# Manage S3 buckets

## Protocols S3 buckets endpoint overview

### Overview

An S3 bucket is a container of objects. Each bucket defines an object namespace. S3 server requests specify objects using a bucket-name and object-name pair. An object consists of data, along with optional metadata and access controls, that is accessible using a name. An object resides within a bucket. There can be more than one bucket in an S3 server. Buckets that are created for the server are associated with an S3 user that is created on the S3 server.

### Examples

#### Retrieving all fields for all S3 buckets of a cluster

```
# The API:
/api/protocols/s3/buckets

# The call:
curl -X GET "https://<mgmt-
ip>/api/protocols/s3/buckets?fields=*&return_records=true" -H "accept:
application/json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "12f3ba4c-7ae0-11e9-8c06-0050568ea123",

[ [ID349f2720e1d0e90aeab2b07403e6b07d] ]
= Retrieve all S3 buckets for all SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/s3/buckets`#

*Introduced In:* 9.7

Retrieves all S3 buckets for all SVMs. Note that in order to retrieve S3
bucket policy conditions, the 'fields' option should be set to '**'.

|False
a|Filter by logical_used_size

|size
|integer
|query
|False
a|Filter by size

* Max value: 70368744177664
* Min value: 83886080

|allowed
|boolean
|query
|False
a|Filter by allowed

* Introduced in: 9.12

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
```

```
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#policy]
```

```
[.api-collapsible-fifth-title]
```

```
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

= Create the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/s3/buckets`#

\*Introduced In:\* 9.8

Creates the S3 bucket configuration of an SVM.

== Important notes

- \* Each SVM can have one or more bucket configurations.
- \* Aggregate lists should be specified explicitly. If not specified, then the bucket is auto-provisioned as a FlexGroup volume.
- \* Constituents per aggregate specifies the number of components (or FlexVol volumes) per aggregate. Is specified only when an aggregate list is explicitly defined.
- \* An access policy can be created along with a bucket create. If creating an access policy fails, bucket configurations are saved and the access policy can be created using the PATCH endpoint.
- \* "qos\_policy" can be specified if a bucket needs to be attached to a QoS group policy during creation time.
- \* "audit\_event\_selector" can be specified if a bucket needs to be specify access and permission type for auditing.

== Required properties

- \* `svm.uuid or svm.name` - Existing SVM in which to create the bucket configuration.
- \* `name` - Bucket name that is to be created.

== Recommended optional properties

- \* `aggregates` - List of aggregates for the FlexGroup volume on which the bucket is hosted on.
- \* `constituents\_per\_aggregate` - Number of constituents per aggregate.

- \* ``size`` - Specifying the bucket size is recommended.
- \* ``policy`` - Specifying a policy enables users to perform operations on buckets; specifying the resource permissions is recommended.
- \* ``qos_policy`` - A QoS policy for buckets.
- \* ``audit_event_selector`` - Audit policy for buckets.
- \* ``versioning_state`` - Versioning state for buckets.
- \* ``type`` - Type of bucket.
- \* ``nas_path`` - NAS path to which the bucket corresponds to.
- \* ``lifecycle_management`` - Object store server lifecycle management policy.

== Default property values

- \* ``size`` - 800MB
- \* ``comment`` - ""
- \* ``aggregates`` - No default value.
- \* ``constituents_per_aggregate`` - `_4_` , if an aggregates list is specified. Otherwise, no default value.
- \* ``policy.statements.actions`` - `GetObject`, `PutObject`, `DeleteObject`, `ListBucket`, `ListBucketMultipartUploads`, `ListMultipartUploadParts`, `GetObjectTagging`, `PutObjectTagging`, `DeleteObjectTagging`, `GetBucketVersioning`, `PutBucketVersioning`.
- \* ``policy.statements.principals`` - all S3 users and groups in the SVM.
- \* ``policy.statements.resources`` - all objects in the bucket.
- \* ``policy.statements.conditions`` - list of bucket policy conditions.
- \* ``versioning_state`` - disabled.
- \* ``type`` - S3

== Related ONTAP commands

- \* ``vserver object-store-server bucket create``
- \* ``vserver object-store-server bucket policy statement create``
- \* ``vserver object-store-server bucket lifecycle-management-rule create``

== Parameters

[cols=5\*,options=header]

|===

|Name

|Type

```
|In
|Required
|Description
```

```
|return_timeout
|integer
|query
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
```

a|The default is false. If set to true, the records are returned.

```
* Default value:
```

```

[#policy]  
[.api-collapsible-fifth-title]  
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

[#s3_bucket]
```

```
[.api-collapsible-fifth-title]
```

```
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```

|Type
|Description

|aggregates
|array[link:#aggregates[aggregates]]
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.

|allowed
|boolean
a|If this is set to true, an SVM administrator can manage the S3 service.
If it is false, only the cluster administrator can manage the service.

|audit_event_selector
|link:#audit_event_selector[audit_event_selector]
a|Audit event selector allows you to specify access and permission types
to audit.

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption

[[ID5c68cb5e14a48630e509d287d5ad3e35]]
= Delete the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/buckets/{svm.uuid}/{uuid}`#

*Introduced In:* 9.8

Deletes the S3 bucket configuration of an SVM. An access policy is also
deleted on an S3 bucket "delete" command.

== Related ONTAP commands

* `vserver object-store-server bucket delete`

```

```
* `vserver object-store-server bucket policy statement delete`  
* `vserver object-store-server bucket policy-statement-condition delete`  
* `vserver object-store-server bucket lifecycle-management-rule delete`
```

```
* xref:{relative_path}protocols_s3_buckets_endpoint_overview.html[DOC  
/protocols/s3/buckets]
```

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|uuid
```

```
|string
```

```
|path
```

```
|True
```

```
a|The unique identifier of the bucket.
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

```
a|The number of seconds to allow the call to execute before returning.
```

When doing a POST, PATCH, or DELETE operation on a single record, the

default is 0 seconds. This means that if an asynchronous operation is

started, the server immediately returns HTTP code 202 (Accepted) along

with a link to the job. If a non-zero value is specified for POST, PATCH,

or DELETE operations, ONTAP waits that length of time to see if the job

completes so it can return something other than 202.

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|svm.uuid
```

```
|string
```

```
|path
|True
a|UUID of the SVM to which this object belongs.

|===

== Response
```

Status: 202, Accepted

```

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|The unique identifier of the bucket.

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response

```

Status: 200, Ok

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|aggregates
|array[link:#aggregates[aggregates]]
a|A list of aggregates for FlexGroup volume constituents where the bucket
is hosted. If this option is not specified, the bucket is auto-provisioned
as a FlexGroup volume.

```

|allowed

|boolean

a|If this is set to true, an SVM administrator can manage the S3 service. If it is false, only the cluster administrator can manage the service.

|audit\_event\_selector

|link:#audit\_event\_selector[audit\_event\_selector]

a|Audit event selector allows you to specify access and permission types to audit.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents\_per\_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|lifecycle\_management

|link:#lifecycle\_management[lifecycle\_management]

a|Lifecycle management is implemented as an object associated with a bucket. It defines rules to be applied against objects within a bucket. These rules are applied in the background and can delete objects.

|logical\_used\_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only

contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|nas\_path

|string

a|Specifies the NAS path to which the nas bucket corresponds to.

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|protection\_status

|link:#protection\_status[protection\_status]

a|Specifies attributes of bucket protection.

|qos\_policy

|link:#qos\_policy[qos\_policy]

a|Specifies "qos\_policy.max\_throughput\_iops" and/or "qos\_policy.max\_throughput\_mbps" or "qos\_policy.min\_throughput\_iops" and/or "qos\_policy.min\_throughput\_mbps". Specifying "min\_throughput\_iops" or "min\_throughput\_mbps" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos\_policy.name" or "qos\_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|role

|string

a|Specifies the role of the bucket.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage\_service\_level

```
|string
a|Specifies the storage service level of the FlexGroup volume on which the
bucket should be created. Valid values are "value", "performance" or
"extreme".
```

```
|svm
|link:#svm[svm]
a|
```

```
|type
|string
a|Specifies the bucket type. Valid values are "s3"and "nas".
```

```
|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```
|versioning_state
|string
a|Specifies the versioning state of the bucket. Valid values are
"disabled", "enabled" or "suspended". Note that the versioning state
cannot be modified to 'disabled' from any other state.
```

```
|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```

|Description

|destination
|link:#destination[destination]
a|
```

```
|is_protected
|boolean
a|Specifies whether a bucket is a source and if it is protected within
ONTAP and/or an external cloud.
```

```
* Default value: 1
* readOnly: 1
* Introduced in: 9.10
* x-nullable: true
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos\_policy.max\_throughput\_iops" and/or "qos\_policy.max\_throughput\_mbps" or "qos\_policy.min\_throughput\_iops" and/or "qos\_policy.min\_throughput\_mbps". Specifying "min\_throughput\_iops" or "min\_throughput\_mbps" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos\_policy.name" or "qos\_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
|===
```

```
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|max_throughput_iops
|integer
a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually
exclusive with name and UUID during POST and PATCH.

|max_throughput_mbps
|integer
a|Specifies the maximum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops
|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

[[ID8d4b3ed8fb184a0ae2aa02279ca04aac]]
= Update the S3 bucket configuration for an SVM
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/s3/buckets/{svm.uuid}/{uuid}`#
```

```
*Introduced In:* 9.8
```

Updates the S3 bucket configuration of an SVM.

```
== Important notes
```

```
* The following fields can be modified for a bucket:
```

```
*** `comment` - Any information related to the bucket.
```

\*\*\* `size` - Bucket size.

\*\*\* `policy` - An access policy for resources (buckets and objects) that defines their permissions. New policies are created after existing policies are deleted. To retain any of the existing policy statements, you need to specify those statements again. Also, policy conditions can be specified as part of a bucket policy.

\*\*\* `qos\_policy` - A QoS policy for buckets.

\*\*\* `audit\_event\_selector` - Audit policy for buckets. None can be specified for both access and permission to remove an audit event selector.

\*\*\* `versioning-state` - Versioning state of the buckets.

\*\*\* `nas\_path` - NAS path to which the bucket corresponds to.

== Related ONTAP commands

- \* `vserver object-store-server bucket modify`
- \* `vserver object-store-server bucket policy statement modify`
- \* `vserver object-store-server bucket policy-statement-condition modify`

== Parameters

[cols=5\*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|The unique identifier of the bucket.

```
|return_timeout
|integer
|query
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|svm.uuid
|string
|path
|True
```

a|UUID of the SVM to which this object belongs.

```
|===
```

== Request Body

```
[cols=3*,options=header]
```

```
|===
|Name
|Type
|Description
```

```
|aggregates
|array[link:#aggregates[aggregates]]
```

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

```
|allowed
|boolean
```

a|If this is set to true, an SVM administrator can manage the S3 service.

If it is false, only the cluster administrator can manage the service.

|audit\_event\_selector

|link:#audit\_event\_selector[audit\_event\_selector]

a|Audit event selector allows you to specify access and permission types to audit.

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|constituents\_per\_aggregate

|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption

|link:#encryption[encryption]

a|

|lifecycle\_management

|link:#lifecycle\_management[lifecycle\_management]

a|Lifecycle management is implemented as an object associated with a bucket. It defines rules to be applied against objects within a bucket. These rules are applied in the background and can delete objects.

|logical\_used\_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

|string

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|nas\_path

|string

a|Specifies the NAS path to which the nas bucket corresponds to.

|policy

|link:#policy[policy]

a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|protection\_status

|link:#protection\_status[protection\_status]

a|Specifies attributes of bucket protection.

|qos\_policy

|link:#qos\_policy[qos\_policy]

a|Specifies "qos\_policy.max\_throughput\_iops" and/or "qos\_policy.max\_throughput\_mbps" or "qos\_policy.min\_throughput\_iops" and/or "qos\_policy.min\_throughput\_mbps". Specifying "min\_throughput\_iops" or "min\_throughput\_mbps" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos\_policy.name" or "qos\_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|role

|string

a|Specifies the role of the bucket.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage\_service\_level

|string

a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

```

|svm
|link:#svm[svm]
a|

|type
|string
a|Specifies the bucket type. Valid values are "s3"and "nas".

|uuid
|string
a|Specifies the unique identifier of the bucket.

|versioning_state
|string
a|Specifies the versioning state of the bucket. Valid values are
"disabled", "enabled" or "suspended". Note that the versioning state
cannot be modified to 'disabled' from any other state.

|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

```

```
a|Condition operator that is applied to the specified condition key.
```

```
|prefixes
|array[string]
a|An array of prefixes that are compared with the input prefix value
specified at the time of execution of an S3-based command, using the
condition operator specified.
```

```
|source_ips
|array[string]
a|An array of IP address ranges that are compared with the IP address of a
source command at the time of execution of an S3-based command, using the
condition operator specified.
```

```
|usernames
|array[string]
a|An array of usernames that a current user in the context is evaluated
against using the condition operators.
```

```

|actions
|array[string]
a|
```

```
|conditions
|array[link:#s3_bucket_policy_condition[s3_bucket_policy_condition]]
a|Specifies bucket policy conditions.
```

```
|effect
|string
a|Specifies whether access is allowed or denied when a user requests the
specific action. If access (to allow) is not granted explicitly to a
resource, access is implicitly denied. Access can also be denied
explicitly to a resource, in order to make sure that a user cannot access
it, even if a different policy grants access.
```

```

```
[#policy]
[.api-collapsible-fifth-title]
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

a|

|is_protected
|boolean
a|Specifies whether a bucket is a source and if it is protected within
ONTAP and/or an external cloud.

* Default value: 1
* readOnly: 1
* Introduced in: 9.10
* x-nullable: true

```

```
|===
```

```

[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy

```

Specifies "qos\_policy.max\_throughput\_iops" and/or "qos\_policy.max\_throughput\_mbps" or "qos\_policy.min\_throughput\_iops" and/or "qos\_policy.min\_throughput\_mbps". Specifying "min\_throughput\_iops" or "min\_throughput\_mbps" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos\_policy.name" or "qos\_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]

```

```

|_links
|link:#_links[_links]
a|

```

```
|max_throughput_iops
```

```

|integer
a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually
exclusive with name and UUID during POST and PATCH.

|max_throughput_mbps
|integer
a|Specifies the maximum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops
|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

```

```

|_links
|link:#_links[_links]
a|

```

```

|name
|string
a|The name of the volume.

```

```

|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid
that is exposed in the CLI and ONTAPI. It does not change due to a volume
move.

```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* Introduced in: 9.6
* x-nullable: true
```

```
|===
```

```
[#s3_bucket]
[.api-collapsible-fifth-title]
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

```
|allowed
```

```
|boolean
```

a|If this is set to true, an SVM administrator can manage the S3 service. If it is false, only the cluster administrator can manage the service.

```
|audit_event_selector
```

```
|link:#audit_event_selector[audit_event_selector]
```

a|Audit event selector allows you to specify access and permission types to audit.

```
|comment
```

```
|string
```

a|Can contain any additional information about the bucket being created or modified.

|constituents\_per\_aggregate  
|integer

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

|encryption  
|link:#encryption[encryption]  
a|

|lifecycle\_management  
|link:#lifecycle\_management[lifecycle\_management]  
a|Lifecycle management is implemented as an object associated with a bucket. It defines rules to be applied against objects within a bucket. These rules are applied in the background and can delete objects.

|logical\_used\_size  
|integer  
a|Specifies the bucket logical used size up to this point.

|name  
|string  
a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

|nas\_path  
|string  
a|Specifies the NAS path to which the nas bucket corresponds to.

|policy  
|link:#policy[policy]  
a|A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

|protection\_status  
|link:#protection\_status[protection\_status]  
a|Specifies attributes of bucket protection.

|qos\_policy  
|link:#qos\_policy[qos\_policy]  
a|Specifies "qos\_policy.max\_throughput\_iops" and/or "qos\_policy.max\_throughput\_mbps" or "qos\_policy.min\_throughput\_iops" and/or "qos\_policy.min\_throughput\_mbps". Specifying "min\_throughput\_iops" or "min\_throughput\_mbps" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos\_policy.name" or "qos\_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|role  
|string  
a|Specifies the role of the bucket.

|size  
|integer  
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|storage\_service\_level  
|string  
a|Specifies the storage service level of the FlexGroup volume on which the bucket should be created. Valid values are "value", "performance" or "extreme".

|svm  
|link:#svm[svm]  
a|

|type  
|string  
a|Specifies the bucket type. Valid values are "s3" and "nas".

|uuid  
|string  
a|Specifies the unique identifier of the bucket.

```

|versioning_state
|string
a|Specifies the versioning state of the bucket. Valid values are
"disabled", "enabled" or "suspended". Note that the versioning state
cannot be modified to 'disabled' from any other state.

|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
