Security

Security overview

Overview

You can use ONTAP security APIs to manage security settings for the cluster and SVMs.

SAML

Configure the SAML 2.0 SP (Service Provider) protocol inside ONTAP. Doing so redirects the authentication task to a third-party Identity Provider (IDP) that can utilize any number of approaches for multi-factor authentication. After SAML authentication is enabled, all interactive web access (System Manager, SPI) is authenticated via SAML and a third-party IDP.

Manage security-related operations

Security endpoint overview

Overview

You can use this API for various cluster-wide security-related operations.

"onboard_key_manager_configurable_status" object

Use this API to retrieve details of whether or not the Onboard Key Manager can be configured on the cluster.

– GET /api/security

– GET /api/security?fields=onboard_key_manager_configurable_status

"software_data_encryption" object

Contains software data encryption related information.

The following APIs can be used to enable or disable and obtain default software data at rest encryption values:

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : true }'

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : false }'

– GET /api/security

– GET /api/security?fields=software_data_encryption

A PATCH request on this API using the parameter "software_data_encryption.conversion_enabled" triggers the conversion of all non-encrypted metadata volumes to encrypted metadata volumes and all non-NAE aggregates to NAE aggregates. For the conversion to start, the cluster must have either an Onboard or an external key manager set up and the aggregates should either be empty or have only metadata volumes. No data volumes should be present in any of the aggregates. For MetroCluster configurations, the PATCH request will fail if the cluster is in the switchover state.

The following API can be used to initiate software data encryption conversion.

– PATCH /api/security -d '{ "software_data_encryption.conversion_enabled" : true }'

"fips" object

Contains FIPS mode information.

A PATCH request on this API using the parameter "fips.enabled" switches the system from using the default cryptographic module software implementations to validated ones or vice versa, where applicable. If the value of the parameter is "true" and unapproved algorithms are configured as permitted in relevant subsystems, those algorithms will be disabled in the relevant subsystem configurations. If "false", there will be no implied change to the relevant subsystem configurations.

– GET /api/security

– GET /api/security?fields=fips

– PATCH /api/security -d '{ "fips.enabled" : true }'

– PATCH /api/security -d '{ "fips.enabled" : false }'

"tls" object

Contains TLS configuration information.

A PATCH request on this API using the parameter "tls.cipher_suites" and/or "tls.protocol_versions" configures the permissible cipher suites and/or protocol versions for all TLS-enabled applications in the system.

– GET /api/security

– GET /api/security?fields=tls

– PATCH /api/security -d '{ "tls" : { "protocol_versions" : ["TLSv1.2", "TLSv1.1"], "cipher_suites" : ["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384", "TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256"] } }'

"management_protocols" object

Contains Security Protocols information.

This security protocols endpoint is used to retrieve and configure security protocols.

– GET /api/security

– GET /api/security?fields=management_protocols

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true, "telnet_enabled" : true } }'

GET Examples

Retrieving information about the security configured on the cluster

The following example shows how to retrieve the configuration of the cluster.

```
# The API:
GET /api/security:

# The call:
curl -X GET 'https://<mgmt-ip>/api/security?fields=*' -H 'accept:
application/hal+json'

# The response:
{
  "onboard_key_manager_configurable_status": {
    "supported": false,
    "message": "Onboard Key Manager cannot be configured on the cluster.
There are no self-encrypting disks in the cluster, and the following nodes
do not support volume granular encryption: ntap-vsim2.",
    "code": 65537300
  },
  "fips": {
    "enabled": false
  },
  "tls": {
    "cipher_suites": [
      "TLS_RSA_WITH_AES_128_GCM_SHA256",
      "TLS_RSA_WITH_AES_128_CBC_SHA",
      "TLS_RSA_WITH_AES_128_CBC_SHA256",
      "TLS_RSA_WITH_AES_256_GCM_SHA384",
      "TLS_RSA_WITH_AES_256_CBC_SHA",

== PATCH Examples

=== Enabling software encryption conversion in the cluster

The following example shows how to convert all the aggregates and metadata volumes in the cluster from non-encrypted to encrypted.

= The API:

PATCH /api/security

= The call

```
curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{  
"software_data_encryption.conversion_enabled" : true }'+++</mgmt_ip>+++
```

= The response:

```
{  
  "job": {  
    "uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",  
    "_links": {  
      "self": {  
        "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-  
005056ac4adc"  
      }  
    }  
  }  
}
```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

= The call

```
curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/ebcbd82d-1cd4-11ea-  
8f75-005056ac4adc"+++</mgmt_ip>+++
```

= The response:

```
{  
  "uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",  
  "description": "PATCH /api/security",  
  "state": "success",  
  "message": "success",  
  "code": 0,  
  "start_time": "2019-12-12T06:45:40-05:00",  
  "end_time": "2019-12-12T06:45:40-05:00",
```

```

    "_links": {
      "self": {
        "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-005056ac4adc"
      }
    }
  }
}

```

[discrete]

=== Enabling FIPS mode in the cluster

The following example shows how to enable FIPS mode in the cluster.

= The API:

PATCH /api/security

= The call

```

curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{ "fips.enabled"
: true }'+++</mgmt_ip>+++

```

= The response:

```

{
  "job": {
    "uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-
bef689bbf2c2"
      }
    }
  }
}

```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

= The call

```

curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/8e7f59ee-a9c4-4faa-
9513-bef689bbf2c2"+++</mgmt_ip>+++

```

= The response:

```

{
  "uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
  "description": "PATCH /api/security",

```

```

"state": "success",
"message": "success",
"code": 0,
"start_time": "2020-04-28T06:55:40-05:00",
"end_time": "2020-04-28T06:55:41-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-bef689bbf2c2"
  }
}
}

```

[discrete]

=== Configuring permissible TLS protocols and cipher suites in the cluster

The following example shows how to configure the cluster to only allow TLSv1.2 with selected cipher suites.

= The API:

PATCH /api/security

= The call

```

curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{ "tls" : {
"protocol_versions" : ["TLSv1.2"], "cipher_suites" :
["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384",
"TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256"] } }'+++</mgmt_ip>+++

```

= The response:

```

{
  "job": {
    "uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d"
      }
    }
  }
}

```

This returns a job UUID. A subsequent GET for this job UUID returns details of the job.

= The call

```
curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d"+++</mgmt_ip>+++
```

= The response:

```
{
  "uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
  "description": "PATCH /api/security",
  "state": "success",
  "message": "success",
  "code": 0,
  "start_time": "2021-03-22T08:52:50-05:00",
  "end_time": "2021-03-22T08:52:51-05:00",
  "_links": {
    "self": {
      "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d"
    }
  }
}
```

[discrete]

=== Enabling security protocols in the cluster

The following example shows how to enable the security protocol rsh in the cluster.

= The API:

PATCH /api/security

= The call

```
curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{
  "management_protocols" : { "rsh_enabled" : true } }'+++</mgmt_ip>+++
```

= The response

```
{
  "job": {
    "uuid": "2980ba28-adab-11eb-8fa3-005056bbfa84",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/2980ba28-adab-11eb-8fa3-005056bbfa84"
      }
    }
  }
}
```

= The call:

```
curl -H "accept: application/hal+json" -X GET "https://+++<mgmt-  
ip>+++/api/security/?fields=management_protocols"+++</mgmt-ip>+++
```

= The response:

```
{  
  "management_protocols": {  
    "rsh_enabled": false,  
    "telnet_enabled": false  
  },  
  "_links": {  
    "self": {  
      "href": "/api/security"  
    }  
  }  
}
```

= Update the software FIPS mode or enable conversion of non-encrypted
metadata volumes non-NAE aggregates

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security`#

```

Introduced In: 9.8

Updates the software FIPS mode or enables conversion of non-encrypted metadata volumes to encrypted metadata volumes and non-NAE aggregates to NAE aggregates.

== Parameters

```
[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description
```

```
|return_timeout
|integer
|query
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
* Max value: 120
* Min value: 0
```

software_data_encryption
```

Cluster-wide software data encryption related information.

```
[cols=3*,options=header]
```

|===

Name
Type
Description

conversion_enabled
boolean
a Indicates whether or not software encryption conversion is enabled on the cluster. A PATCH request initiates the conversion of all non-encrypted metadata volumes in the cluster to encrypted metadata volumes and all non-NAE aggregates to NAE aggregates. For the PATCH request to start, the cluster must have either an Onboard or an external key manager set up and the aggregates should either be empty or have only metadata volumes. No data volumes should be present in any of the aggregates in the cluster. For MetroCluster configurations, a PATCH request enables conversion on all the aggregates and metadata volumes of both local and remote clusters and is not allowed when the MetroCluster is in switchover state.

disabled_by_default
boolean
a Indicates whether or not default software data at rest encryption is disabled on the cluster.

= Manage security-related accounts

:leveloffset: +1

[[ID95594f884a2da2e97e1d66185c8424a5]]

= Security accounts endpoint overview

== Overview

A valid user account is required to login to and provision, monitor, and manage the cluster. The scope of the management operation can be at the cluster level or at an individual SVM level. There is a need to create user accounts with specific privileges apart from the default user accounts, "admin", for cluster and "vsadmin" for SVM. Custom user accounts can be configured to perform specific (scoped) operations. User accounts can either be created locally (on the Netapp system) or referenced from an external directory server (NIS, LDAP, or Active Directory). Apart from creation, modification, and deletion of a user account, locking and unlocking of a user account or resetting the password (for local accounts only) is possible.

A user account must be associated with the following before it can become operational:

- . A management application (SSH, HTTP, console, service_processor, and such like) for user login. HTTP enables REST API access.
- . Scope - either cluster or SVM.
- . Authentication source - password (local, NIS/LDAP, Active Directory), public/private key pair-based, certificate based.
- . RBAC role - determines what operations are permitted for the user account.

=== Restrictions

A number of internal/restricted account names, such as admin, diag, autosupport, and root cannot be used.

There must be at least one console cluster administrator account. Any attempt to delete the last remaining administrator account fails.

Multi-factor authentication is only possible for SSH application and the only combination possible is password (local or NIS/LDAP) and public key.

All authentication sources are not supported by all applications. You must

select a compatible authentication method based on the application. The following types of authentications methods are supported:

```
|===
| Application | Supported Authentication Methods

| amqp
| password

| console
| password

| service_processor
| password

| HTTP
| password, domain, nsswitch, certificate

| ONTAPI
| password, domain, nsswitch, certificate

| SSH
| password, publickey (key pair), domain, nsswitch
|===
```

NOTE: In this table, "certificate" means security certificate, "domain" means that the user directory server is an external Active Directory, "nsswitch" means the directory server is an external NIS or LDAP server. At login time, the user is authenticated with these external directory servers which must be provisioned separately.

== Examples

=== Creating a cluster-scoped user account

Specify the user account name, role name, and the tuples (of application and authentication methods) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped user account.

NOTE: Each entry in the applications array must be for a different application.

The API:

POST "/api/security/accounts"

```
# The call to create a cluster user account with applications ssh, http
and password authentication scheme:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_user1","applications":[{"application":"ssh","authentication_methods":["password"],"second_authentication_method":"none"}, {"application":"http","authentication_methods":["password"]}],"role":"admin","password":"p@ssw@rd123"}'
```

Note: The password is an optional parameter for creation and can be set later using a PATCH request. See the examples for modification of user account or password.

=== Creating an SVM-scoped user account

For an SVM-scoped account, specify either the SVM name as the owner.name or SVM uuid as the owner.uuid along with other parameters for the user account. These indicate the SVM for which the user account is being created and can be obtained from the response body of GET performed on the `_api/svm/svms_` API.

```
# The API:
POST "/api/security/accounts"
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"owner":{"uuid":"aaef7c38-4bd3-11e9-b238-0050568e2e25"},"name":"svm_user1","applications":[{"application":"ssh","authentication_methods":["password"],"second_authentication_method":"none"}],"role":"vsadmin","password":"p@ssw@rd123"}'
```

=== Retrieving the configured user accounts

Use the following API to retrieve all of the user accounts or a filtered list of user accounts (by name, for a specific SVM, and so on).

```
# The API:
GET "/api/security/accounts"
```

```
# The call to retrieve all the user accounts configured in the cluster:
curl -X GET "https://<mgmt-ip>/api/security/accounts"
```

```
# The response:

= Create a new user account

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/accounts`#

*Introduced In:* 9.6

Creates a new user account.

== Required parameters

* `name` - Account name to be created.
* `applications` - Array of one or more application tuples (of application
and authentication methods).

== Optional parameters

* `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-
scoped user account. If not supplied, a cluster-scoped user account is
created.
* `role` - RBAC role for the user account. Defaulted to `admin` for
cluster user account and to `vsadmin` for SVM-scoped account.
* `password` - Password for the user account (if the authentication method
is opted as password for one or more of applications).
* `second_authentication_method` - Needed for MFA and only supported for
ssh application. Defaults to `none` if not supplied.
* `comment` - Comment for the user account (e.g purpose of this account).
* `locked` - Locks the account after creation. Defaults to `false` if not
supplied.

Error Code	Description
------------	-------------

1261215	
---------	--

	The role was not found.
--	-------------------------

1263343	
---------	--

	Cannot lock user with password not set or non-password authentication method.
--	---

5636099	
---------	--

	User creation with a non-admin role is not supported for service-
--	---

processor application.

| 5636121

| The user account name is reserved for use by the system.

| 5636126

| Cannot create a user with the username or role as AutoSupport because it is reserved by the system.

| 5636140

| Creating a login with application console for a data Vserver is not supported.

| 5636141

| Creating a login with application service-processor for a data Vserver is not supported.

| 5636154

| The second-authentication-method parameter is supported for ssh application.

| 5636155

| The second-authentication-method parameter can be specified only if the authentication-method password or public key nsswitch.

| 5636156

| The same value cannot be specified for the second-authentication-method and the authentication-method.

| 5636157

| If the authentication-method is domain, the second-authentication-method cannot be specified.

| 5636164

| If the value for either the authentication-method second-authentication-method is nsswitch or password, the other parameter must differ.

| 7077897

| Invalid character in username.

| 7077898

| The username must contain both letters and numbers.

| 7077899

| The username does not meet length requirements.

| 7077906

```
| A role with that name has not been defined for the Vserver.

| 7077918
| The password cannot contain the username.

| 7077919
| The minimum length for new password does not meet the policy.

| 7077920
| A new password must have both letters and numbers.

| 7077921
| The minimum number of special characters required do not meet the
policy.

| 7077929
| Cannot lock user with password not set or non-password authentication
method.

| 7077940
| The password exceeds the maximum supported length.

| 7077941
| The defined password composition exceeds the maximum password length of
128 characters.

| 7078900
| An admin password is not set. Set the password by including it in the
request.

[[IDd440852f30087f0b147f84d241cec339]]
```

```
= Security accounts owner.uuid name endpoint overview
```

```
== Overview
```

This API displays and manages the configuration of scoped user accounts.

Newly created user accounts might need to be updated for many reasons. For example, a user account might need to use a different application or its role might need to be modified. According to a policy, the password or authentication source of a user account might need to be changed, or a user account might need to be locked or deleted from the system. This API allows you to make these changes to user accounts.

Specify the owner UUID and the user account name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the user account

has been created and can be obtained from the response body of the GET request performed on one of the following APIs:

- `_/_api/security/accounts_` for all user accounts
- `_/_api/security/accounts/?scope=cluster_` for cluster-scoped user accounts
- `_/_api/security/accounts/?scope=svm_` for SVM-scoped accounts
- `_/_api/security/accounts/?owner.name=\{svm-name}_` for a specific SVM

This API response contains the complete URI for each user account that can be used.

== Examples

=== Retrieving the user account details

The API:

GET "/api/security/accounts/{owner.uuid}/{name}"

The call:

curl -X GET "https://<mgmt-ip>/api/security/accounts/aef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1"

The response:

```
{
  "owner": {
    "uuid": "aaef7c38-4bd3-11e9-b238-0050568e2e25",
    "name": "svml",
    "_links": {
      "self": {
        "href": "/api/svm/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25"
      }
    }
  },
  "name": "svm_user1",
  "applications": [
    {
      "application": "ssh",
      "authentication_methods": [
        "password"
      ],
      "second_authentication_method": "none"
    }
  ],
  "role": {
    "name": "vsadmin",
    "_links": {
```

```

    "self": {
        "href": "/api/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25/admin/roles/vsadmin"
    }
},
"locked": false,
"scope": "svm",
"_links": {
    "self": {
        "href": "/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1"
    }
}
}
}
-----

```

=== Updating the applications and role in a user account

Specify the desired configuration in the form of tuples (of applications and authentication methods) and the role. All other previously configured applications that are not specified in the "applications" parameter of the PATCH request will be de-provisioned for the user account.

The API:

```
PATCH "/api/security/accounts/{owner.uuid}/{name}"
```

The call to update the applications and role:

```
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1" -d
'{"applications":[{"application":"http","authentication_methods":["domain"]}, {"application":"ontapi","authentication_methods":["password"]}], "role": {"name": "vsadmin-backup"}}'
```

The call to update only the role:

```
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1" -d '{"role":"vsadmin-protocol"}'
```

=== Updating the password for a user account

The API:

```
PATCH "/api/security/accounts/{owner.uuid}/{name}"
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1" -d '{"password":"newp@ssw@rd2"}'
```

```
----
```

```
=== Locking a user account
```

```
----
```

```
The API:
```

```
PATCH "/api/security/accounts/{owner.uuid}/{name}"
```

```
The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1" -d '{"locked":"true"}'
```

```
----
```

```
=== Deleting a user account
```

```
----
```

```
# The API:
```

```
DELETE "/api/security/accounts/{owner.uuid}/{name}"
```

```
# The call:
```

```
curl -X DELETE "https://<mgmt-ip>/api/security/accounts/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_user1"
```

```
----

= Update a user account
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/accounts/{owner.uuid}/{name}`#
```

Introduced In: 9.6

Updates a user account. Locks or unlocks a user account and/or updates the role, applications, and/or password for the user account.

== Required parameters

- * `name` - Account name to be updated.
- * `owner.uuid` - UUID of the SVM housing the user account to be updated.

== Optional parameters

- * `applications` - Array of one or more tuples (of application and authentication methods).
- * `role` - RBAC role for the user account.
- * `password` - Password for the user account (if the authentication method is opted as password for one or more of applications).
- * `second_authentication_method` - Needed for MFA and only supported for ssh application. Defaults to `none` if not supplied.
- * `comment` - Comment for the user account (e.g purpose of this account).
- * `locked` - Set to true/false to lock/unlock the account.

== Related ONTAP commands

- * `security login create`
- * `security login modify`
- * `security login password`
- * `security login lock`
- * `security login unlock`

Status: Default

ONTAP Error Response Codes

```
|===  
| Error Code | Description  
  
| 1261215  
| The role was not found.  
  
| 1261218  
| The user was not found.  
  
| 1263343  
| Cannot lock user with password not set or non-password authentication  
method.  
  
| 5636096  
| Cannot perform the operation for this user account since the password is  
not set.  
  
| 5636097  
| The operation for user account failed since user password is not set.  
  
| 5636100  
| Modification of a service-processor user's role to a non-admin role is  
not supported.  
  
| 5636125  
| The operation not supported on AutoSupport user account which is  
reserved.  
  
| 5636129  
| The role does not exist.  
  
| 5636154  
| The second-authentication-method parameter is supported for ssh  
application.
```

| 5636155
| The second-authentication-method parameter can be specified only if the authentication-method password or public key nsswitch.

| 5636156
| Same value cannot be specified for the second-authentication-method and the authentication-method.

| 5636157
| If the authentication-method is domain, the second-authentication-method cannot be specified.

| 5636159
| For a given user and application, if the second-authentication-method is specified, only one such login entry is supported.

| 5636164
| If the value for either the authentication-method second-authentication-method is nsswitch or password, the other parameter must differ.

| 7077896
| Cannot lock the account of the last console admin user.

| 7077906
| A role with that name has not been defined for the Vserver.

| 7077911
| The user is not configured to use the password authentication method.

| 7077918
| The password cannot contain the username.

| 7077919
| The minimum length for new password does not meet the policy.

| 7077920
| The new password must have both letters and numbers.

| 7077921
| The minimum number of special characters required do not meet the policy.

| 7077924
| The new password must be different than last N passwords.

| 7077925
| The new password must be different to the old password.

```

| 7077929
| Cannot lock user with password not set or non-password authentication
method.

| 7077940
| The password exceeds maximum supported length.

| 7077941
| Defined password composition exceeds the maximum password length of 128
characters.

| 7078900
| An aAdmin password is not set. Set the password by including it in the
request.

= View and update audit settings

:leveloffset: +1

[[ID141bd5a9e37c8212c0a81c33083daad3]]
= Security audit endpoint overview

== Overview

This API controls what is logged to the audit log files. All operations

```

that make changes are always logged and cannot be disabled. The PATCH request updates administrative audit settings for GET requests. All fields are optional for a PATCH request. A GET request retrieves administrative audit settings for GET requests.

+

'''

== Examples

=== Retrieving administrative audit settings for GET requests

The following example shows the administrative audit settings for GET requests.

+

'''

The API:

/api/security/audit

The call:

curl -X GET "https://<cluster-ip>/api/security/audit"

The response:

```
{
  "cli": false,
  "http": false,
  "ontapi": false,
  "_links": {
    "self": {
      "href": "/api/security/audit"
    }
  }
}
```

}

}

'''

=== Updating administrative audit settings for GET requests

The following example updates the administrative audit settings for GET requests

+

'''

The API:

/api/security/audit

The call:

```
curl -X PATCH "https://<cluster-ip>/api/security/audit" -d
'{"cli":"false", "http": "true", "ontapi": "true"}'
```

'''

= Forward audit logs to syslog/splunk servers
```

```
:leveloffset: +1
```

```
[[IDd4cd1c55c8bdc4543951bc2f47149fce]]
= Security audit destinations endpoint overview
```

```
== Overview
```

This API controls the forwarding of audit log information to remote syslog/splunk servers. Multiple destinations can be configured and all audit records are forwarded to all destinations.

A GET operation retrieves information about remote syslog/splunk server destinations.

A POST operation creates a remote syslog/splunk server destination.

A GET operation on /security/audit/destinations/{address}/{port} retrieves information about the syslog/splunk server destination given its address and port number.

A PATCH operation on /security/audit/destinations/{address}/{port} updates information about the syslog/splunk server destination given its

address and port number.

A DELETE operation on /security/audit/destinations/{address}/{port} deletes a syslog/splunk server destination given its address and port number.

=== Overview of fields used for creating a remote syslog/splunk destination

The fields used for creating a remote syslog/splunk destination fall into the following categories

==== Required properties

All of the following fields are required for creating a remote syslog/splunk destination

- * `address`

==== Optional properties

All of the following fields are optional for creating a remote syslog/splunk destination

- * `port`
- * `protocol`
- * `facility`
- * `verify_server`
- +

'''

== Examples

=== Retrieving remote syslog/splunk server destinations

The following example shows remote syslog/splunk server destinations

- +

'''

The API:
/api/security/audit/destinations

The call:
curl -X GET "https://<cluster-ip>/api/security/audit/destinations"

```

# The response:
{
  "records": [
    {
      "address": "1.1.1.1",
      "port": 514,
      "_links": {
        "self": {
          "href": "/api/security/audit/destinations/1.1.1.1/514"
        }
      }
    }
  ],
  "num_records": 1,
  "_links": {
    "self": {
      "href": "/api/security/audit/destinations"
    }
  }
}
----

'''

=== Creating remote syslog/splunk server destinations

The following example creates remote syslog/splunk server destinations.
+

'''

----

# The API:
/api/security/audit/destinations

# The call:
curl -X POST "https://<cluster-
ip>/api/security/audit/destinations?force=true" -d '{ "address":
"1.1.1.1", "port": 514, "protocol": "udp_unencrypted", "facility":
"kern"}'
----

'''

```

=== Retrieving a remote syslog/splunk server destination given its destination address and port number

The following example retrieves a remote syslog/splunk server destination given its destination address and port number.

+

'''

The API:

/api/security/audit/destinations/{address}/{port}

The call:

curl -X GET "https://<cluster-ip>/api/security/audit/destinations/1.1.1.1/514"

The response:

```
{
  "address": "1.1.1.1",
  "port": 514,
  "protocol": "udp_unencrypted",
  "facility": "kern",
  "verify_server": false,
  "_links": {
    "self": {
      "href": "/api/security/audit/destinations/1.1.1.1/514"
    }
  }
}
```

'''

=== Updating a remote syslog/splunk server destination given its destination address and port number

The following example updates a remote syslog/splunk server destination configuration given its destination address and port number.

+

'''

The API:

```
/api/security/audit/destinations/{address}/{port}
```

```
# The call:
```

```
curl -X PATCH "https://<cluster-  
ip>/api/security/audit/destinations/1.1.1.1/514" -d '{"facility":  
"user"}'
```

```
----
```

```
'''
```

=== Deleting a remote syslog/splunk server destination given its destination address and port number

The following example deletes a remote syslog/splunk server destination configuration given its destination address and port number.

+

```
'''
```

```
----
```

```
# The API:
```

```
/api/security/audit/destinations/{address}/{port}
```

```
# The call:
```

```
curl -X DELETE "https://<cluster-  
ip>/api/security/audit/destinations/1.1.1.1/514"
```

```
----
```

```
'''

```

= Define a remote syslog or splunk server to receive audit information

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/security/audit/destinations`#
```

Introduced In: 9.6

Defines a remote syslog/splunk server for sending audit information to.

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|port
```

```
|integer
```

```
|query
```

```
|False
```

```
a|Filter by port
```

```
|facility
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by facility
```

```
|verify_server
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|Filter by verify_server
```

```
|protocol
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by protocol
```

```
|address
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by address
```

```
|order_by
```

```
|array[string]
```

```

|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|===
|Name
|Type
|Description

|address
|string
a|Destination syslog\|splunk host to forward audit records to. This can be
an IP address (IPv4\|IPv6) or a hostname.

```

```

|facility
|string
a|This is the standard Syslog Facility value that is used when sending
audit records to a remote server.

|port
|integer
a|Destination Port. The default port depends on the protocol chosen:
For un-encrypted destinations the default port is 514.
For encrypted destinations the default port is 6514.

|protocol
|string
a|Log forwarding protocol

|verify_server
|boolean
a|This is only applicable when the protocol is tcp_encrypted. This
controls whether the remote server's certificate is validated. Setting
"verify_server" to "true" will enforce validation of remote server's
certificate. Setting "verify_server" to "false" will not enforce
validation of remote server's certificate.

= Define remote syslog or splunk server information

```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/security/audit/destinations`#
```

Introduced In: 9.6

Configures remote syslog/splunk server information.

== Required properties

All of the following fields are required for creating a remote syslog/splunk destination

* `address`

== Optional properties

All of the following fields are optional for creating a remote syslog/splunk destination

* `port`

* `protocol`

* `facility`

* `verify_server` (Can only be "true" when protocol is "tcp_encrypted")

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|force

|boolean

|query

|False

a|Skip the Connectivity Test

* Default value:

|return_timeout

|integer

```
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|return_records
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|The default is false. If set to true, the records are returned.
```

```
* Default value:
```

= Update remote syslog or splunk server information

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/audit/destinations/{address}/{port}`#

*Introduced In:* 9.6

Updates remote syslog/splunk server information.

== Parameters

[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|address
|string
|path
|True
a|IP address of remote syslog/splunk server.

|port
|integer
|path
|True
a|Port number of remote syslog/splunk server.

|===

== Request Body

[cols=3*,options=header]
|===
|Name

```

```

|Type
|Description

|address
|string
a|Destination syslog\|splunk host to forward audit records to. This can be
an IP address (IPv4\|IPv6) or a hostname.

|facility
|string
a|This is the standard Syslog Facility value that is used when sending
audit records to a remote server.

|port
|integer
a|Destination Port. The default port depends on the protocol chosen:
For un-encrypted destinations the default port is 514.
For encrypted destinations the default port is 6514.

|protocol
|string
a|Log forwarding protocol

|verify_server
|boolean
a|This is only applicable when the protocol is tcp_encrypted. This
controls whether the remote server's certificate is validated. Setting
"verify_server" to "true" will enforce validation of remote server's
certificate. Setting "verify_server" to "false" will not enforce
validation of remote server's certificate.

```
a|Filter by scope
```

```
|node.uuid
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by node.uuid
```

```
|node.name
```

```
|string
```

```
|query
```

```
|False
```

```
a|Filter by node.name
```

```
|user
|string
|query
|False
a|Filter by user
```

```
|timestamp
|string
|query
|False
a|Filter by timestamp
```

```
|input
|string
|query
|False
a|Filter by input
```

```
|state
|string
|query
|False
a|Filter by state
```

```
|location

|query
|False
a|Filter by application
```

```
|index
|integer
|query
|False
a|Filter by index
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_timeout
|integer
|query
```

```

|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|application
|string
a|This identifies the "application" by which the request was processed.

|command_id
|string
a|This is the command ID for this request.
Each command received on a CLI session is assigned a command ID. This
enables you to correlate a request and response.

|index
|integer
a|Internal index for accessing records with same time/node. This is a 64
bit unsigned value.

|input
|string
a|The request.

```

```
|location
|string
a|This identifies the location of the remote user. This is an IP address
or "console".

|message
|string
a|This is an optional field that might contain "error" or "additional
information" about the status of a command.

|node
|link:#node[node]
a|Node where the audit message resides.

|scope
|string
a|Set to "svm" when the request is on a data SVM; otherwise set to
"cluster".

|session_id
|string
a|This is the session ID on which the request is received. Each SSH
session is assigned a session ID.
Each http/ontapi/snmp request is assigned a unique session ID.

|state
|string
a|State of of this request.

|svm
|link:#svm[svm]
a|This is the SVM through which the user connected.

|timestamp
|string
a|Log entry timestamp. Valid in URL

|user

= Security authentication cluster ad-proxy endpoint overview
```

```
== Overview
```

This API configures data SVM account information at the Active Directory. For Active Directory domain-based authentication for cluster accounts, a data SVM must be configured and registered as a machine account at the Active Directory. All authentication requests are proxied through this SVM.

```
== Examples
```

```
=== Creating a data SVM proxy for domain-based authentication for cluster accounts
```

```

-----

# The API:
POST "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy" -d '{"svm.uuid":"13f87d78-70c7-11e9-b722-0050568ec89f"}'
-----

=== Updating a data SVM proxy for domain-based authentication for cluster
accounts

-----

# The API:
PATCH "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy" -d '{"svm.uuid":"13f87d78-70c7-11e9-b722-0050568ec89f"}'
-----

=== Retrieving a data SVM proxy for domain-based authentication for
cluster accounts

-----

# The API:
GET "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy"

# The response:
{
  "svm": {

= Manage LDAP server configuration

:leveloffset: +1

[[ID52f78699024bc5481fb42586dcf70964]]
= Security authentication cluster LDAP endpoint overview

== Overview

LDAP servers are used to centrally maintain user information. LDAP
configurations must be set up
to look up information stored in the LDAP directory on the external LDAP
servers. This API is used to retrieve and manage

```

cluster LDAP server configurations.

== Examples

=== Retrieving the cluster LDAP information

The cluster LDAP GET request retrieves the LDAP configuration of the cluster.

The following example shows how a GET request is used to retrieve the cluster LDAP information:

The API:

/api/security/authentication/cluster/ldap

The call:

```
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/ldap"  
-H "accept: application/hal+json"
```

The response:

```
{  
  "servers": [  
    "10.10.10.10",  
    "domainB.example.com"  
  ],  
  "schema": "ad_idmu",  
  "port": 389,  
  "min_bind_level": "anonymous",  
  "bind_dn": "cn=Administrators,cn=users,dc=domainA,dc=example,dc=com",  
  "base_dn": "dc=domainA,dc=example,dc=com",  
  "base_scope": "subtree",  
  "use_start_tls": true,  
  "session_security": "none",  
  "try_channel_binding": true,  
  "_links": {  
    "self": {  
      "href": "/api/security/authentication/cluster/ldap"  
    }  
  }  
}
```

=== Creating the cluster LDAP configuration

The cluster LDAP POST operation creates an LDAP configuration for the

cluster.

The following example shows how to issue a POST request with all of the fields specified:

The API:

/api/security/authentication/cluster/ldap

The call:

```
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"servers\": [ \"10.10.10.10\", \"domainB.example.com\" ], \"schema\":
\"ad_idmu\", \"port\": 389, \"min_bind_level\": \"anonymous\",
\"bind_dn\": \"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"base_scope\": \"subtree\", \"use_start_tls\": false,
\"session_security\": \"none\"}"
```

The following example shows how to issue a POST request with a number of optional fields not specified:

The API:

/api/security/authentication/cluster/ldap

The call:

```
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"port\": 389, \"bind_dn\":
\"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"session_security\": \"none\"}"
```

=== Updating the cluster LDAP configuration

The cluster LDAP PATCH request updates the LDAP configuration of the cluster.

The following example shows how a PATCH request is used to update the cluster LDAP configuration:

```

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"servers\": [ \"55.55.55.55\" ], \"schema\": \"ad_idmu\", \"port\": 636,
\"use_start_tls\": false }"
-----

=== Deleting the cluster LDAP configuration

The cluster LDAP DELETE request deletes the LDAP configuration of the
cluster.

The following example shows how a DELETE request is used to delete the
cluster LDAP configuration:

-----

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X DELETE "https://<mgmt-
ip>/api/security/authentication/cluster/ldap" -H "accept:
application/hal+json"
-----

[[IDde1ff55a9e81e7bfb24253ebbd648bac]]
= Delete the LDAP configuration for the cluster

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#

*Introduced In:* 9.6

Deletes the LDAP configuration of the cluster.

|_links
|link:#_links[_links]
a|

|base_dn
|string
a|Specifies the default base DN for all searches.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|bind_as_cifs_server
|boolean
a|Specifies whether or not CIFS server's credentials are used to bind to
the LDAP server.

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.

|bind_password
|string
a|Specifies the bind password for the LDAP servers.

|group_dn
|string
a|Specifies the group Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for group lookups.

|group_membership_filter

```

```

|string
a|Specifies the custom filter used for group membership lookups from an
LDAP server.

|group_scope
|string
a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.

|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host

```

```

lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

```

```

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn
|string
a|Specifies the user Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for user lookups.

|user_scope
|string
a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

= Update the LDAP configuration for the cluster
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#
```

Introduced In: 9.6

Both mandatory and optional parameters of the LDAP configuration can be updated.

IPv6 must be enabled if IPv6 family addresses are specified. Configuring more than one LDAP server is recommended to avoid a single point of failure. Both FQDNs and IP addresses are supported for the `servers` property.

The LDAP servers are validated as part of this operation. LDAP validation fails in the following scenarios:

- . The server does not have LDAP installed.
- . The server is invalid.
- . The server is unreachable.

```
|string
```

```
a|Specifies the default search scope for LDAP queries:
```

```
* base - search the named entry only
```

```
* onelevel - search all entries immediately below the DN
```

```
* subtree - search the named DN entry and the entire subtree below the DN
```

```
|bind_as_cifs_server
```

```
|boolean
```

```
a|Specifies whether or not CIFS server's credentials are used to bind to the LDAP server.
```

```
|bind_dn
```

```
|string
```

```
a|Specifies the user that binds to the LDAP servers.
```

```
|bind_password
```

```
|string
```

```
a|Specifies the bind password for the LDAP servers.
```

```
|group_dn
```

```
|string
```

```
a|Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.
```

```
|group_membership_filter
```

```
|string
```

```
a|Specifies the custom filter used for group membership lookups from an LDAP server.
```

```
|group_scope
```

```
|string
```

```

a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.

|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

```

```

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic

```

* seal - seal and sign LDAP traffic

|skip_config_validation

|boolean

a|Indicates whether or not the validation for the specified LDAP configuration is disabled.

|status

|link:#status[status]

a|

|try_channel_binding

|boolean

a|Specifies whether or not channel binding is attempted in the case of TLS/LDAPS.

|use_start_tls

|boolean

a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn

|string

a|Specifies the user Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for user lookups.

|user_scope

|string

a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only

* onelevel - search all entries immediately below the DN

* subtree - search the named DN entry and the entire subtree below the DN

[[ID4353aefadad0604ab7229359e3bf0e96]]
= Create the LDAP configuration for the cluster

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#

*Introduced In:* 9.6

A cluster can have only one LDAP configuration. IPv6 must be enabled if
IPv6 family addresses are specified.

== Required properties

* `servers` - List of LDAP servers used for this client configuration.
* `bind_dn` - Specifies the user that binds to the LDAP servers.
* `base_dn` - Specifies the default base DN for all searches.

== Recommended optional properties

* `schema` - Schema template name.
* `port` - Port used to connect to the LDAP Servers.
* `ldaps_enabled` - Specifies whether or not LDAPS is enabled.
* `min_bind_level` - Minimum bind authentication level.
* `bind_password` - Specifies the bind password for the LDAP servers.

```

- * ``base_scope`` - Specifies the default search scope for LDAP queries.
- * ``use_start_tls`` - Specifies whether or not to use Start TLS over LDAP connections.
- * ``session_security`` - Specifies the level of security to be used for LDAP communications.
- * ``bind_as_cifs_server`` - Indicates if CIFS server's credentials are used to bind to the LDAP server.
- * ``query_timeout`` - Maximum time to wait for a query response from the LDAP server, in seconds.
- * ``user_dn`` - User Distinguished Name (DN) used as the starting point in the LDAP directory tree for user lookups.
- * ``user_scope`` - Default search scope for LDAP for user lookups.
- * ``group_dn`` - Group Distinguished Name (DN) used as the starting point in the LDAP directory tree for group lookups.
- * ``group_scope`` - Default search scope for LDAP for group lookups.
- * ``netgroup_dn`` - Netgroup Distinguished Name (DN) used as the starting point in the LDAP directory tree for netgroup lookups.
- * ``netgroup_scope`` - Default search scope for LDAP for netgroup lookups.
- * ``netgroup_byhost_dn`` - Netgroup Distinguished Name (DN) used as the starting point in the LDAP directory tree for netgroup by host lookups.
- * ``netgroup_byhost_scope`` - Default search scope for LDAP for netgroup by host lookups.
- * ``is_netgroup_byhost_enabled`` - Specifies whether netgroup by host querying is enabled.
- * ``group_membership_filter`` - Custom filter used for group membership lookup from an LDAP server.
- * ``skip_config_validation`` - Indicates whether or not the validation for the specified LDAP configuration is disabled.

== Default property values

- * ``schema`` - `_RFC-2307_`
- * ``port`` - `_389_`
- * ``ldaps_enabled`` - `_false_`
- * ``min_bind_level`` - `_simple_`
- * ``base_scope`` - `_subtree_`
- * ``use_start_tls`` - `_false_`
- * ``session_security`` - `_none_`
- * ``query_timeout`` - `_3_`
- * ``user_scope`` - `_subtree_`
- * ``group_scope`` - `_subtree_`
- * ``netgroup_scope`` - `_subtree_`
- * ``netgroup_byhost_scope`` - `_subtree_`
- * ``is_netgroup_byhost_enabled`` - `_false_`
- * ``skip_config_validation`` - `_false_`
- * ``try_channel_binding`` - `_true_`

Configuring more than one LDAP server is recommended to avoid a single point of failure. Both FQDNs and IP addresses are supported for the `servers` property.

The LDAP servers are validated as part of this operation. LDAP validation fails in the following scenarios:

- . The server does not have LDAP installed.
- . The server is invalid.
- . The server is unreachable.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|bind_as_cifs_server
|boolean
a|Specifies whether or not CIFS server's credentials are used to bind to
the LDAP server.

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.

```

|bind_password
|string
a|Specifies the bind password for the LDAP servers.

|group_dn
|string
a|Specifies the group Distinguished Name (DN) that is used as the starting point in the LDAP directory tree for group lookups.

|group_membership_filter
|string
a|Specifies the custom filter used for group membership lookups from an LDAP server.

|group_scope
|string
a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.

|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind

```

* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|schema

```

```

|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn
|string
a|Specifies the user Distinguished Name (DN) that is used as the starting

```

point in the LDAP directory tree for user lookups.

|user_scope

|string

a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only

* onelevel - search all entries immediately below the DN

* subtree - search the named DN entry and the entire subtree below the DN

:leveloffset: -1
```

```
= Manage NIS configuration
```

```
:leveloffset: +1
```

```
[[ID66e0e6b0aef14674d148ec3e792be517]]  
= Security authentication cluster NIS endpoint overview
```

```
== Overview
```

NIS servers are used to authenticate user and client computers. NIS domain name and NIS server information is required to configure NIS. This API retrieves and manages NIS server configurations.

```
== Examples
```

```
=== Retrieving cluster NIS information
```

The cluster NIS GET request retrieves the NIS configuration of the cluster.

The following example shows how a GET request is used to retrieve the cluster NIS configuration:

```
----
```

```
# The API:  
/security/authentication/cluster/nis
```

```
# The call:  
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/nis" -H  
"accept: application/hal+json"
```

```
# The response:
{
  "domain": "domainA.example.com",
  "servers": [
    "10.10.10.10",
    "example.com"
  ],
  "bound_servers": [
    "10.10.10.10"
  ]
}
```

=== Creating the cluster NIS configuration

The cluster NIS POST request creates a NIS configuration for the cluster.

The following example shows how a POST request is used to create a cluster NIS configuration:

```
# The API:
/security/authentication/cluster/nis
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
  \"domain\": \"domainA.example.com\", \"servers\": [
  \"10.10.10.10\", \"example.com\" ]}"
```

=== Updating the cluster NIS configuration

The cluster NIS PATCH request updates the NIS configuration of the cluster.

The following example shows how to update the domain:

```
# The API:
/security/authentication/cluster/nis
```

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
```

```
\\"domain\\": \\"domainC.example.com\\", \\"servers\\": [ \\"13.13.13.13\\" ]}"
```

The following example shows how to update the server:

The API:

/security/authentication/cluster/nis

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\\"servers\\": [ \\"14.14.14.14\\" ]}"
```

== Deleting the cluster NIS configuration

The cluster NIS DELETE request deletes the NIS configuration of the cluster.

The following example shows how a DELETE request is used to delete the cluster NIS configuration:

The API:

/security/authentication/cluster/nis

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/hal+json"
```

'''

```
[[ID9f1a81be5e3f3d25c767e316f8bf6d2d]]
```

= Delete the NIS configuration for the cluster

```
[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/authentication/cluster/nis`#
```

Introduced In: 9.6

Deletes the NIS configuration of the cluster. NIS can be removed as a source from ns-switch if NIS is not used for lookups.

:leveloffset: -1

= Manage SAML service

:leveloffset: +1

[[ID7579d15c168888f99b16584661e3b91a]]
= Security authentication cluster saml-sp endpoint overview

== Overview

This API is used to retrieve and display relevant information pertaining
to the SAML service provider configuration in the cluster. The POST
request creates a SAML service provider configuration if there is none
present. The DELETE request removes the SAML service provider
configuration. The PATCH request enables and disables SAML in the
cluster. Various responses are shown in the examples below.
+

'''

== Examples

=== Retrieving the SAML service provider configuration in the cluster

The following output shows the SAML service provider configuration in the
cluster.
+

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/saml-
```

```

sp" -H "accept: application/hal+json"

# The response:
{
  "idp_uri": "https://examplelab.customer.com/idp/Metadata",
  "enabled": true,
  "host": "172.21.74.181",
  "certificate": {
    "ca": "cluster1",
    "serial_number": "156F10C3EB4C51C1",
    "common_name": "cluster1"
  },
  "_links": {
    "self": {
      "href": "/api/security/authentication/cluster/saml-sp"
    }
  }
}
----

'''

=== Creating the SAML service provider configuration

The following output shows how to create a SAML service provider
configuration in the cluster.
+

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/saml-
sp?return_records=true" -H "accept: application/hal+json" -d '{ "idp_uri":
"https://examplelab.customer.com/idp/Metadata", "host": "172.21.74.181",
"certificate": { "ca": "cluster1", "serial_number": "156F10C3EB4C51C1" } }'
----

'''

=== Updating the SAML service provider configuration

The following output shows how to enable a SAML service provider

```

configuration in the cluster.

Disabling the configuration requires the client to be authenticated through SAML prior to performing the operation.

+

'''

The API:

/api/security/authentication/cluster/saml-sp

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/saml-sp/" -d '{ "enabled": true }'
```

'''

=== Deleting the SAML service provider configuration

'''

The API:

/api/security/authentication/cluster/saml-sp

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/security/authentication/cluster/saml-sp/"
```

'''

[[IDfe5e5d3682e3e43f46d590e8ddf61c07]]

= Delete a SAML service provider configuration

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-block]#`/security/authentication/cluster/saml-sp`#

Introduced In: 9.6

Deletes a SAML service provider configuration.

```

```
[[ID415c9353819a3f773a838e745f4ba084]]
```

```
= Create a SAML service provider configuration
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-  
block]#`/security/authentication/cluster/saml-sp`#
```

```
*Introduced In:* 9.6
```

Creates a SAML service provider configuration. Note that "common_name" is mutually exclusive with "serial_number" and "ca" in POST. SAML will initially be disabled, requiring a patch to set "enabled" to "true", so that the user has time to complete the setup of the IdP.

```
== Required properties
```

```
* `idp_uri`
```

```
== Optional properties
```

```
* `certificate`
```

```
* `enabled`
```

```
* `host`
```

```
== Parameters
```

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|verify_metadata_server
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|Verify IdP metadata server identity.
```

```
* Default value: 1
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

```
a|The number of seconds to allow the call to execute before returning.
```

When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```

```

```
== Overview
```

This API changes the password for a local user account.

Only cluster administrators with the `_"admin"_` role can change the password for other cluster or SVM user accounts. If you are not a cluster administrator, you can only change your own password.

```
== Examples
```

```
=== Changing the password of another cluster or SVM user account by a
cluster administrator
```

Specify the user account name and the new password in the body of the POST request. The `owner.uuid` or `owner.name` are not required to be specified for a cluster-scoped user account.

For an SVM-scoped account, along with new password and user account name, specify either the SVM name as the `owner.name` or SVM uuid as the `owner.uuid` in the body of the POST request. These indicate the SVM for which the user account is created and can be obtained from the response

body of a GET request performed on the `_/api/svm/svms_` API.

The API:

POST `"/api/security/authentication/password"`

The call to change the password of another cluster user:

`curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d '{"name":"cluster_user1","password":"hello@1234"}'`

The call to change the password of another SVM user:

`curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d '{"owner.name":"svm1","name":"svm_user1","password":"hello@1234"}'`

=== Changing the password of an SVM-scoped user

NOTE: The IP address in the URI must be same as one of the interfaces owned by the SVM.

The API:

POST `"/api/security/authentication/password"`

The call:

`curl -X POST "https://<SVM-ip>/api/security/authentication/password" -d '{"name":"svm_user1","password":"new1@1234"}'`

'''

= Update the user account password

`[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/security/authentication/password`#`

Introduced In: 9.6

Updates the password for a user account.

== Required parameters

- * `name` - User account name.
- * `password` - New password for the user account.

== Optional parameters

- * `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped user account.

== Related ONTAP commands

- * `security login password`

:leveloffset: -1

= Manage authentication keys (for admins)

:leveloffset: +1

[[ID9e0f24bafb4960b4ad006920ae457759]]
= Security authentication publickeys endpoint overview

== Overview

This API configures the public keys for user accounts.

For secure shell (SSH) access, public-private key pair based
authentication is possible by associating the public key with a user
account.
Prerequisites:
You must have generated the SSH key.
You must be a cluster or SVM administrator to perform the user's public
key.

== Examples

=== Creating a public key for cluster-scoped user accounts

Specify the user account name, public key, index, and comment in the body
of the POST request. The owner.uuid or owner.name are not required for a
cluster-scoped user account.

-----

```

```

# The API:
POST "/api/security/authentication/publickey"

# The call
curl -k https://<mgmt-ip>/api/security/authentication/publickeys --request
POST --data '{ "account": "pubuser2","comment": "Cserver-
Creation","index": 0, "public_key": "ssh-rsa
AAAAB3NzaC1yc2EAAAADAQABAAQDWJTerk2xXi3Lkrqrm6Q67aNmNDNKgpezwzl9Ap+DxtM

ciJNBEiMxNkSFGTnkG74S61pvZNFD6mSznV/28hl3zSjwWiuacsP3BelydeG8nEcCRN5Ap7vMd
Vd" }'
----

=== Creating a public key for SVM-scoped user accounts

For a SVM-scoped account, specify either the SVM name as the owner.name or
the SVM UUID as the owner.uuid along with other parameters for the user
account. These parameters indicate the SVM that contains the user account
for the public key being created and can be obtained from the response
body of the GET request performed on the API"/api/svm/svms".

----

# The API:
POST "/api/security/authentication/publickey"

# The call
curl -k https://<mgmt-ip>/api/security/authentication/publickeys --request
POST --data '{ "account": "pubuser4","comment": "Vserver-
Creation","index": 0,"owner.uuid":"513a78c7-8c13-11e9-8f78-
005056bbf6ac","owner.name":"vs0","public_key": "ssh-rsa

```

```
= Security authentication publickeys owner.uuid account.name index  
endpoint overview
```

```
== Overview
```

This API configures the public keys for end-user (non-cluster admin) accounts.

Specify the owner UUID, the user account name, and the index in the URI path. The owner UUID corresponds to the UUID of the SVM containing the user account associated with the public key and can be obtained from the response body of the GET request performed on the API `"/api/svm/svms"`.

The index value corresponds to the public key that needs to be modified or deleted (it is possible to create more than one public key for the same user account).

```
== Examples
```

```
=== Retrieving the specific configured public key for user accounts
```

```
----
```

```
# The API:
```

```
GET
```

```
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{index}"
```

```

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/513a78c7-
8c13-11e9-8f78-005056bbf6ac/pubuser4/0
----

=== Updating the public key and comment for user accounts

----

# The API:
PATCH
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/d49de271-
8c11-11e9-8f78-005056bbf6ac/pubuser1/0 --request PATCH --data '{
"comment": "Cserver-modification", "public_key": "ssh-rsa

= Manage Azure Key Vaults
```

```
:leveloffset: +1
```

```
[[ID75c3e064b1158e74a33966a4068c5905]]
= Security azure-key-vaults endpoint overview
```

```
== Overview
```

Azure Key Vault (AKV) is a cloud key management service (KMS) that provides a secure store for secrets. This feature allows ONTAP to securely store its encryption keys using AKV.

In order to use AKV with ONTAP, you must first deploy an Azure application with the appropriate access to an AKV and then provide ONTAP with the necessary details, such as key vault name, application ID so that ONTAP can communicate with the deployed Azure application. The properties "state", "azure_reachability" and "ekmip_reachability" are considered advanced properties and are populated only when explicitly requested.

== Examples

=== Creating an AKV for a cluster using the client secret authentication method

The example AKV is configured at the cluster-scope. Note the `_return_records=true` query parameter is used to obtain the newly created key manager configuration.

The API:

POST /api/security/azure-key-vaults

The call:

```
curl -X POST 'https://<mgmt-ip>/api/security/azure-key-  
vaults?return_records=true' -H 'accept: application/hal+json' -d "{  
  \"client_id\": \"client1\", \"tenant_id\": \"tenant1\", \"name\":  
  \"https://mykeyvault.azure.vault.net/\", \"key_id\": \"https://keyvault-  
test.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74\",  
  \"client_secret\" : \"myclientPwd\" }"
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "uuid": "85619643-9a06-11ea-8d52-005056bbeba5",  
      "client_id": "client1",  
      "tenant_id": "tenant1",  
      "name": "https://mykeyvault.azure.vault.net/",  
      "key_id": "https://keyvault-test.vault.azure.net/keys/key1",  
      "_links": {  
        "self": {  
          "href": "/api/security/azure-key-vaults/85619643-9a06-11ea-8d52-

=== Creating an AKV for an SVM using the certificate authentication method

The example AKV is configured for a specific SVM. Note the `_return_records=true_` query parameter is used to obtain the newly created key manager configuration.

```

----

```

```

# The API:
POST /api/security/azure-key-vaults

```

```

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/azure-key-

'''

=== Deleting an AKV configuration for a specific SVM

The following example deletes a configured AKV for a specific SVM.

The API:

DELETE /api/security/azure-key-vaults

The call:

curl -X DELETE 'https://<mgmt-ip>/api/security/azure-key-vaults/85619643-9a06-11ea-8d52-005056bbeba5'

'''

=== Restoring the keys for a specific SVM configured with an AKV

The following example restores all the keys of a specific SVM configured with an AKV.

The API:

POST security/azure-key-vaults/{uuid}/restore

The call:

curl -X POST 'https://<mgmt-ip>/api/security/azure-key-vaults/85619643-9a06-11ea-8d52-005056bbeba5/restore'

The response:

```
{
  "job": {
    "uuid": "6ab6946f-9a0c-11ea-8d52-005056bbeba5",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/6ab6946f-9a0c-11ea-8d52-005056bbeba5"
      }
    }
  }
}
```

'''

=== Rekeying the internal key for a specific SVM configured with an AKV

The following example rekeys the internal key of a specific SVM configured with an AKV.

The API:

POST security/azure-key-vaults/{uuid}/rekey-internal

The call:

curl -X POST 'https://<mgmt-ip>/api/security/azure-key-vaults/85619643-9a06-11ea-8d52-005056bbeba5/rekey-internal'

The response:

{

```

"job": {
  "uuid": "6ab6946f-9a0c-11ea-8d52-005056bbeba5",
  "_links": {
    "self": {
      "href": "/api/cluster/jobs/6ab6946f-9a0c-11ea-8d52-005056bbeba5"
    }
  }
}
}
}

= Retrieve AKVs configured for all clusters and SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/azure-key-vaults`#

```

Introduced In: 9.8

Retrieves AKVs configured for all clusters and SVMs.

== Related ONTAP commands

```

* `security key-manager external azure show`
* `security key-manager external azure check`

```

== Parameters

```

a|Filter by key_id

|uuid

|string

|query

|False

a|Filter by uuid

|authentication_method

|string

|query

|False

a|Filter by authentication_method

* Introduced in: 9.10

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is

reached.

- * Default value: 1
- * Max value: 120
- * Min value: 0

|return_records
|boolean
|query
|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

- * Default value: 1

|order_by
|array[string]
|query
|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

[[ID048301e7a78a11a83b94755c15e3771e]]
= Create an AKV configuration for all clusters and SVMs

```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/security/azure-key-vaults`#
```

Introduced In: 9.8

Configures the AKV configuration for all clusters and SVMs.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create a AKV.
- * `client_id` - Application (client) ID of the deployed Azure application with appropriate access to an AKV.
- * `tenant_id` - Directory (tenant) ID of the deployed Azure application with appropriate access to an AKV.
- * `client_secret` - Secret used by the application to prove its identity to AKV.
- * `client_certificate` - PKCS12 Certificate used by the application to prove its identity to AKV.
- * `key_id` - Key Identifier of AKV encryption key.
- * `name` - Name of the deployed AKV used by ONTAP for storing keys.

== Optional properties

- * `proxy_type` - Type of proxy (http, https etc.) if proxy configuration is used.
- * `proxy_host` - Proxy hostname if proxy configuration is used.
- * `proxy_port` - Proxy port number if proxy configuration is used.
- * `proxy_username` - Proxy username if proxy configuration is used.
- * `proxy_password` - Proxy password if proxy configuration is used.

== Related ONTAP commands

- * `security key-manager external azure enable`
- * `security key-manager external azure update-config`

== Parameters

```

Status: Default

ONTAP Error Response Codes

|===

Error Code	Description
------------	-------------

3735553	
---------	--

Failed to create self-signed certificate.

3735664	
---------	--

The specified key size is not supported in FIPS mode.

3735665	
---------	--

The specified hash function is not supported in FIPS mode.
--

3735700	
---------	--

The specified key size is not supported.
--

52559972	
----------	--

```

| The certificates start date is later than the current date.

| 65537500
| A key manager has already been configured for this SVM.

| 65537504
| Internal error. Failed to store configuration in internal database.

| 65537505
| One or more volume encryption keys of the given SVM are stored on a key
manager configured for the admin SVM.

| 65537506
| AKV is not supported in MetroCluster configurations.

| 65537512
| AKV cannot be configured for the given SVM as not all nodes in the
cluster can enable the Azure Key Vault feature.

| 65537514
| Failed to check if the Azure Key Vault feature is enabled.

| 65537518
| Failed to find an interface with Cluster role.

| 65537523
| Invalid key ID format. Example key ID format": "
"https://mykeyvault.vault.azure.net/keys/key1".

| 65537526
| Failed to enable Azure Key Vault feature.

| 65537567
| No authentication method provided.

| 65537573
| Invalid client certificate.

azure_reachability
```

Indicates whether or not the AKV service is reachable from all the nodes in the cluster.

This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

```

```
[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability
```

Provides the connectivity status for the given SVM on the given node to all EKMIP servers configured on all nodes of the cluster.

This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

```
[cols=3*,options=header]
```

```

|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the AKV wrapped internal key is available cluster
wide.

This is an advanced property; there is an added cost to retrieving its
value. The property is not populated for either a collection GET or an
instance GET unless it is explicitly requested using the `fields` query
parameter or GET for all advanced properties is enabled.

[cols=3*,options=header]
|===
|Name
|Type

```

```

|Description

|available
|boolean
a|Set to true when an AKV wrapped internal key is present on all nodes of
the cluster.

|code
|integer
a|Code corresponding to the status message. Returns a 0 if AKV wrapped key
is available on all nodes in the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

|===

ONTAP Error Response Codes

```
|===
| Error Code | Description

| 65536242
| One or more self-encrypting drives are assigned an authentication key.

| 65536243
| Cannot determine authentication key presence on one or more self-
encrypting drives.

| 65536817
| Internal error. Failed to determine if key manager is safe to disable.

| 65536827
| Internal error. Failed to determine if the given SVM has any encrypted
volumes.

| 65536834
| Internal error. Failed to get existing key-server details for the given
SVM.

| 65536867
| Volume encryption keys (VEK) for one or more encrypted volumes are
stored on the key manager configured for the given SVM.

| 65536883
| Internal error. Volume encryption key is missing for a volume.
```

```
| 65536884
| Internal error. Volume encryption key is invalid for a volume.

| 65536924
| Cannot remove key manager that still contains one or more NSE
authentication keys.

| 65537120
| Azure Key Vault is not configured for the given SVM.

| 196608080
| One or more nodes in the cluster have the root volume encrypted using
NVE (NetApp Volume Encryption).

| 196608301
| Internal error. Failed to get encryption type.

| 196608305
| NAE aggregates found in the cluster.

[[ID81becab1a55acd0ce287baclaf68486d]]
= Update the AKV configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/azure-key-vaults/{uuid}`#

*Introduced In:* 9.8

Updates the AKV configuration.

== Optional properties

* `client_secret` - New secret used to prove the application's identity to
the AKV.
* `client_certificate` - New PKCS12 certificate used to prove the
application's identity to the AKV.
* `key_id` - Key Identifier of the new AKV key encryption key.

```

- * ``proxy_type`` - Type of proxy (http, https etc.) if proxy configuration is used.
- * ``proxy_host`` - Proxy hostname if proxy configuration is used.
- * ``proxy_port`` - Proxy port number if proxy configuration is used.
- * ``proxy_username`` - Proxy username if proxy configuration is used.
- * ``proxy_password`` - Proxy password if proxy configuration is used.
- * ``client_id`` - Application (client) ID of the deployed Azure application with appropriate access to an AKV.
- * ``tenant_id`` - Directory (tenant) ID of the deployed Azure application with appropriate access to an AKV.

== Related ONTAP commands

- * ``security key-manager external azure update-client-secret``
- * ``security key-manager external azure update-credentials``
- * ``security key-manager external azure rekey-external``
- * ``security key-manager external azure update-config``

== Parameters

```
[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description
```

```
|uuid
|string
|path
|True
a|AKV UUID
```

```
|return_timeout
|integer
|query
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job

completes so it can return something other than 202.

- * Default value: 1
- * Max value: 120
- * Min value: 0

|===

== Request Body

[cols=3*,options=header]

|===

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|authentication_method

|string

a|Authentication method for the AKV instance.

|azure_reachability

|link:#azure_reachability[azure_reachability]

a|Indicates whether or not the AKV service is reachable from all the nodes in the cluster.

This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

|client_certificate

|string

a|PKCS12 Certificate used by the application to prove its identity to AKV.

|client_id

|string

a|Application client ID of the deployed Azure application with appropriate access to an AKV.

```

|client_secret
|string
a|Secret used by the application to prove its identity to AKV.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|key_id
|string
a|Key Identifier of AKV key encryption key.

|name
|string
a|Name of the deployed AKV that will be used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* Introduced in: 9.8
* readCreate: 1

|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string

```

a|Proxy username.

|scope

|string

a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to "cluster".

|state

|link:#state[state]

a|Indicates whether or not the AKV wrapped internal key is available cluster wide.

This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

|svm

|link:#svm[svm]

a|

|tenant_id

|string

a|Directory (tenant) ID of the deployed Azure application with appropriate access to an AKV.

|uuid

|string

a|A unique identifier for the Azure Key Vault (AKV).

ONTAP Error Response Codes

|===

| Error Code | Description

| 65537120

| Azure Key Vault is not configured for the given SVM.

| 65537504

| Internal error. Failed to store configuration in internal database.

| 65537517

| The field "client_secret" must be specified.

| 65537540

| Invalid client secret.

| 65537541

| No inputs were provided for the patch request.

| 65537547

| One or more volume encryption keys for encrypted volumes of this data SVM are stored in the key manager configured for the admin SVM. Use the REST API POST method to migrate this data SVM's keys from the admin SVM's key manager to this data SVM's key manager before running the rekey operation.

| 65537573

| Invalid client certificate.

| 65537577

| The AKV certificate authentication method cannot be configured for the given SVM as not all nodes in the cluster support the AKV certificate authentication.

[[ID0289803eb992f0199d0ca7f2e69132df]]
= Create a certificate signing request

```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/security/certificate-signing-request`#
```

Introduced In: 9.8

This API generates a Certificate Signing Request(CSR) and a private key pair. A CSR is a message sent securely to a certificate authority (CA) via any electronic media to apply for a digital identity certificate. This is a general utility API for users to generate a CSR.

== Recommended optional properties

- * `subject_name` - Subject details of the certificate.
- * `security_strength` - Key size of the certificate in bits. Specifying a stronger security strength in bits is recommended when creating a certificate.
- * `hash_function` - Hashing function.
- * `algorithm` - Asymmetric algorithm. Algorithm used to generate a public/private key pair when creating a certificate.
- * `subject_alternatives` - Subject Alternate name extensions.

== Default property values

If not specified in POST, the following default property values are assigned:

- * `security_strength` - _112_
- * `hash_function` - _sha256_
- * `algorithm` - _rsa_

== Related ONTAP commands

- * `security certificate generate-csr`

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|return_records
```

```

|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

This API displays security certificate information and manages the certificates in ONTAP.

== Installing certificates in ONTAP

The security certificates GET request retrieves all of the certificates in the cluster.

== Examples

=== Retrieving all certificates installed in the cluster with their common-names

The API:
/api/security/certificates

The call:
curl -X GET "https://<mgmt-
ip>/api/security/certificates?fields=common_name" -H "accept:
application/hal+json"

The response:
{
 "records": [
 {
 "svm": {
 "name": "vs0"
 },
 "uuid": "dad2363b-8ac0-11e8-9058-005056b482fc",
 "common_name": "vs0",

```

    "_links": {
      "self": {
        "href": "/api/security/certificates/dad2363b-8ac0-11e8-9058-005056b482fc"
      }
    },
    {
      "uuid": "1941e048-8ac1-11e8-9058-005056b482fc",
      "common_name": "ROOT",
      "_links": {

=== Signing a new certificate signing request using an existing CA
certificate UUID
```

Once you have created a certificate of type "root_ca", you can use that certificate to act as a local Certificate Authority to sign new certificate signing requests. The following example signs a new certificate signing request using an existing CA certificate UUID. If successful, the API returns a signed certificate.

```
----
```

```

|query
|False
a|Filter by intermediate_certificates

* Introduced in: 9.8

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

```
* Default value: 1
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|authority_key_identifier

|string

a|Provides the key identifier of the issuing CA certificate that signed the SSL certificate.

|ca

|string

a|Certificate authority

|common_name

|string

a|FQDN or custom common name. Provide on POST when creating a self-signed certificate.

|expiry_time

|string

a|Certificate expiration time. Can be provided on POST if creating self-signed certificate. The expiration time range is between 1 day to 10 years.

|hash_function

|string

a|Hashing function. Can be provided on POST when creating a self-signed certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates

|array[string]

a|Chain of intermediate Certificates in PEM format. Only valid in POST when installing a certificate.

|key_size

|integer

a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048, 3072. Can be provided on POST if creating self-signed certificate. Key size of 512 is not allowed on POST.

|name

|string

a|Certificate name. If not provided in POST, a unique name specific to the SVM is automatically generated.

|private_key

|string

a|Private key Certificate in PEM format. Only valid for create when installing a CA-signed certificate. This is not audited.

```

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|serial_number
|string
a|Serial number of certificate.

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6

|uuid

= Create or install security certificates
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates`#
```

Introduced In: 9.6

Creates or installs a certificate.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create or install the certificate.
- * `common_name` - Common name of the certificate. Required when creating a certificate.
- * `type` - Type of certificate.
- * `public_certificate` - Public key certificate in PEM format. Required when installing a certificate.
- * `private_key` - Private key certificate in PEM format. Required when installing a CA-signed certificate.

== Recommended optional properties

- * `expiry_time` - Certificate expiration time. Specifying an expiration time is recommended when creating a certificate.
- * `key_size` - Key size of the certificate in bits. Specifying a strong

key size is recommended when creating a certificate.

* `name` - Unique certificate name per SVM. If one is not provided, it is automatically generated.

== Default property values

If not specified in POST, the following default property values are assigned:

* `key_size` - _2048_

* `expiry_time` - _P365DT_

* `hash_function` - _sha256_

== Related ONTAP commands

* `security certificate create`

* `security certificate install`

== Parameters

ONTAP Error Response Codes

```

|===
| Error Code | Description

| 3735645
| Cannot specify a value for serial. It is generated automatically.

| 3735622

```

```
| The certificate type is not supported.

| 3735664
| The specified key size is not supported in FIPS mode.

| 3735665
| The specified hash function is not supported in FIPS mode.

| 3735553
| Failed to create self-signed Certificate.

| 3735646
| Failed to store the certificates.

| 3735693
| The certificate installation failed as private key was empty.

| 3735618
| Cannot accept private key for server_ca or client_ca.

| 52363365
| Failed to allocate memory.

| 52559975
| Failed to read the certificate due to incorrect formatting.

| 52363366
| Unsupported key type.

| 52560123
| Failed to read the key due to incorrect formatting.

| 52559972
| The certificates start date is later than the current date.

| 52559976
| The certificate and private key do not match.

| 52559973
| The certificate has expired.

| 52363366
| Logic error: use of a dead object.

| 3735696
| Intermediate certificates are not supported with client_ca and server_ca
type certificates.
```

```
| 52559974
| The certificate is not supported in FIPS mode.

| 3735676
| Cannot continue the installation without a value for the common name.
Since the subject field in the certificate is empty, the field
"common_name" must have a value to continue with the installation.

| 3735558
| Failed to extract information about Common Name from the certificate.

| 3735588
| The common name (CN) extracted from the certificate is not valid.

| 3735632
| Failed to extract Certificate Authority Information from the
certificate.

```
a|Provides the key identifier of the issuing CA certificate that signed the SSL certificate.
```

```
|ca
```

```
|string
a|Certificate authority

|common_name
|string
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time. Can be provided on POST if creating self-
signed certificate. The expiration time range is between 1 day to 10
years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates
|array[string]
a|Chain of intermediate Certificates in PEM format. Only valid in POST
when installing a certificate.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate. Key
size of 512 is not allowed on POST.

|name
|string
a|Certificate name. If not provided in POST, a unique name specific to the
SVM is automatically generated.

|private_key
|string
a|Private key Certificate in PEM format. Only valid for create when
installing a CA-signed certificate. This is not audited.
```

```

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|serial_number
|string
a|Serial number of certificate.

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6

[[IDd10ee400ecf252af1e6907e8ff226f67]]
= Sign security certificates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates/{ca.uuid}/sign`#

```

Introduced In: 9.6

Signs a certificate.

== Required properties

* `signing_request` - Certificate signing request to be signed by the given certificate authority.

== Recommended optional properties

* `expiry_time` - Certificate expiration time. Specifying an expiration time for a signed certificate is recommended.

* `hash_function` - Hashing function. Specifying a strong hashing function is recommended when signing a certificate.

== Default property values

If not specified in POST, the following default property values are assigned:

* `expiry_time` - `_P365DT_`

* `hash_function` - `_sha256_`

== Related ONTAP commands

* `security certificate sign`

This API is used to sign a certificate request using a pre-existing self-signed root certificate. The self-signed root certificate acts as a certificate authority within its scope and maintains the records of its signed certificates.

The root certificate can be created for a given SVM or for the cluster using [`POST security/certificates`].

== Parameters

[cols=5*,options=header]
|===

Name	Type	In	Required	Description
------	------	----	----------	-------------

```

|ca.uuid
|string
|path
|True
a|UUID of the existing certificate authority certificate

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

|===

ONTAP Error Response Codes

|===

| Error Code | Description

| 3735628

| Failed to use CA certificate for signing.

| 3735665

| The specified hash function is not supported in FIPS mode.

| 52559974

| The certificate is not supported in FIPS mode.

| 3735626

| Failed to generate signed Certificate.

| 3735558

| Failed to extract information about Common Name from the certificate.

| 3735588

| The common name (CN) extracted from the certificate is not valid.

| 3735632

| Failed to extract Certificate Authority Information from the certificate.

| 3735629

| Failed to sign the certificate because Common Name of signing certificate and Common Name of CA certificate are same.

| 3735630

| Failed to sign the certificate because expiry date of signing certificate exceeds the expiry date of CA certificate.

= Security gcp-kms endpoint overview
```

```
== Overview
```

Google Cloud Key Management Services is a cloud key management service (KMS) that provides a secure store for encryption keys. This feature allows ONTAP to securely store its encryption keys using Google Cloud KMS. In order to use Google Cloud KMS with ONTAP, a user must first deploy a Google Cloud application with appropriate access to the Google Cloud KMS

and then provide
ONTAP with the necessary details, such as, project ID, key ring name,
location, key name and application credentials to allow ONTAP to
communicate
with the deployed Google Cloud application.
The properties ``state``, ``google_reachability`` and ``ekmip_reachability`` are
considered advanced properties and are populated only when explicitly
requested.

== Examples

=== Enabling GCKMS for an SVM

The following example shows how to enable GCKMS at the SVM-scope. Note the
`_return_records=true_` query parameter is used to obtain the newly created
key manager configuration.

The API:

POST /api/security/gcp-kms

The call:

```
curl -X POST 'https://<mgmt-ip>/api/security/gcp-kms?return_records=true'  
-H 'accept: application/hal+json' -d '{"svm":{"uuid":"f36ff553-e713-11ea-  
bd56-005056bb4222" }, "project_id": "testProj",  
"key_ring_name": "testKeyRing", "key_ring_location": "global", "key_name":  
"key1", "application_credentials": "myAppCred"}'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",  
      "svm": {  
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",  
        "name": "vs0"  
      },  
      "project_id": "testProj",  
      "key_ring_name": "testKeyRing",  
      "key_ring_location": "global",  
      "key_name": "key1",  
      "_links": {  
        "self": {  
          "href": "/api/security/gcp-kms/f72098a2-e908-11ea-bd56-
```

```
005056bb4222"
```

```
}
```

```
}
```

```
}
```

```
]
```

```
}
```

```
----
```

```
'''
```

=== Retrieving all GCKMS configurations

The following example shows how to retrieve all GCKMS configurations.

```
----
```

The API:

```
GET /api/security/gcp-kms
```

The call:

```
curl -X GET 'https://<mgmt-ip>/api/security/gcp-kms?fields=*
```

The response:

```
{
```

```
"records": [
```

```
{
```

```
  "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
```

```

|query
|False
a|Limit the number of records returned.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
```

When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

- * Default value: 1
- * Max value: 120
- * Min value: 0

|return_records
|boolean
|query
|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

- * Default value: 1

|order_by
|array[string]
|query
|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

= Create the Google Cloud KMS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms`#

*Introduced In:* 9.9

Configures the Google Cloud KMS configuration for the specified SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a Google
Cloud KMS.

```

- * ``project_id`` - Google Cloud project (application) ID of the deployed Google Cloud application with appropriate access to the Google Cloud KMS.
- * ``key_ring_name`` - Google Cloud KMS key ring name of the deployed Google Cloud application with appropriate access to the specified Google Cloud KMS.
- * ``key_ring_location`` - Google Cloud KMS key ring location.
- * ``key_name`` - Key Identifier of the Google Cloud KMS key encryption key.
- * ``application_credentials`` - Google Cloud application's service account credentials required to access the specified KMS. It is a JSON file containing an email address and the private key of the service account holder.

== Optional properties

- * ``proxy_type`` - Type of proxy (http/https) if proxy configuration is used.
- * ``proxy_host`` - Proxy hostname if proxy configuration is used.
- * ``proxy_port`` - Proxy port number if proxy configuration is used.
- * ``proxy_username`` - Proxy username if proxy configuration is used.
- * ``proxy_password`` - Proxy password if proxy configuration is used.

== Related ONTAP commands

- * ``security key-manager external gcp enable``

== Parameters

= Update the Google Cloud KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/security/gcp-kms/{uuid}`#

Introduced In: 9.9

Updates the Google Cloud KMS configuration.

== Optional properties

- * `key_name` - Key Identifier of the Google Cloud KMS key encryption key.
- * `application_credentials` - New credentials used to verify the application's identity to the Google Cloud KMS.
- * `proxy_type` - Type of proxy (http/https) if proxy configuration is used.
- * `proxy_host` - Proxy hostname if proxy configuration is used.
- * `proxy_port` - Proxy port number if proxy configuration is used.
- * `proxy_username` - Proxy username if proxy configuration is used.
- * `proxy_password` - Proxy password if proxy configuration is used.
- * `project_id` - Google Cloud project (application) ID of the deployed Google Cloud application with appropriate access to the Google Cloud KMS.
- * `key_ring_name` - Google Cloud KMS key ring name of the deployed Google Cloud application with appropriate access to the specified Google Cloud KMS.
- * `key_ring_location` - Google Cloud KMS key ring location.

== Related ONTAP commands

- * `security key-manager external gcp update-credentials`
- * `security key-manager external gcp rekey-external`

== Parameters

[cols=5*,options=header]

```

|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Google Cloud KMS UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|string
a|Google Cloud application's service account credentials required to
access the specified KMS. It is a JSON file containing an email address
and the private key of the service account holder.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|google_reachability
|link:#google_reachability[google_reachability]
a|Indicates whether or not the Google Cloud KMS service is reachable from
all nodes in the cluster.
This is an advanced property; there is an added cost to retrieving its
value. The property is not populated for either a collection GET or an
instance GET unless it is explicitly requested using the `fields` query
parameter or GET for all advanced properties is enabled.

|key_name
|string
a|Key Identifier of Google Cloud KMS key encryption key.

|key_ring_location
|string
a|Google Cloud KMS key ring location.

|key_ring_name
|string
a|Google Cloud KMS key ring name of the deployed Google Cloud application.

|project_id
```

```

|string
a|Google Cloud project (application) ID of the deployed Google Cloud
application that has appropriate access to the Google Cloud KMS.

|proxy_host
|string
a|Proxy host name.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port number.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string
a|Proxy username.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|state
|link:#state[state]
a|Google Cloud Key Management Services is a cloud key management service
(KMS) that provides a secure store for encryption keys. This object
indicates whether or not the Google Cloud KMS key protection is available
on all nodes in the cluster.
This is an advanced property; there is an added cost to retrieving its
value. The property is not populated for either a collection GET or an
instance GET unless it is explicitly requested using the `fields` query
parameter or GET for all advanced properties is enabled.

|Required
|Description

|uuid
|string
|path
|True
a|UUID of the existing Google Cloud KMS configuration.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

|string
|query
|False
a|Filter by svm.name

|certificate.uuid
|string
|query
|False
a|Filter by certificate.uuid

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
```

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

= Add a CA certificate to IPsec
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-  
block]#`/security/ipsec/ca-certificates`#
```

Introduced In: 9.10

Add CA certificate to IPsec. The CA certificate should already be installed on the cluster prior to adding them to IPsec.

The CA certificate can be installed on the cluster using the `/security/certificates` endpoint.

The `svm.uuid` or `svm.name` should not be supplied for certificates that have a scope of cluster.

== Related ONTAP commands

* ``security ipsec ca-certificate add``

== Parameters

== Error

```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description
| 66257099
| Only one protocol can be specified.
| 66257100
| Only one local port can be specified.

```

| 66257101
| Only one remote port can be specified.

| 66257104
| IPsec policy with same name already exists in this SVM.

| 66257107
| The specified pre-shared key is not a valid hexadecimal string.

| 66257109
| The specified pre-shared key is not a valid Base64 encoded binary string.

| 66257110
| Failed to a create policy sequencing value.

| 66257111
| The IPsec policy with action ESP TRANSPORT provides packet protection and requires a secret key for authentication.

| 66257112
| The IPsec policy with the action specified does not provide packet protection and the authentication method provided for the policy will be ignored.

| 66257113
| Only one local IP subnet can be specified.

| 66257114
| Only one remote IP subnet can be specified.

| 66257115
| Port ranges containing more than one port are not supported.

| 66257117
| IPsec is not supported on the SVM specified in the policy, IPsec is supported on data SVMs only.

| 66257120
| The subnet selector must be a host address (An IPv4 address with a 32-bit netmask or an IPv6 address with a 128-bit netmask).

| 66257121
| The maximum limit of IPsec Policies has reached for the specified SVM.

| 66257125
| The local_endpoint.address must be specified with

```

local_endpoint.netmask.

| 66257126
| The remote_endpoint.address must be specified with
remote_endpoint.netmask.

| 66257132
| Invalid value for port field. Value should be in range <1-65535>.

| 66257139
| Certificate with the specified UUID was not found.

| 66257140
| Only certificates with a client or server type are supported.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|action
|string
a|Action for the IPsec policy.

|authentication_method
|string
a|Authentication method for the IPsec policy.

|certificate
|link:#certificate[certificate]
a|Certificate for the IPsec policy.

|enabled
|boolean
a|Indicates whether or not the policy is enabled.

|ipspace
|link:#ipspace[ipspace]
a|Applies to both SVM and cluster-scoped objects. Either the UUID or name
may be supplied on input.

|local_endpoint
|link:#local_endpoint[local_endpoint]
a|Local endpoint for the IPsec policy.

|local_identity
|string
a|Local Identity

|name
|string
```

a|IPsec policy name.

|protocol

|string

a|Lower layer protocol to be covered by the IPsec policy.

|remote_endpoint

|link:#remote_endpoint[remote_endpoint]

a|Remote endpoint for the IPsec policy.

|remote_identity

|string

a|Remote Identity

|scope

|string

a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to "cluster".

|secret_key

|string

a|Pre-shared key for IKE negotiation.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|Unique identifier of the IPsec policy.

ONTAP Error Response Codes

|===

| Error Code | Description

| 65536139

| Cluster-wide passphrase is incorrect.

| 65536805

| Common Criteria Mode requires an effective cluster version of ONTAP 9.4 or later.

| 65536806

| Passphrase length error.

```
| 65536807
| MetroCluster cannot be configured while in Common Criteria mode.

| 65536809
| Common Criteria mode is disabled on the cluster. Contact technical
support for assistance in enabling Common Criteria mode.

| 65537302
| The passphrase field is required when changing cc_mode_enabled to true.

| 65537304
| Unable to modify polling period because no external key management is
configured on the cluster.

[[ID382daeabfa65e2686fbdc5943d4a40f6]]

= Security key-managers endpoint overview

== Overview

A key manager is a key management solution (software or dedicated hardware) that enables other ONTAP client modules to securely and persistently store keys for various uses. For example, WAFL uses the key management framework to store and retrieve the volume encryption keys that it uses to encrypt/decrypt data on NVE volumes. A key manager can be configured at both cluster scope and SVM, with one key manager allowed per SVM. The key management framework in ONTAP supports two mutually exclusive modes for persisting keys: external and onboard.

When an SVM is configured with external key management, the keys are stored on up to four key servers that are external to the system.

Once external key management is enabled for an SVM, key servers can be added or removed using the `_/api/security/key-managers/{uuid}/key-servers_` endpoint. See `[`+POST /security/key-managers/{uuid}/key-servers+`]` and `[`+DELETE /security/key-managers/{uuid}/key-servers/{server}+`]` for more details.

Setting up external key management dictates that the required certificates for securely communicating with the key server are installed prior to configuring the key manager. To install the required client and server_ca certificates, use the `_/api/security/certificates/_` endpoint.

See `[`POST /security/certificates`]`, `[`GET /security/certificates/uuid`]` and `[`+DELETE /security/certificates/{uuid}+`]` for more details.

When an SVM is configured with the Onboard Key Manager, the keys are stored in ONTAP in wrapped format using a key hierarchy created using the salted hash of the passphrase entered when configuring the Onboard Key Manager. This model fits well for customers who use ONTAP to store their own data.

== Examples

=== Creating an external key manager with 1 key server for a cluster

The example key manager is configured at the cluster-scope with one key server. Note that the UUIDs of the certificates are those that are already installed at the cluster-scope. Note the `_return_records=true_query` parameter is used to obtain the newly created key manager configuration

The API:

POST /api/security/key-managers

The call:

```
curl -X POST 'https://<mgmt-ip>/api/security/key-  
managers?return_records=true' -H 'accept: application/hal+json' -d "{  
  \"external\": { \"client_certificate\": { \"uuid\": \"5fb1701a-d922-11e8-  
bfe8-005056bb017d\" }, \"server_ca_certificates\": [ { \"uuid\":  
  \"827d7d31-d6c8-11e8-b5bf-005056bb017d\" } ], \"servers\": [ { \"server\":  
  \"10.225.89.33:5696\" } ] } }"
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "uuid": "815e9462-dc57-11e8-9b2c-005056bb017d",  
      "external": {  
        "client_certificate": {  
          "uuid": "5fb1701a-d922-11e8-bfe8-005056bb017d"  
        },  
        "server_ca_certificates": [  
          {  
            "uuid": "827d7d31-d6c8-11e8-b5bf-005056bb017d"  
          }  
        ],  
        "servers": [  
          {  
            "server": "10.225.89.33:5696"  
          }  
        ]  
      },  
      "_links": {

=== Configuring the Onboard Key Manager on a cluster

The following example shows how to configure the Onboard Key Manager on a

cluster where the Onboard Key Manager is not configured, but is configured on an MetroCluster partner cluster.

— — — —

The API:

```
POST /api/security/key-managers
```

```
# The call:
```

```
curl -X POST 'https://<mgmt-ip>/api/security/key-  
managers?return_records=false' -H 'accept: application/hal+json' -H  
"Content-Type: application/json" -d "{  \"onboard\": {      \"passphrase\":  
\"passphrase\",      \"synchronize\": true  }}"
```

— — — —

▼ ▼ ▼

=== Deleting a configured key manager

The following example shows how to delete a key manager given its UUID.

```
# The API:
```

```
DELETE /api/security/key-managers/{uuid}
```

```
# The call:
```

```
curl -X DELETE 'https://<mgmt-ip>/api/security/key-managers/<uuid>?' -H
'accept: application/hal+json'
```

▼ ▼ ▼

=== Adding a key server to an external key manager

The following example shows how to add a key server with two secondary key servers to an external key manager.

The API:

POST /api/security/key-managers/{uuid}/key-servers

```
# The call:
```

```
curl -X POST 'https://<mgmt-ip>/api/security/key-managers/<uuid>/key-servers?return_records=true' -H 'accept: application/hal+json' -d '{"server": "10.225.89.34:5696", "secondary key servers": [
```

```
\ "1.1.1.1\", \"10.72.204.27:5696\" ] }"
```

```
# The response:
```

```
{
  "num_records": 1,
  "records": [
    {
      "server": "10.225.89.34:5696",
      "secondary_key_servers": [
        "1.1.1.1",
        "10.72.204.27:5096"
      ],
      "_links": {
        "self": {
          "href": "/api/security/key-managers/43e0c191-dc5c-11e8-9b2c-005056bb017d/key-servers/10.225.89.34%3A5696"
        }
      }
    }
  ]
}
```

```
----
```

```
'''
```

```
=== Adding 2 key servers to an external key manager
```

The following example shows how to add 2 key servers to an external key manager. Note that the `_records_` property is used to add multiple key servers to the key manager in a single API call.

```
----
```

```
# The API:
```

```
POST /api/security/key-managers/{uuid}/key-servers
```

```
# The call:
```

```
curl -X POST 'https://<mgmt-ip>/api/security/key-managers/<uuid>/key-servers?return_records=true' -H 'accept: application/hal+json' -d "{
  \"records\": [ { \"server\": \"10.225.89.34:5696\" }, { \"server\": \"10.225.89.33:5696\" } ] }"
```

```
# The response:
```

```
{
  "num_records": 1,
  "records": [
```

```

{
  "_links": {
    "self": {
      "href": "/api/security/key-managers/43e0c191-dc5c-11e8-9b2c-005056bb017d/key-servers/"
    }
  }
}
]
}
----

'''

```

=== Retrieving all the key servers configured in an external key manager

The following example shows how to retrieve all key servers configured in an external key manager.

```

----

# The API:
GET /api/security/key-managers/{uuid}/key-servers

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/key-managers/<uuid>/key-servers?fields=*' -H 'accept: application/hal+json'

# The response:
{
  "records": [
    {
      "uuid": "43e0c191-dc5c-11e8-9b2c-005056bb017d",

= Retrieve key managers

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/security/key-managers`#

Introduced In: 9.6

Retrieves key managers.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `status.message`

* `status.code`

== Related ONTAP commands

|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.
```

```
* Default value: 1
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key management, save the encrypted configuration data in a safe location so that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]

|===

|Name
|Type
|Description

|enabled
|boolean

a|Is the onboard key manager enabled?

|existing_passphrase
|string

a|The cluster-wide passphrase. This is not audited.

|key_backup
|string

a|Backup of the onboard key manager's key hierarchy. It is required to save this backup after configuring the onboard key manager to help in the recovery of the cluster in case of catastrophic failures.

|passphrase
|string

a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean

a|Synchronizes missing onboard keys on any node in the cluster. If a node is added to a cluster that has onboard key management configured, the

synchronize operation needs to be performed in a PATCH operation. In a MetroCluster configuration, if onboard key management is enabled on one site, then the synchronize operation needs to be run as a POST operation on the remote site providing the same passphrase.

|===

```
[#status]
[.api-collapsible-fifth-title]
status
```

Optional status information on the current state of the key manager indicating if it is fully setup or requires more action.

```
[cols=3*,options=header]
```

|===

```
|Name
|Type
|Description
```

```
|code
|integer
```

a|Code corresponding to the status message. Returns 0 if the setup is complete. This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

```
|message
|string
```

a|Current state of the key manager indicating any additional steps to perform to finish the setup. This is an advanced property; there is an added cost to retrieving its value. The property is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter or GET for all advanced properties is enabled.

```

= Create a key manager

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-  
block]#`/security/key-managers`#
```

Introduced In: 9.6

Creates a key manager.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a key manager.

* `external.client_certificate` - Client certificate. Required only when creating an external key manager.

* `external.server_ca_certificates` - Server CA certificates. Required only when creating an external key manager.

* `external.servers.server` - Key servers. Required only when creating an external key manager.

* `onboard.passphrase` - Cluster-wide passphrase. Required only when creating an Onboard Key Manager.

* `synchronize` - Synchronizes missing onboard keys on any node in the cluster. Required only when creating an Onboard Key Manager at the partner site of a MetroCluster configuration.

== Related ONTAP commands

* `security key-manager external enable`

* `security key-manager onboard enable`

|===
| Error Code | Description

| 65536038
| A maximum of 4 active key servers are allowed.

| 65536214
| Failed to generate cluster key encryption key.

| 65536216
| Failed to add cluster key encryption key.

| 65536310
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536341
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536508
| The platform does not support data at rest encryption.

| 65536821
| The certificate is not installed.

| 65536822
| Multitenant key management is not supported in the current cluster
version.

| 65536823
| The SVM has key manager already configured.

| 65536824
| Multitenant key management is not supported in MetroCluster

```

configurations.

| 65536834

| Failed to get existing key-server details for the SVM.

| 65536852

| Failed to query supported KMIP protocol versions.

| 65536870

| Key management servers already configured.

| 65536871

| Duplicate key management servers exist.

| 65536876

| External key management requires client and server CA certificates installed and with one or more key servers provided.

| 65536878

| External key management cannot be configured as one or more volume encryption keys of the SVM are stored in cluster key management server.

| 65536895

| External key manager cannot be configured since this cluster is part of a MetroCluster configuration and the partner site of this MetroCluster configuration has Onboard Key Manager configured.

| 65536900

| The Onboard Key Manager cannot be configured because this cluster is part of a MetroCluster configuration and the partner site has the external key manager configured.

| 65536903

| The Onboard Key Manager has failed to configure on some nodes in the cluster. Use the CLI to sync the Onboard Key Manager configuration on failed nodes.

| 65536906

| The Onboard Key Manager has already been configured at the partner site. Use the CLI to sync the Onboard Key Manager with the same passphrase.

| 65536907

| The Onboard Key Manager is already configured. Use the CLI to sync any nodes with the Onboard Key Manager configuration.

| 65536916

| The Onboard Key Manager is only supported for an admin SVM.

| 65536920
| The Onboard Key Manager passphrase length is incorrect.

| 65537240
| The Onboard Key Manager passphrase must be provided when performing a POST/synchronize operation.

| 65537241
| The Onboard Key Manager existing_passphrase must not be provided when performing a POST/synchronize operation.

| 65537244
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard Key Manager is already configured on the cluster.

| 65537245
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard Key Manager is not configured on the partner cluster.

| 65537246
| Unable to sync/create Onboard Key Manager on local cluster. This cluster is not part of a MetroCluster configuration.

| 66060338
| Failed to establish secure connection for a key management server due to incorrect server_ca certificates.

| 66060339
| Failed to establish secure connection for a key management server due to incorrect client certificates.

| 66060340
| Failed to establish secure connection for a key management server due to Cryptsoft error.

= Update key managers

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/security/key-managers/{uuid}`#

Introduced In: 9.6

Updates a key manager.

== Required properties

* `onboard.existing_passphrase` - Cluster-wide passphrase. Required only when synchronizing the passphrase of the Onboard Key Manager.

* `synchronize` - Synchronizes missing Onboard Key Manager keys on any node in the cluster. Required only when synchronizing the Onboard Key Manager keys in a local cluster.

== Related ONTAP commands

* `security key-manager external modify`

* `security key-manager onboard sync`

* `security key-manager onboard update-passphrase`

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

```

|uuid
|string
|path
|True
a|Key manager UUID

|===

== Request Body

```

```
* `security key-manager migrate`
```

```
== Parameters
```

```
[cols=5*,options=header]  
|===
```

```
|Name  
|Type  
|In
```

```

|Required
|Description

|source.uuid
|string
|path
|True
a|Migration source key manager UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

= List key servers configured in an external key manager

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}/key-servers`#

*Introduced In:* 9.6

Retrieves the list of key servers configured in an external key manager.

== Related ONTAP commands

* `security key-manager external show`
* `security key-manager external show-status`

== Parameters

[cols=5*,options=header]

```

```

|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|External key manager UUID

|username
|string
|query
|False
a|Filter by username

|timeout
|integer
|query
|False
a|Filter by timeout

|secondary_key_servers
|string
|query
|False
a|Filter by secondary_key_servers

* Introduced in: 9.8

|server
|string
|query
|False
a|Filter by server

|fields
|array[string]

```

```

|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

```
= Security key-stores endpoint overview
```

```
:doctype: book
```

```
== Overview
```

A keystore describes a key-manager, specifically the type of key-manager.

```
== Examples
```

```
=== Retrieving information for all configured key managers
```

The following example shows how to retrieve information about all

```
configured key managers.
```

The API:

GET /api/security/key-stores

The call:

```
curl -X GET 'https://<mgmt-ip>/api/security/key-stores?fields=*' -H 'accept: application/hal+json'</mgmt-ip>
```

The response:

```
{ "records": [ { "uuid": "33421d82-0a8d-11ec-ae88-005056bb5955", "keystore": { "type": "akv" }, "_links": { "self": { "href": "/api/security/key-stores/33421d82-0a8d-11ec-ae88-005056bb5955/akv" } } }, { "uuid": "46a0b20a-0a8d-11ec-ae88-005056bb5955", "keystore": { "type": "okm" }, "_links": { "self": { "href": "/api/security/key-stores/46a0b20a-0a8d-11ec-ae88-005056bb5955/okm" } } } ], "num_records": 2, "_links": { "self": { "href": "/api/security/key-stores" } } }
```

Retrieve keystores

GET /security/key-stores

Introduced In: 9.10

Retrieves keystores.

Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [Requesting specific fields](#) to learn more.

- `keystore.location`
- `svm.name`
- `svm.uuid`

Related ONTAP commands

- `security key-manager show-key-store`

Parameters

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
type	string	query	False	Filter by type

Name	Type	In	Required	Description
uuid	string	query	False	Filter by uuid
location	string	query	False	Filter by location
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	<p>The default is true for GET calls. When set to false, only the number of records is returned.</p> <ul style="list-style-type: none"> • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

View and update login message configuration

Security login messages endpoint overview

Overview

You can use this API to display and manage the login messages configuration. The GET request retrieves all of the login messages in the cluster. GET operations on `/security/login/messages/{uuid}` retrieve the login messages configuration by UUID. PATCH operations on `/security/login/messages/{uuid}` update the login messages configuration by UUID.

Examples

Retrieving all of the login messages in the cluster

```
# The API:
/api/security/login/messages

# The call:
curl -X GET "https://<mgmt-ip>/api/security/login/messages?fields=*" -H
"accept: application/hal+json"
```

```
# The response:
{
  "records": [
    {
      "uuid": "2581e5aa-9fe3-11e8-b309-005056bbef18",
      "scope": "cluster",
      "banner": "*** WARNING: DO NOT PROCEED IF YOU ARE NOT AUTHORIZED!
****\n",
      "message": "#### Welcome to Cluster X ####\n",
      "show_cluster_message": true,
      "_links": {
        "self": {
          "href": "/api/security/login/messages/2581e5aa-9fe3-11e8-b309-
005056bbef18"
        }
      }
    },
    {
      "uuid": "7b1b3715-9ffa-11e8-a5dd-005056bbef18",

```

Retrieving the login messages configuration by UUID, including all fields

```
# The API:
/api/security/login/messages/{uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/security/login/messages/7b1b3715-9ffa-11e8-a5dd-005056bbef18?fields=*" -H "accept: application/hal+json"

# The response:
{
  "uuid": "7b1b3715-9ffa-11e8-a5dd-005056bbef18",
  "scope": "svm",
  "svm": {
    "uuid": "7b1b3715-9ffa-11e8-a5dd-005056bbef18",
    "name": "svm1"
  },
  "message": "#### Welcome to SVM1 ####\n",
  "show_cluster_message": true,
  "_links": {
    "self": {
      "href": "/api/security/login/messages/7b1b3715-9ffa-11e8-a5dd-005056bbef18"
    }
  }
}
```

Configuring the login banner in a cluster

```
# The API:
/api/security/login/messages

# The call:
curl -X PATCH "https://<mgmt-
ip>/api/security/login/messages?scope=cluster" -H "accept:
application/hal+json" -H "Content-Type: appplication/json" -d "{
  \"banner\": \"You are entering secure area.\" }"

# The response:
{
  "num_records": 1,
  "_links": {
    "self": {
      "href": "/api/security/login/messages?scope=cluster"
    }
  }
}
```

Configuring the message of the day (MOTD) in a cluster

```
# The API:
/api/security/login/messages

# The call:
curl -X PATCH "https://<mgmt-
ip>/api/security/login/messages?scope=cluster" -H "accept:
application/hal+json" -H "Content-Type: appplication/json" -d "{
  \"message\": \"Welcome to Cluster X\", \"show_cluster_message\": true }"

# The response:
{
  "num_records": 1,
  "_links": {
    "self": {
      "href": "/api/security/login/messages?scope=cluster"
    }
  }
}
```

Clearing the login banner and message of the day (MOTD) in a cluster

```
# The API:
/api/security/login/messages

# The call:
curl -X PATCH "https://<mgmt-
ip>/api/security/login/messages?scope=cluster" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{
  \"banner\": \"\", \"message\": \"\" }"

# The response:
{

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/login/messages/7b1b3715-9ffa-11e8-a5dd-005056bbef18" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"banner\": \"\", \"message\": \"\" }"
```

Retrieve login banner and messages of the day

GET /security/login/messages

Introduced In: 9.6

Retrieves the login banner and messages of the day (MOTD) configured in the cluster and in specific SVMs.

Parameters

Name	Type	In	Required	Description
show_cluster_message	boolean	query	False	Filter by show_cluster_message
uuid	string	query	False	Filter by uuid
banner	string	query	False	Filter by banner
scope	string	query	False	Filter by scope
message	string	query	False	Filter by message
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	<p>The default is true for GET calls. When set to false, only the number of records is returned.</p> <ul style="list-style-type: none"> • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

Name	Type	Description

name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

login_messages

The login banner and message of the day (MOTD) configuration.

Name	Type	Description
_links	_links	

Name	Type	Description
banner	string	The login banner text. This message is displayed during SSH and console device login just before the password prompt displays. When configured, a cluster-level login banner is used for every incoming connection. Each data SVM can override the cluster-level banner to instead display when you log into the SVM. To restore the default setting for a data SVM, set the banner to an empty string. New lines are supplied as either LF or CRLF but are always returned as LF. Optional in the PATCH body.
message	string	The message of the day (MOTD). This message appears just before the clustershell prompt after a successful login. When configured, the cluster message displays first. If you log in as a data SVM administrator, the SVM message is then printed. The cluster-level MOTD can be disabled for a given data SVM using the "show_cluster_message" property. New lines are supplied as either LF or CRLF but are always returned as LF. Optional in the PATCH body.
scope	string	Set to "svm" for interfaces owned by an SVM. Otherwise, set to "cluster".
show_cluster_message	boolean	Specifies whether to show a cluster-level message before the SVM message when logging in as an SVM administrator. This setting can only be modified by the cluster administrator. Optional in the PATCH body.
svm	svm	
uuid	string	The unique identifier (ID) of the login messages configuration.

error_arguments

Manage security roles

Security roles endpoint overview

Overview

ONTAP supports Role Based Access Control (RBAC) wherein a user account must be associated with a role and the role defines the privileges and rights for that user account. A privilege defines the access level of the API as either "none", "readonly", or "all". This specifies whether the user account can perform only a GET operation or POST, PATCH, and DELETE operations as well. A role can comprise of multiple tuples and each tuple consists of the REST API and its access level. For example, "role1" might be a role that has a tuple {"access": "all", "path": "/api/storage/volume"}, which means that a user account with "role1" can perform all GET, POST, PATCH, and DELETE requests on the *api/storage/volume* API or derived APIs which have *api/storage/volume* as the prefix.

In cases where a role has tuples with multiple APIs having the same prefix, the highest match wins out. For example, if "role1" has the following tuples: {"access": "readonly", "path": "/api/cluster"} and {"access": "all", "path": "/api/cluster/schedules"}, then only a GET request is allowed on APIs with *api/cluster* as the prefix; while POST, PATCH and DELETE requests are possible on the *api/cluster/schedules* API.

Predefined (built-in) roles

Related REST APIs are used to form predefined cluster-scoped and SVM-scoped roles, such as: "admin", "backup", "readonly" for cluster and "vsadmin", "vsadmin-backup", "vsadmin-protocol" for SVMs. These can be retrieved by calling a GET request on */api/security/roles* API and can be assigned to user accounts. See the examples for *api/security/accounts*.

These predefined roles cannot be modified or deleted.

Mapped roles

Before REST APIs, the RBAC roles (legacy roles) were defined to contain the CLI commands and their access levels. Now, almost all REST APIs map to one or more CLI commands. When a role is created using a POST request on */api/security/roles*, a mapped legacy role is created. This legacy role has the same access level (as that of the REST API) for the mapped CLI commands. However, if a legacy role with the same name already exists, the POST operation fails and you need to choose a unique name for the role. The legacy roles cannot be managed using the REST endpoint */api/security/roles* or its derivatives. Legacy roles are managed using the CLI commands "security login role <create | modify | delete> -role <rolename>".

Note that the mapped legacy role (for the REST API role created) cannot be manipulated using the CLI.

The reverse case is not true; the creation of a legacy role will not create a mapped role with equivalent REST APIs.

API restrictions

Numerous APIs are scoped for the cluster level only. This results in an access error if assigned to an SVM-scoped role. For example, *api/cluster/nodes* does not work when added as a tuple entry for an SVM-scoped role.

A number of APIs allowed for an SVM-scoped role might have restrictions on the access level. For example, */api/network/ethernet/ports* cannot have an access level of "all" for an SVM-scoped role; this results in an access error when a POST or PATCH request is made.

Roles created with a REST API path prefix which is common to many APIs might have restrictions based on the scope of the role; cluster or SVM. For example, {"access":"all","path":"/api/security"} might be a tuple entry for an SVM role. Any GET, POST, PATCH, or DELETE operation fails on API */api/security/accounts* while the same on */api/security/login/messages* succeeds. However, a role with exactly the same tuple when created at the cluster-scope level allows the operations.

Numerous APIs have restrictions on the objects that can be operated on based on the context of the SVM or cluster. For example, a POST request on */api/security/authentication/password* API changes the password for a user account. If executed in the context of an SVM (POST request on an SVM interface), only the password of the user executing the POST can be modified, and attempts to modify the password of any other user results in an access error. However, if a POST request is performed by a cluster administrator account, the password for any user account (cluster or SVM) can be modified.

Resource-qualified endpoints are now supported. At present, the only supported resource-qualified endpoints are */api/storage/volumes/{volume.uuid}/snapshots* and */api/storage/volumes//snapshots*. "" is a wildcard character denoting "all" volumes.

Examples

Creating a cluster-scoped custom role

Specify the role name and the tuples (of REST APIs and their access level) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped role.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role", "privileges" :
[{"access":"readonly","path":"/api/cluster/jobs"}, {"access":"all","path":"/api/application/applications"}, {"access":"readonly","path":"/api/application/templates"}]}'
```

Creating an SVM-scoped custom role

For an SVM-scoped role, specify either owner.name or owner.uuid in the request body along with other parameters for the role. These correspond to the name or UUID of the SVM for which the role is being created and can be obtained from the response body of the GET request performed on the */api/svm/svms* API.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"owner": {"uuid": "9f93e553-4b02-11e9-a3f9-005056bb7acd"}, "name": "svm_role", "privileges": [{"access": "readonly", "path": "/api/cluster/jobs"}, {"access": "all", "path": "/api/application/applications"}, {"access": "readonly", "path": "/api/application/templates"}]}'
```

Creating a custom role with a resource-qualified endpoint

Specify the role name and the tuples (of REST APIs and their access level) in the body of the POST request. One or more of the tuples can now contain a resource-qualified endpoint. At present, the only supported resource-qualified endpoints are `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//*/snapshots`. `*` is a wildcard character denoting "all" volumes.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"name": "cluster_role", "privileges": [{"access": "readonly", "path": "/api/cluster/jobs"}, {"access": "all", "path": "/api/storage/volumes/4ae77149-7752-11eb-8d4e-0050568ed6bd/snapshots"}, {"access": "all", "path": "/api/storage/volumes/6519986e-7752-11eb-8d4e-0050568ed6bd/snapshots"}, {"access": "readonly", "path": "/api/application/templates"}]}'
```

Retrieving the configured roles

All of the roles or a filtered list of roles (for example by name, predefined, and so on) can be retrieved.

```
# The API:
GET "/api/security/roles"

# The call to retrieve all the roles configured in the cluster:
curl -X GET "https://<mgmt-ip>/api/security/roles"

# The response:
{
  "records": [

Using a scoped call to retrieve the configured roles

```

# Scoped call to retrieve all the roles for a particular SVM using
owner.uuid:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.uuid=aaef7c38-4bd3-11e9-b238-0050568e2e25"

# Scoped call to retrieve all the roles for a particular SVM using
owner.name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.name=svm1"

# Scoped call to retrieve the roles having vsadmin as the prefix in the
role name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?name=vsadmin*"

# Scoped call to retrieve the predefined roles:
curl -X GET "https://<mgmt-ip>/api/security/roles/?builtin=true"

# Scoped call to retrieve the custom roles:
curl -X GET "https://<mgmt-ip>/api/security/roles/?builtin=false"

```

Retrieve a list of roles configured in the cluster

GET /security/roles

Introduced In: 9.6

Retrieves a list of roles configured in the cluster.

Create a new cluster-scoped or SVM-scoped role

POST /security/roles

Introduced In: 9.6

Creates a new cluster-scoped role or an SVM-scoped role. For an SVM-scoped role, specify either the SVM name as the `owner.name` or SVM UUID as the `owner.uuid` in the request body along with other parameters for the role. The `owner.uuid` or `owner.name` are not required to be specified for a cluster-scoped role.

Required parameters

- `name` - Name of the role to be created.
- `privileges` - Array of privilege tuples. Each tuple consists of a REST API path and its desired access level.

Optional parameters

- `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped role.

View or delete a role

Security roles owner.uuid name endpoint overview

Overview

This API is used to retrieve or delete a role. The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET call performed on one of the following APIs: `/api/security/roles` for all roles `/api/security/roles/?scope=svm` for SVM-scoped roles `/api/security/roles/?owner.name={svm-name}` for roles in a specific SVM This API response contains the complete URI for each role that can be used for retrieving or deleting a role.

The pre-defined roles can be retrieved but cannot be deleted.

Examples

Retrieving a role configuration

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/secure_role"

# The response:
{
  "owner": {
    "uuid": "aaef7c38-4bd3-11e9-b238-0050568e2e25",
    "name": "svml",
    "_links": {
      "self": {
        "href": "/api/svm/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25"
      }
    }
  },
  "name": "secure_role",
  "privileges": [
    {
      "path": "/api/security",
      "access": "all",
      "_links": {
        "self": {
          "href": "/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/secure_role/privileges/%2Fapi%2Fsecurity"
        }
      }
    },
    {
      "path": "/api/storage/volumes/651f7fdf-7752-11eb-8d4e-
```

```

0050568ed6bd/snapshots",
  "access": "readonly",

  }
}
}
}

```

Deleting a custom role

```

# The API:
DELETE "/api/security/roles/{owner.uuid}/{name}"

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1"

```

Delete a role

DELETE /security/roles/{owner.uuid}/{name}

Introduced In: 9.6

Deletes the specified role.

Required parameters

- name - Name of the role to be deleted.
- owner.uuid - UUID of the SVM housing the role.

Related ONTAP commands

Manage role privilege details

Security roles owner.uuid name privileges endpoint overview

Overview

This API is used to configure the role privileges (tuples of REST URI path and its access levels). It also retrieves all of the privilege tuples for a role and can add a tuple to an existing role. The REST URI path can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//snapshots`. `"` is a wildcard character denoting "all" volumes.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET request performed on one of the following APIs: `/api/security/roles` for all the roles `/api/security/roles/?scope=svm` for SVM-scoped roles `/api/security/roles/?owner.name=<svm-name><i></i>` for roles in a specific SVM This API response contains the complete URI for each role and can be used after suffixing it with `_"privileges".</svm-name>_`

The pre-defined roles can be retrieved but cannot be updated.

Examples

Adding a privilege tuple for an existing custom role

```
# The API:
POST "/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges" -d
'{"access":"readonly","path":"/api/protocols"}'
```

Retrieving all the privilege tuples for a role

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges"

# The response:
{
  "records": [
    {
      "path": "/api/application",
      "access": "all",
      "_links": {
        "self": {
          "href": "/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fapplication"
        }
      }
    },
    {

Add a privilege tuple to an existing role

POST /security/roles/{owner.uuid}/{name}/privileges

Introduced In: 9.6

Adds a privilege tuple (of REST URI and its access level) to an existing role.

Required parameters

- `owner.uuid` - UUID of the SVM that houses this role.
- `name` - Name of the role to be updated.
- `path` - REST URI path (example: `/api/storage/volumes`). Can be a resource-qualified endpoint (example: `/api/storage/volumes/43256a71-be02-474d-a2a9-9642e12a6a2c/snapshots`). Currently, resource-qualified endpoints are limited to the "snapshots" endpoint: `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//snapshots`. `"` is a wildcard character denoting "all" volumes.
- `access` - Desired access level for the REST URI path (one of "all", "readonly" or "none").

Manage role privilege path

Security roles owner.uuid name privileges path endpoint overview

Overview

A role can comprise of multiple tuples and each tuple consists of the REST API path and its access level. These APIs can be used to retrieve and modify the access level or delete one of the constituent REST API paths within a role. The REST API path can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//snapshots`. `"` is a wildcard character denoting "all" volumes.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET request performed on one of the following APIs: `/api/security/roles` for all roles
`/api/security/roles/?scope=svm` for SVM-scoped roles
`/api/security/roles/?owner.name=<svm-name><i></i>` for roles in a specific SVM This API response contains the complete URI for each tuple of the role and can be used for GET, PATCH, or DELETE operations.`</svm-name>`

The access level for paths in pre-defined roles cannot be updated.

Examples

Updating the access level for a path in the privilege tuple of an existing role

```
# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols" -d '{"access":"all"}'
```

Updating the access level for a resource-qualified endpoint in the privilege tuple of an existing role

```
# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fstorage%2Fvolumes%2F742ef001-24f0-4d5a-9ec1-2fdaadb282f4%2Fsnapshots" -d '{"access":"readonly"}'
```

Retrieving the access level for a path in the privilege tuple of an existing role

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols"

# The response:

    "self": {
      "href": "/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fstorage%2Fvolumes%2Fd0f3b91a-4ce7-4de4-afb9-7eda668659dd%2Fsnapshots"
    }
  }
}
```

Deleting a privilege tuple from an existing role

```
# The API:
DELETE "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols"
```

Deleting a privilege tuple, containing a resource-qualified endpoint, from an existing role

```
# The API:
DELETE "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fstorage%2Fvolumes%2F742ef001-24f0-4d5a-9ec1-2fdaadb282f4%2Fsnapshots"
```

Delete a privilege tuple from the role

DELETE /security/roles/{owner.uuid}/{name}/privileges/{path}

Introduced In: 9.6

Deletes a privilege tuple (of REST URI and its access level) from the role. The REST URI can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//snapshots`. `"` is a wildcard character denoting "all" volumes.

Required parameters

- `owner.uuid` - UUID of the SVM which houses this role.
- `name` - Name of the role to be updated.
- `path` - Constituent REST API path to be deleted from this role. Can be a resource-qualified endpoint (example: `/api/storage/volumes/43256a71-be02-474d-a2a9-9642e12a6a2c/snapshots`). Currently, resource-qualified endpoints are limited to the "snapshots" endpoint: `/api/storage/volumes/{volume.uuid}/snapshots` and `/api/storage/volumes//snapshots`. `"` is a wildcard character denoting "all" volumes.

Manage SSH server

Security SSH endpoint overview

Overview

ONTAP supports SSH server that can be accessed from any standard SSH client. A user account needs to be associated with SSH as the application (refer the documentation for [api/security/accounts DOC](#) [/security/accounts](#)). Upon connecting from a client, the user is authenticated and a command line shell is presented.

This endpoint is used to retrieve or modify the SSH configuration at the cluster level. The configuration consists of SSH security parameters (security algorithms and maximum authentication retry attempts allowed before closing the connection) and SSH connection limits.

The security algorithms include SSH key exchange algorithms, ciphers for payload encryption, and MAC algorithms. This configuration is the default for all newly created SVMs; existing SVM configurations are not impacted. The SSH connection limits include maximum connections per second, maximum simultaneous sessions from the same client host, and overall maximum SSH connections at any given point in time. The connection limits are per node and will be the same for all nodes in the cluster.

Examples

Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{ "ciphers": [
"aes256_ctr", "aes192_ctr" ], "key_exchange_algorithms": [
"diffie_hellman_group_exchange_sha256", "diffie_hellman_group14_sha1" ],
"mac_algorithms": [ "hmac_sha2_512_etm", "umac_128_etm" ],
"max_authentication_retry_count": 3 }'
```

Updating the SSH connection limits

Specify the connection limits in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{
"connections_per_second": 8, "max_instances": 10, "per_source_limit": 5 }'
```

Retrieving the cluster SSH server configuration

```
# The API:
GET "/api/security/ssh"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh"

# The response:
{
  "ciphers": [
    "aes256_ctr",
    "aes192_ctr"
  ],
  "key_exchange_algorithms": [
    "diffie_hellman_group_exchange_sha256",
    "diffie_hellman_group14_sha1"
  ],
  "mac_algorithms": [
    "hmac_sha2_512_etm",
    "umac_128_etm"
  ],
  "max_authentication_retry_count": 3,
  "connections_per_second": 8,
  "max_instances": 10,
  "per_source_limit": 5,
  "_links": {
    "self": {
      "href": "/api/security/ssh"
    }
  }
}
```

Retrieve cluster SSH server ciphers, MAC algorithms, key exchange algorithms, and connection limits

GET /security/ssh

Introduced In: 9.7

Retrieves the cluster SSH server ciphers, MAC algorithms, key exchange algorithms, and connection limits.

Related ONTAP commands

- security ssh
- security protocol ssh

Response

Status: 200, Ok

Name	Type	Description
_links	_links	
ciphers	array[string]	Ciphers for encrypting the data.
connections_per_second	integer	Maximum connections allowed per second.
key_exchange_algorithms	array[string]	Key exchange algorithms.
mac_algorithms	array[string]	MAC algorithms.
max_authentication_retry_count	integer	Maximum authentication retries allowed before closing the connection.
max_instances	integer	Maximum possible simultaneous connections.
per_source_limit	integer	Maximum connections from the same client host.

Update the SSH server setting for a cluster

PATCH /security/ssh

Introduced In: 9.7

Updates the SSH server setting for a cluster.

Optional parameters

- `ciphers` - Encryption algorithms for the payload
- `key_exchange_algorithms` - SSH key exchange algorithms
- `mac_algorithms` - MAC algorithms

- `max_authentication_retry_count` - Maximum authentication retries allowed before closing the connection
- `connections_per_second` - Maximum allowed connections per second
- `max_instances` - Maximum allowed connections per node
- `per_source_limit` - Maximum allowed connections from the same client host

Related ONTAP commands

- `security ssh`
- `security protocol ssh`

Request Body

Name	Type	Description
<code>_links</code>	_links	
<code>ciphers</code>	<code>array[string]</code>	Ciphers for encrypting the data.
<code>connections_per_second</code>	<code>integer</code>	Maximum connections allowed per second.
<code>key_exchange_algorithms</code>	<code>array[string]</code>	Key exchange algorithms.
<code>mac_algorithms</code>	<code>array[string]</code>	MAC algorithms.
<code>max_authentication_retry_count</code>	<code>integer</code>	Maximum authentication retries allowed before closing the connection.
<code>max_instances</code>	<code>integer</code>	Maximum possible simultaneous connections.
<code>per_source_limit</code>	<code>integer</code>	Maximum connections from the same client host.

Example request

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "ciphers": [
    "aes256_ctr",
    "aes192_ctr",
    "aes128_ctr"
  ],
  "key_exchange_algorithms": [
    "diffie_hellman_group_exchange_sha256",

View SSH SVMs

Security SSH svms endpoint overview

Overview

This endpoint is used to retrieve the SSH security configuration for all SVMs. The configuration consists of SSH security parameters. The security algorithms include SSH key exchange algorithms, ciphers for payload encryption, MAC algorithms, and the maximum authentication retry attempts allowed before closing the connection. The SSH configuration for a newly created SVM is the same as the SSH configuration at cluster level. When the cluster SSH configuration is updated using `/security/ssh` endpoint, the SSH configuration of existing SVMs is not impacted. To customize the SSH security parameters for a particular SVM, perform a PATCH operation on the `api/security/ssh/svms/{svm.uuid}` endpoint.

Example

Retrieving the SSH security configuration of all SVMs.

```
# The API:
GET "/api/security/ssh/svms"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh/svms"

# The response:
{
  "num_records": 1,
  "records": [
    {
      "svm": {
        "name": "svm1",
        "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7",
        "_links": {
          "self": {
            "href": "/api/svm/svms/02c9e252-41be-11e9-81d5-00a0986138f7"
```

```

    }
  }
},
"ciphers": [
  "aes256_ctr",
  "aes192_ctr",
  "aes128_ctr"
],
"key_exchange_algorithms": [
  "diffie_hellman_group_exchange_sha256",
  "diffie_hellman_group14_sha1"
],
"mac_algorithms": [
  "hmac_sha1",
  "hmac_sha2_512_etm"
],
"max_authentication_retry_count": 6,
"_links": {
  "self": {
    "href": "/api/security/ssh/svms/02c9e252-41be-11e9-81d5-00a0986138f7"
  }
}
},
],
"_links": {
  "next": {
    "href": "/api/resourcelink"
  },
  "self": {
    "href": "/api/resourcelink"
  }
}
}
}

```

Retrieve the SSH server configuration for all SVMs

GET /security/ssh/svms

Introduced In: 9.10

Retrieves the SSH server configuration for all the SVMs.

Related ONTAP commands

- security ssh

Parameters

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
max_authentication_retry_count	integer	query	False	Filter by max_authentication_retry_count
mac_algorithms	string	query	False	Filter by mac_algorithms
ciphers	string	query	False	Filter by ciphers
key_exchange_algorithms	string	query	False	Filter by key_exchange_algorithms
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

Name	Type	Description

Manage SSH security configuration

Security SSH svms svm.uuid endpoint overview

Overview

This endpoint is used to retrieve or modify the SSH security configuration to an SVM.

The SSH security algorithms include key exchange algorithms, ciphers for payload encryption, MAC algorithms, and the maximum authentication retry attempts allowed before closing the connection. `svm.uuid` corresponds to the UUID of the SVM for which the SSH security setting is being retrieved or modified and it is obtained from the response body of a GET operation performed on the *api/security/ssh/svms* API.

Examples

Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh/svms/{svm.uuid}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh/svms/02c9e252-41be-11e9-81d5-00a0986138f7" -d '{ "ciphers": [ "aes256_ctr", "aes192_ctr" ],
"key_exchange_algorithms": [ "diffie_hellman_group_exchange_sha256",
"diffie_hellman_group14_shal" ], "mac_algorithms": [ "hmac_sha2_512_etm",
"umac_128_etm" ], "max_authentication_retry_count": 3 }'
```

Retrieving the SSH security configuration of an SVM

```

# The API:
GET "/api/security/ssh/svms/{svm.uuid}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh/svms/02c9e252-41be-11e9-81d5-00a0986138f7"

# The response:
{
  "ciphers": [
    "aes256_ctr",
    "aes192_ctr"
  ],
  "key_exchange_algorithms": [
    "diffie_hellman_group_exchange_sha256",
    "diffie_hellman_group14_sha1"
  ],
  "mac_algorithms": [
    "hmac_sha2_512_etm",
    "umac_128_etm"
  ],
  "max_authentication_retry_count": 3,
  "svm": {
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7",
    "_links": {
      "self": {
        "href": "/api/svm/svms/02c9e252-41be-11e9-81d5-00a0986138f7"
      }
    }
  },
  "_links": {
    "self": {
      "href": "/api/security/ssh/svms/02c9e252-41be-11e9-81d5-00a0986138f7"
    }
  }
}

```

Retrieve the SSH server configuration for an SVM

GET /security/ssh/svms/{svm.uuid}

Introduced In: 9.10

Retrieves the SSH server configuration for the specified SVM.

Related ONTAP commands

- `security ssh`

Parameters
