Security

Security overview

Overview

You can use ONTAP security APIs to manage security settings for the cluster and SVMs.

SAML

Configure the SAML 2.0 SP (Service Provider) protocol inside ONTAP. Doing so redirects the authentication task to a third-party Identity Provider (IDP) that can utilize any number of approaches for multi-factor authentication. After SAML authentication is enabled, all interactive web access (System Manager, SPI) is authenticated via SAML and a third-party IDP.

Manage security-related operations

Security endpoint overview

Overview

You can use this API for various cluster-wide security-related operations.

"onboard_key_manager_configurable_status" object

Use this API to retrieve details of whether or not the Onboard Key Manager can be configured on the cluster.

– GET /api/security

– GET /api/security?fields=onboard_key_manager_configurable_status

"software_data_encryption" object

Contains software data encryption related information.

The following APIs can be used to enable or disable and obtain default software data at rest encryption values:

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : true }'

– PATCH /api/security -d '{ "software_data_encryption.disabled_by_default" : false }'

– GET /api/security

– GET /api/security?fields=software_data_encryption

A PATCH request on this API using the parameter "software_data_encryption.conversion_enabled" triggers the conversion of all non-encrypted metadata volumes to encrypted metadata volumes and all non-NAE aggregates to NAE aggregates. For the conversion to start, the cluster must have either an Onboard or an external key manager set up and the aggregates should either be empty or have only metadata volumes. No data volumes should be present in any of the aggregates. For MetroCluster configurations, the PATCH request will fail if the cluster is in the switchover state.

The following API can be used to initiate software data encryption conversion.

– PATCH /api/security -d '{ "software_data_encryption.conversion_enabled" : true }'

"fips" object

Contains FIPS mode information.

A PATCH request on this API using the parameter "fips.enabled" switches the system from using the default cryptographic module software implementations to validated ones or vice versa, where applicable. If the value of the parameter is "true" and unapproved algorithms are configured as permitted in relevant subsystems, those algorithms will be disabled in the relevant subsystem configurations. If "false", there will be no implied change to the relevant subsystem configurations.

– GET /api/security

– GET /api/security?fields=fips

– PATCH /api/security -d '{ "fips.enabled" : true }'

– PATCH /api/security -d '{ "fips.enabled" : false }'

"tls" object

Contains TLS configration information.

A PATCH request on this API using the parameter "tls.cipher_suites" and/or "tls.protocol_versions" configures the permissible cipher suites and/or protocol versions for all TLS-enabled applications in the system.

– GET /api/security

– GET /api/security?fields=tls

– PATCH /api/security -d '{ "tls" : { "protocol_versions" : ["TLSv1.3", "TLSv1.2"], "cipher_suites" : ["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384",
"TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256"] } }'

"management_protocols" object

Contains Security Protocols information.

This security protocols endpoint is used to retrieve and configure security protocols.

– GET /api/security

– GET /api/security?fields=management_protocols

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : true } }'

– PATCH /api/security -d '{ "management_protocols" : { "telnet_enabled" : false } }'

– PATCH /api/security -d '{ "management_protocols" : { "rsh_enabled" : true, "telnet_enabled" : true } }'

GET Examples

Retrieving information about the security configured on the cluster

The following example shows how to retrieve the configuration of the cluster.

```
# The API:
GET /api/security:

# The call:
curl -X GET 'https://<mgmt-ip>/api/security?fields=*' -H 'accept:
application/hal+json'

# The response:
{
"onboard_key_manager_configurable_status": {
  "supported": false,
  "message": "Onboard Key Manager cannot be configured on the cluster.
There are no self-encrypting disks in the cluster, and the following nodes
do not support volume granular encryption: ntap-vsim2.",
  "code": 65537300
},
"fips": {
  "enabled": false
},
"tls": {
  "cipher_suites": [
    "TLS_RSA_WITH_AES_128_CCM",
    "TLS_RSA_WITH_AES_128_CCM_8",

== PATCH Examples

=== Enabling software encryption conversion in the cluster

The following example shows how to convert all the aggregates and metadata
volumes in the cluster from non-encrypted to encrypted.

= The API:

PATCH /api/security

= The call

curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{
```

```
"software_data_encryption.conversion_enabled" : true }'+++</mgmt_ip>+++

= The response:

{
 "job": {
     "uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-
005056ac4adc"
         }
     }
 }
}
This returns a job UUID. A subsequent GET for this job UUID returns
details of the job.

= The call

curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/ebcbd82d-1cd4-11ea-
8f75-005056ac4adc"+++</mgmt_ip>+++

= The response:

{
"uuid": "ebcbd82d-1cd4-11ea-8f75-005056ac4adc",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2019-12-12T06:45:40-05:00",
"end_time": "2019-12-12T06:45:40-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/ebcbd82d-1cd4-11ea-8f75-005056ac4adc"
  }
}
}

[discrete]
=== Enabling FIPS mode in the cluster

The following example shows how to enable FIPS mode in the cluster.

= The API:
```

```
PATCH /api/security

= The call

curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{ "fips.enabled"
: true }'+++</mgmt_ip>+++

= The response:

{
 "job": {
     "uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-
bef689bbf2c2"
         }
     }
 }
}
This returns a job UUID. A subsequent GET for this job UUID returns
details of the job.

= The call

curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/8e7f59ee-a9c4-4faa-
9513-bef689bbf2c2"+++</mgmt_ip>+++

= The response:

{
"uuid": "8e7f59ee-a9c4-4faa-9513-bef689bbf2c2",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2020-04-28T06:55:40-05:00",
"end_time": "2020-04-28T06:55:41-05:00",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/8e7f59ee-a9c4-4faa-9513-bef689bbf2c2"
  }
}
}

[discrete]
```

```
=== Configuring permissible TLS protocols and cipher suites in the cluster

The following example shows how to configure the cluster to only allow
TLSv1.3 & TLSv1.2 with selected cipher suites.

= The API:

PATCH /api/security

= The call

curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{ "tls" : {
"protocol_versions" : ["TLSv1.3", TLSv1.2"], "cipher_suites" :
["TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384", "TLS_AES_256_GCM_SHA384"] }
}'+++</mgmt_ip>+++

= The response:

{
 "job": {
     "uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
     "_links": {
         "self": {
             "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-
4d3ffefe5e0d"
         }
     }
 }
}
This returns a job UUID. A subsequent GET for this job UUID returns
details of the job.

= The call

curl -X GET "https://+++<mgmt_ip>+++/api/cluster/jobs/b45b6290-f4f2-442a-
aa0e-4d3ffefe5e0d"+++</mgmt_ip>+++

= The response:

{
"uuid": "b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d",
"description": "PATCH /api/security",
"state": "success",
"message": "success",
"code": 0,
"start_time": "2021-03-22T08:52:50-05:00",
"end_time": "2021-03-22T08:52:51-05:00",
```

```
"_links": {
  "self": {
    "href": "/api/cluster/jobs/b45b6290-f4f2-442a-aa0e-4d3ffefe5e0d"
  }
}
}
```

[discrete]
=== Enabling security protocols in the cluster

The following example shows how to enable the security protocol rsh in the cluster.

= The API:

```
PATCH /api/security
```

= The call

```
curl -X PATCH "https://+++<mgmt_ip>+++/api/security" -d '{
"management_protocols" : { "rsh_enabled" : true } }'+++</mgmt_ip>+++
```

= The response

```
{
"job": {
"uuid": "2980ba28-adab-11eb-8fa3-005056bbfa84",
"_links": {
  "self": {
    "href": "/api/cluster/jobs/2980ba28-adab-11eb-8fa3-005056bbfa84"
  }
 }
 }
}
```

= The call:

```
curl -H "accept: application/hal+json" -X GET "https://+++<mgmt-
ip>+++/api/security/?fields=management_protocols"+++</mgmt-ip>+++
```

= The response:

```
{
"management_protocols": {
  "rsh_enabled": false,
  "telnet_enabled": false
},
```

```
"_links": {
  "self": {
    "href": "/api/security"
  }
}
}

software_data_encryption
```

```
Cluster-wide software data encryption related information.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|conversion_enabled
|boolean
a|Indicates whether or not software encryption conversion is enabled on
the cluster. A PATCH request initiates the conversion of all non-encrypted
metadata volumes in the cluster to encrypted metadata volumes and all non-
NAE aggregates to NAE aggregates. For the PATCH request to start, the
cluster must have either an Onboard or an external key manager set up and
the aggregates should either be empty or have only metadata volumes. No
data volumes should be present in any of the aggregates in the cluster.
For MetroCluster configurations, a PATCH request enables conversion on all
the aggregates and metadata volumes of both local and remote clusters and
is not allowed when the MetroCluster is in switchover state.

|disabled_by_default
|boolean
a|Indicates whether or not default software data at rest encryption is
disabled on the cluster.

= Update the software FIPS mode or enable conversion of non-encrypted
metadata volumes non-NAE aggregates

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security`#

*Introduced In:* 9.8

Updates the software FIPS mode or enables conversion of non-encrypted
metadata volumes to encrypted metadata volumes and non-NAE aggregates to
NAE aggregates.

== Parameters

[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

:leveloffset: -1

= Manage security-related accounts

:leveloffset: +1

[[ID8512de32608629482950300d0ad717c4]]
= Security accounts endpoint overview

== Overview

A valid user account is required to login to and provision, monitor, and
manage the cluster. The scope of the management operation can be at the
cluster level or at an individual SVM level. There is a need to create
user accounts with specific privileges apart from the default user
accounts, "admin", for cluster and "vsadmin" for SVM. Custom user accounts
can be configured to perform specific (scoped) operations. User accounts
can either be created locally (on the Netapp system) or referenced from an
external directory server (NIS, LDAP, or Active Directory).
Apart from creation, modification, and deletion of a user account, locking
and unlocking of a user account or resetting the password (for local
accounts only) is possible.

A user account must be associated with the following before it can become
operational:

. A management application (SSH, HTTP, console, service_processor, and
such like) for user login. HTTP enables REST API access.
. Scope - either cluster or SVM.
. Authentication source - password (local, NIS/LDAP, Active Directory),
public/private key pair-based, certificate based.
. RBAC role - determines what operations are permitted for the user
account.

=== Restrictions

A number of internal/restricted account names, such as admin, diag,
autosupport, and root cannot be used.

There must be at least one console cluster administrator account. Any
attempt to delete the last remaining administrator account fails.
```

```
Multifactor authentication is only possible for SSH applications, and the
only possible combinations are password (local or NIS/LDAP/Active
Directory) and public key and password or public key (local) and TOTP.

All authentication sources are not supported by all applications. You must
select a compatible authentication method based on the application. The
following types of authentications methods are supported:

|===
| Application | Supported Authentication Methods

| amqp
| password

| console
| password

| service_processor
| password

| HTTP
| password, domain, nsswitch, certificate

| ONTAPI
| password, domain, nsswitch, certificate

| SSH
| password, publickey (key pair), domain, nsswitch, totp
|===

NOTE: In this table, "totp" means time-based one-time password and is only
allowed to be configured as second authentication, "certificate" means
security certificate, "domain" means that the user directory server is an
external Active Directory, "nsswitch" means the directory server is an
external NIS or LDAP server. At login time, the user is authenticated with
these external directory servers which must be provisioned separately.

Support for publickey authentication and MFA for Domain users has been
added.

Support for TOTP as a secondary authentication method with password or
public key as the primary authentication method has been added.

== Examples

=== Creating a cluster-scoped user account
```

```
Specify the user account name, role name, and the tuples (of application
and authentication methods) in the body of the POST request. The
owner.uuid or owner.name are not required to be specified for a cluster-
scoped user account.

NOTE: Each entry in the applications array must be for a different
application.

----

# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with applications ssh, http
and password authentication scheme:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_user1","applications":[{"application":"ssh","authenticat
ion_methods":["password"],"second_authentication_method":"none"},{"applica
tion":"http","authentication_methods":["password"]}],"role":"admin","passw
ord":"p@ssw@rd123"}'
Note: The password is an optional parameter for creation and can be set
later using a PATCH request. See the examples for modification of user
account or password.
----

=== Creating an SVM-scoped user account

For an SVM-scoped account, specify either the SVM name as the owner.name
or SVM uuid as the owner.uuid along with other parameters for the user
account. These indicate the SVM for which the user account is being
created and can be obtained from the response body of GET performed on the
_/api/svm/svms_ API.

----

# The API:
POST "/api/security/accounts"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"owner":{"uuid":"aaef7c38-4bd3-11e9-b238-
0050568e2e25"},"name":"svm_user1","applications":[{"application":"ssh","au
thentication_methods":["password"],"second_authentication_method":"none"}]
,"role":"vsadmin","password":"p@ssw@rd123"}'
----
```

```
=== Retrieving the configured user accounts

Use the following API to retrieve all of the user accounts or a filtered
list of user accounts (by name, for a specific SVM, and so on).

----

# The API:
GET "/api/security/accounts"

# The call to retrieve all the user accounts configured in the cluster:
curl -X GET "https://<mgmt-ip>/api/security/accounts"

# The response:

=== Creating a user with MFA (password+TOTP)

Cluster-scoped user account:
Follow the cluster-scoped user creation example and additionally specify
the 'totp' as the second_authentication_method.

----

# The API:
POST "/api/security/accounts"

# The call to create a cluster user account with application ssh,
authentication password and totp:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"name":"cluster_user_1","applications":[{"application":"ssh","authentica
tion_methods":["password"],"second_authentication_method":"totp"}]}'
----

SVM-scoped user account:
Follow the SVM-scoped user creation example and additionally specify the
'totp' as the second_authentication_method.
```

```
----

#The API

# The call to create a SVM-scoped user account with application ssh,
authentication password and totp:
curl -X POST "https://<mgmt-ip>/api/security/accounts" -d
'{"owner":{"uuid":"aaef7c38-4bd3-11e9-b238-
0050568e2e25"},"name":"svm_user1","applications":[{"application":"ssh","au
thentication_methods":["password"],"second_authentication_method":"totp"}]
,"role":"vsadmin","password":"p@ssw@rd123"}'

|scope
|string
|query
|False
a|Filter by scope

* Introduced in: 9.7

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
```

```
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create a new user account

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/accounts`#

*Introduced In:* 9.6

Creates a new user account.

== Required parameters

* `name` - Account name to be created.
* `applications` - Array of one or more application tuples (of application
and authentication methods).

== Optional parameters
```

```
* `owner.name` or `owner.uuid`  - Name or UUID of the SVM for an SVM-
scoped user account. If not supplied, a cluster-scoped user account is
created.
* `role` - RBAC role for the user account. Defaulted to `admin` for
cluster user account and to `vsadmin` for SVM-scoped account.
* `password` - Password for the user account (if the authentication method
is opted as password for one or more of applications).
* `second_authentication_method` - Needed for MFA and only supported for
ssh application. Defaults to `none` if not supplied.
* `comment` - Comment for the user account (e.g purpose of this account).
* `locked` - Locks the account after creation. Defaults to `false` if not
supplied.
* `ldap_fastbind` - Needed for LDAP Fastbind Authentication and only
supported for applications SSH, ONTAPI, and HTTP with authentication
method "nsswitch" only. Defaults to false if not supplied.

:leveloffset: -1

= Manage scoped user accounts

:leveloffset: +1

[[IDd9d5a792c79260d58c600bfcef661406]]
= Security accounts owner.uuid name endpoint overview

== Overview

This API displays and manages the configuration of scoped user accounts.

Newly created user accounts might need to be updated for many reasons. For
example, a user account might need to use a different application or its
role might need to be modified. According to a policy, the password or
authentication source of a user account might need to be changed, or a
user account might need to be locked or deleted from the system. This API
allows you to make these changes to user accounts.

Specify the owner UUID and the user account name in the URI path. The
owner UUID corresponds to the UUID of the SVM for which the user account
has been created and can be obtained from the response body of the GET
request performed on one of the following APIs:
_/api/security/accounts_ for all user accounts
```

```
_/api/security/accounts/?scope=cluster_ for cluster-scoped user accounts
_/api/security/accounts/?scope=svm_ for SVM-scoped accounts
_/api/security/accounts/?owner.name=\{svm-name}_ for a specific SVM
This API response contains the complete URI for each user account that can
be used.

== Examples

=== Retrieving the user account details

----

# The API:
GET "/api/security/accounts/{owner.uuid}/{name}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/accounts/aef7c38-4bd3-11e9-
b238-0050568e2e25/svm_user1"

# The response:
{
"owner": {
  "uuid": "aaef7c38-4bd3-11e9-b238-0050568e2e25",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25"
    }
        }
},
"name": "svm_user1",
"applications": [
  {
    "application": "ssh",
    "authentication_methods": [
      "password"
    ],
    "second_authentication_method": "none"
  }
],
"role": {
  "name": "vsadmin",
  "_links": {
    "self": {
      "href": "/api/svms/aaef7c38-4bd3-11e9-b238-
0050568e2e25/admin/roles/vsadmin"
```

```
    }
  }
},
"locked": false,
"password_hash_algorithm": "sha512",
"scope": "svm",
"_links": {
  "self": {
    "href": "/api/security/accounts/aaef7c38-4bd3-11e9-b238-
0050568e2e25/svm_user1"
  }
}
}
----

=== Updating the applications and role in a user account

Specify the desired configuration in the form of tuples (of applications
and authentication methods) and the role. All other previously configured
applications that are not specified in the "applications" parameter of the
PATCH request will be de-provisioned for the user account.

----

# The API:
PATCH "/api/security/accounts/{owner.uuid}/{name}"

# The call to update the applications and role:

[[ID87f343292b56732715b881e191fc5856]]
= Update a user account

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/accounts/{owner.uuid}/{name}`#

*Introduced In:* 9.6

Updates a user account. Locks or unlocks a user account and/or updates the
role, applications, and/or password for the user account.

== Required parameters

* `name` - Account name to be updated.
* `owner.uuid`  - UUID of the SVM housing the user account to be updated.
```

```
== Optional parameters

* `applications` - Array of one or more tuples (of application and
authentication methods).
* `role` - RBAC role for the user account.
* `password` - Password for the user account (if the authentication method
is opted as password for one or more of applications).
* `second_authentication_method` - Needed for MFA and only supported for
ssh application. Defaults to `none` if not supplied.
* `comment` - Comment for the user account (e.g purpose of this account).
* `locked` - Set to true/false to lock/unlock the account.
* `ldap_fastbind` - Set to true/false to enable LDAP Fastbind
Authentication.

== Related ONTAP commands

* `security login create`
* `security login modify`
* `security login password`
* `security login lock`
* `security login unlock`

== Learn more

ONTAP Error Response Codes

|===
| Error Code | Description

| 1261215
| The role was not found.

| 1261218
| The user was not found.
```

```
| 1263343
| Cannot lock user with password not set or non-password authentication
method.

| 5636096
| Cannot perform the operation for this user account since the password is
not set.

| 5636097
| The operation for user account failed since user password is not set.

| 5636100
| Modification of a service-processor user's role to a non-admin role is
not supported.

| 5636125
| The operation not supported on AutoSupport user account which is
reserved.

| 5636129
| The role does not exist.

| 5636154
| The second-authentication-method parameter is supported for ssh
application.

| 5636155
| The second-authentication-method parameter can be specified only if the
authentication-method password or public key nsswitch.

| 5636156
| Same value cannot be specified for the second-authentication-method and
the authentication-method.

| 5636159
| For a given user and application, if the second-authentication-method is
specified, only one such login entry is supported.

| 5636164
| If the value for either the authentication-method second-authentication-
method is nsswitch or password, the other parameter must differ.

| 5636197
| LDAP fastbind combination for application and authentication method is
not supported.

| 5636198
```

```
| LDAP fastbind authentication is supported only for nsswitch.

| 5636212
| TOTP is supported only when the primary authentication method is
password or public key.

| 5636214
| Configuring the user with TOTP as secondary authentication method
requires an effective cluster version of 9.13.1 or later

| 7077896
| Cannot lock the account of the last console admin user.

| 7077906
| A role with that name has not been defined for the Vserver.

| 7077911
| The user is not configured to use the password authentication method.

| 7077918
| The password cannot contain the username.

| 7077919
| The minimum length for new password does not meet the policy.

| 7077920
| The new password must have both letters and numbers.

| 7077921
| The minimum number of special characters required do not meet the
policy.

| 7077924
| The new password must be different than last N passwords.

| 7077925
| The new password must be different to the old password.

| 7077929
| Cannot lock user with password not set or non-password authentication
method.

| 7077940
| The password exceeds maximum supported length.

| 7077941
| Defined password composition exceeds the maximum password length of 128
```

```
characters.

| 7078900
| An aAdmin password is not set. Set the password by including it in the
request.

= Clear suspect files of a volume

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/anti-ransomware/suspects/{volume.uuid}`#

*Introduced In:* 9.10

Clears either all the suspect files of a volume or suspect files of a
volume based on file format or suspect time provided.

== Related ONTAP commands

* `security anti-ransomware volume attack clear-suspect`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|volume.uuid
|string
|path
|True
a|Identification of the Anti-ransomware suspect file for the deletion.

* format: uuid

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|return_timeout
|integer
```

```
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|===

== Response
```

Status: 202, Accepted

:leveloffset: -1

= Forward audit logs to syslog/splunk servers

:leveloffset: +1

[[IDac175aef75183361588370f08284411f]]
= Security audit destinations endpoint overview

== Overview

This API controls the forwarding of audit log information to remote
syslog/splunk servers. Multiple destinations can be configured and all
audit records are forwarded to all destinations.
```

```
A GET operation retrieves information about remote syslog/splunk server
destinations.
A POST operation creates a remote syslog/splunk server destination.
A GET operation on /security/audit/destinations/\{address}/\{port}
retrieves information about the syslog/splunk server destination given its
address and port number.
A PATCH operation on /security/audit/destinations/\{address}/\{port}
updates information about the syslog/splunk server destination given its
address and port number.
A DELETE operation on /security/audit/destinations/\{address}/\{port}
deletes a syslog/splunk server destination given its address and port
number.

=== Overview of fields used for creating a remote syslog/splunk
destination

The fields used for creating a remote syslog/splunk destination fall into
the following categories

==== Required properties

All of the following fields are required for creating a remote
syslog/splunk destination

* `address`

==== Optional properties

All of the following fields are optional for creating a remote
syslog/splunk destination

* `port`
* `ipspace`
* `protocol`
* `facility`
* `verify_server`
* `message_format` (Can be either "legacy_netapp" or "rfc_5424")
* `timestamp_format_override` (Can be either "no_override", "rfc_3164",
"iso_8601_utc" or "iso_8601_local_time")
* `hostname_format_override` (Can be either "no_override", "fqdn" or
"hostname_only")
 +

'''

== Examples
```

```
=== Retrieving remote syslog/splunk server destinations

= Define a remote syslog or splunk server to receive audit information

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/audit/destinations`#

*Introduced In:* 9.6

Defines a remote syslog/splunk server for sending audit information to.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|address
|string
|query
|False
a|Filter by address

|timestamp_format_override
|string
|query
|False
a|Filter by timestamp_format_override

* Introduced in: 9.13
```

```
|verify_server
|boolean
|query
|False
a|Filter by verify_server

|hostname_format_override
|string
|query
|False
a|Filter by hostname_format_override

* Introduced in: 9.13

|facility
|string
|query
|False
a|Filter by facility

|port
|integer
|query
|False
a|Filter by port

|protocol
|string
|query
|False
a|Filter by protocol

|ipspace.name
|string
|query
|False
a|Filter by ipspace.name

* Introduced in: 9.12

|ipspace.uuid
```

```
|string
|query
|False
a|Filter by ipspace.uuid

* Introduced in: 9.12

|message_format
|string
|query
|False
a|Filter by message_format

* Introduced in: 9.13

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

[[ID6ef4dbe14fc982144b47dd409e95e641]]
= Define the remote syslog or splunk server information

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/audit/destinations`#

*Introduced In:* 9.6

Configures remote syslog/splunk server information.

== Required properties

All of the following fields are required for creating a remote
syslog/splunk destination

* `address`

== Optional properties

All of the following fields are optional for creating a remote
syslog/splunk destination

* `port`
* `ipspace`
* `protocol`
* `facility`
* `verify_server` (Can only be "true" when protocol is "tcp_encrypted")
* `message_format` (Can be either "legacy-netapp" or "rfc-5424")
* `timestamp_format_override` (Can be either "no-override", "rfc-3164",
"iso-8601-utc" or "iso-8601-local-time")
* `hostname_format_override` (Can be either "no-override", "fqdn" or
"hostname-only")

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|force
|boolean
```

```
|query
|False
a|Skip the Connectivity Test

* Default value:

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

[.api-collapsible-fifth-title]
security_audit_log_forward

[cols=3*,options=header]
|===
|Name
|Type
|Description

|address
|string
a|Destination syslog\|splunk host to forward audit records to. This can be
an IP address (IPv4\|IPv6) or a hostname.

|facility
|string
a|This is the standard Syslog Facility value that is used when sending
audit records to a remote server.

|hostname_format_override
```

```
|string
a|Syslog Hostname Format Override

|ipspace
|link:#ipspace[ipspace]
a|

|message_format
|string
a|Syslog message format to be used. legacy_netapp format (variation of
RFC-3164) is default message format.

|port
|integer
a|Destination Port. The default port depends on the protocol chosen:
For un-encrypted destinations the default port is 514.
For encrypted destinations the default port is 6514.

|protocol
|string
a|Log forwarding protocol

|timestamp_format_override
|string
a|Syslog Timestamp Format Override.

|verify_server
|boolean
a|This is only applicable when the protocol is tcp_encrypted. This
controls whether the remote server's certificate is validated. Setting
"verify_server" to "true" will enforce validation of remote server's
certificate. Setting "verify_server" to "false" will not enforce
validation of remote server's certificate.

:leveloffset: -1

= View administrative audit logs

:leveloffset: +1

[[IDe584fee655df3bb188c701915c65dc99]]
= Security audit messages endpoint overview

== Overview

These APIs return audit log records. The GET requests retrieves all audit
log records. An audit log record contains information such as timestamp,
node name, index and so on.
 +

'''

== Example

=== Retrieving audit log records

The following example shows the audit log records.
 +

'''

----

# The API:
/api/security/audit/messages

# The call:
```

```
curl -X GET "https://<cluster-ip>/api/security/audit/messages"

# The response:
{
"records": [
  {
    "timestamp": "2019-03-08T11:03:32-05:00",
    "node": {
      "name": "node1",
      "uuid": "bc9af9da-41bb-11e9-a3db-005056bb27cf",
      "_links": {
        "self": {
          "href": "/api/cluster/nodes/bc9af9da-41bb-11e9-a3db-
005056bb27cf"
        }
      }
    },
    "index": 4294967299,
    "application": "http",
    "location": "172.21.16.89",
    "user": "admin",
    "input": "GET /api/security/audit/destinations/",
    "state": "pending",
    "scope": "cluster"
  }
],
"num_records": 1,
"_links": {
  "self": {
    "href": "/api/security/audit/messages"
  }
}
}
----

'''

[[ID111a56d552b64744d88c523dfe0d3efa]]
= Retrieve the administrative audit log viewer

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/audit/messages`#
```

```
*Introduced In:* 9.6

Retrieves the administrative audit log viewer.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|command_id
|string
|query
|False
a|Filter by command_id

|application
|string
|query
|False
a|Filter by application

|state
|string
|query
|False
a|Filter by state

|node.uuid
|string
|query
|False
a|Filter by node.uuid

|node.name
|string
|query
```

```
|False
a|Filter by node.name

|session_id
|string
|query
|False
a|Filter by session_id

|timestamp
|string
|query
|False
a|Filter by timestamp

|user
|string
|query
|False
a|Filter by user

|scope
|string
|query
|False
a|Filter by scope

|location
|string
|query
|False
a|Filter by location

|index
|integer
|query
|False
a|Filter by index

|svm.name
```

```
|string
|query
|False
a|Filter by svm.name

|message
|string
|query
|False
a|Filter by message

|input
|string
|query
|False
a|Filter by input

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|application
|string
a|This identifies the "application" by which the request was processed.

|command_id
|string
a|This is the command ID for this request.
Each command received on a CLI session is assigned a command ID. This
enables you to correlate a request and response.

|index
|integer
a|Internal index for accessing records with same time/node. This is a 64
bit unsigned value.

|input
|string
a|The request.

|location
|string
a|This identifies the location of the remote user. This is an IP address
or "console".

|message
|string
```

```
a|This is an optional field that might contain "error" or "additional
information" about the status of a command.

|node
|link:#node[node]
a|Node where the audit message resides.

|scope
|string
a|Set to "svm" when the request is on a data SVM; otherwise set to
"cluster".

|session_id
|string
a|This is the session ID on which the request is received. Each SSH
session is assigned a session ID.
Each http/ontapi/snmp request is assigned a unique session ID.

|state
|string
a|State of of this request.

|svm
|link:#svm[svm]
a|This is the SVM through which the user connected.

|timestamp
|string
a|Log entry timestamp. Valid in URL

|user
|string
a|Username of the remote user.

:leveloffset: -1

= Manage data SVM account information

:leveloffset: +1

[[IDeb033495e125746b84ed53b13bffbd39]]
= Security authentication cluster ad-proxy endpoint overview

== Overview

This API configures data SVM account information at the Active Directory.
For Active Directory domain-based authentication for cluster accounts, a
data SVM must be configured and registered as a machine account at the
Active Directory. All authentication requests are proxied through this
SVM.

== Examples

=== Creating a data SVM proxy for domain-based authentication for cluster
accounts

----

# The API:
POST  "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy" -d '{"svm.uuid":"13f87d78-70c7-11e9-b722-0050568ec89f"}'
----
```

```
=== Updating a data SVM proxy for domain-based authentication for cluster
accounts

----

# The API:
PATCH "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy" -d '{"svm.uuid":"13f87d78-70c7-11e9-b722-0050568ec89f"}'
----

=== Retrieving a data SVM proxy for domain-based authentication for
cluster accounts

----

# The API:
GET "/api/security/authentication/cluster/ad-proxy"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/ad-
proxy"

# The response:
{
"svm": {
  "uuid": "512eab7a-6bf9-11e9-a896-005056bb9ce1",
  "name": "vs2",

= Manage LDAP server configuration

:leveloffset: +1

[[ID004d2373919c591bf89298345b44eb29]]
= Security authentication cluster LDAP endpoint overview

== Overview

LDAP servers are used to centrally maintain user information. LDAP
configurations must be set up
to look up information stored in the LDAP directory on the external LDAP
servers. This API is used to retrieve and manage
cluster LDAP server configurations.

== Examples

=== Retrieving the cluster LDAP information

The cluster LDAP GET request retrieves the LDAP configuration of the
cluster.

The following example shows how a GET request is used to retrieve the
cluster LDAP information:

----

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json"

# The response:
{
"servers": [
  "10.10.10.10",
  "domainB.example.com"
],
"schema": "ad_idmu",
"port": 389,
```

```
"min_bind_level": "anonymous",
"bind_dn": "cn=Administrators,cn=users,dc=domainA,dc=example,dc=com",
"base_dn": "dc=domainA,dc=example,dc=com",
"base_scope": "subtree",
"use_start_tls": true,
"session_security": "none",
"try_channel_binding": true,
"_links": {
  "self": {
    "href": "/api/security/authentication/cluster/ldap"
  }
}
}
----

=== Creating the cluster LDAP configuration

The cluster LDAP POST operation creates an LDAP configuration for the
cluster.

The following example shows how to issue a POST request with all of the
fields specified:

----

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"servers\": [ \"10.10.10.10\", \"domainB.example.com\" ], \"schema\":
\"ad_idmu\", \"port\": 389, \"min_bind_level\": \"anonymous\",
\"bind_dn\": \"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"base_scope\": \"subtree\", \"use_start_tls\": false,
\"session_security\": \"none\"}"
----

The following example shows how to issue a POST request with a number of
optional fields not specified:

----

# The API:
/api/security/authentication/cluster/ldap
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/hal+json" -H "Content-Type: application/json" -d
"{ \"port\": 389, \"bind_dn\":
\"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\",
\"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\",
\"session_security\": \"none\"}"
----

=== Updating the cluster LDAP configuration

The cluster LDAP PATCH request updates the LDAP configuration of the
cluster.

The following example shows how a PATCH request is used to update the
cluster LDAP configuration:

----

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/ldap"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"servers\": [ \"55.55.55.55\" ], \"schema\": \"ad_idmu\", \"port\": 636,
\"use_start_tls\": false }"
----

=== Deleting the cluster LDAP configuration

The cluster LDAP DELETE request deletes the LDAP configuration of the
cluster.

The following example shows how a DELETE request is used to delete the
cluster LDAP configuration:

----

# The API:
/api/security/authentication/cluster/ldap

# The call:
curl -X DELETE "https://<mgmt-
ip>/api/security/authentication/cluster/ldap" -H "accept:
application/hal+json"
----
```

```
[[ID89df241661af678e12634d5517ded04d]]
= Delete the LDAP configuration for the cluster

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#

*Introduced In:* 9.6

Deletes the LDAP configuration of the cluster.

|Description

|_links
|link:#_links[_links]
a|

|base_dn
|string
a|Specifies the default base DN for all searches.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|bind_as_cifs_server
|boolean
a|Specifies whether or not CIFS server's credentials are used to bind to
the LDAP server.
```

```
|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.

|bind_password
|string
a|Specifies the bind password for the LDAP servers.

|group_dn
|string
a|Specifies the group Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for group lookups.

|group_membership_filter
|string
a|Specifies the custom filter used for group membership lookups from an
LDAP server.

|group_scope
|string
a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.

|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.
```

```
|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
```

```
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.
```

```
|user_dn
|string
a|Specifies the user Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for user lookups.

|user_scope
|string
a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

[[ID664cede3d69026e587e9fae68286127e]]
= Update the LDAP configuration for the cluster

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#

*Introduced In:* 9.6

Both mandatory and optional parameters of the LDAP configuration can be
updated.
IPv6 must be enabled if IPv6 family addresses are specified. Configuring
more than one LDAP server is recommended to avoid a single point of
failure. Both FQDNs and IP addresses are supported for the `servers`
property.
The LDAP servers are validated as part of this operation. LDAP validation
fails in the following scenarios:

. The server does not have LDAP installed.
. The server is invalid.
. The server is unreachable.

[.api-collapsible-fifth-title]
status

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the error message. If there is no error, it will
be 0 to indicate success.

|dn_message
|array[string]
a|

|ipv4_state
|string
a|The status of the LDAP service with IPv4 address.

|ipv6_state
|string
a|The status of the LDAP service with IPv6 address.

|message
|string
a|Provides additional details on the error if `ipv4_state` or `ipv6_state`
is down.
If both `ipv4_state` and `ipv6_state` are up, it provides details of the
IP addresses that are connected successfully.
```

```
|state
|string
a|The status of the LDAP service for the SVM. The LDAP service is up if
either `ipv4_state` or `ipv6_state` is up.
The LDAP service is down if both `ipv4_state` and `ipv6_state` are down.

a|

|base_dn
|string
a|Specifies the default base DN for all searches.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|bind_as_cifs_server
|boolean
a|Specifies whether or not CIFS server's credentials are used to bind to
the LDAP server.

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.
```

```
|bind_password
|string
a|Specifies the bind password for the LDAP servers.

|group_dn
|string
a|Specifies the group Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for group lookups.

|group_membership_filter
|string
a|Specifies the custom filter used for group membership lookups from an
LDAP server.

|group_scope
|string
a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.

|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:
```

```
* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.
```

```
|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn
|string
```

```
a|Specifies the user Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for user lookups.

|user_scope
|string
a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

[[IDae7b697e2e799a2f08a48fbc155125dd]]
= Create the LDAP configuration for the cluster

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/cluster/ldap`#

*Introduced In:* 9.6

A cluster can have only one LDAP configuration. IPv6 must be enabled if
IPv6 family addresses are specified.

== Required properties

* `servers` - List of LDAP servers used for this client configuration.
* `bind_dn` - Specifies the user that binds to the LDAP servers.
* `base_dn` - Specifies the default base DN for all searches.
```

```
== Recommended optional properties

* `schema` - Schema template name.
* `port` - Port used to connect to the LDAP Servers.
* `ldaps_enabled` - Specifies whether or not LDAPS is enabled.
* `min_bind_level` - Minimum bind authentication level.
* `bind_password` - Specifies the bind password for the LDAP servers.
* `base_scope` - Specifies the default search scope for LDAP queries.
* `use_start_tls` - Specifies whether or not to use Start TLS over LDAP
connections.
* `session_security` - Specifies the level of security to be used for LDAP
communications.
* `bind_as_cifs_server` - Indicates if CIFS server's credentials are used
to bind to the LDAP server.
* `query_timeout` - Maximum time to wait for a query response from the
LDAP server, in seconds.
* `user_dn` - User Distinguished Name (DN) used as the starting point in
the LDAP directory tree for user lookups.
* `user_scope` - Default search scope for LDAP for user lookups.
* `group_dn` - Group Distinguished Name (DN) used as the starting point in
the LDAP directory tree for group lookups.
* `group_scope` - Default search scope for LDAP for group lookups.
* `netgroup_dn` - Netgroup Distinguished Name (DN) used as the starting
point in the LDAP directory tree for netgroup lookups.
* `netgroup_scope` - Default search scope for LDAP for netgroup lookups.
* `netgroup_byhost_dn` - Netgroup Distinguished Name (DN) used as the
starting point in the LDAP directory tree for netgroup by host lookups.
* `netgroup_byhost_scope` - Default search scope for LDAP for netgroup by
host lookups.
* `is_netgroup_byhost_enabled` - Specifies whether netgroup by host
querying is enabled.
* `group_membership_filter` - Custom filter used for group membership
lookup from an LDAP server.
* `skip_config_validation` - Indicates whether or not the validation for
the specified LDAP configuration is disabled.

== Default property values

* `schema` - _RFC-2307_
* `port` - _389_
* `ldaps_enabled` - _false_
* `min_bind_level` - _simple_
* `base_scope` - _subtree_
* `use_start_tls` - _false_
* `session_security` - _none_
* `query_timeout` - _3_
```

```
* `user_scope` - _subtree_
* `group_scope` - _subtree_
* `netgroup_scope` - _subtree_
* `netgroup_byhost_scope` - _subtree_
* `is_netgroup_byhost_enabled` - _false_
* `skip_config_validation` - _false_
* `try_channel_binding` - _true_

Configuring more than one LDAP server is recommended to avoid a single
point of failure. Both FQDNs and IP addresses are supported for the
`servers` property.
The LDAP servers are validated as part of this operation. LDAP validation
fails in the following scenarios:

. The server does not have LDAP installed.
. The server is invalid.
. The server is unreachable.

a|

|base_dn
|string
a|Specifies the default base DN for all searches.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN
```

```
|bind_as_cifs_server
|boolean
a|Specifies whether or not CIFS server's credentials are used to bind to
the LDAP server.

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.

|bind_password
|string
a|Specifies the bind password for the LDAP servers.

|group_dn
|string
a|Specifies the group Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for group lookups.

|group_membership_filter
|string
a|Specifies the custom filter used for group membership lookups from an
LDAP server.

|group_scope
|string
a|Specifies the default search scope for LDAP for group lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|is_netgroup_byhost_enabled
|boolean
a|Specifies whether or not netgroup by host querying is enabled.

|is_owner
|boolean
a|Specifies whether or not the SVM owns the LDAP client configuration.
```

```
|ldaps_enabled
|boolean
a|Specifies whether or not LDAPS is enabled.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|port
|integer
```

```
a|The port used to connect to the LDAP Servers.

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.
```

```
|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn
|string
a|Specifies the user Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for user lookups.

|user_scope
|string
a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

| Error Code | Description

| 4915203
| The specified LDAP schema does not exist.

| 262222
| The specified LDAP servers contain duplicate server entries.

| 4915229
| DNS resolution failed due to an internal error. Contact technical
support if this issue persists.

| 4915231
| DNS resolution failed for one or more of the specified LDAP servers.
Verify that a valid DNS server is configured.

| 23724132
| DNS resolution failed for all the specified LDAP servers. Verify that a
valid DNS server is configured.

| 4915234
| The specified LDAP server is not supported because it is one of the
following: multicast, loopback, 0.0.0.0, or broadcast.

| 4915248
```

```
| LDAP servers cannot be empty or "-". Specified FQDN is invalid because
it is empty or "-" or it contains either special characters or "-" at the
start or end of the domain.

| 4915251
| STARTTLS and LDAPS cannot be used together.

| 4915257
| The LDAP configuration is invalid. Verify that bind-dn and bind password
are correct.

| 4915258
| The LDAP configuration is invalid. Verify that the servers are reachable
and that the network configuration is correct.

| 13434916
| The SVM is in the process of being created. Wait a few minutes, and then
try the command again.

| 23724130
| Cannot use an IPv6 name server address because there are no IPv6
interfaces.

| 4915252
| LDAP referral is not supported with STARTTLS, with session security
levels sign, seal or with LDAPS.

* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|netgroup_byhost_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup by host lookups.

|netgroup_byhost_scope
|string
a|Specifies the default search scope for LDAP for netgroup by host
lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|netgroup_dn
|string
a|Specifies the netgroup Distinguished Name (DN) that is used as the
starting point in the LDAP directory tree for netgroup lookups.

|netgroup_scope
|string
a|Specifies the default search scope for LDAP for netgroup lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN
```

```
|port
|integer
a|The port used to connect to the LDAP Servers.

|preferred_ad_servers
|array[string]
a|

|query_timeout
|integer
a|Specifies the maximum time to wait for a query response from the LDAP
server, in seconds.

|referral_enabled
|boolean
a|Specifies whether or not LDAP referral is enabled.

|restrict_discovery_to_site
|boolean
a|Specifies whether or not LDAP server discovery is restricted to site-
scope.

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
```

```
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|skip_config_validation
|boolean
a|Indicates whether or not the validation for the specified LDAP
configuration is disabled.

|status
|link:#status[status]
a|

|svm
|link:#svm[svm]
a|

|try_channel_binding
|boolean
a|Specifies whether or not channel binding is attempted in the case of
TLS/LDAPS.

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

|user_dn
|string
a|Specifies the user Distinguished Name (DN) that is used as the starting
point in the LDAP directory tree for user lookups.

|user_scope
|string
a|Specifies the default search scope for LDAP for user lookups:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

:leveloffset: -1

= Manage NIS configuration

:leveloffset: +1

[[ID11f36ebcd9ce7c27c6070bf9778f100c]]
= Security authentication cluster NIS endpoint overview

== Overview

NIS servers are used to authenticate user and client computers. NIS domain
name and NIS server information is required to configure NIS. This API
retrieves and manages NIS server configurations.

== Examples

=== Retrieving cluster NIS information

The cluster NIS GET request retrieves the NIS configuration of the
cluster.

The following example shows how a GET request is used to retrieve the
cluster NIS configuration:

----

# The API:
/security/authentication/cluster/nis
```

```
# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/nis" -H
"accept: application/hal+json"

# The response:
{
"domain": "domainA.example.com",
"servers": [
  "10.10.10.10",
  "example.com"
],
"bound_servers": [
  "10.10.10.10"
]
}
----

=== Creating the cluster NIS configuration

The cluster NIS POST request creates a NIS configuration for the cluster.

The following example shows how a POST request is used to create a cluster
NIS configuration:

----

# The API:
/security/authentication/cluster/nis

# The call:
curl -X POST "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"domain\": \"domainA.example.com\", \"servers\": [
\"10.10.10.10\",\"example.com\" ]}"
----

=== Updating the cluster NIS configuration

The cluster NIS PATCH request updates the NIS configuration of the
cluster.

The following example shows how to update the domain:

----

# The API:
```

```
/security/authentication/cluster/nis

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"domain\": \"domainC.example.com\", \"servers\": [ \"13.13.13.13\" ]}"
----

The following example shows how to update the server:

----

# The API:
/security/authentication/cluster/nis

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/json" -H "Content-Type: application/json" -d "{
\"servers\": [ \"14.14.14.14\" ]}"
----

== Deleting the cluster NIS configuration

The cluster NIS DELETE request deletes the NIS configuration of the
cluster.

The following example shows how a DELETE request is used to delete the
cluster NIS configuration:

----

# The API:
/security/authentication/cluster/nis

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/authentication/cluster/nis"
-H "accept: application/hal+json"
----

'''

[[IDe6d5888c15c979465d53484f1b01bbf7]]
= Delete the NIS configuration for the cluster
```

```
[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/security/authentication/cluster/nis`#

*Introduced In:* 9.6

Deletes the NIS configuration of the cluster. NIS can be removed as a
source from ns-switch if NIS is not used for lookups.

= Manage SAML service

:leveloffset: +1

[[IDddf4b63cf2ae64a96be5c5b4fba9406b]]
= Security authentication cluster saml-sp endpoint overview

== Overview

This API is used to retrieve and display relevant information pertaining
to the SAML service provider configuration in the cluster. The POST
request creates a SAML service provider configuration if there is none
present.  The DELETE request removes the SAML service provider
configuration.  The PATCH request enables and disables SAML in the
cluster.  Various responses are shown in the examples below.
 +
```

```
'''

== Examples

=== Retrieving the SAML service provider configuration in the cluster

The following output shows the SAML service provider configuration in the
cluster.
 +

'''

----

# The API:
/api/security/authentication/cluster/saml-sp

# The call:
curl -X GET "https://<mgmt-ip>/api/security/authentication/cluster/saml-
sp" -H "accept: application/hal+json"

# The response:
{
"idp_uri": "https://examplelab.customer.com/idp/Metadata",

[[ID4659e11b5285762547e95208521c2599]]
= Create a SAML service provider configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
```

```
block]#`/security/authentication/cluster/saml-sp`#

*Introduced In:* 9.6

Creates a SAML service provider configuration. Note that "common_name" is
mutually exclusive with "serial_number" and "ca" in POST. SAML will
initially be disabled, requiring a patch to set "enabled" to "true", so
that the user has time to complete the setup of the IdP.

== Required properties

* `idp_uri`

== Optional properties

* `certificate`
* `enabled`
* `host`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|verify_metadata_server
|boolean
|query
|False
a|Verify IdP metadata server identity.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
```

```
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

:leveloffset: -1

= Update user account password

:leveloffset: +1

[[IDb17b56982dbdc815db940cde2b04864e]]
= Security authentication password endpoint overview

== Overview

This API changes the password for a local user account.

Only cluster administrators with the _"admin"_ role can change the
password for other cluster or SVM user accounts. If you are not a cluster
administrator, you can only change your own password.

== Examples

=== Changing the password of another cluster or SVM user account by a
cluster administrator

Specify the user account name and the new password in the body of the POST
request. The owner.uuid or owner.name are not required to be specified for
a cluster-scoped user account.

For an SVM-scoped account, along with new password and user account name,
specify either the SVM name as the owner.name or SVM uuid as the
owner.uuid in the body of the POST request. These indicate the SVM for
which the user account is created and can be obtained from the response
body of a GET request performed on the _/api/svm/svms_ API.

----

# The API:
POST "/api/security/authentication/password"
```

```
# The call to change the password of another cluster user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"name":"cluster_user1","password":"hello@1234"}'
----

----

# The call to change the password of another SVM user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"owner.name":"svm1","name":"svm_user1","password":"hello@1234"}'
----

----

# The call to change the password hash algorithm of the cluster user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"name":"cluster_user1","password":"hello@1234","password_hash_algorithm"
:"sha256"}'
----

----

# The call to change the password hash algorithm of another SVM user:
curl -X POST "https://<mgmt-ip>/api/security/authentication/password" -d
'{"owner.name":"svm1","name":"svm_user1","password":"hello@1234","password
_hash_algorithm":"sha256"}'
----

=== Changing the password of an SVM-scoped user

NOTE: The IP address in the URI must be same as one of the interfaces
owned by the SVM.

----

# The API:
POST "/api/security/authentication/password"

# The call:
curl -X POST "https://<SVM-ip>/api/security/authentication/password" -d
'{"name":"svm_user1","password":"new1@1234"}'
----

'''

= Update the user account password

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/authentication/password`#

*Introduced In:* 9.6

Updates the password for a user account.

== Required parameters

* `name` - User account name.
* `password` - New password for the user account.

== Optional parameters

* `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped
user account.
* `password_hash_algorithm` - Optional property that specifies the
password hash algorithm used to generate a hash of the user's password for
password matching. Default value is "sha512".

== Related ONTAP commands

* `security login password`

:leveloffset: -1

= Manage authentication keys (for admins)

:leveloffset: +1

[[IDb3c195b91b50b18e77e914e4a5cb46a9]]
= Security authentication publickeys endpoint overview

== Overview

This API configures the public keys for user accounts.

For secure shell (SSH) access, public-private key pair based
authentication is possible by associating the public key with a user
account.
Prerequisites:
You must have generated the SSH key.
You must be a cluster or SVM administrator to perform the user's public
key.

== Examples

=== Creating a public key for cluster-scoped user accounts

Specify the user account name, public key, index, comment, and optionally
the certificate in the body of the POST request. The owner.uuid or
owner.name are not required for a cluster-scoped user account.

:leveloffset: -1

= Manage authentication keys (end-users)

:leveloffset: +1

[[ID9efdb6d4ba693d7042d3cbd154b64834]]
= Security authentication publickeys owner.uuid account.name index
endpoint overview

== Overview

This API configures the public keys for end-user (non-cluster admin)
accounts.
Specify the owner UUID, the user account name, and the index in the URI
path. The owner UUID corresponds to the UUID of the SVM containing the
user account associated with the public key and can be obtained from the
response body of the GET request performed on the API "/api/svm/svms".

The index value corresponds to the public key that needs to be modified or
deleted (it is possible to create more than one public key for the same
user account).

== Examples

=== Retrieving the specific configured public key for user accounts

----

# The API:
GET
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/513a78c7-
```

```
8c13-11e9-8f78-005056bbf6ac/pubuser4/0
----

=== Updating the public key, certificate, and comment for user accounts

----

# The API:
PATCH
"/api/security/authentication/publickeys/{owner.uuid}/{account.name}/{inde
x}"

# The call:
curl -k https://<mgmt-ip>/api/security/authentication/publickeys/d49de271-
8c11-11e9-8f78-005056bbf6ac/pubuser1/0 --request PATCH --data '{

:leveloffset: -1

= Manage AWS KMS

:leveloffset: +1

[[IDf08d8ffd336018ae1ec6e56a2fe2b14b]]
= Security aws-kms endpoint overview

== Overview

Amazon Web Services Key Management Services (AWS KMS) is a cloud key
management service (KMS) that provides a secure store for secrets. This
feature allows ONTAP to securely store its encryption keys using AWS KMS.
In order to use AWS KMS with ONTAP, you must first create a
```

```
Customer Master Key (CMK) in AWS KMS and provide an Access Key ID and
Secret Access Key for a user that has appropriate access to the newly
created CMK in the AWS KMS."

== Examples

=== Enabling AWS KMS for an SVM

The following example shows how to enable AWS KMS at the SVM-scope. Note
the _return_records=true_ query parameter is used to obtain the newly
created key manager configuration.

----

# The API:
POST /api/security/aws-kms

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/aws-kms?return_records=true'
-H 'accept: application/hal+json' -d '{"svm":{"uuid":"f36ff553-e713-11ea-
bd56-005056bb4222" }, "region": "us-east-1", "key_id": "kmip-aws",
"access_key_id": "AK7ATC35ZXU6GKUDQURT", "secret_access_key": "Ahrut-
#ghty5-881Ht"}'

# The response:
{
"num_records": 1,
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"
    },
    "region": "us-east-1",
    "key_id": "kmip-aws",
    "access_key_id": "AK7ATC35ZXU6GKUDQURT",
    "_links": {
        "self": {
        "href": "/api/security/aws-kms/f72098a2-e908-11ea-bd56-
005056bb4222"
            }
        }
    }
]
}
```

```
----

'''

=== Retrieving all AWS KMS configurations

The following example shows how to retrieve all AWS KMS configurations.

----

# The API:
GET /api/security/aws-kms

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/aws-kms?fields=*'

# The response:
{
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "scope": "svm",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"
    },
    "region": "us-east-1",

005056bb4222"
            }
        }
    }
],
"num_records": 1,
"_links": {
    "self": {
    "href": "/api/security/aws-kms?fields=*"
    }
```

```
}
}
----

'''

=== Retrieving a specific AWS KMS configuration

The following example shows how to retrieve information for a specific AWS
KMS configuration.

----

# The API:
GET /api/security/aws-kms/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/aws-kms/f72098a2-e908-11ea-
bd56-005056bb4222?fields=*'

# The response:
{
"uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
"scope": "svm",
"svm": {
    "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",

    "self": {
    "href": "/api/security/aws-kms/f72098a2-e908-11ea-bd56-005056bb4222"
    }
}
}
----

'''

=== Retrieving the advanced properties of an AWS configured for a specific
```

```
SVM

These values are not retrieved by default with the 'fields=*' option.
The following example retrieves the advanced properties of a configured
AWS for a specific SVM; there is an added computational cost in retrieving
their values. The properties are not populated for either a collection GET
or an instance GET unless they are explicitly requested using the `fields`
query parameter or GET for all advanced properties is enabled.

----

# The API:
GET /api/security/aws-kms

# The call:
curl -X GET 'https://<mgmt-ip>/api/security/aws-kms/7052c6c0-a503-11ec-
a68f-005056ac75a0/?fields=state,amazon_reachability,ekmip_reachability'

# The response:

amazon_reachability

Indicates whether or not the Amazon KMS is reachable from all nodes in the
cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[[ID6726c9e04d15d973ca1356017372ade0]]
= Configure the AWS KMS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/aws-kms`#

*Introduced In:* 9.12

Configures the AWS KMS configuration for the specified SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create an AWS KMS.
* `region` - AWS region of the AWS KMS.
* `key_id` - AWS Key ID

== Optional properties

* `access_key_id` - AWS access key ID of the user who has the appropriate
access to AWS KMS.
```

```
* `secret_access_key` - AWS secret access key for the access key ID
provided.
* `service` - AWS service type.
* `default_domain` - AWS KMS default domain.
* `port` - AWS KMS port.
* `proxy_type` - Type of proxy (http, https, etc.), if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `polling_period` - Polling period in minutes.
* `encryption_context` - Additional layer of authentication and logging.

== Related ONTAP commands

* `security key-manager external aws enable`

== Parameters

= Re-key or re-version an AWS KMS key encryption key for AWS KMS

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/aws-kms/{aws_kms.uuid}/rekey-external`#

*Introduced In:* 9.12

Rekeys or re-versions the AWS KMS Key Encryption Key (KEK) for the given
AWS KMS.

== Related ONTAP commands

* `security key-manager external aws rekey-external`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|aws_kms.uuid
|string
|path
|True
a|UUID of the existing AWS KMS configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
```

```
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===

[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
```

```
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the Amazon Web Services Key Management Service
(AWS KMS) key protection is available cluster-wide.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_state
|boolean
a|Set to true when AWS KMS key protection is available on all nodes of the
cluster.

|code
|string
a|Code corresponding to the message. Returns a 0 if AWS KMS key protection
is available on all nodes of the cluster.

|message
|string
a|Error message set when cluster_state is false.

|===

[#svm]

= Update an AWS KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/aws-kms/{uuid}`#

*Introduced In:* 9.12
```

```
Updates the AWS KMS configuration.

== Optional properties

* `region` - AWS region of the AWS KMS.
* `service` - AWS service type.
* `default_domain` - AWS KMS default domain.
* `port` - AWS KMS port.
* `proxy_type` - Type of proxy (http, https, etc.), if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `polling_period` - Polling period in minutes.
* `timeout` - AWS Connection timeout, in seconds.
* `verify` - Set to true to verify the AWS KMS host.
* `verify_host` - Set to true to verify the AWS KMS host's hostname.
* `verify_ip` - Set to true to verify the AWS KMS host's IP address.
* `host` - AWS KMS host's hostname.
* `secret_access_key` - AWS secret access key for the access key ID
provided.
* `access-key-id` - AWS access key ID of the user with the appropriate
access to AWS KMS.
* `skip_verify` - Set to true to bypass verification of the user provided
access_key_id and secret_access_key.
* `encryption_context` - Additional layer of authentication and logging.

== Related ONTAP commands

* `security key-manager external aws update-config`
* `security key-manager external aws update-credentials`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
```

```
|string
|path
|True
a|AWS KMS UUID

|===

== Request Body

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|access_key_id
|string
a|AWS Access Key ID of the user that has appropriate access to AWS KMS.

|amazon_reachability
|link:#amazon_reachability[amazon_reachability]
a|Indicates whether or not the Amazon KMS is reachable from all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|default_domain
|string
a|AWS KMS default domain.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|encryption_context
```

```
|string
a|Additional layer of authentication and logging.

|host
|string
a|AWS KMS host's hostname.

|key_id
|string
a|AWS Key ID.

|polling_period
|integer
a|Polling period in minutes.

|port
|integer
a|AWS KMS port.

|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Proxy type.

|proxy_username
|string
a|Proxy username.
```

```
|region
|string
a|AWS region of the AWS KMS.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|secret_access_key
|string
a|AWS Secret Access Key for the provided access key ID.

|service
|string
a|AWS service type.

|skip_verify
|boolean
a|Set to true to bypass verification of the user provided access_key_id
and secret_access_key. An error will be returned if 'skip_verify' is
provided but 'access_key_id' is not.

|state
|link:#state[state]
a|Indicates whether or not the Amazon Web Services Key Management Service
(AWS KMS) key protection is available cluster-wide.

:leveloffset: -1

= Manage Azure Key Vaults

:leveloffset: +1

[[IDd1f8b239931d75625d636454be3e2c6e]]
= Security azure-key-vaults endpoint overview

== Overview

Azure Key Vault (AKV) is a cloud key management service (KMS) that
provides a secure store for secrets. This feature
allows ONTAP to securely store its encryption keys using AKV.
In order to use AKV with ONTAP, you must first deploy an Azure application
with the appropriate access to an AKV and then provide
ONTAP with the necessary details, such as key vault name, application ID
so that ONTAP can communicate with the deployed Azure application.
The properties "state", "azure_reachability" and "ekmip_reachability" are
considered advanced properties and are populated only when explicitly
requested.

== Examples

=== Creating an AKV for a cluster using the client secret authentication
method
```

```
The example AKV is configured at the cluster-scope. Note the
_return_records=true_ query parameter is used to obtain the newly created
key manager configuration.

----

# The API:
POST /api/security/azure-key-vaults

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/azure-key-
vaults?return_records=true' -H 'accept: application/hal+json' -d "{
\"client_id\": \"client1\", \"tenant_id\": \"tenant1\", \"name\":
\"https://mykeyvault.azure.vault.net/\", \"key_id\": \"https://keyvault-
test.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74\",
\"client_secret\" : \"myclientPwd\" }"

# The response:
{
"num_records": 1,
"records": [
  {
    "uuid": "85619643-9a06-11ea-8d52-005056bbeba5",
    "client_id": "client1",
    "tenant_id": "tenant1",
    "name": "https://mykeyvault.azure.vault.net/",
    "key_id": "https://keyvault-
test.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e2a74",

= Retrieve AKVs configured for all clusters and SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/azure-key-vaults`#

*Introduced In:* 9.8

Retrieves AKVs configured for all clusters and SVMs.

== Related ONTAP commands

* `security key-manager external azure show`
* `security key-manager external azure check`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|ekmip_reachability.code
|string
|query
|False
a|Filter by ekmip_reachability.code

|ekmip_reachability.reachable
|boolean
```

```
|query
|False
a|Filter by ekmip_reachability.reachable

|ekmip_reachability.node.uuid
|string
|query
|False
a|Filter by ekmip_reachability.node.uuid

|ekmip_reachability.node.name
|string
|query
|False
a|Filter by ekmip_reachability.node.name

|ekmip_reachability.message
|string
|query
|False
a|Filter by ekmip_reachability.message

|tenant_id
|string
|query
|False
a|Filter by tenant_id

|proxy_host
|string
|query
|False
a|Filter by proxy_host

|key_id
|string
|query
|False
a|Filter by key_id
```

```
|scope
|string
|query
|False
a|Filter by scope

|authentication_method
|string
|query
|False
a|Filter by authentication_method

* Introduced in: 9.10

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|proxy_port
|integer
|query
|False
a|Filter by proxy_port

|uuid
|string
|query
|False
a|Filter by uuid

|state.message
|string
|query
```

```
|False
a|Filter by state.message

|state.code
|string
|query
|False
a|Filter by state.code

|state.available
|boolean
|query
|False
a|Filter by state.available

|proxy_username
|string
|query
|False
a|Filter by proxy_username

|name
|string
|query
|False
a|Filter by name

|azure_reachability.code
|string
|query
|False
a|Filter by azure_reachability.code

|azure_reachability.reachable
|boolean
|query
|False
a|Filter by azure_reachability.reachable

|azure_reachability.message
```

```
|string
|query
|False
a|Filter by azure_reachability.message

|proxy_type
|string
|query
|False
a|Filter by proxy_type

|client_id
|string
|query
|False
a|Filter by client_id

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#azure_reachability]
[.api-collapsible-fifth-title]
azure_reachability

Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV service is
reachable from all nodes in the cluster.

|message
|string
a|Error message set when reachability is false.

|reachable
|boolean
a|Set to true when the AKV service is reachable from all nodes of the
cluster.
```

```

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the AKV wrapped internal key is available cluster
wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|available
|boolean
```

```
a|Set to true when an AKV wrapped internal key is present on all nodes of
the cluster.

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV wrapped key
is available on all nodes in the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

[[IDb0eb9e8824b33846495c75b2bc5b9189]]
= Create an AKV configuration for all clusters and SVMs
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/azure-key-vaults`#

*Introduced In:* 9.8

Configures the AKV configuration for all clusters and SVMs.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a AKV.
* `client_id` - Application (client) ID of the deployed Azure application
with appropriate access to an AKV.
* `tenant_id` - Directory (tenant) ID of the deployed Azure application
with appropriate access to an AKV.
* `client_secret` - Secret used by the application to prove its identity
to AKV.
* `client_certificate` - PKCS12 Certificate used by the application to
prove its identity to AKV.
* `key_id`- Key Identifier of AKV encryption key.
* `name` - Name of the deployed AKV used by ONTAP for storing keys.

== Optional properties

* `proxy_type` - Type of proxy (http, https etc.) if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.

== Related ONTAP commands

* `security key-manager external azure enable`
* `security key-manager external azure update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description
```

```
|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

ONTAP Error Response Codes

|===
| Error Code | Description

| 3735553
| Failed to create self-signed certificate.

| 3735664
| The specified key size is not supported in FIPS mode.

| 3735665
| The specified hash function is not supported in FIPS mode.

| 3735700
| The specified key size is not supported.

| 52559972
| The certificates start date is later than the current date.

| 65537500
| A key manager has already been configured for this SVM.

| 65537504
| Internal error. Failed to store configuration in internal database.

| 65537505
| One or more volume encryption keys of the given SVM are stored on a key
manager configured for the admin SVM.

| 65537506
| AKV is not supported in MetroCluster configurations.

| 65537512
| AKV cannot be configured for the given SVM as not all nodes in the
cluster can enable the Azure Key Vault feature.

| 65537514
| Failed to check if the Azure Key Vault feature is enabled.

| 65537518
| Failed to find an interface with Cluster role.
```

```
| 65537523
| Invalid key ID format. Example key ID format":"
"https://mykeyvault.vault.azure.net/keys/key1/a8e619fd8f234db3b0b95c59540e
2a74".

| 65537526
| Failed to enable Azure Key Vault feature.

| 65537567
| No authentication method provided.

| 65537573
| Invalid client certificate.

[#azure_reachability]
[.api-collapsible-fifth-title]
azure_reachability

Indicates whether or not the AKV service is reachable from all the nodes
```

```
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV service is
reachable from all nodes in the cluster.

|message
|string
a|Error message set when reachability is false.

|reachable
|boolean
a|Set to true when the AKV service is reachable from all nodes of the
cluster.

|===

[#node]

|===

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|
```

```
|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the AKV wrapped internal key is available cluster
wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|available
|boolean
a|Set to true when an AKV wrapped internal key is present on all nodes of
the cluster.

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV wrapped key
is available on all nodes in the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.
```

```
|===

[.api-collapsible-fifth-title]
svm

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the SVM.

|uuid
|string
a|The unique identifier of the SVM.

|===

[#azure_key_vault]
[.api-collapsible-fifth-title]
azure_key_vault

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|authentication_method
|string
a|Authentication method for the AKV instance.
```

```
|azure_reachability
|link:#azure_reachability[azure_reachability]
a|Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|client_certificate
|string
a|PKCS12 Certificate used by the application to prove its identity to AKV.

|client_id
|string
a|Application client ID of the deployed Azure application with appropriate
access to an AKV.

|client_secret
|string
a|Secret used by the application to prove its identity to AKV.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|key_id
|string
a|Key Identifier of AKV key encryption key.

|name
|string
a|Name of the deployed AKV that will be used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* Introduced in: 9.8
* readCreate: 1
* x-nullable: true
```

```
|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string
a|Proxy username.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|state
|link:#state[state]
a|Indicates whether or not the AKV wrapped internal key is available
cluster wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|svm
|link:#svm[svm]
a|
```

```
|tenant_id
|string
a|Directory (tenant) ID of the deployed Azure application with appropriate
access to an AKV.

|uuid
|string
a|A unique identifier for the Azure Key Vault (AKV).

= Re-key the external key in the key hierarchy

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/azure-key-vaults/{azure_key_vault.uuid}/rekey-external`#

*Introduced In:* 9.11

Rekeys the external key in the key hierarchy for an SVM with an AKV
configuration.

== Required properties

* `key_id`- Key identifier of the new AKV key encryption key.

== Related ONTAP commands

* `security key-manager external azure rekey-external`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|azure_key_vault.uuid
|string
|path
|True
a|UUID of the existing AKV configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
```

```
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

```

```
a|Specify the fields to return.

|===

== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|authentication_method
|string
a|Authentication method for the AKV instance.

|azure_reachability
|link:#azure_reachability[azure_reachability]
a|Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|client_certificate
|string
a|PKCS12 Certificate used by the application to prove its identity to AKV.

|client_id
|string
a|Application client ID of the deployed Azure application with appropriate
access to an AKV.

|client_secret
```

```
|string
a|Secret used by the application to prove its identity to AKV.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|key_id
|string
a|Key Identifier of AKV key encryption key.

|name
|string
a|Name of the deployed AKV that will be used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* Introduced in: 9.8
* readCreate: 1
* x-nullable: true

|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string
a|Proxy username.
```

```
|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|state
|link:#state[state]
a|Indicates whether or not the AKV wrapped internal key is available
cluster wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|svm
|link:#svm[svm]
a|

|tenant_id
|string
a|Directory (tenant) ID of the deployed Azure application with appropriate
access to an AKV.

|uuid
|string
a|A unique identifier for the Azure Key Vault (AKV).

[#azure_reachability]
[.api-collapsible-fifth-title]
azure_reachability

Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV service is
reachable from all nodes in the cluster.

|message
|string
a|Error message set when reachability is false.

|reachable
```

```
|boolean
a|Set to true when the AKV service is reachable from all nodes of the
cluster.

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
```

```
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Indicates whether or not the AKV wrapped internal key is available cluster
wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
```

```
|Type
|Description

|available
|boolean
a|Set to true when an AKV wrapped internal key is present on all nodes of
the cluster.

|code
|string
a|Code corresponding to the status message. Returns a 0 if AKV wrapped key
is available on all nodes in the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

[[IDa7a77537c62f459c549a8b9909946e82]]
= Update the AKV configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/azure-key-vaults/{uuid}`#

*Introduced In:* 9.8

Updates the AKV configuration.

== Optional properties

* `client_secret` - New secret used to prove the application's identity to
the AKV.
* `client_certificate` - New PKCS12 certificate used to prove the
application's identity to the AKV.
* `proxy_type` - Type of proxy (http, https etc.) if proxy configuration
is used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `client_id` - Application (client) ID of the deployed Azure application
with appropriate access to an AKV.
* `tenant_id` - Directory (tenant) ID of the deployed Azure application
with appropriate access to an AKV.

== Related ONTAP commands
```

```
* `security key-manager external azure update-client-secret`
* `security key-manager external azure update-credentials`
* `security key-manager external azure update-config`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|AKV UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|===

== Request Body

[cols=3*,options=header]
|===
```

```
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|authentication_method
|string
a|Authentication method for the AKV instance.

|azure_reachability
|link:#azure_reachability[azure_reachability]
a|Indicates whether or not the AKV service is reachable from all the nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|client_certificate
|string
a|PKCS12 Certificate used by the application to prove its identity to AKV.

|client_id
|string
a|Application client ID of the deployed Azure application with appropriate
access to an AKV.

|client_secret
|string
a|Secret used by the application to prove its identity to AKV.

|ekmip_reachability
|array[link:#ekmip_reachability[ekmip_reachability]]
a|

|key_id
|string
a|Key Identifier of AKV key encryption key.
```

```
|name
|string
a|Name of the deployed AKV that will be used by ONTAP for storing keys.

* example: https://kmip-akv-keyvault.vault.azure.net/
* format: uri
* Introduced in: 9.8
* readCreate: 1
* x-nullable: true

|proxy_host
|string
a|Proxy host.

|proxy_password
|string
a|Proxy password. Password is not audited.

|proxy_port
|integer
a|Proxy port.

|proxy_type
|string
a|Type of proxy.

|proxy_username
|string
a|Proxy username.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|state
|link:#state[state]
a|Indicates whether or not the AKV wrapped internal key is available
```

```
cluster wide.
This is an advanced property; there is an added computationl cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|svm
|link:#svm[svm]
a|

|tenant_id
|string
a|Directory (tenant) ID of the deployed Azure application with appropriate
access to an AKV.

|uuid
|string
a|A unique identifier for the Azure Key Vault (AKV).

[[IDced92206f717d9dac6c9d606ddc82640]]
= Create a certificate signing request

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificate-signing-request`#

*Introduced In:* 9.8

This API generates a Certificate Signing Request(CSR) and a private key
pair. A CSR is a message sent securely to a certificate authority (CA) via
any electronic media to apply for a digital identity certificate. This is
a general utility API for users to generate a CSR.

== Recommended optional properties

* `subject_name` - Subject details of the certificate.
* `security_strength` - Key size of the certificate in bits. Specifying a
stronger security strength in bits is recommended when creating a
certificate.
* `hash_function` -  Hashing function.
* `algorithm` - Asymmetric algorithm. Algorithm used to generate a
public/private key pair when creating a certificate.
* `subject_alternatives` - Subject Alternate name extensions.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `security_strength` - _112_
* `hash_function` - _sha256_
* `algorithm` - _rsa_

== Related ONTAP commands

* `security certificate generate-csr`

== Parameters

= Manage security certificates

:leveloffset: +1

[[IDbd932e6812b43bd5b43660efa8cbc5ad]]
= Security certificates endpoint overview

== Overview

This API displays security certificate information and manages the
certificates in ONTAP.

== Installing certificates in ONTAP

The security certificates GET request retrieves all of the certificates in
the cluster.

== Examples

=== Retrieving all certificates installed in the cluster with their
common-names

----

# The API:
/api/security/certificates

# The call:
curl -X GET "https://<mgmt-
ip>/api/security/certificates?fields=common_name" -H "accept:
application/hal+json"

# The response:

=== Deleting a certificate using its UUID

'''

----

# The API:
/api/security/certificates/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/security/certificates/dad2363b-8ac0-
11e8-9058-005056b482fc?fields=*" -H "accept: application/hal+json"
----

=== Signing a new certificate signing request using an existing CA
certificate UUID

Once you have created a certificate of type "root_ca", you can use that
certificate to act as a local Certificate Authority to sign new
certificate signing requests. The following example signs a new
certificate signing request using an existing CA certificate UUID. If
successful, the API returns a signed certificate.

----

# The API:
/api/security/certificates/{ca.uuid}/sign
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/security/certificates/253add53-8ac9-
11e8-9058-005056b482fc/sign" -H  "accept: application/json" -H  "Content-

|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

```
|authority_key_identifier
|string
a|Provides the key identifier of the issuing CA certificate that signed
the SSL certificate.

|ca
|string
a|Certificate authority

|common_name
|string
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time. Can be provided on POST if creating self-
signed certificate. The expiration time range is between 1 day to 10
years.

|hash_function
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates
|array[string]
a|Chain of intermediate Certificates in PEM format. Only valid in POST
when installing a certificate.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate. Key
size of 512 is not allowed on POST.

|name
|string
a|Certificate name. If not provided in POST, a unique name specific to the
```

```
SVM is automatically generated.

|private_key
|string
a|Private key Certificate in PEM format. Only valid for create when
installing a CA-signed certificate. This is not audited.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|serial_number
|string
a|Serial number of certificate.

|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
```

```
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6
* x-nullable: true

|uuid
|string
a|Unique ID that identifies a certificate.

[[IDe6c68fe61f57f05c283e8920caa0f384]]
= Create or install security certificates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates`#

*Introduced In:* 9.6

Creates or installs a certificate.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create or install
the certificate.
* `common_name` - Common name of the certificate. Required when creating a
certificate.
* `type` - Type of certificate.
```

```
* `public_certificate` - Public key certificate in PEM format. Required
when installing a certificate.
* `private_key` - Private key certificate in PEM format. Required when
installing a CA-signed certificate.

== Recommended optional properties

* `expiry_time` - Certificate expiration time. Specifying an expiration
time is recommended when creating a certificate.
* `key_size` - Key size of the certificate in bits. Specifying a strong
key size is recommended when creating a certificate.
* `name` - Unique certificate name per SVM. If one is not provided, it is
automatically generated.

== Default property values

If not specified in POST, the following default property values are
assigned:

* `key_size` - _2048_
* `expiry_time` - _P365DT_
* `hash_function` - _sha256_

== Related ONTAP commands

* `security certificate create`
* `security certificate install`

== Parameters

ONTAP Error Response Codes

|===
| Error Code | Description

| 3735645
| Cannot specify a value for serial. It is generated automatically.

| 3735622
| The certificate type is not supported.

| 3735664
| The specified key size is not supported in FIPS mode.

| 3735665
| The specified hash function is not supported in FIPS mode.

| 3735553
| Failed to create self-signed Certificate.

| 3735646
| Failed to store the certificates.

| 3735693
| The certificate installation failed as private key was empty.

| 3735618
```

```
| Cannot accept private key for server_ca or client_ca.

| 52363365
| Failed to allocate memory.

| 52559975
| Failed to read the certificate due to incorrect formatting.

| 52363366
| Unsupported key type.

| 52560123
| Failed to read the key due to incorrect formatting.

| 52559972
| The certificates start date is later than the current date.

| 52559976
| The certificate and private key do not match.

| 52559973
| The certificate has expired.

| 52363366
| Logic error: use of a dead object.

| 3735696
| Intermediate certificates are not supported with client_ca and server_ca
type certificates.

| 52559974
| The certificate is not supported in FIPS mode.

| 3735676
| Cannot continue the installation without a value for the common name.
Since the subject field in the certificate is empty, the field
"common_name" must have a value to continue with the installation.

| 3735558
| Failed to extract information about Common Name from the certificate.

| 3735588
| The common name (CN) extracted from the certificate is not valid.

| 3735632
| Failed to extract Certificate Authority Information from the
certificate.

a|

|authority_key_identifier
|string
a|Provides the key identifier of the issuing CA certificate that signed
the SSL certificate.

|ca
|string
a|Certificate authority

|common_name
|string
a|FQDN or custom common name. Provide on POST when creating a self-signed
certificate.

|expiry_time
|string
a|Certificate expiration time. Can be provided on POST if creating self-
signed certificate. The expiration time range is between 1 day to 10
years.

|hash_function
```

```
|string
a|Hashing function. Can be provided on POST when creating a self-signed
certificate. Hash functions md5 and sha1 are not allowed on POST.

|intermediate_certificates
|array[string]
a|Chain of intermediate Certificates in PEM format. Only valid in POST
when installing a certificate.

|key_size
|integer
a|Key size of requested Certificate in bits. One of 512, 1024, 1536, 2048,
3072. Can be provided on POST if creating self-signed certificate. Key
size of 512 is not allowed on POST.

|name
|string
a|Certificate name. If not provided in POST, a unique name specific to the
SVM is automatically generated.

|private_key
|string
a|Private key Certificate in PEM format. Only valid for create when
installing a CA-signed certificate. This is not audited.

|public_certificate
|string
a|Public key Certificate in PEM format. If this is not provided in POST, a
self-signed certificate is created.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|serial_number
|string
a|Serial number of certificate.
```

```
|subject_key_identifier
|string
a|Provides the key identifier used to identify the public key in the SSL
certificate.

|svm
|link:#svm[svm]
a|

|type
|string
a|Type of Certificate. The following types are supported:

* client - a certificate and its private key used by an SSL client in
ONTAP.
* server - a certificate and its private key used by an SSL server in
ONTAP.
* client_ca - a Certificate Authority certificate used by an SSL server in
ONTAP to verify an SSL client certificate.
* server_ca - a Certificate Authority certificate used by an SSL client in
ONTAP to verify an SSL server certificate.
* root_ca - a self-signed certificate used by ONTAP to sign other
certificates by acting as a Certificate Authority.
* enum: ["client", "server", "client_ca", "server_ca", "root_ca"]
* Introduced in: 9.6
* x-nullable: true

|uuid
|string
a|Unique ID that identifies a certificate.

[[ID27e829ed4fbe829f60c635ee71eb8bc1]]
= Sign security certificates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/certificates/{ca.uuid}/sign`#

*Introduced In:* 9.6

Signs a certificate.

== Required properties

* `signing_request` - Certificate signing request to be signed by the
given certificate authority.

== Recommended optional properties

* `expiry_time` - Certificate expiration time. Specifying an expiration
time for a signed certificate is recommended.
* `hash_function` - Hashing function. Specifying a strong hashing function
is recommended when signing a certificate.
```

```
== Default property values

If not specified in POST, the following default property values are
assigned:

* `expiry_time` - _P365DT_
* `hash_function` - _sha256_

== Related ONTAP commands

* `security certificate sign`
This API is used to sign a certificate request using a pre-existing self-
signed root certificate. The self-signed root certificate acts as a
certificate authority within its scope and maintains the records of its
signed certificates.

The root certificate can be created for a given SVM or for the cluster
using [`POST security/certificates`].

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|ca.uuid
|string
|path
|True
a|UUID of the existing certificate authority certificate

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===
```

```
== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|expiry_time
|string
a|Certificate expiration time. The allowed expiration time range is
between 1 day to 10 years.

|hash_function
|string
a|Hashing function

|signing_request
|string
a|Certificate signing request to be signed by the given certificate
authority. Request should be in X509 PEM format.

:leveloffset: -1

= Manage Google Cloud KMS

:leveloffset: +1

[[ID84175ba61a017d06b85baf24b368f81d]]
= Security gcp-kms endpoint overview

== Overview

Google Cloud Key Management Services is a cloud key management service
(KMS) that provides a secure store for encryption keys. This feature
allows ONTAP to securely store its encryption keys using Google Cloud KMS.
In order to use Google Cloud KMS with ONTAP, a user must first deploy a
Google Cloud application with appropriate access to the Google Cloud KMS
and then provide
ONTAP with the necessary details, such as, project ID, key ring name,
location, key name and application credentials to allow ONTAP to
communicate
with the deployed Google Cloud application.
The properties `state`, `google_reachability` and `ekmip_reachability` are
considered advanced properties and are populated only when explicitly
requested.

== Examples

=== Enabling GCKMS for an SVM

The following example shows how to enable GCKMS at the SVM-scope. Note the
_return_records=true_ query parameter is used to obtain the newly created
```

```
key manager configuration.

----

# The API:
POST /api/security/gcp-kms

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/gcp-kms?return_records=true'
-H 'accept: application/hal+json' -d '{"svm":{"uuid":"f36ff553-e713-11ea-
bd56-005056bb4222" }, "project_id": "testProj",
"key_ring_name":"testKeyRing", "key_ring_location": "global", "key_name":
"key1", "application_credentials": "myAppCred"}'

# The response:
{
"num_records": 1,
"records": [
    {
    "uuid": "f72098a2-e908-11ea-bd56-005056bb4222",
    "svm": {
        "uuid": "f36ff553-e713-11ea-bd56-005056bb4222",
        "name": "vs0"
    },
    "project_id": "testProj",
    "key_ring_name": "testKeyRing",
    "key_ring_location": "global",
    "key_name": "key1",

|uuid
|string
|query
|False
a|Filter by uuid

|proxy_username
```

```
|string
|query
|False
a|Filter by proxy_username

|key_ring_name
|string
|query
|False
a|Filter by key_ring_name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.
```

```
* Default value: 1

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
```

```
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#google_reachability]
[.api-collapsible-fifth-title]
google_reachability

Indicates whether or not the Google Cloud KMS is reachable from all nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if Google Cloud KMS
is reachable from all nodes in the cluster.
```

```
|message
|string
a|Set to the error message when 'reachable' is false.

|reachable
|boolean
a|Set to true if the Google Cloud KMS is reachable from all nodes of the
cluster.

|===

[#state]
[.api-collapsible-fifth-title]
state

Google Cloud Key Management Services is a cloud key management service
(KMS) that provides a secure store for encryption keys. This object
indicates whether or not the Google Cloud KMS key protection is available
on all nodes in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_state
|boolean
a|Set to true when Google Cloud KMS key protection is available on all
nodes of the cluster.

|code
|string
a|Error code corresponding to the status message. Returns 0 if Google
Cloud KMS key protection is available in all nodes of the cluster.
```

```
|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

[[ID6c0e7d9b56753610618a4c298b245879]]
= Create a Google Cloud KMS configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms`#

*Introduced In:* 9.9

Configures the Google Cloud KMS configuration for the specified SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a Google
Cloud KMS.
* `project_id` - Google Cloud project (application) ID of the deployed
Google Cloud application with appropriate access to the Google Cloud KMS.
* `key_ring_name` - Google Cloud KMS key ring name of the deployed Google
Cloud application with appropriate access to the specified Google Cloud
KMS.
* `key_ring_location` - Google Cloud KMS key ring location.
* `key_name`- Key Identifier of the Google Cloud KMS key encryption key.
* `application_credentials` - Google Cloud application's service account
credentials required to access the specified KMS. It is a JSON file
```

```
containing an email address and the private key of the service account
holder.

== Optional properties

* `proxy_type` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.

== Related ONTAP commands

* `security key-manager external gcp enable`

[#ekmip_reachability]
[.api-collapsible-fifth-title]
ekmip_reachability

Provides the connectivity status for the given SVM on the given node to
all EKMIP servers configured on all nodes of the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if a given SVM is
able to communicate to the EKMIP servers of all of the nodes in the
cluster.

|message
|string
a|Error message set when cluster-wide EKMIP server availability from the
given SVM and node is false.

|node
|link:#node[node]
a|

|reachable
|boolean
```

```
a|Set to true if the given SVM on the given node is able to communicate to
all EKMIP servers configured on all nodes in the cluster.

|===

[#google_reachability]
[.api-collapsible-fifth-title]
google_reachability

Indicates whether or not the Google Cloud KMS is reachable from all nodes
in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|string
a|Code corresponding to the error message. Returns a 0 if Google Cloud KMS
is reachable from all nodes in the cluster.

|message
|string
a|Set to the error message when 'reachable' is false.

|reachable
|boolean
a|Set to true if the Google Cloud KMS is reachable from all nodes of the
cluster.

|===

[#state]
```

```
[.api-collapsible-fifth-title]
state

Google Cloud Key Management Services is a cloud key management service
(KMS) that provides a secure store for encryption keys. This object
indicates whether or not the Google Cloud KMS key protection is available
on all nodes in the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_state
|boolean
a|Set to true when Google Cloud KMS key protection is available on all
nodes of the cluster.

|code
|string
a|Error code corresponding to the status message. Returns 0 if Google
Cloud KMS key protection is available in all nodes of the cluster.

|message
|string
a|Error message set when top-level internal key protection key (KEK)
availability on cluster is false.

[[ID9594dffca0fdd5e5c4418f2c77ddf947]]
= Re-key the external key in the key hierarchy for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms/{gcp_kms.uuid}/rekey-external`#

*Introduced In:* 9.11

Rekeys the external key in the key hierarchy for an SVM with a Google
Cloud KMS configuration.

== Related ONTAP commands

* `security key-manager external gcp rekey-external`

== Parameters

[cols=5*,options=header]
```

```
|===

|Name
|Type
|In
|Required
|Description

|gcp_kms.uuid
|string
|path
|True
a|UUID of the existing Google Cloud KMS configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

= Update the Google Cloud KMS configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/security/gcp-kms/{uuid}`#

*Introduced In:* 9.9

Updates the Google Cloud KMS configuration.

== Optional properties

* `key_name` - Key Identifier of the Google Cloud KMS key encryption key.
* `application_credentials` - New credentials used to verify the
```

```
application's identity to the Google Cloud KMS.
* `proxy_type`` - Type of proxy (http/https) if proxy configuration is
used.
* `proxy_host` - Proxy hostname if proxy configuration is used.
* `proxy_port` - Proxy port number if proxy configuration is used.
* `proxy_username` - Proxy username if proxy configuration is used.
* `proxy_password` - Proxy password if proxy configuration is used.
* `project_id` - Google Cloud project (application) ID of the deployed
Google Cloud application with appropriate access to the Google Cloud KMS.
* `key_ring_name` - Google Cloud KMS key ring name of the deployed Google
Cloud application with appropriate access to the specified Google Cloud
KMS.
* `key_ring_location` - Google Cloud KMS key ring location.

== Related ONTAP commands

* `security key-manager external gcp update-credentials`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Google Cloud KMS UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
```

```
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

= Re-key the internal key in the key hierarchy for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/gcp-kms/{uuid}/rekey-internal`#

*Introduced In:* 9.10

Rekeys the internal key in the key hierarchy for an SVM with a Google
Cloud KMS configuration.

== Related ONTAP commands

* `security key-manager external gcp rekey-internal`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|UUID of the existing Google Cloud KMS configuration.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
```

```
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===

== Response
```

Status: 202, Accepted

```
== Error
```

Status: Default

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 65537547
| One or more volume encryption keys for encrypted volumes of this data
SVM are stored in the key manager configured for the admin SVM. Use the
REST API POST method to migrate this data SVM's keys from the admin SVM's
key manager to this data SVM's key manager before running the rekey
operation.

| 65537559
| There are no existing internal keys for the SVM. A rekey operation is
allowed for an SVM with one or more encryption keys.

| 65537721
```

```
| Google Cloud KMS is not configured for the given SVM.

|string
|query
|False
a|Filter by certificate.uuid

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
```

```
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|ipspace.uuid
|string
|query
|False
a|Filter by ipspace.uuid

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|local_identity
|string
|query
|False
a|Filter by local_identity

|authentication_method
|string
|query
|False
```

```
a|Filter by authentication_method

* Introduced in: 9.10

|scope
|string
|query
|False
a|Filter by scope

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
```

```
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

== Error
```

Status: Default

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 66257099
| Only one protocol can be specified.

| 66257100
```

```
| Only one local port can be specified.

| 66257101
| Only one remote port can be specified.

| 66257104
| IPsec policy with same name already exists in this SVM.

| 66257107
| The specified pre-shared key is not a valid hexadecimal string.

| 66257109
| The specified pre-shared key is not a valid Base64 encoded binary
string.

| 66257110
| Failed to a create policy sequencing value.

| 66257111
| The IPsec policy with action ESP TRANSPORT provides packet protection
and requires a secret key or certificate for authentication.

| 66257112
| The IPsec policy with the action specified does not provide packet
protection and the authentication method provided for the policy will be
ignored.

| 66257113
| Only one local IP subnet can be specified.

| 66257114
| Only one remote IP subnet can be specified.

| 66257115
| Port ranges containing more than one port are not supported.

| 66257117
| IPsec is not supported on the SVM specified in the policy, IPsec is
supported on data SVMs only.

| 66257120
| The subnet selector must be a host address (An IPv4 address with a 32-
bit netmask or an IPv6 address with a 128-bit netmask).

| 66257121
| The maximum limit of IPsec Policies has reached for the specified SVM.
```

```
| 66257125
| The local_endpoint.address must be specified with
local_endpoint.netmask.

| 66257126
| The remote_endpoint.address must be specified with
remote_endpoint.netmask.

| 66257132
| Invalid value for port field. Value should be in range <1-65535>.

| 66257133
| A pre-shared key is needed for the PSK authentication method. Use the
secret_key option to specify a key.

| 66257134
| An end-entity certificate is needed for the PKI authentication method.
Use the certificate.uuid option to specify an end-entity certificate.

| 66257137
| A pre-shared key is not needed for the PKI authentication method.

| 66257139
| Certificate with the specified UUID was not found.

| 66257140
| Only certificates with a client or server type are supported.

| 66257396
| IPsec is not supported for the admin SVM in a MetroCluster
configuration.

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|action
|string
a|Action for the IPsec policy.

|authentication_method
|string
a|Authentication method for the IPsec policy.

|certificate
|link:#certificate[certificate]
a|Certificate for the IPsec policy.

|enabled
|boolean
a|Indicates whether or not the policy is enabled.

|ipspace
|link:#ipspace[ipspace]
a|Applies to both SVM and cluster-scoped objects. Either the UUID or name
may be supplied on input.

|local_endpoint
|link:#local_endpoint[local_endpoint]
a|Local endpoint for the IPsec policy.

|local_identity
|string
a|Local Identity
```

```
|name
|string
a|IPsec policy name.

|protocol
|string
a|Lower layer protocol to be covered by the IPsec policy.

|remote_endpoint
|link:#remote_endpoint[remote_endpoint]
a|Remote endpoint for the IPsec policy.

|remote_identity
|string
a|Remote Identity

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|secret_key
|string
a|Pre-shared key for IKE negotiation.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|Unique identifier of the IPsec policy.

```
== Error
```

Status: Default

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 66257097
| Internal error. Failed to update the IPsec policy.

| 66257099
| Only one protocol can be specified.

| 66257100
| Only one local port can be specified.

| 66257101
| Only one remote port can be specified.

| 66257110
| Failed to create a policy sequencing value.

| 66257113
| Only one local IP subnet can be specified.

| 66257114
| Only one remote IP subnet can be specified.

| 66257115
| Port ranges containing more than one port are not supported.

| 66257116
| IPsec policy with the specified UUID was not found.

| 66257120
| The subnet selector must be a host address (An IPv4 address with a 32-
bit netmask or an IPv6 address with a 128-bit netmask).
```

```
| 66257139
| Certificate with the specified UUID was not found.

| 66257140
| Only certificates with a client or server type are supported.

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|query
|False
a|Filter by uuid

|lifetime
|integer
|query
|False
a|Filter by lifetime

|ipsec.inbound.security_parameter_index
|string
|query
|False
a|Filter by ipsec.inbound.security_parameter_index

|ipsec.inbound.packets
|integer
```

```
|query
|False
a|Filter by ipsec.inbound.packets

|ipsec.inbound.bytes
|integer
|query
|False
a|Filter by ipsec.inbound.bytes

|ipsec.outbound.packets
|integer
|query
|False
a|Filter by ipsec.outbound.packets

|ipsec.outbound.security_parameter_index
|string
|query
|False
a|Filter by ipsec.outbound.security_parameter_index

|ipsec.outbound.bytes
|integer
|query
|False
a|Filter by ipsec.outbound.bytes

|ipsec.action
|string
|query
|False
a|Filter by ipsec.action

|ipsec.state
|string
|query
|False
a|Filter by ipsec.state
```

```
|policy_name
|string
|query
|False
a|Filter by policy_name

|ike.is_initiator
|boolean
|query
|False
a|Filter by ike.is_initiator

|ike.responder_security_parameter_index
|string
|query
|False
a|Filter by ike.responder_security_parameter_index

|ike.version
|integer
|query
|False
a|Filter by ike.version

|ike.state
|string
|query
|False
a|Filter by ike.state

|ike.initiator_security_parameter_index
|string
|query
|False
a|Filter by ike.initiator_security_parameter_index

|ike.authentication
|string
|query
|False
a|Filter by ike.authentication
```

```
|node.uuid
|string
|query
|False
a|Filter by node.uuid

|node.name
|string
|query
|False
a|Filter by node.name

|local_address
|string
|query
|False
a|Filter by local_address

|scope
|string
|query
|False
a|Filter by scope

|type
|string
|query
|False
a|Filter by type

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
```

```
|False
a|Filter by svm.name

|cipher_suite
|string
|query
|False
a|Filter by cipher_suite

|remote_address
|string
|query
|False
a|Filter by remote_address

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
```

```
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage key managers

:leveloffset: +1

[[IDe6d115b80bcd0cf041660ea41a928c48]]
= Security key-managers endpoint overview

== Overview

A key manager is a key management solution (software or dedicated
hardware) that enables other ONTAP client modules to securely and
persistently store keys for various uses. For example, WAFL uses the key
management framework to store and retrieve the volume encryption keys that
it uses to encrypt/decrypt data on NVE volumes. A key manager can be
configured at both cluster scope and SVM, with one key manager allowed per
SVM. The key management framework in ONTAP supports two mutually exclusive
modes for persisting keys: external and onboard.

When an SVM is configured with external key management, the keys are
stored on up to four primary key servers that are external to the system.

Once external key management is enabled for an SVM, primary key servers
can be added or removed using the _/api/security/key-managers/\{uuid}/key-
```

```
servers_ endpoint. See [`+POST /security/key-managers/{uuid}/key-
servers+`] and [`+DELETE /security/key-managers/{uuid}/key-
servers/{server}+`] for more details.

Setting up external key management dictates that the required certificates
for securely communicating with the key server are installed prior to
configuring the key manager. To install the required client and server_ca
certificates, use the _/api/security/certificates/_ endpoint.

See [`POST /security/certificates`], [`GET /security/certificates/uuid`]
and [`+DELETE /security/certificates/{uuid}+`] for more details.

When an SVM is configured with the Onboard Key Manager, the keys are
stored in ONTAP in wrapped format using a key hierarchy created using the
salted hash of the passphrase entered when configuring the Onboard Key
Manager. This model fits well for customers who use ONTAP to store their
own data.

== Examples

=== Creating an external key manager with 1 primary key server for a
cluster

The example key manager is configured at the cluster-scope with one
primary key server. Note that the UUIDs of the certificates are those that
are already installed at the cluster-scope. Note the _return_records=true_
query parameter is used to obtain the newly created key manager
configuration.

----

# The API:
POST /api/security/key-managers

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/key-
managers?return_records=true' -H 'accept: application/hal+json' -d "{

= Retrieve key managers

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers`#

*Introduced In:* 9.6

Retrieves key managers.

== Expensive properties

There is an added computational cost to retrieving values for these
properties. They are not included by default in GET results and must be
explicitly requested using the `fields` query parameter. See
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields] to learn more.

* `connectivity.cluster_availability`
* `connectivity.node_states.node.name`
* `connectivity.node_states.node.uuid`
* `connectivity.node_states.state`
* `status.message`
* `status.code`

== Related ONTAP commands

* `security key-manager show-key-store`
* `security key-manager external show`
* `security key-manager external show-status`
* `security key-manager onboard show-backup`

== Parameters

[#connectivity]
[.api-collapsible-fifth-title]
connectivity

This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|cluster_availability
|boolean
a|Set to true when key server connectivity state is available on all nodes
of the cluster.

|node_states
|array[link:#key_server_state[key_server_state]]
a|An array of key server connectivity states for each node.

|===

|connectivity
|link:#connectivity[connectivity]
a|This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.

|server
```

```
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.

|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

[cols=3*,options=header]

|Name
|Type
|Description

|client_certificate
|link:#client_certificate[client_certificate]
a|Client certificate (name and UUID)

|server_ca_certificates
|array[link:#server_ca_certificates[server_ca_certificates]]
a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.
```

```
|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
```

```
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

[[ID14be19ac53c01048526f296a3a4b07c0]]
= Create a key manager

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers`#

*Introduced In:* 9.6

Creates a key manager.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create a key
manager.
* `external.client_certificate` - Client certificate. Required only when
creating an external key manager.
* `external.server_ca_certificates` - Server CA certificates. Required
only when creating an external key manager.
* `external.servers.server` - Primary Key servers. Required only when
creating an external key manager.
* `onboard.passphrase` - Cluster-wide passphrase. Required only when
creating an Onboard Key Manager.
* `synchronize` - Synchronizes missing onboard keys on any node in the
cluster. Required only when creating an Onboard Key Manager at the partner
site of a MetroCluster configuration.

== Related ONTAP commands

* `security key-manager external enable`
* `security key-manager onboard enable`
* `security key-manager onboard sync`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|return_records
|boolean
```

```
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

```
ONTAP Error Response Codes

|===
| Error Code | Description

| 65536038
| A maximum of 4 active primary key servers are allowed.

| 65536214
| Failed to generate cluster key encryption key.

| 65536216
| Failed to add cluster key encryption key.

| 65536310
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536341
| Failed to setup the Onboard Key Manager because the MetroCluster peer is
unhealthy.

| 65536508
| The platform does not support data at rest encryption.

| 65536821
| The certificate is not installed.

| 65536823
| The SVM has key manager already configured.

| 65536824
| Multitenant key management is not supported in MetroCluster
configurations.

| 65536834
| Failed to get existing key-server details for the SVM.

| 65536852
```

```
| Failed to query supported KMIP protocol versions.

| 65536870
| Key management servers already configured.

| 65536871
| Duplicate key management servers exist.

| 65536876
| External key management requires client and server CA certificates
installed and with one or more key servers provided.

| 65536878
| External key management cannot be configured as one or more volume
encryption keys of the SVM are stored in cluster key management server.

| 65536895
| External key manager cannot be configured because this cluster is part
of a MetroCluster configuration and the partner site of this MetroCluster
configuration has Onboard Key Manager configured.

| 65536900
| The Onboard Key Manager cannot be configured because this cluster is
part of a MetroCluster configuration and the partner site has the external
key manager configured.

| 65536903
| The Onboard Key Manager has failed to configure on some nodes in the
cluster. Use the CLI to sync the Onboard Key Manager configuration on
failed nodes.

| 65536906
| The Onboard Key Manager has already been configured at the partner site.
Use the CLI to sync the Onboard Key Manager with the same passphrase.

| 65536907
| The Onboard Key Manager is already configured. Use the CLI to sync any
nodes with the Onboard Key Manager configuration.

| 65536916
| The Onboard Key Manager is only supported for an admin SVM.

| 65536920
| The Onboard Key Manager passphrase length is incorrect.

| 65537240
| The Onboard Key Manager passphrase must be provided when performing a
```

```
POST/synchronize operation.

| 65537241
| The Onboard Key Manager existing_passphrase must not be provided when
performing a POST/synchronize operation.

| 65537244
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard
Key Manager is already configured on the cluster.

| 65537245
| Unable to sync/create Onboard Key Manager on the local cluster; Onboard
Key Manager is not configured on the partner cluster.

| 65537246
| Unable to sync/create Onboard Key Manager on local cluster. This cluster
is not part of a MetroCluster configuration.

| 66060338
| Failed to establish secure connection for a key management server due to
incorrect server_ca certificates.

| 66060339
| Failed to establish secure connection for a key management server due to
incorrect client certificates.

| 66060340
| Failed to establish secure connection for a key management server due to
Cryptsoft error.

[#connectivity]
[.api-collapsible-fifth-title]
connectivity

This property contains the key server connectivity state of all nodes in
the cluster.
```

```
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_availability
|boolean
a|Set to true when key server connectivity state is available on all nodes
of the cluster.

|node_states
|array[link:#key_server_state[key_server_state]]
a|An array of key server connectivity states for each node.

|===

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#self_link[self_link]
a|

|connectivity
|link:#connectivity[connectivity]
a|This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
```

```
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.

|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.

|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

[cols=3*,options=header]
|===
|Name
|Type
|Description

|client_certificate
|link:#client_certificate[client_certificate]
a|Client certificate (name and UUID)
```

```
|server_ca_certificates
|array[link:#server_ca_certificates[server_ca_certificates]]
a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.

|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.
```

```
|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
```

```
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

[.api-collapsible-fifth-title]
svm

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the SVM.

|uuid
|string
a|The unique identifier of the SVM.

|===

[#volume_encryption]
[.api-collapsible-fifth-title]
volume_encryption

Indicates whether volume encryption is supported in the cluster.

[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|code
|integer
a|Code corresponding to the status message. Returns a 0 if volume
encryption is supported in all nodes of the cluster.

|message
|string
a|Reason for not supporting volume encryption.

|supported
|boolean
a|Set to true when volume encryption support is available on all nodes of
the cluster.

|===

[#security_key_manager]

|link:#external[external]
a|Configures external key management

|is_default_data_at_rest_encryption_disabled
|boolean
a|Indicates whether default data-at-rest encryption is disabled in the
cluster. This field is deprecated in ONTAP 9.8 and later. Use the
"software_data_encryption.disabled_by_default" of /api/security endpoint.

* Default value: 1
```

```
* Introduced in: 9.7
* x-ntap-readModify: true
* x-nullable: true

|onboard
|link:#onboard[onboard]
a|Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

|policy
|string
a|Security policy associated with the key manager. This value is currently
ignored if specified for the onboard key manager.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|status
|link:#status[status]
a|Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|

|volume_encryption
|link:#volume_encryption[volume_encryption]
a|Indicates whether volume encryption is supported in the cluster.

:leveloffset: -1

= Manage authentication keys

:leveloffset: +1

[[ID452e6d6abc621c90d07b8b95a9f6c2e9]]
= Security key-managers security_key_manager.uuid auth-keys endpoint
overview
```

```
:doctype: book

== Overview

Used to create and list authentication keys (NSE-AK).

== Example

=== Creates an authentication key.

NOTE: an external key  manager must be configured on the admin SVM, as the
authentication key will be associated with the admin SVM.
The following example shows how to create an authentication key.

----

# The API:
POST /api/security/key-managers/{security_key_manager.uuid}/auth-keys

# The call:
curl -X POST 'https://<mgmt-ip>/api/security/key-managers/5fb1701a-d922-
11e8-bfe8-005056bb017d/auth-keys?return_timeout=15&return_records=true' -H
'accept: application/hal+json'

# The response:
{
"num_records": 1,
"records": [
  {
    "key_id":
"000000000000000002000000000000100531d8cdc38437c2627b6b1726dd2675c000000000
0000000",
    "key_tag": "vsim1"
  }
]
}
----

Retrieve authentication keys associated with the admin SVM

GET `/security/key-managers/{security_key_manager.uuid}/auth-keys`

Introduced In: 9.12

Retrieves a list of all authentication keys associated with the admin SVM.

Related ONTAP commands

- `security key-manager key query`

Required properties

- `security_key_manager.uuid` - UUID of the external key manager.

Parameters

Name	Type	In	Required	Description
key_id	string	query	False	Filter by key_id
key_tag	string	query	False	Filter by key_tag
security_key_manager.uuid	string	path	True	External key manager UUID
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

[[ID9de143614eee37c2ce5bd380384734b3]]
= Retrieve and restore unrestored keys

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers/{security_key_manager.uuid}/restore`#

*Introduced In:* 9.13

Retrieves and restores any current unrestored keys (associated with the
storage controller) from the specified key management server.

== Required properties

* `security_key_manager.uuid` - UUID of the key management server.
The UUID of the external key manager can be retrieved using [`GET
```

```
/api/security/key-managers`].

== Related ONTAP commands

* `security key-manager external restore`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|security_key_manager.uuid
|string
|path
|True
a|Key manager UUID.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds.  This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job.  If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.
```

```
* Default value:

[[IDfb5a567a7365860569df6c49e46ed273]]
= Migrate SVM keys between security key managers

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers/{source.uuid}/migrate`#

*Introduced In:* 9.7
```

```
Migrates the keys belonging to an SVM between the cluster's key manager
and the SVM's key manager. This operation can run for several minutes.

== Required properties

* `source.uuid` - UUID of the source key manager.
* `uuid` - UUID of the destination key manager.
The UUID of onboard and external KMIP key manager can be fetched using
[`GET /api/security/key-managers`].
The UUID of Azure Key Vault key manager can be fetched using [`GET
/api/security/azure-key-vaults`].
The UUID of Google Cloud key manager can be fetched using [`GET
/api/security/gcp-kms`].
The UUID of Amazon Web Services key manager can be fetched using [`GET
/api/security/aws-kms`].

== Related ONTAP commands

* `security key-manager key migrate`

= Retrieve key managers

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}`#

*Introduced In:* 9.6

Retrieves key managers.

== Expensive properties

There is an added computational cost to retrieving values for these
properties. They are not included by default in GET results and must be
explicitly requested using the `fields` query parameter. See
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields] to learn more.

* `connectivity.cluster_availability`
* `connectivity.node_states.node.name`
* `connectivity.node_states.node.uuid`
* `connectivity.node_states.state`
* `status.message`
* `status.code`

== Related ONTAP commands

* `security key-manager show-key-store`
* `security key-manager external show`
* `security key-manager external show-status`
* `security key-manager onboard show-backup`

[#connectivity]
[.api-collapsible-fifth-title]
connectivity

This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
```

```
|Type
|Description

|cluster_availability
|boolean
a|Set to true when key server connectivity state is available on all nodes
of the cluster.

|node_states
|array[link:#key_server_state[key_server_state]]
a|An array of key server connectivity states for each node.

|===

|connectivity
|link:#connectivity[connectivity]
a|This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.
```

```
|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.

|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

[cols=3*,options=header]

a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.
```

```
|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
```

```
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

[#connectivity]
[.api-collapsible-fifth-title]
connectivity

This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|cluster_availability
|boolean
a|Set to true when key server connectivity state is available on all nodes
of the cluster.

|node_states
|array[link:#key_server_state[key_server_state]]
a|An array of key server connectivity states for each node.

|===
```

|connectivity
|link:#connectivity[connectivity]
a|This property contains the key server connectivity state of all nodes in
the cluster.
This is an advanced property; there is an added computational cost to
retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|secondary_key_servers
|string
a|A comma delimited string of the secondary key servers associated with
the primary key server.

|server
|string
a|External key server for key management. If no port is provided, a
default port of 5696 is used.

|timeout
|integer
a|I/O timeout in seconds for communicating with the key server.

|username
|string
a|Username credentials for connecting with the key server.
```

```
|===

[#external]
[.api-collapsible-fifth-title]
external

Configures external key management

[cols=3*,options=header]
|===
|Name
|Type
|Description

|client_certificate
|link:#client_certificate[client_certificate]
a|Client certificate (name and UUID)

|server_ca_certificates
|array[link:#server_ca_certificates[server_ca_certificates]]
a|The array of certificates that are common for all the keyservers per
SVM.

|servers
|array[link:#key_server_readcreate[key_server_readcreate]]
a|The set of external key servers.

|===

[#onboard]
[.api-collapsible-fifth-title]
onboard

Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

[cols=3*,options=header]
```

```
|===
|Name
|Type
|Description

|enabled
|boolean
a|Is the onboard key manager enabled?

|existing_passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|key_backup
|string
a|Backup of the onboard key manager's key hierarchy. It is required to
save this backup after configuring the onboard key manager to help in the
recovery of the cluster in case of catastrophic failures.

|passphrase
|string
a|The cluster-wide passphrase. This is not audited.

|synchronize
|boolean
a|Synchronizes missing onboard keys on any node in the cluster. If a node
is added to a cluster that has onboard key management configured, the
synchronize operation needs to be performed in a PATCH operation. In a
MetroCluster configuration, if onboard key management is enabled on one
site, then the synchronize operation needs to be run as a POST operation
on the remote site providing the same passphrase.

|===

[#status]
[.api-collapsible-fifth-title]
status

Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.
```

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns 0 if the setup is
complete. This is an advanced property; there is an added computational
cost to retrieving its value. The property is not populated for either a
collection GET or an instance GET unless it is explicitly requested using
the `fields` query parameter or GET for all advanced properties is
enabled.

|message
|string
a|Current state of the key manager indicating any additional steps to
perform to finish the setup. This is an advanced property; there is an
added computational cost to retrieving its value. The property is not
populated for either a collection GET or an instance GET unless it is
explicitly requested using the `fields` query parameter or GET for all
advanced properties is enabled.

svm

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the SVM.
```

```
|uuid
|string
a|The unique identifier of the SVM.

|===

[#volume_encryption]
[.api-collapsible-fifth-title]
volume_encryption

Indicates whether volume encryption is supported in the cluster.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|code
|integer
a|Code corresponding to the status message. Returns a 0 if volume
encryption is supported in all nodes of the cluster.

|message
|string
a|Reason for not supporting volume encryption.

|supported
|boolean
a|Set to true when volume encryption support is available on all nodes of
the cluster.

|===

a|Configures external key management

|is_default_data_at_rest_encryption_disabled
|boolean
a|Indicates whether default data-at-rest encryption is disabled in the
cluster. This field is deprecated in ONTAP 9.8 and later. Use the
"software_data_encryption.disabled_by_default" of /api/security endpoint.

* Default value: 1
* Introduced in: 9.7
* x-ntap-readModify: true
* x-nullable: true

|onboard
|link:#onboard[onboard]
a|Configures onboard key management. After configuring onboard key
management, save the encrypted configuration data in a safe location so
that you can use it if you need to perform a manual recovery operation.

|policy
|string
a|Security policy associated with the key manager. This value is currently
ignored if specified for the onboard key manager.

|scope
|string
a|Set to "svm" for interfaces owned by an SVM. Otherwise, set to
"cluster".

|status
```

```
|link:#status[status]
a|Optional status information on the current state of the key manager
indicating if it is fully setup or requires more action.

[[ID33e1224ac15dbd5875d5f8ff5ab0ad3c]]
= List key servers configured in an external key manager

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/security/key-managers/{uuid}/key-servers`#

*Introduced In:* 9.6

Retrieves the list of key servers configured in an external key manager.

== Expensive properties
```

```
There is an added computational cost to retrieving values for these
properties. They are not included by default in GET results and must be
explicitly requested using the `fields` query parameter. See
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields] to learn more.

* `connectivity.cluster_availability`
* `connectivity.node_states.node.name`
* `connectivity.node_states.node.uuid`
* `connectivity.node_states.state`

* `security key-manager external show-status`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|External key manager UUID

|username
|string
|query
|False
a|Filter by username

|connectivity.node_states.state
|string
|query
|False
a|Filter by connectivity.node_states.state
```

```
* Introduced in: 9.13

|connectivity.node_states.node.uuid
|string
|query
|False
a|Filter by connectivity.node_states.node.uuid

* Introduced in: 9.13

|connectivity.node_states.node.name
|string
|query
|False
a|Filter by connectivity.node_states.node.name

* Introduced in: 9.13

|connectivity.cluster_availability
|boolean
|query
|False
a|Filter by connectivity.cluster_availability

* Introduced in: 9.7

|server
|string
|query
|False
a|Filter by server

|timeout
|integer
|query
|False
a|Filter by timeout

* Max value: 60
* Min value: 1
```

```
|secondary_key_servers
|string
|query
|False
a|Filter by secondary_key_servers

* Introduced in: 9.8

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Max value: 120
* Min value: 0
* Default value: 1

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Add primary key servers to an external key manager

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/security/key-managers/{uuid}/key-servers`#
```

```
*Introduced In:* 9.6

Adds primary key servers to a configured external key manager.

== Required properties

* `uuid` - UUID of the external key manager.
* `server` - Primary Key server name.

== Related ONTAP commands

* `security key-manager external add-servers`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|External key manager UUID

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

|===

ONTAP Error Response Codes

|===
| Error Code | Description

| 65536038
| A maximum of 4 active primary key servers are allowed.

| 65536042
| Cannot add key server because it is already a secondary key server.

| 65536600
| Cannot add a key server while a node is out quorum.

| 65536821
| The certificate is not installed.

| 65536824
| Multitenant key management is not supported in MetroCluster
configurations.

| 65536828
| External key management is not enabled for the SVM.

| 65536834
| Failed to get existing key-server details for the SVM.

| 65536852
| Failed to query supported KMIP protocol versions.

| 65536870
| Key management servers are already configured.

| 65536871
| Duplicate key management servers exist.

| 65536921
| The following issues were found. Unable to execute command on KMIP
server.
```

```
| 66060338
| Unable to establish secure connection to KMIP server due to incorrect
server_ca certificates.

| 66060339
| Unable to establish secure connection to KMIP server due to incorrect
client certificates.

| 66060340
| Unable to establish secure connection to KMIP server due to Cryptsoft
error.

= View key stores

:leveloffset: +1

[[IDceb95769ca1186d59d601c40c2f34606]]
= Security key-stores endpoint overview

:doctype: book

== Overview

A keystore describes a key-manager, specifically the type of key-manager.

== Examples

=== Retrieving information for all configured key managers

The following example shows how to retrieve information about all
configured key managers.
```

The API:

GET /api/security/key-stores

The call:

curl -X GET 'https://<mgmt-ip>/api/security/key-stores?fields=*' -H 'accept: application/hal+json'</mgmt-ip>

The response:

{ "records": [{ "uuid": "33421d82-0a8d-11ec-ae88-005056bb5955", "keystore": { "type": "akv" }, "_links": { "self": { "href": "/api/security/key-stores/33421d82-0a8d-11ec-ae88-005056bb5955/akv" } } }, { "uuid": "46a0b20a-0a8d-11ec-ae88-005056bb5955", "keystore": { "type": "okm" }, "_links": { "self": { "href": "/api/security/key-stores/46a0b20a-0a8d-11ec-ae88-005056bb5955/okm" } } }], "num_records": 2, "_links": { "self": { "href": "/api/security/key-stores" } } }

Retrieve keystores

GET `/security/key-stores`

Introduced In: 9.10

Retrieves keystores.

Expensive properties

There is an added computational cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See Requesting specific fields to learn more.

- `keystore.location`
- `svm.name`
- `svm.uuid`

Related ONTAP commands

- `security key-manager show-key-store`

Parameters

Name	Type	In	Required	Description
type	string	query	False	Filter by type
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
uuid	string	query	False	Filter by uuid
location	string	query	False	Filter by location
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok

View and update login message configuration

Security login messages endpoint overview

Overview

You can use this API to display and manage the login messages configuration. The GET request retrieves all of the login messages in the cluster. GET operations on /security/login/messages/{uuid} retrieve the login messages configuration by UUID. PATCH operations on /security/login/messages/{uuid} update the login messages configuration by UUID.

Examples

Retrieving all of the login messages in the cluster

```
# The API:
/api/security/login/messages

# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/security/login/messages?fields=*" -H
"accept: application/hal+json"

# The response:
{
"records": [
  {

```

Retrieve login banner and messages of the day

GET `/security/login/messages`

Introduced In: 9.6

Retrieves the login banner and messages of the day (MOTD) configured in the cluster and in specific SVMs.

Parameters

Name	Type	In	Required	Description
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
message	string	query	False	Filter by message • maxLength: 2048 • minLength: 0
scope	string	query	False	Filter by scope
banner	string	query	False	Filter by banner • maxLength: 2048 • minLength: 0
show_cluster_message	boolean	query	False	Filter by show_cluster_message
uuid	string	query	False	Filter by uuid

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[login_messages]	

Example response

```
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "num_records": 1,
  "records": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "scope": "svm",
    "svm": {
      "_links": {
        "self": {
          "href": "/api/resourcelink"
        }
      },
      "name": "svm1",
      "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
    },
    "uuid": "string"
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

login_messages

The login banner and message of the day (MOTD) configuration.

Name	Type	Description
_links	_links	

Name	Type	Description
banner	string	The login banner text. This message is displayed during SSH and console device login just before the password prompt displays. When configured, a cluster-level login banner is used for every incoming connection. Each data SVM can override the cluster-level banner to instead display when you log into the SVM. To restore the default setting for a data SVM, set the banner to an empty string. New lines are supplied as either LF or CRLF but are always returned as LF. Optional in the PATCH body.
message	string	The message of the day (MOTD). This message appears just before the clustershell prompt after a successful login. When configured, the cluster message displays first. If you log in as a data SVM administrator, the SVM message is then printed. The cluster-level MOTD can be disabled for a given data SVM using the "show_cluster_message" property. New lines are supplied as either LF or CRLF but are always returned as LF. Optional in the PATCH body.
scope	string	Set to "svm" for interfaces owned by an SVM. Otherwise, set to "cluster".
show_cluster_message	boolean	Specifies whether to show a cluster-level message before the SVM message when logging in as an SVM administrator. This setting can only be modified by the cluster administrator. Optional in the PATCH body.
svm	svm	
uuid	string	The unique identifier (ID) of the login messages configuration.

Manage TOTP profiles

Security login totps endpoint overview

Overview

This API configures the TOTP(Time based OTP) profile for user accounts for secure shell (SSH) access. Prerequisites: You must configure TOTP as a secondary authentication method in /security/accounts when creating users. You must have a TOTP application that you can use to get TOTP keys. You are only allowed to create a TOTP profile for yourself, not for others. Admin cannot create TOTP profiles for any users.

Examples

Creating a TOTP profile for cluster-scoped user accounts

Specify the user account name and comment in the body of the POST request. The owner.uuid or owner.name are not required for a cluster-scoped user account.

```
# The API:
POST "/api/security/login/totps"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps --request POST --data
'{ "account": { "name": "pubuser2" },"comment": "Cserver-Creation"}'

# The response:
{
"num_records": 1,
"records": [
{
  "owner": {
    "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "Default",
    "_links": {
      "self": {
        "href": "/api/svm/svms/b009a9e7-4081-b576-7575-ada21efcaf16"
      }
    }
  },
  "account": {
    "name": "pubuser2"
  },
  "secret_key": "DRY5CAJGTQCL5TV4D3UAMYXJFM",
  "install_url":
"https://www.google.com/chart?chs=200x200&chld=M&#124;0&cht=qr&chl=otpauth
://totp/root@node1%3Fsecret%3DDRY5CAJGTQCL5TV4D3UAMYXJFM%26issuer%3Dnode1"
,
  "verification_code": "946090",
  "emergency_codes": [
    "54200192",
    "10418385",
    "52726505",
    "41704451",
    "20744310"
  ],
  "_links": {
    "self": {
      "href": "/api/security/login/totps/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
    }
  }
}
 ]
```

```
}
```

Creating a TOTP profile for SVM-scoped user accounts

For an SVM-scoped account, specify either the SVM name as the owner.name or the SVM UUID as the owner.uuid along with other parameters for the user account. These parameters indicate the SVM that contains the user account for the TOTP profile being created and can be obtained from the response body of the GET request performed on the API "/api/svm/svms".

```
# The API:
POST "/api/security/login/totps"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps --request POST --data
'{ "account": { "name": "pubuser4" },"comment": "Vserver-
Creation","owner.name":"vs0" }'

# The response:
{
"num_records": 1,
"records": [
{
  "owner": {
    "uuid": "b019a9e7-4081-b576-7575-ada21efcaf16",
    "name": "vs0",
    "_links": {
      "self": {
        "href": "/api/svm/svms/b019a9e7-4081-b576-7575-ada21efcaf16"
      }
    }
  },
  "account": {
    "name": "pubuser4"
  },
  "secret_key": "DRY5CAJGTQCL5TV4D3UAMYXJFM",
  "install_url":
"https://www.google.com/chart?chs=200x200&chld=M&#124;0&cht=qr&chl=otpauth
://totp/root@node1%3Fsecret%3DDRY5CAJGTQCL5TV4D3UAMYXJFM%26issuer%3Dnode1"
,
  "verification_code": "946090",
  "emergency_codes": [
    "54200192",
    "10418385",
    "52726505",
    "41704451",
    "20744310"
```

```
  ],
  "_links": {
    "self": {
      "href": "/api/security/login/totps/b019a9e7-4081-b576-7575-
ada21efcaf16/pubuser4"
    }
  }
}
 ]
}
```

Retrieving the configured TOTP profile for user accounts

Retrieves the TOTP profiles associated with the user accounts or a filtered list (for a specific user account name, a specific SVM and so on).

```
# The API:
GET "/api/security/login/totps"

# The call to retrieve TOTP profiles associated with TOTP configured user
accounts in the cluster:
curl -k https://<mgmt-ip>/api/security/login/totps

# the response:
{
"records": [
{
  "owner": {
    "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",

Owner name and UUID that uniquely identifies the TOTP profile.

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

totp

TOTP profile for the user account used to access SSH.

Name	Type	Description
_links	_links	
account	account_reference	

Name	Type	Description
comment	string	Optional comment for the TOTP profile.
enabled	boolean	Status of the TOTP profile.
owner	owner	Owner name and UUID that uniquely identifies the TOTP profile.
scope	string	Scope of the entity. Set to "cluster" for cluster owned objects and to "svm" for SVM owned objects.
sha_fingerprint	string	SHA fingerprint for the TOTP secret key.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create a TOTP profile

POST `/security/login/totps`

Introduced In: 9.13

Creates a TOTP profile for a user account.

Required properties

- `owner.uuid` - Account owner UUID.
- `account.name` - Account user name.

Related ONTAP commands

- `security login totp create`

Learn more

- DOC /security/login/totps
- DOC /security/accounts

Parameters

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
_links	_links	
account	account_reference	
comment	string	Optional comment for the TOTP profile.
enabled	boolean	Status of the TOTP profile.
owner	owner	Owner name and UUID that uniquely identifies the TOTP profile.
scope	string	Scope of the entity. Set to "cluster" for cluster owned objects and to "svm" for SVM owned objects.
sha_fingerprint	string	SHA fingerprint for the TOTP secret key.

Example request

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "account": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "joe.smith"
  },
  "comment": "string",
  "enabled": "",
  "owner": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "svm1",
    "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
  },
  "scope": "cluster",
  "sha_fingerprint": "string"
}
```

Response

```
Status: 201, Created
```

Name	Type	Description
num_records	integer	Number of records.
records	array[totp_post]	

Example response

```
{
  "num_records": 1,
  "records": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"

Manage TOTP profile for a specific user account

Security login totps owner.uuid account.name endpoint overview

Overview

This API configures the TOTP profile for user accounts. Specify the owner UUID and the account user name. The owner UUID corresponds to the UUID of the SVM containing the user account associated with the TOTP profile and can be obtained from the response body of the GET request performed on the API "`/api/svm/svms".

Examples

Retrieving the specific configured TOTP profile for user accounts

```
# The API:
GET "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps/513a78c7-8c13-11e9-
8f78-005056bbf6ac/pubuser4

# the response:
{
"owner": {
    "uuid": "b009a9e7-4081-b576-7575-ada21efcaf16",
    "name": "Default",
  "_links": {
    "self": {
      "href": "/api/svm/svms/b009a9e7-4081-b576-7575-ada21efcaf16"
    }
  }
},
"account": {
  "name": "pubuser2",
  "_links": {
    "self": {
      "href": "/api/security/accounts/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
    }
  }
},
"sha_fingerprint":
"21364f5417600e3d9d6a7ac6c05dd244aed9f15dce6786a2c89399a41ff0fdb0",
"scope": "cluster",
"_links": {
  "self": {
    "href": "/api/security/login/totps/b009a9e7-4081-b576-7575-
ada21efcaf16/pubuser2"
  }
}
}
```

Modifying the TOTP profile for a user account

```
# The API:
PATCH "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k "https://<mgmt-ip>/api/security/login/totps/6865196a-8b59-11ed-
874c-0050568e36ed/ysadmin" --request PATCH --data "{  \"comment\":
\"Testing\",  \"enabled\": false}"

# the response:
{}
```

Deleting the TOTP profile for user accounts

```
# The API:
DELETE "/api/security/login/totps/{owner.uuid}/{account.name}"

# The call:
curl -k https://<mgmt-ip>/api/security/login/totps/d49de271-8c11-11e9-
8f78-005056bbf6ac/pubuser1 --request DELETE

# the response:
{}
```

Delete a TOTP profile for a user account

DELETE `/security/login/totps/{owner.uuid}/{account.name}`

Introduced In: 9.13

Deletes the TOTP profile for a user account.

Related ONTAP commands

- `security login totp delete`

Learn more

- DOC /security/login/totps/{owner.uuid}/{account.name}
- DOC /security/accounts

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Account owner UUID.

Name	Type	In	Required	Description
account.name	string	path	True	Account user name.

Response

```
Status: 200, Ok
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",

Retrieve TOTP profile for a user account

GET `/security/login/totps/{owner.uuid}/{account.name}`

Introduced In: 9.13

Retrieves the TOTP profile configured for a user account.

Related ONTAP commands

- `security login totp show`

Learn more

- DOC /security/login/totps/{owner.uuid}/{account.name}
- DOC /security/accounts

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Account owner UUID.
account.name	string	path	True	Account user name.

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
account	account_reference	

Name	Type	Description
comment	string	Optional comment for the TOTP profile.
enabled	boolean	Status of the TOTP profile.

Manage the multi-admin-verify global setting

Security multi-admin-verify endpoint overview

Overview

These APIs provide information on the multi-admin verification global setting. The GET API retrieves the object store that contains the global setting values of the multi-admin-verify feature. The PATCH request is used to modify the multi-admin-verify global setting. All fields are optional for the PATCH request.

Examples

Retrieving the multi-admin-verify global setting

Retrieves the current multi-admin-verify global setting. If the global setting is not set, default values are returned.

```
# The API:
/api/security/multi-admin-verify

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-verify"

# The response:
{
"approval_groups": [
],
"required_approvers": 1,
"enabled": false,
"execution_expiry": "PT1H",
"approval_expiry": "PT1H",
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify"
  }
}
}
```

Updating the multi-admin-verify global setting

The following example updates the multi-admin-verify global settings. Note that the approval_groups needs to be available in /security/multi-admin-verify/approval-groups before it is set in the global setting.

```
# The API:
/api/security/multi-admin-verify

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/multi-admin-verify" -d
'{"required_approvers": "1", "enabled": "true", "execution_expiry": "2h",
"approval_expiry": "3h"}'
```

Retrieve a multi-admin-verify configuration

GET `/security/multi-admin-verify`

Introduced In: 9.11

Retrieves the multi-admin-verify configuration.

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
approval_expiry	string	Default time for requests to be approved, in ISO-8601 duration format.
approval_groups	array[string]	List of approval groups that are allowed to approve requests for rules that don't have approval groups.
enabled	boolean	
execution_expiry	string	Default time for requests to be executed once approved, in ISO-8601 duration format.
required_approvers	integer	The number of required approvers, excluding the user that made the request.

Example response

```
{
  "approval_groups": {
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage multi-admin approval groups

Security multi-admin-verify approval-groups endpoint overview

Overview

A group of users can be defined in a cluster server context. Approval groups can be associated with a rule or global setting from which the associated request can retrieve approvals.

Examples

Creating a multi-admin-verify approval group

Creates an approval group for a specified SVM for a specified list of ONTAP users.

```
# The API:
/api/security/multi-admin-verify/approval-groups

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-verify/approval-
groups?return_records=true" -H "accept: application/hal+json" -d
'{"owner.uuid": "c109634f-7011-11ec-a23d-005056a78fd5", "name": "group1",
"approvers": ["admin"], "email": ["group1.approvers@email.com"]}'

# The response:
{
"num_records": 1,
"records": [
  {
    "owner": {
      "uuid": "c109634f-7011-11ec-a23d-005056a78fd5",
      "_links": {
        "self": {
          "href": "/api/svm/svms/c109634f-7011-11ec-a23d-005056a78fd5"
        }
      }
    },
    "name": "group1",
    "approvers": [
      "admin"
    ],
    "email": [
      "group1.approvers@email.com"
    ],
    "_links": {
      "self": {
        "href": "/api/security/multi-admin-verify/approval-
groups/c109634f-7011-11ec-a23d-005056a78fd5/group1"
      }
    }
  }
]
}
```

Retrieving multi-admin-verify approval groups

Displays information about approval groups and the users that are registered with each group.

```
# The API:
/api/security/multi-admin-verify/approval-groups

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/approval-groups"

# The response:
{
"records": [
  {
    "owner": {
      "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",
      "name": "cluster1",
      "_links": {
        "self": {
          "href": "/api/svm/svms/52b75787-7011-11ec-a23d-005056a78fd5"

Retrieve multi-admin-verify approval groups

GET `/security/multi-admin-verify/approval-groups`

Introduced In: 9.11

Retrieves multi-admin-verify approval groups.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	query	False	Filter by owner.uuid
owner.name	string	query	False	Filter by owner.name
email	string	query	False	Filter by email
approvers	string	query	False	Filter by approvers
name	string	query	False	Filter by name
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[multi_admin_verify_approval_group]	

Example response

```
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "num_records": 1,
  "records": {
    "approvers": {
    },
    "email": {
    },
    "owner": {
      "_links": {
        "self": {
          "href": "/api/resourcelink"
        }
      },
      "name": "svm1",
      "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
    }
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage multi-admin-verify approval groups

Security multi-admin-verify approval-groups owner.uuid name endpoint overview

Overview

These APIs provide information about a specific multi-admin verification approval-group. A group of users can be defined in a cluster server context. Approval groups can be associated with a rule or global setting from which the associated request can retrieve approvals.

Examples

Retrieving a multi-admin-verify approval group

Displays information about a specific approval group and the users that are registered within that group.

```
# The API:
/api/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/approval-groups/52b75787-7011-11ec-a23d-005056a78fd5/group1"

# The response:
{
"owner": {
  "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",
  "name": "cluster1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/52b75787-7011-11ec-a23d-005056a78fd5"
    }
  }
},
"name": "group1",
"approvers": [
  "admin"
],
"email": [
  "group1.approvers@email.com"
],
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify/approval-groups/52b75787-
7011-11ec-a23d-005056a78fd5/group1"
  }
}
}
```

Updating a multi-admin-verify approval group

Modifies attributes of an approval group.

```
# The API:
/api/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/multi-admin-
verify/approval-groups/52b75787-7011-11ec-a23d-005056a78fd5/group1" -d
'{"approvers": ["admin1"], "email": ["group1.approvers.new@email.com"]}'
```

Deleting a multi-admin-verify approval group

Deletes the specified approval group.

```
# The API:
/api/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}

# The call:
curl -X DELETE "https://<cluster-ip>/api/security/multi-admin-
verify/approval-groups/52b75787-7011-11ec-a23d-005056a78fd5/group1"
```

Delete a multi-admin-verify approval group

DELETE `/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}`

Introduced In: 9.11

Deletes a multi-admin-verify approval group.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	
name	string	path	True	

Response

```
Status: 200, Ok
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Retrieve a multi-admin-verify approval group

GET `/security/multi-admin-verify/approval-groups/{owner.uuid}/{name}`

Introduced In: 9.11

Retrieves a multi-admin-verify approval group.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	
name	string	path	True	
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
approvers	array[string]	List of users that can approve a request.
email	array[string]	Email addresses that are notified when a request is created, approved, vetoed, or executed.
name	string	Name of the approval group.
owner	owner	The owner of the approval group. The only valid owner is currently the cluster.

Example response

```
{
  "approvers": {
  },
  "email": {
  },
  "owner": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"

Manage multi-admin-verify approval requests

Security multi-admin-verify requests endpoint overview

Overview

These APIs provide information about multi-admin verification requests. If you need to execute a command that is protected by a multi-admin rule, you must first submit a request to be allowed to execute the command. The request must then be approved by the designated approvers according to the rule associated with the command.

Examples

Creating a multi-admin-verify request

Creates a request for the specified ONTAP operation.

```
# The API:
/api/security/multi-admin-verify/requests

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-
verify/requests?return_records=true" -H "accept: application/hal+json" -d
'{"operation": "volume delete", "query": "-vserver vs0 -volume v1",
"permitted_users": ["user1","user2"]}'

# The response:
{
"num_records": 1,
"records": [
  {
    "index": 10,
    "operation": "volume delete",
    "query": "-vserver vs0 -volume v1",
    "state": "pending",
    "required_approvers": 2,
    "pending_approvers": 2,
    "execute_on_approval": false,
    "permitted_users": [
      "user1",
      "user2"
    ],
    "user_requested": "admin",
    "owner": {
      "uuid": "c1483186-6e73-11ec-bc92-005056a7ad04",
      "name": "cluster1",
      "_links": {
        "self": {
          "href": "/api/svm/svms/c1483186-6e73-11ec-bc92-005056a7ad04"
        }
      }
    },
    "create_time": "2022-01-06T16:59:49-05:00",
    "approve_expiry_time": "2022-01-06T19:59:49-05:00",
    "_links": {
      "self": {
        "href": "/api/security/multi-admin-verify/requests/10"
      }
    }
  }
]
}
```

Retrieving multi-admin-verify requests

Retrieves information about multi-admin verification requests.

```
# The API:
/api/security/multi-admin-verify/requests

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/requests"

# The response:
{
"records": [
  {
    "index": 1,
    "_links": {
      "self": {
        "href": "/api/security/multi-admin-verify/requests/1"
      }
    }
  },
  {
    "index": 2,
    "_links": {
      "self": {
        "href": "/api/security/multi-admin-verify/requests/2"
      }
    }
  }
],
"num_records": 2,
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify/requests"
  }
}
}
```

Retrieve multi-admin-verify requests

GET `/security/multi-admin-verify/requests`

Introduced In: 9.11

Retrieves multi-admin-verify requests.

Parameters

Name	Type	In	Required	Description
permitted_users	string	query	False	Filter by permitted_users
user_requested	string	query	False	Filter by user_requested
operation	string	query	False	Filter by operation

owner

The owner of the request. This can identify the cluster or an SVM.

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

multi_admin_verify_request

Name	Type	Description
approve_expiry_time	string	
approve_time	string	
approved_users	array[string]	The users that have approved the request.
comment	string	Optional user-provided comment that is sent to the approval-group email indicating why the request was made.
create_time	string	

Name	Type	Description
execute_on_approval	boolean	Specifies that the operation is executed automatically on final approval.
execution_expiry_time	string	
index	integer	Unique index that represents a request.
operation	string	The command to execute.
owner	owner	The owner of the request. This can identify the cluster or an SVM.
pending_approvers	integer	The number of approvers remaining that are required to approve.
permitted_users	array[string]	List of users that can execute the operation once approved. If not set, any authorized user can perform the operation.
potential_approvers	array[string]	The users that are able to approve the request.
query	string	Identifies the specific entry upon which the user wants to operate.
required_approvers	integer	The number of required approvers, excluding the user that made the request.
state	string	The state of the request. PATCH supports approved and vetoed. The state only changes after setting to approved once no more approvers are required.
user_requested	string	The user that created the request. Automatically set by ONTAP. • readOnly: 1 • Introduced in: 9.11 • x-nullable: true

Name	Type	Description
user_vetoed	string	The user that vetoed the request.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create a multi-admin-verify request

POST `/security/multi-admin-verify/requests`

Introduced In: 9.11

Creates a multi-admin-verify request.

Parameters

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
approve_expiry_time	string	
approve_time	string	
approved_users	array[string]	The users that have approved the request.
comment	string	Optional user-provided comment that is sent to the approval-group email indicating why the request was made.
create_time	string	
execute_on_approval	boolean	Specifies that the operation is executed automatically on final approval.
execution_expiry_time	string	
index	integer	Unique index that represents a request.
operation	string	The command to execute.
owner	owner	The owner of the request. This can identify the cluster or an SVM.
pending_approvers	integer	The number of approvers remaining that are required to approve.
permitted_users	array[string]	List of users that can execute the operation once approved. If not set, any authorized user can perform the operation.
potential_approvers	array[string]	The users that are able to approve the request.
query	string	Identifies the specific entry upon which the user wants to operate.
required_approvers	integer	The number of required approvers, excluding the user that made the request.

Name	Type	Description
state	string	The state of the request. PATCH supports approved and vetoed. The state only changes after setting to approved once no more approvers are required.
user_requested	string	The user that created the request. Automatically set by ONTAP. • readOnly: 1 • Introduced in: 9.11 • x-nullable: true
user_vetoed	string	The user that vetoed the request.

Example request

```
{
  "approve_expiry_time": "string",
  "approve_time": "string",

Manage a multi-admin-verify approval request

Security multi-admin-verify requests index endpoint overview

Overview

These APIs provide information about a specific multi-admin verification request. If you need to execute a command that is protected by a multi-admin rule, you must first submit a request to be allowed to execute the command. The request must then be approved by the designated approvers according to the rule associated with the command.

Examples

Retrieving a multi-admin-verify request

Retrieves information about a specific multi-admin verification request.

```
# The API:
/api/security/multi-admin-verify/requests/{index}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/requests/1"

# The response:
{
"index": 1,
"operation": "security multi-admin-verify modify",
"query": "",
"state": "expired",
"required_approvers": 1,
"pending_approvers": 1,
"execute_on_approval": false,
"permitted_users": [
  "wenbo"
],
"user_requested": "admin",
"owner": {
  "uuid": "c1483186-6e73-11ec-bc92-005056a7ad04",
  "name": "cluster1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/c1483186-6e73-11ec-bc92-005056a7ad04"
    }
  }
},
"create_time": "2022-01-05T20:07:09-05:00",
"approve_expiry_time": "2022-01-05T21:07:09-05:00",
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify/requests/1"
  }
}
}
```

Updating a multi-admin-verify request

Updates a specific multi-admin-verify request

```
# The API:
/api/security/multi-admin-verify/requests/{index}

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/multi-admin-
verify/requests/1" -d '{"state": "approved", "execute_on_approval":
false}'
```

Delete a multi-admin-verify request

DELETE `/security/multi-admin-verify/requests/{index}`

Introduced In: 9.11

Deletes a multi-admin-verify request.

Parameters

Name	Type	In	Required	Description
index	string	path	True	

Response

```
Status: 200, Ok
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage multi-admin-verify rules

Security multi-admin-verify rules endpoint overview

Overview

Rules define the ONTAP commands (operations) that should be protected by multi-admin approval. While the feature is turned on, any ONTAP operation that is defined with a rule will be enforced with multi-admin approval to execute the command (operation).

Examples

Creating a multi-admin-verify rule

Creates a rule for the specified ONTAP operation.

```
# The API:
/api/security/multi-admin-verify/rules

# The call:
curl -X POST "https://<mgmt-ip>/api/security/multi-admin-
verify/rules?return_records=true" -H "accept: application/hal+json" -d
'{"owner.uuid": "c109634f-7011-11ec-a23d-005056a78fd5", "operation":
"volume delete", "query": "-vserver vs0", "required_approvers": 1}'

# The response:
{
"num_records": 1,
"records": [
  {
    "owner": {
      "uuid": "c109634f-7011-11ec-a23d-005056a78fd5",
      "_links": {
        "self": {
          "href": "/api/svm/svms/c109634f-7011-11ec-a23d-005056a78fd5"
        }
      }
    },
    "operation": "volume delete",
    "auto_request_create": true,
    "query": "-vserver vs0",
    "required_approvers": 1,
    "create_time": "2022-01-07T22:14:03-05:00",
    "system_defined": false,
    "_links": {
      "self": {
        "href": "/api/security/multi-admin-verify/rules/c109634f-7011-
11ec-a23d-005056a78fd5/volume%20delete"
      }
    }
  }
]
}
```

Retrieving multi-admin-verify rules

Displays information about multi admin verification rules.

```
# The API:
/api/security/multi-admin-verify/rules

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-verify/rules"

# The response:
{
"records": [
  {
    "owner": {
      "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",

Retrieve multi-admin-verify rules

GET `/security/multi-admin-verify/rules`

Introduced In: 9.11

Retrieves multi-admin-verify rules.

Parameters

Name	Type	In	Required	Description
auto_request_create	boolean	query	False	Filter by auto_request_create
operation	string	query	False	Filter by operation
required_approvers	integer	query	False	Filter by required_approvers
query	string	query	False	Filter by query
approval_expiry	string	query	False	Filter by approval_expiry
create_time	string	query	False	Filter by create_time
owner.uuid	string	query	False	Filter by owner.uuid
owner.name	string	query	False	Filter by owner.name
approval_groups.name	string	query	False	Filter by approval_groups.name
system_defined	boolean	query	False	Filter by system_defined
execution_expiry	string	query	False	Filter by execution_expiry
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records
records	array[multi_admin_verify_rule]	

Example response

```
{
  "_links": {
    "next": {
      "href": "/api/resourcelink"
    },
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "num_records": 1,
  "records": {
    "approval_groups": {
    },
    "create_time": "string",
    "owner": {
      "_links": {
        "self": {
          "href": "/api/resourcelink"
        }
      },
      "name": "svm1",
      "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7"
    }
  }
}
```

Error

```
Status: Default, Error
```

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage a multi-admin-verify rule

Security multi-admin-verify rules owner.uuid operation endpoint overview

Overview

These APIs provide information about a specific multi-admin verification rule. Rules define the ONTAP commands (operations) that should be protected by multi-admin approval. While the feature is turned on, any ONTAP operation that is defined with a rule will be enforced with multi-admin approval to execute the command (operation).

Examples

Retrieving a multi-admin-verify rule

Displays information about a specific multi admin verification rule.

```
# The API:
/api/security/multi-admin-verify/rules/{owner.uuid}/{operation}

# The call:
curl -X GET "https://<cluster-ip>/api/security/multi-admin-
verify/rules/52b75787-7011-11ec-a23d-005056a78fd5/volume+delete"

# The response:
{
"owner": {
  "uuid": "52b75787-7011-11ec-a23d-005056a78fd5",
  "name": "cluster1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/52b75787-7011-11ec-a23d-005056a78fd5"
    }
  }
},
"operation": "volume delete",
"auto_request_create": true,
"query": "-vserver vs0",
"required_approvers": 1,
"create_time": "2022-01-07T22:14:03-05:00",
"system_defined": false,
"_links": {
  "self": {
    "href": "/api/security/multi-admin-verify/rules/52b75787-7011-11ec-
a23d-005056a78fd5/volume+delete"
  }
}
}
```

Updating a multi-admin-verify rule

Modifies the attributes of the rule.

```
# The API:
/api/security/multi-admin-verify/rules/{owner.uuid}/{operation}

# The call:
curl -X PATCH "https://<cluster-ip>/api/security/multi-admin-
verify/rules/52b75787-7011-11ec-a23d-005056a78fd5/volume+delete" -d
'{"required_approvers": 1}'
```

Deleting a multi-admin-verify rule

Deletes the specified approval group.

```
# The API:
/api/security/multi-admin-verify/rules/{owner.uuid}/{operation}

# The call:
curl -X DELETE "https://<cluster-ip>/api/security/multi-admin-
verify/rules/52b75787-7011-11ec-a23d-005056a78fd5/volume+delete"
```

Delete a multi-admin-verify rule

DELETE `/security/multi-admin-verify/rules/{owner.uuid}/{operation}`

Introduced In: 9.11

Deletes a multi-admin-verify rule.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	
operation	string	path	True	

Response

```
Status: 200, Ok
```

Error

```
Status: Default
```

ONTAP Error Response Codes

Error Code	Description
262310	System rules cannot be deleted or have their query modified.

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Name	Type	Description
name	string	Name of the approval group.

href

Name	Type	Description
href	string	

_links

Name	Type	Description
self	href	

owner

The owner of the rule. The only valid owner is currently the cluster.

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

multi_admin_verify_rule

Name	Type	Description
approval_expiry	string	Time for requests to be approved, in ISO-8601 duration format. If not set, the global setting is used.
approval_groups	array[approval_groups]	List of approval groups that are allowed to approve requests for rules that don't have approval groups.

Name	Type	Description
auto_request_create	boolean	When true, ONTAP automatically creates a request for any failed operation where there is no matching pending request. • Default value: 1 • Introduced in: 9.11 • x-nullable: true
create_time	string	
execution_expiry	string	Time for requests to be executed once approved, in ISO-8601 duration format. If not set, the global setting is used.
operation	string	Command that requires one or more approvals.
owner	owner	The owner of the rule. The only valid owner is currently the cluster.
query	string	When specified, this property limits the entries that require approvals to those that match the specified query.
required_approvers	integer	The number of required approvers, excluding the user that made the request.
system_defined	boolean	Specifies whether the rule is system-defined or user-defined.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Manage security roles

Security roles endpoint overview

Overview

ONTAP supports Role Based Access Control (RBAC) wherein a user account must be associated with a role and that role defines the privileges and rights for that user account. A privilege defines the access level of the API or command/command directory path. If a privilege tuple refers to a command/command directory path, it can also be associated with an optional query. The access level specifies the subset of operations a user account can perform from the complete set of API methods {GET, POST, PATCH, and DELETE} or command operations {create, delete, modify, and show}. The optional query specifies the subset of objects that the role is allowed to access. The query can be specified, only if the privilege tuple refers to a command/command directory path. It is defined using one or more parameters of the command/command directory path.

A role can comprise of multiple privilege tuples and each privilege tuple consists of a REST API or command/command directory path, its access level, and an optional query. For a given role, only one type of privilege tuple can be defined. All privilege tuples for a role must contain REST API paths or all privilege tuples for the role must contain command/command directory paths. However, predefined/built-in roles (those defined later) are an exception to this rule.

For example, "role1" might be a role that has a tuple {"access":"all","path":"/api/network/ip"}, which means that a user account with "role1" can perform GET, POST, PATCH, and DELETE requests on the *api/network/ip* API or derived APIs that have *api/network/ip* as the prefix.

In other examples, "role2" might be a role that has a tuple {"access":"read_create_modify","path":"/api/storage/volumes"}, which means that a user account with "role2" can perform GET, POST and PATCH (but not DELETE) requests on the *api/storage/volumes* API or derived APIs that have *api/storage/volumes* as the prefix.

"role3" might be a role that has a tuple {"access":"read_create","path":"vserver nfs"}, which means that a user account with "role3" can perform "show" and "create" operations on *vserver nfs* command or derived commands that have *vserver nfs* as the prefix. There is no query associated with "role3".

"role4" might be a role that has a tuple {"access":"all","path":"snapmirror policy","query":"-policy !CustomPol*"}, which means that a user account with "role4" can perform "show", "create","modify" and "delete" operations on *snapmirror policy* command or derived commands that have *snapmirror policy* as the prefix. However, a user is not authorized to perform the above set of operations on SnapMirror policies starting with the name "CustomPol".

In cases where a role has tuples with multiple APIs having the same prefix or multiple commands/command directories having the same prefix, the highest match wins out. For example, if "role5" has the following tuples: {"access":"readonly","path":"/api/cluster"} and {"access":"all","path":"/api/cluster/schedules"}, then only a GET request is allowed on APIs with *api/cluster* as the prefix; while GET, POST, PATCH and DELETE requests are possible on the *api/cluster/schedules* API. Similarly, if "role6" has the following tuples: {"access":"readonly","path":"volume"} and {"access":"read_create_delete","path":"volume snapshot"}, then only a "show" operation is allowed on commands/command directories with *volume* but not *volume snapshot* as the prefix; while "show", "create" and "delete" operations are possible on the *volume snapshot* command directory or any other command/command directory under *volume snapshot*.

Predefined (built-in) roles

Related REST APIs and related commands/command directories are used to form predefined cluster-scoped and SVM-scoped roles, such as: "admin", "backup", "readonly" for cluster and "vsadmin", "vsadmin-backup", "vsadmin-protocol" for SVMs. These can be retrieved by calling a GET request on */api/security/roles* API and can be assigned to user accounts. See the examples for *api/security/accounts*.

A GET request on */api/security/roles/{owner.uuid}/{name}* or */api/security/roles/{owner.uuid}/{name}/privileges*, where "name" refers to a predefined (built-in) role, returns privilege tuples containing REST API paths along with privilege tuples containing command/command directory paths.

These predefined roles cannot be modified or deleted.

Mapped roles

Before REST APIs, the RBAC roles (legacy roles) were defined to contain the CLI commands and their access levels. Now, almost all REST APIs map to one or more CLI commands. When a role is created using a POST request on /api/security/roles, a mapped legacy role is created. This legacy role has the same access level (as that of the REST API) for the mapped CLI commands. However, if a legacy role with the same name already exists, the POST operation fails and you need to choose a unique name for the role. Legacy roles are also managed using the REST endpoint /api/security/roles and its derivatives. In CLI, legacy roles are managed using the "security login role <create \| modify \| delete> -role <rolename>" commands.</rolename>

Note that the mapped legacy role (for the REST API role created) cannot be manipulated using either REST API or the CLI.

The reverse case is not true; the creation of a legacy role will not create a mapped role with equivalent REST APIs.

API restrictions

A role can be a REST role or a legacy role but not both. A role cannot be defined to have a mix of privilege tuples with REST API paths and privilege tuples with command/command directory paths. However, predefined (built-in) roles are an exception to this rule. Numerous APIs are scoped for the cluster level only. This results in an access error if assigned to an SVM-scoped role. For example, *api/cluster/nodes* does not work when added as a tuple entry for an SVM-scoped role.

A number of APIs allowed for an SVM-scoped role might have restrictions on the access level. For example, */api/network/ethernet/ports* cannot have an access level of "all" for an SVM-scoped role; this results in an access error when a POST or PATCH request is made.

Roles created with a REST API path prefix which is common to many APIs might have restrictions based on the scope of the role; cluster or SVM. For example, {"access":"all","path":"/api/security"} might be a tuple entry for an SVM role. Any GET, POST, PATCH, or DELETE operation fails on API */api/security/accounts* while the

same on */api/security/login/messages* succeeds. However, a role with exactly the same tuple when created at the cluster-scope level allows the operations.

Numerous APIs have restrictions on the objects that can be operated on based on the context of the SVM or cluster. For example, a POST request on */api/security/authentication/password* API changes the password for a user account. If executed in the context of an SVM (POST request on an SVM interface), only the password of the user executing the POST can be modified, and attempts to modify the password of any other user results in an access error. However, if a POST request is performed by a cluster administrator account, the password for any user account (cluster or SVM) can be modified.

Resource-qualified endpoints are now supported. At present, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Examples

Creating a cluster-scoped custom role of REST API tuples

Specify the role name and the tuples (of REST APIs and their access levels) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped role.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role1", "privileges" :
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/application/applications"},{"access":"readonly","path":"/api/applicat
ion/templates"}]}'
```

Creating a cluster-scoped custom role of command and/or command directory tuples

Specify the role name and the tuples (of commands/command directories, their access levels and associated optional queries) in the body of the POST request. The owner.uuid or owner.name are not required to be specified for a cluster-scoped role.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role2", "privileges" :
[{"access":"readonly","path":"volume
qtree","query":""},{"access":"all","path":"security
certificate"},{"access":"readonly","path":"snapmirror policy","query":"-
policy !CustomPol*"}]}'
```

Creating an SVM-scoped custom role of REST API tuples

For an SVM-scoped role, specify either owner.name or owner.uuid in the request body along with other parameters for the role. These correspond to the name or UUID of the SVM for which the role is being created and can be obtained from the response body of the GET request performed on the */api/svm/svms* API.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"owner": {"uuid"
: "9f93e553-4b02-11e9-a3f9-005056bb7acd"},"name":"svm_role1", "privileges"
:
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/application/applications"},{"access":"readonly","path":"/api/applicat
ion/templates"}]}'
```

Creating an SVM-scoped custom role of command and/or command directory tuples

For an SVM-scoped role, specify either owner.name or owner.uuid in the request body along with other parameters for the role. These correspond to the name or UUID of the SVM for which the role is being created and can be obtained from the response body of the GET request performed on the */api/svm/svms* API.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d '{"owner": {"uuid"
: "9f93e553-4b02-11e9-a3f9-005056bb7acd"},"name":"svm_role2", "privileges"
: [{"access":"readonly","path":"job schedule interval","query":"-days
>1"},{"access":"all","path":"application
snapshot"},{"access":"none","path":"volume move"}]}'
```

Creating a custom role with a resource-qualified endpoint

Specify the role name and the tuples (of REST APIs and their access levels) in the body of the POST request. One or more of the tuples can now contain a resource-qualified endpoint. At present, the only supported resource-qualified endpoints are the *Snapshots* and *File System Analytics* endpoints listed above in the *Overview* section.

```
# The API:
POST "/api/security/roles"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles" -d
'{"name":"cluster_role", "privileges" :
[{"access":"readonly","path":"/api/cluster/jobs"},{"access":"all","path":"
/api/storage/volumes/4ae77149-7752-11eb-8d4e-
0050568ed6bd/snapshots"},{"access":"all","path":"/api/storage/volumes/6519
986e-7752-11eb-8d4e-
0050568ed6bd/snapshots"},{"access":"readonly","path":"/api/storage/volumes
/8823c869-9ea1-11ec-8771-005056bb1a7c/top-
metrics/users"},{"access":"readonly","path":"/api/application/templates"}]
}'
```

Retrieving the configured roles

All of the roles or a filtered list of roles (for example by name, predefined, and so on) can be retrieved.

```
# The API:
GET "/api/security/roles?fields=%2A"

# The call to retrieve all the roles configured in the cluster:
```

```
curl -X GET "https://<mgmt-ip>/api/security/roles"

# The response:

Using a scoped call to retrieve the configured roles

```
# Scoped call to retrieve all the roles for a particular SVM using
owner.uuid:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.uuid=aaef7c38-
4bd3-11e9-b238-0050568e2e25"

# Scoped call to retrieve all the roles for a particular SVM using
owner.name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?owner.name=svm1"

# Scoped call to retrieve the roles having vsadmin as the prefix in the
role name:
curl -X GET "https://<mgmt-ip>/api/security/roles/?name=vsadmin*"

# Scoped call to retrieve the predefined roles:

Parameters

Name	Type	In	Required	Description
privileges.query	string	query	False	Filter by privileges.query • Introduced in: 9.11

Name	Type	In	Required	Description
privileges.path	string	query	False	Filter by privileges.path • Introduced in: 9.7
privileges.access	string	query	False	Filter by privileges.access • Introduced in: 9.7
name	string	query	False	Filter by name • Introduced in: 9.7
scope	string	query	False	Filter by scope • Introduced in: 9.7
owner.uuid	string	query	False	Filter by owner.uuid • Introduced in: 9.7
owner.name	string	query	False	Filter by owner.name • Introduced in: 9.7
builtin	boolean	query	False	Filter by builtin • Introduced in: 9.7
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

owner

Owner name and UUID that uniquely identifies the role.

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

role_privilege

A tuple containing a REST endpoint or a command/command directory path and the access level assigned to that endpoint or command/command directory. If the "path" attribute refers to a command/command directory path, the tuple could additionally contain an optional query. The REST endpoint can be a resource-qualified endpoint. At present, the only supported resource-qualified endpoints are the following

Snapshots APIs

- */api/storage/volumes/{volume.uuid}/snapshots*

File System Analytics APIs

- */api/storage/volumes/{volume.uuid}/files*
- */api/storage/volumes/{volume.uuid}/top-metrics/clients*
- */api/storage/volumes/{volume.uuid}/top-metrics/directories*
- */api/storage/volumes/{volume.uuid}/top-metrics/files*

- */api/storage/volumes/{volume.uuid}/top-metrics/users*
- */api/svm/svms/{svm.uuid}/top-metrics/clients*
- */api/svm/svms/{svm.uuid}/top-metrics/directories*
- */api/svm/svms/{svm.uuid}/top-metrics/files*
- */api/svm/svms/{svm.uuid}/top-metrics/users*

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Name	Type	Description
_links	_links	
access	string	Access level for the REST endpoint or command/command directory path. If it denotes the access level for a command/command directory path, the only supported enum values are 'none','readonly' and 'all'.
path	string	Either of REST URI/endpoint OR command/command directory path.
query	string	Optional attribute that can be specified only if the "path" attribute refers to a command/command directory path. The privilege tuple implicitly defines a set of objects the role can or cannot access at the specified access level. The query further reduces this set of objects to a subset of objects that the role is allowed to access. The query attribute must be applicable to the command/command directory specified by the "path" attribute. It is defined using one or more parameters of the command/command directory path specified by the "path" attribute.

role

A named set of privileges that defines the rights an account has when it is assigned the role.

Name	Type	Description
_links	_links	
builtin	boolean	Indicates if this is a built-in (pre-defined) role which cannot be modified or deleted.
name	string	Role name
owner	owner	Owner name and UUID that uniquely identifies the role.
privileges	array[role_privilege]	The list of privileges that this role has been granted.
scope	string	Scope of the entity. Set to "cluster" for cluster owned objects and to "svm" for SVM owned objects.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Create a new cluster-scoped or SVM-scoped role

POST `/security/roles`

Introduced In: 9.6

Creates a new cluster-scoped role or an SVM-scoped role. For an SVM-scoped role, specify either the SVM name as the owner.name or SVM UUID as the owner.uuid in the request body along with other parameters for the role. The owner.uuid or owner.name are not required to be specified for a cluster-scoped role.

Required parameters

- `name` - Name of the role to be created.
- `privileges` - Array of privilege tuples. Each tuple consists of a REST API or command/command directory path and its desired access level. If the tuple refers to a command/command directory path, it could optionally contain a query.

Optional parameters

- `owner.name` or `owner.uuid` - Name or UUID of the SVM for an SVM-scoped role.

Related ONTAP commands

- `security login rest-role create`
- `security login role create`

View or delete a role

Security roles owner.uuid name endpoint overview

Overview

This API is used to retrieve or delete a role. The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET call performed on one of the following APIs: */api/security/roles* for all roles */api/security/roles/?scope=svm* for SVM-scoped

roles */api/security/roles/?owner.name={svm-name}* for roles in a specific SVM This API response contains the complete URI for each role that can be used for retrieving or deleting a role.

The pre-defined roles can be retrieved but cannot be deleted.

Examples

Retrieving the role configuration for a REST role

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/secure_role"

# The response:
{
"owner": {
  "uuid": "aaef7c38-4bd3-11e9-b238-0050568e2e25",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/aaef7c38-4bd3-11e9-b238-0050568e2e25"
    }
  }
},
"name": "secure_role",
"privileges": [
  {
    "path": "/api/security",
    "access": "all",
    "_links": {
      "self": {
        "href": "/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/secure_role/privileges/%2Fapi%2Fsecurity"
      }
    }
  },
  {
    "path": "/api/storage/volumes/651f7fdf-7752-11eb-8d4e-
0050568ed6bd/snapshots",
    "access": "readonly",
    "_links": {
      "self": {
        "href": "/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/secure_role/privileges/%2Fapi%2Fstorage%2Fvolumes%2F651f7fdf-
```

```

- */api/storage/volumes/{volume.uuid}/top-metrics/users*
- */api/svm/svms/{svm.uuid}/top-metrics/clients*
- */api/svm/svms/{svm.uuid}/top-metrics/directories*
- */api/svm/svms/{svm.uuid}/top-metrics/files*
- */api/svm/svms/{svm.uuid}/top-metrics/users*

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Name	Type	Description
_links	_links	
access	string	Access level for the REST endpoint or command/command directory path. If it denotes the access level for a command/command directory path, the only supported enum values are 'none','readonly' and 'all'.
path	string	Either of REST URI/endpoint OR command/command directory path.
query	string	Optional attribute that can be specified only if the "path" attribute refers to a command/command directory path. The privilege tuple implicitly defines a set of objects the role can or cannot access at the specified access level. The query further reduces this set of objects to a subset of objects that the role is allowed to access. The query attribute must be applicable to the command/command directory specified by the "path" attribute. It is defined using one or more parameters of the command/command directory path specified by the "path" attribute.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Manage role privilege details

Security roles owner.uuid name privileges endpoint overview

Overview

This API is used to configure the role privileges (tuples of REST URI paths or command/command directory paths, their access levels and optional queries, where the tuples refer to command/command directory paths). It also retrieves all of the privilege tuples for a role and can add a tuple to an existing role. The "path" attribute can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET request performed on one of the following APIs:

- */api/security/roles* for all the roles
- */api/security/roles/?scope=svm* for SVM-scoped roles
- /api/security/roles/?owner.name=<svm-name></i> for roles in a specific SVM This API response contains the complete URI for each role and can be used after suffixing it with _"privileges".</svm-name>_

The pre-defined roles can be retrieved but cannot be updated.

Examples

Adding a privilege tuple for a REST URI/endpoint to an existing custom role

```
# The API:
POST "/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges" -d
'{"access":"readonly","path":"/api/protocols"}'
```

Adding a privilege tuple for a command or command directory to an existing custom role

```
# The API:
POST "/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X POST "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges" -d
'{"access":"all","path":"statistics volume show","query":"-vserver
vs1&#124;vs2 -aggregate aggr1&#124;aggr2"}'
```

Retrieving all the privilege tuples for a REST role

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}/privileges"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/svm_role1/privileges"

# The response:
```

```

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Role owner UUID
name	string	path	True	Role name
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Add a privilege tuple to an existing role

POST `/security/roles/{owner.uuid}/{name}/privileges`

Introduced In: 9.6

Adds a privilege tuple (of REST URI or command/command directory path, its access level and an optional query, if the "path" refers to a command/command directory path) to an existing role.

Required parameters

- `owner.uuid` - UUID of the SVM that houses this role.
- `name` - Name of the role to be updated.
- `path` - REST URI path (example: */api/storage/volumes*) or command/command directory path (example: *snaplock compliance-clock*). Can be a resource-qualified endpoint (example: */api/storage/volumes/43256a71-be02-474d-a2a9-9642e12a6a2c/snapshots*). Currently, resource-qualified endpoints are limited to the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

- `access` - Desired access level for the REST URI path or command/command directory.

Manage role privilege path

Security roles owner.uuid name privileges path endpoint overview

Overview

A role can comprise of multiple tuples and each tuple consists of a REST API path or command/command directory path and its access level. If the tuple refers to a command/command directory path, it may optionally be associated with a query. These APIs can be used to retrieve or modify the associated access level and optional query. They can also be used to delete one of the constituent REST API paths or command/command directory paths within a role. The REST API path can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

The role can be SVM-scoped or cluster-scoped.

Specify the owner UUID and the role name in the URI path. The owner UUID corresponds to the UUID of the SVM for which the role has been created and can be obtained from the response body of a GET request performed on one of the following APIs: /api/security/roles for all roles

/api/security/roles/?scope=svm for SVM-scoped roles
/api/security/roles/?owner.name=<svm-name></i> for roles in a specific SVM This API response contains the complete URI for each tuple of the role and can be used for GET, PATCH, or DELETE operations.</svm-name>

The access level for paths in pre-defined roles cannot be updated.

Examples

Updating the access level for a REST API path in the privilege tuple of an existing role

```
# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols" -d
'{"access":"all"}'
```

Updating the access level for a command/command directory path in the privilege tuple of an existing role

```
# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-0050568e2e25/svm_role1/privileges/netp%20port" -d
'{"access":"readonly","query":"-type if-group&#124;vlan"}'
```

Updating the access level for a resource-qualified endpoint in the privilege tuple of an existing role

```
# The API:
PATCH "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-
b238-
0050568e2e25/svm_role1/privileges/%2Fapi%2Fstorage%2Fvolumes%2F742ef001-
24f0-4d5a-9ec1-2fdaadb282f4%2Ffiles" -d '{"access":"readonly"}'
```

Retrieving the access level for a REST API path in the privilege tuple of an existing role

```
# The API:
GET "/api/security/roles/{owner.uuid}/{name}/privileges/{path}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/roles/aaef7c38-4bd3-11e9-b238-
0050568e2e25/svm_role1/privileges/%2Fapi%2Fprotocols"

# The response:
{

```

Delete a privilege tuple from the role

DELETE `/security/roles/{owner.uuid}/{name}/privileges/{path}`

Introduced In: 9.6

Deletes a privilege tuple (of REST URI or command/command directory path, its access level and an optional query) from the role. The REST URI can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Required parameters

- `owner.uuid` - UUID of the SVM which houses this role.

- `name` - Name of the role to be updated.
- `path` - Constituent REST API path or command/command directory path to be deleted from this role. Can be a resource-qualified endpoint (example: */api/svm/svms/43256a71-be02-474d-a2a9-9642e12a6a2c/top-metrics/users*). Currently, resource-qualified endpoints are limited to the *Snapshots* and *File System Analytics* endpoints listed above in the description.

Retrieve the access level for a REST API path or command/command directory path for a role

GET `/security/roles/{owner.uuid}/{name}/privileges/{path}`

Introduced In: 9.6

Retrieves the access level for a REST API path or command/command directory path for the specified role. Optionally retrieves the query, if 'path' refers to a command/command directory path. The REST API path can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Parameters

Name	Type	In	Required	Description
owner.uuid	string	path	True	Role owner UUID
name	string	path	True	Role name
path	string	path	True	REST API path or command/command directory path
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	

Name	Type	Description
access	string	Access level for the REST endpoint or command/command directory path. If it denotes the access level for a command/command directory path, the only supported enum values are 'none','readonly' and 'all'.
path	string	Either of REST URI/endpoint OR command/command directory path.
query	string	Optional attribute that can be specified only if the "path" attribute refers to a command/command directory path. The privilege tuple implicitly defines a set of objects the role can or cannot access at the specified access level. The query further reduces this set of objects to a subset of objects that the role is allowed to access. The query attribute must be applicable to the command/command directory specified by the "path" attribute. It is defined using one or more parameters of the command/command directory path specified by the "path" attribute.

Example response

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "access": "all",
  "path": "volume move start",

Update the access level for a REST API path or command/command directory path

PATCH `/security/roles/{owner.uuid}/{name}/privileges/{path}`

Introduced In: 9.6

Updates the access level for a REST API path or command/command directory path. Optionally updates the query, if 'path' refers to a command/command directory path. The REST API path can be a resource-qualified endpoint. Currently, the only supported resource-qualified endpoints are the following:

Snapshots APIs

– /api/storage/volumes/{volume.uuid}/snapshots

File System Analytics APIs

– /api/storage/volumes/{volume.uuid}/files

– /api/storage/volumes/{volume.uuid}/top-metrics/clients

– /api/storage/volumes/{volume.uuid}/top-metrics/directories

– /api/storage/volumes/{volume.uuid}/top-metrics/files

– /api/storage/volumes/{volume.uuid}/top-metrics/users

– /api/svm/svms/{svm.uuid}/top-metrics/clients

– /api/svm/svms/{svm.uuid}/top-metrics/directories

– /api/svm/svms/{svm.uuid}/top-metrics/files

– /api/svm/svms/{svm.uuid}/top-metrics/users

In the above APIs, wildcard character * could be used in place of *{volume.uuid}* or *{svm.uuid}* to denote *all* volumes or *all* SVMs, depending upon whether the REST endpoint references volumes or SVMs.

Required parameters

- `owner.uuid` - UUID of the SVM that houses this role.
- `name` - Name of the role to be updated.
- `path` - Constituent REST API path or command/command directory path, whose access level and/or query are/is to be updated. Can be a resource-qualified endpoint (example: */api/storage/volumes/43256a71-be02-474d-a2a9-9642e12a6a2c/snapshots*). Currently, resource-qualified endpoints are limited to the *Snapshots* and *File System Analytics* endpoints listed above in the description.
- `access` - Access level for the path.

Optional parameters

- `query` - Optional query, if the path refers to a command/command directory path.

Manage SSH server

Security SSH endpoint overview

Overview

ONTAP supports SSH server that can be accessed from any standard SSH client. A user account needs to be associated with SSH as the application (refer the documentation for *api/security/accounts* DOC /security/accounts . Upon connecting from a client, the user is authenticated and a command line shell is presented.

This endpoint is used to retrieve or modify the SSH configuration at the cluster level. The configuration consists of SSH security parameters (security algorithms and maximum authentication retry attempts allowed before closing the connection) and SSH connection limits.

The security algorithms include SSH key exchange algorithms, ciphers for payload encryption, and MAC algorithms. This configuration is the default for all newly created SVMs; existing SVM configurations are not impacted. The SSH connection limits include maximum connections per second, maximum simultaneous sessions from the same client host, and overall maximum SSH connections at any given point in time. The connection limits are per node and will be the same for all nodes in the cluster.

Examples

Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{ "ciphers": [
"aes256_ctr", "aes192_ctr" ], "key_exchange_algorithms": [
"diffie_hellman_group_exchange_sha256", "diffie_hellman_group14_sha1" ],
"mac_algorithms": [ "hmac_sha2_512_etm", "umac_128_etm" ],
"max_authentication_retry_count": 3 }'
```

Updating the SSH connection limits

Specify the connection limits in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh" -d '{
"connections_per_second": 8, "max_instances": 10, "per_source_limit": 5 }'
```

Retrieving the cluster SSH server configuration

```
# The API:
GET "/api/security/ssh"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh"

# The response:
{
"ciphers": [
  "aes256_ctr",
  "aes192_ctr"
],
"key_exchange_algorithms": [
  "diffie_hellman_group_exchange_sha256",
  "diffie_hellman_group14_sha1"
],
"mac_algorithms": [
  "hmac_sha2_512_etm",
  "umac_128_etm"
],
"max_authentication_retry_count": 3,
"connections_per_second": 8,
"max_instances": 10,
"per_source_limit": 5,
"_links": {
  "self": {
    "href": "/api/security/ssh"
  }
}
}
```

Retrieve cluster SSH server ciphers, MAC algorithms, key exchange algorithms, and connection limits

GET `/security/ssh`

Introduced In: 9.7

Retrieves the cluster SSH server ciphers, MAC algorithms, key exchange algorithms, and connection limits.

Related ONTAP commands

- `security ssh`
- `security protocol ssh`

Response

```
Status: 200, Ok
```

Name	Type	Description

View SSH SVMs

Security SSH svms endpoint overview

Overview

This endpoint is used to retrieve the SSH security configuration for all SVMs. The configuration consists of SSH security parameters. The security algorithms include SSH key exchange algorithms, ciphers for payload encryption, MAC algorithms, and the maximum authentication retry attempts allowed before closing the connection. The SSH configuration for a newly created SVM is the same as the SSH configuration at cluster level. When the cluster SSH configuration is updated using */security/ssh* endpoint, the SSH configuration of existing SVMs is not impacted. To customize the SSH security parameters for a particular SVM, perform a PATCH operation on the *api/security/ssh/svms/{svm.uuid}* endpoint.

Example

Retrieving the SSH security configuration of all SVMs.

```
# The API:
GET "/api/security/ssh/svms"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh/svms"

# The response:
{
"num_records": 1,
"records": [
  {
    "svm": {
      "name": "svm1",
      "uuid": "02c9e252-41be-11e9-81d5-00a0986138f7",
      "_links": {
        "self": {
          "href": "/api/svm/svms/02c9e252-41be-11e9-81d5-00a0986138f7"
```

```
        }
      }
    },
    "ciphers": [
      "aes256_ctr",
      "aes192_ctr",
      "aes128_ctr"
    ],
    "key_exchange_algorithms": [
      "diffie_hellman_group_exchange_sha256",
      "diffie_hellman_group14_sha1"
    ],

Retrieve the SSH server configuration for all SVMs

GET `/security/ssh/svms`

Introduced In: 9.10

Retrieves the SSH server configuration for all the SVMs.

Related ONTAP commands

- `security ssh`

Parameters

Name	Type	In	Required	Description
mac_algorithms	string	query	False	Filter by mac_algorithms
key_exchange_algorithms	string	query	False	Filter by key_exchange_algorithms
ciphers	string	query	False	Filter by ciphers
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
max_authentication_retry_count	integer	query	False	Filter by max_authentication_retry_count • Max value: 6 • Min value: 2
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1

Name	Type	In	Required	Description
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Max value: 120 • Min value: 0 • Default value: 1
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
num_records	integer	Number of records.
records	array[svm_ssh_server]	

Example response

Manage SSH security configuration

Security SSH svms svm.uuid endpoint overview

Overview

This endpoint is used to retrieve or modify the SSH security configuration to an SVM.

The SSH security algorithms include key exchange algorithms, ciphers for payload encryption, MAC algorithms, and the maximum authentication retry attempts allowed before closing the connection. svm.uuid corresponds to the UUID of the SVM for which the SSH security setting is being retrieved or modified and it is obtained from the response body of a GET operation performed on the *api/security/ssh/svms* API.

Examples

Updating the SSH security parameters

Specify the algorithms in the body of the PATCH request.

```
# The API:
PATCH "/api/security/ssh/svms/{svm.uuid}"

# The call:
curl -X PATCH "https://<mgmt-ip>/api/security/ssh/svms/02c9e252-41be-11e9-
81d5-00a0986138f7" -d '{ "ciphers": [ "aes256_ctr", "aes192_ctr" ],
"key_exchange_algorithms": [ "diffie_hellman_group_exchange_sha256",
"diffie_hellman_group14_sha1" ], "mac_algorithms": [ "hmac_sha2_512_etm",
"umac_128_etm" ], "max_authentication_retry_count": 3 }'
```

Retrieving the SSH security configuration of an SVM

```
# The API:
GET "/api/security/ssh/svms/{svm.uuid}"

# The call:
curl -X GET "https://<mgmt-ip>/api/security/ssh/svms/02c9e252-41be-11e9-
81d5-00a0986138f7"

# The response:
{
"ciphers": [
  "aes256_ctr",
  "aes192_ctr"
],
"key_exchange_algorithms": [
  "diffie_hellman_group_exchange_sha256",
  "diffie_hellman_group14_sha1"
],
"mac_algorithms": [
  "hmac_sha2_512_etm",
  "umac_128_etm"

}
}
```

Retrieve the SSH server configuration for an SVM

GET `/security/ssh/svms/{svm.uuid}`

Introduced In: 9.10

Retrieves the SSH server configuration for the specified SVM.

Related ONTAP commands

- `security ssh`

Parameters

Name	Type	In	Required	Description
svm.uuid	string	path	True	SVM UUID
fields	array[string]	query	False	Specify the fields to return.

Response

```
Status: 200, Ok
```

Name	Type	Description
_links	_links	
ciphers	array[string]	Ciphers for encrypting the data.
key_exchange_algorithms	array[string]	Key exchange algorithms.
mac_algorithms	array[string]	MAC algorithms.
max_authentication_retry_count	integer	Maximum authentication retries allowed before closing the connection.
svm	svm	SVM name and UUID for which the SSH server is configured.

Example response

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },

Update the SSH server configuration for an SVM

PATCH `/security/ssh/svms/{svm.uuid}`

Introduced In: 9.10

Updates the SSH server configuration for the specified SVM.

Optional parameters

- `ciphers` - Encryption algorithms for the payload
- `key_exchange_algorithms` - SSH key exchange algorithms
- `mac_algorithms` - MAC algorithms
- `max_authentication_retry_count` - Maximum authentication retries allowed before closing the connection

Related ONTAP commands
