as part of aggregate transition.

Syslog Message

Aggregate transition failed due to unsupported 32-bit snapshots on aggregate %s uuid %s.

Parameters

aggrname (STRING): Name of the aggregate.
aggruuid (STRING): Unique identifier of the aggregate.

wafl.air events

wafl.air.info

Severity

ERROR

Description

Generic wafl air message

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The message from AIR module

wafl.analytics events

wafl.analytics.air.uh

Severity

ALERT

Description

This message occurs when the system detects an inconsistency in the file system analytics database. As a consequence, file system analytics has been disabled.

Corrective Action

Turn file system analytics on again for the volume to initiate new consistent analytics.

Syslog Message

The system detected an inconsistency in the file system analytics database associated with volume %s%s.

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).

wafl.analytics.corruption

Severity

ALERT

Description

This message occurs when a file system analytics record is corrupted. Instances of this message indicate low accuracy of the analytics data reported for the volume.

Corrective Action

Please contact NetApp technical support for assistance.

Syslog Message

A file system analytics record identified by analytics filehandle "%s" on the volume with DSID "%lu" was corrupted due to an unexpected error.

Parameters

afh (STRING): Key identifies the corrupted file system analytics record.
dsid (LONGINT): DSID of the volume affected by the corrupted record.

wafl.analytics.discardNotOk

Severity

ERROR

Description

This message occurs when the analytics subsystem discards a pending reminder work request due to an internal error. Repeated instances of this message indicate low accuracy of the analytics data reported for the volume.

Corrective Action

Taking the volume offline and bringing it back online might resolve the issue. Find the name of the Vserver and volume using the "volume show -dsid <dsid>" command. Take the volume offline using the "volume offline" command, and then bring it back online by using the "volume online" command. If the problem persists or further assistance is needed, contact NetApp technical support.

Syslog Message

An analytics reminder work request was discarded due to an unexpected error. The corresponding volume DSID is "%lu". The error returned was: %s

Parameters

dsid (LONGINT): Data set ID (DSID) of the volume affected by the discarded reminder work request.
error (STRING): Error returned by reminder processing.

wafl.analytics.enterOverload

Severity

NOTICE

Description

This message occurs when the analytics subsystem is not keeping up with the amount of work being generated by the system. This could be an indication of an overloaded system in general. Analytics

accounting might lag, and reported data might not be as current as the data that the subsystem usually reports.

Corrective Action

The system should attempt to resolve the problems by itself. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

The analytics subsystem is not keeping up with the amount of work being generated by the system.

Parameters

(None).

wafl.analytics.exitOverload

Severity

NOTICE

Description

This message occurs when the analytics subsystem is performing normally and has caught up with its pending work.

Corrective Action

(None).

Syslog Message

The analytics subsystem is performing normally.

Parameters

(None).

wafl.analytics.init.fail

Severity

ALERT

Description

This message occurs when a volume fails to have a file system analytics database initialized.

Corrective Action

Disable then re-enable file system analytics for the volume. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

Failed to initialize a file system analytics database for volume %s%s, %s.

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
error (STRING): Error message.

wafl.analytics.languishing

Severity

ALERT

Description

This message occurs when the analytics subsystem is unable to make progress, which could be an indication of an unhealthy node or a larger systemic issue.

Corrective Action

NetApp technical support

Syslog Message

The analytics subsystem has languished for more than 900 seconds.

Parameters

(None).

wafl.analytics.offErr

Severity

ALERT

Description

This message occurs when file system analytics fails to turn off. This can cause incorrect file system analytics results.

Corrective Action

Use the "volume show -dsid <dsid>" command to find the volume on which file system analytics failed to turn off, and then use the "volume analytics off" command to attempt to turn off file system analytics. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

File system analytics failed to turn off on the volume with DSID "%lu". Error: %d. Context: %s.

Parameters

dsid (LONGINT): Data Set ID (DSID) of the volume on which file system analytics failed to turn off.
error (INT): Error code returned when file system analytics failed to turn off.
context (STRING): Which operation attempted to turn off the file system analytics.

wafl.analytics.recover

Severity

ALERT

Description

This message occurs when a volume fails to recover the File System Analytics state after failing to start the initialization scanner. As a consequence, File System Analytics information might be unavailable or might not accurately reflect the volume's content.

Corrective Action

Use the "volume analytics off" command to disable File System Analytics on the volume, and then use the "volume analytics on" command to enable File System Analytics. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

The File System Analytics state for volume DSID (%lu) was not recovered after the initialization scanner failed to start. Reason: %s.

Parameters

dsid (LONGINT): Unique identifier (DSID) of the volume.
error (STRING): Error message.

wafl.analytics.rename.scan

Severity

NOTICE

Description

This message occurs when a rename scan starts while file system analytics is in the "initializing" state. Rename scans can occur to update the file system analytics database when a multipart inode or a directory is renamed or relocated to a different directory.

Corrective Action

(None).

Syslog Message

A file system analytics rename scan has been initiated for the rename of a %s identified by file system analytics filehandle "%s" on the volume with DSID "%lu".

Parameters

file_type (STRING): Identifies whether the scan is initiated for a multipart inode or a directory.
fh (STRING): Filehandle of the multipart inode or directory that is being renamed.
dsid (LONGINT): Data Set ID (DSID) of the volume the multipart inode or directory that is being renamed belongs to.

wafl.analytics.rescan

Severity

ALERT

Description

This message occurs when the system detects an inconsistency in the file system analytics database. As a consequence, file system analytics information might be unavailable or might not accurately reflect the volume's content.

Corrective Action

Turn file system analytics off and then on again for the volume. If problems persist or further assistance is needed, contact NetApp technical support.

The system detected an inconsistency in the file system analytics database associated with volume %s%s.

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).

wafl.analytics.scan.fail

Severity

ALERT

Description

This message occurs when the "volume analytics on" command fails due to an internal error.

Corrective Action

Resolve the error if possible. Disable File System Analytics using the "volume analytics off" command and then re-enable File System Analytics using the "volume analytics on" command. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

File System Analytics scan fails for volume "%s%s. Error: %s".

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
error (STRING): Error message.

wafl.analytics.sp.valid.fail

Severity

ERROR

Description

This message occurs when enabling file system analytics on a volume fails because there is insufficient space in the volume.

Corrective Action

Increase the volume size or free up space on the volume. Use the "volume modify" command to increase volume size.

Syslog Message

Enabling file system analytics on %s "%s" in SVM "%s" with "%s" %s fails because there is insufficient free space.

Parameters

volDesc (STRING): In this message a volume that has not transitioned is described as a "volume".
volName (STRING): Volume name.
vserverName (STRING): Name of the storage virtual machine (SVM) on which the volume resides.
percentUsed (STRING): Percentage of used space in the volume.
usageDesc (STRING): Contains "usage" for a FlexVol volume, and "usage in one of the FlexGroup volume

constituents" for a FlexGroup volume.

wafl.analytics.sp.valid.skip

Severity
NOTICE

Description
This message occurs when enabling file system analytics on the volume fails because there is insufficient space in the volume. The enablement is allowed because the "-skip-space-validation" parameter is specified.

Corrective Action
Increase the volume size or free up space on the volume. Use the "volume modify" command to increase volume size.

Syslog Message
Enabling file system analytics on volume "%s" in SVM "%s" skips the space validation.

Parameters
volName (STRING): Volume name.
vserverName (STRING): Name of the storage virtual machine (SVM) on which the volume resides.

wafl.analytics.state.change

Severity
NOTICE

Description
This message occurs when the file system analytics state has been changed on a volume.

Corrective Action
(None).

Syslog Message
The file system analytics state of volume "%s%s" (DSID: "%lu") has changed to "%s". Reason: %s. Rulegen: %lu.

Parameters
volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
dsid (LONGINT): Unique identifier (DSID) of the volume.
state (STRING): File system analytics state: on or off.
reason (STRING): The reason that the file system analytics state was changed.
rulegen (LONGINT): File system analytics rules generation number.

wafl.analytics.tooMuchMemory

Severity
ALERT

Description

This message occurs when the analytics subsystem has an excessive amount of pending work, causing memory usage to be higher than expected.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

Reminder table size is "%lu", which is above the design limit of "%lu". System memory: "%lu". Time since last merge: "%lu".

Parameters

tablesize (LONGINT): Current size of analytics subsystem reminder table.
limit (LONGINT): Design limit size of analytics subsystem reminder table.
system_memory (LONGINT): Total system memory on this node.
last_merge (LONGINT): Milliseconds since the analytics subsystem last processed a work request.

wafl.analytics.tz.changed

Severity

ERROR

Description

This message occurs when the system timezone is changed while file system analytics is enabled on the node. As a consequence, file system analytics information might not accurately reflect the volume's content.

Corrective Action

Use the "volume analytics show -state on" command to find the volumes with file system analytics enabled, then use the "volume analytics off" and "volume analytics on" commands for each volume where file system analytics is enabled.

Syslog Message

The system timezone has been changed while file system analytics is enabled.

Parameters

(None).

wafl.analytics.updateDiscard

Severity

ALERT

Description

This message occurs when a file system analytics update is discarded. Instances of this message indicate low accuracy of the analytics data reported for the volume.

Corrective Action

Turning file system analytics off and turning it back on again might resolve the issue. Find the name of the Vserver and volume using the "volume show -dsid <dsid>" command. Turn file system analytics off using the "volume analytics off" command, and then turn it back on by using the "volume analytics on" command. If the problem persists or further assistance is needed, contact NetApp technical support.

Syslog Message

A file system analytics update was discarded due to an unexpected error. Analytics filehandle "%s" on the volume with DSID "%lu" was to be updated by file operation "%s".

Parameters

fh (STRING): File handle that the operation targeted.
dsid (LONGINT): DSID of the volume affected by the discarded update.
operation (STRING): Operation that was being performed when this error occurred.

wafl.ap events

wafl.ap.info

Severity

NOTICE

Description

adaptive playlist message

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The message from wafl adaptive playlist

wafl.arl events

wafl.arl.vol.limitChkFailed

Severity

ERROR

Description

This message occurs during the relocation of an aggregate, when the destination node fails the volume count limit and volume size limit checks.

Corrective Action

Ensure that the destination node supports the volume size and volume count limits, or select a different destination node and retry the operation.

Syslog Message

Aggregate '%s': Volume limits check failed on destination node %s.

Parameters

vol (STRING): Name of the aggregate.
reason (STRING): Activity that is preventing the aggregate relocation operation.

wafl.asserts events

wafl.asserts.disabled

Severity

INFORMATIONAL

Description

This message occurs on development kernels when some of the asserts are disabled.

Corrective Action

(None).

Syslog Message

Warning: Some of the asserts are disabled on the filer.

Parameters

(None).

wafl.atime events

wafl.atime.updates.restarted

Severity

NOTICE

Description

This message occurs when the access time updates of all the files in the volumes of an aggregate start because the aggregate has enough free space. Access time updates of all the files were stopped when the aggregate ran out of space. The aggregate now has enough space to start the access time updates.

Corrective Action

(None).

Syslog Message

Access time updates of all the files in the volumes of aggregate "%s" have started.

Parameters

aggregate_name (STRING): Aggregate name for which access time updates of all the files in the volumes start.

wafl.atime.updates.stopped

Severity

ALERT

Description

This message occurs when the access time updates of all the files in the volumes of an aggregate stop because the aggregate has consumed its entire free space.

Corrective Action

Create space by increasing the aggregate size or by deleting some volumes or moving volumes to other aggregates. Use the "storage aggregate show-space" command to view the current space usage of the aggregate. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate snapshots are deleted automatically to make some space when the aggregate is full.

Syslog Message

Access time updates of all the files in the volumes of aggregate "%s" have been stopped.

Parameters

aggregate_name (STRING): Aggregate name for which access time updates of all the files in the volumes stop.

wafl.atime.updates.will.stop

Severity

ALERT

Description

This message occurs when the aggregate is nearly full. The access time updates of all the files in the volumes of an aggregate stop when the aggregate consumes its entire free space.

Corrective Action

Create space by increasing the aggregate size or by deleting some volumes or moving volumes to other aggregates. Use the "storage aggregate show-space" command to view the current space usage of the aggregate. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate snapshots are deleted automatically to make some space when the aggregate is full.

Syslog Message

Access time updates of all the files in the volumes of aggregate "%s" stop when the aggregate becomes full.

Parameters

aggregate_name (STRING): Aggregate name for which access time updates of all the files in the volumes stop.

wafl.attr events

wafl.attr.topK.clear.fail

Severity

ALERT

Description

This message occurs when the large directory report fails to be cleared for a volume when this feature is turned off due to an internal error. Report on large directories might be unavailable or incorrect when it is turned on again.

Corrective Action

The system should attempt to resolve the problems by itself. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

Clearing the large directory report fails for volume "%s%s. Error: %s"

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
error (STRING): Error message.

wafl.attr.topK.init.fail

Severity

ALERT

Description

This message occurs when the large directory report fails to be initialized for a volume due to an internal error. Report on large directories might be unavailable or incorrect.

Corrective Action

The system should attempt to resolve the problems by itself. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

Initializing the large directory report fails for volume "%s%s. Error: %s".

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
error (STRING): Error message.

wafl.attr.topK.scan.fail

Severity

ALERT

Description

This message occurs when the scanning of the analytics database for large directories data fails due to an internal error. Report on large directories may be unavailable or incorrect.

Corrective Action

The system should attempt to resolve the problems by itself. If problems persist or further assistance is needed, contact NetApp technical support.

Syslog Message

Scanning analytics database for large directory report fails for volume "%s%s. Error: %s".

Parameters

volname (STRING): Volume name.
vserveruuid (STRING): Universal Unique ID (UUID) of the volume's storage VM (SVM).
error (STRING): Error message.

wafl.bad events

wafl.bad.aggr.buftree.type

Severity

EMERGENCY

Description

This message occurs when you attempt to bring an aggregate online whose file system buftree type and RAID label format are inconsistent. Buftree type indicates whether the filesystem is a 32-bit or a 64-bit. Attempting to online this aggregate can cause data corruption or a system panic.

Corrective Action

Contact NetApp technical suppor

Syslog Message

Aggregate %s: Inconsistency found with the file system buftree type and RAID label format (large aggr: %d, fs: 0x%x, RAID: %d).

Parameters

name (STRING): The aggregate name.
large (INT): Flag showing if the aggregate size is bigger than 16 TB.
fsbuftree (INT): File system buftree type.
raidfmt (INT): RAID buftree format.

wafl.bad.vol.buftree.type

Severity

EMERGENCY

Description

This message occurs when you attempt to bring online a volume whose file system and volume descriptor buftree type show inconsistency. The buftree type shows whether the file system is a 32-bit or 64-bit. Bringing online such a volume can cause data corruption or system panic.

Corrective Action

(Call support).

Syslog Message

Volume %s: Inconsistency found with the file system buftree type and volume descriptor buftree type (large vol: %d, fs: 0x%x, label: 0x%x, RAID: %d). Bringing the volume online can cause data corruptions or system panic. Contact NetApp technical support.

Parameters

volname (STRING): Volume name.
large (INT): Flag showing if the volume size is bigger than 16 TB.
fsbuftree (INT): File system buftree type.
labelfmt (INT): Volume descriptor buftree type.
raidfmt (INT): RAID buftree type.

wafl.bagofbits events

wafl.bagofbits.name

Severity

ERROR

Description

This message occurs when a read directory request from an NFSv4 client is made to a Unicode-based directory in which directory entries with no NFS alternate name contain non-Unicode characters.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Access the parent directory from an NFSv3 client and rename the entry using Unicode characters.

Syslog Message

Cannot provide directory entry to NFSv4 client for file ID:%d in volume %s%s because it contains non-Unicode characters with no NFS alternate name.

Parameters

fileid (INT): File ID of the entry in the directory for which non-Unicode characters are present.
vol (STRING): Volume in which the directory entry with non-unicode characters is present.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) when the volume name itself is insufficient.

wafl.blkreclaim events

wafl.blkreclaim.abort

Severity

INFORMATIONAL

Description

This message occurs to inform you that the block reclamation scanner was aborted.

Corrective Action

You can disable this message as follows: setflag wafl_blk_reclaim_scan_log 0

Syslog Message

Block reclamation scanner was aborted on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name alone is insufficient.

wafl.blkreclaim.complete

Severity

INFORMATIONAL

Description

This message occurs when the block reclamation scanner is complete.

Corrective Action

Disable this message by running the 'setflag wafl_blk_reclaim_scan_log 0' command.

Syslog Message

Block reclamation scanner was completed on %s %s%s%s%s. The scanner took %ld ms.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
run_time (LONGINT): Total run time of the scanner.

wafl.blkreclaim.noscan

Severity

INFORMATIONAL

Description

This event is issued to inform the user that the block reclamation scanner was not started.

Corrective Action

This message may be disabled with: setflag wafl_blk_reclaim_scan_log 0

Syslog Message

Block reclamation scanner not started on %s %s%s%s%s.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.blkreclaim.reset

Severity

INFORMATIONAL

Description

This message occurs to inform you that the block reclamation scanner was reset.

Corrective Action

You can disable this message as follows: setflag wafl_blk_reclaim_scan_log 0

Syslog Message

Block reclamation scanner was reset on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name alone is insufficient.

wafl.br events

wafl.br.redir.invalid

Severity

ALERT

Description

This event is issued if block reallocation has not been performed on an aggregate but a reallocated block was found that subsequently needs to be redirected. Block reallocation operates in two phases: first the blocks on an aggregate are moved (reallocated), later, when the block is read, the old pointers to the block are updated (redirected). This event is issued when the second phase is required without the first phase occurring. Since this may indicate on-disk data corruption, the aggregate has been taken offline.

Corrective Action

(Call support).

Syslog Message

Invalid redirection: aggr:%s vol:%s

Parameters

aggr (STRING): The name of the aggregate
vol (STRING): The name of the volume

wafl.br.redir.nospace

Severity

NOTICE

Description

This message occurs when there's not enough free space to complete a redirect scan on a volume. The redirect scan improves performance by updating information that was changed because of block reallocation, but is not required for normal operation. This message is usually caused because reallocated blocks are shared between the active file system and a snapshot and cannot be updated without using more blocks than are currently available.

Corrective Action

Create more free space in the volume by deleting snapshots.

Syslog Message

The redirect scanner cannot complete its scan on '%s%s%s' because there is not enough disk space. Remove snapshots.

Parameters

volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier the volume in cases where the volume name itself is insufficient.

wafl.buf events

wafl.buf.badHeader

Severity

EMERGENCY

Description

This message occurs when the system encounters a bad header in the snapshot of the active map block of the filesystem.

Corrective Action

Delete the bad snapshot. For a SnapMirror® target, rebuild from source or resynchronize, after deleting the snapshot. If the problem persists or if you need further assistance, contact NetApp technical support.

Syslog Message

Bad header in snapshot of active map in %s %s%s%s%s, snapshot %d, fbn %llu.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapId (INT): Snapshot identifier.
fbn (LONGINT): File block number.

wafl.buf.freeingFreeBlock

Severity

EMERGENCY

Description

This message occurs when the system encounters a "freeing free block" error due to file system corruption.

Corrective Action

(Call support).

Syslog Message

Freeing free block at VBN %llu in %s %s%s%s%s. WAFL inconsistent. Contact NetApp technical support.

Parameters

vbn (LONGINT): Virtual block number of the block that is freed.
voltype (STRING): Type of the volume.
volowner (STRING): Owner of the volume.
volname (STRING): Name of the volume (again). This is returned from WAFL_VOL_PRINT_NAME_STRINGS.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
vendor (STRING): Name of the vendor.

wafl.c2c events

wafl.c2c.increase.vol.max.size.failed

Severity

ERROR

Description

This message occurs when attempt to increase volume max size limit during c2c restore fails due to an error.

Corrective Action

(None).

Syslog Message

Attempt to increase max size limit for volume:%s failed with Error:%d.

Parameters

vvolname (STRING): Name of the volume.
errorCode (INT): Error code

wafl.c2c.od.restore.scan.cloud.config.failed

Severity

NOTICE

Description

This message occurs when cloud config is unavailable and SMC on-demand restore from object store failed to start.

Corrective Action

(None).

Syslog Message

Phase:%s of the on-demand restore process for volume:%s with FSID:0x%x has failed. Attempt to restart SMC on-demand restore on this volume will continue in the background.

Parameters

>**restore_phase** (STRING): Specifies the phase for which the restore has been failed.
>**vol** (STRING): Volume name.
>**fsid** (INT): File system identifier of the volume.

wafl.c2c.od.restore.scan.initiated

Severity

>NOTICE

Description

>This message occurs when an on-demand restore from object store has been initiated.

Corrective Action

>(None).

Syslog Message

>Phase:%s of the on-demand restore process for volume:%s with FSID:0x%x has initiated.

Parameters

>**restore_phase** (STRING): Specifies the phase for which the restore has been initiated.
>**vol** (STRING): Volume name.
>**fsid** (INT): File system identifier of the volume.

wafl.c2c.od.restore.scan.restart.failed

Severity

>ALERT

Description

>This message occurs when SMC lazy restore scan restart attempt for transient error failed.

Corrective Action

>(None).

Syslog Message

>Restart Phase:%s of the on-demand restore process for volume:%s with FSID:0x%x has failed and error number %d. For more information or assistance, contact NetApp technical support.

Parameters

>**restore_phase** (STRING): Specifies the phase for which the restore has been failed.
>**vol** (STRING): Volume name.
>**fsid** (INT): File system identifier of the volume.
>**error** (INT): Error number.

wafl.c2c.restore.scan.abort

Severity

>NOTICE

Description

This message occurs when an operation to restore file(s)/volume from a cloud storage was aborted.

Corrective Action

(None).

Syslog Message

%s %s%s%s, %s Restore from cloud storage aborted.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
restore_type (STRING): Indicates whether the operation is Full Volume, Single File or On-demand Restore.

wafl.c2c.restore.scan.done

Severity

NOTICE

Description

This message occurs when an operation to restore file(s)/volume from a cloud storage was completed successfully.

Corrective Action

(None).

Syslog Message

%s %s%s%s, %s Restore from cloud storage completed.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
restore_type (STRING): Indicates whether the operation is Full Volume, Single File or On-demand Restore.

wafl.c2c.restore.scan.failed

Severity

ERROR

Description

This message occurs when there is an error during restoring of file(s) or Volume from a Cloud storage.

Corrective Action

(None).

Syslog Message

Restoring file with inode %d from cloud has failed with error %d for the volume %s with FSID 0x%x during %s Restore.

Parameters

fileid (INT): File identifier.
error (INT): Error Code.
vol (STRING): Volume name.
fsid (INT): File system identifier of the volume.
restore_type (STRING): Indicates whether the operation is Full Volume, Single File or On-demand Restore.

wafl.c2c.rst.fsize.exceeded

Severity

NOTICE

Description

This message occurs when the size of a file being restored exceeds the maximum file size allowed by the system during the restoration of either files or a volume from cloud storage. The restore operation will fail for that particular file or volume.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s, FSID 0x%x, Restoring file with file ID %d from cloud has failed because the file size exceeded the maximum file size allowed on the current system, which is %lu bytes. The size of the file being restored is %lu bytes.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume if the volume name itself is insufficient.
fsid (INT): File system identifier of the volume.
fileid (INT): File identifier.
maxsize (LONGINT): Maximum file size allowed on this system.
filesize (LONGINT): Size of the file being restored.

wafl.ca events

wafl.ca.cap.tier.usage.limit

Severity

ERROR

Description

This message occurs when the space used in the capacity tier of a FabricPool aggregate has exceeded or is projected to exceed the size limit set on the capacity tier. The projected usage is calculated based on the cold data already identified for tiering. The system will continue to serve data while space exists in the performance tier, but cold data will not be tiered to the capacity tier.

Corrective Action

Perform one or more of the following actions: o Free space in the capacity tier of the aggregate by moving volumes, removing volumes, or deleting data. o Increase the size limit set on the capacity tier.

Syslog Message

Aggregate %s capacity tier usage (%llu MB) has exceeded its size limit (%llu MB).

Parameters

aggregate (STRING): Aggregate name.
capacityTierUsage (LONGINT): Current capacity tier usage in MB.
capacityTierSizeLimit (LONGINT): Capacity tier size limit in MB.

wafl.ca.cloud.retrieval.policy

Severity

NOTICE

Description

This message occurs when the cloud retrieval policy for a volume in a FabricPool has been modified.

Corrective Action

(None).

Syslog Message

Cloud retrieval policy on volume '%s%s%s%s' has been modified to %s.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Identifier of the volume.
cloud_retrieval_policy (STRING): Cloud retrieval policy configured on the volume.

wafl.ca.cloud.write.disabled

Severity

NOTICE

Description

This message occurs when the cloud write option is disabled on a volume in a FabricPool aggregate.

Corrective Action

(None).

Syslog Message

The Cloud Write option is disabled on volume %s.

Parameters

vol (STRING): Name of the volume.

wafl.ca.cloud.write.enabled

Severity

NOTICE

Description

This message occurs when the cloud write option is enabled on a volume in a FabricPool aggregate.

Corrective Action

(None).

Syslog Message

The Cloud Write option is enabled on volume %s.

Parameters

vol (STRING): Name of the volume.

wafl.ca.cs.hdr.cfg.mismatch

Severity

ALERT

Description

This message occurs when the system detects that the IDs recorded in the configuration map for FabricPool object stores for a specific aggregate do not match the configuration IDs currently in use by the aggregate itself. This mismatch might affect the reporting of statistics and counters for FabricPool object stores.

Corrective Action

Run the "aggr wafliron start <aggr_name>" command on the aggregate specified to fix the inconsistency.

Syslog Message

Aggregate "%s" with bin ID "%d" has configuration IDs in the FabricPool statistics file (configuration ID 1: %d, configuration ID 2: %d) that are different from the configuration IDs of the object stores in the configuration map (primary configuration ID: %d, mirror configuration ID: %d).

Parameters

aggr (STRING): Name of the aggregate.
bin (INT): Bin ID of the object stores.
cfg_id_1 (INT): Configuration ID 1, as reported by the aggregate.
cfg_id_2 (INT): Configuration ID 2, as reported by the aggregate.
primary_cfg_id (INT): Configuration ID of the primary object store.
mirror_cfg_id (INT): Non-zero configuration ID of the mirror object store, or zero if no such store exists.

wafl.ca.GET.latency.thresh

Severity

ALERT

Description

This message occurs when the measured latency for a GET request from a cloud provider, for a specific aggregate and object store, exceeds the maximum threshold specified for that object store. This can impact performance and lead to request timeouts.

Corrective Action

Ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Measured latency for GET request from cloud (%d msec) exceeds the threshold (%d msec) (aggregate: %s, aggregate UUID: %s, object store: %s, object store provider: %s, object name: %s, offset: %d, length: %d).

Parameters

latency_msec (INT): Latency cycles specified in milliseconds.
threshold_msec (INT): Threshold value in milliseconds for the latency.
aggr (STRING): Name of the containing aggregate.
aggr_uuid (STRING): Universal unique identifier (UUID) of the aggregate.
config_name (STRING): Object store configuration name.
objstore_name (STRING): Object store provider name.
object_name (STRING): Object name.
offset (INT): Offset for GET request.
len (INT): Request length for GET request.

wafl.ca.GET.timeout.failure

Severity

EMERGENCY

Description

This message occurs when ONTAP fails to read a block from a cloud object because the underlying GET request times out.

Corrective Action

Ensure that the configuration of your object store has not changed, and that login and connectivity information are still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Failed to read an object from cloud due to GET request timeout (aggregate: %s, aggregate UUID: %s, object store: %s, object store provider: %s, object name: %s, offset: %d, length: %d).

Parameters

aggr (STRING): Name of the containing aggregate.
aggr_uuid (STRING): Universal unique identifier (UUID) of the aggregate.
config_name (STRING): Object store configuration name.
objstore_name (STRING): Object store provider name.

object_name (STRING): Object name.
offset (INT): Offset for GET operation.
len (INT): Request length for GET operation.

wafl.ca.latency.threshold

Severity

NOTICE

Description

This message occurs when the measured I/O latency from a cloud provider, for a specific aggregate and object store, exceeds the maximum threshold. This can impact performance and lead to request timeouts.

Corrective Action

(None).

Syslog Message

Measured latency from cloud (%d msec) exceeds the threshold (%d msec) (aggregate: %s, aggregate UUID: %s, object store: %s, S3 request: %s, object store provider: %s).

Parameters

latency_msec (INT): Latency cycles specified in milliseconds.
threshold_msec (INT): Threshold value in milliseconds for the latency.
aggr (STRING): Name of the containing aggregate.
aggr_uuid (STRING): Universal unique identifier (UUID) of the aggregate.
config_name (STRING): Object store configuration name.
op_name (STRING): S3 or Azure blob operation name.
objstore__name (STRING): Object store provider name

wafl.ca.mcc.tlog.drain.event

Severity

NOTICE

Description

This message occurs when tiering is enabled or disabled on a FabricPool in a MetroCluster(tm) configuration, when one or more mirrored plexes transitions from normal to degraded state or vice versa. Enabling or disabling tiering does not impact data availability or client read/write performance.

Corrective Action

(None).

Syslog Message

Mirrored plex "%s" on FabricPool "%s" is in "%s" state. Tiering is %s.

Parameters

plex_name (STRING): Name of the plex.
aggregate_name (STRING): Name of the FabricPool.
plex_state (STRING): Operational state of the plex.
message (STRING): Indicates whether tiering is enabled or disabled.

wafl.ca.migrate.aggr.nospace

Severity

NOTICE

Description

This message occurs when one or more FabricPool aggregates does not have space for hot data to be migrated back to the performance tier.

Corrective Action

Either free space in the performance tier of the aggregate (by moving volumes, removing volumes, or deleting data), or add space to the performance tier of the aggregate by adding disks.

Syslog Message

Aggregate %s: Current available space in the performance tier is below %d%%. Data migration from the capacity tier to the performance tier is stopped.

Parameters

aggr (STRING): Aggregate name.
threshold_percentage (INT): Percentage of aggregate space that must be unused for migration to occur.

wafl.ca.name.fmt.mismatch

Severity

ERROR

Description

This message occurs when the system detects an internal discrepancy on the name format version used by the FabricPool. Cloud operations on the FabricPool is affected.

Corrective Action

Run the 'debug vreport show' command to see the object name format version discrepancy. Follow the vreport guidance to fix the issue.

Syslog Message

Name format version discrepancy detected for FabricPool "%s". Operations to the object store affected.

Parameters

aggr (STRING): Name of the FabricPool.

wafl.ca.object.check.done

Severity

INFORMATIONAL

Description

This event is issued to indicate that the object check operation on a FabricPool aggregate completed successfully.

Corrective Action

(None).

Object check operation completed on FabricPool %s. Total lost objects: %d.

Parameters

aggr (STRING): Name of the containing aggregate.
num_lost_objs (INT): Number of lost objects identified.

wafl.ca.object.check.start

Severity

INFORMATIONAL

Description

This message occurs when object check operation on a FabricPool aggregate is started successfully.

Corrective Action

(None).

Syslog Message

Object check operation was started on FabricPool %s. Output will be saved at %s.

Parameters

aggr (STRING): Name of the containing aggregate.
logfile (STRING): Path for the logfile for object check output.

wafl.ca.object.storage.class.updated

Severity

NOTICE

Description

This message occurs when the object storage class is updated on a volume in a FabricPool aggregate.

Corrective Action

(None).

Syslog Message

The tiering storage class on volume %s is updated from %s to %s.

Parameters

vol (STRING): Name of the volume.
old_storage_class (STRING): Old tiering storage class.
new_storage_class (STRING): Updated tiering storage class.

wafl.ca.objtag.retry.limit

Severity

NOTICE

Description

This message occurs when the object tagging scanner fails to update tags on an object in the object store even after retrying for the maximum allowed attempts. The scanner is aborted for the current scan and will attempt to tag the object again the next time the scanner runs. The scanner is invoked every minute to check whether there are objects to be tagged.

Corrective Action

(None).

Syslog Message

Failed to update object tags in the object store even after multiple retry attempts, aggregate = %s, object ID =%lu, object name =%s, retries attempted = %d.

Parameters

aggregate_name (STRING): Aggregate name.
object_id (LONGINT): Object ID.
object_name (STRING): Object name.
num_retries (INT): Number of retries attempted.

wafl.ca.objtag.skip.retry

Severity

NOTICE

Description

This message occurs when the object tagging scanner fails to update tags on an object in the object store even after retrying for the maximum allowed attempts. The scanner continues to update tags on other objects instead of aborting the scan due to repeated failures over one or more objects.

Corrective Action

(None).

Syslog Message

Failed to update object tags in the object store even after multiple retry attempts. Tagging skipped on object: aggregate = %s, object ID =%lu, object name =%s, retries attempted = %d.

Parameters

aggregate_name (STRING): Aggregate name.
object_id (LONGINT): Object ID.
object_name (STRING): Object name.
num_retries (INT): Number of retries attempted.

wafl.ca.objtag.unsupported

Severity

NOTICE

Description

This message occurs when object tags are added or updated on a FabricPool volume. This message indicates that objects tiered from this volume will not be tagged in the object store.

Corrective Action

(None).

Syslog Message

Object tagging is supported only for a StorageGRID® object store in this version of ONTAP® software. Objects in %s object store (%s) attached to FabricPool %s will not be tagged in this version.

Parameters

provider_name (STRING): Object store name.
object_store_type (STRING): Object store type (primary or mirror).
aggregate (STRING): Name of the FabricPool.

wafl.ca.promote.none.nospc

Severity

NOTICE

Description

This message occurs when a FabricPool volume with tiering policy set to "none" and cloud retrieve policy set to "promote" does not have enough free space available to fetch all the data from the cloud. The scanner to fetch the data will abort and be periodically rescheduled until the space is available.

Corrective Action

Ensure the aggregate has the estimated amount of space needed available.

Syslog Message

Aggregate %s, Volume %s: Current available space in the performance tier is %llu bytes. There needs to be at least %llu bytes free in the aggregate to fetch an estimated %llu bytes from the cloud. Data migration from the capacity tier to the performance tier is paused.

Parameters

aggr (STRING): Aggregate name.
vol (STRING): Volume name.
avail_space (LONGINT): Free space in aggregate.
space_needed (LONGINT): Estimated amount of physical space that must be free to accommodate data fetched from the cloud.
cloud_space_to_fetch (LONGINT): Estimated amount of physical space to fetch from the cloud.

wafl.ca.promote.snap.nospc

Severity

NOTICE

Description

This message occurs when a FabricPool volume with tiering policy set to "snapshot_only" and cloud retrieve policy set to "promote" does not have enough free space available to fetch the AFS data from the cloud. The scanner to fetch the data will abort and be periodically rescheduled until the space is available.

Corrective Action

Ensure the aggregate has the estimated amount of space needed available.

Aggregate %s, Volume %s: Current available space in the performance tier is %llu bytes. There needs to be at least %llu bytes free in the aggregate to fetch AFS data from the cloud. Data migration from the capacity tier to the performance tier is paused.

Parameters

aggr (STRING): Aggregate name.
vol (STRING): Volume name.
avail_space (LONGINT): Free space in aggregate.
space_needed (LONGINT): Minimum amount of physical space that must be free to accommodate AFS data fetched from the cloud.

wafl.ca.remove.object.tag

Severity

NOTICE

Description

This message occurs when the system encounters a bad header in the block that stores the tag values associated with the objects that belong to the volume. As a result of this corruption, all the tags information stored in the block is cleared.

Corrective Action

(None).

Syslog Message

Clearing all tags due to inconsistencies found in the object tag metafile associated with volume %s.

Parameters

volname (STRING): Volume name.

wafl.ca.repaired.metafile

Severity

ERROR

Description

This message occurs when an inconsistency is discovered in one of the FabricPool metafile blocks. The inconsistency is automatically repaired upon detection.

Corrective Action

(None).

Syslog Message

Inconsistent block (%s) found in %s metafile on FabricPool aggregate (%s). Repaired.

Parameters

state (STRING): A description of the metafile block that was found to be inconsistent.
metafile_name (STRING): Name of the metafile.
aggr (STRING): Name of the FabricPool aggregate.

wafl.ca.resync.complete

Severity

NOTICE

Description

This message occurs when Data ONTAP® completes the resync process from the primary object store to the mirror object store for a mirrored FabricPool aggregate.

Corrective Action

(None).

Syslog Message

FabricPool mirror resync process is completed for FabricPool %s (uuid %s) from primary object store (config id %u) to mirror object store (config id %u).

Parameters

aggr (STRING): Name of the containing aggregate.
aggr_uuid (STRING): Universal Unique ID (UUID) of the aggregate.
primary_config_id (INT): Primary object store config id.
mirror_config_id (INT): Mirror object store config id.

wafl.ca.resync.read.fail

Severity

ALERT

Description

This message occurs when FabricPool mirror resynchronize attempt receives too many consecutive timeout failures while reading a single object from the primary. The mirror will stay in a degraded state until all objects can be read and copied to the mirror.

Corrective Action

Verify that your intercluster LIF is online and functional by using the "network interface show" command. Also, check network connectivity to the object store server by using the "ping" command over the destination node intercluster LIF. Additionally, ensure that the configuration of your object store has not changed, and that login and connectivity information is still accurate. If the condition persists, contact NetApp technical support.

Syslog Message

Unable to read cloud object from capacity tier (objid %llu, btuuid %s, seqno %llu) during FabricPool mirror resync.

Parameters

object_id (LONGINT): Object identifier.
btuuid (STRING): Buftree UUID.
seqno (LONGINT): Sequence number.

wafl.ca.resync.read.set.err.obj

Severity

ALERT

Description

This message occurs when Data ONTAP® marks all blocks in an object in a capacity tier object with an error due to FabricPool mirror resync read errors. This is useful for tracking generation of some pseudobad blocks due to resync read issues.

Corrective Action

Contact Contact NetApp technical support..

Syslog Message

Unable to read cloud object from capacity tier (objid %llu, btuuid %s, seqno %llu) during FabricPool mirror resync. As a result, all blocks in this object are marked with error (%u).

Parameters

object_id (LONGINT): Object identifier.
btuuid (STRING): Buftree UUID.
seqno (LONGINT): Sequence number.
error (INT): Error on the block.

wafl.ca.revert.ufmt.paused

Severity

ERROR

Description

This message occurs when the revert operation to convert a unified object format is paused either because there are one or more offline volumes in the FabricPool aggregate or because the tiering of unified format objects to the object store is pending.

Corrective Action

Bring the volumes online in the aggregate to resume the unified object format revert operation. Use the "volume object-store tiering show" command to check the tiering status of a volume.

Syslog Message

The operation to revert the object format to the native format paused on aggregate "%s" because there are offline volumes or the tiering of unified format objects to the object store is pending.

Parameters

aggregate_name (STRING): Aggregate name.

wafl.ca.slothdr.repair.done

Severity

INFORMATIONAL

Description

This event is issued to indicate that the slothdr repair operation for a FabricPool aggregate completed successfully.

Corrective Action

(None).

Syslog Message

Slothdr metafile repair operation completed for FabricPool %s.

Parameters

aggr (STRING): Name of the containing aggregate.

wafl.ca.slothdr.repair.start

Severity

INFORMATIONAL

Description

This message occurs when an operation to repair the slothdr metafile for a FabricPool aggregate is started successfully.

Corrective Action

(None).

Syslog Message

Slothdr metafile repair operation was started for FabricPool %s.

Parameters

aggr (STRING): Name of the containing aggregate.

wafl.ca.tier.aggr.spc.limit

Severity

ERROR

Description

This message occurs when the FabricPool aggregate does not have enough free space to tier cold data to the capacity tier. The system will continue to serve data, but cold data will not be tiered.

Corrective Action

Either free space in the performance tier of the aggregate by moving volumes, removing volumes, or deleting data, or add space to the performance tier of the aggregate by adding disks.

Syslog Message

Aggregate %s: Current available space in the performance tier is below %d%%. Data tiering from the performance tier is stopped.

Parameters

aggr (STRING): Aggregate name.
threshold_percentage (INT): Percentage of aggregate space that must be unused for tiering to occur.

wafl.ca.tier.max.size.limit

Severity

ERROR

Description

This message occurs when the capacity tier of a FabricPool aggregate reaches the maximum supported capacity tier size. The system will continue to serve data, but cold data will not be migrated to the capacity tier.

Corrective Action

This state can be corrected by performing one or more of the following actions: o Free space in the capacity tier of the aggregate by moving volumes, removing volumes, or deleting data.

Syslog Message

Aggregate %s capacity tier usage (%llu MB) has reached the maximum capacity tier size limit (%llu MB).

Parameters

aggregate (STRING): Aggregate name.
capacityTierUsage (LONGINT): Current capacity tier usage in MB.
maxCapacityTierSizeLimit (LONGINT): Maximum capacity tier size in MB.

wafl.ca.tiering.policy

Severity

NOTICE

Description

This message occurs when the tiering policy for a volume in a FabricPool has been modified.

Corrective Action

(None).

Syslog Message

Tiering policy on volume '%s%s%s%s' has been modified to %s.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
tiering_policy (STRING): Tiering policy configured on the volume.

wafl.ca.tlogput.modified

Severity

INFORMATIONAL

Description

This message occurs when the FabricPool Put operation settings are modified by an administrator.

Corrective Action

(None).

Syslog Message

FabricPool Put operation settings were modified. New Values, bytes-limit: %llu, latency-limit: %llu, preserved: %u,%u

Parameters

bytes_limit (LONGINT): The put-rate-bytes-limit value.
latency_limit (LONGINT): The put-latency-limit value.
preserve (INT): The preserve setting value.
can_preserve (INT): Non-Zero if the node supports preserving settings.

wafl.ca.total.space.incons

Severity

ERROR

Description

This message occurs when the counter tracking the total amount of space used in an object store bucket becomes inconsistent due to other inconsistencies in the object metadata.

Corrective Action

For more information or assistance, contact NetApp technical support.

Syslog Message

Inconsistency was found in the total object store space used by FabricPool aggregate "%s". Skipped space adjustments have caused overcounting by as much as %llu bytes.

Parameters

aggrname (STRING): Name of the aggregate.
space_delta (LONGINT): The estimated amount of space in bytes that could be overcounted as a result of other inconsistencies.

wafl.catalog events

wafl.catalog.invalid

Severity

NOTICE

Description

This event indicates that WAFL catalog block in nvram is invalid during nvram replay.

Corrective Action

(None).

Syslog Message

Wafl Catalog invalid.

Parameters

(None).

wafl.cbin events

wafl.cbin.iron.mirror.config.changed

Severity

INFORMATIONAL

Description

This message occurs when cloud mirror configuration changes during the WAFLiron operation on a FabricPool aggregate with unified format enabled.

Corrective Action

Run wafliron again on the aggregate.

Syslog Message

The wafliron cannot update total physical size on bin label as cloud mirror configuartion has changed on aggreagate %s. Please run wafliron again on the aggregate.

Parameters

aggregate_name (STRING): Aggregate name.

wafl.cbin.iron.objslothdr.invalid.entry.threshold.reached

Severity

INFORMATIONAL

Description

This message occurs when number of invalid entries in objslothdr metafile reaches the upper threshold during the WAFLiron operation on a FabricPool aggregate with unified format enabled.

Corrective Action

Run the fixup tool on the Fabricpool aggregate and after the fixup tool finishes, run wafliron again on the aggregate.

Syslog Message

The wafliron cannot update total physical size on bin label as number of invalid entries in slothdr metafile reached the upper threshold on aggregate %s. Please run the fixup tool on the aggregate before running wafliron again.

Parameters

aggregate_name (STRING): Aggregate name.

wafl.cbin.label.total.physical.size.overcounted

Severity

INFORMATIONAL

Description

This message occurs when overcounting of total physical size on the bin label happens due to invalid entries in slothdr metafile belonging to a Fabricpool aggregate with unified format enabled.

Corrective Action

Run the fixup tool on the Fabricpool aggregate and after the fixup tool finishes, run wafliron again on the aggregate.

Syslog Message

The total physical size on bin label belonging to Fabricpool aggregate %s might be overcounted as there were %llu invalid entries in slothdr metafile. The current physical used is %llu. Previously physical used was %llu. For further assistance, contact NetApp technical support.

Parameters

aggregate_name (STRING): Aggregate name.
invalid_entry_count (LONGINT): Number of invalid entries present in slothdr metafile.
physical_used (LONGINT): Current total physical used in capacity tier.
old_physical_used (LONGINT): Previous total physical used in capacity tier.

wafl.cbin.objslothdr.iron.skip.resync.in.progress

Severity

INFORMATIONAL

Description

This message occurs when wafliron skips ironing objslothdr metafile on a FabricPool aggregate with unified format enabled as resync operation is in progress.

Corrective Action

Run wafliron again once resync operation is complete.

Syslog Message

Wafliron has skipped ironing objslothdr metafile on aggregate %s as resync operation is in progress on this aggregate. Please run wafliron after resync operation is complete.

Parameters

aggregate_name (STRING): Aggregate name.

wafl.cde events

wafl.cde.decompression.fail

Severity

ERROR

Description

This message occurs when the WAFL® kernel cannot decompress a compressed user data block. This is an abnormal condition that can lead to inconsistencies in the user data.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

Failed to decompress a block on volume "%s" (vvbn=%llu pvbn=%llu). Details: %s.

Parameters

vol (STRING): Volume name.
vvbn (LONGINT): Virtual volume block number for which decompression failed.
pvbn (LONGINT): Physical volume block number for which decompression failed.
details (STRING): Additional information.

wafl.cdemap events

wafl.cdemap.repaired.metafile

Severity

ERROR

Description

This message occurs when an inconsistency is discovered in one of the metafile blocks. The inconsistency is automatically repaired upon detection.

Corrective Action

(None).

Syslog Message

Inconsistent block (%s) found in %s metafile on aggregate (%s). Repaired.

Parameters

state (STRING): A description of the metafile block that was found to be inconsistent.
metafile_name (STRING): Name of the metafile.
aggr (STRING): Name of the aggregate.

wafl.check events

wafl.check.info

Severity

ERROR

Description

Generic wafl check message

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): The message from wafl check

wafl.check.lostnfound.error

Severity

NOTICE

Description

WAFL failed to cleanup the lostnfound directory present in the metadir of the given volume.

Corrective Action

(None).

Syslog Message

Failed to cleanup lostnfound from the metadir of volume %s (reason: %s)

Parameters

vol (STRING): The volume name
err (STRING): The error string

wafl.cleanup events

wafl.cleanup.after.giveback

Severity

INFORMATIONAL

Description

This message occurs after WAFL® completes the post-giveback cleanup. The cleanup includes freeing memory resources allocated for the partner file system.

Corrective Action

(None).

Syslog Message

(None).

Parameters

delay (LONGINT): Amount of time (in milliseconds) WAFL took to perform the post giveback cleanup. 1518 blocks

wafl.cleanup.after.relocate

Severity

INFORMATIONAL

Description

This message occurs after WAFL® completes the aggregate relocation cleanup. The cleanup includes freeing memory resources allocated for the partner file system.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggrName (STRING): Name of the aggregate.
delay (LONGINT): Amount of time (in milliseconds) WAFL took to perform the post aggregate relocation cleanup.

wafl.cleanup.after.sendhome

Severity

INFORMATIONAL

Description

This message occurs after WAFL® completes the aggregate post-giveback cleanup. The cleanup includes freeing memory resources allocated for the partner file system.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggrName (STRING): Name of the aggregate.
delay (LONGINT): Amount of time (in milliseconds) WAFL took to perform the aggregate post-giveback cleanup.

wafl.clone events

wafl.clone.invalid.inherited.counters

Severity

ERROR

Description

This message alerts about invalid inherited counters for the clone flexible volume.

Corrective Action

(Call support).

Syslog Message

clone inherited counters for clone flexible volume %s on aggregate %s are invalid. The clone volume will be offlined. It is recommended to online parent volume if not already onlined. Once the parent volume is onlined, the clone also be onlined. Contact technical support for assistance.

Parameters

clonename (STRING): Clone flexible volume name.
aggrname (STRING): Aggregate name.

wafl.clone.no.basesnap

Severity

ERROR

Description

This message alerts you about a missing clone flexible volume base snapshot and strongly recommends that you take the clone flexible volume offline and destroy it.

Corrective Action

Take the clone flexible volume offline immediately. If you know that the clone does not contain any valuable data, you can safely destroy and re-create it.

Syslog Message

Base snapshot for clone flexible volume %s on aggregate %s is missing. It is strongly recommended that you take the clone offline and destroy it. Failure to do so might lead to clone panic at any time.

Parameters

clonename (STRING): Clone flexible volume name.
aggrname (STRING): Aggregate name.

wafl.clone.quota.error.ignored

Severity

ERROR

Description

This message occurs when a clone op cannot fail due to quota error because either quota accounting is ignored by the user (e.g, sfsr) or the clone op cannot fail (eg, split), so it ignores the quota error it received during quota check.

Corrective Action

None required.

Syslog Message

Sis clone running in (vol='%s', volident='%s') ignored quota error '%u' during '%s' operation.

Parameters

vol (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
error_code (INT): A numerical error code indicating the reason why the quota check failed.
op_type (STRING): Type of sis clone operation (create/split).

wafl.clone.snapSpcGuar

Severity

INFORMATIONAL

Description

This event is issued if an attempt is made to delete a snapshot in a clone volume that would require the space guarantee on the clone to exceed the available space in the aggregate. A clone volume initially shares one or more snapshots with its parent volume. This allows the space guarantee to be optimized,

reducing the space requirement in the aggregate. If a shared snapshot is deleted then extra space is required in the aggregate to ensure the space guarantee for the volume can be enforced. If the freespace in the aggregate is too small to allow this then the snap delete is rejected.

Corrective Action

This state can be corrected by performing one or more of the following actions: o Change the space guarantee on the volume so that less space is required in the aggregate. o Free space in the aggregate by shrinking or removing volumes. o Add space to the aggregate, e.g. by adding disks.

Syslog Message

Snapshot '%s' in clone volume '%s%s%s' cannot be deleted, there is insufficient space in the aggregate to enforce the space guarantee (%s)

Parameters

snap_name (STRING): The snapshot name
vol_name (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
guarantee (STRING): The current guarantee

wafl.clone.snapsplit.nospace

Severity

NOTICE

Description

This message occurs when there is not enough free space to complete a file clone split operation from the snapshot. The clone file might become unreadable when the parent snapshot is automatically deleted.

Corrective Action

Increase the space available to the volume by either adding disks or by freeing space in the volume to allow the split operation to continue.

Syslog Message

File clone split from snapshot of '%s%s%s' cannot be completed due to lack of disk space.

Parameters

name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.clone.split.start.vol.fenced

Severity

NOTICE

Description

This event indicates that vol clone split start was called for a fenced volume after iron completion.

Corrective Action

(None).

Syslog Message

Volume clone split start called for fenced volume '%s%s%s'.

Parameters

volname (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.clone.unrecoverable

Severity

ALERT

Description

This message occurs during boot when a clone is marked unrecoverable due to its missing base snapshot.

Corrective Action

If you know that the clone does not contain any valuable data, you can safely destroy and re-create it. If it contains any valuable data, you can recover only the data which was written after the volume clone was created. Trying to access the data which was shared with the base snapshot (original data) will result in error.

Syslog Message

Base snapshot for clone %s on aggregate %s is missing. Marking it unrecoverable.

Parameters

clonename (STRING): Clone name.
aggrname (STRING): Aggregate name.

wafl.compaction events

wafl.compaction.CP.value

Severity

INFORMATIONAL

Description

This message occurs when the aggregates compaction CP value is changed.

Corrective Action

(None).

Syslog Message

Compaction CP count in aggregate "%s" changed from %ld to %ld at aggregate's CP count %ld.

Parameters

volname (STRING): Volume name on which value was changed.
oldval (LONGINT): Old value of CP count.
newval (LONGINT): New value of CP count.
fs_cpcount (LONGINT): CP count of aggregate fsinfo.

wafl.compress events

wafl.compress.auto.disable

Severity

NOTICE

Description

This message occurs when compression is automatically disabled on a space guarantee volume because it is not supported on this platform.

Corrective Action

(None).

Syslog Message

WAFL compression automatically disabled in %s "%s".

Parameters

volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.

wafl.compress.cde.auto.enablement

Severity

NOTICE

Description

This message occurs when WAFL compression on container file level is automatically enabled on a volume.

Corrective Action

(None).

Syslog Message

WAFL auto adaptive compression automatically enabled in %s "%s".

Parameters

volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.

wafl.compress.cde.event

Severity

NOTICE

Description

This message occurs when WAFL compression on container file level is enabled or disabled on a volume.

Corrective Action

(None).

Syslog Message

WAFL container compression state changed in %s "%s" to "%s".

Parameters

volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.
message (STRING): Whether enable or disable.

wafl.compress.enable.failed

Severity

INFORMATIONAL

Description

This event is issued when FAS compression can not be enabled on a volume. The following reasons might be causing the problem: FAS compression might not be supported on the software release you're running; the volume is not a flexible volume or it is a root volume or snaplock volume; the compression/de-compression scanner is already active; or a clone operation is already underway.

Corrective Action

(None).

Syslog Message

Compression could not be enabled on volume "%s" at this time. Check the volume configuration and retry.

Parameters

vol (STRING): Volume name.

wafl.compress.fail.rootVol

Severity

NOTICE

Description

This message occurs when an administrator attempts to enable compression on the root volume. Compression cannot be enabled on the root volume.

Corrective Action

(None).

Syslog Message

'%s' is the root volume and compression cannot be enabled on the root volume.

Parameters

vol (STRING): Volume name.

wafl.compress.mark.cg.bad.hw

Severity

ALERT

Description

This message occurs when the FAS compression writes bad blocks for an inconsistent or corrupted compression group due to hardware errors.

Corrective Action

Restore the corrupted file from the snapshot, or contact NetApp technical support

Syslog Message

FAS compression: Writing bad blocks, at fbn:%llu level:%u in %s inode (fileid:%d snapid:%u) in volume %s%s%s%s.

Parameters

fbn (LONGINT): File block number.
level (INT): Buffer level.
ino_type (STRING): Inode type
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.compress.mark.cg.bad.sw

Severity

ERROR

Description

This message occurs when the FAS compression writes bad blocks for an inconsistent or corrupted compression group due to software errors.

Corrective Action

Restore the corrupted file from the snapshot, or contact NetApp technical support

Syslog Message

FAS compression: Writing bad blocks, at fbn:%llu level:%u in %s inode (fileid:%d snapid:%u) in volume %s%s%s%s.

Parameters

fbn (LONGINT): File block number.
level (INT): Buffer level.
ino_type (STRING): Inode type
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.compress.scan.checkpoint.deleted

Severity

NOTICE

Description

This event is generated when the FAS compression of existing data for volume deletes checkpoint.

Corrective Action

(None).

Syslog Message

vol compress: Checkpoint deleted for compression of existing data for volume "%s%s%s".

Parameters

vol (STRING): Name of the compressed volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.convert events

wafl.convert.directory.failed

Severity

ERROR

Description

This message occurs when a directory cannot be safely converted to Unicode format. The directory contains files or subdirectories that must first be renamed.

Corrective Action

Use the "volume file show-inode" command with the directory inode number and volume name information to find the path of the directory that could not be converted. There are some files or subdirectories within this parent directory that have names like "{123456789}". File names like these can make it unsafe for ONTAP® software to automatically convert a directory to Unicode format. To convert the directory, first rename the files or subdirectories in this parent directory that have names matching this pattern. To perform these renames, make sure that the volume has the "-convert-ucode" property set to "false", and then rename the content using an NFSv3 client.

Syslog Message

Volume "%s:%s" was unable to convert directory %u to Unicode.

Parameters

vserver_uuid (STRING): Universal Unique ID (UUID) of the volume's Vserver.
volume (STRING): Volume name that the directory is in.
directory_inum (LONGINT): The Inode number (fileid) of the directory.

wafl.cop events

wafl.cop.flowcontrol.end

Severity

NOTICE

Description

This message occurs when the system is out of the flow control mode which was earlier initiated as a high number of volumes were receiving modify operations concurrently beyond a certain threshold.

Corrective Action

(None).

Syslog Message

The node is out of the flow control mode which was earlier initiated as a high number volumes were receiving modify operations concurrently beyond a certain threshold (%lu).

Parameters

high_concurrency_flowcontrol_thres (LONGINT): System defined threshold beyond which high-concurrency flow control mode is triggered.

wafl.cop.flowcontrol.start

Severity

NOTICE

Description

This message occurs when the system is in a very high concurrency mode; i.e., when a high number of volumes receive modify operations concurrently beyond a certain threshold. The system is automatically getting into a flow control mode, where it may hold ops on certain volumes for longer time in order to reduce high-concurrency related impacts.

Corrective Action

If the flow control situation is long-lived, and the delays are not acceptable, the concurrency level among the volumes need to be brought down by moving the volumes (preferably the ones encountering delays) out of this node.

Syslog Message

Very high number of volumes (%lu) are receiving modify operations concurrently. The node is in a flow control mode (threshold: %lu). As a result few volumes may experience higher delay in latency.

Parameters

concurrent_vvols_cnt (LONGINT): Number of volumes actively receiving modify operations.
high_concurrency_flowcontrol_thres (LONGINT): System defined threshold beyond which high-concurrency flow control mode is triggered.

wafl.cop.high.concurrency

Severity

NOTICE

Description

This message occurs when the system is in high-concurrency mode; i.e., when a high number of FlexVol® volumes receive modify operations concurrently during a monitoring interval. High concurrency might cause degradation in performance.

Corrective Action

(None).

Syslog Message

A high number of FlexVol volumes are receiving modify operations concurrently. Interval (ms): %lu, Aggregate: %s, Frequency: %lu out of %lu times, Threshold criteria: more than %u FlexVol volumes were concurrently receiving modify operations, Distribution: %s.

Parameters

monitoring_interval (LONGINT): Duration of monitoring interval in milliseconds.
aggr (STRING): Name of the aggregate.
cp_above_vvol (LONGINT): Number of Consistency Points (CPs) with FlexVol volumes participating above the vvol_threshold value in this monitoring interval.
total_cp_in_interval (LONGINT): Number of CPs that happened in the monitoring interval.
vvol_threshold (INT): Minimum number of FlexVol volumes in a CP to call it a "highly concurrent CP".
histogram (STRING): A histogram [b1 : v1, b2 : v2, …, b8 : v8], where "b" represents bin ID and "v" represents count of the corresponding bin ID.

wafl.cp events

wafl.cp.toolong

Severity

ERROR

Description

This message occurs when a WAFL® consistency point (CP) takes longer than 30 seconds. A CP lasting more than 30 seconds might cause client latency and potentially a client outage.

Corrective Action

For additional information about this specific CP, see the kernel log file and the corresponding CM archive. For further information about correcting the problem, search the knowledgebase of the NetApp technical support support web site for the "wafl.cp.toolong" keyword.

Syslog Message

Aggregate %s experienced a long CP.

Parameters

aggrname (STRING): Name of the aggregate.
repeats (INT): Number of consecutive long CPs on this volume.
cp_count (INT): CP count on the volume corresponding to the long CP.
total_ms (INT): Total time taken by the CP, in milliseconds.
total_dbufs (LONGINT): Total number of dirty buffers in the CP.
tetrises (INT): Number of tetrises that were written across all raidgroups in volume.
blocks (LONGINT): Number of blocks that were written across all raid groups in the volume.
rgid (INT): ID of the raid group with the highest average tetris write time.
clean (INT): Milliseconds to write allocate (clean) all normal files.
flush (INT): Milliseconds to write all remaining blocks to disk.

wafl.csm events

wafl.csm.sessionStopped

Severity

INFORMATIONAL

Description

This message occurs when the Cluster Session Manager (CSM) session is stopped as part of the shutdown process.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

wafl.data events

wafl.data.compaction.event

Severity

NOTICE

Description

This message occurs when data compaction functionality is enabled or disabled on a volume.

Corrective Action

(None).

Syslog Message

WAFL volume data compaction state changed in %s "%s" to "%s".

Parameters

volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.
message (STRING): Whether enable or disable.

wafl.delete events

wafl.delete.bad.indirect

Severity

NOTICE

Description

This message occurs when the system encounters a lost indirect block while deleting a file. As a result, some space occupied by the file being deleted might not be reclaimed.

Corrective Action

Run wafliron to fix any space accounting discrepancies.

Syslog Message

Lost indirect block encountered while deleting inode %d (level %d, vbn %llu) on %s %s%s%s%s. Contact NetApp technical support.

Parameters

ino (INT): Inode number of the file.
level (INT): Indirection level of the block.
vbn (LONGINT): Block number of the block within the volume.
type (STRING): Type of the object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Name of the volume containing the file.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.delete.fenced.file

Severity

NOTICE

Description

This message occurs when the user attempts to delete a fenced file. Depending on the type of fence, reads and/or writes will not be permitted for the file.

Corrective Action

Use the "volume file show-inode" command to confirm the file name that matches the inode, for example, "volume file show-inode -vserver 'vserver that fenced file is stored on' -volume 'volume that fenced file is stored on' -inode-number 'inode number of fenced file'". Clear the fenced status by using the "iofence clear 'file path name'" diagnostic privilege nodeshell command, and then the file can be deleted from the NFS/CIFS client.

Syslog Message

The file with inode %d on volume %s cannot be deleted because it is fenced by %s operation.

Parameters

fid (INT): Inode of the fenced file.
vol (STRING): Name of the volume that contains the fenced file.
owner (STRING): Name of the operation that fenced the file.

wafl.delete.specdev

Severity

INFORMATIONAL

Description

This message occurs when the system encounters a block or character device during zombie delete processing.

Corrective Action

(None).

Syslog Message

Block or character device encountered in zombie path: inode: %d, type: %d, size: %lld, block count: %llu. Possible inconsistency detected on %s %s%s%s%s.

Parameters

ino (INT): Inode number.
inotype (INT): Inode type.
size (LONGINT): Size.
blocks (LONGINT): Block count.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
vendor (STRING): Vendor contact information.

wafl.descend events

wafl.descend.fail

Severity

ERROR

Description

This message occurs when there is an error during descendency checking. This message can occur when accessing a directory in a snapshot that is being deleted.

Corrective Action

This condition might be transient; try the operation again. If the problem persists, contact NetApp technical support.

Syslog Message

Descendency check failure: {x%x %d %d %d %d} parent of {x%x %d %d %d %d}. Contact NetApp technical support.

Parameters

pfh0 (INT): Parent file handle's flags.
pfh1 (INT): Parent file handle's snapid.
pfh2 (INT): Parent file handle's fileid.
pfh3 (INT): Parent file handle's generation.
pfh4 (INT): Parent file handle's FSID.
cfh0 (INT): Child file handle's flags.
cfh1 (INT): Child file handle's snapid.
cfh2 (INT): Child file handle's fileid.
cfh3 (INT): Child file handle's generation.

cfh4 (INT): Child file handle's FSID.
vendor (STRING): Vendor contact information.

wafl.dir events

wafl.dir.convert

Severity

NOTICE

Description

This message indicates that CIFS directory conversion is in progress and WAFL will not hang due to timeout. Directory conversion happens the first time a volume with 8.3-format names is accessed by a CIFS client.

Corrective Action

(None).

Syslog Message

WAFL %s directory conversion in progress.

Parameters

type (STRING): Type of directory operation (revert/convert).

wafl.dir.convert.denied.2big

Severity

ERROR

Description

This message occurs when access to a directory is rejected because an attempted operation requires the directory to be converted to Unicode format and the directory is too large to be converted quickly. Directory conversion is required for a directory with 8.3-format names to be accessed by a CIFS or NFSv4 client.

Corrective Action

Use the "volume modify" command to enable the "convert_ucode" option on the volume experiencing the rejected access, and then retry the access attempt. Note that this might result in system performance degradation or temporary loss of service while the conversion occurs. Search on "Converting existing directories to Unicode format" for more information.

Syslog Message

Access to large directory on volume MSID:%u, file ID:%u rejected for requiring conversion.

Parameters

msid (LONGINTHEX): Volume master data set identifier (MSID) of the volume experiencing the rejected access.
fileid (INT): File identifier of the directory experiencing the rejected access.

wafl.dir.depth.max

Severity

ERROR

Description

This message occurs when a directory depth reaches its maximum depth limit. The default maximum depth is 2000.

Corrective Action

Reduce the depth of the directory, by moving directory hierarchy to higher levels.

Syslog Message

Directory depth for inum %d in volume %s%s exceeds the maximum directory depth limit. To fix this issue, please reduce the directory depth.

Parameters

fileid (INT): Fileid of the directory for which directory depth reached its maximum limit.
vol (STRING): Volume in which directory depth reached its maximum limit.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier in cases where volume name itself is insufficient.

wafl.dir.duplicate.hash

Severity

NOTICE

Description

This message occurs when a directory entry has a duplicate index hash for longname and dosname/altname is deleted from the directory.

Corrective Action

(None).

Syslog Message

An entry with duplicate index hash is found in directory inum %d in volume %s%s%s. Directory index clears to fix this issue.

Parameters

fileid (INT): File ID of the directory.
vol (STRING): Volume name.
app (STRING): Application universal unique identifier(UUID).
volident (STRING): Unique volume identifier in cases where volume name itself is insufficient.

wafl.dir.fileId.err

Severity

ERROR

Description

This event is issued when directory prefetch results in inconsistent file identifier data. The fh[0] to fh[4] parameters represent the encoded filehandle value.

Corrective Action

If this error condition occurs, contact NetApp technical support for further assistance.

Syslog Message

wafl_prefetch_dir_inos: inconsistent fileid %d in %s directory {x%x %d %d %d %d}.

Parameters

fileId (INT): The file identifier
ino_type (STRING): The inode type
fh0 (INT): fh[0]
fh1 (INT): fh[1]
fh2 (INT): fh[2]
fh3 (INT): fh[3]
fh4 (INT): fh[4]

wafl.dir.link.max

Severity

ERROR

Description

This message occurs as a warning when a parent directory reaches its maximum link limit within a specified time interval and the no of parent directory reached maximum hard link limit reached the upper limit. A directory has only one parent directory, which counts as a hard link. All other hard links are from the directories contained within this directory. The link to the parent directory cannot be removed.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Reduce the hard link count of this directory by moving some of its subdirectories to another directory, or remove some of its subdirectories.

Syslog Message

This is the last warning for failure to create a new sub-directory since parent directory with fileid %d in volume %s%s has reached its sub-directory limit.

Parameters

fileid (INT): File ID of the parent directory that has reached its maximum hard link limit.
vol (STRING): Name of the volume in which the parent directory resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory resides, when the volume name alone is insufficient.

wafl.dir.link.reachingLimit

Severity

ERROR

Description

This message occurs when a parent directory surpasses 90% of its maximum hard link limit. The total hard link count for a directory is the number of its subdirectories plus other hard links to the directory.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Move some of the parent directory's subdirectories to a different directory. Take care not to create too many new subdirectories in the parent directory that is reaching its limit until you reduce the hard link count.

Syslog Message

The directory with fileid %d in volume %s%s%s is approaching the maximum link limit of %d. Reduce the number of links to the existing parent directory.

Parameters

fileid (INT): File ID of the parent directory that has surpassed 90% of its maximum hard link limit.
vol (STRING): Name of the volume in which the parent directory resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory resides, when the volume name alone is insufficient.
maxLink (INT): Maximum number of hard links for the parent directory.

wafl.dir.link.trap

Severity

ALERT

Description

This message occurs as a warning when a directory has reached its maximum hard link limit and the specified time interval is exceeded.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Reduce the hard link count of this directory by moving some of its subdirectories to another directory, or remove some of its subdirectories.

Syslog Message

(None).

Parameters

fileid (INT): File ID of the parent directory that has reached its maximum hard link limit.
vol (STRING): Name of the volume in which the parent directory resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory resides, when the volume name alone is insufficient.
maxLink (INT): Maximum number of hard links allowed.

wafl.dir.link.warning

Severity

ERROR

Description

This event occurs as a warning when a parent directory reached its maximum hard link limit within a specified time interval and the no of parent directory reached maximum hard link limit is below the upper limit.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. create new subdirectories in a different parent directory. Alternatively, move some of the current parent directory's subdirectories to a different directory.

Syslog Message

A request to make a subdirectory in parent directory with fileid %d in volume %s%s could not be handled because the parent directory has reached its link limit; use a different parent directory or reduce the number of hard links by moving some of its subdirectories to a different directory.

Parameters

fileid (INT): File ID of the parent directory that has reached its maximum hard link limit.
vol (STRING): Name of the volume in which the parent directory resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory resides, when the volume name alone is insufficient.

wafl.dir.nt.max

Severity

ERROR

Description

This message occurs when an inode has reached its maximum number of NT streams.

Corrective Action

Reduce the number of streams on the file.

Syslog Message

Inode "%d" in volume "%s%s%s" has reached its maximum number of NT streams.

Parameters

fileId (INT): File identifier.
vol (STRING): Name of the volume in which the inode resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the inode is present.

wafl.dir.nt.warning

Severity

NOTICE

Description

This message occurs when an inode is nearing its maximum number of NT streams.

Corrective Action

(None).

Syslog Message

Inode "%d" in volume "%s%s%s" is nearing its maximum number of NT streams.

Parameters

fileId (INT): File identifier.
vol (STRING): Name of the volume in which the inode resides.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the inode is present.

wafl.dir.size.max

Severity

EMERGENCY

Description

This message occurs after a directory has reached its maximum directory size (maxdirsize) limit.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Reduce the number of files in the directory. If not possible, use the (privilege:advanced) option "volume modify -volume vol_name -maxdir-size new_value" to increase the maximum number of files per directory. However, doing so could impact system performance. If you need to increase the maximum directory size, contact NetApp technical support.

Syslog Message

Directory size for fileid "%d" in volume "%s%s" reached the maxdirsize limit.

Parameters

fileid (INT): File ID of the directory that has reached maximum size for directories in its volume.
vol (STRING): Volume in which the directory is present.
app (STRING): Application universal unique identifier(UUID).
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory resides, when the volume name alone is insufficient.

wafl.dir.size.max.warning

Severity

ERROR

Description

This message occurs when the size of a directory has reached or surpassed a configured percentage (default: 90%) of its current maximum directory size (maxdirsize) limit, and the current maxdirsize is less than the default maxdirsize, which is 1% of total system memory.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Reduce the number of files in the directory. If not possible, use the (privilege:advanced) option "volume modify -volume vol_name -maxdir-size new_value" to increase the maximum number of files per directory. However, doing so could impact system performance. If you need to increase the maximum directory size, contact technical support.

Syslog Message

Directory size for file ID "%d" in volume "%s%s" is approaching the maximum directory size (maxdirsize) limit.

Parameters

fileid (INT): File ID of the directory that has reached or is approaching the current maximum size for directories in its volume.
vol (STRING): Name of the volume in which the directory is located.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory is located, when the volume name alone is insufficient.

wafl.dir.size.warning

Severity

ALERT

Description

This message occurs when the size of a directory surpasses a configured percentage (default: 90%) of its current maximum directory size (maxdirsize) limit.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Reduce the number of files in the directory. If not possible, use the (privilege:advanced) option "volume modify -volume vol_name -maxdir-size new_value" to increase the maximum number of files per directory. However, doing so could impact system performance. If you need to increase the maximum directory size, contact NetApp technical support.

Syslog Message

Directory size for file ID "%d" in volume "%s%s" is approaching the maximum directory size (maxdirsize) limit.

Parameters

fileid (INT): File ID of the directory that has surpassed 90% of current maximum size for directories in its volume.
vol (STRING): Name of the volume in which the directory is located.
app (STRING): Application universal unique identifier(UUID).
volident (STRING): Unique volume identifier (UUID) of the volume in which the parent directory is located, when the volume name alone is insufficient.

wafl.dir.surrpair.filename

Severity

ERROR

Description

This message occurs as a warning when a file name with surrogate pair characters in UTF-16 encoding fails to be created in a parent directory.

Corrective Action

To allow names with surrogate pairs to be created, use the following command: "setflag wafl_reject_surrogate_pair 0". If the option needs to be set across reboots, set the bootarg 'wafl-accept-surrogate-pair?' to "true" at the LOADER prompt.

Failed to create a file with surrogate pair characters in the name in the directory %s.

Parameters

dir (STRING): Parent directory.

wafl.dirent events

wafl.dirent.illegal.encoding

Severity

ERROR

Description

This message occurs when a user attempts to use a directory entry name that is not supported by the virtual server's language setting.

Corrective Action

Use directory entry name with encoding that matches the virtual server's language setting.

Syslog Message

The encoding of directory entry name %s doesn't match the virtual server's language code %s.

Parameters

filename (STRING): The filename
langcode (STRING): Language code

wafl.disable events

wafl.disable.vol.guarantee

Severity

NOTICE

Description

This message occurs when the volume guarantee of a flexible volume is disabled due to aggregate space being physically overallocated.

Corrective Action

Remount the aggregate after creating space by increasing the aggregate size or by deleting/moving some volumes to the other aggregates. Use the "storage aggregate show-space" command to view the current space usage of the aggregate. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate snapshots are deleted automatically to make some space when the aggregate is full.

Syslog Message

Volume guarantee on volume "%s" is disabled after the aggregate "%s" becomes physically overallocated.

Parameters

> **vol** (STRING): Volume name whose guarantee is getting disabled.
> **aggr** (STRING): The aggregate name on which the volume whose guarantee is getting disabled resides.

wafl.dosname events

wafl.dosname.repair.fail

Severity

> ERROR

Description

> This message occurs when the system cannot correct duplicate dosnames present in a directory.

Corrective Action

> From the NFS client, check the directory for file or subdirectory names like {}. Rename these, and then run (privilege diag) the "wafl dosname" node shell command on the directory.

Syslog Message

> Dosname repair failed for file ID: %d volume %s:%s.

Parameters

> **fileid** (INT): Directory file ID where dosname repair failed.
> **vserver_uuid** (STRING): Universal Unique ID (UUID) of the volume's Vserver.
> **volume** (STRING): Volume name.

wafl.dosname.repair.success

Severity

> NOTICE

Description

> This message occurs when the "wafl dosname" command is completed successfully.

Corrective Action

> (None).

Syslog Message

> "wafl dosname" command successfully completed on volume %s:%s. Total files corrected: %d.

Parameters

> **vserver_uuid** (STRING): Universal Unique ID (UUID) of the volume's Vserver.
> **volume** (STRING): Volume name.
> **total** (INT): Total number of directory entries changed.

wafl.enc events

wafl.enc.aggrMFRecreated

Severity

NOTICE

Description

This message occurs when the system detects a corrupted WAFL aggregate encryption keys metafile and creates a corrected replacement.

Corrective Action

(None).

Syslog Message

"Recreated aggregate %s encryption keys metafile."

Parameters

aggr (STRING): Aggregate name.

wafl.enc.aggrMFRecreateFail

Severity

ALERT

Description

This message occurs when the system detects a corrupted WAFL aggregate encryption keys metafile and is unable to create a corrected replacement. The system might not be able to mount volumes.

Corrective Action

Contact NetApp technical support.

Syslog Message

"Failed to recreate aggregate %s encryption key metafile."

Parameters

aggr (STRING): Aggregate name.

wafl.encrypted events

wafl.encrypted.aggr.created

Severity

NOTICE

Description

This message occurs when a NetApp® Aggregate Encryption (NAE) aggregate is created.

Corrective Action

(None).

Syslog Message

NAE aggregate "%s" is created.

Parameters

Aggregate (STRING): Name of the aggregate.
KeyID_1 (STRING): Aggregate key ID of key1.
KeyID_2 (STRING): Aggregate key ID of key2.
KeyID_3 (STRING): Aggregate key ID of key3.
KeyID_4 (STRING): Aggregate key ID of key4.

wafl.encrypted.aggr.modified

Severity

NOTICE

Description

This message occurs when an aggregate is converted to a NetApp® Aggregate Encryption (NAE) aggregate.

Corrective Action

(None).

Syslog Message

Aggregate "%s" is converted to a NAE aggregate.

Parameters

Aggregate (STRING): Name of the aggregate.
KeyID_1 (STRING): Aggregate key ID of key1.
KeyID_2 (STRING): Aggregate key ID of key2.
KeyID_3 (STRING): Aggregate key ID of key3.
KeyID_4 (STRING): Aggregate key ID of key4.

wafl.encryption events

wafl.encryption.unsupported

Severity

ALERT

Description

This message occurs when the system takes offline an encrypted virtual volume because encryption became unsupported.

Corrective Action

Reenable support for encryption by setting the bootarg "bootarg.disable.volume.softwareencryption.support" to "false", reboot the system and then bring online the encrypted volume.

Syslog Message

Keeping encrypted volume "%s" (UUID: %s) offline because encryption has become unsupported.

Parameters

> **uuid** (STRING): UUID of the volume.
> **vol** (STRING): Volume name.

wafl.err events

wafl.err.L1.compacted.block

Severity

> NOTICE

Description

> This message occurs when a level 1 indirect block with given block number is not found in a compacted block.

Corrective Action

> (None).

Syslog Message

> Block number 0x%llx is not found in the compacted block.

Parameters

> **vvbn** (LONGINT): Volume block number.

wafl.extent events

wafl.extent.size.reset

Severity

> NOTICE

Description

> This message occurs when the volume extent option is set and WAFL® encounters an invalid extent size. This message indicates that the extent size was reset to a valid default value.

Corrective Action

> (None).

Syslog Message

> Extent size for volume %s was reset to %d.

Parameters

> **vol** (STRING): Name of the volume.
> **extent_size** (INT): New extent size.

wafl.failed events

wafl.failed.mount

Severity

EMERGENCY

Description

This message occurs when the ONTAP® kernel cannot mount a volume because of file system inconsistency.

Corrective Action

Contact NetApp technical support.

Syslog Message

WAFL inconsistent: Mount failed for volume %s%s%s%s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.failed.mount.bad.fsid

Severity

EMERGENCY

Description

This message occurs when DATA ONTAP® cannot mount a volume because of a hardware failure in the disk subsystem. The failure invalidates and clears the unique identifier (FSID) that was assigned to the volume at the time of creation, resulting in an invalid FSID value of 0 and making the volume inaccessible for clients. The volume will be left in the offline state without any data loss.

Corrective Action

Check for disk failures and replace any failed disks. A subsequent mount call for the volume, either from the boot path or an admin level online request, would be able to read a valid FSID now, thus solving this problem. For more information or assistance, contact NetApp technical support.

Syslog Message

Invalid file system identifier (FSID): Mount failed for volume %s%s%s%s.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name itself is insufficient.

wafl.failed.online.labelread

Severity

ERROR

Description

This message occurs if the system is unable to read a valid aggregate label from the disks which prevents onlining the aggregate.

Corrective Action

Contact NetApp technical support.

Syslog Message

Unable to read the label for aggregate ID "%d" and will not be online.

Parameters

fa_id (INT): Aggregate ID for which the label read fails.

wafl.failed.online.vol.info

Severity

ERROR

Description

This message occurs if the system is unable to read valid aggregate volume information from the disks which prevents onlining the aggregate.

Corrective Action

Contact NetApp technical support.

Syslog Message

Unable to read the volume information for aggregate ID "%d" and will not be online.

Parameters

fa_id (INT): Aggregate ID which fails to read the volume info.

wafl.failed.rootAggr.online

Severity

ERROR

Description

This message occurs if the system is unable to bring any of the aggregates online because the root aggregate cannot be onlined.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to online the root aggregate.

Parameters

(None).

wafl.fc events

wafl.fc.recl.csm.disconnect

Severity

EMERGENCY

Description

This message occurs when a FlexCache® origin node detects that its FlexCache volume has disconnected while a lock reclaim operation is in progress.

Corrective Action

Verify that the intercluster LIFs on both nodes are operational.

Syslog Message

FlexCache origin node with UUID %s detected potential disconnect with FlexCache with UUID %s while processing lock reclaims for the volume with MSID %u hosted on Vserver with UUID %s.

Parameters

localbladeuuid (STRING): Universally unique identifier (UUID) of the origin node.
bladeuuid (STRING): UUID of the FlexCache Cache node.
msid (LONGINT): Volume master data set identifier (MSID) of the FlexCache volume.
vserveruuid (STRING): UUID of the FlexCache Vserver.

wafl.fgmember events

wafl.fgmember.rollback

Severity

ERROR

Description

This message occurs when a member of a FlexGroup experiences an unexpected rollback in its state due to a loss of the NVRAM log for the member. This indicates that the volume might have inconsistencies between members.

Corrective Action

Run the fgiron tool against the FlexGroup to ensure consistency.

Syslog Message

FlexGroup %u member %u/%u detected a rollback.

Parameters

FlexGroupMSID (LONGINTHEX): Volume master data set identifier (MSID) of the FlexGroup that experienced a rollback due to NVRAM loss.
FlexGroupMemberMSID (LONGINTHEX): Volume master data set identifier (MSID) of the FlexGroup member that experienced a rollback due to NVRAM loss.
FlexGroupMemberDSID (LONGINTHEX): Volume data set identifier (DSID) of the FlexGroup member that experienced a rollback due to NVRAM loss.

wafl.filecg events

wafl.fileCG.vvol.size.exceeded

Severity

ERROR

Description

This message occurs when a volume with file-based compression(either secondary compression or 8k/16K/32K adaptive compression) have nominal size greater than 300TB.

Corrective Action

(None).

Syslog Message

Nominal size of the "%s" volume exceeded the 300TB limit.

Parameters

vvolname (STRING): Name of the volume.

wafl.fs events

wafl.fs.corrupt.fr.pct.changed

Severity

NOTICE

Description

This message occurs during volume mount, when the fractional reservation value for a volume is found to be corrupted. This is necessary because the storage system software only supports fractional reservation values of 0% and 100%. The guarantee type setting of a volume determines what the correct fractional reservation must be. For volumes with a guarantee type of VOLUME or NONE the value must be corrected to be 0%. For volumes with a guarantee type of FILE the value must be set to 100%.

Corrective Action

(None).

Syslog Message

The corrupted fractional reservation value for volume '%s%s%s' with guarantee type '%s' has been changed from %d%% to %d%%.

Parameters

vol (STRING): Name of the volume whose fractional reservation value was changed.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
guarantee_type (STRING): Guarantee type of the volume.
old_fr_pct (INT): Old fractional reservation value of the volume.
new_fr_pct (INT): New fractional reservation value of the volume.

wafl.fs.file.guarnt.upgraded

Severity

ERROR

Description

This message occurs during a volume upgrade, when the space guarantee style for a volume is changed to either "none" or "volume" (guarantee is disabled). This is necessary because Data ONTAP® no longer supports "file" space guarantee style for flexible volumes.

Corrective Action

Use the "volume show -volume <volume-name> -fields space-guarantee" command to display the volume's new space guarantee style. To modify the style to "volume", ensure that there is enough space in the aggregate, and then enter the "volume modify -vserver <vserver-name> -space-guarantee volume <volume-name>" command. To modify the style to "none" enter the "volume modify -vserver <vserver-name> -space-guarantee none <volume-name>" command.

Syslog Message

The space guarantee type for volume '%s%s%s' has been upgraded from file to %s.

Parameters

vol (STRING): Name of the volume whose file guarantee was changed.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
new_guarantee_type (STRING): New space guarantee type chosen for the volume.

wafl.fs.upgrade.fr.pct.changed

Severity

NOTICE

Description

This message occurs during a volume upgrade, when the fractional reservation value for a volume is checked and corrected. This is necessary because the storage system software only supports fractional reservation values of 0% and 100%. The guarantee type setting of a volume determines what the fractional reservation value must be. For volumes with a guarantee type of VOLUME or NONE the value must be set to 0%. For volumes with a guarantee type of FILE the value must be set to 100%.

Corrective Action

(None).

Syslog Message

The fractional reservation value for volume '%s%s%s' with guarantee type '%s' has been changed from %d%% to %d%%.

Parameters

vol (STRING): Name of the volume whose fractional reservation value was changed.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
guarantee_type (STRING): Guarantee type of the volume.
old_fr_pct (INT): Old fractional reservation value of the volume.
new_fr_pct (INT): New fractional reservation value of the volume.

wafl.fsa events

wafl.fsa.autosize.valid.fail

Severity

ERROR

Description

This message occurs when enabling file system analytics on a volume with autosize enabled fails because there is insufficient space in the volume.

Corrective Action

Increase the volume size or free space on the volume until there is at least 8% free space for transitioned volumes or 5% for non-transitioned ones. Use the "volume modify" command to increase volume size.

Syslog Message

Enabling file system analytics on %s "%s" in SVM "%s" with "%s" usage while its size is "%s" fails because there is insufficient space.

Parameters

volDesc (STRING): This message contains "transitioned volume" when the volume is a transitioned volume, otherwise, it contains "volume".
volName (STRING): Volume name.
vserverName (STRING): Name of the storage virtual machine (SVM) on which the volume resides.
spaceUsed (STRING): Space usage in the volume, represented in bytes.
volSize (STRING): Volume size, represented in bytes.

wafl.gd events

wafl.gd.alloc.size.rsrv.fail

Severity

ERROR

Description

This message occurs when reserving allocation size fails for a file using granular data because there is no space available in the volume.

Corrective Action

Create space by increasing the volume or aggregate sizes, or by deleting data or deleting snapshots. To increase a volume's size, use the "volume size" command. To delete a volume's snapshots, use the "volume snapshot delete" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate snapshots are deleted automatically when the aggregate is full.

Syslog Message

Reserving allocation size for fileid "%d" on volume "%s%s%s%s" fails because there is no space available in the volume.

Parameters

fileid (INT): File identifier.
owner (STRING): Owner of the volume.

vol (STRING): Name of the volume.
app (STRING): Application universal unique identifier (UUID).
volident (STRING): Volume identifier that uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.gd.convert.scan.running

Severity

NOTICE

Description

This message occurs when converting a file to use granular data fails because a scanner is currently running on the volume. The conversion cannot be completed until the scan is complete or filesystem inconsistencies can occur. Granular data conversion is required for non-disruptive file moves that occur as part of volume rebalancing.

Corrective Action

Retry the operation after some time to allow the scan to complete. If the problem persists, contact NetApp technical support for assistance.

Syslog Message

Granular data conversion failed for fileid "%d" on volume "%s%s%s%s" because scan "%s" is currently running on the volume.

Parameters

fileid (INT): File identifier.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Volume identifier that uniquely identifies the volume in cases where the volume name itself is insufficient.
scantype (STRING): Type of scan.

wafl.gd.convert.unknown.pvbn

Severity

NOTICE

Description

This message occurs when converting a file to use granular data fails because the file contains unresolved physical block numbers (PVBNs). Unresolved PVBNs occur when you move a volume to a different aggregate. PVBNs are resolved by a background process following the volume move.

Corrective Action

Retry the operation after some time to allow the background process to complete.

Syslog Message

Granular data conversion failed for fileid "%d" on volume "%s%s%s%s" because the inode contains unresolved PVBNs.

Parameters

> **fileid** (INT): File identifier.
> **owner** (STRING): Owner of the volume.
> **vol** (STRING): Name of the volume.
> **app** (STRING): Application UUID.
> **volident** (STRING): Volume identifier that uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.giveback events

wafl.giveback.create.fail

Severity

> ERROR

Description

> This message occurs when the system cannot perform a giveback due to vol create, and must abort giveback.

Corrective Action

> A volume is being created. Wait for volume creation to finish and then retry giveback.

Syslog Message

> %s %s%s%s%s is being created; canceling giveback.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.giveback.fence.fail

Severity

> ERROR

Description

> This message occurs when the system cannot perform a giveback operation because a fence is set on one of the volumes in the aggregate. The giveback operation is aborted.

Corrective Action

> A volume in the aggregate is currently fenced for group operations. Retry giveback after any group SnapRestore® or mirror transfers are complete. If the problem persists, contact technical support.

Syslog Message

> %s %s%s%s%s has a fence set; canceling giveback.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.giveback.iron.fail

Severity

ERROR

Description

This message occurs when the system cannot perform a giveback due to wafliron, and must abort giveback.

Corrective Action

(Call support).

Syslog Message

%s %s%s%s%s has vol wafliron start underway; canceling giveback.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.giveback.sp.fail

Severity

ERROR

Description

This message occurs when the system cannot perform a giveback operation because a secure purge operation is being performed on one of the volumes in the aggregate. The giveback operation is aborted.

Corrective Action

A volume in the aggregate is undergoing a secure purge operation. Retry giveback after this operation is complete, or after you abort the operation by using the "volume encryption secure-purge abort" command. If the problem persists, contact NetApp technical support.

Syslog Message

A secure purge operation is in progress on %s %s%s%s. Canceling giveback.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.giveback.statusvol.fail

Severity

ERROR

Description

This message occurs when the system cannot perform a giveback due to the volume being used to host wafliron status files.

Corrective Action

Use "aggr wafliron show" command to monitor the status of wafliron and retry giveback after the completion of wafliron that uses the status files hosting volume.

Syslog Message

%s %s%s%s%s is being used by wafliron to host status files. Canceling giveback.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.giveback.vetoedByNvsave

Severity

ERROR

Description

This message occurs when a high-availability (HA) giveback is vetoed because there are NVSave files for an aggregate or a flexible volume that must be replayed before the aggregate or flexible volume can be given back.

Corrective Action

Retry the giveback operation after the NVSave files either are replayed (by bringing the aggregate or flexible volume online) or are deleted from the root volume. Successful replay, for example, is indicated by the EMS message 'wafl.nvsave.replaying.pass'.

Syslog Message

Giveback vetoed because NVSave files are present for %s FSID %d name %s%s%s. UUID is %s.

Parameters

vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.
fsid (INT): File system identifier.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.
UUID (STRING): UUID of the volume.

wafl.gs events

wafl.gs.metafile.load.failed

Severity

ERROR

Description

This message occurs when wafl is unsuccessful to check and load Granular Set metafile for the volume.

Corrective Action

Issue volume offline followed by volume online and confirm this error message does not happen again. For more information or assistance, contact NetApp technical support.

Syslog Message

Wafl failed to load metafile that stores wafl copy of SnapMirror CG.

Parameters

volume (STRING): Volume name.
error (INT): Error code.

wafl.gs.modify.op.failed

Severity

NOTICE

Description

This message occurs when WAFL® prohibits loading a file for a modify operation on a read-only consistency group.

Corrective Action

NONE.

Syslog Message

Failed to load file ID %u on volume %s%s%s%s FSID:%u for a modify operation because it is part of a read-only sync relationship.

Parameters

fileid (INT): File identifier.
volowner (STRING): Owner of the volume.
volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient. Consists of the Vserver name and UUID.
fsid (INT): File system ID of the volume.

wafl.gs.remove.rename.op.failed

Severity

NOTICE

Description

This message occurs when WAFL® prohibits a rename operation or an unlink operation on a file part of a consistency group.

Corrective Action

NONE.

Syslog Message

Failed to load file ID %u on volume %s%s%s%s FSID:%u for a rename operation or an unlink operation because it is part of a sync relationship.

Parameters

fileid (INT): File identifier.
volowner (STRING): Owner of the volume.
volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient. Consists of the Vserver name and UUID.
fsid (INT): File system ID of the volume.

wafl.gs.resync.gen.check.failed

Severity

NOTICE

Description

This message occurs when WAFL® prohibits modification to a file that is part of a consistency group and the operation does not have the right generation enforcement parameters. This can occur if the operation happened before the SnapMirror® relationship was established.

Corrective Action

NONE.

Syslog Message

Unexpected operation on consistency group file ID %u on volume %s%s%s%s FSID:%u. This can occur if the operation happened before the SnapMirror relationship was established.

Parameters

fileid (INT): File identifier.
volowner (STRING): Owner of the volume.
volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient. Consists of the Vserver name and UUID.
fsid (INT): File system ID of the volume.

wafl.hya events

wafl.hya.aggr.policy.init

Severity

INFORMATIONAL

Description

This message occurs when the default caching policies are to be configured on all volumes contained in this aggregate.

Corrective Action

(None).

Syslog Message

Attempting to configure the default caching policies on all volumes in the aggregate '%s %s'.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.

wafl.hya.bc.add.cbi

Severity

INFORMATIONAL

Description

This message occurs when a hybrid aggregate adds one counter file block (CBI - counter block index).

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr (STRING): Aggregate name.
aggr_uuid (STRING): Universal Unique ID (UUID) of the aggregate.
volume (STRING): Volume name.
volume_uuid (STRING): UUID of the volume.
btid (LONGINT): Buftree ID.
cbi (INT): CBI value.
volume_info (STRING): Volume type information.

wafl.hya.bc.del.flexvol

Severity

INFORMATIONAL

Description

This message occurs when a hybrid aggregate block accounting module receives a FlexVol® deletion notification.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr (STRING): Aggregate name.
aggr_uuid (STRING): UUID of the aggregate.
volume (STRING): Volume name.
volume_uuid (STRING): UUID of the volume.
volume_info (STRING): Volume type information.
btid (LONGINT): Buftree ID.
cbi (INT): CBI (counter block index) value.
ctr0 (LONGINT): Counter 0, total used blocks by this buftree ID at the time of the delete event.

wafl.hya.bc.free.cbi

Severity

INFORMATIONAL

Description

This message occurs when a hybrid aggregate block accounting module frees a CBI (counter block index).

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr (STRING): Aggregate name.
aggr_uuid (STRING): UUID of the aggregate.
btid (LONGINT): Buftree ID.
cbi (INT): CBI value.
ctr0 (LONGINT): Counter 0, total used blocks by this buftree ID at the time of the free event.

wafl.hya.cache.ret.policy

Severity

INFORMATIONAL

Description

This message occurs when the cache retention priority policy for a volume in a hybrid aggregate has been modified.

Corrective Action

(None).

Syslog Message

Cache retention priority policy on volume '%s%s%s%s' has been modified to %s.

Parameters

owner (STRING): Owner of the volume.

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
cache_retention_priority (STRING): Cache retention priority policy configured on the volume.

wafl.hya.policy.init.skipped

Severity

INFORMATIONAL

Description

This message occurs when cache policies could not be configured because of an invalid volume state.

Corrective Action

(None).

Syslog Message

Default caching policies were not set on volume '%s%s%s'.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.hya.rcache.policy

Severity

INFORMATIONAL

Description

This message occurs when the read caching policy for a volume in a hybrid aggregate has been modified.

Corrective Action

(None).

Syslog Message

Read caching policy on volume '%s%s%s%s' has been modified to '%s'.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
read_policy (STRING): Read caching policy configured on the volume.

wafl.hya.sizer.warning

Severity

NOTICE

Description

This message occurs when Flash Pool (tm) AWA (Automatic Workload Analyzer) encounters an abnormal condition such as low sampling rate or low memory resource.

Corrective Action

Contact NetApp technical support for assistance in resolving this issue.

Syslog Message

(None).

Parameters

aggr (STRING): Aggregate name.
aggr_uuid (STRING): UUID of the aggregate.
vol (STRING): Name of the volume.
event_info (STRING): Flash Pool (tm) Sizer warning information.

wafl.hya.wcache.policy

Severity

INFORMATIONAL

Description

This message occurs when write caching policy for a volume in a hybrid aggregate has been modified.

Corrective Action

(None).

Syslog Message

Write caching policy on volume '%s%s%s%s' has been modified to '%s'.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
write_policy (STRING): Write caching policy configured on the volume.

wafl.i2p events

wafl.i2p.entries.mismatch

Severity

NOTICE

Description

This message occurs when the ONTAP® kernel detects that an i2p metafile on one of the snapshot has more entries than necessary for an inode.

Corrective Action

(None).

Syslog Message

There are more entries in the i2p metafile than there should be in volume %s%s%s%s, for inode %d in snapshot %d.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases where the volume name itself is insufficient.
fileid (INT): Identifying number for the suspect inode.
snapid (INT): The snapshot identifier.

wafl.i2p.fix.parent.pointer

Severity

NOTICE

Description

This message occurs when an inode-to-parent (i2p) scan detects and rectifies an incorrect parent inode number or cookie in an inode while fixing i2p data in a converted directory.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s: Inode %u, fixing parent pointer, was: (parent: %u, cookie: 0x%x).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
inode (INT): Inode number.
old_parent_inode (INT): Existing parent inode number.
old_cookie (INT): Existing parent cookie.

wafl.ialloc events

wafl.ialloc.is.disabled

Severity

NOTICE

Description

This message occurs when an inode allocation in a stripe is disabled.

Corrective Action

(None).

Syslog Message

Inode allocation in stripe is disabled for %s inode space.

Parameters

ino_type (STRING): Inode type.

wafl.inaccessible events

wafl.inaccessible.userdata

Severity

ERROR

Description

This message occurs when an access request is received for inaccessible user data (area blocked by wafliron).

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Recover the file from a backup. For a SnapMirror® target, rebuild from the source or resynchronize. If the block is in a snapshot, delete the snapshot. Contact NetApp technical support for more options.

Syslog Message

Inaccessible user data block at FBN %llu Level %u in %s inode (file ID:%s snapshot ID:%u file_type:%d disk_flags:0x%x) in volume %s%s%s%s.

Parameters

fbn (LONGINT): File block number.
level (INT): Buffer level.
file_space (STRING): File space.
fileid (STRING): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
type (INT): File type.
flags (LONGINT): Inode disk flags.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.incomplete events

wafl.incomplete.i2p

Severity

ERROR

Description

This event occurs when the WAFL® kernel detects incomplete inode to path information for an inode on disk. This will cause the inode to path database to be reconstructed.

Corrective Action

No immediate action is required. The Inode to Path database will be reconstructed in the background. Please contact NetApp technical support or disable i2p using the volume option no_i2p.

Syslog Message

Incomplete Inode to Path information detected in volume %s%s%s%s. I2P data will be reconstructed.

Parameters

owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
func (STRING): The internal function name
fileid (INT): The identifying number for the suspect inode
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot
reason (STRING): An indication of the nature of the event.

wafl.incons events

wafl.incons.compr.metadata

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects inconsistent compression metadata for a compression group.

Corrective Action

If the snapshot ID (snapid) is 0, the inconsistency is in the active file system and you need to run wafliron. To run wafliron, first find the aggregate the volume belongs to by running the "volume show -volume [vol_name]" command. Then enter diag mode by using the "set diagnostic" command, and start wafliron by running the command: "storage aggregate wafliron start -aggregate [aggr_name]". If the snapid is not 0, then run the "snapshot show -volume [vol-name] -instance" command, and then delete the snapshot whose Snap ID field matches the given snapid.

Syslog Message

WAFL inconsistent: bad compression indirect found (level:%u compression group first vbn:%llu) in %s inode (fileid:%d snapid:%u) in volume %s%s%s%s.

Parameters

level (INT): Metadata level.
cg_first_vbn (LONGINT): First block of the compression group in which the inconsistency was found.
ino_type (STRING): Inode type.
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.incons.compressed.buf

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects an inconsistent compressed block on a disk.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Restore the inconsistent file from the snapshot.

Syslog Message

WAFL inconsistent: bad compressed block at VBN %llu (vvbn:%llu fbn:%llu level:%u compression group first vbn:%llu compression group size %d) in %s inode (fileid:%d snapid:%u) in volume %s%s%s%s.

Parameters

vbn (LONGINT): Volume block number.
vvbn (LONGINT): Virtual block number.
fbn (LONGINT): File block number.
level (INT): Buffer level.
cg_first_vbn (LONGINT): First block of the compression group in which the inconsistency was found.
cg_size (INT): Number of allocated blocks in the compression group.
ino_type (STRING): Inode type.
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.incons.objslothdr.buf.fixup.required

Severity

INFORMATIONAL

Description

This message occurs when number of inconsistent objslothdr entries are more than threshold on a FabricPool aggregate with unified format enabled.

Corrective Action

For further assistance, contact NetApp technical support.

Syslog Message

Number of inconsistent objslothdr entriesi(%d) are more than threshold. For further assistance, contact NetApp technical support.

Parameters

invalid_entry_count (INT): Number of invalid entries present in slothdr metafile.
aggregate_name (STRING): Aggregate name.

wafl.incons.snap.metadata

Severity

ERROR

Description

This message occurs when a snapshot or its metadata is found to be inconsistent.

Corrective Action

Delete the inconsistent snapshot by using the "volume snapshot delete" command.

Syslog Message

WAFL inconsistent: Inconsistent snapshot found in volume %s%s%s%s with snapshot ID %d. Reason: %s.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapid (INT): Snapshot identifier.
reason (STRING): Reason the snapshot is bad.

wafl.incons.tlog

Severity

ERROR

Description

This message occurs when an object cannot be written to the object store due to a corrupted data block within one of the metafiles.

Corrective Action

Contact NetApp technical support for further assistance.

Syslog Message

Inconsistency found in the staging metafile in FabricPool aggregate %s. Skip writing object to object store due to bad block (pvbn %llu).

Parameters

aggrname (STRING): Name of the aggregate.
pvbn (LONGINT): Unloadable block number that resulted in skipping a write of the corresponding object to the object store.

wafl.incons.userdata.vol

Severity

ALERT

Description

This message occurs when the WAFL® kernel discovers an inconsistent volume with bad user data blocks.

Corrective Action

The volume has an inconsistent user data block. Use the fileid and volume name information to run the 'inodepath' command. The 'inodepath' command will output the path name for the fileid. Recover the file from a backup. For a SnapMirror® target, rebuild from the source or resynchronize. If the block is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: %s %s%s%s%s has an inconsistent user data block. Note: Any new snapshots might contain this inconsistency.

Parameters

type (STRING): Container type (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
vendor (STRING): Vendor name.

wafl.inconsistent events

wafl.inconsistent.acl

Severity

ERROR

Description

This message occurs when the ONTAP® kernel detects an inconsistent WAFL® Access Control List (ACL) on disk. Access to this ACL is disabled until you repair it by running wafliron.

Corrective Action

Contact NetApp technical support.

Syslog Message

WAFL inconsistent: bad ACL (xfileid:%u snapid:%u) for inode (fileid:%u) in volume %s%s%s%s.

Parameters

xfileid (INT): Identifying number for the suspect ACL.
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot.
fileid (INT): Identifying number for the inode.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.inconsistent.acl.data

Severity

ERROR

Description

This message occurs when Data ONTAP detects inconsistent Access Control List (ACL) data on disk.

Corrective Action

The volume has inconsistent Access Control List (ACL) data. Use the "volume file show-inode" command with the file ID and volume name information to find the file path. .Rebuild ACL for the file.

Syslog Message

WAFL inconsistent: bad ACL data (acl_fileid:%u acl_snapid:%u) for inode (fileid:%u snapid:%u file_type:%d disk_flags:0x%x) in volume %s%s%s%s%s.

Parameters

acl_fileid (INT): Identifying number for the ACL inode
acl_snapid (INT): Snapshot identifier for ACL inode: (0) - active file system (non-zero) - refers to snapshot
fileid (INT): Identifying number for the inode that owns the ACL.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
type (INT): File type.
flags (LONGINT): Inode disk flags.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.
inotype (STRING): The inode space (public or private)

wafl.inconsistent.compacted.block

Severity

NOTICE

Description

This message occurs when an inconsistency is detected in a compacted block.

Corrective Action

(None).

Syslog Message

Inconsistent compacted block %llu in %s "%s". %s

Parameters

pvbn (LONGINT): Volume block number.
volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.
message (STRING): Type of inconsistency in compacted block.

wafl.inconsistent.container

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects a block in a FlexVol® volume that is inaccessible. Access to this block is disabled until you repair it by running wafliron.

Corrective Action

The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency. For a SnapMirror® target, rebuild from the source or resynchronize. If the inode is in a snapshot, delete the snapshot, then contact NetApp technical support.

Syslog Message

WAFL inconsistent: Volume %s%s%s%s has unreachable block at vvbn %llu (pvbn %llu).

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
vvbn (LONGINT): Virtual block number.
pvbn (LONGINT): Physical block number.

wafl.inconsistent.dir

Severity

ALERT

Description

This event occurs when the WAFL® kernel detects an inconsistent directory on disk. Access to this directory is disabled until you repair it by running wafliron.

Corrective Action

The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency; for a snapmirror target, rebuild from source or resync or if inode is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: %s: bad directory (%s fileid:%u, snapid: %u, type:%u, size:%u) in volume %s%s%s%s.

Parameters

func (STRING): The internal function name
ino_type (STRING): The inode type
fileid (INT): The identifying number for the suspect inode
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot
type (INT): The type of inode that's supposed to be a directory of some type
size (INT): The possibly corrupt size of the suspect inode.
owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.inconsistent.dirent

Severity

EMERGENCY

Description

This event occurs when an inconsistent directory entry has been detected. Access to this directory entry is disabled.

Corrective Action

If this error condition occurs, contact NetApp technical support for further assistance.

Syslog Message

WAFL inconsistent: %s: bad entry {x%x %d snapid: %d %d %d} <%.*s> in %s directory {x%x %d snapid: %d %d %d} in volume %s%s%s%s.

Parameters

func (STRING): The internal function name
fh0 (INT): fh[0]
fh1 (INT): fh[1] - snapid (0) - active file system (non-zero) - refers to snapshot
fh2 (INT): fh[2]
fh3 (INT): fh[3]
fh4 (INT): fh[4]
name (STRINGARRAY): The name of the directory entry
ino_type (STRING): The inode type
dfh0 (INT): dfh[0]
dfh1 (INT): dfh[1] - snapid in filehandle (0) - active file system (non-zero) - refers to snapshot
dfh2 (INT): dfh[2]
dfh3 (INT): dfh[3]
dfh4 (INT): dfh[4]
owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.inconsistent.ino

Severity

ERROR

Description

This message occurs when the ONTAP® kernel detects an inconsistent inode on disk. Access to this inode is disabled until you repair it by running wafliron.

Corrective Action

Contact NetApp technical support.

Syslog Message

WAFL inconsistent: %s: bad inode (%s fileid: %u snapid: %u) in volume %s%s%s%s.

Parameters

func (STRING): Internal function name.
ino_type (STRING): Inode type.
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.

app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

wafl.inconsistent.ino.tid

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects an inconsistent inode on a disk with a bad qtree ID.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency. For a SnapMirror target, rebuild from the source or resynchronize. If the inode is in a snapshot, delete the snapshot. Then contact technical support.

Syslog Message

WAFL inconsistent: bad qtree ID in inode (fileid:%u snapid:%u) in volume %s%s. Turning quotas off on the volume.

Parameters

fileid (INT): Identifying number for the suspect inode
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume
vol (STRING): Name of the volume

wafl.inconsistent.snapshot

Severity

ERROR

Description

This event occurs when the WAFL kernel discovers that a snapshot has either an invalid inofile, fsinfo, or snapmap file, or the snapshot vbn stored is invalid.

Corrective Action

Delete the snapshot. For a snapmirror target, rebuild from source or resync.

Syslog Message

WAFL inconsistent: deleting bad snapshot in volume %s%s%s%s, snapid %d, reason: %s

Parameters

owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
snapid (INT): The snapshot identifier
reason (STRING): The reason the snapshot is bad

wafl.inconsistent.stream

Severity

ERROR

Description

This event occurs when the WAFL® kernel detects an inconsistent stream information on disk. Access to the stream is disabled until you repair it by running wafliron.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency; for a snapmirror target, rebuild from source or resync or if the inode is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: bad stream (sfileid:%u snapid: %u) for inode (fileid:%u) in volume %s%s%s%s.

Parameters

sfileid (INT): The identifying number for the suspect stream
snapid (INT): Snapshot identifier (0) - active file system (non-zero) - refers to snapshot
fileid (INT): The identifying number for the inode
owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.inconsistent.threshold.reached

Severity

EMERGENCY

Description

This event occurs when the number of inconsistencies the WAFL® kernel detected and avoided reached the threshold.

Corrective Action

The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency; for a snapmirror target, rebuild from source or resync or if the inode is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: The threshold for number of %s inconsistencies was reached. Volume %s %s%s%s%s will be taken offline. Contact NetApp technical support.

Parameters

reason (STRING): Reason : snapshot/inode/block
type (STRING): The container type (volume / aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

vendor (STRING): The vendor name

wafl.inconsistent.vol

Severity

ERROR

Description

This event occurs when the WAFL® kernel discovers an inconsistent volume.

Corrective Action

The volume is inconsistent. Run wafliron as soon as possible to clear this inconsistency; For a SnapMirror® target, rebuild from source or resynchronize. If the inode is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: %s %s%s%s%s is inconsistent. Note: Any new snapshots might contain this inconsistency.

Parameters

type (STRING): The container type (volume / aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
vendor (STRING): The vendor

wafl.inconsistent.vol.nomnt

Severity

ERROR

Description

This message occurs when the ONTAP® kernel discovers an inconsistent volume and determines that the volume should not be mounted.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s %s%s is not mounted.

Parameters

type (STRING): Container type (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.

wafl.ino events

wafl.ino.upgrade.aborted

Severity

INFORMATIONAL

Description

This message occurs when an inode upgrade for the specified WAFL volume or aggregate is aborted.

Corrective Action

(None).

Syslog Message

Inode upgrade of volume or aggregate '%s %s' has been aborted.

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.cantAbort

Severity

NOTICE

Description

This message occurs when an attempt to abort the inode upgrade scan by using the "wafl scan abort" command. The inode upgrade scan cannot be interrupted.

Corrective Action

Wait for the inode upgrade to finish or use the "{ vol | aggr } inode-upgrade suspend" command to stop the scan.

Syslog Message

User cannot abort the inode upgrade scan. Use the '{ vol | aggr } inode-upgrade suspend' command.

Parameters

(None).

wafl.ino.upgrade.completed

Severity

INFORMATIONAL

Description

This message occurs when the inode upgrade of the specified WAFL volume or aggregate is complete.

Corrective Action

(None).

Syslog Message

An inode upgrade to version %d for volume or aggregate '%s %s' has completed.

Parameters

to_version (INT): Version the inode upgraded to.
owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.disabled

Severity

ALERT

Description

This message occurs when the inode upgrade is disabled on the node via the "wafl_v4ino_upgrade_disable" bootarg. All aggregates and volumes are still usable, but there might be some features that cannot be enabled on certain volumes until the inode upgrade is completed on those volumes.

Corrective Action

Contact technical support for assistance.

Syslog Message

Inode upgrade is disabled on this node.

Parameters

(None).

wafl.ino.upgrade.rem.mdata

Severity

INFORMATIONAL

Description

This message occurs when inode upgrade metadata was removed either by administrator actions or due to wafliron.

Corrective Action

(None).

Syslog Message

Inode upgrade metadata for volume or aggregate '%s %s' has been removed.

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.resumed

Severity

INFORMATIONAL

Description

This message occurs when an inode upgrade of the specified WAFL volume or aggregate is resumed.

Corrective Action

(None).

Syslog Message

An inode upgrade for volume or aggregate '%s %s' was resumed.

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.stalled

Severity

NOTICE

Description

This message occurs when the administrator suspended an inode upgrade for the specified WAFL volume or aggregate sometime in the past. The volume or aggregate is still usable, but there might be some features that cannot be enabled until the inode upgrade is complete.

Corrective Action

Use the command 'volume inode-upgrade resume "volume"' or 'storage aggregate inode-upgrade resume "aggregate"' to resume the upgrade.

Syslog Message

Inode upgrade of volume or aggregate '%s %s' is suspended.

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.started

Severity

INFORMATIONAL

Description

This message occurs when the inode upgrade for the specified WAFL volume or aggregate begins.

Corrective Action

(None).

Syslog Message

An inode upgrade from version %d for volume or aggregate '%s %s' has begun.

Parameters

from_version (INT): Current inode version.
owner (STRING): Owner of the volume or aggregate.

volname (STRING): Name of the volume or aggregate.

wafl.ino.upgrade.susp

Severity

INFORMATIONAL

Description

This message occurs when an inode upgrade for the specified WAFL volume or aggregate is suspended by the administrator or because wafliron is running. The volume or aggregate is still usable, but there might be some features that cannot be enabled until the inode upgrade is complete.

Corrective Action

(None).

Syslog Message

An inode upgrade for volume or aggregate '%s %s' was suspended. Reason %s. Metadata was %s.

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.
reason (STRING): Reason the upgrade was suspended.
metadata_removed (STRING): Atring indicating whether metadata was removed as part of the suspension.

wafl.ino.upgrade.susp.nospc

Severity

ERROR

Description

This message occurs when an inode upgrade for the specified WAFL volume or aggregate is suspended due to a lack of space. The volume or aggregate is still usable, but there might be some features that cannot be enabled until the inode upgrade is complete.

Corrective Action

Ensure that the volume or aggregate has at least as many bytes available for use as indicated by 'space_required'. Simply add the space to the volume and the upgrade is automatically retried.

Syslog Message

An inode upgrade for volume or aggregate '%s %s' was suspended due to a lack of space (space required: %d bytes).

Parameters

owner (STRING): Owner of the volume or aggregate.
volname (STRING): Name of the volume or aggregate.
space_required (LONGINT): Estimated amount of disk space required, in bytes, to complete the upgrade.

wafl.inode events

wafl.inode.cache.highLoad

Severity

INFORMATIONAL

Description

This message occurs when the in-memory inode cache is under high load and fully utilized. The system will likely experience high cache miss rates and some file system operations might experience delays due to increased disk activity, but that is the extent of the problem.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

wafl.inode.fileAttr.fail

Severity

ERROR

Description

This message occurs when the system discover that an inode to file attribute translation is unsuccessful due to an unexpected file type. The fh parameters represent the filehandle.

Corrective Action

The filesystem being accessed is inconsistent. If the filesystem is read-write and if the system is booted in read-only mode then reboot in normal (read-write) mode and run wafliron as soon as possible to clear this inconsistency. For all other cases contact NetApp technical support.

Syslog Message

wafl_inode_to_file_attr: unexpected file type 0%o in %s {x%x %d %d %d %d}.

Parameters

type (INT): The unexpected type
ino_type (STRING): The inode type
fh0 (INT): fh[0]
fh1 (INT): fh[1]
fh2 (INT): fh[2]
fh3 (INT): fh[3]
fh4 (INT): fh[4]

wafl.inode.fill.noDisblRsvFO

Severity

NOTICE

Description

This message occurs when the system cannot disable the fill reservation for a file or LUN. This happens when the file or LUN is the destination of an ongoing file operation that is currently in the Allocation_Map phase.

Corrective Action

Verify that the indicated file operation has completed the Allocation_Map phase and rerun the original command.

Syslog Message

Cannot disable fill reservation for inode %u in volume %s%s%s due to %s job %s-%u.

Parameters

ino (INT): Inode number.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
type (STRING): Operation type: file copy, file move, LUN copy, or LUN move.
job_uuid (STRING): Job UUID of the file operation.
file_index (INT): File index of the file operation.

wafl.inofile events

wafl.inofile.buf.badHeader

Severity

ERROR

Description

This event can occur when a snapshot's inofile buffer header has the wrong magic or file block number.

Corrective Action

Contact customer support.

Syslog Message

Bad header in snapshot %s inofile in %s %s%s%s%s, snapid %d, fbn %llu, vbn %llu, cp_count %u was magic 0x%x, fbn %llu, cp_count %u

Parameters

ino_type (STRING): The type of inofile
type (STRING): The type of object (volume/aggregate)
owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
snapid (INT): The snapshot identifier
fbn (LONGINT): The file block number
vbn (LONGINT): The volume block number
cp_count (INT): The volume CP count
omagic (INT): The magic number in the header
ofbn (LONGINT): The file block number in the header
ocp_count (INT): The CP count in the header

wafl.iron events

wafl.iron.7mode

Severity

ERROR

Description

This message occurs when wafliron is running on a transitioned aggregate in precommit phase and there are 7-Mode volumes present. Wafliron ignores the 7-Mode volumes.

Corrective Action

Run the "storage transition aggregate start" command to convert the aggregate to a cluster aggregate.

Syslog Message

Transitioned aggregate %s has 7-Mode volumes which cannot be ironed.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.iron.abort.noConToCloud

Severity

EMERGENCY

Description

This message occurs when the file system consistency checker (wafliron) aborts because the connection to the cloud service provider is not available.

Corrective Action

Restore the connection to the cloud service provider, then retry the "aggr wafliron start <aggr_name>" command.

Syslog Message

File system consistency checker aborted on aggregate "%s". The connection to the cloud service provider is not available.

Parameters

aggrname (STRING): Aggregate name.

wafl.iron.abort.offline

Severity

NOTICE

Description

This message occurs when wafliron is aborted and the aggregate or volume is taken offline. This will occur if the aggregate or volume is inconsistent at the time of abort or if wafliron was invoked in optional commit mode. If wafliron was invoked in optional commit mode, all changes are rejected because they might not be consistent.

Corrective Action

No corrective action is required for this notification event. Wafliron automatically takes an inconsistent aggregate or volume offline. Wafliron automatically takes the aggregate offline in optional commit mode.

Syslog Message

Wafliron was aborted on %s%s '%s'; the aggregate or volume was taken offline.

Parameters

volinfo (STRING): Descriptive information about the volume, such as whether it was inconsistent when taken offline.
voltype (STRING): Aggregate or flexible volume.
aggrname (STRING): Aggregate or flexible volume name.

wafl.iron.abort.offlineFail

Severity

NOTICE

Description

This message occurs when wafliron is aborted and taking an inconsistent aggregate or volume offline was not successful.

Corrective Action

(Call support).

Syslog Message

Wafliron abort failed to take offline inconsistent %s '%s': %s.

Parameters

voltype (STRING): Aggregate or flexible volume.
aggrname (STRING): Aggregate or flexible volume name.
errmsg (STRING): Error message.

wafl.iron.abort.offlineMsg

Severity

NOTICE

Description

This message occurs when the wafliron operation is aborted. Taking the aggregate offline was not successful.

Corrective Action

(None).

Syslog Message

Wafliron abort on %s '%s': %s.

Parameters

voltype (STRING): Aggregate.
aggrname (STRING): Aggregate name.

errmsg (STRING): Error message.

wafl.iron.backup.exists

Severity
NOTICE

Description
This message occurs when a SnapIron backup image already exists on the volume. Wafliron will continue to run without creating another SnapIron backup image.

Corrective Action
(Call support).

Syslog Message
A SnapIron backup image %s already exists on %s.

Parameters
vol (STRING): Volume name.
name (STRING): Name of the backup image.

wafl.iron.backup.expired

Severity
INFORMATIONAL

Description
This message occurs when a SnapIron backup image expires and will be deleted.

Corrective Action
(None).

Syslog Message
The SnapIron backup image %s of %s expired.

Parameters
name (STRING): Name of the backup image being deleted.
vol (STRING): Volume name.

wafl.iron.backup.expiring

Severity
NOTICE

Description
This message occurs when a SnapIron backup image is close to expiring.

Corrective Action
Pay attention to the integrity of the data on this volume before the backup image expires and is subsequently deleted by automatic deletion of aggregate snapshots. Contact NetApp technical support.

The SnapIron backup image %s of %s will expire in %d hour(s).

Parameters

name (STRING): Name of the backup image.
vol (STRING): Volume name.
hours (INT): Number of hours remaining from the lifetime of the backup image.

wafl.iron.backup.impossible

Severity

NOTICE

Description

This message occurs when wafliron encounters a problem when creating a SnapIron backup image. The message explains the reason. Wafliron will continue to run without the SnapIron backup image.

Corrective Action

(None).

Syslog Message

Wafliron could not create a SnapIron backup image on %s, %s.

Parameters

vol (STRING): Volume name.
reason (STRING): Reason for not being able to create a SnapIron backup image.

wafl.iron.backup.removed

Severity

NOTICE

Description

This message occurs when a SnapIron backup image is removed. Wafliron will continue to run without a SnapIron backup image if it is running.

Corrective Action

(None).

Syslog Message

The SnapIron backup image %s of %s was deleted.

Parameters

name (STRING): Name of the backup image being deleted.
vol (STRING): Volume name.

wafl.iron.backup.rst.failed

Severity

ALERT

Description

The message occurs when the system cannot restore the aggregate from the wafliron backup image. The active file system will be loaded.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failed to restore %s %s%s%s%s from its wafliron backup image (ID %d). The active file system will be loaded.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
id (INT): Backup image ID.
reason (STRING): Reason for the failure.

wafl.iron.backup.rst.noExist

Severity

NOTICE

Description

The message occurs when the system cannot restore the aggregate from the wafliron backup image because the image does not exist. The active file system will be loaded.

Corrective Action

(None).

Syslog Message

Could not restore %s %s%s%s%s from its wafliron backup image because the image does not exist. The active file system will be loaded.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.iron.backup.rst.success

Severity

INFORMATIONAL

Description

The message occurs when the system restores the aggregate from its wafliron backup image.

Corrective Action

(None).

Syslog Message

Restored %s %s%s%s%s from its wafliron backup image (ID %d).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
id (INT): Backup image ID.

wafl.iron.backup.snaprsv.inc

Severity

INFORMATIONAL

Description

This message occurs when wafliron tries to increase the snapshot reserve of the aggregate temporarily to allow keeping the SnapIron backup image longer. The message shows whether the attempt was successful.

Corrective Action

(None).

Syslog Message

The attempt to increase snapshot reserve of %s temporarily from %d percent by %d %s.

Parameters

vol (STRING): Volume name.
rsv (INT): Old value of the aggregate snapshot reserve, in percentage.
delta (INT): Change in the new value of the aggregate snapshot reserve, in percentage. If the snapshot reserve was successfully increased, it will be returned to its original value automatically after the SnapIron backup image expires, the new snapshot reserve space becomes full again, or the snapshot is deleted. In the latter case, the SnapIron backup image will be deleted by automatic deletion of aggregate snapshots.
result (STRING): Whether the attempt was successful.

wafl.iron.backup.snaprsv.rst

Deprecated

This is deprecated as success doesn't require any action failure can never happen.

Severity

NOTICE

Description

This message occurs when the snapshot reserve of the aggregate, which was temporarily increased by wafliron, is restored to its original value.

Corrective Action

If wafliron fails to return the volume's snapshot reserve to the original value, contact NetApp technical support.

Syslog Message

The reset of snapshot reserve value of %s by %d from %d was %s.

Parameters

vol (STRING): Volume name.
val (INT): Current value of the aggregate snapshot reserve, in percentage.
delta (INT): Change in the value of the aggregate snapshot reserve, in percentage.
result (STRING): Whether the attempt was successful.

wafl.iron.backup.success

Severity

INFORMATIONAL

Description

This message occurs when wafliron creates a SnapIron backup image.

Corrective Action

(None).

Syslog Message

Wafliron created SnapIron backup image %s on volume %s, ID %d.

Parameters

name (STRING): Backup image name.
vol (STRING): Volume name.
id (INT): Backup image ID.

wafl.iron.backup.useimage

Severity

INFORMATIONAL

Description

This message occurs when wafliron is using a SnapIron backup image to check the file system.

Corrective Action

(None).

Syslog Message

Wafliron is using SnapIron backup image of %s (ID %u).

Parameters

vol (STRING): Volume name.
id (INT): ID of SnapIron backup image.

wafl.iron.backup.verify.data

Severity
NOTICE

Description
This message occurs when wafliron creates a SnapIron backup image and you need to verify whether user data is stored in the aggregate or volume as soon as possible.

Corrective Action
Validate the user data stored in the aggregate or volume as soon as possible, before the SnapIron backup image is deleted. Contact NetApp technical support.

Syslog Message
Verify user data of %s.

Parameters
vol (STRING): Volume name.

wafl.iron.badfsid

Severity
ALERT

Description
This message occurs when a flexible volume has an invalid file system ID(FSID). Wafliron skips this volume.

Corrective Action
Contact NetApp technical support.

Syslog Message
Flexible volume %s%s%s on aggregate %s has an invalid FSID (%08x).

Parameters
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
aggrname (STRING): Aggregate name.
fsid (INT): File system identifier.

wafl.iron.completion.times

Severity
INFORMATIONAL

Description
This event provides the time taken to complete the different phases of Wafliron.

Corrective Action
(None).

Syslog Message

%s phase of %s %s took %s.

Parameters

p (STRING): Name of the iron phase.
ty (STRING): Type of the volume.
v (STRING): Name of the volume.
t (STRING): Time taken for the phase.

wafl.iron.cont.corrupt

Severity

ALERT

Description

This message occurs when a volume granular wafliron operation running on an aggregate finds corruption in the container file of a volume on which wafliron is not being run.

Corrective Action

Contact Contact NetApp technical support..

Syslog Message

Volume granular wafliron is in progress on aggregate %s. Corruption was found in volume %s container file with file id %d in which wafliron might have not run.

Parameters

aggr_name (STRING): Name of the aggregate on which wafliron is running.
vol_name (STRING): Name of the volume in which corruption was found in the container file.
container_file_id (INT): File id of container file of the volume in which corruption was found.

wafl.iron.current.phase

Severity

INFORMATIONAL

Description

This message specifies the phase name that wafliron is currently working on.

Corrective Action

(None).

Syslog Message

wafliron is active on %s %s : %s.

Parameters

ty (STRING): Type of the volume.
v (STRING): Name of the volume.
phase (STRING): Name of the current wafliron phase.

wafl.iron.dp.mirror.broken

Severity

ERROR

Description

This message occurs when a Data Protection mirrored volume is broken from its SnapMirror® relationship as a result of starting wafliron with the '-include-mirrors' option. When this happens, the Volume Location Database (VLDB), which is managed by the management host, must also be updated manually after wafliron finishes to avoid any discrepancy between the VLDB and Dblade.

Corrective Action

Run the 'debug vreport' command to resolve the inconsistency in the VLDB. Step 1) run 'debug vreport show' to show the object name. Step 2) run 'debug vreport fix -type volume -object object-name'.

Syslog Message

WaflIron broke the SnapMirror® relationship for volume '%s%s%s'. Use the 'debug vreport' command to resolve inconsistencies before reestablishing the SnapMirror relationship.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.iron.grow.fs.failed

Severity

ERROR

Description

This message occurs when WAFL® cannot grow a volume or aggregate because wafliron is running and the root volume does not have enough free space to grow the iron status files.

Corrective Action

Check the free space in the root volume. Abort wafliron or grow the root volume to accommodate the grown status files

Syslog Message

WAFL failed to grow %s %s due to a failure in growing wafliron status files in the root volume.

Parameters

voltype (STRING): Volume type: volume or aggregate.
volname (STRING): Name of the volume or aggregate.

wafl.iron.i2p.dir.convert

Severity

INFORMATIONAL

Description

This message occurs to inform you why wafliron is starting the inode-to-parent (i2p) initialization scan. The i2p scan updates the information in the volume necessary to perform i2p path name translations. The reason i2p information needs updating is that the volume contains converted directories, and the entries in the converted directories need their i2p information updated. This message does not indicate anything abnormal or problematic.

Corrective Action

(None).

Syslog Message

Found converted directories in %s %s%s%s%s that require their entry's inode-to-parent (i2p) information updated. Starting the i2p initialization scanner to update the entries in the converted directories. This is normal.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.iron.incompleteVol

Severity

ALERT

Description

This wafliron event indicates that a volume is partially created and might be in an inconsistent state. Wafliron is marking the volume as unrecoverable. For instance, if filer panics before snap restore completes when a clone volume is created it may leave the volume partially created.

Corrective Action

If the volume is known not to contain any valuable data, it can be safely destroyed and recreated.

Syslog Message

Flexible volume %s%s on aggregate %s is partially created. Marking it unrecoverable. You may destroy this volume and recreate it.

Parameters

volname (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
aggrname (STRING): Aggregate name

wafl.iron.invalid.vvol

Severity

ERROR

Description

This wafliron message indicates that a volume is invalid. Wafliron cannot run on invalid volumes. A volume can become invalid as a result of an aborted 'vol copy' operation or SnapMirror® initial transfer. To bring the volume back online, you must re-create it through a completed 'vol copy' operation or SnapMirror transfer.

Corrective Action

If you know that the volume does not contain any valuable data, you can safely destroy and re-created it.

Syslog Message

Flexible volume %s%s%s on aggregate %s is invalid. Wafliron cannot run on invalid volumes.

Parameters

volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
aggrname (STRING): Aggregate name.

wafl.iron.lost.blocks

Severity

INFORMATIONAL

Description

This message indicates that wafliron is running on a particular inode.

Corrective Action

(None).

Syslog Message

Wafliron on %s %s%s%s is verifying %lld %s inode now.

Parameters

voltype (STRING): Volume type.
volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
inode_number (LONGINT): Number of inode buftrees not verified.
ino_type (STRING): The inode type.

wafl.iron.manualUpgradeRequired

Severity

ERROR

Description

This event is issued when wafliron can't run on the volume because it's not upgraded yet. This happens when system was upgraded with an offlined or restricted volume (possibly due to corruption) and wafliron is started after the upgrade with the volume offlined or restricted.

Corrective Action

Manually online the volume and then restart wafliron. Or fix any corruption on an inconsistent volume and bring it online before a kernel upgrade.

Syslog Message

Wafliron cannot run on volume '%s' that is in an older format. Manually online the volume and retry wafliron.

Parameters

volname (STRING): Volume name.

wafl.iron.mount.inconsistency

Severity

ERROR

Description

This message occurs when wafliron finds some WAFL® inconsistency issues on an aggregate during mount.

Corrective Action

Run the 'storage aggregate wafliron review <aggregate-name>' command to review the issues that wafliron found. If you need assistance resolving any of the issues, contact NetApp technical support.

Syslog Message

wafliron on aggregate %s found some WAFL inconsistency issues during mount.

Parameters

aggrname (STRING): Aggregate name.

wafl.iron.mount.inconsistent

Severity

ALERT

Description

This wafliron message indicates that the FlexVol® volume cannot be mounted; the volume is marked as inconsistent.

Corrective Action

Re-run wafliron with the '-prev_cp' option set to restore the FlexVol volume to the closest Consistency Point(CP)/snapshot.

Syslog Message

wafliron could not mount volume %s due to %s. Volume is marked as inconsistent.

Parameters

vvolname (STRING): Volume name.
reason (STRING): Reason for the failure.

wafl.iron.mount.times

Severity

INFORMATIONAL

Description

This message prints the mount times taken by the different phases of aggregate mount during wafliron. This message occurs after wafliron completion or through a wafliron status message.

Corrective Action

(None).

Syslog Message

%s mount phase of %s %s took %s.

Parameters

phase (STRING): Name of the mount phase.
voltype (STRING): Type of the volume (aggergate/flexvol).
volname (STRING): Name of the volume or aggregate.
time (STRING): Time taken for the phase.

wafl.iron.mounted.volume

Severity

INFORMATIONAL

Description

This message is used to print on the console that the volume is mounted during wafliron.

Corrective Action

(None).

Syslog Message

Wafliron mounted volume %s.

Parameters

vol (STRING): Name of the volume.

wafl.iron.mw.ioc.not.supported

Severity

ERROR

Description

This event is issued when IOC is issued on metawafl aggregate.

Corrective Action

(Call support).

Syslog Message

Iron optional commit is not supported on metawafl aggregate '%s'. Please run wafliron.

Parameters

volname (STRING): Volume name.

wafl.iron.nvsave.disable.selection

Severity

INFORMATIONAL

Description

This message is used to print on the console that the wafliron cannot run in volume select mode on the aggr as the aggregate has nvsave file records.

Corrective Action

(None).

Syslog Message

The aggr %s has nvlog records in the system. Wafliron cannot run in volume selection mode. Volumes will be brought online in random order.

Parameters

aggr (STRING): Name of the aggregate.

wafl.iron.oc.abort.bad_blk

Severity

EMERGENCY

Description

This message occurs when the system aborts wafliron in optional commit mode on the volume due to a bad block in the change log and lost write context status files.

Corrective Action

Refer to the Recovery Decision Tree.

Syslog Message

Aborting wafliron in optional commit mode because a bad block was found in volume '%s'.

Parameters

volname (STRING): Volume name.

wafl.iron.oc.abort.clog_full

Severity

EMERGENCY

Description

This message occurs when the system aborts an optional commit wafliron operation on a volume because the change log file was full, due to extensive filesystem consistency changes.

Corrective Action

Contact NetApp technical support.

Syslog Message

Aborting wafliron in optional commit mode on aggregate '%s'. The change log is full.

Parameters
    volname (STRING): Volume name.

wafl.iron.oc.committedChangeLog

Severity
    NOTICE

Description
    This wafliron event indicates that optional commit change log files have been committed to disk.

Corrective Action
    This happens when the user explicitly commits the changes to disk.

Syslog Message
    Committed change log files for aggregate %s.

Parameters
    volname (STRING): Volume name

wafl.iron.oc.deletedChangeLog

Severity
    EMERGENCY

Description
    This wafliron event indicates that optional commit change log files have been deleted.

Corrective Action
    This happens when the change log files have been writted to disk, or have been rejected.

Syslog Message
    Deleted change log files for aggregate %s.

Parameters
    volname (STRING): Volume name

wafl.iron.oc.errorCommitLog

Severity
    EMERGENCY

Description
    This wafliron event indicates that optional commit change log files' commit process has encountered an error.

Corrective Action
    Corrective action may include offlining the aggregate and running wafliron in optional commit mode again.

Syslog Message

Error committing change log files for aggregate %s.

Parameters

aggrname (STRING): Aggregate name

wafl.iron.oc.noCorruption

Severity

NOTICE

Description

This wafliron event indicates that optional commit did not find any corruption in the aggregate that it is being run on.

Corrective Action

No corrective action is required for this notification event. Wafliron will automatically online the aggregate.

Syslog Message

Wafliron did not find any corruption on aggregate %s. The aggregate and its volumes will be offlined automatically.

Parameters

aggrname (STRING): Aggregate name

wafl.iron.oc.rejectChangeLog

Severity

NOTICE

Description

This wafliron event indicates that optional commit change log files have been rejected (not committed).

Corrective Action

No corrective action required for this notification event.

Syslog Message

Rejecting change log files for aggregate %s.

Parameters

aggrname (STRING): Aggregate name

wafl.iron.oc.root.committedChanges

Severity

NOTICE

Description

This wafliron event indicates that optional commit changes have been committed to disks of the root aggregate/tradvol.

Corrective Action

No corrective action required.

Syslog Message

Committed changes for %s '%s'. The system will reboot now.

Parameters

voltype (STRING): Volume type - aggregate or tradvol
volname (STRING): Volume name

wafl.iron.oc.root.lowMemory

Severity

EMERGENCY

Description

Wafliron Optional Commit on the Root has exhausted available memory and cannot continue. Options will be presented to the administrator to either abort the changes or write to disk.

Corrective Action

Changes will have to be committed to disk for wafliron to continue or will have to be rejected.

Syslog Message

Wafliron Optional Commit on '%s' has run out of available memory and cannot continue. Please either commit to continue Wafliron by writing changes to disk or reject the changes (which will reboot the system).

Parameters

volname (STRING): Volume name

wafl.iron.oc.root.noCorruption

Severity

NOTICE

Description

This wafliron message indicates that the optional commit operation does not find any corruption in the root aggregate that it is being run on.

Corrective Action

No corrective action is required.

Syslog Message

Wafliron did not find any corruption on aggregate %s. The system will reboot now.

Parameters

aggrname (STRING): Root aggregate name.

wafl.iron.oc.root.rejectedChanges

Severity

NOTICE

Description

This wafliron event indicates that optional commit changes have been rejected.

Corrective Action

No corrective action required.

Syslog Message

Rejected changes for %s '%s'. The system will reboot now.

Parameters

voltype (STRING): Volume type - aggregate or tradvol
volname (STRING): Volume name

wafl.iron.offline.destroying

Severity

INFORMATIONAL

Description

This message occurs when a volume is being destroyed and cannot be ironed/onlined.

Corrective Action

(None).

Syslog Message

Volume '%s%s%s' is being destroyed and was taken offline.

Parameters

volname (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.iron.optcommit.upgradeScan

Severity

ERROR

Description

This message occurs when wafliron optional commit is started in a volume that has an upgrade still in progress.

Corrective Action

Wait for the upgrade scanner to finish for this volume, then restart wafliron.

Syslog Message

Wafliron optional commit cannot run in volume '%s' that still has an upgrade in progress. Run the advanced CLI command 'wafl scan status' to check whether an upgrade is still in progress.

Parameters
volname (STRING): Volume name.

wafl.iron.outofspace

Severity
ERROR

Description
This message oocurs when an aggregate is out of space. Wafliron omits the volumes in this aggregate when managing the aggregate.

Corrective Action
Run the "storage transition commit start" command to commit the aggregate transition and delete the pinned snapshot.

Syslog Message
Volumes in the aggregate %s are kept offline since aggregate is out of space. Wafliron omits volumes in this aggregate.

Parameters
aggrname (STRING): Name of the aggregate.

wafl.iron.parallel.mount.notify

Severity
NOTICE

Description
This message indicates that wafliron parallel mount is proceeding for the flexible volumes in an aggregate. All sparse volumes are mounted in parallel first, followed by non-clone flexible volumes in parallel. Each clone is mounted following its parent volume.

Corrective Action
(None).

Syslog Message
Wafliron parallel mount enabled. Wafliron is mounting flexible volumes in parallel in the aggregate %s.

Parameters
aggr (STRING): Aggregate name

wafl.iron.parent.volume.selected

Severity
INFORMATIONAL

Description
This message occurs when the parent of a clone volume is added to the list of volumes wafliron will mount first because the clone volume is on the list.

Corrective Action

(None).

Syslog Message

Volume %s in aggregate %s was added to the list of volumes that wafliron will mount first because its clone volume %s is present in this list.

Parameters

parent_volume (STRING): Name of the parent volume.
aggr (STRING): Name of the aggregate.
clone_volume (STRING): Name of the clone volume.

wafl.iron.pending.delete.vvol

Severity

ERROR

Description

This wafliron event indicates that a volume is awaiting deletion and cannot be ironed/onlined. It's deletion also cannot be canceled while iron is running, so its retention time may need to be extended in order to keep the volume.

Corrective Action

If you do not want the volume to be deleted while iron is running, check the retention time and consider extending it.

Syslog Message

Flexible volume %s%s%s on aggregate %s is awaiting deletion. Wafliron cannot run on such volumes.

Parameters

volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
aggrname (STRING): Aggregate name.

wafl.iron.ral.exception

Severity

ERROR

Description

This message occurs when wafliron is loading an inode that has a remote entry, but the corresponding remote volume is not reachable.

Corrective Action

Inspect the status of the FlexGroup remote volume, which might be down due to network errors, cluster node failures, or corruption in one or more of its constituent aggregates. Also check the health and connectivity of all nodes that are hosting these aggregates.

Syslog Message

Wafliron could not load inode "%d" on volume "%s" because the remote volume is not accessible.

Parameters

> **inode** (INT): Inode that could not be loaded.
> **volume** (STRING): Volume being inspected by wafliron.

wafl.iron.ral.inode.loaded

Severity

> NOTICE

Description

> This message occurs when wafliron succeeds in loading an inode in a FlexGroup origin volume that was not reachable earlier.

Corrective Action

> NONE.

Syslog Message

> After several retries, wafliron has processed inode "%d" in volume "%s".

Parameters

> **inode** (INT): Inode loaded after retries.
> **volume** (STRING): Volume being inspected by wafliron.

wafl.iron.readonly

Severity

> NOTICE

Description

> This message occurs during wafliron volume initialization, indicating that read-only volumes might not be checked.

Corrective Action

> Use either the "-f" or the "-include-mirrors" option to run wafliron on SnapMirror® destination volumes. For more information or assistance, contact NetApp technical support.

Syslog Message

> %s%s%s: Readonly volumes require additional command options to be checked using wafliron

Parameters

> **owner** (STRING): Owner of the volume.
> **vol** (STRING): Name of the volume.
> **app** (STRING): Application UUID.
> **volident** (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.iron.readonlyQtrees

Severity

> NOTICE

Description

This message occurs during wafliron volume initialization, indicating that volumes with read-only qtrees might not be checked.

Corrective Action

Use either the "-f" or the "-include-mirrors" option to run wafliron on SnapMirror® destination volumes.

Syslog Message

%s%s%s: Volumes containing readonly qtrees require additional command options to be checked using wafliron

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.iron.rebuild.dir.volful

Severity

ERROR

Description

This message occurs while running wafliron, when there might not be enough free space on the volume to rebuild a damaged directory.

Corrective Action

Increase the size of the volume or free space on the aggregate that contains the volume.

Syslog Message

Volume %s might run out of space while wafliron is rebuilding the damaged directory %d. The required space is %d MB.

Parameters

vol (STRING): Name of the volume.
fileid (INT): Identifying number for the damaged directory.
spaceNeeded (INT): Amount of spaced needed, in megabytes.

wafl.iron.salvaged.rootdir

Severity

INFORMATIONAL

Description

This message occurs when wafliron detects a corrupted rootdir in an index-dir-enabled volume and re-creates it with all valid entries in the rootdir. The old corrupted rootdir has been converted into a regular file and linked to the /lost+found directory.

Corrective Action

Remove the file from the /lost+found directory.

Syslog Message

Rootdir of volume %s has been corrected and contains all valid names. The contents of the old rootdir have been copied to file i#%d.* in the /lost+found directory.

Parameters

volume (STRING): Name of the volume.
fileid (INT): File ID of the regular file that contains the old rootdir contents as is.

wafl.iron.scan.skipped

Severity

NOTICE

Description

This event occurs when non-specified or read only volumes are not processed during a wafliron run on their containing aggregate.

Corrective Action

(None).

Syslog Message

Aggregate %s, wafliron completed - Read only, offline, old version or non-specified volume(s) %s not checked.

Parameters

aggr (STRING): The aggr name
vvols (STRING): Flexible volumes not processed

wafl.iron.scan.stats

Severity

INFORMATIONAL

Description

This message prints the wafliron scan details about various data objects: for example, files, directories, blocks.

Corrective Action

(None).

Syslog Message

%llu %s done.

Parameters

count (LONGINT): Number of data objects scanned so far.
object (STRING): Name of the data object.

wafl.iron.scanning.status

Severity

INFORMATIONAL

Description

This message prints wafliron scanning status.

Corrective Action

(None).

Syslog Message

Scanning (%d%% done).

Parameters

percentage (INT): Scanning percentage.

wafl.iron.slow

Severity

ERROR

Description

This message occurs when a "wafliron start" or a "wafliron show" command is issued and the aggregate that hosts wafliron status files for the aggregate on which wafliron is running contains only one data disk.

Corrective Action

1.Use the "-status-files-vserver" and "-status-files-volume" parameters of the "aggr wafliron start" command to host status files on a non-root aggregate volume, that has an adequate number of data disks that can accommodate the extra workload. 2.Add more disks to the root aggregate using "aggr add" command.

Syslog Message

Aggregate %s: wafliron performance will be significantly impacted because aggregate %s contains only one data disk. Running wafliron with status files hosted on a non-root aggregate volume that has an adequate number of data disks, or adding more disks to the root aggregate is recommended.

Parameters

aggr_name (STRING): Name of the aggregate on which wafliron is running.
status_vol_aggr_name (STRING): Name of the aggregate containing the volume hosting the wafliron status files.

wafl.iron.start

Severity

INFORMATIONAL

Description

This message occurs when the system starts the wafliron process on a volume.

Corrective Action

(None).

Syslog Message

Starting wafliron on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
optcommit (STRING): Whether wafliron is running in optional-commit mode. If this mode is used, the decision to commit changes is made by the user after wafliron is complete.
prev_cp (STRING): Whether the prev_cp feature of wafliron is being used and, if so, which consistency point the user chose at the prompt.
backup (STRING): Whether the backup feature of wafliron is being used and, if so, what option {no|yes|force|use} is selected. Only applicable to aggregates.

wafl.iron.unrecoverable

Severity

ALERT

Description

This message occurs when a volume is unrecoverable and cannot be ironed or brought online.

Corrective Action

Contact NetApp technical support.

Syslog Message

Flexible volume %s%s on aggregate %s is unrecoverable.

Parameters

volname (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
aggrname (STRING): Aggregate name.

wafl.iron.upgradeRequired

Severity

NOTICE

Description

This message occurs during volume or aggregate initialization if wafliron is enabled and does not support the volume or aggregate file system version. The message indicates that a volume or aggregate upgrade is required and is being attempted without wafliron checking. A wafliron check of the volume or aggregate might be possible after a successful upgrade.

Corrective Action

(None).

%s '%s%s%s%s' has not been upgraded. Upgrade will proceed without wafliron. The WAFL version on the %s is '%d'; the current WAFL version is '%d'.

Parameters

Type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume or aggregate.
vol (STRING): Name of the volume or aggregate.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume or aggregate in cases where the volume or aggregate name itself is insufficient.
type (STRING): Type of object (volume or aggregate).
vol_wafl_version (INT): WAFL® version on the volume or aggregate.
current_wafl_version (INT): Current WAFL version.

wafl.iron.volumes.selected.not.exist

Severity

INFORMATIONAL

Description

This message is used to print on the console that the volumes selected for ironing on the aggregate do not exist in the aggregate.

Corrective Action

(None).

Syslog Message

Some of the volumes selected for ironing do not exist in the aggregate %s.

Parameters

aggr (STRING): Name of the aggregate.

wafl.latest events

wafl.latest.physical.snapid.info

Severity

INFORMATIONAL

Description

This message occurs when WAFL® detects an inconsistent physical snapshot ID for the latest snapshot on a volume or an aggregate.

Corrective Action

(None).

Syslog Message

Corrected the latest_snapid for %s %s from %d to %d.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **volume** (STRING): Volume or aggregate name.
> **invalid_latest_snapid** (INT): Invalid latest snapshot ID stored on disk.
> **corrected_latest_snapid** (INT): The corrected latest snapshot ID.

wafl.lmgr events

wafl.lmgr.meta.mv

Severity

> NOTICE

Description

> The appliance file lock state for a volume could not be moved during a file system check operation (wafliron).

Corrective Action

> (None).

Syslog Message

> Move of file lock manager state for volume fsid %08x (uuid %s) for file system check received error %s

Parameters

> **fsId** (INT): File system identifier of the volume.
> **uuid** (STRING): Uuid of the volume.
> **err** (STRING): Error message.

wafl.lmgr.meta.rm

Severity

> NOTICE

Description

> The appliance file lock state for a volume could not be removed.

Corrective Action

> (None).

Syslog Message

> Cannot remove lock manager host metafile %s in recycle bin: error %s

Parameters

> **path** (STRING): Metadata file path.
> **err** (STRING): Error message.

wafl.lookup events

wafl.lookup.smDirErr

Severity

ERROR

Description

This message occurs when the system encounters an unexpected deleted directory entry in a snapmirrored qtree. This message can occur when accessing a directory in a snapmirrored qtree.

Corrective Action

This condition is transient. Wait for any in-progress SnapMirror(tm) operations to finish and try the operation again.

Syslog Message

wafl_nfs_lookup: unexpected deleted directory entry in snapmirrored qtree %d: {x%x %d %d %d %d} <%.*s> in {x%x %d %d %d %d}.

Parameters

qtree (INT): Qtree identifier.
fh0 (INT): Directory file handle's flags.
fh1 (INT): Directory file handle's snapid.
fh2 (INT): Directory file handle's fileid.
fh3 (INT): Directory file handle's generation.
fh4 (INT): Directory file handle's FSID.
name (STRINGARRAY): Name of the directory.
dfh0 (INT): Requested file handle's flags.
dfh1 (INT): Requested file handle's snapid.
dfh2 (INT): Requested file handle's fileid.
dfh3 (INT): Requested file handle's generation.
dfh4 (INT): Requested file handle's FSID.

wafl.make events

wafl.make.container.dense.failed

Severity

NOTICE

Description

This message occurs when container cant be made dense

Corrective Action

(None).

Syslog Message

Container cannot be made dense for %s "%s" due to "%s".

Parameters

volume_identifier (STRING): Volume identifier.
volume (STRING): Volume name.
message (STRING): Reason for failure to make container dense

wafl.maxdirsize events

wafl.maxdirsize.boot.notice

Severity

NOTICE

Description

This message occurs for each volume that has a maximum directory size greater than the default during boot.

Corrective Action

Use the (privilege:advanced) option of the "volume modify -volume vol_name -maxdir-size new_value" command to set the volume's maximum directory size to the default maxdirsize. However, doing so could impact system performance. If you need to increase the maximum directory size, work with NetApp technical support. For ASA r2, contact NetApp technical support for assistance to resolve this internal error.

Syslog Message

%s%s%s%s: This volume's maxdirsize (%uKB) is higher than the default (%uKB). There might be a performance penalty when doing operations on large directories.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): UUID of the volume when the volume name alone is insufficient.
current_maxdirsize (INT): Default maximum directory size value.
default_maxdirsize (INT): Default maximum directory size value.

wafl.mcc events

wafl.mcc.config.notFound

Deprecated

Deprecated as of version 9.4 as this debug EMS not supported now.

Severity

ERROR

Description

This message occurs when WAFL® does not find the MetroCluster configuration information on this node.

Corrective Action

Run the 'metrocluster check' command to verify the MetroCluster configuration.

Syslog Message

(None).

Parameters

(None).

wafl.mcc.exceed.volcnt.limit

Severity

ERROR

Description

This message occurs when the MetroCluster® volume count limit for this node is reached. No additional volumes can be created on this node unless some existing volumes are moved or destroyed.

Corrective Action

Either destroy some existing volumes or perform a 'volume move' operation to move some existing volumes to a storage aggregate located on a different node to make room for the new ones. Alternatively, you can also create new volumes on a different node to avoid moving or deleting the existing volumes.

Syslog Message

MCC volume count limit of %d reached for this node.

Parameters

max_volcnt (INT): Volume count limit for this node.

wafl.mcc.nso.left.behind

Severity

ERROR

Description

This message occurs when the system aborts a negotiated switchover because an online left-behind aggregate was found on this node.

Corrective Action

Check whether there exists any online left-behind aggregates on this node from a previous switchover or takeover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner, and then retry the operation. You can use the "override-vetoes" option to proceed without performing the corrective action.

Syslog Message

One or more online left-behind aggregates exist. Negotiated switchover is canceled.

Parameters

(None).

wafl.mcc.nso.veto.cmode.vols

Severity

ERROR

Description

This message occurs when the system aborts negotiated switchover because a cluster volume was found on an aggregate with Controller Failover (CFO) HA policy.

Corrective Action

Retry the negotiated switchover operation after the volume is deleted or moved to an aggregate with SFO HA policy. The override-vetoes option may be used to proceed without deleting or moving the volume.

Syslog Message

%s %s%s%s%s has a CFO HA policy and contains one or more cluster volumes. Negotiated switchover canceled.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.mcc.sb.left.behind

Severity

ERROR

Description

This message occurs when WAFL® leaves behind an aggregate during MetroCluster(tm) switchback because this aggregate does not meet all the WAFL veto criteria for switchback.

Corrective Action

Correct the issue that caused the aggregate to be left behind, based on the specific reason identified in an earlier EMS message. After correcting the issue, run the 'metrocluster switchback' command to return the aggregate to its original owner.

Syslog Message

Aggregate %s was left behind during switchback.

Parameters

vol (STRING): Name of the aggregate that was left behind.

wafl.mcc.sb.nso.veto.create

Severity

ERROR

Description

This message occurs when the system aborts a switchback or negotiated switchover because a volume create operation is running.

Corrective Action

Retry the switchback or negotiated switchover operation after the volume create operation is complete.

Syslog Message

%s %s%s%s%s is being created. Switchback or negotiated switchover canceled.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.mcc.sb.nso.veto.fence

Severity

> ERROR

Description

> This message occurs when the system aborts a switchback or negotiated switchover operation because a volume has a fence set.

Corrective Action

> A volume in the aggregate is currently fenced for group operations. Retry the switchback or negotiated switchover operation after any group SnapRestore® or mirror transfers are complete. If the problem persists, contact technical support.

Syslog Message

> %s %s%s%s%s has a fence set. Switchback or negotiated switchover canceled.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.mcc.sb.nso.veto.iron

Severity

> NOTICE

Description

> This message occurs when the system aborts a switchback or negotiated switchover because wafliron is running.

Corrective Action

> Retry the switchback or negotiated switchover operation after wafliron is finished.

Syslog Message

> %s %s%s%s%s is running wafliron. Switchback or negotiated switchover canceled.

Parameters

> **type** (STRING): Type of object (volume or aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.mcc.sb.nso.veto.lock

Severity

ERROR

Description

This message occurs when WAFL® vetoes a switchback or negotiated switchover operation because the system cannot obtain an aggregate level lock.

Corrective Action

Retry the switchback or negotiated switchover operation after waiting for other operations on the aggregate to finish.

Syslog Message

Switchback or negotiated switchover vetoed because the system could not obtain a lock on aggregate %s.

Parameters

vol (STRING): Aggregate name.

wafl.mcc.sb.nso.veto.nvsave

Severity

ERROR

Description

This message occurs when WAFL® vetoes a switchback or negotiated switchover operation because there are NVSave files for an aggregate or a flexible volume that must be replayed before the aggregate or flexible volume can be switched back.

Corrective Action

Retry the switchback or negotiated switchover operation after replaying NVSave files (by bringing the aggregate or flexible volume online) or deleting them from the root volume.

Syslog Message

Switchback or negotiated switchover vetoed due to presence of NVSave files for '%s' (FSID %d, UUID %s).

Parameters

vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.
fsid (INT): File system identifier.
UUID (STRING): UUID of the Volume.

wafl.mcc.sb.nso.veto.revert

Severity

ERROR

Description

This message occurs when the system aborts a switchback or negotiated switchover because a volume revert operation is running.

Corrective Action

Retry the switchback or negotiated switchover operation after the volume revert operation is complete.

Syslog Message

%s %s%s%s%s is being reverted. Switchback or negotiated switchover canceled.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.mcc.so.replay.disabled

Severity

NOTICE

Description

This message occurs during MetroCluster(tm) switchover processing on a simulator. WAFL® replay is disabled on simulators.

Corrective Action

(None).

Syslog Message

MetroCluster switchover: WAFL replay disabled on simulators.

Parameters

(None).

wafl.mcc.so.start

Severity

INFORMATIONAL

Description

This message occurs when WAFL starts switchover operation.

Corrective Action

(None).

Syslog Message

WAFL starts switchover operation (force-nvfail-all=%s).

Parameters

force_nvfail_all (STRING): Switchover command option.

wafl.mcc.so.vols.mounted

Severity

INFORMATIONAL

Description

This message occurs when the volumes are mounted during switchover.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

wafl.mcc.subphase.times

Severity

INFORMATIONAL

Description

Issued upon completion of the WAFL portion of a MetroCluster operation with sub-phase timings in milliseconds.

Corrective Action

(None).

Syslog Message

(None).

Parameters

operation (STRING): Operation that was completed, such as switchover or switchback.
subPhaseTimes (STRING): Report of sub-phase times for the WAFL portion of the MetroCluster operation.

wafl.mcc.total.maxvvols

Severity

NOTICE

Description

This message occurs in a MetroCluster(tm) configuration when the system cannot configure a FlexVol® volume because the maximum number of volumes has been reached.

Corrective Action

Check whether there exists a left-behind aggregate on this node from a previous switchover or takeover operation. If such an aggregate exists, then perform the corrective actions specified in the earlier EMS messages for the left-behind aggregate to return it to its original owner. Otherwise, either destroy some existing volumes or perform a 'volume move' operation to move some existing volumes to a storage aggregate located on a different node to make room for the new ones.

Syslog Message

Cannot configure FlexVol volume '%s' (UUID %s) in aggregate '%s': There are too many FlexVol volumes on the system.

Parameters

vol (STRING): FlexVol volume name.
uuid (STRING): FlexVol volume unique ID.
aggregate (STRING): Aggregate name.

wafl.mcc.volLimit.exceeded

Deprecated

Deprecated as of version 9.2 as the additional volume count soft limit for MCC is removed. The regular MCC limit based on the setting of node-object-limit is still in place.

Severity

ERROR

Description

This message occurs when the total volume count exceeds the limit supported on this node.

Corrective Action

Bring the number of volumes below the supported limit on this node, either by performing a 'volume move' operation to move the extra volumes to a storage aggregate located on a different node, or by destroying some or all of the unused extra volumes on this node.

Syslog Message

There are more volumes (%d) than the maximum number of volumes (%d) supported on this node for host: %s.

Parameters

numVols (INT): Current number of volumes.
limit (INT): Maximum number of volumes supported.
host (STRING): Host on this node for which the volume limit has been exceeded.

wafl.mem events

wafl.mem.stomper

Severity

NOTICE

Description

This event indicates whether memory stomper code is running or not.

Corrective Action

(None).

Syslog Message

You are %s running in corruption detection diagnostic mode with degraded performance.

Parameters

onoff (STRING): The stomper code is on/off

wafl.memory events

wafl.memory.status

Severity

INFORMATIONAL

Description

This message occurs periodically to inform the administrator about the amount of WAFL memory that is currently available.

Corrective Action

(None).

Syslog Message

%dMB of memory is currently available for the WAFL file system.

Parameters

mem (INT): Available WAFL memory, in megabytes (MB).

wafl.memory.statusLowMemory

Severity

NOTICE

Description

This message occurs when WAFL is low on memory.

Corrective Action

(None).

Syslog Message

WAFL is running low on memory, with %dMB remaining.

Parameters

mem (INT): Available WAFL memory, in megabytes (MB).

wafl.memory.statusVeryLowMemory

Severity

ALERT

Description

This message occurs when WAFL is very low on memory.

Corrective Action

(None).

Syslog Message

WAFL is running very low on memory, with %dMB remaining.

Parameters

mem (INT): Available WAFL memory, in megabytes (MB).

wafl.metadata events

wafl.metadata.rsrv.decreased

Severity

NOTICE

Description

This message occurs when the space reserved for volume metadata is decreased when the value of "space-guarantee" for a FlexClone volume is changed from "volume" to "none". After the decrease in the metadata reserve, the freed up space is added to the space available in the aggregate.

Corrective Action

(None).

Syslog Message

Metadata reserve for volume "%s" has decreased.

Parameters

volume_name (STRING): Volume name.

wafl.metadata.rsrv.increased

Severity

NOTICE

Description

This message occurs when the space reserved for volume metadata is increased when the value of "space-guarantee" for a FlexClone volume is changed from "none" to "volume" or when a FlexClone volume is split from its parent volume. This metadata reserve is required to store volume metadata inside an aggregate.

Corrective Action

(None).

Syslog Message

Metadata reserve for volume "%s" has increased.

Parameters

volume_name (STRING): Volume name.

wafl.metafile events

wafl.metafile.reg.unknown

Severity

NOTICE

Description

This message occurs when a metafile to be created is not documented, has information about it missing, or has not been identified and associated with an entry from the wiki page: MetafileRegistration. METAFILE_UNKNOWN is used as a placeholder in these cases.

Corrective Action

If you are familiar with this metafile, its purpose, or others who have worked with this file, please contact dl-replication-developer.

Syslog Message

%s is declared as METAFILE_UNKNOWN. If you are familiar with this metafile, its purpose, or others who have worked with this file, please contact dl-replication-developer.

Parameters

path (STRING): Filepath of the metafile

wafl.metafile.reg.unused

Severity

NOTICE

Description

This message occurs when a metafile believed to be unused or obsolete is about to be created.

Corrective Action

The information in the wiki page: MetafileRegistration and metafiles.h needs to be corrected. Please contact dl-replication-developer.

Syslog Message

%s is declared as METAFILE_UNUSED. The information in the wiki page: MetafileRegistration and metafiles.h needs to be corrected. Please contact dl-replication-developer.

Parameters

path (STRING): Filepath of the metafile

wafl.mirror events

wafl.mirror.access.denied

Severity

ERROR

Description

This message occurs when the system rejects client access to a primordial volume. A primordial volume is a volume that has been configured as the destination of a SnapMirror® relationship but has not yet been initialized through that relationship.

Corrective Action

You can avoid this event by using the 'volume unmount' command to unmount the volume from the namespace, or by using the 'snapmirror initialize' command to initialize the SnapMirror relationship to the volume.

Syslog Message

Access to SnapMirror volume '%s' was denied because SnapMirror initialization was not complete (exported snapshot identifier '%d' is invalid).

Parameters

vol (STRING): Volume name.
snapid (INT): Exported snapshot identifier.

wafl.mirror.upgrade.fail

Severity

ERROR

Description

This message occurs when WAFL® unexpectedly encounters a Data ONTAP® 10.0.x mirrored volume during an upgrade. This mirrored volume should have been deleted or broken off from its mirroring relationship prior to the upgrade.

Corrective Action

Avoid this event by destroying all Data ONTAP 10.0.x mirrored volumes prior to the upgrade. This event resulted in the volume being marked offline, corrupt, and unrecoverable. Because the current version of Data ONTAP does not recognize this mirrored volume, the volume cannot be recovered by file system repair mechanisms such as wafliron and cannot be brought online.

Syslog Message

Data ONTAP 10.0.x mirror (type %d) cannot be upgraded by the current version of Data ONTAP. Mirrored volume '%s' was marked offline, corrupt, and unrecoverable. Read the upgrade notes for this release. Such mirrored volumes should be deleted or broken off from their mirroring relationships prior to the upgrade.

Parameters

type (INT): Mirror type in Data ONTAP 10.0.x.
vol (STRING): Volume name.

wafl.mount events

wafl.mount.fa.incons

Severity

ERROR

Description

This message occurs when the flexaggregate cannot be mounted; the flexaggregate is marked as inconsistent.

Corrective Action

Contact NetApp technical support.

Syslog Message

wafliron could not mount flexaggregate %s due to %s. Flexaggregate is marked as inconsistent.

Parameters

flexaggrname (STRING): Flexaggregate name.
reason (STRING): Reason for the failure.

wafl.mount.inconsistent

Severity

ERROR

Description

This message occurs when the FlexVol® volume cannot be mounted; the volume is marked as inconsistent.

Corrective Action

Unable to mount the volume. Run wafliron to diagnose the volume.

Syslog Message

WAFL: Unable to mount volume %s due to %s. Volume is marked as inconsistent.

Parameters

vvolname (STRING): Volume name.
reason (STRING): Reason for the inability to mount the volume.

wafl.mount.info

Severity

NOTICE

Description

mount message

Corrective Action

(None).

Syslog Message

%s

Parameters

msg (STRING): Message from wafl vol mount path which prints how many messages were sent to WAFL.

wafl.mount.transient.error

Severity

ERROR

Description

This message occurs when a FlexVol® volume cannot be mounted due to transient errors and the volume is taken offline.

Corrective Action

Firstly, attempt to bring the volume online manually by using the "volume online" command. If the issue persists, determine whether the volume is a NetApp® Aggregate Encryption (NAE) volume by using the "volume show -encryption-type aggregate" command. If so, remount the aggregate of the volume by taking it offline (using the "aggr offline" command), and then bringing it online again (using the "aggr online" command). If the issue still persists, contact NetApp technical support. For ASA r2, contact NetApp technical support for assistance to resolve this internal error.

Syslog Message

WAFL: Unable to mount volume %s, UUID %s due to %s. Volume is taken offline due to transient errors.

Parameters

vvolname (STRING): Volume name.
uuid (STRING): Universal unique identifier (UUID) of the volume.
reason (STRING): Reason for the failure to mount the volume.

wafl.mp events

wafl.mp.vldb.update.failed

Severity

ERROR

Description

This message occurs when the value of the "multipart enabled" setting in the RAID label changes during the restoration of a snapshot, and an attempt to update the value in the Volume Location Database (VLDB) to match the new RAID label value fails.

Corrective Action

Perform the following steps using the 'debug vreport' command to resolve the inconsistency in the VLDB. 1. Run the "debug vreport show" command to show the object name. 2. Run the "debug vreport fix -type volume -object object-name" command.

Syslog Message

Updating the VLDB "granular-data" property of volume "%s" with DSID "%08x" to "%s" failed. Reason: %s.

Parameters

vol (STRING): Name of the volume.
dsid (LONGINT): Unique identifier (DSID) of the volume.
value (STRING): New value to be set.
errmsg (STRING): Error message.

wafl.needs events

wafl.needs.blog

Severity
ERROR

Description
This message occurs when batched_free_log needs to be turned on to allow performing one of the requested actions, such as "Dense Undo", "Dense Revert", and "Clone Split".

Corrective Action
Contact NetApp technical support..

Syslog Message
batched_free_log needs to be turned on.

Parameters
(None).

wafl.nfsv4 events

wafl.nfsv4.acl.not.mapped

Severity
ERROR

Description
This message occurs when the system cannot map an ID stored in the Access Control Entry (ACE) to a valid UNIX® User ID/Group ID (UID/GID) pair. This failure makes this ACE an invalid one, resulting in a possible loss of access to the file or directory for which this ACE was set.

Corrective Action
Contact NetApp technical support.

Syslog Message
ID in NFS Access Control Entry (ACE) on inode number %x, file system ID %x could not be mapped to a user or group. Possible loss of access can result.

Parameters
inum (INT): Inode number.
fsid (INT): File system ID.

wafl.no events

wafl.no.large.vvol.size.set

Severity
ERROR

Description
This message occur when a volume don't have 'large_size_enabled' flag set even when the nominal size

crosses the 100TB limit.

Corrective Action

(None).

Syslog Message

Nominal size of the "%s" volume exceeded either 100TB limit.

Parameters

vvolname (STRING): Name of the volume.

wafl.ntfsunixsecurityops events

wafl.ntfsUnixSecurityOps

Severity

NOTICE

Description

This message occurs when a UNIX-type permissions or ownership change is attempted by an NFS client on an NTFS (Windows) volume, but changes of this type are prohibited by an export policy rule.

Corrective Action

Use the "vserver show -fields uuid" command to find the Vserver name corresponding to the Vserver's UUID. Use the "volume file show-inode" command with the file ID and volume name information to find the file or directory path and consider using Windows client to set file or directory attributes.

Syslog Message

NFS client attempted prohibited change of UNIX permissions for file ID: %d, on NTFS volume : %s%s%s

Parameters

fileid (INT): File ID of the entry in the directory.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Vserver's Universal Unique Identifier (UUID).

wafl.nvlog events

wafl.nvlog.stats.createError

Severity

NOTICE

Description

This event is issued to indicate that the system is unable to create nvlog stats file.

Corrective Action

(None).

Syslog Message

Can't create nvlog replay stats file

Parameters

(None).

wafl.nvlog.stats.writeError

Severity

NOTICE

Description

This event is issued to indicate the system is unable to write to nvlog stats file.

Corrective Action

(None).

Syslog Message

Nvlog replay stats fio_write failed

Parameters

(None).

wafl.nvlog.versionFail

Severity

ALERT

Description

This message occurs when the nvlog version found in the NV log is not recognized by the current version of Data ONTAP®.

Corrective Action

This might be the result of an upgrade or revert attempt after a dirty boot. If so, try the upgrade or revert after a clean shutdown. If the problem persists, or if this was not due to an upgrade or revert, contact NetApp technical support.

Syslog Message

Could not replay WAFL NV log: nvlog format is of a prior or future release (%d, %d).

Parameters

version (INT): WAFL® NV log version in the NV log.
myversion (INT): Kernel WAFL NV log version.

wafl.nvsave events

wafl.nvsave.deletion.status

Severity

INFORMATIONAL

Description

This message occurs when one or more NVSave files are deleted from the local root volume or the partner root volume while in takeover mode, or from the partner node when the partner node is not in takeover mode.

Corrective Action

(None).

Syslog Message

Deleted NVSave files corresponding to %s %s with FSID %d, HA policy %d, CP_count %d %s on %s node. UUID is %s.

Parameters

vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.
vol_name (STRING): Volume name.
fsid (INT): File system identifier.
ha_policy (INT): High-availability (HA) policy of the parent aggregate.
CP_count (INT): Volume's WAFL® consistency point (CP) count.
status (STRING): Whether deletion failed or succeeded.
node (STRING): Whether deletion was attempted on a local or partner node.
UUID (STRING): UUID of Volume.

wafl.nvsave.overwritingstale

Severity

NOTICE

Description

This message occurs during replay of the WAFL® nvlog, when the system discovers records associated with an offline volume. These records need to be stored in a system file on the root volume for future replay. However, a previously saved replay file already exists for this volume in the root volume. The system overwrites the stale replay file if the Consistency Point (CP) count stored in the file is less than that in nvlog.

Corrective Action

(None).

Syslog Message

Detected stale system nvlog replay file for a nonexistent volume with FSID '%d' in the '%s' root volume for WAFL nvlog %d. This stale file was overwritten because of '%s'.

Parameters

fsid (INT): File system ID (FSID) of the missing volume.
host (STRING): Owner of the root volume to which the detected nvlog records are successfully stored.
log (INT): WAFL NV log section in which nvlog records for the volume are located.
error (STRING): Reason for overwriting the existing nvsave file.

wafl.nvsave.replaying

Severity

NOTICE

Description

This message occurs when a volume comes online and detects relevant nvlog data to be replayed from the system file in the root volume.

Corrective Action

(None).

Syslog Message

Relevant nvlog data detected for volume %s%s%s%s, FSID %d, CP count %d in WAFL NV log %d. Replaying nvlog records for the volume from a system file in the root volume.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Consistency Point (CP) count found in the system nvlog file.
log (INT): WAFL nvlog section in which nvlog records for the volume are located.
vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.nvsave.replaying.fail

Severity

EMERGENCY

Description

This message occurs when a volume comes online and fails to replay relevant nvlog data from the system file in the root volume. The nvlog data for the volume might be lost.

Corrective Action

Take appropriate recovery action to recover from data loss, if any.

Syslog Message

Relevant nvlog data detected for volume %s%s%s%s, FSID %d, CP count %d. Failed to replay nvlog records in WAFL nvlog %d for the volume from a system file in the root volume due to error: %s.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Consistency Point (CP) count found in the system nvlog file that could not be replayed.
log (INT): WAFL® nvlog section in which nvlog records for the volume are located.
error (STRING): Reason for the failure.
log0_replay_time (LONGINT): Milliseconds to replay nvlog records from the first NVSave file.
log0_cp_time (LONGINT): Milliseconds to complete the WAFL CP after nvlog records from the first NVSave file are replayed.
log1_replay_time (LONGINT): Milliseconds to replay nvlog records from the second NVSave file.
log1_cp_time (LONGINT): Milliseconds to complete the WAFL CP after nvlog records from the second NVSave file are replayed.

vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.nvsave.replaying.partial

Severity

NOTICE

Description

This message occurs when a volume comes online and does a partial replay of the nvlog data from the system file in the root volume. The reason for the partial replay is listed.

Corrective Action

(None).

Syslog Message

%s. Nvlog records from the system file in the root volume for volume with FSID %d might have been partially replayed.

Parameters

reason (STRING): Reason for the partial replay.
fsid (INT): File system ID (FSID) of the volume.

wafl.nvsave.replaying.pass

Severity

NOTICE

Description

This message occurs when a volume comes online and successfully replays relevant nvlog data from the system file in the root volume.

Corrective Action

(None).

Syslog Message

Relevant nvlog data detected for volume %s%s%s%s, FSID %d, CP count %d. Successfully replayed nvlog records for the volume from a system file in the root volume.

Parameters

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Consistency Point (CP) count found in the system nvlog file.
log0_replay_time (LONGINT): Milliseconds to replay nvlog records from the first NVSave file.
log0_cp_time (LONGINT): Milliseconds to complete WAFL® CP after nvlog records from the first NVSave file are replayed.
log1_replay_time (LONGINT): Milliseconds to replay nvlog records from the second NVSave file.
log1_cp_time (LONGINT): Milliseconds to complete the WAFL CP after nvlog records from the second NVSave file are replayed.
vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.nvsave.saving

Severity

NOTICE

Description

This message occurs during replay of the WAFL® nvlog, when records associated with a nonexistent or currently offline volume are discovered. These records will be stored in a system file on the root volume and will be replayed when the offline volume comes online.

Corrective Action

(None).

Syslog Message

Replay detected nvlog records for a nonexistent or offline volume with FSID %d and CP count %d in WAFL nvlog %d. The nvlog records will be stored in a system file in the "%s" root volume for possible future replay.

Parameters

fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Volume's WAFL Consistency Point (CP) count found in the nvlog.
log (INT): WAFL nvlog section in which nvlog records for the volume are located.
host (STRING): Owner of the root volume on which the detected nvlog records are stored.
vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.nvsave.saving.fail

Severity

EMERGENCY

Description

This message occurs when, during replay of the WAFL® nvlog, records associated with a non-existent or offline volume are discovered, but not successfully saved to a system file on the root volume. Data loss is possible when the volume comes back online.

Corrective Action

Nvlog records for an offline volume were not successfully saved, data loss is possible when the volume comes back online. Take appropriate recovery action to recover from data loss, if any, when the volume comes back online.

Syslog Message

Replay detected nvlog records for a nonexistent volume with FSID %d and CP count %d in WAFL nvlog %d. Failed to store nvlog records in a system file in the "%s" root volume due to error: %s.

Parameters

fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Volume's WAFL Consistency Point (CP) count found in the nvlog.
log (INT): WAFL nvlog section in which nvlog records for the volume are located.
host (STRING): Owner of the root volume on which the detected nvlog records were intended to be stored.
error (STRING): Error code.
vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.nvsave.saving.pass

Severity

NOTICE

Description

This message occurs when, during replay of the WAFL® nvlog, records associated with a currently offline volume are discovered and successfully stored in a system file on the root volume. These records are replayed when the volume comes back online.

Corrective Action

The nvlog records for an offline volume are successfully saved on the root volume. These records are replayed when the volume comes back online.

Syslog Message

Replay detected nvlog records for an offline volume with FSID %d and CP count %d in WAFL nvlog %d. The nvlog records were successfully stored in a system file on the "%s" root volume in %llu milliseconds.

Parameters

fsid (INT): File system ID (FSID) of the missing volume.
cp_count (INT): Volume's WAFL Consistency Point (CP) count found in the system nvlog file.
log (INT): WAFL NV log section in which nvlog records for the volume are located.
host (STRING): Owner of the root volume on which the detected nvlog records are successfully stored.
timetaken (LONGINT): Time taken to save the nvlog records, in milliseconds.
vol_type (STRING): Whether this message refers to NVSave files for an aggregate or a flexible volume.

wafl.objstore events

wafl.objstore.ownership.conflict

Severity

ALERT

Description

This message occurs when FabricPool aggregate and SnapMirror® tries to share the same underlying objectstore connection pools in a platform where the sharing is not supported.

Corrective Action

For more information or assistance, contact NetApp technical support.

Syslog Message

FabricPool aggregate and SnapMirror® cannot share the underlying objectstore connection pool. Objectstore Config id: %u, current owner: %u.

Parameters

primary_config_id (INT): Primary object store config id.
current_owner (INT): Existing owner. FabricPool(1)/SnapMirror(2).

wafl.offline events

wafl.offline.infoError

Severity
ALERT

Description
This message occurs when the system attempts to place a volume online, but cannot read the volinfo or fsinfo data for the volume.

Corrective Action
Volume is inconsistent. Contact NetApp technical support.

Syslog Message
Either both volinfo blocks or fsinfo block on %s %s%s%s%s are/is invalid.

Parameters
type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume, for cases when the volume name is insufficient.

wafl.offline.openfiles

Severity
NOTICE

Description
This message occurs when wafliron detects a failure while trying to perform an operation because files are open.

Corrective Action
No corrective action is required for this notification event.

Syslog Message
'%s %s' might not be '%s%s' because of '%u' open file'%s'.

Parameters
voltype (STRING): Aggregate.
volname (STRING): Volume name.
operation (STRING): Operation.
suffix (STRING): Suffix.
uses (INT): Number of open files.
plural (STRING): Plural.

wafl.offline.proc.file

Severity

NOTICE

Description

This message occurs when wafliron detects a failure while trying to perform an operation because a process has open files.

Corrective Action

No corrective action is required for this notification event.

Syslog Message

The '%s' process has '%u' file'%s' open.

Parameters

procname (STRING): Process name.
openfiles (INT): Number of open files.
plural (STRING): Plural.

wafl.offline.proc.file.unres

Severity

NOTICE

Description

This message occurs when wafliron detects a failure while trying to perform an operation because a process has unresolved open files.

Corrective Action

No corrective action is required for this notification event.

Syslog Message

Could not resolve '%u' of '%s's' open file names.

Parameters

openfiles (INT): Number of open files.
procname (STRING): Process name.

wafl.offline.quiesce.aborted

Severity

NOTICE

Description

This message occurs when wafliron detects a failure while waiting for a volume reference lock to be taken.

Corrective Action

No corrective action is required for this notification event.

Syslog Message

The wait for uses of '%s %s' to quiesce was aborted.

Parameters

voltype (STRING): Aggregate.
aggrname (STRING): Aggregate name.

wafl.offline.quiesced

Severity

NOTICE

Description

This message occurs when wafliron detects a success while waiting for a volume reference lock to be taken.

Corrective Action

No corrective action is required for this notification event.

Syslog Message

Uses of '%s %s' preventing '%s' have quiesced.

Parameters

voltype (STRING): Aggregate.
aggrname (STRING): Aggregate name.
operation (STRING): Operation.

wafl.offline.versionMismatch

Severity

EMERGENCY

Description

This message occurs when the system is inspecting an offline volume by reading the super block and discovers that there is a version mismatch.

Corrective Action

Confirm that the correct Data ONTAP® version is in use; if not, reboot or upgrade to the correct version as necessary. For more information or assistance, contact NetApp technical support.

Syslog Message

This version of Data ONTAP does not recognize the filesystem of offline %s %s%s%s%s. The volume is probably from a later version of the software.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.

wafl.offline.volref.msg

Severity

NOTICE

Description

This message indicates the volume reference message that prevents the operation on an aggregate.

Corrective Action

No corrective action is required for this notification event.

Syslog Message

'%s' prevents '%s' of '%s %s'.

Parameters

volreftext (STRING): Volume reference message text.
operation (STRING): Operation.
voltype (STRING): Aggregate.
aggrname (STRING): Aggregate name.

wafl.ondemand events

wafl.ondemand.aggr.rsv.fail

Severity

ERROR

Description

This message occurs when Data ONTAP® fails to reserve space for a file operation due to lack of space on the aggregate.

Corrective Action

Create free space on the aggregate by either adding more disks or manually deleting data. If this condition persists, contact NetApp technical support for further assistance.

Syslog Message

Insufficient space on aggregate '%s %s' to perform file operation on volume '%s%s%s' (failed to re-create %s flexible space pool).

Parameters

owner (STRING): Owner of the aggregate.
aggr (STRING): Name of the aggregate.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
fsptype (STRING): Type of the flexible space pool.

wafl.ondemand.destroy.pending

Severity

NOTICE

Description

This message occurs when a file operation cannot be immediately destroyed because the destination file has been captured in one or more snapshots.

Corrective Action

Delete the snapshots that have captured the destination file.

Syslog Message

%s

Parameters

destroy_info (STRING): Status of the file operation.

wafl.ondemand.done

Severity

NOTICE

Description

This message occurs when a file operation is completed.

Corrective Action

(None).

Syslog Message

%s

Parameters

done_info (STRING): Status of the completed file operation.

wafl.ondemand.dst.fsize.exceeded

Severity

NOTICE

Description

This message occurs when the size of a file or LUN being moved or copied exceeds the maximum file or LUN size allowed by the system. The ondemand operation will fail for that particular file or LUN.

Corrective Action

(None).

Syslog Message

%s destination job %s-%d. %s %s%s%s%s, FSID 0x%x, The file operation with file ID %d has failed because the file size exceeded the maximum file size allowed on the current system, which is %lu bytes. The size of the file being copied or moved is %lu bytes.

Parameters

job_type (STRING): Operation type.
job_uuid (STRING): Unique ID (UUID) of the file operation source job.
file_index (INT): Unique identifier for the file in the source job.

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume if the volume name itself is insufficient.
fsid (INT): File system identifier of the volume.
fileid (INT): File identifier.
maxsize (LONGINT): Maximum file size allowed on this system.
filesize (LONGINT): Size of the file being copied or moved.

wafl.ondemand.dstPresent

Severity
INFORMATIONAL

Description
This message occurs when a file shows up in the public name space of destination volume during file operation.

Corrective Action
(None).

Syslog Message
%s

Parameters
file_info (STRING): Destination file's UUID and index.

wafl.ondemand.errPaused

Severity
ALERT

Description
This message occurs when a file or LUN operation is paused due to an error condition.

Corrective Action
Based on the information in the event, resolve the problem that is causing the error condition, if possible. The operation is retried automatically on an hourly interval, or you can unpause the operation by using the appropriate command: file copy modify, file move modify, lun copy resume, or lun move resume. If the error condition persists, contact NetApp technical support.

Syslog Message
%s

Parameters
error_info (STRING): Error information for the paused operation.

wafl.ondemand.jobLookupFailed

Severity

ERROR

Description

This message occurs when an ondemand msg returns an error and, upon trying to check if snapshots are fenced during the cleanup process, cannot find the associated job.

Corrective Action

Check if snapshots can be taken on the volume. If not, try to abort the previous job using either 'file copy destroy' or 'file move destroy'. If neither suggestions are successful, contact technical support for assistance.

Syslog Message

OnDemand lookup job failed: %s

Parameters

job_lookup_info (STRING): Information regarding the OnDemand msg.

wafl.ondemand.metafileErr

Severity

ERROR

Description

This message occurs when the special-purpose metafile that Data ONTAP® creates to store information on file operations cannot be read. The volume has been left offline as a consequence.

Corrective Action

Issue the 'volume online' command to attempt to bring the affected volume back online. If this condition persists, contact NetApp technical support for futher assistance.

Syslog Message

OnDemand metafile load error, volume '%s%s%s': %s

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
error_info (STRING): Error infomation.

wafl.ondemand.repaired.metafile

Severity

ERROR

Description

This message occurs when an inconsistency is discovered in the OnDemand metafile header or entry. The inconsistency is automatically repaired upon detection.

Corrective Action

(None).

Syslog Message

%s certification failed: %s, %s, %s, %s, %s, fbn (%llu), record_index (%llu)

Parameters

fh (STRING): File handle of ondemand metafile which is repaired.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.
condition (STRING): The initial metadata validation test that failed.
source (STRING): The location of the failing metadata validation test.
fbn (LONGINT): File block number (fbn) of the repaired block.
record_index (LONGINT): Index of the record entry in the repaired block.

wafl.ondemand.space.rsv.fail

Severity

ERROR

Description

This message occurs when Data ONTAP® fails to reserve space for a file operation due to lack of space on the volume.

Corrective Action

Manually delete data to create free space on the volume, and then modify the job to unpause the data scanner by using the "volume file [copy|move] modify -job-uuid <job_uuid> -file-index <file_index> -scanner -paused false" command. If this condition persists, contact NetApp technical support for further assistance.

Syslog Message

Insufficient space on '%s%s%s' to perform file operation %s-%d (failed to re-create %s flexible space pool).

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
job_uuid (STRING): Unique ID (UUID) of the file operation.
file_index (INT): Unique identifier for the file in the job.
fsptype (STRING): Type of the flexible space pool.

wafl.ondemand.srcJobRecFail

Severity

ERROR

Description

This message occurs when the system fails to repair a corrupted record in the special-purpose metafile that holds information about file operations.

Corrective Action

The source job recovery will be reattempted the next time the volume comes online. To explicitly reattempt the recovery, take the source volume offline and then bring it back online. If this error condition persists, contact NetApp technical support.

Syslog Message

Volume %s%s%s: %s

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
result (STRING): Result of the failed recovery.

wafl.ondemand.srcJobRecovery

Severity

NOTICE

Description

This message occurs when the system repairs a corrupted record in the special-purpose metafile that holds information about file operations. If the file operation associated with the recovered source job is still in progress, the file operation can be resumed. Otherwise, the original source file can be recovered to lost+found by using the "file source recover" command.

Corrective Action

(None).

Syslog Message

Recovered file operation source job %s-%d in volume "%s%s%s".

Parameters

job_uuid (STRING): Unique ID (UUID) of the file operation source job.
file_index (INT): Unique identifier for the file in the source job.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.ondemand.srcRecovered

Severity

INFORMATIONAL

Description

This message occurs when a file operation source recovery is completed.

Corrective Action

(None).

Syslog Message

Recovered %s source job %s-%d to {DSID:%d:%s}.

Parameters

type (STRING): Operation type.
job_uuid (STRING): Unique ID (UUID) of the file operation source job.
file_index (INT): Unique identifier for the file in the source job.

dsid (INT): Data set identifier (DSID) of the volume where the recovery was performed.
path (STRING): Path to the recovered object.

wafl.ondemand.started

Severity

NOTICE

Description

This message occurs when an OnDemand file or LUN operation is started. The "operation_info" parameter contains information on the type and identity of the started operation.

Corrective Action

(None).

Syslog Message

OnDemand operation started: %s

Parameters

operation_info (STRING): Initial status of the OnDemand operation.

wafl.ondemand.volBusy

Severity

ERROR

Description

This message occurs when a volume operation fails because the volume is the source or destination of one or more file operations. Continuing with the volume operation could potentially disrupt file operations.

Corrective Action

Make sure that file operations are making progress, and if they are paused unpause them. Retry the volume operation after the completion of the file operations.

Syslog Message

Volume %s%s%s can not be offlined, until all pending file operations are completed.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.online events

wafl.online.admin.vol

Severity

INFORMATIONAL

Description

This message occurs when a cluster admin volume comes online during MetroCluster™ switchover.

Corrective Action

None.

Syslog Message

Cluster admin volume %s DSID (%08x) in aggregate %s is online.

Parameters

vol (STRING): Name of the volume.
dsid (LONGINT): Unique identifier (DSID) of the volume.
aggr (STRING): Name of the containing aggregate.

wafl.online.fail.vmalign

Severity

EMERGENCY

Description

This message occurs when a virtual volume cannot be brought online because it has the 'vm-align' option set, which is not supported in this release of Data ONTAP®.

Corrective Action

Install a version of Data ONTAP that supports the 'vm-align' option, available from your vendor.

Syslog Message

Volume '%s%s%s%s' is being taken offline because it has the 'vm-align' option set, which is not supported in this version of Data ONTAP.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.online.infoError

Severity

ALERT

Description

This message occurs when there is a problem reading the volinfo or fsinfo data while trying to mount an online volume.

Corrective Action

(Call support).

Syslog Message

Neither volinfo block of %s %s%s%s%s is valid OR the fsinfo block is invalid.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.

wafl.online.mode.corrupted

Severity

ALERT

Description

This event is issued when there is an inconsistency in the mode bits that indicate whether this volume is in a clustered or nonclustered environment.

Corrective Action

Run wafliron on the containing aggregate to fix up the mode bits.

Syslog Message

The mode bits that indicate whether the %s '%s' volume is in a clustered or nonclustered environment are inconsistent.

Parameters

type (STRING): Type of object (flexible volume).
vol (STRING): Name of the flexible volume.

wafl.online.notCompatibleVer

Severity

EMERGENCY

Description

This message occurs when a volume or aggregate cannot be brought online because SnapLock® is not supported on this version of Data ONTAP®.

Corrective Action

Install a version of Data ONTAP that is supported with SnapLock, available from your vendor.

Syslog Message

%s %s%s%s%s is being taken offline. SnapLock is not supported on this version of Data ONTAP.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.online.toomany

Severity

ALERT

Description

This message occurs when an attempt to bring a volume online fails because the maximum number of volumes are already online for this node.

Corrective Action

Take a currently mounted volume on this node offline so that you can bring the new volume online.

Syslog Message

%s %s%s cannot be brought online because the maximum online count has been reached.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.

wafl.online.unknownVersion

Severity

ALERT

Description

This message occurs when mounting an online volume reveals that the volume version is not recognized by the current version of Data ONTAP®.

Corrective Action

Confirm that the correct Data ONTAP version is in use; if not, reboot or upgrade to the correct version as necessary. For more information or assistance, contact NetApp technical support.

Syslog Message

This version of Data ONTAP does not recognize the filesystem of %s %s%s%s%s. The volume is being taken offline.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.

wafl.online.unsup.deployment

Severity

ALERT

Description

This message occurs when the system determines that the deployment in which this aggregate was created does not match the current (clustered or nonclustered) deployment of Data ONTAP®.

Corrective Action

Bring the aggregate online on a node that matches the clustered or nonclustered deployment in which it was created.

Syslog Message

This deployment of Data ONTAP does not support the file system of '%s %s'. It is being taken offline.

Parameters

type (STRING): Type of object (aggregate).
vol (STRING): Name of the aggregate.

wafl.online.vbnMismatch

Severity

EMERGENCY

Description

This message occurs when there is an error in the block number data associated with a volume, for example, if WAFL®and RAID have different values for the size of the volume.

Corrective Action

Run wafliron on the volume. For more information or assistance, contact NetApp technical support.

Syslog Message

There is a block number error in either the fsinfo block or disk labels on %s %s%s%s%s. The volume is being taken offline.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.

wafl.onoff events

wafl.onOff.mirType.inv

Severity

ERROR

Description

This message occurs when WAFL® attempts to bring online or take offline a mirror volume that does not have a valid mirror-type attribute.This situation might be a direct result of an upgrade to a version of Data ONTAP® that requires the mirror-type attribute or as a result of a corruption.

Corrective Action

This condition cannot be fixed by file system repair mechanisms such as wafliron. The data is not lost, but it is inaccessible to the administrator. To access the data, contact NetApp technical support. Alternatively, the administrator can destroy the mirror volume by using the 'volume delete -vserver vserver_name -volume vol_name' command.

Syslog Message

The mirror type associated with the mirror volume %s %s%s%s%s is invalid.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name by itself is insufficient.

wafl.playlist events

wafl.playlist.bad_fh

Severity

INFORMATIONAL

Description

This event indicates bad playlist file handle

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr_name (STRING): Aggregate name
vol_name (STRING): Volume name

wafl.playlist.create.failure

Severity

INFORMATIONAL

Description

This event indicates that playlist creation failed.

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr_name (STRING): Aggregate name
vol_name (STRING): Volume name

wafl.playlist.no_playlist

Severity

INFORMATIONAL

Description

This event indicates no playlist was found for a volume

Corrective Action

(None).

Syslog Message

(None).

Parameters

aggr_name (STRING): Aggregate name
vol_name (STRING): Volume name

wafl.pnso events

wafl.pnso.offload.engine.error

Severity

ALERT

Description

This message occurs when hardware offload engine requests failed with EIO error.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s [%d]

Parameters

msg (STRING): Error message to be displayed.
err (INT): Error code received.

wafl.pvbn events

wafl.pvbn.check.done

Severity

INFORMATIONAL

Description

This event is issued to inform the user that the pvbn check has completed. It lists detailed information on what work was performed.

Corrective Action

This message may be disabled by passing -s to wafl scan pvbn_check when starting the scanner.

Syslog Message

PVBN check has completed on %s, snapid %d. inos: %d, pvbns: %llu, unks: %llu, errs: %llu.

Parameters

vol (STRING): The volume name
snapid (INT): ID of the snapshot that has been completely scanned
inos (INT): How many inodes were checked
pvbns (LONGINT): How many block pointers were checked
unks (LONGINT): How many pvbn unknowns were encountered
errs (LONGINT): How many pvbn mismatches were encountered

wafl.pvbn.check.found.mismatch

Severity

EMERGENCY

Description

This event is issued to inform the user that the pvbn check has found a pvbn mismatch.

Corrective Action

This message may be disabled by passing -s to wafl scan pvbn_check when starting the scanner.

Syslog Message

PVBN check has found a pvbn mismatch on %s, snapid=%d, %s ino=%d, level=%d, fbn=%llu, index=%d, pvbn=%llu, pvbn2=%llu.

Parameters

vol (STRING): The volume name
snapid (INT): ID of the snapshot being scanned
ino_type (STRING): The inode type
inum (INT): Inum being scanned
level (INT): Level of the buftree being scanned
fbn (LONGINT): Block number containing unknown
index (INT): Index in block that is unknown
pvbn (LONGINT): PVBN as found in the buftree
pvbn2 (LONGINT): PVBN as found in the container indirect

wafl.pvbn.check.found.unknown

Severity

NOTICE

Description

This event is issued to inform the user that the pvbn check has found a pvbn unknown.

Corrective Action

This message may be disabled by passing -s to wafl scan pvbn_check when starting the scanner.

Syslog Message

PVBN check has found a pvbn unknown on %s, snapid=%d, %s ino=%d, level=%d, fbn=%llu, index=%d.

Parameters

vol (STRING): The volume name
snapid (INT): ID of the snapshot being scanned
ino_type (STRING): The inode type
inum (INT): Inum being scanned
level (INT): Level of the buftree being scanned
fbn (LONGINT): Block number containing unknown
index (INT): Index in block that is unknown

wafl.pvbn.check.no.snapshot

Severity

INFORMATIONAL

Description

This event is issued to inform the user that the snapshot being scanned by the pvbn checker no longer exists.

Corrective Action

This message may be disabled by passing -s to wafl scan pvbn_check when starting the scanner.

Syslog Message

PVBN check on %s aborted, snapshot with snapid %d is gone.

Parameters

vol (STRING): The volume name
snapid (INT): ID of the snapshot that no longer exists

wafl.qat events

wafl.qat.offload.engine.error

Severity

ALERT

Description

This message occurs when hardware offload engine (QAT) has failed to process a request.

Corrective Action

Contact NetApp technical support.

Syslog Message

%s [%d]

Parameters

msg (STRING): Error message to be displayed.
err (INT): Error code received.

wafl.qtree events

wafl.qtree.id.mismatch

Severity

ERROR

Description

This message occurs when a qtree ID derived from a WAFL® buffer does not match the given tree ID in a snapshot.

Corrective Action

Delete the snapshot containing the qtree for non SnapMirror® DP volumes. For SnapMirror DP volumes, run wafliron with the "-include-mirrors" option set to true to fix the entry. For example, run the "wafliron start -aggr aggr_name -include-mirrors true" command, where aggr_name is the aggregate for the given volume.

Syslog Message

Qtree ID %d is recorded as ID %d in %s %s%s%s%s in snapshot %d.

Parameters

tid (INT): Source tree identifier.
id (INT): Qtree root identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapId (INT): Snapshot identifier.

wafl.qtree.invalid.state

Severity

ERROR

Description

This message occurs when the qtree file in a snapshot is in an invalid state.

Corrective Action

Delete the snapshot containing the qtree for non SnapMirror® DP volumes. For SnapMirror DP volumes, run wafliron with the "-include-mirrors" option set to true to fix the entry.For example, run the "wafliron start -aggr aggr_name -include-mirrors true" command, where aggr_name is the aggregate for the given volume.

Syslog Message

Qtree file in %s %s%s%s%s is in an invalid state %d in snapshot %d.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is

insufficient.
reason (INT): State of the qtree file.
snapId (INT): Snapshot identifier.

wafl.qtree.metafile.corrupt

Severity

ERROR

Description

This message occurs when the qtree metafile in a snapshot is inconsistent.

Corrective Action

Run wafliron to fix the inconsistent volume. Use the "-include-mirrors" option if the volume is a SnapMirror® DP volume. For example, run the "wafliron start -aggr aggr_name -include-mirrors true" command, where aggr_name is the aggregate for the given volume.

Syslog Message

Qtree metafile inconsistent in volume %s%s%s, snapshot %d.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
snapId (INT): Snapshot identifier.

wafl.qtree.qsmBreak.base

Severity

ERROR

Description

This message occurs when the SnapMirror® information of the qtree is being removed as result of WAFL_check operation.

Corrective Action

Use the "snapmirror resync" or "snapmirror initialize" to reestablish the SnapMirror relationship.

Syslog Message

Breaking SnapMirror qtree %d in %s %s%s%s%s: base snapshot no longer exists. Use the "snapmirror resync" or "snapmirror initialize" to reestablish the SnapMirror relationship.

Parameters

qtree (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.qtree.qsmBreak.iron

Severity

ERROR

Description

This message occurs when the SnapMirror® information of the qtree is being removed as result of a wafliron operation.

Corrective Action

Use the "snapmirror resync" or "snapmirror initialize" command to reestablish the SnapMirror relationship.

Syslog Message

Breaking SnapMirror qtree %d in %s %s%s%s%s: wafliron broke all SnapMirror relationships in %s %s%s%s%s. Use the "snapmirror resync" or "snapmirror initialize" command to reestablish the SnapMirror relationship.

Parameters

qtree (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident1 (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
type2 (STRING): Type of object (volume or aggregate).
owner2 (STRING): Volume owner.
vol2 (STRING): Volume name.
app2 (STRING): Application UUID.
volident2 (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.qtree.qsmBreak.wc

Severity

ERROR

Description

This message occurs when snapmirror information of the qtree is being removed as result of wack

Corrective Action

Use the "snapmirror resync" or "snapmirror initialize" command to reestablish the SnapMirror relationship.

Syslog Message

Breaking SnapMirror qtree %d in %s %s%s%s%s: WAFL_check broke all SnapMirror relationships in %s %s%s%s%s. Use the "snapmirror resync" or "snapmirror initialize" command to reestablish the SnapMirror relationship.

Parameters

qtree (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.

volident1 (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
type2 (STRING): Type of object (volume or aggregate).
owner2 (STRING): Volume owner.
vol2 (STRING): Volume name.
app2 (STRING): Application UUID.
volident2 (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.quota events

wafl.quota.control.inconsistent

Severity

ERROR

Description

This message occurs when the quota control file is inconsistent, or when it is consistent but the qtree metatdata file refers to a vFiler(tm) unit that no longer exists.

Corrective Action

Reinitialize quotas for the volume.

Syslog Message

Quota: /vol/%s%s%s or a quota tree on it referred to a nonexistent vFiler unit. Quota: Quotas have been turned off.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.quota.control.invalid

Severity

ERROR

Description

This message occurs when the system discovers that an invalid quota control file exists.

Corrective Action

Reinitialize quotas for the volume.

Syslog Message

Quota: Invalid quota control file on %s %s%s%s%s. Quota: Quotas have been turned off.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.quota.db.createFail

Severity

NOTICE

Description

This message occurs when the system cannot create the quota database file.

Corrective Action

(None).

Syslog Message

Quota: Could not create the quota database on %s %s%s%s%s (volume might be full).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.quota.db.missing

Severity

ERROR

Description

This message occurs when the system is unable to locate a quota usage database.

Corrective Action

Reinitialize quotas for the volume.

Syslog Message

WAFL: No quota usage database on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.quota.db.noMemory

Severity

ERROR

Description

This message occurs when the system cannot allocate the quota usage database during initialization.

Corrective Action

Add more memory or upgrade the hardware.

Syslog Message

WAFL: Could not obtain memory during load of quota usage database. The quota system was not started on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.quota.db.scanFailed

Severity

ERROR

Description

This event is issued when the system tries and fails to start the scanner necessary to complete a "quota on" command.

Corrective Action

Quota initialization has failed due to lack of resources. Re-running a "quota on" after some time should solve the problem.

Syslog Message

wafl: quota initialization could not be started on %s %s%s%s%s due to lack of resources. Please wait and re-run "quota on".

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.quota.group.exceeded

Severity

NOTICE

Description

This event is issued when a group quota has been exceeded on a volume. This event will not be repeated for this group for a set time for until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage by members of this group on this volume or increase the quota and run 'quota resize'.

Syslog Message

gid %d: disk quota exceeded on volume %s%s%s%s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

id (INT): The group identifier
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
mins (INT): Number of minutes warnings will be supressed

wafl.quota.groupQtree.correct

Severity

NOTICE

Description

This message occurs when a group quota has been corrected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

id (INT): Group identifier.
tid (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfwarn (STRING): vFiler warning suffix.

wafl.quota.groupQtree.exceeded

Severity

NOTICE

Description

This event is issued when a group quota has been exceeded on a tree. This event will not be repeated for this group and tree for a set time or until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage by members of this group in this tree or increase the quota and run 'quota resize'.

Syslog Message

gid %d tid %d: disk quota exceeded on volume %s%s%s%s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

id (INT): The group identifier
tid (INT): The tree identifier
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
mins (INT): Number of minutes warnings will be supressed

wafl.quota.names.createFail

Severity

NOTICE

Description

This message occurs when the system cannot create the quota names file.

Corrective Action

(None).

Syslog Message

quota: Could not create new quota names file on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.quota.ntfs.defaultAclFail

Severity

NOTICE

Description

This message indicates that the system was unable to set the default ACL on an NTFS volume.

Corrective Action

Set the security style to NTFS again or re-create the volume.

Syslog Message

Unable to set default ACL on NTFS %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.quota.off.vol.fail

Severity

ERROR

Description

This message occurs when the system could not turn off quotas on the volume.

Corrective Action

Use the 'quota off' command to turn off quotas on the volume.

Syslog Message

Quotas could not be turned off on volume %s%s.

Parameters

owner (STRING): Owner of the volume
vol (STRING): Name of the volume

wafl.quota.qtree.correct

Severity

NOTICE

Description

This message occurs when a tree quota has been corrected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

tid (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfwarn (STRING): vFiler warning suffix.

wafl.quota.qtree.exceeded

Severity

NOTICE

Description

This event is issued when a tree quota has been exceeded on a volume. This event will not be repeated for this tree for a set amount of time or until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage in this tree or increase the quota and run 'quota resize'.

Syslog Message

tid %d: tree quota exceeded on %s %s%s%s%s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

tid (INT): The tree identifier
type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
mins (INT): Number of minutes warnings will be suppressed
object_uuid (STRING): Volume instance UUID of the resource object.

wafl.quota.sec.change

Severity

INFORMATIONAL

Description

This message indicates that the security style for a directory has been changed.

Corrective Action

(None).

Syslog Message

security style for /vol/%s%s%s/%s changed from %s to %s

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
dir (STRING): Directory name.
ostyle (STRING): Former security style.
nstyle (STRING): New security style.

wafl.quota.user.exceeded

Severity

NOTICE

Description

This event is issued when a user quota has been exceeded on a volume. This event will not be repeated for this user and volume for a set time or until a 'quota resize' is performed. The amount of time is set by the

'quota logmsg' command.

Corrective Action

Reduce usage by this user on this volume or increase the quota and run 'quota resize'.

Syslog Message

uid %d: disk quota exceeded on volume %s%s%s%s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

id (INT): The user identifier
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
mins (INT): Number of minutes warnings will be supressed

wafl.quota.user.exceeded.win

Severity

NOTICE

Description

This event is issued when a user quota has been exceeded on a volume. This event will not be repeated for this user and volume for a set time or until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage by this user on this volume or increase the quota and run 'quota resize'.

Syslog Message

disk quota exceeded on volume %s%s%s%s for Windows user ID: %s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
id (STRING): Windows user identifier
mins (INT): Number of minutes warnings will be supressed

wafl.quota.userQtree.correct

Severity

NOTICE

Description

This message occurs when a user quota has been corrected.

Corrective Action

(None).

Syslog Message

(None).

Parameters

id (INT): User identifier.
tid (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfwarn (STRING): vFiler warning suffix.

wafl.quota.userQtree.correct.win

Severity

NOTICE

Description

This message occurs when a user quota has been corrected and the user ID is a SID.

Corrective Action

(None).

Syslog Message

(None).

Parameters

id (STRING): Windows identifier value.
tid (INT): Qtree identifier.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume in cases in which the volume name alone is insufficient.
vfwarn (STRING): vFiler warning suffix.

wafl.quota.userQtree.exceeded

Severity

NOTICE

Description

This event is issued when a user quota has been exceeded on a tree. This event will not be repeated for this user and tree for a set time or until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage by this user in this tree or increase the quota and run 'quota resize'.

Syslog Message

uid %d tid %d: disk quota exceeded on volume %s%s%s%s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

id (INT): The user identifier
tid (INT): The tree identifier
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
mins (INT): Number of minutes warnings will be supressed

wafl.quota.userQtree.exceeded.win

Severity

NOTICE

Description

This event is issued when a user quota has been exceeded on a tree. This event will not be repeated for this user and tree for a set time or until a 'quota resize' is performed. The amount of time is set by the 'quota logmsg' command.

Corrective Action

Reduce usage by this user in this tree or increase the quota and run 'quota resize'.

Syslog Message

tid %d: disk quota exceeded on volume %s%s%s%s for Windows user ID: %s. Additional warnings will be suppressed for approximately %d minutes or until a 'quota resize' is performed.

Parameters

tid (INT): The tree identifier
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
id (STRING): Windows user identifier
mins (INT): Number of minutes warnings will be supressed

wafl.raid events

wafl.raid.cft.aggr.snapshot.missing

Severity

ERROR

Description

This message occurs during an aggregate transition workflow when an aggregate snapshot created in a 7-Mode environment is missing.

Corrective Action

Return the disks to the 7-Mode environment, create the snapshot for the aggregate, and then repeat the transition workflow.

Syslog Message

Aggregate transition failed for aggregate %s due to unavailability of the 7-Mode aggregate snapshot.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.raid.incons.buf

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects an inconsistent block on a disk. Access to the block is disabled until corrective action is taken.

Corrective Action

Use the "volume file show-inode" command with the file ID and volume name information to find the file path. If the volume is inconsistent, run wafliron as soon as possible to clear the inconsistency. For a SnapMirror® target, rebuild from the source or resynchronize. If the block is in a snapshot, delete the snapshot. If the problem persists, contact NetApp technical support for more options.

Syslog Message

WAFL inconsistent: bad block at VBN %llu (vvbn:%llu fbn:%llu level:%u) in %s inode (fileid:%s snapid:%u fixable:%d file_type:%d disk_flags:0x%x error:%u raid_set:%d) in volume %s%s%s%s.

Parameters

vbn (LONGINT): Volume block number.
vvbn (LONGINT): Virtual block number.
fbn (LONGINT): File block number.
level (INT): Buffer level.
file_space (STRING): File space.
fileid (STRING): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
fixable (INT): Boolean value indicating whether iron can repair this block.
type (INT): File type.
flags (LONGINT): Inode disk flags.
error (INT): Error on the block.
raid_set (INT): Boolean indicating whether RAID set the error.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.raid.incons.clear.error

Severity

NOTICE

Description

This message occurs when Data ONTAP® resets the error on a data block.

Corrective Action

Contact NetApp technical support.

Syslog Message

Resetting error (%u) on data block in %s inode (fileid:%u snapid:%u fbn:%llu level:%u) in volume %s%s%s%s

Parameters

error (INT): Error number that was reset.
inotype (STRING): Inode space (public or private).
fileid (INT): Identifying number for the inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
fbn (LONGINT): File block number.
level (INT): Buffer level.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

wafl.raid.incons.dir.block

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects an inconsistent directory block on disk, causing some entries on the directory not to appear. The message indicates the fileid and snapshot of the block being accessed.

Corrective Action

The volume has a bad directory block. Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Recover the directory from a backup. For a SnapMirror® target, rebuild from the source or resynchronize. If the block is in a snapshot, delete the snapshot. Then contact NetApp technical support.

Syslog Message

WAFL inconsistent: bad directory block in inode (fileid:%u snapid:%u) in volume %s%s%s%s.

Parameters

fileid (INT): Identifying number for the suspect inode
snapid (INT): Snapshot identifier. (0) - active file system. (non-zero) - refers to snapshot.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.

volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.raid.incons.set.err.obj

Severity

ALERT

Description

This message occurs when Data ONTAP® marks a block in a capacity tier object with an error. This is useful for tracking movement of pseudobad and unverified blocks.

Corrective Action

Contact Contact NetApp technical support..

Syslog Message

Data block at VBN %llu tiered to capacity tier (objid %llu, slot %u, btuuid %s, seqno %llu) and marked with error (%u). Block previously had error (%u).

Parameters

vbn (LONGINT): Volume block number.
object_id (LONGINT): Object identifier.
slot (INT): Slot number.
btuuid (STRING): Buftree UUID.
seqno (LONGINT): Sequence number.
error (INT): Error on the block.
prev_error (INT): Previous error on the block.

wafl.raid.incons.set.error

Severity

ALERT

Description

This message occurs when Data ONTAP® marks an on-disk data block with an error. This is useful for tracking pseudo bad and unverified blocks.

Corrective Action

Contact NetApp technical support.

Syslog Message

Data block in %s inode (fileid: %u snapid: %u fbn: %llu level: %u) in volume %s%s%s%s marked with error (%u) by %s. Block previously had error (%u).

Parameters

inotype (STRING): Inode space (public or private).
fileid (INT): Identifying number for the inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
fbn (LONGINT): File block number.
level (INT): Buffer level.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.

volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.
error (INT): Error on the block.
module (STRING): Module that is marking the block with the error.
prev_error (INT): Previous error on the block.

wafl.raid.incons.snapmap

Severity

NOTICE

Description

This message occurs when WAFL detects a RAID inconsistency error in a snapmap block. The message recommends to delete the snapshot in which inconsistent snapmap resides.

Corrective Action

(None).

Syslog Message

Snapshot(snapid %u) block accounting metadata is corrupted. To avoid trapping unnecessary blocks in the snapshot, please delete the snapshot.

Parameters

snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot

wafl.raid.incons.snapmap.chk

Severity

NOTICE

Description

This message occurs when the WAFL® kernel detects a RAID inconsistency error in a snapshot active map block, even though the block content passes a metadata check.

Corrective Action

Contact NetApp technical support.

Syslog Message

(None).

Parameters

fbn (LONGINT): File block number.
level (INT): Buffer level.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.

wafl.raid.incons.snapshot

Severity

ERROR

Description

This message occurs when WAFL® detects a RAID inconsistency error in a snapshot. The message indicates what snapshots have the inconsistent block, and how to recover from the inconsistency.

Corrective Action

Delete the specified snapshot(s) during the next reboot, either by using the boot menu command 'boot_snap_delete' or by using the CLI command 'vol online -r'.

Syslog Message

VBN %llu has RAID inconsistency errors on volume %s. This block is in use by one or more snapshots. These snapshots should be deleted in the next boot. The affected snapshot IDs are: %s.

Parameters

vbn (LONGINT): Virtual block number.
volname (STRING): Name of the volume.
snapstring (STRING): The string containing the list of snapid(s) of the snapshots that have the inconsistent blocks.

wafl.raid.incons.ssd.cached.buf

Severity

NOTICE

Description

This message occurs when the WAFL® kernel detects an inconsistent cached block on a ssd disk in a hybrid aggregate. Any access to this block will result in the io getting redirected to the source location on hdd disk.

Corrective Action

An error on a cached ssd block will not result in bad data being served to the reader: the io will be redirected to hdd and the correct data will be served. So, no corrective action is necessary for this case. But, if there are many errors on data cached on ssd disks, then the ssd disks may be verified for disk consistency.

Syslog Message

WAFL inconsistent: bad cached ssd block %llu (vvbn:%llu fbn:%llu level:%u) in %s inode (fileid:%s snapid:%u file_type:%d disk_flags:0x%x error:%u) in volume %s%s%s%s. IO will be redirected to the source hdd block %llu.

Parameters

vbn (LONGINT): Volume SSD block number.
vvbn (LONGINT): Virtual block number.
fbn (LONGINT): File block number.
level (INT): Buffer level.
file_space (STRING): File space: private or public.
fileid (STRING): Identifying number for the inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
type (INT): File type.
flags (LONGINT): Inode disk flags.

error (INT): Error on the block.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
hdd_vbn (LONGINT): Volume HDD block number.

wafl.raid.incons.userdata

Severity

ERROR

Description

This message occurs when the WAFL® kernel detects an inconsistent user data block on a disk. Access to this block is disabled until you recover it from a backup.

Corrective Action

The volume has an inconsistent user data block. Use the "volume file show-inode" command with the file ID and volume name information to find the file path. Recover the file from a backup. For a SnapMirror® target, rebuild from the source or resynchronize. If the block is in a snapshot, delete the snapshot. Contact NetApp technical support for more options.

Syslog Message

WAFL inconsistent: inconsistent user data block at VBN %llu (vvbn:%llu fbn:%llu level:%u) in %s inode (fileid:%s snapid:%u file_type:%d disk_flags:0x%x error:%u raid_set:%d) in volume %s%s%s%s.

Parameters

vbn (LONGINT): Volume block number.
vvbn (LONGINT): Virtual block number.
fbn (LONGINT): File block number.
level (INT): Buffer level.
file_space (STRING): File space.
fileid (STRING): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
type (INT): File type.
flags (LONGINT): Inode disk flags.
error (INT): Error on the block.
raid_set (INT): Boolean indicating whether RAID set the error.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.raid.incons.xidata

Severity

EMERGENCY

Description

This message occurs when the WAFL® kernel detects an inconsistent extended inode data block on disk.

Corrective Action

Contact NetApp technical support.

Syslog Message

WAFL inconsistent: bad extended inode data block at VBN %llu (vvbn:%llu fbn:%llu) in inode (fileid:%u snapid:%u disk_flags:0x%x error:%u raid_set:%d) in volume %s%s%s%s.

Parameters

vbn (LONGINT): Volume block number.
vvbn (LONGINT): Virtual block number.
fbn (LONGINT): File block number.
fileid (INT): Identifying number for the suspect inode.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
flags (LONGINT): Inode disk flags.
error (INT): Error on the block.
raid_set (INT): Boolean indicating whether RAID set the error.
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
inotype (STRING): Inode space (public or private).

wafl.rclm events

wafl.rclm.est.scan.done

Severity

NOTICE

Description

This message occurs when an attempt to estimate the space that can be reclaimed for the aggregate was completed successfully.

Corrective Action

(None).

Syslog Message

Estimate Reclaim Scanner done for %s with estimated free logical blocks=%llu, physical blocks=%llu, duration=%ld ms.

Parameters

aggr (STRING): Aggregate name.
logical_free_blks (LONGINT): Estimated number of reclaimable logical blocks found by the scanner.
physical_free_blks (LONGINT): Estimated number of reclaimable physical blocks found by the scanner.
run_time (LONGINT): Duration of the scan in milliseconds.

wafl.readdir events

wafl.readdir.expired

Severity

ERROR

Description

This message occurs when a READDIR file operation has exceeded the timeout that it is allowed to run in WAFL. This can be the result of very large or sparse directories, and corrective action is recommended.

Corrective Action

You can find information specific to recent directories that have had READDIR file operations expire by using the 'diag' privilege nodeshell CLI command: "wafl readdir notice show" If a directory is indicated as sparse, it is recommended that you copy the contents of the directory to a new directory to remove the sparseness of the directory file. If a directory is not indicated as sparse and the directory is large, it is recommended that you reduce the size of the directory file by reducing the number of file entries in the directory.

Syslog Message

A READDIR file operation has expired for the directory associated with volume "%s%s/%s" snapshot ID %d and inode %d.

Parameters

volume (STRING): Volume name that the directory is in.
app (STRING): Application universal unique identifier (UUID).
volident (STRING): Volume identifier to uniquely identify the volume in cases where the volume name alone is insufficient.
snapid (LONGINT): Snapshot ID that the directory is in.
directory_inum (LONGINT): The inode number (file ID) of the directory.
object_uuid (STRING): Volume instance UUID of the resource object.

wafl.readdir.sparse

Severity

NOTICE

Description

This message occurs when a READDIR file operation detects that a directory is sparse while iterating over its directory entries. Iterating over sparse directories could negatively impact performance on the node.

Corrective Action

You can find information specific to directories that have had READDIR file operations detect a sparse directory by using the 'diag' privilege nodeshell CLI command: "wafl readdir notice show" It is recommended that you copy the contents of the directory to a new directory to remove the sparseness of the directory file.

Syslog Message

A READDIR file operation has detected that a directory associated with volume %s%s/%s snapshot ID %d and inode %d is sparse.

Parameters

volume (STRING): Volume name that the directory is in.
app (STRING): Application UUID.
volident (STRING): Volume identifier to uniquely identify the volume in cases where the volume name

alone is insufficient.
snapid (LONGINT): Snapshot ID the that the directory is in.
directory_inum (LONGINT): The inode number (fileid) of the directory.

wafl.reallocate events

wafl.reallocate.aggr.interrupt

Severity

INFORMATIONAL

Description

This message occurs when an aggregate reallocation scan is interrupted. The scan was scheduled using the 'reallocate -A' command.

Corrective Action

None required.

Syslog Message

Aggregate reallocation scan on '%s' was interrupted.

Parameters

path (STRING): Scan path.

wafl.reallocate.check.high

Severity

INFORMATIONAL

Description

This event is issued if an allocation check scan (issued before reallocation starts) returns indicating that the path requires reallocation.

Corrective Action

None required. The reallocation scan will automatically be started.

Syslog Message

Allocation check on '%s' is %d, hotspot %d (threshold %d), so will reallocate.

Parameters

path (STRING): The scan path
optim (INT): The current optimization of the path
hot_spot (INT): The current hot-spot optimization of the path
threshold (INT): The reallocation threshold of the path

wafl.reallocate.check.highAdvise

Severity

INFORMATIONAL

Description

This event is issued if an allocation check scan returns indicating that the path would benefit from reallocation.

Corrective Action

Consider reallocating the path (see na_reallocate(1))

Syslog Message

Allocation check on '%s' is %d, hotspot %d (threshold %d), consider running reallocate.

Parameters

path (STRING): The scan path
optim (INT): The current optimization of the path
hot_spot (INT): The current hot-spot optimization of the path
threshold (INT): The reallocation threshold of the path

wafl.reallocate.check.value

Severity

INFORMATIONAL

Description

This event is issued to report the optimization of a path.

Corrective Action

None required.

Syslog Message

Allocation measurement check on '%s' is %d.

Parameters

path (STRING): The scan path
optim (INT): The path optimization.

wafl.reallocate.full.done

Severity

INFORMATIONAL

Description

This event is issued to report the completion of a full, one-time, reallocation scan.

Corrective Action

None required.

Syslog Message

Full reallocation on '%s' is complete.

Parameters

path (STRING): The scan path

wafl.reallocate.full.interrupt

Severity

INFORMATIONAL

Description

This event is issued to report that a full, one-time, reallocation scan was interrupted.

Corrective Action

None required.

Syslog Message

Full reallocation on '%s' was interrupted.

Parameters

path (STRING): The scan path

wafl.reallocate.path.invalid

Severity

ERROR

Description

This event is issued if an invalid scan path is detected.

Corrective Action

Check why the scan path is invalid, including file removal or volume offline. If the condition is persistent remove the associated reallocation scan.

Syslog Message

Unavailable/invalid reallocation path '%s' detected.

Parameters

path (STRING): The scan path

wafl.reallocate.recheck.ok

Severity

INFORMATIONAL

Description

This event is issued if an allocation recheck scan (issued after reallocation has completed) returns indicating the optimization is under the threshold.

Corrective Action

None required.

Syslog Message

Allocation check on '%s' is under threshold.

Parameters

>**path** (STRING): The scan path

wafl.reallocate.scan.exists

Severity

>INFORMATIONAL

Description

>This event is issued if an attempt is made to add a new reallocation scan but a scan job already exists for the supplied path.

Corrective Action

>Check the path is correct. If it is correct then delete the previous reallocation job, and add a new one. Use the 'reallocate status' command to list reallocation jobs.

Syslog Message

>A reallocation scan for %s already exists.

Parameters

>**path** (STRING): The path with the scan.

wafl.reallocate.scan.noStart

Severity

>NOTICE

Description

>Reallocation tasks, such as measuring the layout of a file or performing block reallocation, may be perfomed using an asynchronous WAFL scanner. This event is issued if an error occurs unexpectedly while trying to start such a WAFL scanner.

Corrective Action

>(Call support).

Syslog Message

>reallocate: unable to start '%s' scanner for '%s': %d (%s)

Parameters

>**scan_type** (STRING): The type of scan operation.
>**path** (STRING): The scan path or aggregate name.
>**err_code** (INT): A numerical error code indicating the reason why the scanner could not be started.
>**err_string** (STRING): A string interpreting the err_code.

wafl.reallocate.scan.remove

Severity

>INFORMATIONAL

Description

This event is issued when a reallocation job is persistently removed from the system.

Corrective Action

None required.

Syslog Message

Reallocation scan for '%s' is being removed.

Parameters

path (STRING): The path with the scan.

wafl.reallocate.schedule.invalid

Severity

ERROR

Description

This event is issued if an invalid reallocation schedule is detected.

Corrective Action

Correct the schedule syntax then retry the operation

Syslog Message

Invalid schedule: %s

Parameters

reason (STRING): The reason why the schedule is invalid

wafl.relocate events

wafl.relocate.statusvol.fail

Severity

ERROR

Description

This message occurs when the system cannot perform an aggregate relocation because one or more of its volumes are used by wafliron to host status files. The relocation is aborted.

Corrective Action

Use "aggr wafliron show" command to monitor the status of wafliron and retry aggregate relocation after wafliron is complete.

Syslog Message

%s %s%s%s%s is being used by wafliron to host status files. Canceling aggregate relocation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.

app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.relocate.vetoedByNvsave

Severity

ERROR

Description

This message occurs when an aggregate relocation is vetoed because there are NVSave files for an aggregate or a flexible volume that must be replayed before the aggregate or flexible volume can be relocated.

Corrective Action

Retry the aggregate relocation after the NVSave files either are replayed (by bringing the aggregate or flexible volume online) or deleted from the root volume. Successful replay, for example, is indicated by the EMS message 'wafl.nvsave.replaying.pass'.

Syslog Message

Aggregate relocation vetoed because NVSave files are present for %s FSID %d name %s%s%s. UUID is %s.

Parameters

vol_type (STRING): Whether this message applies to an aggregate or a flexible volume.
fsid (INT): File system identifier.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases in which the volume name itself is insufficient.
UUID (STRING): UUID of the volume.

wafl.relocating events

wafl.relocating.fence.fail

Severity

ERROR

Description

This message occurs when the system cannot perform an aggregate relocation because a fence is set on one of the volumes in the aggregate. The relocation is aborted.

Corrective Action

A volume in the aggregate is currently fenced for group operations. Retry aggregate relocation after any group SnapRestore® or mirror transfers are complete. If the problem persists, contact technical support.

Syslog Message

%s %s%s%s%s has a fence set. Canceling aggregate relocation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.relocating.iron.fail

Severity

ERROR

Description

This message occurs when the system cannot perform an aggregate relocation because wafliron is active. The relocation is aborted.

Corrective Action

Retry aggregate relocation after wafliron is finished.

Syslog Message

%s %s%s%s%s is running vol wafliron. Canceling aggregate relocation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.relocating.sp.fail

Severity

ERROR

Description

This message occurs when the system cannot perform an aggregate relocation because a secure purge operation is in progress on one of the volumes in the aggregate. The relocation is aborted.

Corrective Action

A volume in the aggregate is currently going through a secure purge operation. Retry aggregate relocation after this operation is complete, or after you abort the operation by using the "volume encryption secure-purge abort" command. If the problem persists, contact NetApp technical support.

Syslog Message

A secure purge operation is in progress on %s %s%s%s. Canceling aggregate relocation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.repl events

wafl.repl.badTimestamp

Severity

NOTICE

Description

This message occurs when a replication operation receives a timestamp with an invalid nanoseconds portion, and clears it.

Corrective Action

(None).

Syslog Message

Encountered invalid %s time on inode %u of volume %u.

Parameters

type (STRING): Type of timestamp.
inode_num (INT): Identifier of the affected file.
fsid (INT): Identifier of the volume.

wafl.repl.maxdirsize.notice

Severity

NOTICE

Description

This message occurs when WAFL® sets the maximum directory size of a SnapMirror® destination volume to a value higher than its default during a SnapMirror transfer.

Corrective Action

(None).

Syslog Message

The maxdirsize (%u KB) of volume %s (FSID %u) is higher than the default (%u KB). There might be a performance penalty when doing operations on large directories. This was generated for a SnapMirror relationship with ID %s.

Parameters

current_maxdirsize (INT): Current maximum directory size value.
vol (STRING): Name of the volume.
volFsid (INT): File system ID (FSID) of the volume.
default_maxdirsize (INT): Default maximum directory size value.
SnapMirrorID (STRING): Unique ID of the SnapMirror relationship for this operation, which can be used to match this message with messages for the same relationship in other logs (for example, the SnapMirror log at /mroot/etc/log/snapmirror_audit).

wafl.repl.src.inconsistent

Severity

ERROR

Description

This message occurs when the replication source engine encounters a disk error in the file system metadata. Replication transfer will abort.

Corrective Action

Run wafliron to fix the active file system. To continue replication transfer, delete the snapshots containing this bad block.

Syslog Message

%s: %s%s%s%s: WAFL metadata inconsistent due to disk errors. (vvbn:%u level:%u file_type:%d). Aborting transfer.

Parameters

vol_type (STRING): Whether the block was being accessed for a volume or an aggregate.
owner (STRING): String indicating the owner of the affected volume or aggregate.
vol (STRING): Name of the volume or aggregate.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
vvbn (INT): Virtual Volume Block Number.
level (INT): Buffer level.
file_type (INT): File type.

wafl.repl.zombie.scan.susp

Severity

INFORMATIONAL

Description

This message occurs when a logical break zombie restart is going through a scan of composite zombies and it suspends the incoming client composite delete requests.

Corrective Action

(None).

Syslog Message

The deletion of file with fileid %d is suspended because volume %s (FSID %u) is going through a logical break. The file delete will be resumed after logical break is complete.

Parameters

fileid (INT): File identifier.
vol (STRING): Name of the volume.
volFsid (INT): File system ID (FSID) of the volume.

wafl.replay events

wafl.replay.aggr.early.mt

Severity

NOTICE

Description

This message occurs when a partner aggregate is mounted early before replay.

Corrective Action

(None).

Syslog Message

Partner aggregate %s is mounted early before WAFL NV log replay.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.replay.completed

Severity

NOTICE

Description

This message occurs when WAFL® replay is complete following an abrupt failure, such as a panic. This event logs the time spent in the various phases of WAFL replay.

Corrective Action

(None).

Syslog Message

(None).

Parameters

log (STRING): Entry count, bytes used, and duration of operation replay.
catalog (STRING): Catalog statistics for WAFL replay.
swarm (STRING): Information about the cost of operations during WAFL replay.
nvce (STRING): Information about number of nvce hits, skips and misses during WAFL replay.

wafl.replay.early.mounted

Severity

NOTICE

Description

This message occurs when partner aggregates are mounted early before replay.

Corrective Action

(None).

Syslog Message

%d of %d partner aggregates are mounted early before WAFL NV log replay.

Parameters

early_aggrs (INT): Number of aggregates mounted early.
total_aggrs (INT): Total number of data aggregates being replayed.

wafl.replay.nvlog.ignore.entries

Severity

NOTICE

Description

This message occurs when entries are being ignored during replay.

Corrective Action

(None).

Syslog Message

%s Ignoring entries in %s log %d for %s %s%s%s%s FSID 0x%x. Volume CP count:%d, Log count: %d.

Parameters

reason (STRING): Reason for ignoring entries.
log_host (STRING): Host in replay.
log (INT): Log section identifier.
voltype (STRING): Volume type: volume or aggregate.
volowner (STRING): Owner of the volume: local or partner.
app (STRING): Application UUID.
volname (STRING): Name of the volume or aggregate.
server_uuid (STRING): Vserver's Universal Unique Identifier (UUID), if any.
FSID (INT): File system identifier.
vol_cp_count (INT): Consistency Point (CP) count on the volume.
log_cp_count (INT): CP count found in the nvlog.

wafl.replay.nvlog.not.needed

Severity

NOTICE

Description

This message occurs when all entries in a log were ignored, so no replay was performed.

Corrective Action

(None).

Syslog Message

No replay was required for %s log %d.

Parameters

log_host (STRING): Host in replay.
log (INT): Log section identifier.

wafl.replay.resource.limited

Severity

NOTICE

Description

This message occurs when the WAFL replay admin cannot obtain all of the system resources required to allocate the optimal number of replay messages.

Corrective Action

(None).

Syslog Message

(None).

Parameters

log_no (INT): The NVLOG log number.
host (INT): The host in replay.
msgs_wanted (INT): The number of replay messages requested.
msgs_allocated (INT): The number of replay messages allocated.

wafl.replay.swizzle.fsid

Severity

INFORMATIONAL

Description

The volume was using the old FSID at the time the operations were recorded in the NVLog. Now that the filer is about to replay logged operations, the filer will use the new FSID for the volume. No corrective action is required.

Corrective Action

(None).

Syslog Message

FSID collision mapping created during replay for %s %s%s%s old fsid:%x, new fsid:%x, uuid:%s.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
app (STRING): Application UUID.
volident (STRING): Unique Identifier of the volume in cases where the volume name itself is insufficient.
old_fsid (INTHEX): Old filesystem identifier
new_fsid (INTHEX): New filesystem identifier
uuid (STRING): UUID of the volume

wafl.root events

wafl.root.content.changed

Severity

ERROR

Description

This message occurs when the contents of the root volume are changed to those of a previous point in time. One of the following operations or events can cause the contents of the root volume to change: - The root volume is changed from the boot menu. - The nvlog is jettisoned. - The system is booted with prev_cp. - The 'wafliron -prev_cp' command is used and the changes are commited. - A SnapRestore® operation is done on the root volume.

Corrective Action

Verify that all recent configuration changes are still in effect.

Syslog Message

Contents of the root volume '%s' might have changed. Verify that all recent configuration changes are still in effect.

Parameters

vol (STRING): Name of the root volume.

wafl.root.create

Severity

INFORMATIONAL

Description

This message occurs when the system creates a root volume.

Corrective Action

(None).

Syslog Message

New root volume %s created.

Parameters

vol (STRING): Name of the root volume.

wafl.root.mark.error

Severity

NOTICE

Description

This event is issued when there is an error in syncing the vvol raid label of a newly created root volume.

Corrective Action

(None).

Syslog Message

Error setting volume %s%s as root. Changes may not be saved.

Parameters

vol (STRING): The root volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.root.overwritesUnsafe

Severity

ERROR

Description

This message occurs when the root volume is not volume guaranteed or does not guarantee overwrites for space reserved files.

Corrective Action

Set the Space Guarantee on the root volume to "volume" and the Fractional Reserve on the root volume to 100%.

Syslog Message

Root volume %s does not protect overwrites in space reserved files.

Parameters

vol (STRING): Root volume name.

wafl.root.volume.create.fail

Severity

EMERGENCY

Description

This message occurs when root volume creation fails during cluster create or cluster join. Failure to create a root volume, required for storage of critical system data, will leave the system in an unusable state.

Corrective Action

Based on the error in the event, resolve the problem that is causing the error condition before retrying the operation. If the error condition persists, contact NetApp technical support.

Syslog Message

Root volume creation fails. Error: %s.

Parameters

error (STRING): Reason for the failure.

wafl.s2c events

wafl.s2c.snap.check.failed

Severity

ERROR

Description

This message occurs when SnapMirror® logical transfer is not possible due to incompatible snapshot.

Corrective Action

Create new snapshot on the source volume and use that for Logical transfer.

Syslog Message

SnapMirror operation failed in volume '%s%s%s' for snapshot ID %d because %s.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
snapId (INT): Identifier for the snapshot.
reason (STRING): Specific reason for failure.

wafl.s2c.snap.lang.mismatch

Severity

ERROR

Description

This message occurs when SnapMirror® restore cannot proceed due to language mismatch at source and destination end.

Corrective Action

Create new volume with correct language settings.

Syslog Message

SnapMirror operation failed in %s because of language mismatch between source and destination.Language at destination: '%s'. Language at source: '%s'.

Parameters

vol (STRING): Name of the volume.
src_lang_setting (STRING): Language setting at source.
dest_lang_setting (STRING): Language setting at destination.

wafl.scan events

wafl.scan.abort.nospace

Severity

ERROR

Description

This message occurs when the system is aborting the WORM clear scan because there is no space available in the volume.

Corrective Action

For non-ASA r2 platforms, create space by increasing the volume or aggregate sizes, or by deleting data or by deleting Snapshot copies. To increase a volume's size, use the "volume size" command. To delete a

volume's Snapshot copies, use the "volume snapshot delete" command. To increase an aggregate's size, add disks by using the "storage aggregate add-disks" command. Aggregate Snapshot copies are deleted automatically when the aggregate is full. For ASA r2 platforms, create space in the volume or aggregate. To create space in an aggregate, add more disks to the cluster. To create space in a volume, delete data or delete Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

Aborting WAFL %s scanner on volume %s because there is no space available in the volume.

Parameters

type (STRING): String to indicate the scanner that is aborted.
vol (STRING): Volume name.

wafl.scan.autocommit.disable

Severity

INFORMATIONAL

Description

This event is issued to inform the user that the system is aborting the autocommit scanner on a Snaplock volume.

Corrective Action

(None).

Syslog Message

Aborting autocommit scan on %s %s%s%s%s.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner of the snaplock volume where the autocommit scanner was aborted.
vol (STRING): The name of the snaplock volume where the autocommit scanner was aborted.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the snaplock volume where the autocommit scanner was aborted in cases where volume name itself is insufficient.

wafl.scan.blkreclaim.activeDelta

Severity

ERROR

Description

This event indicates a flexible mirror volume is unable to relinquish free blocks to its containing aggregate. As a result, the containing aggregate may run out of space if this state persists beyond the following incremental transfer.

Corrective Action

Monitor the state after the next incremental update for this volume and the space available in its containing aggregate

Syslog Message

Flexible volume '%s%s' cannot release free blocks to its containing aggregate '%s'.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
aggr (STRING): The aggregate name

wafl.scan.blockcheck.done

Severity

NOTICE

Description

This event is issued when the 'aggr block_check' tool finishes scanning an aggregate.

Corrective Action

(None).

Syslog Message

Writing WAFL aggr block_check log %s

Parameters

filename (STRING): The name of the log file.

wafl.scan.br.realloc.done

Severity

INFORMATIONAL

Description

This message occurs when a block reallocation scan is complete on an aggregate. The block reallocation scan improves WAFL® write efficiency by reducing free space fragmentation. It runs automatically when aggregate reallocation is scheduled using the 'reallocate -A' command.

Corrective Action

(None).

Syslog Message

Block reallocation scan on aggregate %s is complete.

Parameters

aggr (STRING): Aggregate name.

wafl.scan.br.redir.abort

Severity

INFORMATIONAL

Description

This message occurs when a redirect scan is aborted on a volume or aggregate. The redirect scan improves performance following block reallocation by updating metadata that was changed during reallocation. It runs automatically when aggregate reallocation is scheduled using the 'reallocate -A' command.

Corrective Action

(None).

Syslog Message

Redirect scan on %s %s%s%s%s has been aborted.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume or aggregate owner.
vol (STRING): Volume or aggregate name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.scan.br.redir.done

Severity

INFORMATIONAL

Description

This message occurs when a redirect scan is complete on a volume or aggregate. The redirect scan improves performance following block reallocation by updating metadata that was changed during reallocation. It runs automatically when aggregate reallocation is scheduled using the 'reallocate -A' command.

Corrective Action

(None).

Syslog Message

Redirect scan on %s %s%s%s%s is complete. The scanner took %ld ms.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume or aggregate owner.
vol (STRING): Volume or aggregate name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
run_time (LONGINT): Total run time of the scanner.

wafl.scan.br.redir.noStart

Severity

NOTICE

Description

This message occurs when a redirect scan cannot be started on a volume or aggregate. The redirect scan improves performance following block reallocation by updating metadata that was changed during

reallocation. It runs automatically when aggregate reallocation is scheduled using the 'reallocate -A' command.

Corrective Action

(None).

Syslog Message

Redirect scan on %s %s%s%s%s could not be started.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume or aggregate owner.
vol (STRING): Volume or aggregate name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.scan.cantStart

Severity

INFORMATIONAL

Description

The message occurs when the scan could not start because the maximum number of scans of the specified type are already running.

Corrective Action

The maximum number of scan operations has been reached. Please wait until the current scan operations have completed before trying any new ones.

Syslog Message

Cannot start scan %s on %s %s%s%s%s because maximum number of scans (%d) already running.

Parameters

scantype (STRING): The type of scan
type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
max (INT): The maximum number of scans that can run

wafl.scan.ckpt.init.failed

Severity

NOTICE

Description

This message occurs when the creation of Scan Checkpoint Metafile fails.

Corrective Action

(None).

Syslog Message

On %s %s%s%s%s, FSID 0x%x, Creation of Scan Checkpoint Metafile failed with error %d.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
fsid (INT): File system identifier of the volume.
error (INT): Error number.

wafl.scan.ckpt.remove.failed

Severity

NOTICE

Description

This message occurs when the removal of Scan Checkpoint in Metafile fails.

Corrective Action

(None).

Syslog Message

On %s %s%s%s%s, FSID 0x%x, Removal of Scan Checkpoint failed with error %d.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
fsid (INT): File system identifier of the volume.
error (INT): Error number.

wafl.scan.clone.split.abort

Severity

INFORMATIONAL

Description

This event is issued to indicate that an operation to split a clone flexible volume from its parent volume was aborted.

Corrective Action

(None).

Syslog Message

%s %s%s%s, clone split operation stopped.

Parameters

> **type** (STRING): The type of object (volume/aggregate)
> **owner** (STRING): The volume owner
> **vol** (STRING): The volume name
> **app** (STRING): Application UUID.
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.clone.split.cantLock

Severity

> ERROR

Description

> This event is issued when the system cannot create a volume reference to complete a clone split operation. Check the type to determine if the reference is for the volume or for its enclosing aggregate.

Corrective Action

> Determine why the volume reference failed, and retry the operation if necessary.

Syslog Message

> Unable to lock %s %s%s to complete clone split operation.

Parameters

> **type** (STRING): The type of object (volume/aggregate)
> **vol** (STRING): The volume name
> **app** (STRING): Application UUID.
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.clone.split.complete

Severity

> INFORMATIONAL

Description

> This event is issued to indicate that an operation to split a clone flexible volume from its parent volume completed successfully.

Corrective Action

> (None).

Syslog Message

> Clone split complete for %s %s%s%s

Parameters

> **type** (STRING): The type of object (volume/aggregate)
> **owner** (STRING): The volume owner
> **vol** (STRING): The volume name
> **app** (STRING): Application UUID.
> **volident** (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.clone.split.fail

Severity

INFORMATIONAL

Description

This event is issued to indicate that an operation to split a clone flexible volume from its parent volume has failed.

Corrective Action

(None).

Syslog Message

%s %s%s%s, clone split operation failed.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.css.undo.complete

Severity

INFORMATIONAL

Description

This event is issued to indicate that an operation to undo sharing-by-split in a flexible volume has completed.

Corrective Action

(None).

Syslog Message

Clone sharing-by-split undo complete for %s %s%s

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.deswizzle.aborted

Severity

ERROR

Description

This message occurs when the deswizzler scanner encounters an error and aborts.

Corrective Action

Correct the issue based on the reason the deswizzler scanner aborted.

Syslog Message

The deswizzler scanner running on volume %s (snapshot ID %d) was aborted. Reason: "%s".

Parameters

vol (STRING): Volume that was being deswizzled.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
reason (STRING): Reason the deswizzler scanner aborted.

wafl.scan.deswizzle.check.referenced

Severity

INFORMATIONAL

Description

This event is triggered when deswizzling a block already pointed to by pvbn in an older snapshot. If snap1 is not 0 (i.e. not the active fs), there is a strong possibility this may lead to a corruption.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vol (STRING): The volume name
snap1 (INT): The snapshot of the block being deswizzled.
snap2 (INT): The next older snapshot.
cp1 (INT): CP count of snap1.
cp2 (INT): CP count of snap2.
ino_type (STRING): The inode type
inum (INT): Inode containing the block being deswizzled.
fbn (LONGINT): FBN of the block in the inode.
level (INT): Level of the block.
vvbn (LONGINT): VVBN of the block in snap1.
pvbn1 (LONGINT): PVBN of the block in snap1.
pvbn2 (LONGINT): PVBN of the block in snap2.
parent (LONGINT): VVBN of the parent block in snap2.

wafl.scan.deswizzle.exception

Severity

ERROR

Description

This message occurs when the deswizzler scanner encounters an exception.

Corrective Action

(None).

The deswizzler scanner running on volume %s (snapshot ID %d) was excepted. Error: "%d".

Parameters

vol (STRING): Volume that was being deswizzled.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
error (INT): Message status.

wafl.scan.deswizzle.failed

Severity

ERROR

Description

This message occurs when the deswizzler scanner has encounters a volume inconsistency and stops running.

Corrective Action

An inconsistency was found in the specified snapshot. Delete the snapshot. To ensure that the active file system is intact, you might want to run wafliron.

Syslog Message

The deswizzler scanner on flexvol %s, snapshot %s (ID %d) encountered a volume inconsistency and stopped running on the volume.

Parameters

vol (STRING): Volume that was being deswizzled.
snapname (STRING): Inconsistent snapshot name.
snapid (INT): Inconsistent snapshot snapid.

wafl.scan.done

Severity

NOTICE

Description

This message occurs when a WAFL® scan is completed.

Corrective Action

(None).

Syslog Message

Completed %s on %s %s%s%s%s.

Parameters

scantype (STRING): Type of scan.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.scan.filecheck.done

Severity

NOTICE

Description

This event is issued when the 'file check' diagnostic tool finishes scanning a file for corrupt data blocks.

Corrective Action

(None).

Syslog Message

Writing WAFL filecheck log %s

Parameters

filename (STRING): The name of the log file.

wafl.scan.i2p.cantAbort

Severity

INFORMATIONAL

Description

This message occurs during an attempt to abort the I2P scan by using the "wafl scan abort" command while running clustered Data ONTAP®. The I2P scan cannot be interrupted.

Corrective Action

(None).

Syslog Message

You cannot abort an I2P scan on a cluster volume.

Parameters

(None).

wafl.scan.iron.done

Severity

INFORMATIONAL

Description

This message informs the user that the system has completed a wafliron scan.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s, wafliron %s.

Parameters

type (STRING): Type of object (volume/aggregate).

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
status (STRING): Status string.

wafl.scan.iron.snapshot

Severity

INFORMATIONAL

Description

This message informs the user that the system has started wafliron scan on the snapshot.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s, wafliron started on snapshot %d.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
snapid (INT): The snapshot Identifier.

wafl.scan.iv.metatype.done

Severity

INFORMATIONAL

Description

This message occurs when the system completes a WAFL_FLAG_IV_METATYPE inode flag scan on the Infinite Volume namespace constituent.

Corrective Action

(None).

Syslog Message

The WAFL_FLAG_IV_METATYPE inode flag scanner has completed the scan on %s %s%s%s%s. The scanner scanned %d inodes, tagged %d inodes with the inode flag, and took %ld msecs to complete the scan.

Parameters

type (STRING): Type of object (volume).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
inodes_visited (INT): Total number of inodes visited by the scanner.

inodes_tagged (INT): Total number of inodes tagged with the WAFL_FLAG_IV_METATYPE inode flag by the scanner.
run_time (LONGINT): Total run time of the scanner in milliseconds.

wafl.scan.iv.metatype.dud

Severity

ERROR

Description

This message occurs when the system tries and fails to start the WAFL_FLAG_IV_METATYPE inode flag scan on the Infinite Volume namespace constituent. This might cause errors in file operations over NFS/CIFS in the Infinite Volume until the scanner is restarted and the scan is completed.

Corrective Action

The scanner will restart automatically in cases where the failure to start occurs due to a storage failover event, an in-progress node revert operation, or a node reboot. In other cases, contact NetApp technical support for assistance.

Syslog Message

Failed to launch the WAFL_FLAG_IV_METATYPE inode flag scanner on %s %s%s%s%s. The error code returned was %d (%s).

Parameters

type (STRING): Type of object (volume).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
err_code (INT): Numerical error code indicating the reason the scan could not be launched.
err_string (STRING): String interpreting the error code.

wafl.scan.iv.metatype.start

Severity

INFORMATIONAL

Description

This message occurs when the system starts a WAFL_FLAG_IV_METATYPE inode flag scan on the Infinite Volume namespace constituent.

Corrective Action

(None).

Syslog Message

The WAFL_FLAG_IV_METATYPE inode flag scanner has started running on %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.

volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.scan.l1.uncompact.done

Severity
NOTICE

Description
This message occurs when the operation to uncompact indirect blocks in a FlexVol® volume is complete.

Corrective Action
(None).

Syslog Message
L1 uncompact operation complete for %s (UUID: %s). %d indirect blocks were uncompacted.

Parameters
name (STRING): Volume name.
vol_uuid (STRING): Volume UUID.
count (INT): Number of indirect blocks being uncompacted.

wafl.scan.l1.uncompact.nobt

Severity
ERROR

Description
This message occurs when an indirect block uncompact operation is attempted on a volume before block type metadata initialization is complete.

Corrective Action
Check whether the block type scan is still running on the volume. Try the indirect block uncompact operation on the volume after the block type scan is complete.

Syslog Message
Indirect block uncompact scan can't be started on volume %s (UUID: %s) because block type initialization is not complete on the volume. Try again after block type scan is complete on the volume.

Parameters
name (STRING): Volume name.
vol_uuid (STRING): Volume UUID.

wafl.scan.l1.uncompact.nospc

Severity
ERROR

Description
This message occurs when there is not enough free space to uncompact the indirect blocks during the volume uncompact operation.

Corrective Action

Create space by increasing the volume size, or by deleting data or deleting snapshots. To increase a volume's size, use the "volume size" command. To delete a volume's snapshots, use the "volume snapshot delete" command.

Syslog Message

Indirect block uncompact scan for volume %s (UUID: %s) stopped because of insufficient free space.

Parameters

name (STRING): Volume name.
vol_uuid (STRING): Volume UUID.

wafl.scan.layout.advise

Severity

INFORMATIONAL

Description

This event is issued to advise the operator of optimal settings for their layout ratio.

Corrective Action

(None).

Syslog Message

WAFL layout ratio for %s %s%s%s%s is %d.%02d. A ratio of 1 is optimal. Based on your free space, %d.%02d is expected.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
ratio1 (INT): The ratio integer
ratio2 (INT): The ratio fraction of 100
eratio1 (INT): The expected ratio integer
eratio2 (INT): The expected ratio fraction of 100

wafl.scan.layout.advise.ino

Severity

INFORMATIONAL

Description

This event is issued to advise the operator of optimal settings for their layout ratio.

Corrective Action

(None).

Syslog Message

WAFL layout ratio for %s %s%s%s%s, %s inode %u is %d.%02d. A ratio of 1 is optimal. Based on your free space, %d.%02d is expected.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
inotype (STRING): The inode space (public or private)
ino (INT): The inode value
ratio1 (INT): The ratio integer
ratio2 (INT): The ratio fraction of 100
eratio1 (INT): The expected ratio integer
eratio2 (INT): The expected ration fraction of 100

wafl.scan.layout.cantWrite

Severity

ERROR

Description

This message occurs when the system cannot write out the WAFL®scan layout log.

Corrective Action

The most likely cause of a failure in writing the file is lack of space on the specified volume. Use the 'df' command to check available space. If the volume is full, free some space on the volume, and then restart the command.

Syslog Message

Cannot write WAFL scan layout log %s.

Parameters

filename (STRING): Name of the log file.

wafl.scan.layout.write

Severity

NOTICE

Description

This event is issued when the system initiate writing of the scan layout log.

Corrective Action

(None).

Syslog Message

Writing WAFL layout log %s

Parameters

filename (STRING): The name of the log file

wafl.scan.log.cantWrite

Severity

NOTICE

Description

This message occurs when the system cannot write out the scan report log.

Corrective Action

If the error is due to lack of space, add more space or free space in the volume. If the problem persists, contact NetApp technical support.

Syslog Message

Cannot write WAFL vbntoino log %s: %d (%s).

Parameters

filename (STRING): Name of the log file.
err_code (INT): A numerical error code indicating the reason why the log was not written.
err_string (STRING): A string interpreting the error code.

wafl.scan.lost.obj.recovery

Severity

NOTICE

Description

This message occurs after a lost object recovery scanner has been completed or aborted.

Corrective Action

None.

Syslog Message

Lost object recovery scanner on volume "%s%s%s" is %s. (num_lost=%llu, num_inserted=%llu, num_deleted=%llu, num_skipped=%llu, num_objs_in_namespace=%llu)

Parameters

volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
state (STRING): State of the scan, either aborted or completed
num_lost (LONGINT): Number of objects found that were not in the namespace.
num_inserted (LONGINT): Number of objects fixed by adding them back into the namespace.
num_deleted (LONGINT): Number of objects fixed by deletion.
num_skipped (LONGINT): Number of inodes skipped during scanning due to some error.
num_objs_in_namespace (LONGINT): Number of objects that were found to exist already in the namespace.

wafl.scan.ownblocks.done

Severity

INFORMATIONAL

Description

This message occurs when a scan operation to check owned blocks is complete.

Corrective Action

(None).

Syslog Message

Completed %s on %s %s%s%s%s. The scanner took %ld ms.

Parameters

op (STRING): Name of the operation.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
run_time (LONGINT): Total run time of the scanner.

wafl.scan.quota.init.cantAbort

Severity

INFORMATIONAL

Description

This message occurs during an attempt to abort the quota initialization scan by using the "wafl scan abort" command. The quota initialization scan cannot be interrupted.

Corrective Action

Wait for the quota initialization to complete or use the "quota off" command.

Syslog Message

User cannot abort quota initialization scan. Please use 'quota off' command.

Parameters

(None).

wafl.scan.realloc.oldsnaps

Severity

ERROR

Description

This message occurs when a block reallocation scanner cannot move blocks trapped in aggregate snapshots, because the snapshots are older than the value in 'wafl_blkr_max_snap_age' flag (default is 360 seconds). You can display the value of this flag by using 'printflag wafl_blkr_max_snap_age'.

Corrective Action

Delete all aggregate snapshots or snapshot schedules before running a block reallocation scan. In the case of RaidSyncmirror aggregates, ensure that the resyncsnaptime option has a value that is less than in the 'age' parameter.

Syslog Message

Block reallocation scan on aggregate %s found snapshots older than %d seconds.

Parameters

aggr (STRING): Aggregate name.
age (INT): Maximum allowed age of aggregate snapshots, (in seconds), for block reallocation scan.

wafl.scan.reallocDisallowed

Severity

ERROR

Description

This event is issued when an attempt is made to reallocate a file or LUN that cannot be reallocated. Examples of such files/LUNs include file in snapshots, or Qtree Snapmirror destinations.

Corrective Action

File/LUN reallocation should be specified on files/LUNs in the active filesystem that are not part of a QSM destination.

Syslog Message

Reallocation disallowed on %s inode %d in volume %s%s: readonly or snapshot.

Parameters

inotype (STRING): The inode space (public or private)
inode (INT): The inode that could not be reallocated.
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.relocation.nocontiguousFree

Severity

ERROR

Description

This event is issued to indicate there is not enough contiguous free space to rewrite the blocks during file or volume reallocation.

Corrective Action

Free space in the volume, or increase the size of the aggregate, then retry the operation.

Syslog Message

Reallocate scan for volume %s%s has stopped because there is insufficient contiguous free space.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.relocation.nospaceFree

Severity

ERROR

Description

This event is issued to indicate there is not enough free space to rewrite the blocks during file or volume reallocation.

Corrective Action

Free space in the volume, or increase the size of a flexible volume, then retry the operation.

Syslog Message

Reallocate scan for volume %s%s has stopped because there is insufficient free space.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.relocation.nospaceSnap

Severity

ERROR

Description

This event is issued to indicate there is not enough snapshot free space to rewrite the blocks during file or volume reallocation.

Corrective Action

Remove snapshots in the volume, or increase the size of a flexible volume, then retry the operation.

Syslog Message

Reallocate scan for volume %s%s has stopped because there is insufficient snapshot free space.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.scan.snap.vbnOutOfRange

Severity

ERROR

Description

This messges occurs when scanners find an out-of-range block number in the snapshot.

Corrective Action

Delete the specified snapshot.

Syslog Message

Out of range block number error detected at %s %s%s%s%s in snapshot %d, during block type scan. Delete the specified snapshot.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapId (INT): Identifier for the snapshot.

wafl.scan.split.inofile.cantAbort

Severity

INFORMATIONAL

Description

This message occurs during an attempt to abort the split inofile scan by using the "wafl scan abort" command. The split inofile scan cannot be interrupted.

Corrective Action

(None).

Syslog Message

User cannot abort the split inofile scan.

Parameters

(None).

wafl.scan.typebits.diffFail

Severity

ALERT

Description

This message occurs when the type bit scan encounters an unexpected error from the snapdiff APIs. This can imply that prev_snapid snapshot might be corrupt.

Corrective Action

Contact NetApp technical support for corrective steps.

Syslog Message

Aborting the type bit scan due to error %d on volume %s while running a diff operation on inode %u of %s space between snapshot ID %u and snapshot ID %u after fbn %llu.

Parameters

error (INT): Error number.
volname (STRING): Volume name.
inum (INT): File ID under scan.
ino_type (STRING): Inode type.
snapId (INT): Identifier for the snapshot under scan.

prev_snapId (INT): Identifier for the reference snapshot.
start_fbn (LONGINT): Starting file block number (fbn) of the diff operation.
vendor (STRING): Name of the vendor.

wafl.scan.typeBitsMismatch

Severity
NOTICE

Description
This messages occurs when scanners find a type bits mismatch for a block number. This might indicate a file system inconsistency in a file system or snapshot.

Corrective Action
(Call support).

Syslog Message
Type bits mismatch found at %s %s%s%s%s in snapshot %d, vbn %llu, during block type scan. On-disk type bits %d, expected type bits %d.

Parameters
type (STRING): Type of object (volume or aggregate).
owner (STRING): Node that owns the object.
vol (STRING): Name of the object.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the object in cases where the object name itself is insufficient.
snapId (INT): Identifier for the snapshot.
vbn (LONGINT): Block number of the block within the volume.
diskbits (INT): On-disk type bits of the block.
expectedbits (INT): Expected type bits of the block.

wafl.scan.uncompact.aborted

Severity
ERROR

Description
This message occurs when the uncompaction scanner is aborted.

Corrective Action
(None).

Syslog Message
%s scanner aborted on %s %s%s%s%s with error: %s. %s was tried on %ld blocks before failure.

Parameters
opname (STRING): Opname for the scanner.
voltype (STRING): Volume type on which scanner was run.
aggr_owner (STRING): Owner of the volume.
aggr_name (STRING): Volume name.
app (STRING): Application UUID.
uuid (STRING): Volume uuid.

abort_reason (STRING): Reason for stoppping scan.
opname1 (STRING): Opname for the scanner.
val (LONGINT): Number of vbns acted on.

wafl.scan.vbn.outOfRange

Severity

NOTICE

Description

This message occurs when scanners find an out-of-range block number in the active file system.

Corrective Action

(None).

Syslog Message

Out-of-range block number error detected at %s %s%s%s%s, during block type scan.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.scan.wafliron.cantAbort

Severity

INFORMATIONAL

Description

This message occurs during an attempt to abort the wafliron scan by using the "wafl scan abort" command. The wafliron scan cannot be interrupted.

Corrective Action

Wait for the wafliron scan to finish or use "aggr wafliron stop" to stop the scan.

Syslog Message

User cannot abort wafliron scan. Please use 'vol wafliron stop' command.

Parameters

(None).

wafl.seclabel events

wafl.seclabel.syncsm.mutex

Severity

NOTICE

Description

This message occurs when the mutual exclusion has failed between the SnapMirror Synchronous and NFS v4.2 Security Labels features. This happens when an existing volume participating in a SnapMirror relationship receives an NFS "open", "create", or "setattr" operation carrying a security label. The system will not let a security label operation continue on a volume that participates in a SnapMirror Synchronous relationship, so the system administrator must either stop mirroring the volume or drop the security label operation completely.

Corrective Action

(None).

Syslog Message

An incompatible NFS v4.2 security label operation was received on a file in volume "%s" having a SnapMirror Synchronous relationship. To allow NFS operations carrying security label on the volume, the mirroring must be stopped first: FSID "%d" SNAPID "%d" FILEID "%llu": "%s"

Parameters

volname (STRING): Volume name.
fsid (INT): File System ID (FSID) of the volume.
snapid (INT): Snapshot ID.
fileid (LONGINT): File ID.
error_msg (STRING): Detailed error message to provide context while debugging the issue. The relevant input/output parameters of the message are also included to aid in debugging.

wafl.sfsr events

wafl.sfsr.abort.ino

Severity

NOTICE

Description

This event is issued when the system is forced to abort a file restore.

Corrective Action

(None).

Syslog Message

Single-file snaprestore of inode %u (snapid %d, %s %s%s%s%s) to inode %u prematurely halted.

Parameters

srcIno (INT): The source inode number
snapId (INT): The snapshot identifier
type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
dstIno (INT): The target inode number

wafl.sfsr.abort.inoDeleted

Severity

NOTICE

Description

This event is issued when the system is forced to abort a file restore. The inode was deleted.

Corrective Action

(None).

Syslog Message

Single-file snaprestore of inode %u (snapid %d, %s %s%s%s%s) to inode %u aborted. File was deleted.

Parameters

srcIno (INT): The source inode number
snapId (INT): The snapshot identifier
type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
dstIno (INT): The target inode number

wafl.sfsr.done

Severity

INFORMATIONAL

Description

This message occurs when a file restore operation has completed.

Corrective Action

(None).

Syslog Message

Single-file snaprestore of inode %u (snapid %d, %s %s%s%s%s) to inode %u has completed.

Parameters

srcIno (INT): Source inode number.
snapId (INT): Snapshot identifier.
type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
dstIno (INT): Target inode number.

wafl.sfsr.lun.error

Severity

ERROR

Description

This message occurs when the system attempts to restore a file onto a LUN. This is not a supported action; files cannot be restored onto a LUN.

Corrective Action

No corrective action is possible; files cannot be restored onto a LUN.

Syslog Message

Attempted to restore a file onto a LUN, but files cannot be restored onto a LUN. (vol='%s', volident='%s', snapname='%s', filename='%s')

Parameters

vol (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapname (STRING): Name of the snapshot that the file is being restored from.
filename (STRING): Name of the file that cannot be restored onto a LUN.

wafl.sfsr.lun.name.error

Severity

ERROR

Description

This event is issued when a LUN is being restored to a new location and the path to the new location contains invalid characters. The valid characters for the last component in the lun path are A-Z, a-z, 0-9, '-', '.', '_', '{' and '}'.

Corrective Action

Make sure that the last component of the path to the new location contains characters from A-Z, a-z, 0-9, '-', '.', '_', '{' and '}'.

Syslog Message

Can't restore LUN due to invalid restore path. The last component of the restore path can only contain characters from A-Z, a-z, 0-9, '-', '.', '_', '{' and '}'.

Parameters

(None).

wafl.sfsr.lun.restore.error

Severity

ERROR

Description

This message occurs when the system attempts to restore a LUN to something other than qtree root. This is not a supported action; LUNs can only be restored into qtree roots.

Corrective Action

No corrective action is possible; LUNs can only be restored into qtree roots.

Syslog Message

Attempted to restore a LUN to something other than a qtree root, but LUNs can only be restored into qtree roots. (vol='%s', volident='%s', snapname='%s', filename='%s')

Parameters

vol (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
snapname (STRING): Name of the snapshot that the LUN is being restored from.
filename (STRING): Name of the file that the LUN is being restored from.

wafl.sfsr.sr.disabled

Severity

ERROR

Description

This event is generated when a single-file snap restore (sfsr) operation on a file with a space reservation fails because there is not enough space on the volume to restore the file with its space reservation. If there was room for the file without a space reservation, then the file was restored with its space reservation disabled.

Corrective Action

If this event happened because the single-file snaprestore (sfsr) failed then space on the volume must be freed and the sfsr redone. If the sfsr was otherwise successful then space on the volume must be freed and reservations re-enabled by using "file reservation file-path enable".

Syslog Message

Single-file snaprestore of inode %u on %s %s%s%s) did not restore space reservations due to lack of disk space.

Parameters

srcIno (INT): The source inode number
type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.shutdown events

wafl.shutdown.notClean

Severity

NOTICE

Description

This message occurs during shutdown, to indicate that a volume has not been marked clean. By itself, this is not necessarily a problem. When this event occurs in conjunction with WAFL inconsistency panics or

higher-severity EMS events, this message can indicate a potential source of the inconsistencies.

Corrective Action

No immediate action is required. If this message occurs in conjunction with WAFL inconsistency panics or other EMS messages, contact NetApp technical support.

Syslog Message

%s %s%s%s%s not marked clean (volume state is %s).

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
state (STRING): State of the volume.

wafl.sidl events

wafl.sidl.blkincons.recovery

Severity

NOTICE

Description

This message occurs when a volume or aggregate with single instance data logging enabled encounters a problem in a metafile required for the functioning of the single instance data logging feature. The system will attempt automatic recovery within the next couple of Consistency Points (CPs). During the period of recovery, write performance could be lower than usual.

Corrective Action

(None).

Syslog Message

%s:%s encountered a problem in a metafile (sidl). The system will automatically repair the problem.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
object_name (STRING): Name of the object.
fileid (INT): File identifier of the metafile.
l0_blk_cnt (LONGINT): Number of L0 blocks present.
exp_blk_cnt (LONGINT): Number of L0 blocks expected.
cpcount (INT): CP that performs automatic recovery.

wafl.sidl.l0incons.recovery

Severity

NOTICE

Description

This message occurs when a volume or aggregate with single instance data logging enabled encounters a

problem in a metafile required for the functioning of the single instance data logging feature. The system will attempt automatic recovery within the next couple of Consistency Points (CPs). During the period of recovery, write performance could be lower than usual.

Corrective Action

(None).

Syslog Message

%s:%s encountered a problem in a metafile (sidl). The system will automatically repair the problem.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
object_name (STRING): Name of the object.
fbn (LONGINT): File block number (fbn) where the problem was encountered.
fileid (INT): File identifier of the metafile.
vbn (LONGINT): Value of the volume block number (vbn) that had a problem.
where (STRING): The module that generated the event (write or refill).
cpcount (INT): CP that performs automatic recovery.

wafl.sidl.space.disable

Severity

NOTICE

Description

This message occurs when a volume or aggregate disables the single instance data logging feature because the volume or aggregate is too close to full. During the period when single instance data logging is disabled, write performance could be lower than usual.

Corrective Action

Decrease the space utilization in the volume or aggregate either by deleting data or by growing the volume or aggregate.

Syslog Message

%s:%s has disabled the single instance data logging feature. Write performance could be lower than usual.

Parameters

object_type (STRING): Identifier for the type of object to which this event applies (aggregate or volume).
object_name (STRING): Name of the object.
cpcount (INT): Consistency Point (CP) at which the event is generated.

wafl.sis events

wafl.sis.clone.autodelete.file

Severity

NOTICE

Description

This message occurs when a file clone is autodeleted

Corrective Action

(None).

Syslog Message

'%s' is sent for auto deletion.

Parameters

path (STRING): File path.

wafl.sis.clone.autodelete.threshold

Severity

NOTICE

Description

This message occurs when file clone create operation fails because volume crossed autodelete threshold.

Corrective Action

Increase the space available to the volume by either adding disks or by freeing space in the volume to allow the cloning operation to continue.

Syslog Message

File clone creation cannot be completed because volume crossed autodelete threshold.

Parameters

name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.

wafl.sis.clone.backup.file.cleanup.failed

Severity

ERROR

Description

This message occurs when clone create gets an error while cleaning up the backup file of the pre-existing clone.

Corrective Action

A backup of the pre-existing clone file is saved at the backup file location. Its cleanup needs manual intervention.

Syslog Message

File clone create for the source %s and clone %s returned error while cleaning up the backup file %s of the pre-existing clone with error: %d. Backup file should be deleted to reclaim space.

Parameters

src_filename (STRING): Source filename.
clone_filename (STRING): Clone filename.
backup_filename (STRING): Backup filename.
error (INT): Error returned from FlexClone® subsystem.

wafl.sis.clone.backup.file.restore.failed

Severity

ERROR

Description

This message occurs when clone create errors out while restoring the backup file to the pre-existing clone.

Corrective Action

Clone create failed after deleting the pre-existing clone. A backup of the pre-existing clone file is saved at the backup file location. It can be used to recover the pre-existing clone file.

Syslog Message

File clone create for the source %s and clone %s failed while restoring the backup file %s to the pre-existing clone with error: %d. Backup file can be moved to the pre-existing clone location for recovering the clone file.

Parameters

src_filename (STRING): Source filename.
clone_filename (STRING): Clone filename.
backup_filename (STRING): Backup filename.
error (INT): Error returned from FlexClone® subsystem.

wafl.sis.clone.create.failed

Severity

INFORMATIONAL

Description

This message occurs when attempts to create a file clone fail.

Corrective Action

(None).

Syslog Message

File clone create of clone file %s (fileid: %d) from source file %s (fileid: %d) in volume %s failed with error:%s at line %d with src_fsid %d, dst_fsid %d, src_snapid %d, dir_fileid %d, type %s, category %s.

Parameters

clone_filename (STRING): Clone filename.
dst_fileid (INT): File identifier for destination file.
src_filename (STRING): Source filename.
src_fileid (INT): File identifier for source file.
volname (STRING): Volume name.
error (STRING): Error returned from the FlexClone® subsystem.
line_number (INT): Line number where the error has occurred.
src_fsid (INT): File system identifier of source volume.
dst_fsid (INT): File system identifier of destination volume.
snapid (INT): Snapshot identifier.
dir_fileid (INT): File identifier for the directory.
type (STRING): Type of Cloning.
category (STRING): Clone create requestor information.

wafl.sis.clone.unlock.snapshot

Severity

NOTICE

Description

This event is issued when the volume options are set such that the autodelete destroy policy is allowed to destroy backing snapshots for sis clones. The snapshot autodelete destroy policy is used as a last resort to recover space in a thin provisioned aggregate. The disruptive effect of destroying sis clone backing snapshots should be understood when setting this policy.

Corrective Action

(None).

Syslog Message

Unlocked sis clone backing snapshot in volume %s. Clone files based on snapshot (%d, %d) might become inconsistent.

Parameters

name (STRING): The volume name
snapid (INT): Snapshot identifier.
cp_cnt (INT): The CP(Consistency Point) count. The (snapid, cp_count) pair uniquely identifies a snapshot.

wafl.slice events

wafl.slice.invalid.stream

Severity

NOTICE

Description

This message occurs when an invalid slice stream was not fixed by wafliron because the associated slice base file was not recognized at the time wafliron ran. Once this invalid stream file is removed, 'wafl slice_repair' can recreate and repair the stream file.

Corrective Action

A slice stream file in the slicevol is not valid. Please remove the file and rerun 'wafl slice_repair' to create a valid slice stream file - Use the (privilege :diag) "rm -x [stream_file_name] [slice_base_path]" command to remove the invalid slice stream file in the slicevol. Then use the (privilege:diag) "wafl slice_repair[slice_base_path] start" command to repair the stream file. If the problem persists, contact NetApp technical support.

Syslog Message

Invalid slice stream file: %s (fileid %d) in the slice base path %s in volume %s%s%s detected. Please run the following commands in the diag mode: %s to fix it.

Parameters

stream_name (STRING): The name of an invalid slice stream file.
stream_fileid (INT): The file ID of an invalid slice stream file.
base_path (STRING): The slice base file path that is being repaired.
vol (STRING): Name of the volume.

app (STRING): Application UUID.
volident (STRING): Vserver's Universal Unique Identifier (UUID).
repair_cmd (STRING): The repair command to restore the stream file to be valid.

wafl.sm events

wafl.sm.vvol.read.failed

Severity

ALERT

Description

This message occurs when SnapMirror® fails to read a block from the container file of a FlexVol® SnapMirror source volume. This error typically means that there is some corruption in the FlexVol volume.

Corrective Action

Contact NetApp technical support for assistance.

Syslog Message

SnapMirror encountered an error while reading the block at VVBN %llu in volume '%s%s%s'.

Parameters

vvbn (LONGINT): Virtual volume block number (VVBN) on which the read failed.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume, if the volume name itself is insufficient.

wafl.snap events

wafl.snap.autoDel.policyChg

Severity

NOTICE

Description

This message occurs when the system detects a possible change in the autodelete or autosize policy of the volume. This can happen when a version of Data ONTAP® is loaded that might not support the reclaim policy currently set in the active filesystem.

Corrective Action

Unrecognized reclaim policy settings are cleared in the active file system. If you subsequently load a version of Data ONTAP® that recognizes the reclaim policy settings, you need to reestablish the policy settings using 'snap autodelete' or 'vol autosize' commands.

Syslog Message

Reclaim policy might have changed in %s %s%s%s%s. Check the 'snap autodelete' or 'vol autosize' command settings.

Parameters

type (STRING): Container type, either volume or aggregate.
owner (STRING): Volume owner.

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.snap.autoDelete

Severity

INFORMATIONAL

Description

This message occurs when the aggregate snapshot reserve is full and snapshots are being deleted to free space.

Corrective Action

If aggregate snapshots are being deleted too frequently or while they are still being used, then consider the following options: o Increase the snapshot reserve percentage for the aggregate. o Alter the aggregate snapshot schedule to create less frequent snapshots.

Syslog Message

Deleting snapshot '%s' in aggregate '%s' to free up space.

Parameters

name (STRING): Snapshot name.
aggr (STRING): Aggregate name.

wafl.snap.autoDelete.createStateSnap.fail

Severity

INFORMATIONAL

Description

This event indicates that after auto-deletion of all aggregate snapshots, we have failed to take a state snapshot.

Corrective Action

(None).

Syslog Message

Unable to create snapshot '%s' in aggregate '%s': %s

Parameters

name (STRING): The snapshot name
vol (STRING): The volume name
err (STRING): Reason why the operation failed.

wafl.snap.autoDelete.fail

Severity

NOTICE

Description

This event indicates that the automatic deletion of a snapshot in an aggregate has failed. An appliance may automatically delete an aggregate snapshot if the aggregate snap reserve fills.

Corrective Action

The appliance will automatically retry the snapshot deletion shortly after the failure occurs. If the deletion succeeds then no corrective action is necessary. If deletion repeatedly fails then the aggregate could potentially become full. To address this please contact customer support.

Syslog Message

Unable to delete snapshot '%s' in aggregate '%s' to recover space: %s

Parameters

name (STRING): The snapshot name
aggr (STRING): The aggregate name
err (STRING): The reason why the deletion failed.

wafl.snap.create

Severity

NOTICE

Description

This message occurs when a snapshot is created successfully.

Corrective Action

(None).

Syslog Message

Snapshot %s was created successfully for volume %s%s%s in %ld milliseconds.

Parameters

name (STRING): Snapshot name.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
time (LONGINT): Time taken to create the snapshot, in milliseconds.

wafl.snap.create.skip.reason

Severity

ERROR

Description

This message occurs when the creation of a snapshot is skipped.

Corrective Action

Address the issue identified by the "reason" parameter. For example, if the reason is "Volume is too full", increase the volume size or free up disk space on the target volume.

Syslog Message

%s %s %s: Skipping creation of %s snapshot (%s).

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier.
snapname (STRING): Name of the snapshot being created.
reason (STRING): Reason for skipping the snapshot.

wafl.snap.delete

Severity

INFORMATIONAL

Description

This message occurs when a snapshot is deleted.

Corrective Action

(None).

Syslog Message

Snapshot %s on %s %s%s%s%s %s was deleted by the Data ONTAP function %s. The unique ID for this snapshot is (%d, %d).

Parameters

snap_name (STRING): Name of the deleted snapshot.
type (STRING): Container type (volume or aggregate).
owner (STRING): Volume or aggregate owner.
vol (STRING): Volume or aggregate name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume or aggregate when the volume or aggregate name by itself is insufficient.
vendor (STRING): Vendor name.
caller_func (STRING): Function in Data ONTAP® that invokes the deletion process.
snapid (INT): Numerical ID of the snapshot. The (snapid, cp_count) pair uniquely identifies a snapshot.
cp_count (INT): The CP (consistency point) count. The (snapid, cp_count) pair uniquely identifies a snapshot.

wafl.snap.delete.32bit

Severity

INFORMATIONAL

Description

This message occurs when a snapshot on an aggregate or volume is deleted because it has an unsupported 32-bit or mixed format file system.

Corrective Action

(None).

Syslog Message

A snapshot on %s %s%s%s%s was deleted because it has an unsupported 32-bit or mixed format file system. The unique ID for this snapshot is (%d, %d).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
snapid (INT): Numerical ID of the snapshot. As a pair, the values of the "snapid" and "cp_count" parameters uniquely identify a snapshot.
cp_count (INT): CP (consistency point) count. As a pair, the values of the "snapid" and "cp_count" parameters uniquely identify a snapshot.

wafl.snap.delete.pending

Severity

INFORMATIONAL

Description

This message occurs when the deletion of a snapshot is pending.

Corrective Action

(None).

Syslog Message

Pending snapshot (ID %u) deletion in %s %s%s%s%s.

Parameters

snapid (INT): Snapshot ID.
type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.snap.deleteError

Severity

INFORMATIONAL

Description

This message occurs when attempts to delete a snapshot fail.

Corrective Action

(None).

Syslog Message

Unable to remove old snapshot "%s" on %s %s%s%s. Error: %s.

Parameters

name (STRING): Name of the snapshot.
type (STRING): Type of object (volume or aggregate).
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): UUID of the volume, to uniquely identify the volume when the volume name alone is insufficient.
err (STRING): Error description

wafl.snap.sched.notok

Severity

NOTICE

Description

This message occurs when the creation of a snapshot is skipped:

Corrective Action

(None).

Syslog Message

%s%s%s%s: %s

Parameters

message (STRING): Generic scheduled snapshot failure indication.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
reason (STRING): Specific reason for the snapshot failure.

wafl.snaplock events

wafl.snaplock.scan.complete

Severity

NOTICE

Description

This event indicates that the snaplock scan has completed.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s SnapLock scan determined upgraded volume expiry date: %s

Parameters

typestr_cap (STRING): wafl_Volume type, capitalized
owner (STRING): owner string (foreign, partner, et al)
vol_name (STRING): Volume name
app (STRING): Application UUID.

volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
timebuf (STRING): Text string describing expiration time/date.

wafl.snaprestore events

wafl.snaprestore.badVersion

Severity

ERROR

Description

This message occurs during a snapshot restore operation, when the system cannot recognize the version of Data ONTAP® from the snapshot it is reverting to. The snapshot is corrupt and cannot be used.

Corrective Action

Cancel the snapshot restore operation, if necessary, and restore to a different snapshot.

Syslog Message

Snapshot is from an unrecognizable version of Data ONTAP. (vol='%s', volident='%s')

Parameters

vol (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.snaprestore.cancel.invalid

Severity

NOTICE

Description

This message occurs during volume initialization when the system cancels a SnapRestore® process due to an invalid snapshot.

Corrective Action

Select a different snapshot and reattempt the restore operation.

Syslog Message

Snapshot is invalid; canceling pending "vol snaprestore" for %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.snaprestore.cancel.prevcp

Severity

INFORMATIONAL

Description

This message occurs during volume initialization from a previous consistency point (CP) when the system cancels a SnapRestore® process. This happens when booting to a previous CP.

Corrective Action

Retry the SnapRestore operation after the system completes bootup.

Syslog Message

Canceling pending "vol snaprestore" for %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.snaprestore.defer.prevcp

Severity

INFORMATIONAL

Description

This message occurs during a read-only boot to the previous consistency point (CP). In this case, the pending SnapRestore® process is deferred.

Corrective Action

(None).

Syslog Message

Readonly mode; deferring "vol snaprestore" for %s %s%s%s%s.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.snaprestore.revert

Severity

INFORMATIONAL

Description

This message occurs during volume initialization when the system reverts to a previous snapshot.

Corrective Action

(None).

Syslog Message

Reverting %s %s%s%s%s to a previous snapshot with snapid %d.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
snapId (INT): Identifier for the snapshot.

wafl.snaprestore.stale

Severity

ERROR

Description

This message occurs during a snapshot restore operation, when the system determines that the snapshot it is restoring from is stale. The snapshot is corrupt and cannot be used.

Corrective Action

Cancel the snapshot restore operation, if necessary, and restore from a different snapshot.

Syslog Message

Snapshot is stale. (vol='%s', volident='%s')

Parameters

vol (STRING): Volume name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.snapshot events

wafl.snapshot.badFilesize

Severity

NOTICE

Description

This event is issued when the system discover that a filesize is out of range in a snapshot.

Corrective Action

(None).

Syslog Message

File size out of range in snapshot.

Parameters

(None).

wafl.snapshot.badLevel

Severity

NOTICE

Description

This event is issued when there is an inconsistency in the metadata of an inode in a snapshot. This message is advisory only. The inconsistency will be corrected in memory only, and the data will be made available.

Corrective Action

No action is required; however, the message may repeat until the snapshot is deleted.

Syslog Message

Corrected bad level %d for buftree of %s fileid %d, snapid %d in %s %s%s%s%s

Parameters

level (INT): The level of the buftree of the file
ino_type (STRING): The inode type
fileid (INT): The file identifier
snapid (INT): The snapshot identifier
type (STRING): The type of object (volume/aggregate)
owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.snapshot.ecv.fail

Severity

ERROR

Description

This message occurs when the system attempts to create a snapshot on a mixed-version cluster. However, the effective version of the cluster is ONTAP® 9.3 or earlier, and the maximum number of snapshots supported by this effective version has already been reached.

Corrective Action

Upgrade all nodes in the cluster to ONTAP 9.4 or later.

Syslog Message

Snapshot create operation failed on volume %s%s%s. Maximum number of snapshots reached on a mixed-version cluster.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): ID of the volume.

wafl.snapshot_xlation_duplicate_entry events

wafl.snapshot_xlation_duplicate_entry

Severity

ALERT

Description

This message occurs when WAFL® determines that there are duplicate snapshot entries in the snapshot translation table. Access to this snapshot is disabled until the problem is resolved.

Corrective Action

The snapshot is inaccessible because the corresponding entry in the translation table has been cleared. Contact NetApp technical support resolve the problem.

Syslog Message

WAFL snapshot translation table: Duplicate entry for volume '%s%s%s' that maps physical snapshot '%d' to logical snapshot '%d'.

Parameters

owner (STRING): Owner of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
physical_snapid (INT): Physical snapshot index.
Logical_snapid (INT): Logical snapshot index.

wafl.snapshot_xlation_setupfailed events

wafl.snapshot_xlation_setupfailed

Severity

ERROR

Description

This message occurs when WAFL® cannot setup the snapshot translation table. Access to this snapshot is disabled until the problem is resolved.

Corrective Action

The snapshot is inaccessible, possibly due to a resource issue.Contact NetApp technical support.

Syslog Message

WAFL snapshot translation table: Cannot to add entry on volume '%s%s%s' that maps physical snapshot '%d' to logical snapshot '%d'

Parameters

owner (STRING): Owner of the volume.
app (STRING): Application UUID.
volident (STRING): Unique Identifier of the volume in cases where the volume name itself is insufficient.
physical_snapid (INT): Physical snapshot index.
Logical_snapid (INT): Logical snapshot index.

wafl.spacemgmnt events

wafl.spacemgmnt.policyChg

Severity

NOTICE

Description

This message occurs when autodelete/autosize policy of a volume is changed.

Corrective Action

(None).

Syslog Message

The space management policy for volume %s has changed: %s.

Parameters

vol (STRING): Volume name.
changes (STRING): A string of changes being made.

wafl.spacetax events

wafl.spacetax.disabled

Severity

ERROR

Description

This message occurs when the spacetax feature is disabled for all flexible volumes in the system because of the 'wafl-disable-spacetax?' boot option.

Corrective Action

Reboot with the 'wafl-disable-spacetax?' boot option removed.

Syslog Message

Spacetax disabled for all flexible volumes.

Parameters

(None).

wafl.sparse events

wafl.sparse.meta.rm

Severity

NOTICE

Description

This event is issued when a sparse config metafile can not be removed in recycling bin

Corrective Action

(None).

Syslog Message

Unable to remove sparse metafile %s in recycle bin: error %s

Parameters

path (STRING): The metadata filepath
err (STRING): The error message

wafl.spcmgmt events

wafl.spcmgmt.policyConflict

Severity

NOTICE

Description

This message occurs when a space management strategy or an autosize grow threshold for a volume is being configured and the autogrow or autodelete thresholds conflict with the space-mgmt-try-first policy. The conflict can arise when the autogrow threshold is less than the autodelete threshold and the space-mgmt-try-first policy is configured for "snap_delete". The conflict can also arise when the autogrow threshold is more than the autodelete threshold and space-mgmt-try-first is configured for "volume_grow".

Corrective Action

Consider changing either the space-mgmt-try-first policy with the command "volume modify -volume <volume_name> -space-mgmt-try-first <option>" or the autogrow threshold with the command "volume modify -volume <vol_name> -autosize-grow-threshold-percent <value>", and keep them in sync.

Syslog Message

While configuring "%s" for volume "%s", space_mgmt_try_first policy ("%s") is conflicted with the autogrow threshold (%d%%) and autodelete threshold (%d%%).

Parameters

command (STRING): Command being executed.
volume_name (STRING): Name of the volume.
space_mgmt_try_first (STRING): space-mgmt-try-first policy for volume_grow or snap_delete.
grow_threshold (INT): Used-space threshold, as a percentage, for the automatic growth of the volume.
delete_threshold (INT): Used-space threshold, as a percentage, for the auto-deletion of snapshots.

wafl.spcres events

wafl.spcres.not.changed

Severity

NOTICE

Description

This event indicates that the new space reservation guarantee was unabled to be obtained, so the old reservation type was kept unchanged.

Corrective Action

(None).

Syslog Message

Retaining volume reservation on %s%s (%s) because new reservation could not be guaranteed.

Parameters

vol_name (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
spcres_desc (STRING): Text string describing space reservation type.

wafl.spinhi events

wafl.spinhi.new.err.code

Severity

NOTICE

Description

This message occurs when a new spinnp error is being propagated to a blade that does not understand that error yet. Nothing bad should happen because the error will receive default error handling when received by that blade. This message is for debugging in case you need to know the original source and reason for the error.

Corrective Action

(None).

Syslog Message

Spinnp operation %s was executed on DSID(%08x), fileid %u, snapid %u, proto %s and returned spinnp error %d to blade UUID %s.'

Parameters

opname (STRING): Spinnp operation name.
dsid (LONGINT): The data set identifier.
fileid (INT): ID of the file specified by the spinnp operation.
snapid (INT): Snapshot identifier: (0) - active file system (non-zero) - refers to snapshot
proto (STRING): Protocol used on the operation.
spinerror (INT): Spinnp error number.
bladeuuid (STRING): Universally Unique Identifier (UUID) of the blade where this error will be returned.

wafl.split events

wafl.split.inofile.scan.complete

Severity

NOTICE

Description

This event indicates that the split inofile scan has completed.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s Split inofile scan completed.

Parameters

typestr_cap (STRING): wafl_Volume type, capitalized
owner (STRING): owner string (foreign, partner, et al)
vol_name (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.stream events

wafl.stream.check.complete

Severity

NOTICE

Description

This message occurs when the "wafl scan stream_check" command is completed successfully.

Corrective Action

(None).

Syslog Message

"wafl scan stream_check" command successfully completed on volume "%s:%s". The total number of invalid stream files detected is %u.

Parameters

volume (STRING): Volume name.
vserver_uuid (STRING): Universal Unique ID (UUID) of the volume's SVM.
total (INT): Total number of invalid stream files detected.

wafl.stream.check.invalid.file

Severity

ERROR

Description

This message occurs when the "wafl scan stream_check" command detects a stream file with the name "." or "..". Files with these names are not allowed. If you have files with these names, you might be unable to access these files.

Corrective Action

Manually delete the base file which in turn will also delete the invalid stream file.

Syslog Message

Detected invalid stream file associated with base file inode "%d" on volume "%s:%s".

Parameters

fileId (INT): The base file inode number that has a stream file with the name "." or "..".
volume (STRING): Volume name.
vserver_uuid (STRING): Universal Unique ID (UUID) of the volume's SVM.

wafl.stream.check.start

Severity

NOTICE

Description

This message occurs when the "wafl scan stream_check" command is started.

Corrective Action

(None).

Syslog Message

"wafl scan stream_check" command successfully started on volume "%s:%s".

Parameters

volume (STRING): Volume name.
vserver_uuid (STRING): Universal Unique ID (UUID) of the volume's SVM.

wafl.svo events

wafl.svo.checkFailed

Severity

NOTICE

Description

This event is generated if a write to a svo enabled volume fails to pass a check

Corrective Action

(None).

Syslog Message

SnapValidator: Validation error %s

v:%s vol:%s%s%s inode:%d length:%d Offset: %lld

Parameters

error (STRING): error that occurred when validating the write
version (STRING): string to describe version of oracle tests that were run
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
inode (INT): The inode number of the file which was being written
length (INT): The length of the invalid write
offset (LONGINT): The offset into the inode where the write sent. Note for Luns this will be to the main inode, and does not include space used by prefix streams.

wafl.svo.optionSet

Severity

INFORMATIONAL

Description

This event is generated when a SnapValidator option is set on a volume

Corrective Action

(None).

Syslog Message

SnapValidator option '%s' set to '%s' on volume '%s%s'

Parameters

opname (STRING): name of the option being set
opvalue (STRING): value of the option being set
vol (STRING): name of the volume the option is being set on
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.takeover events

wafl.takeover.nvram.missing

Severity

INFORMATIONAL

Description

This message occurs when the system does not find any WAFL® nvlog records to replay during takeover processing.

Corrective Action

(None).

Syslog Message

WAFL takeover: No WAFL nvlog records were found to replay.

Parameters

(None).

wafl.takeover.nvram.warn

Severity

ERROR

Description

This message occurs when NVRAM loss is detected during takeover. Some updates might have been lost, but takeover is proceeding.

Corrective Action

(Call support).

Syslog Message

WAFL takeover: Last few seconds of updates to partner might be lost.

Parameters

(None).

wafl.takeover.vol.mType.inv

Severity

ERROR

Description

This message occurs when WAFL® attempts to take over a mirror volume that does not have a valid mirror-type attribute. This situation might be a direct result of an upgrade to a version of Data ONTAP® that requires the mirror-type attribute or as a result of a corruption.

Corrective Action

This condition cannot be fixed by file system repair mechanisms such as wafliron. The data is not lost, but it is inaccessible to the administrator. To access the data, contact NetApp technical support. Alternatively, the administrator can destroy the mirror volume by using the 'volume delete -vserver vserver_name -volume vol_name' command.

Syslog Message

The mirror type associated with the mirror volume %s%s%s is invalid.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name by itself is insufficient.

wafl.takeover.vol.nomount

Severity

ERROR

Description

This message occurs during a takeover or switchover operation when the system discovers that a partner volume cannot be mounted because it is inconsistent.

Corrective Action

The volume is inconsistent. Run wafliron to clear this inconsistency, and then contact technical support.

Syslog Message

%s partner volume %s%s%s is not mounted because it is inconsistent.

Parameters

operation (STRING): Whether this message refers to takeover or switchover.
vol (STRING): Volume name.

app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.takeover.vol.offline

Severity

ERROR

Description

This message occurs during a takeover or switchover operation when the system discovers that a partner volume cannot be brought online because it is inconsistent. The volume is left unmounted.

Corrective Action

The volume is inconsistent and is left unmounted. Run wafliron to clear this inconsistency, and then contact technical support.

Syslog Message

%s partner volume %s%s%s cannot be brought online because it is inconsistent.

Parameters

operation (STRING): Whether this message refers to takeover or switchover.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identity when the volume name itself is insufficient.

wafl.takeover.vols.mounted

Severity

INFORMATIONAL

Description

This message occurs when the volumes are mounted during takeover.

Corrective Action

(None).

Syslog Message

(None).

Parameters

(None).

wafl.timer events

wafl.timer.disk.io.stalled

Severity

ERROR

Description

This message occurs when disk I/O is stalled, possibly during a disk firmware download operation. If automatic firmware update is enabled, the download operation restarts automatically.

Corrective Action

If disk firmware updates were in progress, verify that the update has automatically resumed by using the "storage download status" command. If the disk firmware updates have not resumed, restart the download by using the "storage download" command.

Syslog Message

All disk I/O stalled.

Parameters

(None).

wafl.trans events

wafl.trans.ssd.cache.disable

Severity

NOTICE

Description

This message occurs when the system transitions a hybrid aggregate from 7-Mode to clustered Data ONTAP. As part of transition, SSD caching is disabled until the transition is committed.

Corrective Action

No action is required. After the transition operation is committed, SSD caching is automatically reenabled.

Syslog Message

SSD caching on hybrid aggregate "%s" has been disabled because a transition operation is in the pre-commit phase.

Parameters

name (STRING): Aggregate name.

wafl.transition events

wafl.transition.cp.completed

Severity

NOTICE

Description

This message occurs at the completion of a WAFL® consistency point (CP) that occurs during a failover transition, such as takeover or giveback. This event logs the time spent and other important performance information.

Corrective Action

(None).

Transition CP with reason %s for %s volumes with a total of %s dirty buffers took %ums with longest CP phases being %s on aggregate %s.

Parameters

tag (STRING): Reason for the CP occurring and a status code.
vols (STRING): Counts of flexible volumes that participated in the CP.
dirty_bufs (STRING): Number of WAFL buffers that were in use when the CP began and the number required to complete the CP.
total_time (INT): Number of milliseconds that the CP ran for.
top_phases (STRING): Top time consuming phases of the CP.
aggrname (STRING): Name of the aggregate.

wafl.unable events

wafl.unable.markinconsistent

Severity

INFORMATIONAL

Description

This message occurs when the FlexVol® volume cannot be marked as inconsistent.

Corrective Action

(None).

Syslog Message

WAFL: Unable to mark volume %s inconsistent as %s.

Parameters

vvolname (STRING): Volume name.
reason (STRING): Reason for the inability to mark the volume inconsistent.

wafl.upgrade events

wafl.upgrade.useActiveInofile

Severity

NOTICE

Description

This event is issued during an upgrade where the system need to use the active filesystem inofile.

Corrective Action

(None).

Syslog Message

Using active filesystem inofile on upgrade from legacy %s %s%s%s%s.

Parameters

    type (STRING): The type of object (volume/aggregate)
    owner (STRING): The owner of the volume
    vol (STRING): The name of the volume
    app (STRING): Application UUID.
    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vol events

wafl.vol.access.denied

Severity

    ERROR

Description

    This message occurs when the system rejects client access to a volume.

Corrective Action

    You can avoid this event by unmounting the volume.

Syslog Message

    Access to volume '%s' was denied, reason='%s'.

Parameters

    vol (STRING): Volume name.
    reason (STRING): Reason that access was denied.

wafl.vol.add

Severity

    INFORMATIONAL

Description

    This message indicates that a new volume has been added to the system.

Corrective Action

    (None).

Syslog Message

    %s %s%s%s%s has been added to the system.

Parameters

    type (STRING): Type of object (volume/aggregate).
    owner (STRING): Volume owner.
    vol (STRING): Volume name.
    app (STRING): Application UUID.
    volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.vol.add.keyinfo.into.vldb

Severity

NOTICE

Description

This message occurs when encryption key-info is added into vldb table.

Corrective Action

(None).

Syslog Message

Key-info is added into vldb for volume %s (dsid %lu, aggr '%s') with index %d, key-id %s.

Parameters

vol (STRING): Volume name.
dsid (LONGINT): Unique identifier (DSID) of the volume.
aggr (STRING): Name of the containing aggregate.
key_idx (INT): Key index.
key_id (STRING): Key id.

wafl.vol.appdm.upgrade.nospc

Severity

ERROR

Description

This message occurs when ONTAP® software cannot increase the size of an AppDM volume by five percent during an upgrade to ONTAP 9.5.

Corrective Action

ONTAP has increased the snapshot reserve percentage on this AppDM volume from zero to five percent as part of the upgrade to ONTAP 9.5. To retain the same available free space on the volume, consider increasing the size of the volume by five percent by using the "vol modify -size" command. It might be necessary to increase the size of the aggregate first, using the "aggr add-disks" command.

Syslog Message

The file system on %s %s%s%s%s could not be grown 5%% larger as part of the upgrade to ONTAP 9.5.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier when the volume name alone is insufficient.

wafl.vol.autoSize.done

Severity

NOTICE

Description

This message occurs when an autosize for a volume is successful. This can happen when the "autosize grow" option is on and the volume reaches the grow threshold percentage.

Corrective Action

(None).

Syslog Message

Volume autosize: Automatic %s of volume '%s%s%s' by %s is complete.

Parameters

event_type (STRING): Type of autosize event.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
size (STRING): Human readable size.
object_uuid (STRING): Volume instance UUID of the resource object.

wafl.vol.autoSize.fail

Severity

NOTICE

Description

This message occurs when automatic sizing of a volume fails.

Corrective Action

Increase the maximum size of the volume while setting the autosize.

Syslog Message

Unable to grow volume '%s%s%s' to recover space: %s.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier the volume in cases where the volume name itself is insufficient.
err (STRING): Reason for the failure.
object_uuid (STRING): Volume instance UUID of the resource object.

wafl.vol.autoSize.shrink.cap

Severity

NOTICE

Description

As a volume grows, there can be an automatic increase in the number of files that it is allowed to contain, but that number is unchanged as the volume shrinks. This number of files puts a constraint on the minimum size of the volume when it is automatically shrunk. This message indicates that the automatic shrinking of a volume did not reach the configuration's minimum size because it is constrained by the number of files the volume is allowed to contain.

Corrective Action

Consider using the command "volume modify <volume-name> -files <new-files-value>" to decrease the number of files that the volume is allowed to contain. You can view the current value of the number of files by using the command "volume show <volume-name> -fields files".

Syslog Message

Volume Autosize: Volume '%s%s%s' could not be auto shrunk below %s to recover space.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
size (STRING): Human-readable minimum size to which the volume can be automatically shrunk.

wafl.vol.bgTruncate.full

Severity

ALERT

Description

This message occurs when a background truncation operation for large files stalls due to insufficient free space for allocating additional metadata on the volume.

Corrective Action

Manually delete snapshots or increase the volume's size for one-time space issues. For frequent space issues, consider changing autogrow or autodelete settings for the volume in question.

Syslog Message

Insufficient free space available on %s %s%s %s to complete background truncation operation.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Volume identifier.

wafl.vol.blks_used.done

Severity

INFORMATIONAL

Description

This message occurs when the 'blks used' calculation is complete.

Corrective Action

(None).

Syslog Message

(None).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
run_time (LONGINT): Total run time of the scanner.

wafl.vol.clearing.in.nvfailed.state

Severity

INFORMATIONAL

Description

This message occurs when a volume that was marked as in-nvfailed-state is explicitly cleared.

Corrective Action

(None).

Syslog Message

Volume %s%s%s that was marked as in-nvfailed-state has been cleared.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): If the volume belongs to a Vserver, the Vserver's Universal Unique Identifier (UUID).

wafl.vol.clone.split.nospace

Severity

NOTICE

Description

This event is issued when there's not enough free space to complete a volume clone split operation. The usual cause for this is when there are many data blocks in the snapshot that is shared between the clone volume and its parent.

Corrective Action

Free space in the clone volume to allow the split operation to take place, for example by deleting all snapshots in the clone volume.

Syslog Message

Volume clone split of '%s%s' cannot be completed, not enough disk space. Consider removing snapshots.

Parameters

name (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vol.clone.unlock.snapshot.destroy.failed

Severity

NOTICE

Description

This event is issued when the volume options are set such that the autodelete destroy policy is allowed to destroy volume clones referring to the snapshot to be deleted. It indicates an attempt to destroy a volume clone has failed.

Corrective Action

(None).

Syslog Message

Volume clone destroy of '%s' failed.

Parameters

name (STRING): The volume clone name

wafl.vol.clone.unlock.snapshot.failure

Severity

NOTICE

Description

This event is issued when the volume options are set such that the autodelete destroy policy is allowed to destroy volume clones referring to the snapshot to be deleted. It indicates the process of destroying volume clones has failed. Some volume clones may have been destroyed or left offline as a result.

Corrective Action

(None).

Syslog Message

Process of destroying volume clones using volume %s snapid %d failed. Some volume clones may have been taken offline or destroyed.

Parameters

name (STRING): The volume name
snapid (INT): Snapshot identifier.

wafl.vol.clone.unlock.snapshot.offline.failed

Severity

NOTICE

Description

This event is issued when the volume options are set such that the autodelete destroy policy is allowed to destroy volume clones referring to the snapshot to be deleted. It indicates an attempt to offline a volume clone has failed.

Corrective Action

(None).

Syslog Message

Volume clone offline of '%s' failed.

Parameters

name (STRING): The volume clone name

wafl.vol.clone.unlock.snapshot.start

Severity

INFORMATIONAL

Description

This message occurs when the volume options are set so that the autodelete destroy policy is allowed to destroy volume clones referring to the snapshot to be deleted. The message indicates that the process of destroying volume clones is beginning. The snapshot autodelete destroy policy is used when all other attempts to recover space in a thin-provisioned aggregate fail. The disruptive effect of destroying volume clones should be understood when setting this policy.

Corrective Action

(None).

Syslog Message

Starting process of destroying volume clones using volume %s snapid %d.

Parameters

name (STRING): Volume name.
snapid (INT): Snapshot identifier.

wafl.vol.clone.unlock.snapshot.success

Severity

INFORMATIONAL

Description

This message occurs when the volume options are set so that the autodelete destroy policy is allowed to destroy volume clones referring to the snapshot to be deleted. The message indicates that the process of destroying volume clones has successfully completed.

Corrective Action

(None).

Syslog Message

Destroyed all volume clones using using volume %s snapid %d.

Parameters

name (STRING): Volume name.
snapid (INT): Snapshot identifier.

wafl.vol.create.clusterVolOnCFOaggr

Severity

ERROR

Description

This message occurs when a volume is created on a Controller Failover (CFO) high-availablity (HA) style aggregate. File access delays will occur for a period following giveback.

Corrective Action

To minimize file access delays following giveback, create the volume on an aggregate with a Storage Failover (SFO) HA policy.

Syslog Message

Creating volume '%s' on an aggregate with a CFO HA policy. File access delays will occur for a period following giveback.

Parameters

vol (STRING): Name of the volume.

wafl.vol.deswizzle.done

Severity

INFORMATIONAL

Description

This message occurs when the deswizzle scan is complete.

Corrective Action

(None).

Syslog Message

(None).

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
run_time (LONGINT): Total run time of the scanner.

wafl.vol.fix.comp.algo.list

Severity

NOTICE

Description

This message occurs when CP detects and rectifies an incorrect compression algorithm list in volume.

Corrective Action

(None).

Syslog Message

List of used compression algorithms in the volume %s has been fixed. was %llu, now %llu.

Parameters

vol (STRING): Volume name.
old_val (LONGINT): Old value of compression algorithm list
new_val (LONGINT): New value of compression algorithm list

wafl.vol.fsp.full

Severity

ERROR

Description

This message occurs when an operation requests more space than is available in the Flexible Space Pool.

Corrective Action

Report this condition to NetApp technical support.

Syslog Message

%s %s%s%s%s: insufficient space in FSP %s to satisfy a request of %llu holes and %llu overwrites.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Volume identifier, in order to uniquely identify the volume in cases where volume name alone is insufficient.
fspname (STRING): The name of the flexible space pool.
requested (LONGINT): Amount of space requested from the flexible space pool.
requested_overwrites (LONGINT): Amount of overwrite reserve space requested from the flexible space pool.

wafl.vol.full

Severity

ALERT

Description

This message occurs when an operation requests more space than is available in the relevant volume.

Corrective Action

Consider manually deleting data or increasing the volume's size for one-time space issues. For frequent space issues, consider changing autogrow/autodelete settings.

Syslog Message

Insufficient space on %s %s%s%s%s to perform operation. %s was requested but only %s was available.

Parameters

> **type** (STRING): Type of object (volume/aggregate).
> **owner** (STRING): Volume owner.
> **vol** (STRING): Volume name.
> **app** (STRING): Application UUID.
> **volident** (STRING): Volume identifier, in order to uniquely identify the volume in cases where volume name alone is insufficient.
> **requested** (STRING): Amount of space requested in the volume.
> **available** (STRING): Amount of space available in the volume.

wafl.vol.guarantee.fail

Severity

> NOTICE

Description

> This message occurs when an attempt is made to apply the space guarantee for a flexible volume, but there is not enough space in the aggregate to do so. The volume will be mounted, but subsequent writes to the volume might fail if the volume's aggregate becomes full.

Corrective Action

> Either increase the size of the corresponding aggregate by adding disks, or decrease the total volume space requirements in the aggregate by shrinking or destroying one or more volumes.

Syslog Message

> Space for volume %s%s is not guaranteed. %s of additional space is required to enable the guarantee.

Parameters

> **vol** (STRING): Name of the volume whose space guarantee could not be applied.
> **app** (STRING): Application UUID.
> **volident** (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
> **short_by** (STRING): Amount of additional space required in the volume.

wafl.vol.guarantee.stayoff

Severity

> NOTICE

Description

> This message occurs when WAFL® would otherwise have attempted to enable a volume's space guarantee, but the last time it tried, an error was encountered (most likely due to insufficient space). This error was recorded in the volume's on-disk RAID label so that the same error would not be repeated on future mounts. The volume will be mounted. However, because the volume is not guaranteed, it is possible that subsequent writes to the volume could fail if the volume's aggregate becomes full.

Corrective Action

> Determine the cause of the error the last time WAFL attempted to enable this guarantee, either through logs or by attempting to enable it again manually. Typically, the issue is a lack of space at mount time detected during boot, which can be resolved by increasing the size of the corresponding aggregate (by adding disks or by shrinking or destroying some of the aggregate's volumes). After the issue is resolved, manually attempt to re-enable the guarantee using the 'volume modify' command.

Syslog Message

The space guarantee for volume %s%s was not enabled because an error occurred the last time a guarantee was enabled on this volume.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Volume identifier.

wafl.vol.inode.space.usage

Severity

ERROR

Description

This message occurs when public inode space usage exceeds threshold value configured by admin.

Corrective Action

Use the command "volume modify <volume-name> -files <new-files-value>" to increase the number of files that the volume is allowed to contain. View the current value of the file threshold by using the command "volume show <volume-name> -fields files". If volume modify fails, increase volume size and try again.

Syslog Message

The file system on %s %s%s%s%s is currently using %d%% of the files that can be contained on the volume. The admin has configured the threshold for monitoring public inode usage as %d%%.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique volume identifier when the volume name alone is insufficient.
current_inofile_used (INT): Current value of inodes in public inode space.
threshold_ems_inofile_used_pct (INT): Threshold percent value to monitor inodes usage.

wafl.vol.invalid.nomount

Severity

NOTICE

Description

This event is issued when a volume has not been fully copied and cannot be mounted.

Corrective Action

(None).

Syslog Message

Volume %s is not fully copied and cannot be mounted.

Parameters

vol (STRING): The volume name

wafl.vol.invalidate.fh

Severity

NOTICE

Description

This message indicates that an NVRAM failure is detected, invalidating outstanding filehandles.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s: Invalidating all filehandles due to previous NVRAM failure — Filesystem must be remounted by the client(s)

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.vol.mirrorType.invalid

Severity

ERROR

Description

This message occurs when WAFL® attempts to bring online a mirror volume that does not have a valid mirror-type attribute. This situation might be a direct result of an upgrade to a version of Data ONTAP® that requires the mirror-type attribute or as a result of a corruption.

Corrective Action

This condition cannot be fixed by file system repair mechanisms such as wafliron. The data is not lost, but it is inaccessible to the administrator. To access the data, contact NetApp technical support. Alternatively, the administrator can destroy the mirror volume by using the 'volume delete -vserver vserver_name -volume vol_name' command.

Syslog Message

The mirror type associated with the mirror volume %s %s%s%s%s is invalid.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name by itself is insufficient.

wafl.vol.mislabeled.root

Severity

NOTICE

Description

This event is issued when a volume or aggregate is labeled as root but was not selected as the root volume or aggregate. It is used to indicate that the label will be removed.

Corrective Action

(None).

Syslog Message

%s '%s%s%s' was incorrectly labeled as root. Removing the label.

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner Can be the empty string
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vol.nvfail.offline

Severity

EMERGENCY

Description

This message occurs when the system detects an NVRAM failure and the volume is inconsistent. The volume might have data loss due to NVRAM failure. The volume has taken offlined.

Corrective Action

Take the appropriate recovery action to recover from the possible data loss. Access to the volume is restricted until you clear the NVFAIL state manually.

Syslog Message

Volume %s%s is offline.

Parameters

owner (STRING): Volume owner.
vol (STRING): Volume name.

wafl.vol.nvfail.recovery.needed

Severity

NOTICE

Description

This message occurs periodically to inform the administrator that recovery procedures must be performed on a volume that is marked as in-nvfailed-state.

Corrective Action

Take the appropriate recovery action to recover from the possible data loss. Access to the volume is

restricted until you clear the NVFAIL state manually.

Syslog Message

Volume %s%s%s is marked as in-nvfailed-state. The recovery process needs to be initiated on the volume to recover from the NVFAIL event.

Parameters

vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): If the volume belongs to a Vserver, the Vserver's Universal Unique Identifier (UUID).

wafl.vol.offline

Severity

INFORMATIONAL

Description

This message indicates that a volume has been taken offline.

Corrective Action

(None).

Syslog Message

%s %s%s%s%s has been taken temporarily offline.

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
instuuid (STRING): Volume Instance UUID

wafl.vol.offline.callbacks

Severity

NOTICE

Description

Data ONTAP was trying to offline a volume and had to ignore the result of file-locking callbacks being sent to clients in order to make progress. This is transparent to clients, as they will retry their original requests, which will be serviced when the volume comes back online.

Corrective Action

(None).

Syslog Message

Ignoring %d callbacks when offlining %s %s%s%s%s.

Parameters

count (INT): The number of callbacks which were ignored
type (STRING): The type of object (volume or aggregate)

owner (STRING): The owner of the volume
vol (STRING): The name of the volume
app (STRING): Application UUID.
volident (STRING): The unique identifier of the volume in case the volume name itself is insufficient

wafl.vol.outOfInodes

Severity

ERROR

Description

This message occurs when a volume or aggregate reaches its maximum number of files and is out of inodes.

Corrective Action

For a volume, either use the command "volume modify -files" to increase the number the files that the volume is allowed to contain, or delete files from the volume. For an aggregate, add space to the aggregate.

Syslog Message

file system on %s %s%s%s%s is out of inodes because it has reached the maximum number of files

Parameters

type (STRING): Type of object (volume or aggregate)
owner (STRING): Owner of the volume or aggregate
vol (STRING): Name of the volume or aggregate
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume or aggregate in cases where the name itself is insufficient.

wafl.vol.outOfPrInodes

Deprecated
Severity

NOTICE

Description

This event is issued when the system discover that a volume is out of private inodes.

Corrective Action

(None).

Syslog Message

file system on %s %s%s%s%s is out of private inodes

Parameters

type (STRING): The type of object (volume/aggregate)
owner (STRING): The volume owner
vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vol.quiesce.giveback

Severity

INFORMATIONAL

Description

This event is issued to indicate a volume quiescing has failed because wafl giveback is running.

Corrective Action

Retry quiescing the volume after giveback has completed.

Syslog Message

Quiescing volume %s failed because wafl giveback is running.

Parameters

vol (STRING): The volume name

wafl.vol.quiesce.iron

Severity

INFORMATIONAL

Description

This event is issued to indicate a volume quiescing has failed because wafl iron is running.

Corrective Action

Retry quiescing the volume after wafl iron has completed.

Syslog Message

Quiescing volume %s failed because wafl iron is running.

Parameters

vol (STRING): The volume name

wafl.vol.quiesce.notdrain

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation fails because of a general failure in draining the suspended messages or outstanding callbacks. This covers unknown cases that wafl.vol.quiesce.timeoutcb does not catch.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because draining message and callbacks failed. The total time spent quiescing the volume was %d milliseconds, %d of which was spent aborting scanners, %d milliseconds were spent flushing client requests for locks and watches, %d milliseconds were spent draining volume

references and %d milliseconds were spent draining callbacks and suspended messages.

Parameters

    vol (STRING): Volume name.
    ttq (INT): Time spent (in milliseconds) quiescing the volume.
    tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
    twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.
    twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.
    twdcm (INT): Time spent (in milliseconds) waiting for draining of suspended messages and callbacks.

wafl.vol.quiesce.notFlex

Severity

    INFORMATIONAL

Description

    This event is issued to indicate a volume quiescing has failed because it is not a flex vol.

Corrective Action

    (None).

Syslog Message

    Quiescing volume %s failed because it's not a flexible volume.

Parameters

    vol (STRING): The volume name

wafl.vol.quiesce.notMounted

Severity

    INFORMATIONAL

Description

    This event is issued to indicate a volume quiescing has failed because it is not in mounted state.

Corrective Action

    (None).

Syslog Message

    Quiescing volume %s failed because it's not mounted. It's in %s state.

Parameters

    vol (STRING): The volume name
    statename (STRING): The state

wafl.vol.quiesce.relocating

Severity

    ERROR

Description

This message occurs when a volume cannot be quiesced because an aggregate relocation operation is running.

Corrective Action

Retry the volume move operation after the aggregate relocation operation is complete.

Syslog Message

Volume %s could not be quiesced because aggregate relocation is running.

Parameters

vol (STRING): Volume name.

wafl.vol.quiesce.rootVol

Severity

INFORMATIONAL

Description

This event is issued to indicate a volume quiescing has failed because it is a root volume.

Corrective Action

(None).

Syslog Message

Quiescing volume %s failed because it's a root volume.

Parameters

vol (STRING): The volume name

wafl.vol.quiesce.statusvol

Severity

ERROR

Description

This message occurs when a volume cannot be quiesced because it is being used to host wafliron status files.

Corrective Action

Use "aggr wafliron show" command to monitor the status of wafliron and retry the operation after wafliron is complete.

Syslog Message

Volume %s could not be quiesced because it is being used by wafliron to host status files.

Parameters

vol (STRING): Volume name.

wafl.vol.quiesce.timeoutcb

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring draining of suspended callbacks or messages fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because there are %d outstanding callbacks and %d suspended messages. The time spent waiting for these to drain was %d milliseconds. The time spent quiescing the volume (%d milliseconds) was split between scan aborts (%d), flushing client requests (%d), and draining references (%d).

Parameters

vol (STRING): Volume name.
ncbo (INT): Number of outstanding callbacks.
nsm (INT): Number of suspended messages.
twdcm (INT): Time spent (in milliseconds) waiting for draining of suspended messages and callbacks.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
twcr (INT): Time spent (in millseconds) flushing client requests for locks and watches.
twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.

wafl.Vol.QuiesceTO.AbrtScan

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring scanners to abort fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of the volume %s failed because aborting the scanners resulted in a timeout. The time spent quiescing the volume was %d milliseconds of which %d milliseconds were spent waiting for the scanners to abort.

Parameters

vol (STRING): Volume name.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
ttq (INT): Time spent (in milliseconds) quiescing the volume.

wafl.Vol.QuiesceTO.CIntReqs

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring flushing of client requests for locks and watches fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because time spent waiting for flushing of client requests for locks and watches (%d milliseconds) resulted in a timeout. The total time spent quiescing the volume was %d milliseconds - %d milliseconds were spent aborting scanners.

Parameters

vol (STRING): Volume name.
twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.

wafl.Vol.QuiesceTO.RalDrain

Severity

NOTICE

Description

This message occurs during a volume move operation, when a volume quiesce attempt fails to drain all of the outstanding remote cached inodes within the allowable time frame. This can occur and might persist on a heavily loaded system, and it prevents the move from being completed. However, as soon as the load drops to a more reasonable level, ONTAP flushes the cached inodes and completes the move without customer intervention.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because it was unable to drain all outstanding remote inodes for the volume. Initially the volume reported %d cached inodes, but timed out with %d cached inodes remaining.

Parameters

vol (STRING): Volume name.
nStart (INT): Number of cached inodes when drain starts.
nEnd (INT): Number of cached inodes when request times out.

wafl.Vol.QuiesceTO.RefDrain

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring draining of volume references fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because the time spent draining the references on the volume (%d milliseconds) resulted in a timeout. There are %d references on the volume. One of the owners is %s. The command "wafl vref status" under diag privileges can be used to view all the references on a volume on the node owning the volume. The time spent quiescing the volume (%d milliseconds) was split between scan aborts (%d) and flushing client requests(%d).

Parameters

vol (STRING): Volume name.
twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.
wvc (INT): Number of references on the volume.
vo_1 (STRING): Text string representing the first volume reference owner.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.

wafl.Vol.QuiesceTO.RefsDrain

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring draining of volume references fails because of a timeout. The references are released.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because the time spent draining the references on the volume (%d milliseconds) resulted in a timeout. The time spent quiescing the volume (%d milliseconds), was split between scan aborts (%d) and flushing client requests (%d).

Parameters

vol (STRING): Volume name.
twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.

wafl.Vol.QuiesceTO.SAN.Ntfy

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring a notification to the SAN component fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because a quiesce notification to the SAN component (%d milliseconds) resulted in a timeout. The time spent quiescing the volume (%d milliseconds) was split between scan aborts (%d), flushing client requests (%d), draining references (%d), draining callbacks and suspended messages (%d), and draining zombies (%d).

Parameters

vol (STRING): Volume name.
twsc (INT): Time spent (in milliseconds) waiting to for quiescing of the SAN component.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.
twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.
twdcm (INT): Time spent (in milliseconds) waiting for draining of suspended messages and callbacks.
twzd (INT): Time spent (in milliseconds) waiting for draining of zombies.

wafl.Vol.QuiesceTO.ZmbDrain

Severity

INFORMATIONAL

Description

This message occurs when a volume quiesce operation requiring draining of zombies fails because of a timeout.

Corrective Action

(None).

Syslog Message

Quiescing of volume %s failed because the time spent draining zombies (%d milliseconds) resulted in a timeout. The time spent quiescing the volume (%d milliseconds) was split between scan aborts (%d), flushing client requests (%d), draining references (%d), and draining callbacks and suspended messages (%d).

Parameters

vol (STRING): Volume name.
twzd (INT): Time spent (in milliseconds) waiting for draining of zombies.
ttq (INT): Time spent (in milliseconds) quiescing the volume.
tws (INT): Time spent (in milliseconds) waiting for scanners to abort.
twcr (INT): Time spent (in milliseconds) flushing client requests for locks and watches.
twvr (INT): Time spent (in milliseconds) waiting for draining of volume references.
twdcm (INT): Time spent (in milliseconds) waiting for draining of suspended messages and callbacks.

wafl.vol.rekey.stat

Severity

NOTICE

Description

This message occurs when rekey scan ends to dump the stats.

Corrective Action

(None).

Syslog Message

Rekey scan is complete on volume '%s' (dsid %lu, aggr '%s'). Scan Stats: max_usecs_in_cpu = %lu, blks_total = %lu, max_blks_rekeyed_in_step = %lu, blks_rekeyed_by_scanner = %lu blks_rekeyed_by_client_io = %lu blks_with_error = %lu blks_skipped_dirty = %lu blks_suspended_fake_dirty = %lu blks_skipped_holes = %lu blks_packed = %lu

Parameters

vol (STRING): Volume name.
dsid (LONGINT): Unique identifier (DSID) of the volume.
aggr (STRING): Name of the containing aggregate.
max_usecs_in_cpu (LONGINT): Max. time (in micro-sec.) scanner runs in CPU.
blks_total (LONGINT): Total number of blocks scanner is expected to process.
max_blks_rekeyed_in_step (LONGINT): Max. number of blocks scanner process in one step.
blks_rekeyed_by_scanner (LONGINT): Number of blocks rekeyed by scanner.
blks_rekeyed_by_client_io (LONGINT): Number of blocks rekeyed by client I/O.
blks_with_error (LONGINT): Number of blocks failed to be loaded by scanner due to error.
blks_skipped_dirty (LONGINT): Number of blocks skipped by scanner because they are already dirty.
blks_suspended_fake_dirty (LONGINT): Number of blocks rekey scanner suspended on because they were fake dirty.
blks_skipped_holes (LONGINT): Number of blocks skipped by scanner because they are holes.
blks_packed (LONGINT): Number of blocks packed.

wafl.vol.runningOutOfInodes

Severity

ERROR

Description

This message occurs when the system detects that a volume is close to reaching its limit on the number of files that it can contain.

Corrective Action

Consider using the "volume modify <volume-name> -files <new-files-value>" command to increase the number of files that the volume is allowed to contain. You can view the current value of the file threshold by using the "volume show <volume-name> -fields files" command.

Syslog Message

The file system on "%s %s%s%s%s" is using 80 percent or more of the files in %s inode space that can be contained on the volume.

Parameters

ino_type (STRING): Inode type

type (STRING): Type of object (volume or aggregate).

owner (STRING): Volume owner.

vol (STRING): Volume name.

app (STRING): Application UUID.

volident (STRING): Unique volume identifier when the volume name alone is insufficient.

wafl.vol.setting.in.nvfailed.state

Severity

ERROR

Description

This message occurs when the system detects an NVFAIL event in a volume and marks the volume as in-nvfailed-state.

Corrective Action

Access to the volume is restricted until you clear the NVFAIL state manually. See the Data Protection Online Backup and Recovery Guide.

Syslog Message

Volume %s%s%s is marked as in-nvfailed-state: %s.

Parameters

vol (STRING): Name of the volume.

app (STRING): Application UUID.

volident (STRING): If the volume belongs to a Vserver, the Vserver's Universal Unique Identifier (UUID).

err (STRING): Error that caused the volume to be marked in in-nvfailed-state.

wafl.vol.snap_create.done

Severity

INFORMATIONAL

Description

This message occurs when the 'snap create' scan is complete.

Corrective Action

(None).

Syslog Message

(None).

Parameters

type (STRING): Type of object (volume or aggregate).

owner (STRING): Volume owner.

vol (STRING): Volume name.

app (STRING): Application UUID.

volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

run_time (LONGINT): Total run time of the scanner.

wafl.vol.spcslo.conflict

Severity

ERROR

Description

This message occurs when the Service Level Objective related to space management (the space SLO setting) for a volume conflicts with other volume settings.

Corrective Action

Try correcting the conflicting volume setting or space SLO by using the "volume modify <volname>" command.

Syslog Message

The space SLO setting %s for volume %s%s is incompatible with the volume's %s setting (%s)%s.

Parameters

space_slo (STRING): Space SLO of the volume.
vol (STRING): Name of the volume with conflicting settings.
app (STRING): Application UUID.
volident (STRING): String that uniquely identifies the volume when the volume name is insufficient.
setting (STRING): Name of the conflicting volume setting.
value (STRING): Value of the conflicting volume setting.
detail (STRING): Corrective action already taken, if any.

wafl.vol.tooFullForUnlink

Severity

ALERT

Description

This message occurs when an unlink operation requires more space than is available for unlinking in the relevant volume. Clients cannot remove files or directories until free space is added.

Corrective Action

Manually delete snapshots or increase the volume's size for one-time space issues. For frequent space issues, consider changing autogrow or autodelete settings for the volume or aggregate in question.

Syslog Message

Insufficient free space available on %s %s %s%s %s to perform unlink operation.

Parameters

type (STRING): Type of object (volume or aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Volume identifier.

wafl.vol.unable.autogrow

Severity

ERROR

Description

This message occurs when automatically growing a volume fails because the underlying storage of the SVM (Vserver) has reached the SVM's storage limit.

Corrective Action

Increase the storage of the SVM by raising the storage limit. Alternatively, recover storage space by deleting volumes, snapshots, LUNs, or files.

Syslog Message

Auto-grow of volume "%s" failed because the SVM's storage limit has been reached.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
object_uuid (STRING): Volume instance UUID of the resource object.

wafl.vol.walloc.rsv.dbg.reset

Severity

NOTICE

Description

This event is issued to indicate that the write allocation reserve thresholds for a volume or aggregate have reset to normal. This message is issued on DEBUG builds only.

Corrective Action

(None).

Syslog Message

DBG: Volume %s allocation reserve thresholds reset.

Parameters

vol (STRING): The volume or aggregate name

wafl.vol.walloc.rsv.dbg.warn.blkcnt

Severity

NOTICE

Description

This event is issued to indicate that the write allocation reserve code has triggered but the volume block counters appear to be in the normal range.

Corrective Action

(None).

Syslog Message

DBG: Volume (or aggregate) %s free space reserve hit %s threshold but block count doesn't match.

Parameters

vol (STRING): The volume or aggregate name
type (STRING): Threshold type: "low" or "high"

wafl.vol.walloc.rsv.failmount

Severity

EMERGENCY

Description

This message occurs when a volume consumes almost all of its free space reserve and should not be brought back online without assistance from technical support to address the free space issue.

Corrective Action

Contact NetApp technical support.

Syslog Message

Failing mount of volume %s. Free space reserve is too low. Contact NetApp technical support for assistance.

Parameters

vol (STRING): Volume name.

wafl.vol.walloc.rsv.offline

Severity

ALERT

Description

This message occurs when a volume or aggregate has consumed almost all of its free space reserve. The system is being shut down and rebooted cleanly and the affected aggregate or volume will be taken offline until the situation can be corrected with help from technical support.

Corrective Action

Contact NetApp technical support..

Syslog Message

Volume %s free space reserve is critically low. Rebooting system to take volume offline. Contact technical support for assistance.

Parameters

vol (STRING): Volume or aggregate name.

wafl.vol.walloc.rsv.root

Severity

ALERT

Description

This message occurs when the root volume has consumed almost its entire free space reserve. This is a highly abnormal condition that can lead to data loss if the free space reserve is completely consumed.

Corrective Action

Increasing the root volume size. Contact NetApp technical support for more information.

Syslog Message

Root volume (or aggregate) %s free space reserve is critically low.

Parameters

vol (STRING): Root volume or aggregate name.

wafl.volinfo events

wafl.volinfo.fsinfo.error

Severity

ALERT

Description

This message occurs when there is an error while reading the volinfo or fsinfo block of a volume.

Corrective Action

Take appropriate action based on the reason for the error.

Syslog Message

%s for %s '%s'

Parameters

reason (STRING): Reason for the error
type (STRING): The type of object (volume/aggregate)
vol (STRING): The name of the volume

wafl.volmove events

wafl.volmove.dst.amd.corrupt

Severity

ALERT

Description

This message occurs when the active map delta file for a volume move destination is corrupt.

Corrective Action

Run wafliron on the volume after the "volume move" operation is complete. For further assistance, contact NetApp technical support.

Active map delta file for the "volume move" destination "%s" is corrupt.

Parameters

vol (STRING): Volume name.

wafl.volref events

wafl.volref.subsystem.string

Severity

ERROR

Description

This message occurs when wafliron is started on aggregate containing volumes, which are in-use by other subsystems.

Corrective Action

Stop the subsystem which is using this volume/aggregate So that wafliron can be run.

Syslog Message

wafliron: %s %s is being used by '%s'

Parameters

type (STRING): Type of object (volume or aggregate).
vol (STRING): Name of the volume or aggregate.
volref (STRING): volume reference string of the subsystem using this volume/aggregate.

wafl.voltrans events

wafl.voltrans.clear.noi2p

Severity

NOTICE

Description

This message occurs when a volume transition clears the noi2p option on a volume.

Corrective Action

(None).

Syslog Message

Volume transition will disable the noi2p option by default on volume %s.

Parameters

volname (STRING): Name of the volume.

wafl.voltrans.clear.svo

Severity

NOTICE

Description

This message occurs when a volume transition operation clears the SnapValidator for Oracle options on a volume.

Corrective Action

(None).

Syslog Message

Volume transition will disable the SnapValidator® for Oracle (svo) options by default on volume %s.

Parameters

volname (STRING): Name of the volume.

wafl.voltrans.dircopy.fail

Severity

ALERT

Description

This message occurs when a volume transition convert directory operation fails.

Corrective Action

Check the status of the job by using the "volume transition-convert-dir show" (privilege: diag) command. Retry the volume transition after all volume directory transition operations have finished. If the operation fails on the second attempt, contact NetApp technical support.

Syslog Message

Volume transition-convert-dir operation failed on volume "%s", copying path "%s" to temporary directory "%s". Error code: %d.

Parameters

volname (STRING): Name of the volume.
path (STRING): Path of the directory to be copied.
tempname (STRING): Directory name to use as the temporary target for copy conversion.
errcode (INT): Error code upon completion.

wafl.voltrans.flexcache

Severity

ERROR

Description

This message occurs during volume transition workflow when the transition volume is a FlexCache® volume. Support for FlexCache is deprecated.

Corrective Action

Delete the FlexCache volume.

Syslog Message

Volume transition failed due to unsupported FlexCache volume %s uuid %s.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.inconsistent.state

Severity

ERROR

Description

This message occurs when a volume transition operation fails because the volume is in an inconsistent state.

Corrective Action

Delete the inconsistent volume. Alternatively, return the disks to a 7-Mode environment to repair the volume.

Syslog Message

Volume transition failed for volume %s uuid %s due to its inconsistent state.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.qtree.novfiler

Severity

NOTICE

Description

This message occurs when a volume transition operation encounters qtrees not associated with the default vFiler unit.

Corrective Action

(None).

Syslog Message

Volume transition detected non-default vfiler qtrees in volume %s%s%s.

Parameters

volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the owning Vserver when the volume name alone is insufficient.

wafl.voltrans.qtree.replica

Severity

ERROR

Description

This message occurs when a volume transition operation is attempted on a volume that is a qtree replica volume. Transitioning volumes that are qtree replica volumes is an unsupported operation. This condition exists because the source volume for the Transition Data Protection (TDP) SnapMirror® relationship is a qtree replica volume.

Corrective Action

Break all of the qtree replica relationships associated with the source volume of the TDP SnapMirror relationship. After that is done, perform a 'snapmirror update' or 'snapmirror resync' operation, and then a 'snapmirror break' operation, to attempt the volume transition operation again.

Syslog Message

The source of volume %s is a qtree replica. It cannot be transitioned to clustered Data ONTAP.

Parameters

volname (STRING): Name of the volume.

wafl.voltrans.sfsr.pending

Severity

ERROR

Description

This message occurs when a volume transition operation fails because of a pending file restore process.

Corrective Action

Move the disks back to 7-Mode, use ZAPI command 'snapshot-restore-file-info' to ensure that all pending single file restore sessions are completed, and then try the transition again.

Syslog Message

Volume transition failed for volume %s uuid %s due to pending single file restore process.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.snapids

Severity

ERROR

Description

This message occurs when a volume transition operation fails because it cannot update the logical SnapID table.

Corrective Action

(None).

Syslog Message

Volume %s failed to update the logical SnapID table and could not be transitioned.

Parameters

volname (STRING): Name of the volume.

wafl.voltrans.snapshot.32bit

Severity

ERROR

Description

This message occurs during volume transition workflow when 32-bit snapshot is detected for the transition volume.

Corrective Action

Retry volume transition to bypass this specific error. All 32-bit snapshots are automatically deleted as part of the volume transition.

Syslog Message

Volume transition failed due to unsupported 32-bit snapshots on volume %s uuid %s.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.ss.lun.clone

Severity

ERROR

Description

This message occurs when a volume transition operation detects one or more LUN clones backed up by snapshots within a voliume.

Corrective Action

Retry volume transition to bypass this specific error, force the volume online, and continue the transition operation. This results in data loss for all the LUN clones that have snapshots in this volume. Alternatively, return the disks to a 7-Mode environment, split the LUN clones, and then repeat the transition workflow.

Syslog Message

Volume transition failed for volume %s uuid %s due to one or more snapshot backed lun clones.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.vol.32bit

Severity

ERROR

Description

This message occurs during volume transition workflow when a 32-bit volume is detected for the transition volume.

Corrective Action

Delete the 32-bit volume. Alternatively, return the disks to a 7-Mode environment and upgrade the 32-bit volume to a 64-bit volume and then repeat the transition workflow.

Syslog Message

Volume transition failed due to unsupported 32-bit volume %s uuid %s.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.was.offline

Severity

ERROR

Description

This message occurs when a volume transition operation encounters an offline volume.

Corrective Action

Retry volume transition to bypass this specific error, force the volume online, and continue the transition operation. This might lead to data loss if the offline volume contains uncommitted data.

Syslog Message

Volume transition failed for offline volume %s uuid %s.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.voltrans.was.restricted

Severity

ERROR

Description

This message occurs when a volume transition operation encounters a restricted volume.

Corrective Action

Retry volume transition to bypass this specific error, force the volume online, and continue the transition operation.

Syslog Message

Volume transition failed for restricted volume %s uuid %s.

Parameters

volname (STRING): Name of the volume.
voluuid (STRING): Unique identifier for this volume.

wafl.volume events

wafl.volume.charmap.loadfail

Severity

ERROR

Description

This message occurs when a volume comes online with a corrupted or unavailable character mapping configuration.

Corrective Action

Remove character mapping by using the "vserver cifs character-mapping delete" command. Then reapply it by using the "vserver cifs character-mapping create" command. For more information, see the "vserver cifs character-mapping" man page. For further assistance, contact NetApp technical support.

Syslog Message

Failed to load character mapping configuration for volume %s. Reason: %s.

Parameters

volname (STRING): Volume for which loading of the character mapping configuration failed.
reason (STRING): Reason for failure.

wafl.volume.clone.created

Severity

INFORMATIONAL

Description

This message occurs when a clone of a flexible volume is created successfully.

Corrective Action

(None).

Syslog Message

Volume clone %s of volume %s was created successfully.

Parameters

clonename (STRING): Volume clone name
volname (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.volume.clone.fractional_rsrv.changed

Severity

INFORMATIONAL

Description

This message occurs when the space reservation of a flexible volume clone is changed to 100 percent because guarantee of the clone is set to 'file'.

Corrective Action

(None).

Syslog Message

Fractional reservation for clone '%s:%d' was changed to 100 percent because guarantee is set to 'file'.

Parameters

clonename (STRING): Volume clone name.
Ordinal (INT): Volume Ordinal.

wafl.volume.clone.snap.cpcount.load.failure

Severity

ERROR

Description

This message occurs when a clone of a flexible volume fails to load the cp count of its or the parent volume's base snapshots.

Corrective Action

(None).

Syslog Message

Volume clone %s failed to load the cp count of its or the parent volume's base snapshot, with Snap ID %d.

Parameters

clonename (STRING): Volume clone name.
snapid (INT): Snapshot ID of the clone volume's base snapshot.

wafl.volume.clone.split.started

Severity

INFORMATIONAL

Description

This message occurs when an operation to split a flexible volume clone from its parent volume is started successfully.

Corrective Action

(None).

Syslog Message

Clone split was started for volume %s%s%s

Parameters

volname (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.volume.clone.with.uid.gid

Severity

INFORMATIONAL

Description

This message occurs when a clone of a flexible volume is created with a volume-level UID and GID.

Corrective Action

Split the clone volume before creating this as a source of an XDP-type SnapMirror relationship.

Syslog Message

Volume clone %s%s%s was created with vol-level UID and GID. If this clone volume is used as a source of XDP type SnapMirror relationship, then UID and GID of all the transferred file at the destination will be unpredictable.

Parameters

clonename (STRING): Volume clone name.
app (STRING): Application UUID.
vserver_uuid (STRING): Universal Unique ID (UUID) of the clone volume's Vserver.

wafl.volume.find.valid_base.snap.failure

Severity

NOTICE

Description

This event is issued when an error occurs while finding the valid base snapshot for a clone volume.

Corrective Action

None required.

Syslog Message

Encountered error %u while finding the valid base snapshot having snapid %u for clone volume (clonename='%s', volident='%s').

Parameters

error_code (INT): A numerical error code indicating the reason why finding valid base snapshot failed for clone volume.
snapid (INT): Snapshot ID of the clone volume base snapshot.
clonename (STRING): Volume clone name.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.volume.inuse

Severity

ALERT

Description

This message occurs when a volume operation fails because the volume is being used in another operation.

Corrective Action

Check the status of the volume and aggregate using the "vol show" and "aggr show" commands. If there are no other operations running on either of them then retry your request. If problems persists, or you need further assistance, contact NetApp technical support.

Syslog Message

%s %s %s operation failed as volume is busy in another operation.

Parameters

type (STRING): Type of object (volume or aggregate).
vol (STRING): Name of the volume.
operation (STRING): Operation.

wafl.volume.inuse.by

Severity

ALERT

Description

This message occurs when a volume operation fails because the volume or parent aggregate is being used by another operation.

Corrective Action

Check the status of the volume and aggregate. Wait for the current operation to finish, and then retry your request. If problems persist or you need further assistance, contact NetApp technical support.

Syslog Message

%s %s %s operation failed because the volume or parent aggregate is locked by operation %s.

Parameters

type (STRING): Type of object (volume or aggregate).
vol (STRING): Name of the volume.
operation (STRING): Operation that failed.
locked_by (STRING): Operation currently locking the volume or parent aggregate.

wafl.volume.sidl.enableErr

Severity

ERROR

Description

This message occurs when an attempt to enable Single Instance Data Logging (SIDL) on a volume fails.

Corrective Action

Use the "volume efficiency show" and "volume show" commands to check the volume for enabled features that are incompatible with SIDL, such as compaction or inline deduplication. After the incompatible features are disabled, wait 10 seconds and then enable SIDL again.

Syslog Message

SIDL was not enabled on volume %s

Parameters

volume (STRING): Volume name.

wafl.volume.sidl.offline

Severity

ERROR

Description

This message occurs when a volume with single instance data logging enabled is taken offline due to the current version of Data ONTAP not supporting that feature. This situation can occur if a volume with the feature enabled is attempted to be onlined using a version of Data ONTAP that doesn't support it.

Corrective Action

To bring the volume online, use a version of Data ONTAP that supports single instance data logging.

Syslog Message

Volume "%s" was taken offline because the current version of Data ONTAP does not support single instance data logging, an enabled feature on this volume.

Parameters

volume (STRING): Volume name.

wafl.volume.slag.loadfailed

Severity

ERROR

Description

This message occurs when a loading or update of Storage-Level Access Guard(SLAG) fails because of an internal error. In this case, SLAG is not activated on the volume or qtree.

Corrective Action

Remove SLAG by using the "vserver security file-directory remove-slag" command, and then reapply it by using the "vserver security file-directory apply" command.

Syslog Message

Failed to load or update SLAG for SLAG level: %d on qtree ID: %d in volume "%s%s%s%s". Error:%d Reason: %s.

Parameters

loadflag (INT): SLAG load flag.
qtree (INT): Qtree identifier.

owner (STRING): Owner of the volume.
vol (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume in cases where the volume name itself is insufficient.
waflerror (INT): WAFL error which caused the failure.
reason (STRING): Reason for the failure.

wafl.volume.snap.autoDelete

Severity

INFORMATIONAL

Description

This message occurs when a snapshot in the volume is being deleted to free space. Snapshots can be deleted automatically from a volume to enforce the corresponding automatic deletion policy.

Corrective Action

(None).

Syslog Message

Deleting snapshot '%s' in volume '%s%s%s' to recover storage.

Parameters

name (STRING): Snapshot name.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.volume_snap events

wafl.volume_snap.autoDelete.fail

Severity

INFORMATIONAL

Description

This message occurs when automatic deletion of a snapshot fails.

Corrective Action

(None).

Syslog Message

Unable to delete snapshot '%s' in volume '%s%s%s' to recover space: %s

Parameters

name (STRING): Snapshot name.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Uniquely identifies the volume when the volume name itself is insufficient.
err (STRING): Reason for failure.

wafl.vv events

wafl.vv.bad.DSIDorMSID

Severity

ERROR

Description

This message occurs when Data ONTAP® cannot map a volume to serve a client request because of invalid data Set Identifiers. Protocol access to the volume is disabled.

Corrective Action

Take the volume offline and contact NetApp technical support.

Syslog Message

Cannot map volume '%s%s%s' to serve client requests because of invalid data set identifiers.

Parameters

vol (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vv.clone.splitBusySnap

Severity

NOTICE

Description

This event is to inform the user that a volume clone cannot split from its parent volume due to busy snapshots.

Corrective Action

Determine which snapshots in the clone volume are busy and correct the condition that is causing them to be busy. Then, retry the operation.

Syslog Message

Volume '%s%s%s' has locked snapshots, not splitting.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vv.clone.splitNoScan

Severity

NOTICE

Description

This event is to inform user that the system is unable to start a volume clone scanner, so the clone volume will not be split from its parent volume.

Corrective Action

This may be a temporary issue. Please retry the volume clone split operation after sometime.

Syslog Message

Unable to start clone split scanner on volume '%s%s%s'.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vv.dup.DSID2

Severity

ERROR

Description

This message occurs when another volume is already registered with the data set identifier (DSID) assigned to this volume.

Corrective Action

Contact NetApp technical support.

Syslog Message

Duplicate volume '%s%s%s' DSID (%08x) detected in aggregate '%s'.

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
dsid (LONGINT): Data set identifier.
aggr (STRING): Aggregate name.

wafl.vv.dup.UUID

Severity

NOTICE

Description

This message occurs when the system detects and updates a duplicate volume Universally Unique Identifier (UUID).

Corrective Action

(None).

Syslog Message

vvol '%s' in aggregate '%s' duplicate UUID %s was changed to %s.

Parameters

vol (STRING): Volume name.
aggr (STRING): Aggregate name.

old_uuid (STRING): Old duplicated UUID for the volume.
new_uuid (STRING): Replacement UUID for the volume.

wafl.vv.raidfile.open

Severity
NOTICE

Description
This event is to inform user that the system can not open the raid label file for update and the reason.

Corrective Action
(None).

Syslog Message
Unable to open volume descriptor: %s

Parameters
err (STRING): The error message

wafl.vv.raidfile.readOnly

Severity
NOTICE

Description
This event is to inform user that the raid label file can not be updated on a read only volume.

Corrective Action
(None).

Syslog Message
Unable to update volume descriptor, aggregate '%s' is readonly

Parameters
vol (STRING): The volume name

wafl.vv.raidfile.update

Severity
NOTICE

Description
This event is to inform user that while renaming a virtual volume, the system is unable to update the volume's raid label file

Corrective Action
(None).

Syslog Message
%s: Can't rewrite descriptor for volume '%s%s%s', aggregate '%s', error code %d.

Parameters

    cmd (STRING): The command name
    vol (STRING): The volume name
    app (STRING): Application UUID.
    volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
    aggr (STRING): The aggregate name
    err (INT): The error code

wafl.vv.regen.instance.uuid

Severity

    INFORMATIONAL

Description

    This message occurs when the instance UUID and the provenance UUID of a FlexVol(tm) volume have been regenerated.

Corrective Action

    (None).

Syslog Message

    For FlexVol volume '%s' with FSID 0x%x and instance UUID %s, a new instance UUID and provenance UUID (both being %s) have been generated.

Parameters

    vol (STRING): Volume name.
    fsid (INT): File system identifier.
    oldinstuuid (STRING): Old instance UUID of the volume.
    instuuid (STRING): New instance UUID of the volume. This is also the new prevenance UUID.

wafl.vv.rename.dup

Severity

    NOTICE

Description

    This message occurs when a duplicate flexible volume name is changed to a unique name.

Corrective Action

    (None).

Syslog Message

    Duplicate flexible volume name '%s%s%s' changed to '%s%s%s' in aggregate '%s'.

Parameters

    oldname (STRING): Duplicate name.
    app (STRING): Application UUID.
    volident1 (STRING): If the volume belongs to a vserver, this is that vserver's Universal Unique Identifier (UUID).
    newname (STRING): New name.
    app2 (STRING): Application UUID.
    volident2 (STRING): If the volume belongs to a vserver, this is that vserver's Universal Unique Identifier

(UUID).
aggrname (STRING): Name of the containing aggregate.

wafl.vv.set.size

Severity

NOTICE

Description

This event is issued when setting virtual volume size to the size indicated in fsinfo

Corrective Action

(None).

Syslog Message

Setting volume size for %s%s%s%s to match nominal size.

Parameters

owner (STRING): The volume owner
name (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vv.softlocks.noParent

Severity

NOTICE

Description

This event is to inform user that to remove softlocks associated with a volume clone, the parent volume must be online

Corrective Action

(None).

Syslog Message

Unable to find parent volume when destroying clone '%s%s%s' softlocks. Ensure the parent volume is online then retry the operation.

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.

wafl.vv.vol.config

Severity

NOTICE

Description

This event is issued to inform the user that the system can not configure a virtual volume and the reason.

Corrective Action

(None).

Syslog Message

Unable to configure volume in aggregate '%s': %s

Parameters

vol (STRING): The volume name
err (STRING): The error string

wafl.vv.vol.maxvols

Severity

NOTICE

Description

This message occurs when the system cannot configure a FlexVol® volume because the maximum number of volumes has been reached.

Corrective Action

Destroy some existing volumes to make room for new ones.

Syslog Message

Cannot configure FlexVol volume '%s' (UUID %s) in aggregate '%s': There are too many FlexVol volumes (%d) on the system. The limit for %s is %d.

Parameters

vol (STRING): FlexVol name.
uuid (STRING): FlexVol unique ID.
aggregate (STRING): Aggregate name.
count (INT): Current number of FlexVol volumes.
model (STRING): System model name.
limit (INT): Limit for the number of FlexVol volumes.

wafl.vvclock events

wafl.vvclock.string

Severity

ERROR

Description

This message occurs when an operation is run on an aggregate while the flexible volume level admin (vvc) lock of one of volumes of the aggregate is held by another subsystem. The message prints the name the subsystem that is holding the lock and the type of lock.

Corrective Action

Stop the subsystem that is using this volume/aggregate so that the operation can be run.

%s: aggregate %s is busy. Reason: vvc lock of the volume %s is held by subsystem %s. %s.

Parameters

operation (STRING): Name of the operation.
aggrname (STRING): Name of the aggregate, one of the volumes of which is holding the vvc lock.
vvolname (STRING): Name of the volume that is holding the vvc lock.
lockerstring (STRING): Name of the subsystem that is holding the vvc lock.
locktype (STRING): vvc lock type:WAFL® or SnapMirror®.

wafl.vvol events

wafl.vvol.create.encrypted

Severity

NOTICE

Description

This message occurs when an encrypted flexible volume is created.

Corrective Action

(None).

Syslog Message

New %s encrypted volume %s is created on aggregate %s.

Parameters

key_type (STRING): This Indicates encryption type of this volume is NetApp Aggregate Encryption (NAE) or NetApp Volume Encryption (NVE).
vol (STRING): Volume name.
aggr (STRING): Name of the containing aggregate.
voluuid (STRING): Volume UUID.
keyid (STRING): Encryption Key ID.
buftreeid (LONGINT): Buftreeid.
cp_count (INT): Consistency Point (CP) at which this volume is created.

wafl.vvol.delete.metadata.recrm

Severity

NOTICE

Description

This message occurs when the system cannot remove volume metadata during a volume delete operation after moving it to recycle bin.

Corrective Action

(None).

Syslog Message

Could not remove volume %s%s%s metadata. Error: %d.

Parameters

vol (STRING): Name of the flexible volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name alone is insufficient.
errorCode (INT): Error number.

wafl.vvol.delete.metadata.rename

Severity

NOTICE

Description

This message occurs when the system cannot rename volume metadata during a volume delete operation.

Corrective Action

(None).

Syslog Message

Could not rename volume %s%s%s metadata. Error: %d.

Parameters

vol (STRING): Name of the flexible volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name alone is insufficient.
errorCode (INT): Error number.

wafl.vvol.delete.metadata.rm

Severity

NOTICE

Description

This message occurs when the system cannot remove volume metadata during a volume delete operation. The system will retry removing the metadata during any operation that brings the containing aggregate online(for example, takeover).

Corrective Action

(None).

Syslog Message

Cannot remove volume %s%s%s metadata. Error: %s(%d).

Parameters

vol (STRING): Name of the flexible volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name alone is insufficient.
reason (STRING): Reason for the failure.
errorCode (INT): Error number.

wafl.vvol.delete.recovered

Severity

INFORMATIONAL

Description

This event occurs when a flexible volume that was queued for delete is recovered.

Corrective Action

(None).

Syslog Message

Volume %s%s%s%s recovered.

Parameters

owner (STRING): String indicating the owner of the affected volume.
vol (STRING): Name of the flexible volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name alone is insufficient.

wafl.vvol.destroyed

Severity

NOTICE

Description

This message occurs when a flexible volume is destroyed.

Corrective Action

(None).

Syslog Message

Volume %s%s%s%s destroyed.

Parameters

owner (STRING): String indicating the owner of the affected volume.
vol (STRING): Name of the flexible volume.
app (STRING): Application UUID.
volident (STRING): Unique identifier for the volume when the volume name alone is insufficient.
vol_btid (LONGINT): Internal buftree identifier for the volume.

wafl.vvol.encrypted.offline

Severity

INFORMATIONAL

Description

This message occurs when an encrypted virtual volume is taken offline.

Corrective Action

(None).

Syslog Message

Volume '%s%s%s' is encrypted and was taken offline.

Parameters

name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.

wafl.vvol.excessive.contsize

Severity

ERROR

Description

This message occurs when a flexible volume container that exceeds the maximum size supported on the running platform is detected. This event can be encountered after a headswap to a platform supporting a lower maximum capacity.

Corrective Action

Back up the dataset in the volume as soon as possible and take the volume offline. Alternatively, consider a system or hardware upgrade to a platform that supports a higher maximum capacity.

Syslog Message

Volume '%s' exceeded the maximum container capacity supported on this platform (container blkcnt=%llu, maxlimit=%llu). Back up the dataset and take the volume offline as soon as possible.

Parameters

vol (STRING): The volume name
blkcount (LONGINT): The total blocks capacity of the volume container
maxblkcount (LONGINT): The maximum container capacity supported on the platform

wafl.vvol.excessive.volsize

Severity

ERROR

Description

This message occurs when a flexible volume that exceeds the maximum size supported on the running platform is detected. This event can be encountered after a headswap to a platform supporting a lower maximum capacity.

Corrective Action

If possible, shrink the flexible volume using the 'vol size' command. If not, back up the dataset in the volume as soon as possible and take the volume offline. Alternatively, consider a system or hardware upgrade to a platform that supports a higher maximum capacity.

Syslog Message

Volume '%s' exceeded the maximum volume size supported on this platform (nominal blkcnt=%llu, maxlimit=%llu). Shrink the volume or back up the dataset and take the volume offline as soon as possible.

Parameters

vol (STRING): Volume name
blkcount (LONGINT): Total block count of the volume.
maxblkcount (LONGINT): Maximum block count supported on the platform.

wafl.vvol.invalid.DSID

Severity

ERROR

Description

This message occurs when ONTAP® finds a volume with an invalid data set identifier (DSID). This might have occurred as a result of disk corruption.

Corrective Action

Contact NetApp technical support to have a new DSID assigned to the volume as soon as possible.

Syslog Message

Volume '%s%s%s' has an invalid DSID (0x%x).

Parameters

vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
dsid (LONGINT): Data set identifier.

wafl.vvol.move.encrypted

Severity

NOTICE

Description

This message occurs when an encrypted destination volume is created as part of volume move operation.

Corrective Action

(None).

Syslog Message

%s encrypted volume %s%s%s is created on aggregate %s as part of a volume move operation.

Parameters

key_type (STRING): This Indicates encryption type of this volume is NetApp Aggregate Encryption (NAE) or NetApp Volume Encryption (NVE).
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.
aggr (STRING): Name of the containing aggregate.
voluuid (STRING): Volume UUID.
keyid (STRING): Encryption Key ID.
buftreeid (LONGINT): Buftreeid.
cp_count (INT): Consistency Point (CP) at which this volume is created.

wafl.vvol.offline

Severity

INFORMATIONAL

Description

This message indicates when a virtual volume is taken offline.

Corrective Action

(None).

Syslog Message

Volume '%s%s%s' has been set temporarily offline

Parameters

name (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
instuuid (STRING): Volume Instance UUID

wafl.vvol.offline.err

Severity

NOTICE

Description

This event is issued if the system fail to set the raid label of the virtual volume when it's taken offline.

Corrective Action

(None).

Syslog Message

Error persistently transitioning volume %s%s%s from 'restricted' to 'offline', unable to update descriptor, error %d

Parameters

name (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
error (INT): The error code

wafl.vvol.offline.persist

Severity

INFORMATIONAL

Description

This message occurs when a flexible volume that was marked temporarily offline as part of the volume migration process is now marked persistently offline.

Corrective Action

(None).

Syslog Message

(None).

Parameters

name (STRING): Volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient.

wafl.vvol.online

Severity

INFORMATIONAL

Description

This event occurs when the state of flexible volume moves to the online state.

Corrective Action

(None).

Syslog Message

(None).

Parameters

vol (STRING): The name of the flexible volume
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
instuuid (STRING): Volume instance UUID

wafl.vvol.ownVserver.changed

Severity

INFORMATIONAL

Description

This message occurs when either a cluster repair tool changes the owning vserver of the volume, or when the volume is transitioned from being a node volume to a cluster volume or vice versa.

Corrective Action

(None).

Syslog Message

Volume '%s%s' owning vserver / name changed to '%s%s%s'.

Parameters

oldname (STRING): Original name of the volume.
oldownerIdent (STRING): Original vserver identifier.
newname (STRING): New name of the volume.
app (STRING): Application UUID.

newownerIdent (STRING): New vserver identifier.

wafl.vvol.renamed

Severity

INFORMATIONAL

Description

This message occurs when the administrator renames a flexible volume.

Corrective Action

(None).

Syslog Message

Volume '%s%s' renamed to '%s%s%s'.

Parameters

oldname (STRING): Original volume name.
volident1 (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.
newname (STRING): New volume name.
app (STRING): Application UUID.
volident2 (STRING): Unique identifier of the volume in cases where the volume name itself is insufficient.

wafl.vvol.restrict

Severity

INFORMATIONAL

Description

This event is issued to indicate a flexible volume has been restricted

Corrective Action

(None).

Syslog Message

(None).

Parameters

vol (STRING): The volume name
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
instuuid (STRING): Volume Instance UUID

wafl.vvol.vvlabel.error

Severity

ERROR

Description

This message occurs when the verification of the vvlabel fails on a flexible volume. This event provides all the information available in the vvlabel so that it can be used later, for recovery.

Corrective Action

Contact NetApp technical support.

Syslog Message

Cannot determine volume label information (%s). (Flexible volume with UUID '%s', unique ID '%d' on aggregate '%s' with raidtree ID '%s')

Parameters

err (STRING): Error string.
voluuid (STRING): UUID of the flexible volume as identified by the metadir.
id_in_aggr (INTHEX): Unique ID within the containing aggregate.
aggr_name (STRING): Containing aggregate name.
aggr_rtid (STRING): RAID tree ID of the aggregate.
version (INTHEX): vvlabel version.
mirror_flags (INTHEX): Mirror type flags.
vol_flags (INTHEX): Flags for the volume.
fsid (INTHEX): File system identifier for the volume.
clone_parent (INTHEX): 'id_in_aggr' value of the clone's parent volume.
base_snapid (INTHEX): Clone base snapshot ID.
vvuuid (STRING): UUID of the flexible volume as identified by the vvlabel.
vvol_type (INTHEX): Flexible volume's type.
dsid (LONGINTHEX): Volume data set identifier.
msid (LONGINTHEX): Volume master data set identifier.
owneruuid (STRING): UUID of the owning Vserver.
volname (STRINGARRAY): Volume name in raw hexadecimal format.

wafl.vvol.xfer.nospacedestErr

Severity

ERROR

Description

This message occurs when transfer to a destination flexible volume has fails because the aggregate that contains this volume is out of space.

Corrective Action

For non-ASA r2 platforms, increase space available in the aggregate by either adding disks or freeing space by deleting aggregate Snapshot copies, shrinking flexible volumes or moving flexible volumes to another aggregate. Ensure that there is sufficient space available in the aggregate (using the "df -A command") to accommodate the flexible volumes it contains. The "volume size" command may be used to obtain flexible volume sizes and also to grow or shrink them. For ASA r2 platforms, increase space in an aggregate by either adding disks to the cluster or freeing space by deleting data or Snapshot copies. To delete a Snapshot copy, use the "vserver consistency-group snapshot delete" command.

Syslog Message

Transfer to volume "%s%s%s" failed because the containing aggregate, "%s", is out of space.

Parameters

vol (STRING): The volume name
app (STRING): Application universal unique identifier(UUID)
volident (STRING): To uniquely identify the volume in cases where volume name itself is insufficient.
aggr (STRING): The aggregate name.

wafl.watch events

wafl.watch.cache.limit.near

Severity

INFORMATIONAL

Description

This message occurs when WAFL® "change notify" requests approach the size limit of the inode cache pool. This is caused by an excessive number of "change notify" requests being generated by the Server Message Block(SMB) server. If the maximum limit is reached and the limit is not increased, significant system performance degradation could occur.

Corrective Action

Contact Contact NetApp technical support. for assistance.

Syslog Message

Size of "change notify" requests in inode cache pool: %d, approaching the size limit: %d

Parameters

current_size (INT): Current size of the inode cache pool.
max_size (INT): Maximum size of the inode cache pool.

wafl.write events

wafl.write.fail.cifsSpace

Severity

ERROR

Description

This message occurs when a write to a file with CIFS-style space reservations fails due to a lack of space in the volume or aggregate.

Corrective Action

If the volume is a Flexvol® volume, and the volume guarantee is disabled, increase the amount of space available in the aggregate. Otherwise, increase the amount of space available in the volume.

Syslog Message

Write failed to file with CIFS space reservations due to lack of disk space in %s %s%s%s%s (%s%s, inode %u, offset %llu, len %u).

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
space_info (STRING): Text string specifying whether there is a guarantee.
guarantee_state (STRING): Text string describing the state of the guarantee on the volume (disabled, volume, file, and so on).

ino (INT): Inode number.
offset (LONGINT): Block offset.
len (INT): Length value.

wafl.write.fail.spcres

Severity

ERROR

Description

This message occurs when a write to a space-reserved file fails due to a lack of space in the volume or aggregate. This is possible when the fractional reserve is not 100% or the space guarantee of the containing flexible volume is not guaranteed.

Corrective Action

If the volume is a Flexvol® volume, and the volume guarantee is disabled, increase the amount of space available in the aggregate. Otherwise, increase the amount of space available in the volume.

Syslog Message

Write failed to file with space reservations due to lack of disk space in %s %s%s%s%s (%s%s, inode %u, offset %llu, len %u).

Parameters

type (STRING): Type of object (volume/aggregate).
owner (STRING): Volume owner.
vol (STRING): Volume name.
app (STRING): Application UUID.
volident (STRING): Unique identifier of the volume when the volume name by itself is insufficient.
space_info (STRING): Text string specifying whether there is a guarantee.
guarantee_state (STRING): Text string describing the state of the guarantee on the volume (disabled, volume, file, and so on).
ino (INT): Inode number.
offset (LONGINT): Block offset.
len (INT): Length value.

wafl.zombie events

wafl.zombie.susp.aggr.limit

Severity

NOTICE

Description

This message occurs when the aggregate encounters the zombie throttling limits during zombie delete processing for large number of file deletions.

Corrective Action

(None).

Syslog Message

WAFL® aggregate %s is experiencing zombie throttling possibly due to requests for large number of file deletions. This can be mitigated by a combination of a) reducing the load on the aggregate or b) issuing the

file deletion requests in smaller batches.

Parameters

aggrname (STRING): Name of the aggregate.

wafl.zombie.susp.vol.limit

Severity

NOTICE

Description

This message occurs when the volume encounters the zombie throttling limits during zombie delete processing for large number of file deletions.

Corrective Action

(None).

Syslog Message

WAFL® volume %s%s%s%s is experiencing zombie throttling possibly due to requests for large number of file deletions. This can be mitigated by a combination of a) reducing the load on the volume or b) issuing the file deletion requests in smaller batches.

Parameters

volowner (STRING): Owner of the volume.
volname (STRING): Name of the volume.
app (STRING): Application UUID.
volident (STRING): To uniquely identify the volume in cases where the volume name itself is insufficient. Consists of the Vserver name and UUID.

wafliron events

wafliron.summary events

wafIlron.summary.scanStatus

Severity

INFORMATIONAL

Description

This message occurs periodically when wafliron is running and its state is "starting" or "scanning". It reports wafliron summary scanning status.

Corrective Action

(None).

Syslog Message

Wafliron summary scan (%d%% done).

Parameters

percentage (INT): Wafliron summary scan completion percentage.

xfcvi events

xfcvi.attr events

xfcvi.attr.changed

Severity

NOTICE

Description

This message occurs when any of the xfcvi attributes changes.

Corrective Action

(None).

Syslog Message

FC-VI adapter: %s changed on port %s. %s

Parameters

attr_type (STRING): Attribute type.
port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.cm events

xfcvi.cm.timedout

Severity

NOTICE

Description

This message occurs when connection requests times out.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Connection request timedout on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.cross events

xfcvi.cross.connect.detected

Severity

ERROR

Description

This message occurs when the xfcvi driver detects a cross connection

Corrective Action

Check the xfcvi interconnect cabling at the local and remote nodes. xfcvi adapter ports xfcvi_device_0s and xfcvi_device_1s should not be connected to the same fabric. Contact NetApp technical support if the problem persists.

Syslog Message

FC-VI adapter: Cross Connection detected between local port %s and remote port %s. Local System ID = %llu, Remote System ID = %llu.

Parameters

lname (STRING): Local node's port name.
rname (STRING): Remote node's port name.
lsid (LONGINT): Local node's system id.
rsid (LONGINT): Remote node's system id.

xfcvi.disabled events

xfcvi.disabled

Severity

ALERT

Description

This message occurs when the HA interconnect card is disabled by the ic-type environment variable.

Corrective Action

Either remove the HA interconnect card from the controller or change the ic-type environment variable.

Syslog Message

FC-VI adapter: Port %s has been disabled because of the ic-type environment variable.

Parameters

port (STRING): xfcvi Interconnect NIC.

xfcvi.fcrenabled events

xfcvi.fcrEnabled

Severity

NOTICE

Description

This message occurs if Fiber Channel Routing (FCR) functionality is enabled on the system.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Fiber Channel Routing (FCR) is enabled.

Parameters

(None).

xfcvi.initfailed events

xfcvi.initFailed

Severity

ERROR

Description

This message occurs when the driver fails to initialize a FC-VI port.

Corrective Action

Reboot the controller. Contact NetApp technical support if the problem persists.

Syslog Message

FC-VI adapter: %s failed for port %s.

Parameters

operation (STRING): Type of operation
port (STRING): xfcvi Interconnect NIC.

xfcvi.invalid events

xfcvi.invalid.advertisement

Severity

ERROR

Description

This message occurs when xfcvi driver receives invalid advertisement.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid advertisement. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.invalid.sfp

Severity

ERROR

Description

This message occurs when the SFP (Small Form-Factor Pluggable) module of the Fibre Channel Virtual Interface (FC-VI) is invalid or incompatible.

Corrective Action

Replace the SFP with a compatible one.

Syslog Message

FC-VI adapter: Invalid SFP - Reason: %s on port %s.

Parameters

reason (STRING): Reason for the incompatibility.
port (STRING): Interconnect NIC.

xfcvi.link events

xfcvi.link.down

Severity

NOTICE

Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter goes down.

Corrective Action

1. Ensure that the FC-VI link has not been tampered with. 2. Verify that the physical status of the FC-VI adapter is "Up" by using the command "metrocluster interconnect adapter show". 3. If the configuration includes fabric switches, ensure that they are properly cabled and configured.

Syslog Message

(None).

Parameters

alertId (STRING): Alert ID.
alertingResource (STRING): Alerting resource unique name.
alertingResourceName (STRING): Alerting resource name.
possibleEffect (STRING): Possible effect for link transition.
probableCause (STRING): Probable cause of the event.

probableCauseDescription (STRING): Probable cause description of the event.
additionalInfo (STRING): Any additional information for the event.

xfcvi.link.up

Severity

NOTICE

Description

This message occurs when the physical link of the Fibre Channel Virtual Interface (FC-VI) adapter comes up.

Corrective Action

(None).

Syslog Message

(None).

Parameters

alertId (STRING): Alert ID.
alertingResource (STRING): Alerting resource unique name.

xfcvi.qlgc events

xfcvi.qlgc.async.event.overflow

Severity

ERROR

Description

This message occurs when total number of async events are overflowed.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s async event overflowed. Resetting the adapter.

Parameters

port (STRING): xfcvi Interconnect NIC.

xfcvi.qlgc.connErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter detects a connection error. The FC-VI driver will attempt to retry the connection.

Corrective Action

If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s detects connection error. FC-VI opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
opcode_str (STRING): xfcvi opcode.
opcode (INTHEX): xfcvi opcode.
qpname (STRING): QP name.
qpnum (INT): QP number.
systemID (LONGINT): Remote node's system ID.
info (STRING): Additional info.

xfcvi.qlgc.cpr.reset.cancelled

Severity

ERROR

Description

This message occurs when the CPR reset initiated by the FC-VI port got cancelled.

Corrective Action

Reboot the filer. If issue still persists then replace the xfcvi adapter.

Syslog Message

FC-VI adapter: CPR reset initiated by port %s got cancelled. Offlining the port.

Parameters

port (STRING): xfcvi Interconnect adapter.

xfcvi.qlgc.cpr.reset.failed

Severity

ERROR

Description

This message occurs when the CPR reset initiated by the FC-VI port fails.

Corrective Action

Reboot the filer. If issue still persists then replace the xfcvi adapter.

Syslog Message

FC-VI adapter: CPR reset initiated by port %s failed.

Parameters

port (STRING): xfcvi Interconnect adapter.

xfcvi.qlgc.cpr.reset.unsupported

Severity

ERROR

Description

This message occurs when the CPR reset is not supported by the adapter.

Corrective Action

Reboot the filer. If issue still persists then replace the xfcvi adapter.

Syslog Message

FC-VI adapter: CPR reset is not supported by port %s.

Parameters

port (STRING): xfcvi Interconnect adapter.

xfcvi.qlgc.FrameDiscardErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter firmware discards a received frame because of a receive frame error.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Discarded a received frame because of a receive frame error. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.hard.reset.failed

Severity

ERROR

Description

This message occurs when an FC-VI port's soft reset fails.

Corrective Action

If CPR reset is not supported in the platform, then reboot the filer to recover from this issue. If issue persists then replace the xfcvi adapter.

Syslog Message

FC-VI adapter: Hard reset failed at port %s.

Parameters

port (STRING): xfcvi Interconnect adapter.

xfcvi.qlgc.invalid.data

Severity

ERROR

Description

This message occurs when xfcvi driver receives invalid data from firmware.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid data. QP index = %d, completion status = %s(status code = %d), opcode = %s(%d), remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpnum (INT): QP index.
status (STRING): Completion status.
status_code (INT): Completion status code.
opcode_str (STRING): xfcvi opcode in string.
opcode (INT): xfcvi opcode.
systemID (LONGINT): Remote node's system Id.
info (STRING): Additional info.

xfcvi.qlgc.invalid.exch.address

Severity

ERROR

Description

This message occurs when xfcvi driver receives a response with invalid exchange address.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s received invalid exchange address for %s. QP name = %s, QP index = %d, expected exchange address = 0x%x, received exchange address = 0x%x. %s

Parameters

> **port** (STRING): xfcvi Interconnect NIC.
> **resp_type** (STRING): Response type.
> **qpname** (STRING): QP name.
> **qpnum** (INT): QP number.
> **exp_oxid** (INTHEX): Expected exchange address.
> **rcvd_oxid** (INTHEX): Received exchange address.
> **info** (STRING): Additional info.

xfcvi.qlgc.invalid.qp

Severity

> ERROR

Description

> This message occurs when xfcvi driver receives invalid QP index from firmware.

Corrective Action

> (None).

Syslog Message

> FC-VI adapter: Port %s received invalid QP. Received QP index = %d, completion status = %s(status code = %d), entry type = %s(entry code = %d). %s

Parameters

> **port** (STRING): xfcvi Interconnect NIC.
> **qpnum** (INT): QP index.
> **status** (STRING): Completion status.
> **status_code** (INT): Completion status code.
> **entry_type** (STRING): Request/Response entry type.
> **entry_code** (INT): Request/Response entry code.
> **info** (STRING): Additional info.

xfcvi.qlgc.invalid.response

Severity

> ERROR

Description

> This message occurs when xfcvi driver receives invalid response from firmware.

Corrective Action

> (None).

Syslog Message

> FC-VI adapter: Port %s received invalid response. %s. %s

Parameters

> **port** (STRING): xfcvi Interconnect NIC.
> **error_type** (STRING): Type of error.
> **info** (STRING): Additional info.

xfcvi.qlgc.ioErr

Severity

ERROR

Description

This message occurs when the FC-VI driver receives some IO error.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: xfcvi driver on port %s received IO error. Status = %s(status code = 0x%x), xfcvi opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): xfcvi opcode in string.
opcode (INTHEX): xfcvi opcode.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system ID.

xfcvi.qlgc.login.timedout

Severity

NOTICE

Description

This message occurs when port login request times out.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Remote port login timedout on port %s. Remote port id = 0x%x, Remote port handle = %d. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
portid (INTHEX): Remote port identifier.
porthandle (INT): Remote port handle.
info (STRING): Additional info.

xfcvi.qlgc.ls.reject

Severity

ERROR

Description

This message occurs when the xfcvi firmware rejects a link service.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link service = %s(code = %d), rejected on port %s. %s

Parameters

ls (STRING): Link service name.
ls_code (INT): Link service code.
port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.qlgc.mbox.cmd.pending

Severity

ERROR

Description

This message occurs when a mailbox command is pending for a long time.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Mailbox command '%s(code = 0x%x)' pending on port %s. %s

Parameters

cmd (STRING): Mailbox command.
cmd_code (INTHEX): Mailbox command code.
port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.qlgc.mbox.cmd.timedout

Severity

ERROR

Description

This message occurs when a mailbox command times out.

Corrective Action

(None).

xfcvi.qlgc.no.iu.buffer

Severity

ERROR

Description

This message occurs when the xfcvi firmware identifies no more incoming IU buffers in the free pool.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s doesn't have free IU buffer. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.qlgc.no.recv.buffer

Severity

ERROR

Description

This message occurs when the xfcvi firmware identifies no more receive buffers available for the incoming receive frames.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s doesn't have free receive buffer. QP name = %s, QP index = %d, Message ID = 0x%x. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
msg_id (INTHEX): Message id of the incoming message.
info (STRING): Additional info.

xfcvi.qlgc.oodErr

Severity

ERROR

Description

This message occurs when the FC-VI driver receives out of order completions.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: xfcvi driver on port %s receives out of order completions. xfcvi opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
opcode_str (STRING): xfcvi opcode in string.
opcode (INTHEX): xfcvi opcode.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system ID.

xfcvi.qlgc.PCIErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter firmware encounters a PCI error because it cannot write a frame to host memory.

Corrective Action

(None).

Syslog Message

FC-VI adapter: PCI error while writing a frame to host memory. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.port.reset

Severity

ERROR

Description

This message occurs when a xfcvi port resets.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Resetting the port %s. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
reason (STRING): Reason for port reset.

xfcvi.qlgc.qp.create.err

Severity

ERROR

Description

This message occurs when QP creation fails.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Failed to create QP on port %s. Requested QP index = %d, completion status = %s(status code = %d). %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpnum (INT): QP index.
status (STRING): Completion status.
status_code (INT): Completion status code.
info (STRING): Additional info.

xfcvi.qlgc.qp.destroy.failed

Severity

ERROR

Description

This message occurs when the QP destroy request failed.

Corrective Action

(None).

FC-VI adapter: QP destroy failed on port %s. QP index = %d. %s

Parameters

> **port** (STRING): xfcvi Interconnect NIC.
> **qpnum** (INT): QP index.
> **info** (STRING): Additional info.

xfcvi.qlgc.qpErr

Severity

> ERROR

Description

> This message occurs when the FC-VI driver receives a QP error from the Firmware. The FC-VI driver will attempt to retry the connection.

Corrective Action

> If this message repeats frequently, there may be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

> FC-VI adapter: xfcvi driver on port %s received QP Error. QP name = %s, QP index = 0x%x, VI state = %s(state code = 0x%x), sub-error = %s(error code = 0x%x). Remote node's system id = %llu. This error has occurred %d times. %s

Parameters

> **port** (STRING): Interconnect Adapter.
> **qpname** (STRING): QP name.
> **qpnum** (INTHEX): QP number.
> **state_str** (STRING): QP state.
> **state** (INTHEX): QP state code.
> **suberror** (STRING): Sub-error.
> **code** (INTHEX): Sub-error code.
> **system_id** (LONGINT): Remote node's system ID.
> **errcnt** (INT): Number of times QP async error was encountered.
> **info** (STRING): Additional info.

xfcvi.qlgc.rcvd.invalid.iu.buffer

Severity

> ERROR

Description

> This message occurs when the FC-VI adapter receives invalid information unit buffer.

Corrective Action

> No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

FC-VI adapter: Port %s received invalid IU buffer. Status = %s(status code = 0x%x), xfcvi opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): xfcvi opcode in string.
opcode (INTHEX): xfcvi opcode.
qpname (STRING): QP name.
qpnum (INT): QP number.
bufhdl (INT): Buffer handle.
systemID (LONGINT): Remote node's system ID.
info (STRING): Additional info.

xfcvi.qlgc.receive.error

Severity

ERROR

Description

This message occurs when the xfcvi firmware detects an error in the received frame.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Received bad frame on port %s. Mailbox-1 = %d, Mailbox-2 = %d. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
mbox1 (INT): Content of mailbox-1.
mbox2 (INT): Content of mailbox-2.
info (STRING): Additional info.

xfcvi.qlgc.received.disconnect

Severity

NOTICE

Description

This message occurs when xfcvi driver receives disconnect request from partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Disconnect request received on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.received.reject

Severity

NOTICE

Description

This message occurs when xfcvi driver receives connection reject from partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Connect request rejected on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.recvIUErr

Severity

ERROR

Description

This message occurs when the FC-VI adapter receives some error in received information unit.

Corrective Action

No corrective action is required. The driver internally resets the adapter if required. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s received IU error. Status = %s(status code = 0x%x), xfcvi opcode = %s(0x%x), QP name = %s, QP index = %d, buffer handle = %d, Remote node's system id = %llu.

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code.
opcode_str (STRING): xfcvi opcode in string.
opcode (INTHEX): xfcvi opcode.

qpname (STRING): QP name.
qpnum (INT): QP number.
bufhdl (INT): Buffer handle.
systemID (LONGINT): Remote node's system ID.

xfcvi.qlgc.regDumped

Severity

NOTICE

Description

This message occurs when the xfcvi driver saves a diagnostic dump in a file.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Diagnostic dump for port %s saved to file %s.

Parameters

port (STRING): xfcvi Interconnect NIC.
filename (STRING): File to which the diagnostic dump was saved.

xfcvi.qlgc.RespFrameErr

Severity

ERROR

Description

This message occurs when the adapter firmware sends a response frame with the error bit set.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Firmware sent a response with the error bit set. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.risc.paused

Severity

ERROR

Description

This message occurs when xfcvi RISC is paused.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Port %s detected a RISC pause error. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.qlgc.rmt.link.down

Severity

NOTICE

Description

This message occurs when xfcvi driver lost link to partner port.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link to partner node over port %s is down. Partner port id = 0x%x, partner node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
port_id (INTHEX): Partner port id.
system_id (LONGINT): Partner node's system id.
info (STRING): Additional info.

xfcvi.qlgc.rmt.link.up

Severity

NOTICE

Description

This message occurs when xfcvi driver gets link to partner port.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Link to partner node over port %s is up. Partner port id = 0x%x, partner node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
port_id (INTHEX): Partner port id.
system_id (LONGINT): Partner node's system id.
info (STRING): Additional info.

xfcvi.qlgc.sendIUError

Severity

ERROR

Description

This message occurs when the FC-VI adapter fails to send an information unit.

Corrective Action

No corrective action is required. The driver internally retries. However, if you see this message frequently, there might be an issue with the FC fabric or the adapter. Contact NetApp technical support.

Syslog Message

FC-VI adapter: Port %s sendIU status = %s(status code = 0x%x), xfcvi opcode = %s(0x%x), QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): Interconnect NIC.
status_str (STRING): Completion status in string.
status (INTHEX): Completion status code in hex.
opcode_str (STRING): xfcvi opcode in string.
opcode (INTHEX): xfcvi opcode in hex.
qpName (STRING): QP name.
qpIndex (INT): QP number.
systemID (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.sent.disconnect

Severity

NOTICE

Description

This message occurs when xfcvi driver sends disconnect request to remote partner.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Disconnect request sent on port %s. QP name = %s, QP index = %d, Remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qpname (STRING): QP name.
qpnum (INT): QP index.

system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.soft.reset.failed

Severity

ERROR

Description

This message occurs when an FC-VI port's soft reset fails.

Corrective Action

None.

Syslog Message

FC-VI adapter: Soft reset failed at port %s.

Parameters

port (STRING): xfcvi Interconnect adapter.

xfcvi.qlgc.system.error

Severity

ERROR

Description

This message occurs when xfcvi driver receives system error from xfcvi firmware.

Corrective Action

No corrective action is required. The driver internally resets the adapter. However, if you see this message frequently, there might be an issue with the adapter/firmware. Contact NetApp technical support.

Syslog Message

FC-VI adapter: System Error on port %s. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
info (STRING): Additional info.

xfcvi.qlgc.TimeOutErr

Severity

ERROR

Description

This message occurs when the adapter firmware cannot send a request.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Firmware could not send a request. Port %s, QP name = %s, QP index = %d, exchange ID 0x%x, address offset 0x%x, remote node's system id = %llu. %s

Parameters

port (STRING): xfcvi Interconnect NIC.
qp_name (STRING): QP name.
qp_index (INT): QP number.
exchange_id (INTHEX): Exchange ID.
address (INTHEX): Address offset of the last good frame.
system_id (LONGINT): Remote node's system id.
info (STRING): Additional info.

xfcvi.qlgc.transfer.error

Severity

ERROR

Description

This message occurs when the xfcvi firmware detects a transfer error.

Corrective Action

(None).

Syslog Message

FC-VI adapter: %s transfer error on port %s. Affected queue number = %d. %s

Parameters

trans_type (STRING): Transfer type.
port (STRING): xfcvi Interconnect NIC.
queue_num (INT): Queue number.
info (STRING): Additional info.

xfcvi.qlgc_regdumpfailed events

xfcvi.qlgc_regDumpFailed

Severity

NOTICE

Description

This message occurs when the HA interconnect driver could not save a diagnostic dump.

Corrective Action

(None).

Syslog Message

FC-VI adapter: Failed to save diagnostic dump for port %s. %s.

Parameters

> **port** (STRING): xfcvi Interconnect NIC.
> **reason** (STRING): Reason for the failure.

xfcvi.unsupported events

xfcvi.unsupported.config

Severity

> ERROR

Description

> This message occurs when a network adapter port behavior type is set to use FC-VI on a platform that has not been validated for its use and is therefore unsupported.

Corrective Action

> Change the port behavior type to a value other than "FC-VI". Use the "system hardware unified-connect show" command to view network adaptor port information, including the current behavior type. Use the "system hardware unified-connect modify" command to change the network adapter port behavior type.

Syslog Message

> FC-VI port behavior type not supported on network adapter port %s.

Parameters

> **port** (STRING): The network adapter port whose behavior type is set to use FC-VI.

xfcvi.update events

xfcvi.update.link.state

Severity

> NOTICE

Description

> This message occurs when there is a change in physical link state of the Fibre Channel Virtual Interface (FC-VI) adapter.

Corrective Action

> (None).

Syslog Message

> FC-VI adapter: Physical link is %s on port %s.

Parameters

> **link_state** (STRING): New link state.
> **port** (STRING): Interconnect NIC.

xinetd events

xinetd.hit events

xinetd.hit.cps.limit

Severity

ERROR

Description

This message occurs when the rate of incoming network connections for a service exceeds the maximum allowed rate. The service is temporarily suspended and restarted after a configured wait time. Many such connection attempts can potentially disallow other users from logging in to the storage system, causing a Denial of Service (DOS) attack.

Corrective Action

Reduce the rate at which the network connections are issued.

Syslog Message

Number of incoming network connections exceeded the configured limit of %d connections per second for the service %s. This service will be stopped and restarted after %d seconds.

Parameters

connections (INT): Maximum number of network connections allowed to access the service per second.
service (STRING): Service invoked by xinetd.
seconds (INT): Number of seconds xinetd must wait before reenabling the service.

xinetd.hit.instances.limit

Severity

ERROR

Description

This message occurs when the maximum number of SSH or Telnet requests that can be fulfilled simultaneously is reached. After the limit is reached, no new SSH or Telnet requests are accepted.

Corrective Action

Reduce the number of SSH or Telnet connections attempted simultaneously.The storage administrator can monitor and terminate excessive sessions, if necessary, using the security session "kill-cli" command.

Syslog Message

Maximum number of simultaneous incoming network connections exceeded the configured limit of %d connections for the service %s.

Parameters

instances (INT): Maximum number of SSH or Telnet requests that can be fulfilled simultaneously.
service (STRING): Service invoked by xinetd daemon.

xinetd.hit.per.source.limit

Severity

ERROR

Description

This message occurs when the maximum number of incoming network connections per source IP address for a service is reached. New connection requests from this source IP address for the service are rejected until the existing connections are terminated. Many such connection attempts could potentially disallow other users from logging in to the storage system, causing a Denial of Service (DOS) attack.

Corrective Action

If the remote host is retrying the network connection repeatedly, block the remote host by adding its IP address to the deny list using the "firewall policy" command.

Syslog Message

Maximum number of network connections of %d received from the remote host %s for the service %s.

Parameters

limit (INT): Maximum number of network connections for a service per source IP address.
ipaddress (STRING): IP address of the remote host that triggered maximum number of network connections of a service.
service (STRING): Service invoked by xinetd.

xyz events

zapi events

zapi.killed events

zapi.killed

Severity

NOTICE

Description

This message occurs when ZAPI Socket Manager (ZSM) terminates and no longer offers a connection on which a client can deliver Zephyr API (ZAPI) requests.

Corrective Action

(None).

Syslog Message

ZAPI Socket Manager (ZSM) terminated.

Parameters

(None).

zapi.retired events

zapi.retired.usageDetected

Severity

NOTICE

Description

This message occurs when ONTAPI (ZAPI) is used for ONTAP data storage management. ONTAPI (ZAPI) is approaching end of availability. Search your vendor's support site for information about the end of availability for ONTAPI and transition to the ONTAP REST API.

Corrective Action

Ensure that all ONTAP data storage management functions using ONTAPI (ZAPI) have transitioned to ONTAP REST API.

Syslog Message

ONTAPI (ZAPI), which is approaching end of availability, was last used from source address: %s, for ONTAP data storage management.

Parameters

sourceAddress (STRING): The source address from which the last ONTAPI (ZAPI) call was made.

zapi.sf events

zapi.sf.up.ready

Severity

INFORMATIONAL

Description

This message occurs when the M-host layer is operational and has notified the high-availability (HA) subsystem, which can then proceed with certain storage failover operations, such as giveback.

Corrective Action

(None).

Syslog Message

ZAPI: system node stable after startup.

Parameters

(None).

zapi.snapshot events

zapi.snapshot.success

Severity

NOTICE

Description

This event occurs when an asynchronous Snapshot(tm) copy is created successfully through the Zephyr API (ZAPI) interface.

Corrective Action

(None).

Syslog Message

Asynchronous creation of Snapshot copy named %s in volume %s was successful. The Snapshot copy was created %d milliseconds after the request was received by ZAPI.

Parameters

snapshot (STRING): Name of the Snapshot copy.
volume (STRING): Volume name in which the Snapshot copy was created.
time (INT): Duration, in milliseconds, that it took to create the Snapshot copy.

zrto events

zrto.lif events

zrto.lif.upgrade.failed

Severity

ERROR

Description

This message occurs when ONTAP® fails to re-create a previously deleted LIF during an upgrade. The LIF must be re-created manually.

Corrective Action

Attempt the failed command again. If the problem persists, contact NetApp technical support.

Syslog Message

Failed to re-create a LIF during upgrade. Command: "network interface create %s". Reason: %s.

Parameters

command_arguments (STRING): Arguments of the command that failed.
error (STRING): Error that LIF creation encountered.

zsm events

zsm.send events

zsm.send.request.timeout

Severity

ERROR

Description

This message occurs when a socket timeout occurs on an intracluster Manage ONTAP® API request to an internal ONTAPI® server.

Corrective Action

Check your network configuration and other potential error conditions, such as the node being down or too busy. Correct the error condition and retry the operation.

Syslog Message

An intracluster Manage ONTAP API request timed out while waiting for an internal ONTAPI server response.

Parameters

(None).

zsm.socket events

zsm.socket.listener.create

Severity

NOTICE

Description

The event posted when the listener socket for the ZAPI Socket Manager (ZSM) service cannot be created.

Corrective Action

No corrective action is possible. ZSM service is not available without a reboot.

Syslog Message

%s initialization failure; cannot create listener socket; error code %d (%s). ZSM service is inaccessible.

Parameters

zsmstring (STRING): The string describing the type of socket that was not created; currently ZSM.
errorcode (INT): The error code (errno) returned from the failed ZSM listener socket create call.
errorstring (STRING): The character string translation of the error code (errno) returned from the failed ZSM listener socket create call.

zsm.socket.listener.setoption

Severity

NOTICE

Description

This event is posted when the listener socket for the ZAPI Socket Manager (ZSM) service cannot be properly initialized.

Corrective Action

No corrective action is possible. ZSM service is not available without a reboot.

Syslog Message

ZSM initialization failure; cannot set listener socket option %s at level %s; error code %d (%s). ZSM service is inaccessible.

Parameters

socketoption (STRING): The socket option value that failed.
socketlevel (STRING): The socket option level that failed.
errorcode (INT): The error code (errno) returned from the failed option set call.
errorstring (STRING): The character string translation of the error code (errno) returned from the failed option set call.

zsm.socket.output.event

Severity

INFORMATIONAL

Description

This event occurs when the socket for the ZAPI Socket Manager (ZSM) service cannot send output data.

Corrective Action

This message usually means that a network error occurred or that the client closed its connection to the storage appliance. Typically, there is no corrective action that you can be take. However, if the destination is available check whether you can examine the storage appliance's and client's event logs to see if networking errors were reported.

Syslog Message

(None).

Parameters

destination (STRING): Client that was to receive the output. If the client is disconnected and its IP address is not available, the text "Not known" is printed.
errorcode (INT): Error code (errno) returned from the failed write call.
errorstring (STRING): The character string translation of the errno returned from the failed socket write call.
