= Create an NVMe subsystem map

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/nvme/subsystem-maps`#

*Introduced In:* 9.6

```

Creates an NVMe subsystem map.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe subsystem map.
- * `namespace.uuid` or `namespace.name` - Existing NVMe namespace to map to the specified NVMe subsystem.
- * `subsystem.uuid` or `subsystem.name` - Existing NVMe subsystem to map to the specified NVMe namespace.

== Related ONTAP commands

- * `vserver nvme subsystem map create`

== Learn more

- * [xref:{relative_path}protocols_nvme_subsystem-maps_endpoint_overview.html](#)[DOC /protocols/nvme/subsystem-maps]

== Parameters

[cols=5*,options=header]
|===

Name
Type
In
Required
Description

return_records
boolean
query
False

a|The default is false. If set to true, the records are returned.

- * Default value:

= Retrieve an NVMe subsystem map

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/nvme/subsystem-maps/{subsystem.uuid}/{namespace.uuid}`#

*Introduced In:* 9.6

Retrieves an NVMe subsystem map.

== Expensive properties

There is an added cost to retrieving values for these properties. They are

```

not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `anagrpid`

== Parameters

[cols=5*,options=header]
|==

|Name
|Type
|In
|Required
|Description

|subsystem.uuid
|string
|path
|True
a|The unique identifier of the NVMe subsystem.

|namespace.uuid
|string
|path
|True
a|The unique identifier of the NVMe namespace.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

```
|===
```

```
== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|anagrpid
```

```
|string
```

```
a|The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace.
```

The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|namespace
```

```
|link:#namespace[namespace]
```

```
a|The NVMe namespace to which the NVMe subsystem is mapped. Required in POST by supplying either the UUID, name, or both.
```

```
|nsid
```

```
|string
```

```
a|The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace.
```

The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".

```
|subsystem
|link:#subsystem[subsystem]
a|The NVMe subsystem to which the NVMe namespace is mapped. Required in
POST by supplying either `subsystem.uuid`, `subsystem.name` or both.
```

```
|svm
|link:#svm[svm]
a|
```

```

```

```
= Manage NVMe subsystems
```

```
:leveloffset: +1
```

```
[[ID02f06c7c6d4ce42f950063c6106fb310]]  
= Protocols NVMe subsystems endpoint overview
```

```
== Overview
```

An NVMe subsystem maintains configuration state and namespace access control for a set of NVMe-connected hosts.

The NVMe subsystem REST API allows you to create, update, delete, and discover NVMe subsystems as well as add and remove NVMe hosts that can access the subsystem and associated namespaces.

```
== Examples
```

```
=== Creating an NVMe subsystem
```

```
----
```

```
# The API:  
POST /api/protocols/nvme/subsystems
```

```
# The call:  
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems' -H 'accept:  
application/json' -d '{ "svm": { "name": "svm1" }, "name": "subsystem1",  
"os_type": "linux" }'  
----
```

```
'''
```

```
=== Creating an NVMe subsystem with multiple NVMe subsystem hosts
```

```
----
```

```
# The API:
```

```
POST /api/protocols/nvme/subsystems
```

```
# The call:
```

```
curl -X POST 'https://<mgmt-ip>/api/protocols/nvme/subsystems' -H 'accept: application/json' -d '{ "svm": { "name": "svm1" }, "name": "subsystem2", "os_type": "vmware", "hosts": [ { "nqn": "nqn.1992-01.example.com:host1" }, { "nqn": "nqn.1992-01.example.com:host2" } ] }'
```

```

= Create an NVMe subsystem

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/nvme/subsystems`#

Introduced In: 9.6

Creates an NVMe subsystem.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe subsystem.

* `name` - Name for NVMe subsystem. Once created, an NVMe subsystem cannot be renamed.

* `os_type` - Operating system of the NVMe subsystem's hosts.

== Related ONTAP commands

* `vserver nvme subsystem create`

== Learn more

* xref:{relative_path}protocols_nvme_subsystems_endpoint_overview.html[DOC /protocols/nvme/subsystems]

== Parameters

|Description
```

```
|subsystem.uuid
```

```
|string
```

```
|path
```

```
|True
```

```
a|The unique identifier of the NVMe subsystem.
```

```
|fields
```

```
|array[string]
```

```
|query
```

```
|False
```

```
a|Specify the fields to return.
```

```
|max_records
```

```
|integer
```

```
|query
```

```
|False
```

```
a|Limit the number of records returned.
```

```
|return_records
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|The default is true for GET calls. When set to false, only the number
```

of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by
|array[string]
|query
|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

ONTAP Error Response Codes

|===

Error Code	Description
72089705	The NVMe subsystem host already exists for the NVMe subsystem.
72089771	The NQN is invalid. A non-empty qualifier is required after the prefix. An example of a valid NQN is <code>_nqn.1992-01.com.example:string_</code> .
72089772	The NQN is invalid. Add the prefix <code>_nqn_</code> . An example of a valid NQN is <code>_nqn.1992-01.com.example:string_</code> .
72089773	The NQN is invalid. The date field must be formatted <code>_yyyy-mm_</code> . An example of a valid NQN is <code>_nqn.1992-01.com.example:string_</code> .
72090002	The POST request of hosts to an NVMe subsystem can only contain an 'nqn' property or 'records' property, but not both.
72090003	The elements in the records array for a POST of hosts to an NVMe subsystem must contain only the nqn property.

= Retrieve an NVMe subsystem

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/nvme/subsystems/{uuid}`#

Introduced In: 9.6

Retrieves an NVMe subsystem.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `subsystem_maps.++`

== Related ONTAP commands

* `vserver nvme subsystem host show`

* `vserver nvme subsystem map show`

* `vserver nvme subsystem show`

== Learn more

* [xref:{relative_path}protocols_nvme_subsystems_endpoint_overview.html\[DOC /protocols/nvme/subsystems\]](#)

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|The unique identifier of the NVMe subsystem.

```

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response

```

Status: 200, Ok

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|comment
|string
a|A configurable comment for the NVMe subsystem. Optional in POST and
PATCH.

|delete_on_unmap
|boolean
a|An option that causes the subsystem to be deleted when the last
subsystem map associated with it is deleted. This property defaults to
_false_ when the subsystem is created.

|hosts
|array[link:#hosts[hosts]]
a|The NVMe hosts configured for access to the NVMe subsystem. Optional in
POST.

|io_queue
|link:#io_queue[io_queue]
a|The properties of the submission queue used to submit I/O commands for

```

execution by the NVMe controller.

|name
|string
a|The name of the NVMe subsystem. Once created, an NVMe subsystem cannot be renamed. Required in POST.

|os_type
|string
a|The host operating system of the NVMe subsystem's hosts. Required in POST.

|serial_number
|string
a|The serial number of the NVMe subsystem.

|subsystem_maps
|array[link:#subsystem_maps[subsystem_maps]]
a|The NVMe namespaces mapped to the NVMe subsystem.

There is an added cost to retrieving property values for `subsystem_maps`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|svm
|link:#svm[svm]
a|

|target_nqn
|string
a|The NVMe qualified name (NQN) used to identify the NVMe storage target.

|uuid
|string
a|The unique identifier of the NVMe subsystem.

```
= Storage namespaces endpoint overview
```

```
== Overview
```

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

The NVMe namespace REST API allows you to create, update, delete and discover NVMe namespaces.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

```
== Performance monitoring
```

Performance of an NVMe namespace can be monitored by observing the ``metric.++`` and ``statistics.++`` properties. These properties show the performance of an NVMe namespace in terms of IOPS, latency, and throughput. The ``metric.++`` properties denote an average, whereas ``statistics.++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an NVMe namespace

This example creates a 300 gigabyte NVMe namespace, with 4096-byte blocks, in SVM `_svml_`, volume `_voll_`, configured for use by `_linux_` hosts. The ``return_records`` query parameter is used to retrieve properties of the newly created NVMe namespace in the POST response.

The API:

POST /api/storage/namespaces

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/storage/namespaces?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svml" }, "os_type": "linux",  
"space": { "block_size": "4096", "size": "300G" }, "name" :  
"/vol/voll/namespacel" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "uuid": "dccc3e6-cf4e-498f-bec6-f7897f945669",  
      "svm": {  
        "uuid": "6bf967fd-2a1c-11e9-b682-005056bbc17d",  
        "name": "svml",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/6bf967fd-2a1c-11e9-b682-005056bbc17d"  
          }  
        }  
      },  
      "name": "/vol/voll/namespacel",  
      "location": {
```

```

    "namespace": "namespace1",
    "volume": {
        "uuid": "71cd0dba-2a1c-11e9-b682-005056bbc17d",
        "name": "vol1",
        "_links": {
            "self": {
                "href": "/api/storage/volumes/71cd0dba-2a1c-11e9-b682-
005056bbc17d"
            }
        }
    },
    "enabled": true,
    "os_type": "linux",
    "space": {
        "block_size": 4096,
        "size": 322122547200,
        "used": 0,
        "guarantee": {
            "requested": false,
            "reserved": false
        }
    },
    "status": {
        "container_state": "online",
        "read_only": false,
        "state": "online"
    },
    "_links": {
        "self": {

        }
    }
}
]
}
-----
'''

```

=== Updating an NVMe namespace

This example sets the `comment` property of an NVMe namespace.

```

# The API:
PATCH /api/storage/namespaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-f7897f945669' -H 'accept: application/hal+json' -d '{ "comment": "Data for the research department." }'
-----

'''

=== Retrieving NVMe namespaces

This example retrieves summary information for all online NVMe namespaces in SVM_svm1_. The `svm.name` and `status.state` query parameters are to find the desired NVMe namespaces.

-----

# The API:
GET /api/storage/namespaces

# The call:
curl -X GET 'https://<mgmt-ip>/api/storage/namespaces?svm.name=svm1&status.state=online' -H 'accept: application/hal+json'

# The response:
{
  "records": [
    {
      "uuid": "5c254d22-96a6-42ac-aad8-0cd9ebd126b6",
      "svm": {
        "name": "svm1"
      },
      "name": "/vol/vol1/namespace2",
      "status": {
        "state": "online"
      },
      "_links": {
        "self": {
          "href": "/api/storage/namespaces/5c254d22-96a6-42ac-aad8-0cd9ebd126b6"
        }
      }
    }
  ]
}

```

```

    },
    {
      "uuid": "dccdc3e6-cf4e-498f-bec6-f7897f945669",
      "svm": {
        "name": "svm1"
      },
      "name": "/vol/vol1/namespace1",
      "status": {
        "state": "online"
      },
      "_links": {
        "self": {
          "href": "/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-

'''

```

=== Retrieving details for a specific NVMe namespace

In this example, the ``fields`` query parameter is used to request all fields, including advanced fields, that would not otherwise be returned by default for the NVMe namespace.

The API:

GET /api/storage/namespaces/{uuid}

The call:

curl -X GET 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-f7897f945669?fields=**' -H 'accept: application/hal+json'

The response:

```
{
  "uuid": "dccdc3e6-cf4e-498f-bec6-f7897f945669",
  "svm": {
    "uuid": "6bf967fd-2a1c-11e9-b682-005056bbc17d",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/6bf967fd-2a1c-11e9-b682-005056bbc17d"
      }
    }
  },
  "name": "/vol/vol1/namespace1",
  "location": {
    "namespace": "namespace1",
    "volume": {
      "uuid": "71cd0dba-2a1c-11e9-b682-005056bbc17d",
      "name": "vol1",
      "_links": {
        "self": {
          "href": "/api/storage/volumes/71cd0dba-2a1c-11e9-b682-005056bbc17d"
        }

```

== Cloning NVMe namespaces

A clone of an NVMe namespace is an independent "copy" of the namespace that shares unchanged data blocks with the original. As blocks of the source and clone are modified, unique blocks are written for each. NVMe

namespace clones can be created quickly and consume very little space initially. They can be created for the purpose of back-up, or to replicate data for multiple consumers.

An NVMe namespace clone can also be set to auto-delete by setting the ``auto_delete`` property. If the namespace's volume is configured for automatic deletion, NVMe namespaces that have auto-delete enabled are deleted when a volume is nearly full to reclaim a target amount of free space in the volume.

=== Creating a new NVMe namespace clone

You create an NVMe namespace clone as you create any NVMe namespace -- a POST to

`xref:{relative_path}getting_started_with_the_ontap_rest_api.html#/NVMe/nvme_namespace_create[/storage/namespaces]`. Set ``clone.source.uuid`` or ``clone.source.name`` to identify the source NVMe namespace from which the clone is created. The NVMe namespace clone and its source must reside in the same volume.

The source NVMe namespace can reside in a Snapshot copy, in which case, the ``clone.source.name`` field must be used to identify it. Add ``/.snapshot/<snapshot_name>`` to the path after the volume name to identify the Snapshot copy. For example ``/vol/vol1/.snapshot/snap1/namespacel``.

The API:

POST /api/storage/namespaces

The call:

```
curl -X POST 'https://<mgmt-ip>/api/storage/namespaces' -H 'accept:
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name":
"/vol/vol1/namespace2clone1", "clone": { "source": { "name":
"/vol/vol1/namespace2" } } }'
```

'''

=== Over-writing an existing NVMe namespace's data as a clone of another

You can over-write an existing NVMe namespace as a clone of another. You do this as a PATCH on the NVMe namespace to overwrite -- a PATCH to `xref:{relative_path}getting_started_with_the_ontap_rest_api.html#/NVMe/nvme_namespace_modify[/storage/namespaces/{uuid}]`. Set the ``clone.source.uuid`` or ``clone.source.name`` property to identify the source NVMe namespace from which the clone data is taken. The NVMe namespace

clone and its source must reside in the same volume.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete`, `subsystem_map`, `status.state`, and `uuid`.

The API:

PATCH /api/storage/namespaces/{uuid}

The call:

```
curl -X PATCH 'https://<mgmt-ip>/api/storage/namespaces/dccdc3e6-cf4e-498f-bec6-f7897f945669' -H 'accept: application/hal+json' -d '{ "clone": { "source": { "name": "/vol/vol1/namespace2" } } }'
```

'''

== Deleting an NVMe namespace

The API:

DELETE /api/storage/namespaces/{uuid}

The call:

```
curl -X DELETE 'https://<mgmt-ip>/api/storage/namespaces/5c254d22-96a6-42ac-aad8-0cd9ebd126b6' -H 'accept: application/hal+json'
```

= Retrieve NVMe namespaces

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/storage/namespaces`#

Introduced In: 9.6

Retrieves NVMe namespaces.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

- * `auto_delete`
- * `subsystem_map.+++`
- * `status.mapped`
- * `statistics.+++`
- * `metric.+++`

== Related ONTAP commands

- * `vserver nvme namespace show`
- * `vserver nvme subsystem map show`

|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1
* Max value: 120
* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

[#source]
[.api-collapsible-fifth-title]
source

```

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

```

[#clone]
[.api-collapsible-fifth-title]
clone

```

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a

namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`,
`status.state`, and `uuid`.

```
[#qtree]
[.api-collapsible-fifth-title]
qtree
```

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or
`location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

```

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized

```

failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#guarantee]

[.api-collapsible-fifth-title]

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|requested

|boolean

a|The requested space reservation policy for the NVMe namespace. If `_true_`, a space reservation is requested for the namespace; if `_false_`, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.

The space reservation policy for an NVMe namespace is determined by ONTAP.

* readOnly: 1
* Introduced in: 9.6

|reserved
|boolean
a|Reports if the NVMe namespace is space guaranteed.

This property is `_true_` if a space guarantee is requested and the containing volume and aggregate support the request. This property is `_false_` if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.

|===

[#space]
[.api-collapsible-fifth-title]
space

The storage space related properties of the NVMe namespace.

[cols=3*,options=header]

|===

|Name
|Type
|Description

|block_size
|integer

a|The size of blocks in the namespace in bytes.

Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.

Valid in POST.

|guarantee
|link:#guarantee[guarantee]

a|Properties that request and report the space guarantee for the NVMe namespace.

```
|size
|integer
a|The total provisioned size of the NVMe namespace.
```

NVMe namespaces do not support resize.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

```
* example: 1073741824
* Max value: 140737488355328
* Min value: 4096
* Introduced in: 9.6
* readCreate: 1
```

```
|used
|integer
a|The amount of space consumed by the main data stream of the NVMe
namespace.
```

This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

```
* readOnly: 1
* Introduced in: 9.6
```

|===
```

```
[#nvme_namespace]
[.api-collapsible-fifth-title]
nvme_namespace
```

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|auto_delete
```

```
|boolean
```

```
a|This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.
```

When set to `_true_`, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new NVMe namespace is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|comment
|string
a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time
|string
a|The time the NVMe namespace was created.

|enabled
|boolean
a|The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the `state` property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

|location
|link:#location[location]
a|The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

* Introduced in: 9.6
* readCreate: 1

|metric

[[IDc3d00bb002acfffae970a0f4c8b6cf3d]]
= Create an NVMe namespace
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/storage/namespaces`#
```

Introduced In: 9.6

Creates an NVMe namespace.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create the NVMe namespace.
- * `name`, `location.volume.name` or `location.volume.uuid` - Existing volume in which to create the NVMe namespace.
- * `name` or `location.namespace` - Base name for the NVMe namespace.
- * `os_type` - Operating system from which the NVMe namespace will be accessed. (Not used for clones, which are created based on the `os_type` of the source NVMe namespace.)
- * `space.size` - Size for the NVMe namespace. (Not used for clones, which are created based on the size of the source NVMe namespace.)

== Default property values

If not specified in POST, the following default property values are assigned:

- * `auto_delete` - `__false__`
- * `space.block_size` - `__4096__`

== Related ONTAP commands

```
* `volume file clone autodelete`  
* `volume file clone create`  
* `vserver nvme namespace create`
```

== Learn more

```

/storage/namespaces]
```

== Parameters

```
[cols=5*,options=header]  
|===
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|return_records  
|boolean  
|query  
|False
```

```
a|The default is false. If set to true, the records are returned.
```

```
* Default value:
```

```
|===
```

== Request Body

```
[cols=3*,options=header]  
|===  
|Name  
|Type  
|Description
```

```
|auto_delete  
|boolean
```

```
a|This property marks the NVMe namespace for auto deletion when the volume  
containing the namespace runs out of space. This is most commonly set on  
namespace clones.
```

When set to `_true_`, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new NVMe namespace is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|clone

|link:#clone[clone]

a|This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:
``auto_delete`` (unless specified in the request), ``subsystem_map``, ``status.state``, and ``uuid``.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the NVMe namespace was created.

|enabled

|boolean

a|The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the ``state`` property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

|location
|link:#location[location]
a|The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

* Introduced in: 9.6
* readCreate: 1

|name
|string
a|The fully qualified path name of the NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

|os_type
|string
a|The operating system type of the NVMe namespace.

Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.

|space
|link:#space[space]
a|The storage space related properties of the NVMe namespace.

|status
|link:#status[status]
a|Status information about the NVMe namespace.

|subsystem_map
|link:#subsystem_map[subsystem_map]
a|The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|The unique identifier of the NVMe namespace.

```
|Name
```

```
|Type
```

```
|Description
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#guarantee]

guarantee
```

Properties that request and report the space guarantee for the NVMe namespace.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|requested
```

```
|boolean
```

a|The requested space reservation policy for the NVMe namespace. If `_true_`, a space reservation is requested for the namespace; if `_false_`, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.

The space reservation policy for an NVMe namespace is determined by ONTAP.

* readOnly: 1

* Introduced in: 9.6

```
|reserved
```

```
|boolean
```

a|Reports if the NVMe namespace is space guaranteed.

This property is `_true_` if a space guarantee is requested and the containing volume and aggregate support the request. This property is `_false_` if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.

```

|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|block_size
|integer
a|The size of blocks in the namespace in bytes.
```

Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.

Valid in POST.

```
|guarantee
|link:#guarantee[guarantee]
a|Properties that request and report the space guarantee for the NVMe namespace.
```

```
|size
|integer
a|The total provisioned size of the NVMe namespace.
```

NVMe namespaces do not support resize.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

```
* example: 1073741824
* Max value: 140737488355328
* Min value: 4096
* Introduced in: 9.6
* readCreate: 1
```

```
|used
|integer
a|The amount of space consumed by the main data stream of the NVMe namespace.
```

This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe

filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

- * readOnly: 1
- * Introduced in: 9.6

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp
|string
a|The timestamp of the performance data.

[#status]
[.api-collapsible-fifth-title]

status

Status information about the NVMe namespace.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|container_state

|string

a|The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.

|mapped

|boolean

a|Reports if the NVMe namespace is mapped to an NVMe subsystem.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|read_only

|boolean

a|Reports if the NVMe namespace allows only read access.

|state

|string

a|The state of the NVMe namespace. Normal states for a namespace are `_online_` and `_offline_`. Other states indicate errors.

|===

[#subsystem]

[.api-collapsible-fifth-title]

subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

```

|string

a|The name of the SVM.

|uuid

|string

a|The unique identifier of the SVM.

|===

[#nvme_namespace]

[.api-collapsible-fifth-title]

nvme_namespace

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed, resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|auto_delete
```

```
|boolean
```

```
a|This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.
```

When set to `_true_`, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new NVMe namespace is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|clone
|link:#clone[clone]
a|This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`,
`status.state`, and `uuid`.

|comment
|string
a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time
|string
a|The time the NVMe namespace was created.

|enabled
|boolean
a|The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the `state` property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

|location
|link:#location[location]
a|The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

* Introduced in: 9.6
* readCreate: 1

|name
|string

a|The fully qualified path name of the NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

|os_type

|string

a|The operating system type of the NVMe namespace.

Required in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.

|space

|link:#space[space]

a|The storage space related properties of the NVMe namespace.

|status

|link:#status[status]

a|Status information about the NVMe namespace.

|subsystem_map

|link:#subsystem_map[subsystem_map]

a|The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the NVMe namespace.

[#source]
[.api-collapsible-fifth-title]
source

```

The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

```
[#clone]
[.api-collapsible-fifth-title]
clone
```

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`,
`status.state`, and `uuid`.

```
[#qtree]
[.api-collapsible-fifth-title]
qtree
```

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or
`location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

```

|link:#_links[_links]
a|

|id
|integer
```

a|The identifier for the qtree, unique within the qtree's volume.

|name

|string

a|The name of the qtree.

|===

[#volume]

[.api-collapsible-fifth-title]

volume

The volume in which the NVMe namespace is located. Valid in POST.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|name

|string

a|The name of the volume.

|uuid

|string

a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7

* Introduced in: 9.6

|===

[#location]
[.api-collapsible-fifth-title]
location

The location of the NVMe namespace within the ONTAP cluster. Valid in POST.

NVMe namespaces do not support rename, or movement between volumes.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|namespace
|string
a|The base name component of the NVMe namespace. Valid in POST.

If properties `name` and `location.namespace` are specified in the same request, they must refer to the base name.

NVMe namespaces do not support rename.

|qtree
|link:#qtree[qtree]
a|The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

|volume
|link:#volume[volume]
a|The volume in which the NVMe namespace is located. Valid in POST.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

|===

[#iops]
[.api-collapsible-fifth-title]
iops

The rate of I/O operations observed at the storage object.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|other

|integer

a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

|read

|integer

a|Performance metric for read I/O operations.

|total

|integer

a|Performance metric aggregated over all types of I/O operations.

|write

|integer

a|Performance metric for write I/O operations.

|===

```
[#latency]
[.api-collapsible-fifth-title]
latency
```

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#throughput]
[.api-collapsible-fifth-title]
throughput
```

The rate of throughput bytes per second observed at the storage object.

```
[cols=3*,options=header]
|===
|Name
```

```
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#metric]
[.api-collapsible-fifth-title]
metric
```

Performance numbers, such as IOPS latency and throughput

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

```
|iops
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#guarantee]

[.api-collapsible-fifth-title]

guarantee

Properties that request and report the space guarantee for the NVMe namespace.

[cols=3*,options=header]

|===

|Name

```

|Type
|Description

|requested
|boolean
a|The requested space reservation policy for the NVMe namespace. If
_true_, a space reservation is requested for the namespace; if _false_,
the namespace is thin provisioned. Guaranteeing a space reservation
request for a namespace requires that the volume in which the namespace
resides also be space reserved and that the fractional reserve for the
volume be 100%.

The space reservation policy for an NVMe namespace is determined by ONTAP.

* readOnly: 1
* Introduced in: 9.6

|reserved
|boolean
a|Reports if the NVMe namespace is space guaranteed.

This property is _true_ if a space guarantee is requested and the
containing volume and aggregate support the request. This property is
_false_ if a space guarantee is not requested or if a space guarantee is
requested and either the containing volume and aggregate do not support
the request.

|===

[#space]
[.api-collapsible-fifth-title]
space

The storage space related properties of the NVMe namespace.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|block_size
|integer

```

a|The size of blocks in the namespace in bytes.

Valid in POST when creating an NVMe namespace that is not a clone of another. Disallowed in POST when creating a namespace clone.

Valid in POST.

|guarantee

|link:#guarantee[guarantee]

a|Properties that request and report the space guarantee for the NVMe namespace.

|size

|integer

a|The total provisioned size of the NVMe namespace.

NVMe namespaces do not support resize.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The maximum size is variable with respect to large NVMe namespace support in ONTAP. If large namespaces are supported, the maximum size is 128 TB (140737488355328 bytes) and if not supported, the maximum size is just under 16 TB (17557557870592 bytes). The minimum size supported is always 4096 bytes.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* example: 1073741824

* Max value: 140737488355328

* Min value: 4096

* Introduced in: 9.6

* readCreate: 1

|used

|integer

a|The amount of space consumed by the main data stream of the NVMe namespace.

This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge

of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* readOnly: 1
* Introduced in: 9.6

[[ID32a671f57454887f0695e4f5a6f76a71]]
= Update an NVMe namespace

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/storage/namespaces/{uuid}`#

*Introduced In:* 9.6

Updates an NVMe namespace.

== Related ONTAP commands

* `volume file clone autodelete`
* `vserver nvme namespace modify`

== Learn more

* xref:{relative_path}storage_namespaces_endpoint_overview.html[DOC
/storage/namespaces]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type

```

```
| In
| Required
| Description
```

```
| uuid
| string
| path
| True
```

a|The unique identifier of the NVMe namespace to update.

```
|===
```

== Request Body

```
[cols=3*,options=header]
```

```
|===
```

```
| Name
| Type
| Description
```

```
| auto_delete
| boolean
```

a|This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.

When set to `_true_`, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new NVMe namespace is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
| clone
| link:#clone[clone]
```

a|This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing

namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`, `status.state`, and `uuid`.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the NVMe namespace was created.

|enabled

|boolean

a|The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the `state` property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

|status

|link:#status[status]

a|Status information about the NVMe namespace.

|subsystem_map

|link:#subsystem_map[subsystem_map]

a|The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|svm

```

|link:#svm[svm]
a|

|uuid
|string
a|The unique identifier of the NVMe namespace.

```
|Description
```

|name
|string
a|The fully qualified path name of the clone source NVMe namespace composed of a "/vol" prefix, the volume name, the (optional) qtree name and base name of the namespace. Valid in POST and PATCH.

|uuid
|string
a|The unique identifier of the clone source NVMe namespace. Valid in POST and PATCH.

|===

[#clone]
[.api-collapsible-fifth-title]
clone

This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`,
`status.state`, and `uuid`.

[cols=3*,options=header]

|===

|Name
|Type
|Description

|source

|link:#source[source]

a|The source NVMe namespace for a namespace clone operation. This can be specified using property `clone.source.uuid` or `clone.source.name`. If both properties are supplied, they must refer to the same namespace.

Valid in POST to create a new NVMe namespace as a clone of the source.

Valid in PATCH to overwrite an existing NVMe namespace's data as a clone of another.

|===

```
[#qtree]
[.api-collapsible-fifth-title]
qtree
```

The qtree in which the NVMe namespace is optionally located. Valid in POST.

If properties ``name`` and ``location.qtree.name`` and/or ``location.qtree.uuid`` are specified in the same request, they must refer to the same qtree.

NVMe namespaces do not support rename.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|id
|integer
a|The identifier for the qtree, unique within the qtree's volume.
```

```
|name
|string
a|The name of the qtree.
```

|===

```
[#volume]
[.api-collapsible-fifth-title]
volume
```

The volume in which the NVMe namespace is located. Valid in POST.

If properties ``name`` and ``location.volume.name`` and/or

`location.volume.uuid` are specified in the same request, they must refer to the same volume.

NVMe namespaces do not support movement between volumes.

```

metric
```

Performance numbers, such as IOPS latency and throughput

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#guarantee]
[.api-collapsible-fifth-title]
guarantee
```

Properties that request and report the space guarantee for the NVMe namespace.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|requested
|boolean
```

a|The requested space reservation policy for the NVMe namespace. If `_true_`, a space reservation is requested for the namespace; if `_false_`, the namespace is thin provisioned. Guaranteeing a space reservation request for a namespace requires that the volume in which the namespace resides also be space reserved and that the fractional reserve for the volume be 100%.

The space reservation policy for an NVMe namespace is determined by ONTAP.

```
* readOnly: 1
* Introduced in: 9.6
```

```
|reserved
|boolean
a|Reports if the NVMe namespace is space guaranteed.
```

This property is `_true_` if a space guarantee is requested and the containing volume and aggregate support the request. This property is `_false_` if a space guarantee is not requested or if a space guarantee is requested and either the containing volume and aggregate do not support the request.

|===

[#space]

[.api-collapsible-fifth-title]

space

The storage space related properties of the NVMe namespace.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|guarantee

|link:#guarantee[guarantee]

a|Properties that request and report the space guarantee for the NVMe namespace.

|used

|integer

a|The amount of space consumed by the main data stream of the NVMe namespace.

This value is the total space consumed in the volume by the NVMe namespace, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways NVMe filesystems and applications utilize blocks within a namespace, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the namespace blocks are utilized outside of ONTAP, this property should not be used and an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* readOnly: 1

* Introduced in: 9.6

|===

[#status]

[.api-collapsible-fifth-title]

status

Status information about the NVMe namespace.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|container_state
|string
a|The state of the volume and aggregate that contain the NVMe namespace. Namespaces are only available when their containers are available.

|mapped
|boolean
a|Reports if the NVMe namespace is mapped to an NVMe subsystem.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|read_only
|boolean
a|Reports if the NVMe namespace allows only read access.

|state
|string
a|The state of the NVMe namespace. Normal states for a namespace are `_online_` and `_offline_`. Other states indicate errors.

|===

[#subsystem]
[.api-collapsible-fifth-title]
subsystem

The NVMe subsystem to which the NVMe namespace is mapped.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string

a|The name of the NVMe subsystem.

|uuid

|string

a|The unique identifier of the NVMe subsystem.

|===

[#subsystem_map]

[.api-collapsible-fifth-title]

subsystem_map

The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|anagrpid

|string

a|The Asymmetric Namespace Access Group ID (ANAGRPID) of the NVMe namespace.

The format for an ANAGRPID is 8 hexadecimal digits (zero-filled) followed by a lower case "h".

|nsid

|string

a|The NVMe namespace identifier. This is an identifier used by an NVMe controller to provide access to the NVMe namespace.

The format for an NVMe namespace identifier is 8 hexadecimal digits (zero-filled) followed by a lower case "h".

```
|subsystem
|link:#subsystem[subsystem]
a|The NVMe subsystem to which the NVMe namespace is mapped.
```

```

```

```
[#svm]
[.api-collapsible-fifth-title]
svm
```

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|name
|string
a|The name of the SVM.
```

```
|uuid
|string
a|The unique identifier of the SVM.
```

```
|===
```

```
[#nvme_namespace]
[.api-collapsible-fifth-title]
nvme_namespace
```

An NVMe namespace is a collection of addressable logical blocks presented to hosts connected to the storage virtual machine using the NVMe over Fabrics protocol.

In ONTAP, an NVMe namespace is located within a volume. Optionally, it can be located within a qtree in a volume.

An NVMe namespace is created to a specified size using thin or thick provisioning as determined by the volume on which it is created. NVMe namespaces support being cloned. An NVMe namespace cannot be renamed,

resized, or moved to a different volume. NVMe namespaces do not support the assignment of a QoS policy for performance management, but a QoS policy can be assigned to the volume containing the namespace. See the NVMe namespace object model to learn more about each of the properties supported by the NVMe namespace REST API.

An NVMe namespace must be mapped to an NVMe subsystem to grant access to the subsystem's hosts. Hosts can then access the NVMe namespace and perform I/O using the NVMe over Fabrics protocol.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|auto_delete
```

```
|boolean
```

a|This property marks the NVMe namespace for auto deletion when the volume containing the namespace runs out of space. This is most commonly set on namespace clones.

When set to `_true_`, the NVMe namespace becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the namespace is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new NVMe namespace is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|clone
```

```
|link:#clone[clone]
```

a|This sub-object is used in POST to create a new NVMe namespace as a clone of an existing namespace, or PATCH to overwrite an existing namespace as a clone of another. Setting a property in this sub-object indicates that a namespace clone is desired.

When used in a PATCH, the patched NVMe namespace's data is over-written as a clone of the source and the following properties are preserved from the

patched namespace unless otherwise specified as part of the PATCH:

`auto_delete` (unless specified in the request), `subsystem_map`,
`status.state`, and `uuid`.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the NVMe namespace was created.

|enabled

|boolean

a|The enabled state of the NVMe namespace. Certain error conditions cause the namespace to become disabled. If the namespace is disabled, you can check the `state` property to determine what error disabled the namespace. An NVMe namespace is enabled automatically when it is created.

|status

|link:#status[status]

a|Status information about the NVMe namespace.

|subsystem_map

|link:#subsystem_map[subsystem_map]

a|The NVMe subsystem with which the NVMe namespace is associated. A namespace can be mapped to zero (0) or one (1) subsystems.

There is an added cost to retrieving property values for `subsystem_map`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the NVMe namespace.

|False
a|Filter by timestamp
```

```
|throughput.total
|integer
|query
|False
a|Filter by throughput.total
```

```
|throughput.read
|integer
|query
|False
a|Filter by throughput.read
```

```
|throughput.other
|integer
|query
|False
a|Filter by throughput.other
```

```
|throughput.write
|integer
|query
|False
a|Filter by throughput.write
```

```
|latency.total
|integer
|query
|False
a|Filter by latency.total
```

```
|latency.read
|integer
|query
```

```
|False  
a|Filter by latency.read
```

```
|latency.other  
|integer  
|query  
|False  
a|Filter by latency.other
```

```
|latency.write  
|integer  
|query  
|False  
a|Filter by latency.write
```

```
|status  
|string  
|query  
|False  
a|Filter by status
```

```
|iops.total  
|integer  
|query  
|False  
a|Filter by iops.total
```

```
|iops.read  
|integer  
|query  
|False  
a|Filter by iops.read
```

```
|iops.other  
|integer  
|query  
|False  
a|Filter by iops.other
```

```
|iops.write
```

```
|integer
|query
|False
a|Filter by iops.write
```

```
|uuid
|string
|path
|True
a|Unique identifier of the NVMe namespace.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

```
* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|fields
|array[string]
|query
|False
```

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|string
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

= Name-services overview
```

```
== Overview
```

ONTAP uses name-services to obtain information about users and clients. This information is used to authenticate users accessing data on or administering the storage system, and to map user credentials in a mixed environment. If the user database is stored in NIS or LDAP servers, NIS and LDAP name services need to be configured in ONTAP. DNS is used for resolving the hostnames. ns-switch is used to configure the SVMs with sources to search for network information and the order in which to search them.

= Name-services dns endpoint overview

== Overview

Displays DNS information and controls the DNS subsystem. DNS domain name and DNS servers are required parameters.

== Retrieving DNS information

The DNS GET endpoint retrieves all of the DNS configurations for data SVMs.

DNS configuration for the cluster is retrieved via
xref:{relative_path}cluster-endpoint-overview.html[/api/cluster] .

== Examples

=== Retrieving all of the fields for all of the DNS configurations

The API:

/api/name-services/dns

The call:

```
curl -X GET "https://<mgmt-ip>/api/name-services/dns?fields=*" -H "accept: application/hal+json"
```

The response:

```
{
  "records": [
    {
      "svm": {
        "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
        "name": "vs1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
          }
        }
      },
      "domains": [
        "domainA.example.com"
      ],
      "servers": [

    }
  ]
}
-----

=== Retrieving the DNS configuration for a specific SVM

-----

```

```

# The API:
/api/name-services/dns/{svm.uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/hal+json"

# The response:
{
  "svm": {
    "uuid": "179d3c85-7053-11e8-b9b8-005056b41bd1",
    "name": "vs1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/179d3c85-7053-11e8-b9b8-005056b41bd1"
      }
    }
  },
  "domains": [
    "domainA.example.com"
  ],
  "servers": [
    "10.10.10.10"
  ],
  "_links": {
    "self": {
      "href": "/api/name-services/dns/179d3c85-7053-11e8-b9b8-005056b41bd1"
    }
  }
}
-----

== Creating a DNS configuration

The DNS POST endpoint creates a DNS configuration for the specified SVM.

== Example

The following example shows a POST operation:

-----

# The API:
/api/name-services/dns

# The call:

```

```
curl -X POST "https://<mgmt-ip>/api/name-services/dns" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": { \"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domains\": [ \"domainA.example.com\" ], \"servers\": [ \"10.10.10.10\" ] }"
```

== Updating a DNS configuration

The DNS PATCH endpoint updates the DNS configuration for the specified SVM.

== Examples

=== Updating both the DNS domains and servers

The API:

/api/name-services/dns/{svm.uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"domains\": [ \"domainA.example.com\", \"domainB.example.com\" ], \"servers\": [ \"10.10.10.10\", \"10.10.10.11\" ] }"
```

=== Updating the DNS servers only

The API:

/api/name-services/dns/{svm.uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"servers\": [ \"10.10.10.10\" ] }"
```

== Deleting a DNS configuration

The DNS DELETE endpoint deletes the DNS configuration for the specified SVM.

== Example

The following example shows a DELETE operation.

The API:

/api/name-services/dns/{svm.uuid}

The call:

curl -X DELETE "https://<mgmt-ip>/api/name-services/dns/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"

[[IDb47036b61ff81609c645df8fb2fab231]]

= Retrieve DNS configurations for all SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/name-services/dns`#

Introduced In: 9.6

Retrieves the DNS configurations of all data SVMs.

DNS configuration for the cluster is retrieved and managed via
xref:{relative_path}cluster-endpoint-overview.html[/api/cluster] .

== Related ONTAP commands

* `vserver services name-service dns show`
* `vserver services name-service dns check`

== Learn more

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

```
|In
|Required
|Description

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|servers
|string
|query
|False
a|Filter by servers

|domains
|string
|query
|False
a|Filter by domains

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
```

```

|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create DNS domain and server configurations

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/name-services/dns`#

Introduced In: 9.6

Creates DNS domain and server configurations for an SVM.

== Important notes

- * Each SVM can have only one DNS configuration.
- * The domain name and the servers fields cannot be empty.
- * IPv6 must be enabled if IPv6 family addresses are specified in the `servers` field.
- * Configuring more than one DNS server is recommended to avoid a single point of failure.
- * The DNS server specified using the `servers` field is validated during this operation.

The validation fails in the following scenarios:

- . The server is not a DNS server.
- . The server does not exist.
- . The server is unreachable.

== Parameters

[cols=5*,options=header]

|====

|Name

|Type

|In

|Required

|Description

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

= Update DNS domain and server configurations

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/name-services/dns/{svm.uuid}`#

*Introduced In:* 9.6

Updates DNS domain and server configurations of an SVM.

```

== Important notes

- * Both DNS domains and servers can be modified.
- * The domains and servers fields cannot be empty.
- * IPv6 must be enabled if IPv6 family addresses are specified for the `servers` field.
- * The DNS server specified using the `servers` field is validated during this operation.

The validation fails in the following scenarios:

- . The server is not a DNS server.
- . The server does not exist.
- . The server is unreachable.

== Parameters

= Manage LDAP server configurations

```

```

:leveloffset: +1

```

```

[[ID8fc141bfae68776b944b05401616f551]]
= Name-services LDAP endpoint overview

```

```

== Overview

```

LDAP servers are used to centrally maintain user information. LDAP configurations must be set up to lookup information stored in the LDAP directory on the external LDAP servers. This API is used to retrieve and manage LDAP server configurations.

```

== Retrieving LDAP information

```

The LDAP GET endpoint retrieves all of the LDAP configurations in the cluster.

== Examples

=== Retrieving all of the fields for all LDAP configurations

'''

The API:

/api/name-services/ldap

The call:

```
curl -X GET "https://<mgmt-ip>/api/name-services/ldap?fields=*" -H
"accept: application/hal+json"
```

The response:

```

/api/name-services/ldap

The call:
curl -X POST "https://<mgmt-ip>/api/name-services/ldap" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"svm\": { \"name\": \"vs2\" }, \"servers\": [\"11.11.11.11\"], \"port\": 389, \"bind_dn\": \"cn=Administrators,cn=users,dc=domainA,dc=example,dc=com\", \"bind_password\": \"abc\", \"base_dn\": \"dc=domainA,dc=example,dc=com\", \"session_security\": \"none\"}"

'''

== Updating an LDAP configuration

The LDAP PATCH endpoint updates the LDAP configuration for the specified SVM. The following example shows a PATCH operation:

The API:
/api/name-services/ldap/{svm.uuid}

The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/ldap/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type: application/json" -d "{ \"servers\": [\"55.55.55.55\"], \"schema\": \"ad_idmu\", \"port\": 636, \"use_start_tls\": false }"

'''

== Deleting an LDAP configuration

The LDAP DELETE endpoint deletes the LDAP configuration for the specified SVM. The following example shows a DELETE operation:

The API:

/api/name-services/ldap/{svm.uuid}

The call:

curl -X DELETE "https://<mgmt-ip>/api/name-services/ldap/179d3c85-7053-11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"

'''

|==

|Name

|Type

|In

|Required

|Description

|schema

|string

|query

|False

a|Filter by schema

* Introduced in: 9.7

```
|session_security
|string
|query
|False
a|Filter by session_security
```

* Introduced in: 9.7

```
|base_dn
|string
|query
|False
a|Filter by base_dn
```

* Introduced in: 9.7

```
|svm.uuid
|string
|query
|False
a|Filter by svm.uuid
```

* Introduced in: 9.7

```
|svm.name
|string
|query
|False
a|Filter by svm.name
```

* Introduced in: 9.7

```
|port
|integer
|query
|False
a|Filter by port
```

* Introduced in: 9.7

```
|min_bind_level
```

```
|string
|query
|False
a|Filter by min_bind_level
```

* Introduced in: 9.7

```
|use_start_tls
|boolean
|query
|False
a|Filter by use_start_tls
```

* Introduced in: 9.7

```
|preferred_ad_servers
|string
|query
|False
a|Filter by preferred_ad_servers
```

* Introduced in: 9.7

```
|servers
|string
|query
|False
a|Filter by servers
```

* Introduced in: 9.7

```
|base_scope
|string
|query
|False
a|Filter by base_scope
```

* Introduced in: 9.7

```
|bind_dn
|string
|query
```

```

|False
a|Filter by bind_dn

* Introduced in: 9.7

|ad_domain
|string
|query
|False
a|Filter by ad_domain

* Introduced in: 9.7

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

[[ID00e197cebc7cd006fc6ce75868291920]]
= Create an LDAP configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/name-services/ldap`#

```

Introduced In: 9.6

Creates an LDAP configuration for an SVM.

== Important notes

- * Each SVM can have one LDAP configuration.
- * The LDAP servers and Active Directory domain are mutually exclusive fields. These fields cannot be empty. At any point in time, either the LDAP servers or Active Directory domain must be populated.
- * LDAP configuration with Active Directory domain cannot be created on an admin SVM.
- * IPv6 must be enabled if IPv6 family addresses are specified.

=== The following parameters are optional:

- * preferred AD servers
- * schema
- * port
- * min_bind_level
- * bind_password
- * base_scope
- * use_start_tls
- * session_security

Configuring more than one LDAP server is recommended to avoid a single point of failure.

Both FQDNs and IP addresses are supported for the "servers" field.

The Active Directory domain or LDAP servers are validated as part of this operation.

LDAP validation fails in the following scenarios:

- . The server does not have LDAP installed.
- . The server or Active Directory domain is invalid.
- . The server or Active Directory domain is unreachable.

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

```

|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false.  If set to true, the records are returned.

* Default value:

a|This parameter specifies the name of the Active Directory domain
used to discover LDAP servers for use by this client.
This is mutually exclusive with `servers` during POST and PATCH.

|base_dn
|string
a|Specifies the default base DN for all searches.

|base_scope
|string
a|Specifies the default search scope for LDAP queries:

* base - search the named entry only
* onelevel - search all entries immediately below the DN
* subtree - search the named DN entry and the entire subtree below the DN

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers.

|min_bind_level
|string
a|The minimum bind authentication level. Possible values are:

* anonymous - anonymous bind
* simple - simple bind
* sasl - Simple Authentication and Security Layer (SASL) bind

|port
|integer
a|The port used to connect to the LDAP Servers.

```

```

|preferred_ad_servers
|array[string]
a|

|schema
|string
a|The name of the schema template used by the SVM.

* AD-IDMU - Active Directory Identity Management for UNIX
* AD-SFU - Active Directory Services for UNIX
* MS-AD-BIS - Active Directory Identity Management for UNIX
* RFC-2307 - Schema based on RFC 2307
* Custom schema

|servers
|array[string]
a|

|session_security
|string
a|Specifies the level of security to be used for LDAP communications:

* none - no signing or sealing
* sign - sign LDAP traffic
* seal - seal and sign LDAP traffic

|svm
|link:#svm[svm]
a|

|use_start_tls
|boolean
a|Specifies whether or not to use Start TLS over LDAP connections.

= Update the LDAP configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/name-services/ldap/{svm.uuid}`#

Introduced In: 9.6

Updates an LDAP configuration of an SVM.

== Important notes

* Both mandatory and optional parameters of the LDAP configuration can be updated.

* The LDAP servers and Active Directory domain are mutually exclusive fields. These fields cannot be empty. At any point in time, either the LDAP servers or Active Directory domain must be populated.

* IPv6 must be enabled if IPv6 family addresses are specified.

Configuring more than one LDAP server is recommended to avoid a single point of failure.

Both FQDNs and IP addresses are supported for the "servers" field.

The Active Directory domain or LDAP servers are validated as part of this operation.

LDAP validation fails in the following scenarios:

- . The server does not have LDAP installed.
- . The server or Active Directory domain is invalid.
- . The server or Active Directory domain is unreachable

Status: Default

ONTAP Error Response Codes

|===

| Error Code | Description

| 262186

| LDAP Servers cannot be used with Active Directory domain and/or preferred Active Directory servers

| 2621488

| Invalid SVM context

| 2621706

| The specified SVM UUID is incorrect for the specified SVM name

| 4915203

| The specified LDAP schema does not exist

| 4915208

| The specified LDAP servers or preferred Active Directory servers contain duplicate server entries

| 4915229

| DNS resolution failed due to an internal error. Contact technical support if this issue persists

| 4915231

| DNS resolution failed for one or more of the specified LDAP servers. Verify that a valid DNS server is configured

| 23724132

| DNS resolution failed for all the specified LDAP servers. Verify that a valid DNS server is configured

| 4915234

| The specified LDAP server or preferred Active Directory server is not supported because it is one of the following: multicast, loopback, 0.0.0.0, or broadcast

| 4915248

| LDAP servers cannot be empty or "-". Specified Active Directory domain

is invalid because it is empty or "-" or it contains either the special characters or "-" at the start or end of the domain.

| 4915251
| STARTTLS and LDAPS cannot be used together

| 4915257
| The LDAP configuration is invalid. Verify that the distinguished names and bind password are correct

| 4915258
| The LDAP configuration is invalid. Verify that the Active Directory domain or servers are reachable and that the network configuration is correct

| 4915259
| LDAP configurations with Active Directory domains are not supported on admin SVM.

| 23724130
| Cannot use an IPv6 name server address because there are no IPv6 LIFs

:leveloffset: -1

= Manage name mappings for SVMs

```

```
:leveloffset: +1
```

```
[[IDdd25b9cb894204cf153f6938eb160dfc]]  
= Name-services name-mappings endpoint overview
```

== Overview

Name mapping is used to map CIFS identities to UNIX identities, Kerberos identities to UNIX identities, and UNIX identities to CIFS identities. It needs this information to obtain user credentials and provide proper file access regardless of whether they are connecting from an NFS client or a CIFS client.

The system keeps a set of conversion rules for each Storage Virtual Machine (SVM). Each rule consists of two pieces: a pattern and a replacement. Conversions start at the beginning of the appropriate list and perform a substitution based on the first matching rule. The pattern is a UNIX-style regular expression. The replacement is a string containing escape sequences representing subexpressions from the pattern, as in the UNIX sed program.

Name mappings are applied in the order in which they occur in the priority list; for example, a name mapping that occurs at position 2 in the priority list is applied before a name mapping that occurs at position 3. Each mapping direction (Kerberos-to-UNIX, Windows-to-UNIX, and UNIX-to-Windows) has its own priority list. You are prevented from creating two name mappings with the same pattern.

== Examples

=== Creating a name-mapping with client_match as the ip-address

Use the following API to create a name-mapping. Note the `_return_records=true_` query parameter is used to obtain the newly created entry in the response.

The API:

```
POST /api//name-services/name-mappings
```

The call:

```
curl -X POST "https://<mgmt-ip>/api/name-services/name-  
mappings?return_records=true" -H "accept: application/json" -H "Content-
```

```
Type: application/json" -d "{ \"client_match\": \"10.254.101.111/28\",
\"direction\": \"win_unix\", \"index\": 1, \"pattern\":
\"ENGCIIFS_AD_USER\", \"replacement\": \"unix_user1\", \"svm\": { \"name\":
\"vs1\", \"uuid\": \"f71d3640-0226-11e9-8526-000c290a8c4b\" }}"
```

The response:

```
{
  "num_records": 1,
  "records": [
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 1,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "10.254.101.111/28"
    }
  ]
}
```

=== Creating a name-mapping with client_match as the hostname

Use the following API to create a name-mapping. Note the `_return_records=true_` query parameter is used to obtain the newly created entry in the response.

The API:

POST /api//name-services/name-mappings

The call:

```
curl -X POST "https://<mgmt-ip>/api/name-services/name-
mappings?return_records=true" -H "accept: application/json" -H "Content-
Type: applicatio/json" -d "{ \"client_match\": \"google.com\",
\"direction\": \"win_unix\", \"index\": 2, \"pattern\":
\"ENGCIIFS_AD_USER\", \"replacement\": \"unix_user1\", \"svm\": { \"name\":
\"vs1\", \"uuid\": \"f71d3640-0226-11e9-8526-000c290a8c4b\" }}"
```

The response:

```
{
  "num_records": 1,
```

```

"records": [
  {
    "svm": {
      "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
      "name": "vs1"
    },
    "direction": "win_unix",
    "index": 2,
    "pattern": "ENGCIIFS_AD_USER",
    "replacement": "unix_user1",
    "client_match": "google.com"
  }
]
}
----

```

=== Retrieving all name-mapping configurations for all SVMs in the cluster

The API:

GET /api/name-services/name-mappings

The call:

```

curl -X GET "https://<mgmt-ip>/api/name-services/name-
mappings?fields=&return_records=true&return_timeout=15" -H "accept:
application/json"

```

The response:

```

{
  "records": [
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      },
      "direction": "win_unix",
      "index": 1,
      "pattern": "ENGCIIFS_AD_USER",
      "replacement": "unix_user1",
      "client_match": "10.254.101.111/28"
    },
    {
      "svm": {
        "uuid": "f71d3640-0226-11e9-8526-000c290a8c4b",
        "name": "vs1"
      }
    }
  ]
}

```

```

    },
    "direction": "win_unix",
    "index": 2,
    "pattern": "ENGCIIFS_AD_USER",
    "replacement": "unix_user1",
    "client_match": "google.com"
  }
],
"num_records": 2
}
----
```

=== Retrieving a name-mapping configuration for a specific SVM, and for the specified direction and index

```
'''
```

```
----
```

The API:

```
GET /api/name-services/name-mappings/{svm.uuid}/{direction}/{index}

|client_match
|string
a|Client workstation IP Address which is matched when searching for the
pattern.
You can specify the value in any of the following formats:

* As an IPv4 address with a subnet mask expressed as a number of bits; for
instance, 10.1.12.0/24
* As an IPv6 address with a subnet mask expressed as a number of bits; for
instance, fd20:8ble:b255:4071::/64
* As an IPv4 address with a network mask; for instance,
10.1.16.0/255.255.255.0
* As a hostname

|direction
|string
a|Direction in which the name mapping is applied. The possible values are:

*** krb_unix - Kerberos principal name to UNIX user name

*** win_unix - Windows user name to UNIX user name

*** unix_win - UNIX user name to Windows user name mapping

|index
|integer
a|Position in the list of name mappings.

|pattern
|string
a|Pattern used to match the name while searching for a name that can be
used as a replacement. The pattern is a UNIX-style regular expression.
Regular expressions are case-insensitive when mapping from Windows to
UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and
UNIX to Windows.

= Create hostname mappings for an SVM
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-  
block]#`/name-services/name-mappings`#
```

Introduced In: 9.6

Creates name mappings for an SVM.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the name mapping.

* `index` - Name mapping's position in the priority list.

* `direction` - Direction of the name mapping.

* `pattern` - Pattern to match to. Maximum length is 256 characters.

* `replacement` - Replacement pattern to match to. Maximum length is 256 characters.

== Recommended optional properties

* `client_match` - Hostname or IP address added to match the pattern to the client's workstation IP address.

== Related ONTAP commands

* `vserver name-mapping create`
* `vserver name-mapping insert`

== Learn more

|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|client_match
```

```
|string
```

a|Client workstation IP Address which is matched when searching for the pattern.

You can specify the value in any of the following formats:

- * As an IPv4 address with a subnet mask expressed as a number of bits; for instance, 10.1.12.0/24

- * As an IPv6 address with a subnet mask expressed as a number of bits; for instance, fd20:8ble:b255:4071::/64

- * As an IPv4 address with a network mask; for instance, 10.1.16.0/255.255.255.0

- * As a hostname

```
|pattern
```

```
|string
```

a|Pattern used to match the name while searching for a name that can be used as a replacement. The pattern is a UNIX-style regular expression. Regular expressions are case-insensitive when mapping from Windows to UNIX, and they are case-sensitive for mappings from Kerberos to UNIX and UNIX to Windows.

```
|replacement
```

```
|string
```

a|The name that is used as a replacement, if the pattern associated with this entry matches.

```

```
[[IDb616f4f43dce8ad10e11e672715fa81f]]
= Name-services NIS endpoint overview
```

```
== Overview
```

NIS servers are used to authenticate user and client computers. NIS domain name and NIS server information is required to configure NIS. It is important to note that this API is used to retrieve and manage NIS server configurations for data SVMs only. NIS configuration for the cluster is managed via `xref:{relative_path}security-authentication-cluster-nis-endpoint-overview.html[/api/security/authentication/cluster/nis]` .

```
== Retrieving NIS Information
```

The NIS GET endpoint retrieves all of the NIS configurations for data SVMs.

```
== Examples
```

```
=== Retrieving all fields for all NIS configurations
```

```
'''

== Creating a NIS configuration

The NIS POST endpoint creates a NIS configuration for the specified SVM.

== Example

The following example shows a POST operation:

The API:

/api/name-services/nis

The call:

```

curl -X POST "https://<mgmt-ip>/api/name-services/nis" -H "accept:
application/json" -H "Content-Type: application/json" -d "{ \"svm\": {
\"uuid\": \"179d3c85-7053-11e8-b9b8-005056b41bd1\" }, \"domain\":
\"domainA.example.com\", \"servers\": [ \"10.10.10.10\", \"example.com\"
] }"
-----

```

'''

== Updating the NIS configuration

The NIS PATCH endpoint updates the NIS configuration for the specified NIS server.

== Examples

=== Updating the domain

'''

The API:

/api/name-services/nis/{svm.uuid}

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"domain\": \"domainC.example.com\", \"servers\":
[ \"13.13.13.13\" ]}"
```

'''

== Updating the server

'''

```
# The API:
/api/name-services/nis/{svm.uuid}
```

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-11e8-
b9b8-005056b41bd1" -H "accept: application/json" -H "Content-Type:
application/json" -d "{ \"servers\": [ \"14.14.14.14\" ]}"
```

'''

== Deleting a NIS configuration

The NIS DELETE endpoint deletes the NIS configuration for the specified SVM.

== Example

The following example shows a DELETE operation:

'''

```
# The API:
/api/name-services/nis/{svm.uuid}
```

```
# The call:
curl -X DELETE "https://<mgmt-ip>/api/name-services/nis/179d3c85-7053-
11e8-b9b8-005056b41bd1" -H "accept: application/hal+json"
```

|string
|query
|False
a|Filter by servers

* Introduced in: 9.7

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

* Introduced in: 9.7

|svm.name
|string
|query
|False
a|Filter by svm.name

* Introduced in: 9.7

|bound_servers
|string
|query
|False
a|Filter by bound_servers

* Introduced in: 9.7

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records

```

|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create the NIS domain and server configuration for a data SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/name-services/nis`#

Introduced In: 9.6

Creates an NIS domain and server configuration for a data SVM.

NIS configuration for the cluster is managed via

xref:{relative_path}security-authentication-cluster-nis-endpoint-overview.html[/api/security/authentication/cluster/nis] .

== Important notes

- * Each SVM can have one NIS domain configuration.

- * Multiple SVMs can be configured with the same NIS domain. Specify the NIS domain and NIS servers as input. Domain name and servers fields cannot be empty.

- * Both FQDNs and IP addresses are supported for the servers field.

- * IPv6 must be enabled if IPv6 family addresses are specified in the servers field.

- * A maximum of ten NIS servers are supported.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create the NIS configuration.

- * `domain` - NIS domain to which the configuration belongs.

- * `servers` - List of NIS server IP addresses.

== Related ONTAP commands

- * `vserver services name-service nis-domain create`

== Learn more

- * xref:{relative_path}name-services_nis_endpoint_overview.html[DOC /name-services/nis]

= Retrieve the NIS domain and server configurations for an SVM
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/name-services/nis/{svm.uuid}`#
```

```
*Introduced In:* 9.6
```

Retrieves NIS domain and server configurations of an SVM. Both NIS domain and servers are displayed by default. The `bound_servers` field indicates the successfully bound NIS servers.

= Update the NIS domain and server configuration for an SVM

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-  
block]#`/name-services/nis/{svm.uuid}`#
```

Introduced In: 9.6

Updates NIS domain and server configuration of an SVM.

== Important notes

- * Both NIS domain and servers can be modified.
- * Domains and servers cannot be empty.
- * Both FQDNs and IP addresses are supported for the servers field.
- * If the domain is modified, NIS servers must also be specified.
- * IPv6 must be enabled if IPv6 family addresses are specified for the servers field.

== Related ONTAP commands

```

```
= Networking
```

```
:leveloffset: +1
```

```
[[IDce4ebfa0af68b27d30cf2bbc732dfb9d]]
= Networking overview
```

```
== Overview
```

The ONTAP networking APIs enable reporting on networking information, such as IPspaces, interfaces, routes, ports, service policies and broadcast domains. Some can also be used to manage networking.

```
'''
```

```
== IPspaces
```

IPspaces enable you to configure a single ONTAP cluster so that it can be accessed by clients from more than one administratively separate network domain, even if those clients are using the same IP address subnet range. This allows for separation of client traffic for privacy and security.

An IPspace defines a distinct IP address space in which storage virtual machines (SVMs) reside. Ports and IP addresses defined for an IPspace are

applicable only within that IPspace. A distinct routing table is maintained for each SVM within an IPspace, so that no cross-SVM or cross-IPspace traffic routing occurs.

'''

== Ethernet

=== Broadcast Domains

A broadcast domain is a set of ports which would all receive a broadcast packet that is sent from any of the ports.

By accurately representing the physical network with an ONTAP broadcast domain, ONTAP ensures that IP interfaces are able to migrate to appropriate ports in case of failure. ONTAP also ensures that characteristics, such as MTU, stay matched across all ports of the broadcast domain.

A broadcast domain resides in an IPspace, and can be used by cluster-scoped or SVM-scoped IP interfaces in that IPspace. The scope of the broadcast domain's uniqueness is the IPspace it is in. You must create as many broadcast domains in an IPspace as there are IP subnets with interfaces in that IPspace.

Ports are mapped to an IPspace by assigning the port's broadcast domain.

=== Ports

A port is a physical or virtual Ethernet network device. Physical ports may be combined into Link Aggregation Groups (LAGs, or ifgrps), or divided into Virtual LANS (VLANs).

The GET and PATCH APIs are available for all port types. The POST and DELETE APIs are available for "lag" and "vlan" port types.

A given port can host zero or more IP interfaces.

A port exists in a broadcast domain and all ports within the same broadcast domain must have layer 2 network connectivity to one another. If a port within a broadcast domain goes down, any IP interfaces hosted by that port can fail over to other ports in the same broadcast domain.

'''

== Fibre Channel

=== Interfaces

Fibre Channel (FC) interfaces are the logical endpoints for Fibre Channel network connections to an SVM. A Fibre Channel interface provides Fibre Channel access to storage within the interface's SVM using either Fibre Channel Protocol (FCP) or Non-Volatile Memory Express over Fibre Channel (NVMe over FC).

The Fibre Channel interface REST API allows you to create, delete, update and discover Fibre Channel interfaces and obtain status information for Fibre Channel interfaces.

A Fibre Channel interface is created on a Fibre Channel port that is located on a cluster node. The Fibre Channel port must be specified to identify the location of the interface for a POST or PATCH that relocates an interface. You can identify the port by either supplying the node and port names or the port UUID.

=== Ports

Fibre Channel ports are the physical ports of Fibre Channel adapters on ONTAP cluster nodes that can be connected to Fibre Channel networks to provide Fibre Channel network connectivity. A Fibre Channel port defines the location of a Fibre Channel interface within the ONTAP cluster.

The Fibre Channel port REST API allows you to discover Fibre Channel ports, obtain status information for Fibre Channel ports, and configure Fibre Channel port properties.

=== Learn More

* `_Fibre Channel Logins_` found in both the `_SAN_` and `_NVMe_` sections. Fibre Channel logins represent connections formed by Fibre Channel initiators that have successfully logged in to ONTAP.

'''

== IP

=== Interfaces

An interface (also referred to as a `_LIF_` in ONTAP documentation) represents a network access point to a node in a cluster. In other words, an interface is essentially an IPv4 or IPv6 address with associated attributes.

IP interfaces are configured on ports to send and receive communications

over the network. The port that will host the interface can either be explicitly specified using node and/or port fields or implicitly specified using a broadcast domain.

The IPspace of the interface is required for cluster-scoped interfaces. The SVM owning the interface is required for SVM-scoped interfaces. These interfaces are in the SVM's IPspace.

The service policy of an interface defines what network services are provided by the interface.

=== Routes

Routes indicate which IPv4 or IPv6 gateway to use to communicate with hosts that are not on the local subnet. Typically, an IP interface (or LIF) can only use a gateway if it has the same address family and is in the LIF's subnet.

It is important that every gateway address belongs to a physical or virtual router that has connectivity to the specified destination network.

SVM-scoped routes can only be used by IP interfaces of the specified SVM. Likewise, cluster-scoped routes can only be used by cluster-scoped IP interfaces in the specified IPspace.

=== Service Policies

Service policies are named groupings that define what services are supported by an IP interface. These include both built-in service policies (for example: default-data-files or default-management) and custom service policies.

Service policies are scoped to either an SVM or IPspace.

'''

= Manage broadcast domains

:leveloffset: +1

[[IDcead08b456e4cb5b6cd15c80e2ac4f8d]]

= Network Ethernet broadcast-domains endpoint overview

== Overview

A broadcast domain is a collection of Ethernet ports that have layer 2 connectivity. They are used to determine which Ethernet ports can host interfaces of various types. The broadcast domain REST API allows you to retrieve, create, modify, and delete broadcast domains. The broadcast domain APIs do not manage port membership. To add a port to a broadcast domain or to move a port to a different broadcast domain, use PATCH `/network/ethernet/ports/+++<uuid>+++.``+++</uuid>+++`

== Retrieving network Ethernet broadcast domain information

The broadcast domains GET API retrieves and displays relevant information pertaining to the broadcast domains configured in the cluster. The API retrieves the list of all broadcast domains configured in the cluster, or a specific broadcast domain.

'''

== Examples

=== Retrieving all broadcast domains in the cluster

The following output shows the list of all broadcast domains configured in a cluster.

'''

The API:

'''

== Creating network Ethernet broadcast domains

You can use the POST API to create broadcast domains.

'''

== Example

=== Creating a new broadcast domain

The following example shows how to create a broadcast domain with a name of 'bd1' and an MTU of 1500.

'''

The API:

/api/network/ethernet/broadcast-domains

The call:

```

curl -X POST "https://<mgmt-ip>/api/network/ethernet/broadcast-
domains?return_records=true" -H "accept: application/hal+json" -d '{
"name": "bd1", "mtu": 1500 }'

```

```

# The response:
{
  "num_records": 1,
  "records": [
    {
      "name": "bd1",
      "mtu": 1500,
      "_links": {
        "self": {
          "href": "/api/network/ethernet/broadcast-domains/"
        }
      }
    }
  ]
}
-----

'''

== Updating network Ethernet broadcast domains

You can use the PATCH API to update the attributes of broadcast domains.

'''

== Examples

=== Updating the name and MTU of a specific broadcast domain

The following example shows how the PATCH request changes the broadcast
domain name to 'bd2' and the broadcast domain MTU to 9000.

'''

-----

# The API:
/api/network/ethernet/broadcast-domains/{uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/broadcast-
domains/6cde03b2-f8a2-11e8-8d33-005056bb986f/" -d '{ "name": "bd2", "mtu":
9000 }'
{
}
-----

```

```
'''
```

```
== Updating the IPspace of a specific broadcast domain
```

The following example shows how the PATCH request changes the IPspace of a broadcast domain to 'ipspace2'.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ethernet/broadcast-domains/{uuid}
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/broadcast-  
domains/c6fe2541-61f4-11e9-a66e-005056bbe83e" -d '{ "ipspace" : { "name" :  
"ipspace2" } }'
```

```
{  
}
```

```
----
```

```
'''
```

```
== Deleting network Ethernet broadcast domains
```

You can use the DELETE API to delete a broadcast domain from the cluster configuration.

```
== Example
```

```
== Deleting a specific broadcast domain
```

The following DELETE request deletes a broadcast domain.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ethernet/broadcast-domains/{uuid}
```

```
# The call:
```

```
curl -X DELETE "https://<mgmt-ip>/api/network/ethernet/broadcast-  
domains/6cde03b2-f8a2-11e8-8d33-005056bb986f/"
```

```
----
```

```

= Retrieve broadcast domains for the entire cluster

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/broadcast-domains`#

*Introduced In:* 9.6

Retrieves a collection of broadcast domains for the entire cluster.

== Related ONTAP commands

* `network port broadcast-domain show`

== Parameters

[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|ports.name
|string
|query
|False
a|Filter by ports.name

|ports.node.name
|string
|query
|False
a|Filter by ports.node.name

|ports.uuid

```

```
|string
|query
|False
a|Filter by ports.uuid
```

```
|name
|string
|query
|False
a|Filter by name
```

```
|ipospace.name
|string
|query
|False
a|Filter by ipospace.name
```

```
|ipospace.uuid
|string
|query
|False
a|Filter by ipospace.uuid
```

```
|uuid
|string
|query
|False
a|Filter by uuid
```

```
|mtu
|integer
|query
|False
a|Filter by mtu
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

= Create a new broadcast domain

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ethernet/broadcast-domains`#

*Introduced In:* 9.6

Creates a new broadcast domain.

== Required properties

* `name` - Name of the broadcast-domain to create.
* `mtu` - Maximum transmission unit (MTU) of the broadcast domain.

```

== Recommended optional properties

* `ipspace.name` or `ipspace.uuid` - IPspace the broadcast domain belongs to.

== Default property values

If not specified in POST, the following default property values are assigned:

* `ipspace` - `_Default_`

== Related ONTAP commands

* `network port broadcast-domain create`

== Parameters

ONTAP Error Response Codes

|===

Error Code	Description
------------	-------------

1377267	
---------	--

	The specified IPspace does not exist.
--	---------------------------------------

1377269	
---------	--

	Failed to lookup the specified IPspace.
--	-----------------------------------------

1377560	
---------	--

	Broadcast domain already exists in specified IPspace.
--	-------------------------------------------------------

1377605	
---------	--

	Moving the system-generated broadcast domain to another IPspace is not supported.
--	-----------------------------------------------------------------------------------

1967082	
---------	--

	The specified ipspace.name does not match the IPspace name of ipspace.uuid.
--	-----------------------------------------------------------------------------

1967150	
---------	--

	The specified ipspace.uuid is not valid.
--	------------------------------------------

1967151	
---------	--

	The specified ipspace.uuid and ipspace.name do not match.
--	-----------------------------------------------------------

1967152	
---------	--

	Patching IPspace for a broadcast domain requires an effective cluster version of 9.7 or later.

:leveloffset: -1

= Manage network Ethernet ports

:leveloffset: +1

[[ID583be69994ab89d34be2cbb9831d1176]]

= Network Ethernet ports endpoint overview

== Overview

A port is a physical or virtual Ethernet network device. Physical ports may be combined into Link Aggregation Groups (LAGs or ifgrps), or divided into Virtual LANs (VLANs).

GET (collection), GET (instance), and PATCH APIs are available for all port types. POST and DELETE APIs are available for "lag" (ifgrp) and "vlan" port types.

== Retrieving network port information

The network ports GET API retrieves and displays relevant information pertaining to the ports configured in the cluster. The API retrieves the list of all ports configured in the cluster, or specifically requested ports. The fields returned in the response vary for different ports and configurations.

== Examples

=== Retrieving all ports in the cluster

The following output displays the UUID, name, and port type for all ports

configured in a 2-node cluster. The port types are physical, vlan, and lag (ifgrp).

'''

The API:

/api/network/ethernet/ports

The call:

```
curl -X GET "https://<mgmt-  
ip>/api/network/ethernet/ports?fields=uuid,name,type" -H "accept:  
application/hal+json"
```

The response:

```

== Creating VLAN and LAG ports

You can use the network ports POST API to create VLAN and LAG ports. If you supply the optional broadcast domain property, the specified broadcast domain will be assigned to the new port immediately. Otherwise, within a few minutes automatic probing will determine the correct broadcast domain and will assign it to the port. During that period of time, the port will not be capable of hosting interfaces.

'''

== Examples

=== Creating a VLAN port

The following output displays the record returned after the creation of a VLAN port on "e0e" and VLAN tag "100".

'''

```

# The API:
/api/network/ethernet/ports

```

```

# The call:
curl -X POST "https://<mgmt-

```

```
ip>/api/network/ethernet/ports?return_records=true" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{ \"type\":
\"vlan\", \"node\": { \"name\": \"user-cluster-01\" }, \"enabled\": true,
\"vlan\": { \"tag\": 100, \"base_port\": { \"name\": \"e0e\", \"node\": {
\"name\": \"user-cluster-01\" } } } } }
```

'''

== Updating ports

You can use the network ports PATCH API to update the attributes of ports.

'''

== Examples

=== Updating the broadcast domain of a port

The following PATCH request removes the port from the current broadcast
domain and adds it to the specified broadcast domain.

'''

----

# The API:
/api/network/ethernet/ports/{uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/6867efaf-d702-
11e8-994f-005056bbc994" -H "accept: application/hal+json" -H "Content-
Type: application/json" -d "{ \"broadcast_domain\": { \"name\":
\"Default\", \"ipspace\": { \"name\": \"Default\" } } }"
----

'''

=== Updating the admin status of a port

The following PATCH request brings the specified port down.

'''

----

# The API:
/api/network/ethernet/ports/{uuid}

```

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/51d3ab39-d86d-11e8-aca6-005056bbc994" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"enabled\": \"false\" }"
----
```

'''

=== Repairing a port

The following PATCH request repairs a port. Only ports that have reachability as "repairable" can be repaired. The "reachability" parameter cannot be patched in the same request as other parameters that might affect the target port's reachability status.

'''

```
# The API:
/api/network/ethernet/ports/{uuid}
```

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/network/ethernet/ports/51d3ab39-d86d-11e8-aca6-005056bbc994" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"reachability\": \"ok\" }"
----
```

'''

== Deleting ports

You can use the network ports DELETE API to delete VLAN and LAG ports in the cluster. Note that physical ports cannot be deleted. Deleting a port also removes the port from the broadcast domain.

'''

== Example

=== Deleting a VLAN port

The network ports DELETE API is used to delete a VLAN port.

'''

```

# The API:
/api/network/ethernet/ports/{uuid}

# The call:

= Retrieve ports

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/ports`#

*Introduced In:* 9.6

Retrieves a collection of ports (physical, VLAN and LAG) for an entire
cluster.

== Related ONTAP commands

* `network port show`
* `network port ifgrp show`
* `network port vlan show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|reachable_broadcast_domains.uuid
|string

```

```
|query
|False
a|Filter by reachable_broadcast_domains.uuid
```

* Introduced in: 9.8

```
|reachable_broadcast_domains.name
|string
|query
|False
a|Filter by reachable_broadcast_domains.name
```

* Introduced in: 9.8

```
|reachable_broadcast_domains.ipspace.name
|string
|query
|False
a|Filter by reachable_broadcast_domains.ipspace.name
```

* Introduced in: 9.8

```
|state
|string
|query
|False
a|Filter by state
```

```
|statistics.timestamp
|string
|query
|False
a|Filter by statistics.timestamp
```

* Introduced in: 9.8

```
|statistics.throughput_raw.write
|integer
|query
|False
a|Filter by statistics.throughput_raw.write
```

* Introduced in: 9.8

```
|statistics.throughput_raw.read  
|integer  
|query  
|False  
a|Filter by statistics.throughput_raw.read
```

* Introduced in: 9.8

```
|statistics.throughput_raw.total  
|integer  
|query  
|False  
a|Filter by statistics.throughput_raw.total
```

* Introduced in: 9.8

```
|statistics.device.receive_raw.packets  
|integer  
|query  
|False  
a|Filter by statistics.device.receive_raw.packets
```

* Introduced in: 9.8

```
|statistics.device.receive_raw.discards  
|integer  
|query  
|False  
a|Filter by statistics.device.receive_raw.discards
```

* Introduced in: 9.8

```
|statistics.device.receive_raw.errors  
|integer  
|query  
|False  
a|Filter by statistics.device.receive_raw.errors
```

* Introduced in: 9.8

```
|statistics.device.timestamp
|string
|query
|False
a|Filter by statistics.device.timestamp
```

* Introduced in: 9.8

```
|statistics.device.transmit_raw.packets
|integer
|query
|False
a|Filter by statistics.device.transmit_raw.packets
```

* Introduced in: 9.8

```
|statistics.device.transmit_raw.discards
|integer
|query
|False
a|Filter by statistics.device.transmit_raw.discards
```

* Introduced in: 9.8

```
|statistics.device.transmit_raw.errors
|integer
|query
|False
a|Filter by statistics.device.transmit_raw.errors
```

* Introduced in: 9.8

```
|statistics.device.link_down_count_raw
|integer
|query
|False
a|Filter by statistics.device.link_down_count_raw
```

* Introduced in: 9.8

```
|statistics.status
```

```
|string
|query
|False
a|Filter by statistics.status
```

* Introduced in: 9.8

```
|speed
|integer
|query
|False
a|Filter by speed
```

```
|reachability
|string
|query
|False
a|Filter by reachability
```

* Introduced in: 9.8

```
|mac_address
|string
|query
|False
a|Filter by mac_address
```

```
|enabled
|boolean
|query
|False
a|Filter by enabled
```

```
|node.name
|string
|query
|False
a|Filter by node.name
```

```
|node.uuid
|string
```

```
|query
|False
a|Filter by node.uuid
```

```
|mtu
|integer
|query
|False
a|Filter by mtu
```

```
|vlan.tag
|integer
|query
|False
a|Filter by vlan.tag
```

```
|vlan.base_port.name
|string
|query
|False
a|Filter by vlan.base_port.name
```

```
|vlan.base_port.node.name
|string
|query
|False
a|Filter by vlan.base_port.node.name
```

```
|vlan.base_port.uuid
|string
|query
|False
a|Filter by vlan.base_port.uuid
```

```
|broadcast_domain.uuid
|string
|query
|False
a|Filter by broadcast_domain.uuid
```

```
|broadcast_domain.name
|string
|query
|False
a|Filter by broadcast_domain.name

|broadcast_domain.ipspace.name
|string
|query
|False
a|Filter by broadcast_domain.ipspace.name

|lag.active_ports.name
|string
|query
|False
a|Filter by lag.active_ports.name

|lag.active_ports.node.name
|string
|query
|False
a|Filter by lag.active_ports.node.name

|lag.active_ports.uuid
|string
|query
|False
a|Filter by lag.active_ports.uuid

|lag.mode
|string
|query
|False
a|Filter by lag.mode

|lag.member_ports.name
|string
|query
|False
a|Filter by lag.member_ports.name
```

```
|lag.member_ports.node.name
|string
|query
|False
a|Filter by lag.member_ports.node.name
```

```
|lag.member_ports.uuid
|string
|query
|False
a|Filter by lag.member_ports.uuid
```

```
|lag.distribution_policy
|string
|query
|False
a|Filter by lag.distribution_policy
```

```
|name
|string
|query
|False
a|Filter by name
```

```
|uuid
|string
|query
|False
a|Filter by uuid
```

```
|metric.timestamp
|string
|query
|False
a|Filter by metric.timestamp
```

* Introduced in: 9.8

```
|metric.duration
```

```
|string
|query
|False
a|Filter by metric.duration
```

* Introduced in: 9.8

```
|metric.throughput.write
|integer
|query
|False
a|Filter by metric.throughput.write
```

* Introduced in: 9.8

```
|metric.throughput.read
|integer
|query
|False
a|Filter by metric.throughput.read
```

* Introduced in: 9.8

```
|metric.throughput.total
|integer
|query
|False
a|Filter by metric.throughput.total
```

* Introduced in: 9.8

```
|metric.status
|string
|query
|False
a|Filter by metric.status
```

* Introduced in: 9.8

```
|type
|string
|query
```

```

|False
a|Filter by type

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.

```

Default direction is 'asc' for ascending.

```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|status
```

```
|string
```

```
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".
```

"inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the port object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```

```

```
|link:#device[device]
```

```
a|Device-related counters for the port object. These counters are applicable at the lowest layer of the networking stack. These values can be used to calculate both transmit and receive packet and error rates by comparing two samples taken at different times and calculating the increase in counter value divided by the elapsed time between the two
```

samples.

|status

|string

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".

"inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value.

"inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw

|link:#throughput_raw[throughput_raw]

a|Throughput bytes observed at the port object. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp

|string

a|The timestamp of the throughput_raw performance data.

[[IDf9f126f8d261a7e605e434d7c8239e31]]

= Create a new VLAN or LAG

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/ethernet/ports`#

Introduced In: 9.6

Creates a new VLAN (such as node1:e0a-100) or LAG (ifgrp, such as node2:a0a).

== Required properties

* `node` - Node the port will be created on.

* `type` - Defines if a VLAN or LAG will be created:

*** VLAN

***** `vlan.base_port` - Physical port or LAG the VLAN will be created on.

***** `vlan.tag` - Tag used to identify VLAN on the base port.

*** LAG

***** `lag.mode` - Policy for the LAG that will be created.

***** `lag.distribution_policy` - Indicates how the packets are distributed between ports.

***** `lag.member_ports` - Set of ports the LAG consists of.

== Optional properties

* `broadcast_domain` - The layer-2 broadcast domain the port is associated with. The port will be placed in a broadcast domain if it is not specified. It may take several minutes for the broadcast domain to be

assigned. During that period the port cannot host interfaces.

== Related ONTAP commands

- * `network port ifgrp create`
- * `network port vlan create`

== Parameters

| 1967083
| The specified type is not valid.

| 1967084
| The specified node UUID is not valid.

| 1967085
| The specified node name is not valid.

| 1967086
| Node name and UUID must match if both are provided.

| 1967087
| The specified broadcast domain UUID is not valid.

| 1967088
| The specified broadcast domain name does not exist in the specified IPspace.

| 1967089
| The specified broadcast domain UUID, name, and IPspace name do not match.

| 1967090
| The specified VLAN base port UUID is not valid.

| 1967091
| The specified VLAN base port name and node name are not valid.

| 1967092
| The specified node does not match the node specified for the VLAN base port.

| 1967093
| The specified VLAN base port UUID, name, and VLAN base port node name do not match.

| 1967094
| The specified LAG member port UUID is not valid.

| 1967095
| The specified LAG member port name and node name combination is not valid.

| 1967096

```
| The specified node does not match the specified LAG member port node.

| 1967097
| The specified LAG member ports UUID, name, and node name do not match.

| 1967098
| VLAN POST operation has failed because admin status could not be set for
the specified port.

| 1967099
| Partial success of the VLAN POST operation. Verify the state of the
created VLAN for more information.

| 1967100
| LAG POST operation failed because admin status could not be set.

| 1967101
| Partial success of the LAG POST operation. Verify the state of the
created LAG for more information.

| 1967102
| POST operation might have left the configuration in an inconsistent
state. Check the configuration.

| 1967148
| Failure to remove port from broadcast domain.

| 1967149
| Failure to add port to broadcast domain.

| 1967175
| VLANs cannot be created on ports in the Cluster IPspace.

|Description

|broadcast_domain
|link:#broadcast_domain[broadcast_domain]
a|Broadcast domain UUID along with a readable name. Either the UUID or
both names may be provided on input.

|enabled
|boolean
a|

|lag
|link:#lag[lag]
a|

|mac_address
|string
a|

|mtu
|integer
a|MTU of the port in bytes. Set by broadcast domain.

|name
|string
a|Portname, such as e0a, e1b-100 (VLAN on ethernet), a0c (LAG/ifgrp), a0d-
200 (vlan on LAG/ifgrp)

|node

```

```

|link:#node[node]
a|

|reachable_broadcast_domains
|array[link:#reachable_broadcast_domains[reachable_broadcast_domains]]
a|Reachable broadcast domains.

|speed
|integer
a|Link speed in Mbps

|state
|string
a|Operational state of the port.

|type
|string
a|Type of physical or virtual port

|uuid
|string
a|Port UUID

|vlan
|link:#vlan[vlan]

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of

```

data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the port object.
```

```
|timestamp
|string

= Update a port

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/network/ethernet/ports/{uuid}`#

*Introduced In:* 9.6

Updates a port.

== Related ONTAP commands

* `network port broadcast-domain add-ports`
* `network port broadcast-domain remove-ports`
* `network port ifgrp modify`
* `network port modify`
* `network port vlan modify`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid
|string
|path

```

```

|True
a|Port UUID

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|broadcast_domain
|link:#broadcast_domain[broadcast_domain]
a|Broadcast domain UUID along with a readable name. Either the UUID or
both names may be provided on input.

|enabled
|boolean
a|

|lag
|link:#lag[lag]
a|

|mac_address
|string
a|

|mtu
|integer
a|MTU of the port in bytes. Set by broadcast domain.

|name
|string
a|Portname, such as e0a, e1b-100 (VLAN on ethernet), a0c (LAG/ifgrp), a0d-
200 (vlan on LAG/ifgrp)

|reachability
|string
a|Reachability status of the port. Enum value "ok" is the only acceptable

```

value for a PATCH request to repair a port.

```
|reachable_broadcast_domains
|array[link:#reachable_broadcast_domains[reachable_broadcast_domains]]
a|Reachable broadcast domains.
```

```
|speed
|integer
a|Link speed in Mbps
```

```
|state
|string
a|Operational state of the port.
```

```
|uuid
|string
a|Port UUID
```

```
|===
```

```

== Response

```

Status: 200, Ok

```
== Error
```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description
| 1376361
| Port is already a member of a LAG.

```

| 1377562
| Port cannot be used because it is currently the home port or current port of an interface.

| 1377563
| Port is already a member of a LAG.

| 1967087
| The specified broadcast domain UUID is not valid.

| 1967088
| The specified broadcast domain name does not exist in the specified IPspace.

| 1967089
| The specified broadcast domain UUID, name and IPspace name do not match.

| 1967094
| The specified LAG member port UUID is not valid.

| 1967095
| The specified LAG member port name and node name combination is not valid.

| 1967096
| The specified node does not match the specified LAG member port node.

| 1967097
| The specified LAG member ports UUID, name, and node name do not match.

| 1967148
| Failure to remove port from broadcast domain.

| 1967149
| Failure to add port to broadcast domain.

| 1967184
| The reachability parameter cannot be patched in the same request as other parameters that might affect the target port's reachability status.

| 1967185
| The port cannot be repaired because the port is deemed as non-repairable.

| 1967186
| Invalid value for the reachability parameter.

```
| 1967580
| This command is not supported as the effective cluster version is
earlier than 9.8.
```

```
| 1967582
| The reachability parameter is not supported on this cluster.

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations  
are represented in the ISO-8601 standard format. Samples can be calculated  
over the following durations:
```

```

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the port object.

|timestamp
|string
a|The timestamp of the performance data.

[#receive_raw]
[.api-collapsible-fifth-title]
receive_raw
```

Packet receive counters for the Ethernet port.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|discards
```

```
|integer
a|Total number of discarded packets.
```

```
|errors
|integer
a|Number of packet errors.
```

```
|packets
|integer
a|Total packet count.
```

```
|===
```

```
[#transmit_raw]
[.api-collapsible-fifth-title]
transmit_raw
```

Packet transmit counters for the Ethernet port.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|discards
|integer
a|Total number of discarded packets.
```

```
|errors
|integer
a|Number of packet errors.
```

```
|packets
|integer
a|Total packet count.
```

```
|===
```

```
[#device]
[.api-collapsible-fifth-title]
device
```

Device-related counters for the port object. These counters are applicable at the lowest layer of the networking stack. These values can be used to calculate both transmit and receive packet and error rates by comparing two samples taken at different times and calculating the increase in counter value divided by the elapsed time between the two samples.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|link_down_count_raw
|integer
a|The number of link state changes from up to down seen on the device.
```

```
|timestamp
|string
a|The timestamp when the device specific counters were collected.
```

```
|===
```

```
[#throughput_raw]
[.api-collapsible-fifth-title]
throughput_raw
```

Throughput bytes observed at the port object. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

= Retrieve historical port performance metrics

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ethernet/ports/{uuid}/metrics`#

*Introduced In:* 9.8

Retrieves historical performance metrics for a port.

== Parameters

[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|timestamp
|string
|query
|False
a|Filter by timestamp

|duration
|string
|query
|False
a|Filter by duration

|throughput.write
|integer
|query
|False
a|Filter by throughput.write
```

```
|throughput.read
|integer
|query
|False
a|Filter by throughput.read
```

```
|throughput.total
|integer
|query
|False
a|Filter by throughput.total
```

```
|status
|string
|query
|False
a|Filter by status
```

```
|uuid
|string
|path
|True
a|Unique identifier of the port.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

```
* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]
```

```
|return_timeout
```

```

|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

== Overview
```

This API can be used to get the port information for an ethernet switch used in a cluster or storage networks. This API supports GET only. The GET operation returns a list of ports with status and configuration information.

```
== Examples
```

```
=== Retrieving the ports for ethernet switches
```

The following example retrieves the ethernet switch ports for all the ethernet switches used for cluster and/or storage networks. Note that if the `_fields=*` parameter is not specified, the fields in-

octets, in-errors, in-discards, out-octets, out-errors, out-discards, interface-number, unique-name, mac-address are not returned. Filters can be added on the fields to limit the results.

```
[,json]
```

```
----
```

```
# The API:
```

```
GET /network/ethernet/switch/ports
```

```
# The call:
```

```
curl -X GET "https://<mgmt-  
ip>/api/network/ethernet/switch/ports?return_records=true" -H "accept:  
application/json" -H "Content-Type: application/hal+json"
```

```
# The response: (abbreviated output due to length, shows a port connected  
to a node, a port with no remote connection and a port connected to shelf)
```

```

|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

```

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

:leveloffset: -1

= Manage Ethernet switches

:leveloffset: +1

[[ID6ad14c4bb6c8e0d79f574262787b61d2]]
= Network Ethernet switches endpoint overview

== Overview

```

This API can be used to get information about the ethernet switches used for cluster and/or storage networks. This API support GET and PATCH calls.

The GET operation returns a list of discovered switches with status and configuration information. The PATCH can be used to modify state of the switch.

== Examples

=== Retrieving the ethernet switches for a cluster

The following example retrieves the ONTAP switches from the cluster. Note that if the `_fields=*` parameter is not specified, the fields `snmp.version`, `snmp.credential`, `model`, `sw-version`, `reason`, `version-source`, `monitoring.enable`, `monitoring.subsystem.type` and `monitoring.subsystem.poll_interval` are not returned. Filters can be added on the fields to limit the results.

```
[,json]
```

```
----
```

```
# The API:
```

```
GET network/ethernet/switches
```

```
# The call:
```

```

|query
|False
a|Filter by version
```

```
|fields
|array[string]
|query
|False
```

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

```

= Manage FC network interfaces

```

```

:leveloffset: +1

```

```

[[ID00b11ca1b528b4f5fb1b3b2df2d0ce0d]]
= Network FC interfaces endpoint overview

```

```

== Overview

```

Fibre Channel (FC) interfaces are the logical endpoints for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over FC (NVMe/FC).

The Fibre Channel interface REST API allows you to create, delete, update, and discover FC interfaces, and obtain status information for FC interfaces.

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH request that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

== Performance monitoring

Performance of an FC interface can be monitored by observing the ``metric.++`` and ``statistics.++`` properties. These properties show the performance of an FC interface in terms of IOPS, latency, and throughput. The ``metric.++`` properties denote an average, whereas ``statistics.++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an FC interface using the port node and name to identify the location

This example uses the ``return_records`` query parameter to retrieve the newly created FC interface in the POST response.

The API:

POST /api/network/fc/interfaces

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/network/fc/interfaces?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name": "lif1",  
"location": { "home_port": { "name": "0a", "home_node": { "name": "node1"  
} } }, "data_protocol": "fc" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "cf300f5c-db83-11e8-bd46-005056bba0e0",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/cf300f5c-db83-11e8-bd46-005056bba0e0"  
          }  
        }  
      },  
      "uuid": "f6045b92-dec7-11e8-a733-005056bba0e0",  
      "name": "lif1",
```

```

=== Retrieving a list of selected FC interfaces

This example uses property query parameters to retrieve FC interfaces configured for the FC Protocol that are set to `_up_`.

The API:

GET /api/network/fc/interfaces

The call:

```

curl -X GET 'https://<mgmt-ip>/api/network/fc/interfaces?data_protocol=fcp&state=up' -H 'accept: application/hal+json'

```

The response:

```

{
  "records": [
    {
      "svm": {
        "uuid": "cf300f5c-db83-11e8-bd46-005056bba0e0",
        "name": "svm1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/cf300f5c-db83-11e8-bd46-005056bba0e0"
          }
        }
      }
    }
  ]
}

```

```

    },
    "uuid": "f6045b92-dec7-11e8-a733-005056bba0e0",
    "name": "lif1",
    "state": "up",
    "data_protocol": "fcp",

'''

```

== Disabling an FC interface

When updating certain properties or deleting an FC interface, the interface must first be disabled using the following:

```

-----

# The API:
PATCH /api/network/fc/interfaces/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-11e8-a733-005056bba0e0' -H 'accept: application/hal+json' -d '{ "enabled": false }'
-----

'''

```

=== Moving an FC interface to a new node and port

To move an FC interface to another node or port, the destination FC port must be specified in a PATCH request. Either the port UUID or node and port names can be used to identify the port.

Note that only FC interfaces configured for the FC Protocol can be moved. FC interfaces configured for NVMe/FC cannot be moved. The interface must also be set to the disabled state before being moved.

```

-----

# The API:

```

```
PATCH /api/network/fc/interfaces/{uuid}
```

```
# The call:
```

```
curl -X PATCH 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-11e8-a733-005056bba0e0' -H 'accept: application/hal+json' -d '{
  "location": { "home_port": { "uuid": "a1dc7aa5-db83-11e8-9ef7-005056bbbbcc" } } }'
```

```
----
```

```
'''
```

```
=== Deleting an FC interface
```

The FC interface must be disabled before being deleted.

```
----
```

```
# The API:
```

```
DELETE /api/network/fc/interfaces/{uuid}
```

```
# The call:
```

```
curl -X DELETE 'https://<mgmt-ip>/api/network/fc/interfaces/f6045b92-dec7-11e8-a733-005056bba0e0' -H 'accept: application/hal+json'
```

|duration
|string

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops
|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status
|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with

"backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
[#fc_interface]  
[.api-collapsible-fifth-title]  
fc_interface
```

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

```
[cols=3*,options=header]
```

```

|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|comment
|string
a|A user configurable comment. Optional in POST; valid in PATCH. To clear
a prior comment, set the property to an empty string in PATCH.

|data_protocol
|string
a|The data protocol for which the FC interface is configured. Required in
POST.

|enabled
|boolean
a|The administrative state of the FC interface. The FC interface can be
disabled to block all FC communication with the SVM through this
interface. Optional in POST and PATCH; defaults to _true_ (enabled) in
POST.

|location
|link:#location[location]
a|The location of the FC interface is defined by the location of its port.
An FC port is identified by its UUID, or a combination of its node name
and port name. Either the UUID or the node name and port name are required
for POST. To move an interface, supply either the UUID or the node name
and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and
"location.home_port" during a POST or PATCH. "location.node" and
"location.port" refer to the current location of the FC interface. This
may be different from "location.home_node" and "location.home_port" in
instances where the FC interface failed over due to an offline node.

|metric
|link:#metric[metric]

= Create an FC interface

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/fc/interfaces`#

*Introduced In:* 9.6

Creates an FC interface.

```

== Required properties

- * ``svm.uuid`` or ``svm.name`` - Existing SVM in which to create the FC interface.
- * ``name`` - Name of the FC interface.
- * ``location.port.uuid`` or both ``location.port.name`` and ``location.port.node.name`` - FC port on which to create the FC interface.
- * ``data_protocol`` - Data protocol for the FC interface.

== Default property values

If not specified in POST, the following default property values are assigned.

- * ``enabled`` - `_true_`

== Related ONTAP commands

- * ``network interface create``

== Learn more

- * `xref:{relative_path}network_fc_interfaces_endpoint_overview.html[DOC/network/fc/interfaces]`

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|return_records

```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
```

```
|link:#throughput[throughput]
```

a|The rate of throughput bytes per second observed at the storage object.

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
[cols=3*,options=header]

```

```
|===
```

```
[#fc_interface]
[.api-collapsible-fifth-title]
fc_interface
```

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|comment
|string
```

a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.

```
|data_protocol
|string
```

a|The data protocol for which the FC interface is configured. Required in POST.

|enabled

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This may be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|The unique identifier of the FC interface. Required in the URL.
```

```
|wwnn
|string
a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is
generated by ONTAP when Fibre Channel Protocol or the NVMe service is
created for the FC interface SVM.
```

```
* example: 20:00:00:50:56:b4:13:01
* readOnly: 1
* Introduced in: 9.6
```

```
|wwpn
|string
a|The world wide port name (WWPN) of the FC interface. The WWPN is
generated by ONTAP when the FC interface is created.
```

```
* example: 20:00:00:50:56:b4:13:a8
* readOnly: 1
* Introduced in: 9.6
```

|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS latency and throughput
```

```
|name
|string
a|The name of the FC interface. Required in POST; optional in PATCH.
```

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn

|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

```
* example: 20:00:00:50:56:b4:13:01
```

```
* readOnly: 1
```

```
* Introduced in: 9.6
```

```
|wwpn
```

```
|string
```

```
a|The world wide port name (WWPN) of the FC interface. The WWPN is  
generated by ONTAP when the FC interface is created.
```

```
* example: 20:00:00:50:56:b4:13:a8
```

```
* readOnly: 1
```

```
* Introduced in: 9.6
```

[#location]
```

```
[.api-collapsible-fifth-title]
```

```
location
```

The location of the FC interface is defined by the location of its port.

An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This may be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|duration

|string

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops

|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

= Update an FC interface

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/network/fc/interfaces/{uuid}`#

Introduced In: 9.6

Updates an FC interface.

== Related ONTAP commands

* `network interface modify`

== Learn more

* xref:{relative_path}network_fc_interfaces_endpoint_overview.html[DOC /network/fc/interfaces]

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|The unique identifier for the FC interface.

|===

== Request Body

[cols=3*,options=header]

|===

|Name
|Type
|Description

|comment
|string

a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.

|enabled
|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location
|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This may be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|name
|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address
|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC

switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|svm

|link:#svm[svm]

a|

|uuid

|string

a|The unique identifier of the FC interface. Required in the URL.

|wwnn

|string

a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is generated by ONTAP when Fibre Channel Protocol or the NVMe service is created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01

* readOnly: 1

* Introduced in: 9.6

|wwpn

|string

a|The world wide port name (WWPN) of the FC interface. The WWPN is generated by ONTAP when the FC interface is created.

* example: 20:00:00:50:56:b4:13:a8

* readOnly: 1

* Introduced in: 9.6

[cols=3*,options=header]
|===
|Name
|Type
|Description

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string

```

a|The timestamp of the performance data.

|===

[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

|uuid

|string

a|The unique identifier of the SVM.

|===

[#fc_interface]

[.api-collapsible-fifth-title]

fc_interface

A Fibre Channel (FC) interface is the logical endpoint for FC network connections to an SVM. An FC interface provides FC access to storage within the interface SVM using either Fibre Channel Protocol or NVMe over Fibre Channel (NVMe/FC).

An FC interface is created on an FC port which is located on a cluster node. The FC port must be specified to identify the location of the interface for a POST or PATCH operation that relocates an interface. You can identify the port by supplying either the node and port names or the port UUID.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|comment

|string

a|A user configurable comment. Optional in POST; valid in PATCH. To clear a prior comment, set the property to an empty string in PATCH.

|enabled

|boolean

a|The administrative state of the FC interface. The FC interface can be disabled to block all FC communication with the SVM through this interface. Optional in POST and PATCH; defaults to `_true_` (enabled) in POST.

|location

|link:#location[location]

a|The location of the FC interface is defined by the location of its port. An FC port is identified by its UUID, or a combination of its node name and port name. Either the UUID or the node name and port name are required for POST. To move an interface, supply either the UUID or the node name and port name in a PATCH.

The location of an FC interface can be set using "location.home_node" and "location.home_port" during a POST or PATCH. "location.node" and "location.port" refer to the current location of the FC interface. This may be different from "location.home_node" and "location.home_port" in instances where the FC interface failed over due to an offline node.

|name

|string

a|The name of the FC interface. Required in POST; optional in PATCH.

|port_address

|string

a|The port address of the FC interface. Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the address given by a switch to the FC interface when the SVM performs a port login (PLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a hexadecimal encoded numeric value.

|state

|string

a|The current operational state of the FC interface. The state is set to `_down_` if the interface is not enabled.

If the node hosting the port is down or unavailable, no state value is returned.

|svm

|link:#svm[svm]

a|

```

|uuid
|string
a|The unique identifier of the FC interface. Required in the URL.

|wwnn
|string
a|The world wide node name (WWNN) of the FC interface SVM. The WWNN is
generated by ONTAP when Fibre Channel Protocol or the NVMe service is
created for the FC interface SVM.

* example: 20:00:00:50:56:b4:13:01
* readOnly: 1
* Introduced in: 9.6

|wwpn
|string
a|The world wide port name (WWPN) of the FC interface. The WWPN is
generated by ONTAP when the FC interface is created.

* example: 20:00:00:50:56:b4:13:a8
* readOnly: 1
* Introduced in: 9.6

a|Filter by latency.write
```

```
|uuid
|string
|path
|True
a|Unique identifier of the FC interface.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
```

```

|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

= Retrieve FC port information

```

```

:leveloffset: +1

```

```

[[ID7e368a1567d2503fad49a85cdd39a3f9]]
= Network FC ports endpoint overview

```

```

== Overview

```

Fibre Channel (FC) ports are the physical ports of FC adapters on ONTAP cluster nodes that can be connected to FC networks to provide FC network connectivity. An FC port defines the location of an FC interface within the ONTAP cluster.

The Fibre Channel port REST API allows you to discover FC ports, obtain status information for FC ports, and configure FC port properties. POST and DELETE requests are not supported. You must physically add and remove FC adapters to ONTAP nodes to create and remove ports from the ONTAP cluster.

== Performance monitoring

Performance of an FC port can be monitored by observing the ``metric.++`` and ``statistics.++`` properties. These properties show the performance of an FC port in terms of IOPS, latency, and throughput. The ``metric.++`` properties denote an average, whereas ``statistics.++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Retrieving all FC ports

The API:

GET /api/network/fc/ports

The call:

```
curl -X GET "https://<mgmt-ip>/api/network/fc/ports" -H "accept:
application/hal+json"
```

The response:

```

=== Disabling an FC port

If an active FC interface exists on an FC port, the port cannot be disabled.

The API:

PATCH /api/network/fc/ports/{uuid}

The call:

```
curl -X PATCH "http://<mgmt-ip>/api/network/fc/ports/931b20f8-b047-11e8-9af3-005056bb838e" -H "accept: application/hal+json" -d '{ "enabled": false }'
```

[[IDffffde6ac93b8abbedd55a23fa377dd9f]]

= Retrieve FC ports

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/network/fc/ports`#

Introduced In: 9.6

Retrieves FC ports.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `fabric.name`

* `statistics.+++`

|query
|False
a|Filter by transceiver.form-factor
```

```
|transceiver.capabilities
|integer
|query
|False
a|Filter by transceiver.capabilities
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

[#fabric]
[.api-collapsible-fifth-title]
fabric

```

Properties of the fabric to which the FC port is attached.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|connected
```

```
|boolean
```

a|Reports if the physical port has established a connection with the FC fabric.

```
|connected_speed
```

```
|integer
```

a|The negotiated data rate between the target FC port and the fabric in gigabits per second.

```
|name
```

```
|string
```

a|The name of the fabric to which the port is connected. This is only available when the FC port is connected to a fabric.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|port_address
```

```
|string
```

a|The FC port address of the host bus adapter (HBA) physical port.

Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the FC port address given to the physical host bus adapter (HBA) port when the port performs a fabric login (FLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a six-digit hexadecimal encoded numeric value.

```
|switch_port
|string
a|The switch port to which the FC port is connected.
```

```
|===
```

```

```
|_links
|link:#_links[_links]
a|
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

```
|iops
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#fabric]
```

```
[.api-collapsible-fifth-title]
```

`fabric`

Properties of the fabric to which the FC port is attached.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|connected
```

```
|boolean
```

`a|`Reports if the physical port has established a connection with the FC fabric.

```
|connected_speed
```

```
|integer
```

`a|`The negotiated data rate between the target FC port and the fabric in gigabits per second.

```
|name
```

```
|string
```

`a|`The name of the fabric to which the port is connected. This is only available when the FC port is connected to a fabric.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is

explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|port_address

|string

a|The FC port address of the host bus adapter (HBA) physical port.

Each FC port in an FC switched fabric has its own unique FC port address for routing purposes. The FC port address is assigned by a switch in the fabric when that port logs in to the fabric. This property refers to the FC port address given to the physical host bus adapter (HBA) port when the port performs a fabric login (FLOGI).

This is useful for obtaining statistics and diagnostic information from FC switches.

This is a six-digit hexadecimal encoded numeric value.

|switch_port

|string

a|The switch port to which the FC port is connected.

|===

[#iops]

[.api-collapsible-fifth-title]

iops

The rate of I/O operations observed at the storage object.

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```

= Update an FC port

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/network/fc/ports/{uuid}`#

Introduced In: 9.6

Updates an FC port.

== Related ONTAP commands

* `network fcp adapter modify`

== Learn more

* xref:{relative_path}network_fc_ports_endpoint_overview.html[DOC /network/fc/ports]

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|The unique identifier for the FC port.

|===

== Request Body

[cols=3*,options=header]

|===

|Name

```

|Type
|Description

|description
|string
a|A description of the FC port.

|enabled
|boolean
a|The administrative state of the FC port. If this property is set to
  _false_, all FC connectivity to FC interfaces are blocked. Optional in
  PATCH.

|fabric
|link:#fabric[fabric]
a|Properties of the fabric to which the FC port is attached.

|name
|string
a|The FC port name.

|node
|link:#node[node]
a|

|physical_protocol
|string
a|The physical network protocol of the FC port.

|speed
|link:#speed[speed]
a|The physical device speed related properties of the FC port.

|state
|string
a|The operational state of the FC port.

* startup - The port is booting up.
* link_not_connected - The port has finished initialization, but a link
  with the fabric is not established.
* online - The port is initialized and a link with the fabric has been

```

established.

* link_disconnected - The link was present at one point on this port but is currently not established.

* offlined_by_user - The port is administratively disabled.

* offlined_by_system - The port is set to offline by the system. This happens when the port encounters too many errors.

* node_offline - The state information for the port cannot be retrieved. The node is offline or inaccessible.

|supported_protocols

|array[string]

a|The network protocols supported by the FC port.

|transceiver

|link:#transceiver[transceiver]

a|Properties of the transceiver connected to the FC port.

|uuid

|string

a|The unique identifier of the FC port.

|wwnn

|string

a|The base world wide node name (WWNN) for the FC port.

|wwpn

|string

a|The base world wide port name (WWPN) for the FC port.

|===

[#transceiver]
[.api-collapsible-fifth-title]
transceiver

Properties of the transceiver connected to the FC port.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|capabilities
|array[integer]
a|The speeds of which the transceiver is capable in gigabits per second.

|form-factor
|string
a|The form factor of the transceiver. Possible values are:

* _sfp_ - Small Form Factor - Pluggable
* _sff_ - Small Form Factor
* _unk_ - Unknown

|manufacturer
|string
a|The manufacturer of the transceiver.

|part_number
|string
a|The part number of the transceiver.

|===

```

```
[#fc_port]
[.api-collapsible-fifth-title]
fc_port
```

A Fibre Channel (FC) port is the physical port of an FC adapter on an ONTAP cluster node that can be connected to an FC network to provide FC network connectivity. An FC port defines the location of an FC interface within the ONTAP cluster.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|description
|string
a|A description of the FC port.
```

```
|enabled
|boolean
a|The administrative state of the FC port. If this property is set to
  _false_, all FC connectivity to FC interfaces are blocked. Optional in
  PATCH.
```

```
|fabric
|link:#fabric[fabric]
a|Properties of the fabric to which the FC port is attached.
```

```
|name
|string
a|The FC port name.
```

```
|node
|link:#node[node]
a|
```

```
|physical_protocol
|string
a|The physical network protocol of the FC port.
```

```

|speed
|link:#speed[speed]
a|The physical device speed related properties of the FC port.

|state
|string
a|The operational state of the FC port.

* startup - The port is booting up.
* link_not_connected - The port has finished initialization, but a link
with the fabric is not established.
* online - The port is initialized and a link with the fabric has been
established.
* link_disconnected - The link was present at one point on this port but
is currently not established.
* offlined_by_user - The port is administratively disabled.
* offlined_by_system - The port is set to offline by the system. This
happens when the port encounters too many errors.
* node_offline - The state information for the port cannot be retrieved.
The node is offline or inaccessible.

|supported_protocols
|array[string]
a|The network protocols supported by the FC port.

|transceiver
|link:#transceiver[transceiver]
a|Properties of the transceiver connected to the FC port.

|uuid
|string
a|The unique identifier of the FC port.

|wwnn
|string
a|The base world wide node name (WWNN) for the FC port.

|wwpn
|string
a|The base world wide port name (WWPN) for the FC port.

= Retrieve FC port historical performance metrics

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/fc/ports/{uuid}/metrics`#

*Introduced In:* 9.8

Retrieves historical performance metrics for an FC port

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|duration
|string
|query
|False
a|Filter by duration

```

```
|timestamp  
|string  
|query  
|False  
a|Filter by timestamp
```

```
|throughput.write  
|integer  
|query  
|False  
a|Filter by throughput.write
```

```
|throughput.read  
|integer  
|query  
|False  
a|Filter by throughput.read
```

```
|throughput.total  
|integer  
|query  
|False  
a|Filter by throughput.total
```

```
|latency.total  
|integer  
|query  
|False  
a|Filter by latency.total
```

```
|latency.read  
|integer  
|query  
|False  
a|Filter by latency.read
```

```
|latency.other  
|integer  
|query  
|False  
a|Filter by latency.other
```

```
|latency.write
|integer
|query
|False
a|Filter by latency.write
```

```
|status
|string
|query
|False
a|Filter by status
```

```
|iops.total
|integer
|query
|False
a|Filter by iops.total
```

```
|iops.read
|integer
|query
|False
a|Filter by iops.read
```

```
|iops.other
|integer
|query
|False
a|Filter by iops.other
```

```
|iops.write
|integer
|query
|False
a|Filter by iops.write
```

```
|uuid
|string
|path
```

```

|True
a|Unique identifier of the FC port.

|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

```

```

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

  },
  "server": "1.1.1.1",
  "port": 3128
}
-----

```

=== Creating an HTTP proxy configuration

You can use the HTTP proxy POST operation to create an HTTP proxy configuration for the specified SVM.

=== Examples

=== Creating an HTTP proxy configuration for a particular SVM

The API:

/api/network/http-proxy

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/http-proxy" -H "accept:
application/json" -H "Content-Type: application/json" -d "{  \"port\":
3128,  \"server\": \"1.1.1.1\",  \"svm\": {      \"name\": \"cluster-1\"
}}"
```

=== Creating an HTTP proxy configuration for a particular IPspace

The API:

/api/network/http-proxy

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/http-proxy" -H "accept:
application/json" -H "Content-Type: application/json" -d "{  \"ipspace\":
{      \"name\": \"Default\"  },  \"port\": 3128,  \"server\": \"1.1.1.1\"}"
```

== Update an HTTP proxy configuration for a specified SVM

You can use the HTTP proxy PATCH operation to update the HTTP proxy configuration for the specified SVM.

== Example

The following example shows how a PATCH operation is used to update an HTTP proxy configuration for a specific SVM:

The API:

/api/network/http-proxy/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/http-proxy/96219ce3-7214-
11e9-828c-005056bb4f0c" -H "accept: application/json" -H "Content-Type:
application/json" -d "{      \"port\": 3128,  \"server\":
\"server2.example.com\"}"
```

====

== Delete an HTTP proxy configuration for a specified SVM

You can use the HTTP proxy DELETE operation to delete the HTTP proxy configuration for the specified SVM.

== Example

The following example shows how a DELETE operation is used to delete an HTTP proxy configuration for a specific SVM:

```
# The API:
/api/network/http-proxy/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/network/http-proxy/96219ce3-7214-11e9-828c-005056bb4f0c" -H "accept: application/json"
```

```
[[ID81e7eebead808474b151781f3c101062]]
= Retrieve HTTP proxy configurations for all SVMs and cluster IPspaces
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/http-proxy`#
```

Introduced In: 9.7

Retrieves the HTTP proxy configurations of all the SVMs and Cluster IPspaces.

== Related ONTAP commands

* `vserver http-proxy show`

of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID27fbe88d795b194bd1bc529d8614fe55]]
= Create an HTTP proxy configuration for an SVM or cluster IPspace

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/http-proxy`#
```

***Introduced In:* 9.7**

Creates an HTTP proxy configuration for an SVM or a Cluster IPspace.
Important notes:

- * IPv6 must be enabled if IPv6 family addresses are specified in the "server" field.
- * The server and the port combination specified using the "server" and "port" fields is validated during this operation. The validation will fail in the following scenarios:

- *** The HTTP proxy service is not configured on the server.

```

*** The HTTP proxy service is not running on the specified port.

*** The server is unreachable.

== Required properties

* SVM-scoped HTTP proxy

*** `svm.uuid` or `svm.name` - Existing SVM in which to create the HTTP
proxy.

* Cluster-scoped HTTP proxy

*** `ipspace.uuid` or `ipspace.name` - Existing Cluster IPspace in which
to create the HTTP proxy.

* `server` - HTTP proxy server FQDN or IP address.
* `port` - HTTP proxy server port.

== Related ONTAP commands

* `vserver http-proxy create`

== Parameters

= Manage BGP peer groups

:leveloffset: +1

[[ID5a78070681a8c9893717d7657e677fd6]]

= Network IP BGP peer-groups endpoint overview

== Overview

The following operations are supported:

- * Creation: POST network/ip/bgp/peer-groups
- * Collection Get: GET network/ip/bgp/peer-groups
- * Instance Get: GET network/ip/bgp/peer-groups/{uuid}
- * Instance Patch: PATCH network/ip/bgp/peer-groups/{uuid}
- * Instance Delete: DELETE network/ip/bgp/peer-groups/{uuid}

== Retrieving network BGP sessions information

The IP BGP peer-groups GET API retrieves and displays relevant information pertaining to the BGP peer-groups configured in the cluster. The response can contain a list of multiple BGP peer-groups or a specific peer-group. Each BGP peer-group represents a BGP session configured between a local interface and a peer router.

== Examples

=== Retrieving all BGP peer-groups in the cluster

The following example shows the list of all BGP peer-groups configured in a cluster.

```
'''
```

```
----
```

```
# The API:
```

```
/api/network/ip/bgp/peer-groups
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/network/ip/bgp/peer-groups" -H "accept: application/hal+json"
```

```
# The response:
{
  "records": [
    {
      "uuid": "5f22ae9d-87b2-11e9-a3a6-005056bb81a4",
      "name": "pg1",
      "_links": {
        "self": {
          "href": "/api/network/ip/bgp/peer-groups/5f22ae9d-87b2-11e9-a3a6-005056bb81a4"
        }
      }
    },
    {
      "uuid": "5fd08be3-87b2-11e9-952f-005056bb2170",

----
'''

```

== Creating a BGP peer-group

The BGP peer-group POST API is used to create a peer-group as shown in the following examples.

```
'''
```

== Examples

=== Creating a BGP peer-group with an existing interface

The following example shows how to create a BGP peer-group between an existing interface "bgp1" and peer router with the address "10.10.10.10". The local interface "bgp1" needs to support the management-bgp service, otherwise the system returns an error.

```
'''
```

```
----
```

The API:

/api/network/ip/bgp/peer-groups

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/ip/bgp/peer-groups?return_records=true" -d'{"name": "newPg", "ipspace.name": "Default",
```

```
"local.interface.name": "bgp1", "peer.address": "10.10.10.10"}'
```

```
# The response:
{
  "num_records": 1,
  "records": [
    {
      "uuid": "e3faacc6-87cb-11e9-a3a6-005056bb81a4",
      "name": "newPg",
      "ipspace": {
        "name": "Default"
      },
      "local": {
        "interface": {
          "name": "bgp1"
        }
      },
      "peer": {
        "address": "10.10.10.10"
      },
      "_links": {
        "self": {
          "href": "/api/network/ip/bgp/peer-groups/e3faacc6-87cb-11e9-a3a6-005056bb81a4"
        }
      }
    }
  ]
}
----
```

```
'''
```

=== Creating a BGP peer-group and provisioning a new local interface

The following example shows how to create a BGP peer-group with any local interface. If the local interface doesn't exist, the system will create it first before creating the peer-group.

```
'''
----
```

```
# The API:
/api/network/ip/bgp/peer-groups
```

```

# The call:
curl -X POST "https://<mgmt-ip>/api/network/ip/bgp/peer-
groups?return_records=true" -d'{"name": "newPg1",
"ipspace.name":"Default", "local": {"interface": {"name": "newlif"}, "ip":
{"address": "9.9.9.9", "netmask": "24"}, "port": {"name": "e0f", "node":
{"name": "node1"}}}, "peer.address":"10.10.10.10"}'

# The response:
{
  "num_records": 1,
  "records": [
    {
      "uuid": "c292f069-8872-11e9-a3a6-005056bb81a4",
      "name": "newPg1",
      "ipspace": {
        "name": "Default"
      },
      "local": {
        "interface": {
          "name": "newlif"
        },
        "port": {
          "name": "e0f",
          "node": {
            "name": "node1"
          }
        }
      },
      "peer": {
        "address": "10.10.10.10"
      },
      "_links": {
        "self": {
          "href": "/api/network/ip/bgp/peer-groups/c292f069-8872-11e9-a3a6-
005056bb81a4"
        }
      }
    }
  ]
}
----

'''

== Updating BGP peer-groups

```

The BGP peer-groups PATCH API is used to update attributes of a peer-group.

'''

== Examples

=== Updating the peer router address

The following example shows how the PATCH request changes the peer router IP address.

'''

The API:

/api/network/ip/bgp/peer-groups/{uuid}

The call:

curl -X PATCH "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d

'{"peer.address": "10.10.10.20" }'

{

}

'''

=== Updating the peer-group to a new name

The following example shows how the PATCH request renames the peer-group.

'''

The API:

/api/network/ip/bgp/peer-groups/{uuid}

The call:

curl -X PATCH "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d

'{"name": "NewName" }'

{

}

'''

== Deleting BGP peer-groups

The BGP peer-groups DELETE API is used to delete an BGP peer-group.

'''

== Example

=== Deleting a BGP peer-group

The following DELETE request deletes a BGP peer-group.

'''

The API:

/api/network/ip/bgp/peer-group/{uuid}

The call:

curl -X DELETE "https://<mgmt-ip>/api/network/ip/bgp/peer-groups/80d271c9-1f43-11e9-803e-005056a7646a"

{
}

'''

= Create a new BGP peer group for VIP

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/network/ip/bgp/peer-groups`#

Introduced In: 9.7

Creates a new BGP peer group for VIP. Multipath-routing is turned on cluster-wide automatically if the peer group being created results in multiple paths being available for an existing or future VIP interface.

== Required properties

* `name` - Name of the peer-group to create.

* `ipspace.name` or `ipspace.uuid`

*** Required with local.interface.name to identify a local interface

*** Optional when local.interface.uuid is specified

* `local.interface.uuid` or `local.interface.name`

*** Required when specifying an existing local interface.

* `local.interface.name`, `local.ip` and `local.port`

*** Required to create a new local interface.

* `peer.address` - IP address of the peer router

== Related ONTAP commands

* `network bgp peer-group create`

== Parameters

[cols=5*,options=header]

|==

|Name

|Type

```

|In
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

ONTAP Error Response Codes

```
|===
```

```
| Error Code | Description
```

```
| 1376963
```

```
| Duplicate IP address is specified.
```

```
| 1966133
```

```
| Since masking an address with a netmask represents an entire IP subnet,  
the masked and unmasked IP addresses cannot be the same.
```

```
| 1966267
```

```
| IPv6 addresses must have a prefix length of 64.
```

```
| 1966269
```

```
| IPv4 addresses must have a netmask length between 1 and 32.
```

```
| 1967082
```

```
| IPspace name and UUID must match if both are given.
```

```
| 1967155
```

```
| The specified local.port.name does not match the location.port.name for  
the specified local.interface.
```

```
| 1967156
```

```
| The specified local.port.node.name does not match the  
location.port.node.name for the specified local.interface.
```

```
| 1967157
```

```
| The specified local.port.uuid does not match the location.port.uuid for  
the specified local.interface.
```

```
| 1967158
```

```
| The specified local.interface.name does not exist in the associated
```

IPspace. local.ip.address and local.ip.netmask are required to create a new LIF.

| 1967159

| local.interface does not support management-bgp service.

| 1967160

| The specified local.interface.name does not match the specified interface name of local.interface.uuid.

| 1967161

| The specified local.interface.uuid does not exist in the specified IPspace.

| 1967162

| Either local.interface or local.ip and local.port are required to specify a local LIF.

| 1967163

| The specified local.port.name does not match the specified port name of local.port.uuid.

| 1967164

| The specified local.port.node.name does not match the specified node name of local.port.uuid.

| 1967165

| The specified local.port does not exist.

| 1967166

| ipspace.uuid or ipspace.name must be provided with local.interface.name together to identify a LIF.

| 1967167

| Internal error. Failed to update BGP configuration for node. Retry the command, if necessary.

| 1967168

| Internal error. Failed to create a VIP port for IPspace on node. Retry the command, if necessary.

| 1967169

| Internal error. BGP configuration changed during the operation. Retry the command, if necessary.

| 1967170

| Internal error. VIP port configuration changed during the operation.

Retry the command, if necessary.

| 1967171

| Internal error. Fail to access or update BGP peer group. Retry the command, if necessary.

| 1967172

| Peer group could not be updated because IPspace does not exist. Retry the command, if necessary.

| 1967173

| The specified local.ip.address does not match the address for the specified local.interface.

| 1967174

| The specified local.ip.netmask does not match the netmask for the specified local.interface.

| 1967176

| The specified local.interface.name does not exist in the associated IPspace. local.port.name, local.port.node.name, or local.port.uuid is required to create a new LIF.

| 1967177

| Internal error. Failed to access the local interface. Retry the command, if necessary.

| 1967178

| The IPv6 address specified with local.ip.address is not supported because it is link-local, multicast, v4-compatible, v4-mapped, loopback or "::".

| 1967179

| The IPv4 address specified with local.ip.address is not supported because it is multicast, loopback or 0.0.0.0.

| 53281985

| Internal error. Failed to update BGP peer group because BGP LIF moved during the operation. Wait a few minutes and try the command again.

| 53282006

| BGP peer group could not be updated to use a peer address because the value provided is not a valid peer address. If necessary, try the command again with a routable host address.

| 53282007

| BGP peer group could not be updated to use a peer address because the

address represents a different address family to the address of the associated BGP LIF. If necessary, try the command again with a matching address family.

```
| 53282018
| Failed to create BGP peer group because an existing peer group has
| already established a BGP session between LIF and peer address. If
| necessary, try the command again with a different BGP LIF or a different
| peer address.

Status: 200, Ok

== Error

Status: Default

ONTAP Error Response Codes

|===

Error Code	Description
------------	-------------

1967171	
---------	--

	Internal error. Fail to access or update BGP peer group. Retry the command, if necessary.
--	-------------------------------------------------------------------------------------------

53281998	
----------	--

	Failed to rename the BGP peer group because that name is already assigned to a different peer group in the IPspace.
--	---------------------------------------------------------------------------------------------------------------------

53282006	
----------	--

	BGP peer group could not be updated to use a peer address because the value provided is not a valid peer address. If necessary, try the command again with a routable host address.
--	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

53282007	
----------	--

	BGP peer group could not be updated to use a peer address because the address represents a different address family to the address of the associated BGP LIF. If necessary, try the command again with a matching address family.
--	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

53282018	
----------	--

	Failed to create BGP peer group because an existing peer group has already established a BGP session between LIF and peer address. If necessary, try the command again with a different BGP LIF or a different peer address.
--	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

```
:leveloffset: +1
```

```
[[ID271145f24952492cf373afb01e4692f0]]
```

= Network IP interfaces endpoint overview

== Overview

The following operations are supported:

- * Creation: POST network/ip/interfaces
- * Collection Get: GET network/ip/interfaces
- * Instance Get: GET network/ip/interfaces/{uuid}
- * Instance Patch: PATCH network/ip/interfaces/{uuid}
- * Instance Delete: DELETE network/ip/interfaces/{uuid}

== Retrieving network interface information

The IP interfaces GET API retrieves and displays relevant information pertaining to the interfaces configured in the cluster. The response can contain a list of multiple interfaces or a specific interface. The fields returned in the response vary for different interfaces and configurations.

== Examples

=== Retrieving all interfaces in the cluster

The following example shows the list of all interfaces configured in a cluster.

```

== Updating IP interfaces

You can use the IP interfaces PATCH API to update the attributes of an IP interface.

'''

== Examples

=== Updating the auto revert flag of an IP interface

The following example shows how the PATCH request changes the auto revert flag to 'false'.

'''

The API:

/api/network/ip/interfaces/{uuid}

The call:

```

curl -X PATCH "https://<mgmt-ip>/api/network/ip/interfaces/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d '{
"location": { "auto_revert": "false" } }'
{
}

```

'''

=== Updating the service policy of an IP interface

The following example shows how the PATCH request changes the service policy to 'default-management'.

'''

The API:

/api/network/ip/interfaces/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ip/interfaces/80d271c9-1f43-11e9-803e-005056a7646a" -H "accept: application/hal+json" -d '{
"service_policy": { "name": "default-management" } }'
```

'''

== Deleting IP interfaces

You can use the IP interfaces DELETE API to delete an IP interface in the cluster.

'''

== Example

=== Deleting an IP Interface

The following DELETE request deletes a network IP interface.

'''

The API:

/api/network/ip/interfaces/{uuid}

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/network/ip/interfaces/80d271c9-1f43-11e9-803e-005056a7646a"
{
```

```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|status
```

```
|string
```

```
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".
```

"inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.
```

```
|timestamp
|string
a|The timestamp of the performance data.

[[IDe3f94ada58b33e303eb0086bf802c55d]]
= Create a new cluster-scoped or SVM-scoped interface

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ip/interfaces`#

*Introduced In:* 9.6

Creates a new Cluster-scoped or SVM-scoped interface.

== Required properties

* `name` - Name of the interface to create.
* `ip.address` - IP address for the interface.
* `ip.netmask` - IP subnet of the interface.
* `ipspace.name` or `ipspace.uuid`

*** Required for Cluster-scoped interfaces.

*** Optional for SVM-scoped interfaces.

* `svm.name` or `svm.uuid`

*** Required for an SVM-scoped interface.

```

```

*** Invalid for a Cluster-scoped interface.

* `location.home_port` or `location.home_node` or
`location.broadcast_domain` - One of these properties must be set to a
value to define where the interface will be located.

== Recommended property values

* `service_policy`

*** `for SVM scoped interfaces`

***** `_default-data-files_` for interfaces carrying file-oriented NAS data
traffic

***** `_default-data-blocks_` for interfaces carrying block-oriented SAN
data traffic

***** `_default-management_` for interfaces carrying SVM management requests

*** `for Cluster scoped interfaces`

***** `_default-intercluster_` for interfaces carrying cluster peering
traffic

***** `_default-management_` for interfaces carrying system management
requests

***** `_default-route-announce_` for interfaces carrying BGP peer
connections

== Default property values

If not specified in POST, the following default property values are
assigned:

* `scope`

*** `_svm_` if svm parameter is specified.

*** `_cluster_` if svm parameter is not specified

* `enabled` - `_true_`
* `location.auto_revert` - `_true_`
* `service_policy`

*** `_default-data-files_` if scope is `svm`

```

```

*** _default-management_ if scope is `cluster` and IPspace is not
`Cluster`

*** _default-cluster_ if scope is `svm` and IPspace is `Cluster`

* `failover` - Selects the least restrictive failover policy supported by
all the services in the service policy.

== Related ONTAP commands

* `network interface create`

== Parameters

| The specified svm.uuid is not valid.

| 1967153
| No suitable port exists on location.home_node to host the interface.

| 1967154
| Interfaces cannot be created on ports that are down. If a broadcast
domain is specified, ensure that it contains at least one port that is
operationally up.

| 1967381
| Post VIP interfaces requires an effective cluster version of 9.7 or
later.

| 1967382
| VIP interfaces only reside in SVM scope.

| 1967383
| Neither location.home_port.uuid or location.home_port.name should be set
with vip=true.

| 1967384
| Failed to create VIP interface because the home node does not have
active BGP sessions to support Virtual IP (VIP) traffic.

| 1967385
| VIP interfaces with an IPv4 address must use ip.netmask=32. VIP
interfaces with an IPv6 address must use ip.netmask=128.

| 1967387
| The specified IP address is in use by a subnet in this IPspace.

| 5373966
| An iSCSI interface cannot be created in an SVM configured for NVMe.

| 53281065
| The service_policy does not exist in the SVM.

|===

[#throughput]
[.api-collapsible-fifth-title]
throughput

The rate of throughput bytes per second observed at the interface.

[cols=3*,options=header]
|===
|Name
|Type
|Description

```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#metric]
[.api-collapsible-fifth-title]
metric
```

The most recent sample of I/O metrics for the interface.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|duration
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|status
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two

collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===

```

```
|===
```

```
[#throughput_raw]
[.api-collapsible-fifth-title]
throughput_raw
```

Throughput bytes observed at the interface. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Performance metric for write I/O operations.

|===
```

```
[#statistics]
[.api-collapsible-fifth-title]
statistics
```

The real time I/O statistics for the interface.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
```

collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the interface. This can be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#svm]
[.api-collapsible-fifth-title]
svm

Applies only to SVM-scoped objects. Either the UUID or name must be supplied on POST.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|The name of the SVM.

|uuid
|string
a|The unique identifier of the SVM.

|===

```

[#ip_interface]
[.api-collapsible-fifth-title]
ip_interface

[cols=3*,options=header]

|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.

|timestamp
|string
a|The timestamp of the performance data.

= Update an IP interface

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-  
block]#`/network/ip/interfaces/{uuid}`#
```

Introduced In: 9.6

Updates an IP interface.

== Related ONTAP commands

- * `network interface migrate`
- * `network interface modify`
- * `network interface rename`
- * `network interface revert`

== Parameters

```
[cols=5*,options=header]  
|===
```

Name
Type
In
Required
Description

uuid
string
path
True
a IP interface UUID

```
|===
```

== Request Body

```
[cols=3*,options=header]  
|===
```

Name
Type
Description

enabled

```

|boolean
a|The administrative state of the interface.

|ip
|link:#ip_info[ip_info]
a|IP information

|location
|link:#location[location]
a|Current or home location can be modified. Specifying a port implies a
node. Specifying a node allows an appropriate port to be automatically
selected. Ports are not valid and not shown for VIP interfaces. For POST,
broadcast_domain can be specified alone or with home_node.

|name
|string
a|Interface name

|service_policy
|link:#service_policy[service_policy]
a|

|services
|array[string]
a|The services associated with the interface.

|state
|string
a|The operational state of the interface.

|uuid
|string
a|The UUID that uniquely identifies the interface.

|===

| Error Code | Description
```

```
| 1376963
```

```
| Duplicate IP address.
```

```
| 1966138
```

```
| The same IP address may not be used for both a mgmt interface and a  
gateway address.
```

```
| 1967106
```

```
| The specified location.home_port.name does not match the specified port  
name of location.home_port.uuid.
```

```
| 1967107
```

```
| The specified location.home_port.uuid is not valid.
```

```
| 1967111
```

```
| A home node must be specified by at least one location.home_node,  
location.home_port, or location.broadcast_domain field.
```

```
| 1967113
```

```
| The specified location.port.name does not match the port name of  
location.port.uuid.
```

```
| 1967114
```

```
| The specified location.port.uuid is not valid.
```

```
| 1967115
```

```

location.node.uuid.
```

```
| 1967116
```

```
| The specified location.port.node.name does not match the node name of  
location.node.uuid.
```

```
| 1967117
```

| The specified location.port.node.name does not match location.node.name.

| 1967118

| A node must be specified by at least one location.node or location.port field.

| 1967119

| The specified location.node.name does not match the node name of location.port.uuid.

| 1967120

| The specified service_policy.name does not match the specified service policy name of service_policy.uuid.

| 1967121

| The specified service_policy.uuid is not valid.

| 1967125

| You cannot patch the "location.node" or "location.port" fields to migrate interfaces using the iSCSI data protocol. Instead perform the following PATCH operations on the interface: set the "enabled" field to "false"; change one or more "location.home_port" fields to migrate the interface; and then set the "enabled" field to "true".

| 1967129

| The specified location.home_port.uuid is not valid.

| 1967130

| The specified location.home_port.name is not valid.

| 1967131

| The specified location.home_port.uuid and location.home_port.name are not valid.

| 1967132

| The specified location.port.uuid is not valid.

| 1967133

| The specified location.port.name is not valid.

| 1967134

| The specified location.port.uuid and location.port.name are not valid.

| 1967138

| Cannot patch port for a VIP interface. The specified parameter location.port.uuid is not valid.

```
| 1967139
| Cannot patch port for a VIP interface. The specified parameter
location.port.name is not valid.

| 1967140
| Cannot patch port for a VIP interface. The specified parameters
location.port.uuid and location.port.name are not valid.

| 1967141
| Cannot patch home_port for a VIP interface. The specified parameter
location.home_port.uuid is not valid.

| 1967142
| Cannot patch home_port for a VIP interface. The specified parameter
location.home_port.name is not valid.

| 1967143
| Cannot patch home_port for a VIP interface. The specified parameters
location.home_port.uuid and location.home_port.name are not valid.

| 1967145
| The specified location.failover is not valid.

| 1967153
| No suitable port exists on location.home_node to host the interface.

| 1967380
| Cannot patch home_port for a VIP interface. The specified parameter
location.home_port.node.name is not valid. Consider using
location.home_node.name instead.

| 1967386
| Cannot patch port for a VIP interface. The specified parameter
location.port.node.name is not valid. Consider using location.node.name
instead.

| 1967387
| The specified IP address is in use by a subnet in this IPspace.

| 53281065
| The service_policy does not exist in the SVM.

|False
a|Filter by duration
```

```
|uuid
|string
|path
|True
a|Unique identifier of the interface.
```

```
|interval
|string
|query
|False
```

a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.

The period for each time range is as follows:

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

```

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

a|

|duration

|string

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|status

|string

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an

expected monotonically increasing value has decreased in value.
"inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the interface.

|timestamp
|string
a|The timestamp of the performance data.

:leveloffset: -1

= Manage network IP routes

:leveloffset: +1

[[IDb1fb6c217c277f7c60d3e1b40c3f4ca8]]
= Network IP routes endpoint overview

== Overview

```

This endpoint supports the following operations: GET (collection and instance), POST, and DELETE.

'''

== Retrieving network routes

You can use the IP routes GET API to retrieve and display relevant information pertaining to the routes configured in the cluster. The API retrieves the list of all routes configured in the cluster, or a specific route. The fields that are returned in the response will differ with the configuration.

== Examples

=== Retrieving all routes in the cluster

The following output shows the list of all routes configured in a cluster.

'''

The API:

/api/network/ip/routes

The call:

```
curl -X GET "https://<mgmt-ip>/api/network/ip/routes?fields=*" -H "accept: application/hal+json"
```

The response:

```
{
  "records": [

-----

'''
```

== Creating network routes

You can use the POST API to create an SVM-scoped route by specifying the associated SVM, or a Cluster-scoped route by specifying the associated IPspace.

== Examples

=== Creating a Cluster-scoped route

IPspace is required to create a Cluster-scoped route. If the IPspace is not specified, the route will be created in the Default IPspace. The default destination will be set to "0.0.0.0/0" for IPv4 gateway addresses or "::/0" for IPv6 gateway addresses.

'''

The API:

/api/network/ip/routes

The call:

```
curl -X POST "https://<mgmt-ip>/api/network/ip/routes?return_records=true"
-H "accept: application/json" -d '{ "ipspace": { "name":"ips1" },
"gateway": "10.10.10.1"}'
```

The response:

```
{
"num_records": 1,
"records": [
  {
    "uuid": "ae583c9e-9ac7-11e8-8bc9-005056bbd531",
    "ipspace": {
      "name": "ips1"
    },
    "gateway": "10.10.10.1"
  }
]
}
```

'''

=== Creating an SVM-scoped route

To create an SVM-scoped route, the associated SVM can be identified by either its UUID or name.

'''

The API:

/api/network/ip/routes

```
# The call:
curl -X POST "https://<mgmt-ip>/api/network/ip/routes?return_records=true"
-H "accept: application/json" -d '{ "svm": { "name":"vs0" }, "gateway":
"10.10.10.1"}'
```

```
# The response:
```

```
{
  "num_records": 1,
  "records": [
    {
      "uuid": "38805a91-9ac9-11e8-8bc9-005056bbd531",
      "svm": {
        "name": "vs0"

= Create a cluster-scoped or SVM-scoped static route

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ip/routes`#

*Introduced In:* 9.6

Creates a Cluster-scoped or SVM-scoped static route.

== Required properties

* `gateway` - IP address to route packets to.
* SVM-scoped routes

*** `svm.name` or `svm.uuid` - SVM that route is applied to.

* cluster-scoped routes

*** There are no additional required fields for Cluster-scoped routes.

== Default property values

If not specified in POST, the following default property values are

```

assigned:

* `destination` - `_0.0.0.0/0_` for IPv4 or `_::/0_` for IPv6.
* `ipspace.name`

*** `_Default_` for Cluster-scoped routes.

*** Name of the SVM's IPspace for SVM-scoped routes.

:leveloffset: -1

= Manage network IP service policies

:leveloffset: +1

[[IDba2a2ea593c8cae6bd17315d4ac836c3]]
= Network IP service-policies endpoint overview

== Overview

Service policies are named groupings that define what services are

```

supported by an IP interface.

The following operations are supported:

*** Creation: POST network/ip/service-policies

*** Collection Get: GET network/ip/service-policies

*** Instance Get: GET network/ip/service-policies/{uuid}

*** Instance Patch: PATCH network/ip/service-policies/{uuid}

*** Instance Delete: DELETE network/ip/service-polices/{uuid}

== Examples

=== Retrieving all service policies in the cluster

The following output shows the collection of all service policies configured in a 2-node cluster. By default (without 'field=*' parameter), only the UUID and name fields are shown for each entry.

'''

The API:

/api/network/ethernet/ip/service-policies

The call:

```
curl -X GET "https://<mgmt-ip>/api/network/ip/service-policies" -H
"accept: application/hal+json"
```

The response:

```

'''
```

```
== Creating service policies
```

You can use this API to create an SVM-scoped service policy by specifying the associated SVM, or a cluster-scoped service policy by specifying the associated IPspace. If the scope is not specified, it is inferred from the presence of the IPspace or SVM.

Cluster scoped service policies will operate on the IPspace "Default" unless IPspace is explicitly specified.

```
== Examples
```

```
=== Creating a cluster-scoped service policy
```

The following output displays the response when creating a service policy with a scope of "cluster" and an IPspace of "Default".

```

*Introduced In:* 9.6

Retrieves a collection of service policies.

== Related ONTAP commands

* `network interface service-policy show`

```

```

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|uuid
|string
|query
|False
a|Filter by uuid

|scope
|string
|query
|False
a|Filter by scope

|services
|string
|query
|False
a|Filter by services

```

```
|ipospace.name
|string
|query
|False
a|Filter by ipospace.name
```

```
|ipospace.uuid
|string
|query
|False
a|Filter by ipospace.uuid
```

```
|name
|string
|query
|False
a|Filter by name
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

```
* Default value: 1
```

```
|return_timeout
```

```

|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create a service policy for network interfaces

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/network/ip/service-policies`#

Introduced In: 9.8

Creates a service policy for network interfaces.

== Required properties

* `name` - Name of the service policy to create.
* `ipspace.name` or `ipspace.uuid`

*** Required for cluster-scoped service policies.

*** Optional for SVM-scoped service policies.

* `svm.name` or `svm.uuid`

*** Required for SVM-scoped service policies.

*** Not valid for cluster-scoped service policies.

== Default property values

If not specified in POST, the following default property values are assigned:

* `scope`

*** svm if the svm parameter is specified

*** cluster if the svm parameter is not specified

== Parameters

[cols=5*,options=header]
|==

|Name
|Type
|In
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.

* Default value:

|==

|In
|Required

```

```

|Description

|uuid
|string
|path
|True
a|Service policy UUID

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```
= Network ipspaces endpoint overview
```

```
== Overview
```

An IPspace is an addressing domain within which each IP address is unique. The same address may appear in a different IPspace, but the matching addresses are considered to be distinct. SVMs and broadcast domains, and therefore IP interfaces and Ethernet ports, are associated with a single IPspace. This endpoint supports the following operations: GET (collection and instance), POST, PATCH, and DELETE.

== Retrieving IPspace information

You can use the IPspaces GET API to retrieve all IPspaces configured in the cluster, including built-in and custom IPspaces, and specifically requested IPspaces.

== Examples

=== Retrieving a list of the IPspaces in the cluster

The following example returns the requested list of IPspaces configured in the cluster.

The API:

/api/network/ipspaces

The call:

```
curl -X GET "https://<mgmt-ip>/api/network/ipspaces?fields=*" -H "accept: application/hal+json"
```

The response:

```
{
  "records": [
    {
      "uuid": "dcc7e79c-5acc-11e8-b9de-005056b42b32",
      "name": "Default",
      "_links": {
        "self": {
          "href": "/api/network/ipspaces/dcc7e79c-5acc-11e8-b9de-005056b42b32"
        }
      }
    },
    {
      "uuid": "dfd3c1b2-5acc-11e8-b9de-005056b42b32",
      "name": "Cluster",
      "_links": {
        "self": {
          "href": "/api/network/ipspaces/dfd3c1b2-5acc-11e8-b9de-005056b42b32"
        }
      }
    }
  ],
}
```

```

{
  "uuid": "dedec1be-5aec-1eee-beee-0eee56be2b3e",
  "name": "IpSPACE1",
  "_links": {
    "self": {
      "href": "/api/network/ipspaces/dedec1be-5aec-1eee-beee-0eee56be2b3e"
    }
  }
},
"num_records": 3,
"_links": {
  "self": {
    "href": "/api/network/ipspaces?fields=*"
  }
}
}
----
'''

```

=== Retrieving a specific IPspace in the cluster

The following example returns the specific IPspace requested. The system returns an error if there is no IPspace with the requested UUID.

```

'''
----

```

The API:

/api/network/ipspaces/{uuid}

The call:

```

curl -X GET "https://<mgmt-ip>/api/network/ipspaces/dfd3c1b2-5acc-11e8-b9de-005056b42b32?fields=*" -H "accept: application/hal+json"

```

The response:

```

{
  "uuid": "dcc7e79c-5acc-11e8-b9de-005056b42b32",
  "name": "Default",
  "_links": {
    "self": {
      "href": "/api/network/ipspaces/dcc7e79c-5acc-11e8-b9de-005056b42b32"
    }
  }
}

```

```

    }
}
----

'''

== Creating IPspaces

You can use the network IPspaces POST API to create IPspaces.

'''

== Example

=== Creating an IPspace

The following output displays the record returned after the creation of an
IPspace with the name "ipspace1".

'''

----

# The API:
/api/network/ipspaces

# The call:
curl -X POST "https://<mgmt-ip>/api/network/ipspaces?return_records=true"
-H "accept: application/hal+json" -d '{"name": "ipspace2"}'

# The response:
{
  "num_records": 1,
  "records": [
    {
      "uuid": "4165655e-0528-11e9-bd68-005056bb046a",
      "name": "ipspace2",
      "_links": {
        "self": {

'''

== Updating IPspaces

You can use the IPspaces PATCH API to update the attributes of the IPspace.

'''

== Example

=== Updating the name of an IPspace

The following PATCH request is used to update the name of the IPspace from "ipspace2" to "ipspace20".

'''

The API:

/api/network/ipspaces/{uuid}

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/network/ipspaces/4165655e-0528-11e9-  
bd68-005056bb046a" -H "accept: application/hal+json" -d "{  \"name\":  
\"ipspace20\"}"
```

'''

== Deleting IPspaces

You can use the IPspaces DELETE API to delete an IPspace.

'''

== Example

=== Deleting an IPspace

The following DELETE request is used to delete an IPspace.

'''

```

# The API:
/api/network/ipspaces/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/network/ipspaces/4165655e-0528-11e9-
bd68-005056bb046a" -H "accept: application/hal+json" -H "Content-Type:
application/json"

= Retrieve IPspaces for a cluster

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/network/ipspaces`#

*Introduced In:* 9.6

Retrieves a collection of IPspaces for the entire cluster.

== Related ONTAP commands

* `network ipspace show`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|name
|string
|query
|False
a|Filter by name

```

```
|uuid
|string
|query
|False
a|Filter by uuid
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1
* Max value: 120
* Min value: 0

```

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

:leveloffset: -1

:leveloffset: -1

= Object-store

:leveloffset: +1

= Manage S3 buckets

:leveloffset: +1

[[IDa78f6179ab595477f1c1d2998ddf0681]]
= Protocols S3 buckets endpoint overview

== Overview

```

An S3 bucket is a container of objects. Each bucket defines an object namespace. S3 server requests specify objects using a bucket-name and object-name pair. An object consists of data, along with optional metadata and access controls, that is accessible using a name. An object resides within a bucket. There can be more than one bucket in an S3 server. Buckets that are created for the server are associated with an S3 user that is created on the S3 server.

== Examples

=== Retrieving all fields for all S3 buckets of a cluster

The API:

/api/protocols/s3/buckets

The call:

```
curl -X GET "https://<mgmt-  
ip>/api/protocols/s3/buckets?fields=*&return_records=true" -H "accept:  
application/json"
```

The response:

```
{  
  "records": [  
    {  
      "svm": {

= Retrieve all S3 buckets for all SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/s3/buckets`#

Introduced In: 9.7

Retrieves all S3 buckets for all SVMs. Note that in order to retrieve S3 bucket policy conditions, the 'fields' option should be set to '**'.

== Related ONTAP commands

- * `vserver object-store-server bucket show`
- * `vserver object-store-server bucket policy statement show`

|query
|False
a|Filter by qos_policy.uuid

* Introduced in: 9.8

|qos_policy.min_throughput_iops
|integer
|query
|False
a|Filter by qos_policy.min_throughput_iops

```

* Introduced in: 9.8

|qos_policy.min_throughput_mbps
|integer
|query
|False
a|Filter by qos_policy.min_throughput_mbps

* Introduced in: 9.8

|qos_policy.name
|string
|query
|False
a|Filter by qos_policy.name

* Introduced in: 9.8

|encryption.enabled
|boolean
|query
|False
a|Filter by encryption.enabled

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number

of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by
|array[string]
|query
|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

[[ID7964a4638142a9aea6a58ab037b26483]]
= Create the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/buckets`#

```

Introduced In: 9.8

Creates the S3 bucket configuration of an SVM.

== Important notes

- * Each SVM can have one or more bucket configurations.
- * Aggregate lists should be specified explicitly. If not specified, then the bucket is auto-provisioned as a FlexGroup volume.
- * Constituents per aggregate specifies the number of components (or FlexVol volumes) per aggregate. Is specified only when an aggregate list is explicitly defined.
- * An access policy can be created along with a bucket create. If creating an access policy fails, bucket configurations are saved and the access policy can be created using the PATCH endpoint.
- * "qos_policy" can be specified if a bucket needs to be attached to a QoS group policy during creation time.

== Required properties

- * `svm.uuid or svm.name` - Existing SVM in which to create the bucket configuration.
- * `name` - Bucket name that is to be created.

== Recommended optional properties

- * `aggregates` - List of aggregates for the FlexGroup volume on which the bucket is hosted on.
- * `constituents_per_aggregate` - Number of constituents per aggregate.
- * `size` - Specifying the bucket size is recommended.
- * `policy` - Specifying a policy enables users to perform operations on buckets; specifying the resource permissions is recommended.
- * `qos_policy` - A QoS policy for buckets.

== Default property values

- * `size` - 800MB
- * `comment` - ""
- * `aggregates` - No default value.
- * `constituents_per_aggregate` - _4_ , if an aggregates list is specified. Otherwise, no default value.
- * `policy.statements.actions` - GetObject, PutObject, DeleteObject, ListBucket.
- * `policy.statements.principals` - all S3 users and groups in the SVM.
- * `policy.statements.resources` - all objects in the bucket.
- * `policy.statements.conditions` - list of bucket policy conditions.

== Related ONTAP commands

- * ``vserver object-store-server bucket create``
- * ``vserver object-store-server bucket policy statement create``

== Learn more

- * `xref:{relative_path}protocols_s3_buckets_endpoint_overview.html` [DOC /protocols/s3/buckets]

== Parameters

[cols=5*,options=header]
|===

Name
Type
In
Required
Description

return_timeout
integer
query
False

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

- * Default value: 1
- * Max value: 120
- * Min value: 0

return_records
boolean
query
False

a|The default is false. If set to true, the records are returned.

- * Default value:

|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

```
|comment
```

```
|string
```

a|Can contain any additional information about the bucket being created or modified.

```
|constituents_per_aggregate
```

```
|integer
```

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

```
|encryption
```

```
|link:#encryption[encryption]
```

```
a|
```

```
|logical_used_size
```

```
|integer
```

a|Specifies the bucket logical used size up to this point.

```
|name
```

```
|string
```

a|Specifies the name of the bucket. Bucket name is a string that can only contain the following combination of ASCII-range alphanumeric characters 0-9, a-z, ".", and "-".

```
|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.
```

```
|qos_policy
|link:#qos_policy[qos_policy]
a|Specifies "qos_policy.max_throughput_iops" and/or
"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".
Specifies "min_throughput_iops" is only supported on volumes hosted on a
node that is flash optimized. A pre-created QoS policy can also be used by
specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or
assigning a QoS policy to a bucket is not supported if its containing
volume or SVM already has a QoS policy attached.
```

```
|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.
```

```
|svm
|link:#svm[svm]
a|
```

```
|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```

```
|sid
|string
a|Specifies the statement identifier used to differentiate between
statements.
```

```
|===
```

```
[#policy]
[.api-collapsible-fifth-title]
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```

```
|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

|===

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
```

|===

```
|Name
|Type
|Description
```

```
|max_throughput_iops
|integer
```

a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|max_throughput_mbps
|integer
```

a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|min_throughput_iops
|integer
```

a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.

```
|min_throughput_mbps
|integer
```

a|Specifies the minimum throughput in Megabytes per sec, 0 means none.

This is mutually exclusive with name and UUID during POST and PATCH.

```
|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.
```

```
|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.
```

```

```
|===
```

```
[#s3_bucket]
```

```
[.api-collapsible-fifth-title]
```

```
s3_bucket
```

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.
```

```

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.

[[IDd4b4b0b1fd0846eb2f623ed960f9596e]]
= Delete the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/buckets/{svm.uuid}/{uuid}`#

*Introduced In:* 9.8

Deletes the S3 bucket configuration of an SVM. An access policy is also
deleted on an S3 bucket "delete" command.

== Related ONTAP commands

* `vserver object-store-server bucket delete`
* `vserver object-store-server bucket policy statement delete`
* `vserver object-store-server bucket policy-statement-condition delete`

== Learn more

* xref:{relative_path}protocols_s3_buckets_endpoint_overview.html[DOC
/protocols/s3/buckets]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|uuid

```

```

|string
|path
|True
a|The unique identifier of the bucket.

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

[[IDf96376e99e1ca31625e9d32da0905f90]]
= Update the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/s3/buckets/{svm.uuid}/{uuid}`#

*Introduced In:* 9.8

Updates the S3 bucket configuration of an SVM.

== Important notes

* The following fields can be modified for a bucket:

*** `comment` - Any information related to the bucket.

*** `size` - Bucket size.

*** `policy` - An access policy for resources (buckets and objects) that
defines their permissions. New policies are created after existing
policies are deleted. To retain any of the existing policy statements, you
need to specify those statements again. Also, policy conditions can be
specified as part of a bucket policy.

*** `qos_policy` - A QoS policy for buckets.

== Related ONTAP commands

* `vserver object-store-server bucket modify`

```

```
* `vserver object-store-server bucket policy statement modify`  
* `vserver object-store-server bucket policy-statement-condition modify`
```

== Learn more

```
* xref:{relative_path}protocols_s3_buckets_endpoint_overview.html[DOC  
/protocols/s3/buckets]
```

== Parameters

```
[cols=5*,options=header]  
|==
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|uuid  
|string  
|path  
|True  
a|The unique identifier of the bucket.
```

```
|return_timeout  
|integer  
|query  
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1  
* Max value: 120  
* Min value: 0
```

```
|svm.uuid  
|string  
|path
```

```

|True
a|UUID of the SVM to which this object belongs.

|===

== Request Body

[cols=3*,options=header]
|===
|Name
|Type
|Description

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifes "qos_policy.max_throughput_iops" and/or
"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".
Specifes "min_throughput_iops" is only supported on volumes hosted on a
node that is flash optimized. A pre-created QoS policy can also be used by
specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or

```

assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

|size

|integer

a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|uuid

|string

a|Specifies the unique identifier of the bucket.

|volume

|link:#volume[volume]

a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

```

:leveloffset: +1

```

```

[[IDac87942fd2d6fda3297f08d928194473]]
= Protocols S3 services endpoint overview

```

```

== Overview

```

An S3 server is an object store server that is compatible with the Amazon S3 protocol. In the initial version, only a subset of the protocol features necessary to support Fabric Pool capacity tier usecases are implemented. S3 server allows you to store objects in ONTAP using Amazon S3 protocol. This feature can be used as a target object store server for ONTAP FabricPools.

```

== Performance monitoring

```

Performance of the SVM can be monitored by the `metric.+++` and

`statistics.++` properties. These show the performance of the SVM in terms of IOPS, latency and throughput. The `metric.++` properties denote an average whereas `statistics.++` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Retrieving all of the S3 configurations

The API:

/api/protocols/s3/services

The call:

```
curl -X GET "https://<mgmt-  
ip>/api/protocols/s3/services?fields=*&return_records=true&return_timeout=  
15" -H "accept: application/json"
```

The response:

```

 = Retrieve the S3 server configuration for all SVMs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/s3/services`#

Introduced In: 9.7

Retrieves the S3 server configuration for all SVMs. Note that in order to retrieve S3 bucket policy conditions, 'fields' option should be set to '**'.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `statistics.+++`
 * `metric.+++`

== Related ONTAP commands

* `vserver object-store-server show`

== Learn more

* [xref:{relative_path}protocols_s3_services_endpoint_overview.html\[DOC /protocols/s3/services\]](#)

== Parameters

[cols=5*,options=header]

[#s3_bucket_policy_condition]
[.api-collapsible-fifth-title]
s3_bucket_policy_condition
```

Information about policy conditions based on various condition operators and condition keys.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|delimiters

|array[string]

a|An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.

|max_keys

|array[integer]

a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator

|string

a|Condition operator that is applied to the specified condition key.

|prefixes

|array[string]

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|Description

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

|===

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
|===
|Name
```

```

|Type
|Description

|_links
|link:#_links[_links]
a|

|max_throughput_iops
|integer
a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually
exclusive with name and UUID during POST and PATCH.

|max_throughput_mbps
|integer
a|Specifies the maximum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops
|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

|Description

|_links
|link:#_links[_links]
a|

|name
|string
```

a|The name of the volume.

|uuid

|string

a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7

* Introduced in: 9.6

|===

[#s3_bucket]

[.api-collapsible-fifth-title]

s3_bucket

A bucket is a container of objects. Each bucket defines an object namespace. S3 requests specify objects using a bucket-name and object-name pair. An object resides within a bucket.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|comment

|string

a|Can contain any additional information about the bucket being created or modified.

|encryption

|link:#encryption[encryption]

a|

|logical_used_size

|integer

a|Specifies the bucket logical used size up to this point.

|name

```

|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifies "qos_policy.max_throughput_iops" and/or
"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".
Specifies "min_throughput_iops" is only supported on volumes hosted on a
node that is flash optimized. A pre-created QoS policy can also be used by
specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or
assigning a QoS policy to a bucket is not supported if its containing
volume or SVM already has a QoS policy attached.

|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|Specifies the unique identifier of the bucket.

|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.

|===

```

```
[#certificate]
[.api-collapsible-fifth-title]
certificate
```

Specifies the certificate that will be used for creating HTTPS connections to the S3 server.

|Name
|Type
|Description

|read
|integer
a|Performance metric for read I/O operations.

|total
|integer
a|Performance metric aggregated over all types of I/O operations.

|write
|integer
a|Performance metric for write I/O operations.

|===

[#metric]
[.api-collapsible-fifth-title]
metric

```

Performance numbers, such as IOPS latency and throughput, for SVM protocols.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|other
```

```
|integer
```

a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

```
|read
```

```
|integer
```

a|Performance metric for read I/O operations.

```
|total
```

```
|integer
```

a|Performance metric aggregated over all types of I/O operations.

```
|write
```

```
|integer
```

a|Performance metric for write I/O operations.

```
|===
```

```
[#latency_raw]  
[.api-collapsible-fifth-title]  
latency_raw
```

The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type

|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|iops_raw
```

```
|link:#iops_raw[iops_raw]
```

a|The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

|latency_raw

|link:#latency_raw[latency_raw]

a|The raw latency in microseconds observed at the storage object. This should be divided by the raw IOPS value to calculate the average latency per I/O operation.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput_raw

|link:#throughput_raw[throughput_raw]

a|Throughput bytes observed at the storage object. This should be used along with delta time to calculate the rate of throughput bytes per unit of time.

|timestamp

|string

a|The timestamp of the performance data.

= Create S3 server, users, and buckets configurations

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/s3/services`#

Introduced In: 9.7

Creates an S3 server, users, and buckets configurations.

== Important notes

- * Each SVM can have one S3 server configuration.
- * One or more buckets and users can also be created using this end-point.
- * If creating a user configuration fails, buckets are not created either and already created users are not saved.
- * If creating a bucket configuration fails, all buckets already created are saved with no new buckets created.

== Required properties

- * `svm.uuid` - Existing SVM in which to create an S3 server configuration.

== Recommended optional properties

- * `enabled` - Specifies the state of the server created.
- * `comment` - Any information related to the server created.

== Default property values

- * `comment` - ""
- * `enabled` - `_true_`

== Related ONTAP commands

- * `vserver object-store-server create`
- * `vserver object-store-server bucket create`
- * `vserver object-store-server bucket policy statement create`
- * `vserver object-store-server bucket policy-statement-condition create`
- * `vserver object-store-server user create`

== Learn more

- * `xref:{relative_path}protocols_s3_services_endpoint_overview.html` [DOC /protocols/s3/services]

== Parameters

== Error

```

ONTAP Error Response Codes

|===

| Error Code | Description

| 2621706

| The specified SVM UUID is incorrect for the specified SVM name.

| 92405789

| The specified object server name contains invalid characters or not a fully qualified domain name. Valid characters for an object store server name are 0-9, A-Z, a-z, ".", and "-".

| 92405790

| Object store server names must have between 1 and 15 characters.

| 92405839

| Creating an object store server requires an effective cluster version of data ONTAP 9.7.0 or later. Upgrade all the nodes to 9.7.0 or later and try the operation again.

| 92405853

| Failed to create the object store server because Cloud Volumes ONTAP does not support object store servers.

| 92405863

| An error occurs when creating an S3 user or bucket. The reason for failure is detailed in the error message. Follow the error codes specified for the user or bucket endpoints to see details for the failure.

| 92405884

| An object store server can only be created on a data SVM. An object store server can also be created on a system SVM on a mixed platform cluster.

```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.
```

```

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.

|qos_policy
|link:#qos_policy[qos_policy]
a|Specifes "qos_policy.max_throughput_iops" and/or
"qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops".
Specifes "min_throughput_iops" is only supported on volumes hosted on a

```

node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
|size
|integer
a|Specifies the bucket size in bytes; ranges from 80MB to 64TB.
```

```
|svm
|link:#svm[svm]
a|

|uuid
|string
a|Specifies the unique identifier of the bucket.
```

```
|volume
|link:#volume[volume]
a|Specifies the FlexGroup volume name and UUID where the bucket is hosted.
```

```

metric
```

Performance numbers, such as IOPS latency and throughput, for SVM protocols.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

= Delete the S3 server configuration for an SVM
```

```
[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}`#
```

Introduced In: 9.7

Deletes the S3 server configuration of an SVM. If the 'delete_all' parameter is set to false, only the S3 server is deleted. Otherwise S3 users and buckets present on the SVM are also deleted. Note that only empty buckets can be deleted. This endpoint returns the S3 server delete job-uuid in response. To monitor the job status follow
/api/cluster/jobs/+++<job-uuid>+++.
+++</job-uuid>+++

```
[#policy]
[.api-collapsible-fifth-title]
policy
```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```
[cols=3*,options=header]
|===
|Name
|Type

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
|===

|Description

|_links
```

|link:#_links[_links]

a|

|max_throughput_iops

|integer

a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|max_throughput_mbps

|integer

a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops

|integer

a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_mbps

|integer

a|Specifies the minimum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|name

|string

a|The QoS policy group name. This is mutually exclusive with UUID and other QoS attributes during POST and PATCH.

|uuid

|string

a|The QoS policy group UUID. This is mutually exclusive with name and other QoS attributes during POST and PATCH.

|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
[cols=3*,options=header]
```

```
|===
```

```

```
|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|max_throughput_iops
```

```
|integer
```

a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|max_throughput_mbps
```

```
|integer
```

a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|min_throughput_iops
```

```
|integer
```

a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|duration

|string

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops

|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Any errors associated with the sample. For example, if the aggregation of data over multiple nodes fails then any of the partial errors might be returned, "ok" on success, or "error" on any internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

```
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

```
= Protocols S3 services svm.uuid buckets endpoint overview
```

```
== Overview
```

An S3 bucket is a container of objects. Each bucket defines an object namespace. S3 server requests specify objects using a bucket-name and object-name pair. An object consists of data, along with optional metadata and access controls, accessible via a name. An object resides within a bucket. There can be more than one bucket in an S3 server. Buckets which are created for the server are associated with an S3 user that is created on the S3 server.

An access policy is an object that when associated with a resource, defines their permissions. Buckets and objects are defined as resources. By default, only the "root" user can access these resources. Access policies are used to manage access to these resources by enabling ONTAP admin to provide "grants" to allow other users to perform operations on the buckets.

```
== Examples
```

```
=== Retrieving all fields for all S3 buckets of an SVM
```

```
----
```

```
# The API:
```

```
/api/protocols/s3/services/{svm.uuid}/buckets
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-11e9-8c06-0050568ea123/buckets?fields=*&return_records=true" -H "accept: application/json"
```

```

= Retrieve S3 bucket configurations for an SVM

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets`#

Introduced In: 9.7

Retrieves the S3 bucket's configuration of an SVM. Note that in order to retrieve S3 bucket policy conditions, the 'fields' option should be set to

'**'.

|string
|query
|False
a|Filter by name
```

```
|comment
|string
|query
|False
a|Filter by comment
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
```

```

|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#s3_bucket_policy_condition] [.api-collapsible-fifth-title] s3_bucket_policy_condition

Information about policy conditions based on various condition operators and condition keys.

[cols=3*,options=header]	===	Name	Type	Description
delimiters	array[string]	a An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.		
max_keys	array[integer]	a An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.		
operator	string	a Condition operator that is applied to the specified condition key.		
prefixes	array[string]			

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|===

[#s3_bucket_policy_statement]

[.api-collapsible-fifth-title]

s3_bucket_policy_statement

Specifies information about a single access permission.

[[IDe68227d0a504aa7119033a61d9168cf4]]
= Create an S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets`#

*Introduced In:* 9.7

Creates the S3 bucket configuration of an SVM.

== Important notes

* Each SVM can have one or more bucket configurations.
* Aggregate lists should be specified explicitly. If not specified, then

```

the bucket is auto-provisioned as a FlexGroup.

- * Constituents per aggregate specifies the number of components (or FlexVols) per aggregate. Is specified only when an aggregate list is explicitly defined.

- * An access policy can be created when a bucket is created.

- * "qos_policy" can be specified if a bucket needs to be attached to a QoS group policy during creation time.

== Required properties

- * `svm.uuid` - Existing SVM in which to create the bucket configuration.

- * `name` - Bucket name that is to be created.

== Recommended optional properties

- * `aggregates` - List of aggregates for the FlexGroup on which the bucket is hosted on.

- * `constituents_per_aggregate` - Number of constituents per aggregate.

- * `size` - Specifying the bucket size is recommended.

- * `policy` - Specifying policy enables users to perform operations on buckets. Hence specifying the resource permissions is recommended.

- * `qos_policy` - A QoS policy for buckets.

== Default property values

- * `size` - 800MB

- * `comment` - ""

- * `aggregates` - No default value.

- * `constituents_per_aggregate` - `_4_` , if an aggregates list is specified. Otherwise, no default value.

- * `policy.statements.actions` - GetObject, PutObject, DeleteObject, ListBucket.

- * `policy.statements.principals` - all S3 users and groups in the SVM.

- * `policy.statements.resources` - all objects in the bucket.

- * `policy.statements.conditions` - list of bucket policy conditions.

- * `qos-policy` - No default value.

== Related ONTAP commands

- * `vserver object-store-server bucket create`

- * `vserver object-store-server bucket policy statement create`

- * `vserver object-store-server bucket policy-statement-condition create`

```

```
== Parameters
```

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

```
|return_records
```

```
|boolean
```

```
|query
```

```
|False
```

a|The default is false. If set to true, the records are returned.

* Default value:

```
|svm.uuid
```

```
|string
```

```
|path
```

```
|True
```

a|UUID of the SVM to which this object belongs.

```
|===
```

== Request Body

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.

```
|comment
```

```
|string
```

a|Can contain any additional information about the bucket being created or modified.

```
|constituents_per_aggregate
```

```
|integer
```

a|Specifies the number of constituents or FlexVol volumes per aggregate. A FlexGroup volume consisting of all such constituents across all specified aggregates is created. This option is used along with the aggregates option and cannot be used independently.

```
|encryption
```

```
|link:#encryption[encryption]

a|Specifies bucket access policy statement.
```

|===

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
```

|===

```
|Name
|Type
|Description
```

```
|max_throughput_iops
|integer
```

a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|max_throughput_mbps
|integer
```

a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

```
|min_throughput_iops
|integer
```

a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.

```
|min_throughput_mbps
|integer
```

a|Specifies the minimum throughput in Megabytes per sec, 0 means none.

This is mutually exclusive with name and UUID during POST and PATCH.

```
|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.
```

```
|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.
```

|Description
```

```
|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|A list of aggregates for FlexGroup volume constituents where the bucket is hosted. If this option is not specified, the bucket is auto-provisioned as a FlexGroup volume.
```

```

|comment
|string
a|Can contain any additional information about the bucket being created or
modified.

|constituents_per_aggregate
|integer
a|Specifies the number of constituents or FlexVol volumes per aggregate. A
FlexGroup volume consisting of all such constituents across all specified
aggregates is created. This option is used along with the aggregates
option and cannot be used independently.

|encryption
|link:#encryption[encryption]
a|

|logical_used_size
|integer
a|Specifies the bucket logical used size up to this point.

|name
|string
a|Specifies the name of the bucket. Bucket name is a string that can only
contain the following combination of ASCII-range alphanumeric characters
0-9, a-z, ".", and "-".

|policy
|link:#policy[policy]
a|A policy is an object associated with a bucket. It defines resource
(bucket, folder, or object) permissions. These policies get evaluated when
an S3 user makes a request by executing a specific command. The user must
be part of the principal (user or group) specified in the policy.
Permissions in the policies determine whether the request is allowed or
denied.

[[ID2af19b2436466f1fab396b1e15ce0841]]
= Delete the S3 bucket configuration for an SVM

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets/{uuid}`#

*Introduced In:* 9.7

Deletes the S3 bucket configuration of an SVM. An access policy is also
deleted on an S3 bucket "delete" command.

== Related ONTAP commands

* `vserver object-store-server bucket delete`
* `vserver object-store-server bucket policy statement delete`
* `vserver object-store-server bucket policy-statement-condition delete`

== Learn more

*
xref:{relative_path}protocols_s3_services_svm.uuid_buckets_endpoint_overvi
ew.html[DOC /protocols/s3/services/{svm.uuid}/buckets]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

```

```
|uuid
|string
|path
|True
a|The unique identifier of the bucket.
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.
```

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|===
```

```

[#s3_bucket_policy_condition]
[.api-collapsible-fifth-title]
s3_bucket_policy_condition

Information about policy conditions based on various condition operators
and condition keys.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|delimiters

```

|array[string]

a|An array of delimiters that are compared with the delimiter value specified at the time of execution of an S3-based command, using the condition operator specified.

|max_keys

|array[integer]

a|An array of maximum keys that are allowed or denied to be retrieved using an S3 list operation, based on the condition operator specified.

|operator

|string

a|Condition operator that is applied to the specified condition key.

|prefixes

|array[string]

a|An array of prefixes that are compared with the input prefix value specified at the time of execution of an S3-based command, using the condition operator specified.

|source_ips

|array[string]

a|An array of IP address ranges that are compared with the IP address of a source command at the time of execution of an S3-based command, using the condition operator specified.

|usernames

|array[string]

a|An array of usernames that a current user in the context is evaluated against using the condition operators.

|===

[#s3_bucket_policy_statement]

[.api-collapsible-fifth-title]

s3_bucket_policy_statement

Specifies information about a single access permission.

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|actions
|array[string]
a|

|conditions
|array[link:#s3_bucket_policy_condition[s3_bucket_policy_condition]]
a|Specifies bucket policy conditions.

|effect
|string
a|Specifies whether access is allowed or denied when a user requests the
specific action. If access (to allow) is not granted explicitly to a
resource, access is implicitly denied. Access can also be denied
explicitly to a resource, in order to make sure that a user cannot access
it, even if a different policy grants access.

|principals
|array[string]
a|

|resources
|array[string]
a|

|sid
|string
a|Specifies the statement identifier used to differentiate between
statements.

|===

[#policy]
[.api-collapsible-fifth-title]
policy

```

A policy is an object associated with a bucket. It defines resource (bucket, folder, or object) permissions. These policies get evaluated when

an S3 user makes a request by executing a specific command. The user must be part of the principal (user or group) specified in the policy. Permissions in the policies determine whether the request is allowed or denied.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|statements
|array[link:#s3_bucket_policy_statement[s3_bucket_policy_statement]]
a|Specifies bucket access policy statement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

Specifies "qos_policy.max_throughput_iops" and/or "qos_policy.max_throughput_mbps" or "qos_policy.min_throughput_iops". Specifies "min_throughput_iops" is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying "qos_policy.name" or "qos_policy.uuid" properties. Setting or assigning a QoS policy to a bucket is not supported if its containing volume or SVM already has a QoS policy attached.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|max_throughput_iops
|integer
a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.
```

|max_throughput_mbps
|integer
a|Specifies the maximum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops
|integer
a|Specifies the minimum throughput in IOPS, 0 means none. Setting
"min_throughput" is supported on AFF platforms only, unless FabricPool
tiering policies are set. This is mutually exclusive with name and UUID
during POST and PATCH.

|min_throughput_mbps
|integer
a|Specifies the minimum throughput in Megabytes per sec, 0 means none.
This is mutually exclusive with name and UUID during POST and PATCH.

|name
|string
a|The QoS policy group name. This is mutually exclusive with UUID and
other QoS attributes during POST and PATCH.

|uuid
|string
a|The QoS policy group UUID. This is mutually exclusive with name and
other QoS attributes during POST and PATCH.

[[ID226a367df40b86bb6e09489d4dca37bf]]
= Update an S3 bucket configuration for an SVM
```

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/buckets/{uuid}`#
```

```
*Introduced In:* 9.7
```

Updates the S3 bucket configuration of an SVM.

== Important notes

* The following fields can be modified for a bucket:

*** `comment` - Any information related to the bucket.

*** `size` - Bucket size.

*** `policy` - An access policy for resources (buckets and objects) that defines their permissions. New policies are created after existing policies are deleted. To retain any of the existing policy statements, you need to specify those statements again. Policy conditions can also be modified using this API.

*** `qos_policy` - A QoS policy for buckets.

== Related ONTAP commands

```
* `vserver object-store-server bucket modify`  
* `vserver object-store-server bucket policy statement modify`  
* `vserver object-store-server bucket policy-statement-condition modify`
```

== Learn more

*

== Parameters

[cols=5*,options=header]

|==

|Name

|Type

|In

|Required

|Description

|uuid

|string

|path

|True

a|The unique identifier of the bucket.

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

|svm.uuid

```

|string
|path
|True
a|UUID of the SVM to which this object belongs.

|===

= Manage S3 service group configuration

:leveloffset: +1

[[IDbbc197f9a3c05d41dacad18bd39dac3f]]
= Protocols S3 services svm.uuid groups endpoint overview

```

== Overview

An S3 group consists of one or many users. Policies are attached to the S3 group to have access control over S3 resources at group level.

== Examples

=== Retrieving all fields for all S3 groups of an SVM

The API:

/api/protocols/s3/services/{svm.uuid}/groups:

The call:

```

w.html[DOC /protocols/s3/services/{svm.uuid}/groups]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In

```

```
|Required
|Description

|comment
|string
|query
|False
a|Filter by comment

|name
|string
|query
|False
a|Filter by name

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|id
|integer
|query
|False
a|Filter by id

|users.name
|string
|query
|False
a|Filter by users.name

|policies.name
|string
```

```
|query
|False
a|Filter by policies.name
```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

= Create an S3 group configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/protocols/s3/services/{svm.uuid}/groups`#

Introduced In: 9.8

Creates the S3 group configuration.

== Important notes

* Each SVM can have one or more s3 group configurations.

== Required properties

* `svm.uuid` - Existing SVM in which to create the user configuration.

* `name` - Group name that is to be created.

* `users` - List of users to be added into the group.

* `policies` - List of policies are to be attached to this group.

== Recommended optional properties

* `comment` - Short description about the S3 Group.

== Related ONTAP commands

* `vserver object-store-server group create`

== Learn more

*

xref:{relative_path}protocols_s3_services_svm.uuid_groups_endpoint_overview.html[DOC /protocols/s3/services/{svm.uuid}/groups]

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

```
|Required
|Description

|return_records
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.
```

* Default value:

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|===
```

== Request Body

= Update S3 group configuration for an SVM

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/groups/{id}`#

*Introduced In:* 9.8

Updates the S3 group configuration of an SVM.

== Important notes

* The following fields can be modified for a group:
* `name` - Group name that needs to be modified.
* `users` - List of users present in the group.
* `policies` - List of policies to be attached to this group.

== Recommended optional properties

* `comment` - Short description about the S3 Group.

== Related ONTAP commands

* `vserver object-store-server group modify`

= Retrieve S3 protocol historical performance metrics

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/s3/services/{svm.uuid}/metrics`#

Introduced In: 9.8

Retrieves historical performance metrics for the S3 protocol of an SVM.

== Parameters

[cols=5*,options=header]

|==

|Name

|Type

|In

|Required

|Description

|timestamp

|string

|query

|False

a|Filter by timestamp

|duration

|string

|query

|False

a|Filter by duration

|throughput.total

|integer

|query

|False

a|Filter by throughput.total

```
|throughput.read
|integer
|query
|False
a|Filter by throughput.read

|throughput.other
|integer
|query
|False
a|Filter by throughput.other

|throughput.write
|integer
|query
|False
a|Filter by throughput.write

|latency.total
|integer
|query
|False
a|Filter by latency.total

|latency.read
|integer
|query
|False
a|Filter by latency.read

|latency.other
|integer
|query
|False
a|Filter by latency.other

|latency.write
|integer
|query
|False
a|Filter by latency.write
```

```
|status
|string
|query
|False
a|Filter by status
```

```
|iops.total
|integer
|query
|False
a|Filter by iops.total
```

```
|iops.read
|integer
|query
|False
a|Filter by iops.read
```

```
|iops.other
|integer
|query
|False
a|Filter by iops.other
```

```
|iops.write
|integer
|query
|False
a|Filter by iops.write
```

```
|svm.uuid
|string
|path
|True
a|Unique identifier of the SVM.
```

```
|interval
|string
|query
```

```

|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

```
|===
```

```
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|duration
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

:leveloffset: -1

= Manage S3 service policies

```

```
:leveloffset: +1
```

```
[[IDf11765edfa8ccbc1b5fc6f2e1c813d54]]  
= Protocols S3 services svm.uuid policies endpoint overview
```

```
== Overview
```

An S3 policy is an object that when associated with a resource, defines their permissions. Buckets and objects are defined as resources. Policies are used to manage access to these resources.

```
== Examples
```

```
=== Retrieving all fields for all S3 policies of an SVM
```

```
----
```

```
# The API:
```

```
/api/protocols/s3/services/{svm.uuid}/policies:
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/12f3ba4c-7ae0-  
11e9-8c06-  
0050568ea123/policies?fields=*&return_records=true&return_timeout=15" -H  
"accept: application/json"
```

```
# The response:
```

```
{  
  "num_records": 2,  
  "records": [  
    {  
      "comment": "S3 policy.",

|query

|False

a|Filter by read-only

|svm.uuid

|string

|path

|True

a|UUID of the SVM to which this object belongs.

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

```

|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

s3_policy_statement

Specifies information about a single access policy statement.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|actions

|array[string]

a|For each resource, S3 supports a set of operations. The resource operations allowed or denied are identified by an action list:

* GetObject - retrieves objects from a bucket.

* PutObject - puts objects in a bucket.

* DeleteObject - deletes objects from a bucket.

* ListBucket - lists the objects in a bucket.

* GetBucketAcl - retrieves the access control list (ACL) of a bucket.

* GetObjectAcl - retrieves the access control list (ACL) of an object.

* ListAllMyBuckets - lists all of the buckets in a server.

The wildcard character "*" can be used to form a regular expression for specifying actions.

|effect

|string

a|Specifies whether access is allowed or denied. If access (to allow) is not granted explicitly to a resource, access is implicitly denied. Access can also be denied explicitly to a resource, in order to make sure that a user cannot access it, even if a different policy grants access.

|index

|integer

a|Specifies a unique statement index used to identify a particular statement. This parameter should not be specified in the POST method. A statement index is automatically generated and is retrieved using the GET method.

|resources

|array[string]

a|

```

|sid
|string
a|Specifies the statement identifier which contains additional information
about the statement.

= Create an S3 policy configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/policies`#

*Introduced In:* 9.8

Creates the S3 policy configuration.

== Important notes

* Each SVM can have one or more s3 policy configurations.

== Required properties

* `svm.uuid` - Existing SVM in which to create the s3 policy
configuration.
* `name` - Policy name that is to be created.

== Recommended optional properties

* `comment` - Short description about the S3 policy.
* `statements.effect` - Indicates whether to allow or deny access.
* `statements.actions` - List of actions that can be allowed or denied
access. Example: GetObject, PutObject, DeleteObject, ListBucket and
ListMyBuckets.
* `statements.resources` - Buckets or objects that can be allowed or

```

denied access.

* `statements.sid` - Statement identifier providing additional information about the statement.

== Related ONTAP commands

* `vserver object-store-server policy create`

* `vserver object-store-server policy add-statement`

== Learn more

*

[#s3_policy_statement]

[.api-collapsible-fifth-title]

s3_policy_statement

Specifies information about a single access policy statement.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|actions

|array[string]

a|For each resource, S3 supports a set of operations. The resource operations allowed or denied are identified by an action list:

* GetObject - retrieves objects from a bucket.

* PutObject - puts objects in a bucket.

* DeleteObject - deletes objects from a bucket.

* ListBucket - lists the objects in a bucket.

* GetBucketAcl - retrieves the access control list (ACL) of a bucket.

* GetObjectAcl - retrieves the access control list (ACL) of an object.

* ListAllMyBuckets - lists all of the buckets in a server.

The wildcard character "*" can be used to form a regular expression for specifying actions.

|effect

|string

a|Specifies whether access is allowed or denied. If access (to allow) is not granted explicitly to a resource, access is implicitly denied. Access can also be denied explicitly to a resource, in order to make sure that a user cannot access it, even if a different policy grants access.

|index

|integer

a|Specifies a unique statement index used to identify a particular statement. This parameter should not be specified in the POST method. A statement index is automatically generated and is retrieved using the GET method.

|resources

|array[string]

a|

```

|sid
|string
a|Specifies the statement identifier which contains additional information
about the statement.

[[ID4e3e458fd9b3a8417341806a21eda662]]
```

```
= Protocols S3 services svm.uuid users endpoint overview
```

```
== Overview
```

An S3 user account is created on the S3 server. Buckets that are created for the server are associated with that user (as the owner of the buckets).

The creation of the user account involves generating a pair of keys "access" and "secret".

These keys are shared with clients (by the administrator out of band) who want to access the S3 server. The `access_key` is sent in the request and it identifies the user performing the operation. The client or server never send the `secret_key` over the wire.

Only the `access_key` can be retrieved from a GET operation. The `secret_key` along with the `access_key` is returned from a POST operation and from a PATCH operation if the administrator needs to regenerate the keys.

== Examples

=== Retrieving S3 user configurations for a particular SVM

The API:

/api/protocols/s3/services/{svm.uuid}/users

The call:

```
curl -X GET "https://<mgmt-ip>/api/protocols/s3/services/db2ec036-8375-11e9-99e1-0050568e3ed9/users?fields=*&return_records=true" -H "accept: application/hal+json"
```

The response:

```
{
  "records": [
    {
      "svm": {
        "uuid": "db2ec036-8375-11e9-99e1-0050568e3ed9",

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|access_key
|string
|query
|False
a|Filter by access_key

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|comment
|string
|query
|False
a|Filter by comment

|name
|string
|query
|False
a|Filter by name

```

```
|svm.uuid
|string
|path
|True
a|UUID of the SVM to which this object belongs.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1
* Max value: 120
* Min value: 0

```
|order_by
```

```
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create an S3 user configuration

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/users`#

*Introduced In:* 9.7

Creates the S3 user configuration.

== Important notes

* Each SVM can have one or more user configurations.
* If user creation is successful, a user access_key and secret_key is
returned as part of the response.

== Required properties

* `svm.uuid` - Existing SVM in which to create the user configuration.
* `name` - User name that is to be created.

== Default property values

* `comment` - ""

== Related ONTAP commands

* `vserver object-store-server user create`

== Learn more

= Update an S3 user configuration

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/protocols/s3/services/{svm.uuid}/users/{name}`#

*Introduced In:* 9.7

Updates the S3 user configuration of an SVM.

== Important notes

* User access_key and secret_key pair can be regenerated using the PATCH
operation.
* User access_key and secret_key is returned in a PATCH operation if the
"regenerate_keys" field is specified as true.

== Recommended optional properties

* `regenerate_keys` - Specifies if secret_key and access_key need to be
regenerated.
* `comment` - Any information related to the S3 user.

== Related ONTAP commands

```

```
* `vserver object-store-server user show`  
* `vserver object-store-server user regenerate-keys`
```

== Learn more

```
*

:leveloffset: -1

= SAN

:leveloffset: +1

```

```
[[ID872ec17405eebbacb306bf03c4539649]]  
= SAN overview
```

`== Overview`

The storage area network (SAN) endpoints and objects enable you to configure, provision, and manage SAN-related objects.

```
'''
```

`== Fibre Channel`

`=== Logins`

Fibre Channel logins represent connections, formed by Fibre Channel initiators, that have successfully logged in to ONTAP. This represents the Fibre Channel login on which higher-level protocols, such as Fibre Channel Protocol (FCP) and Non-Volatile Memory Express over Fibre Channel (NVMe over FC), rely.

The Fibre Channel logins REST API provides information about active Fibre Channel logins.

`=== WWPN Aliases`

A WWPN (world wide port name) is a unique 64-bit identifier for a Fibre Channel initiator. It is displayed as a 16-character hexadecimal value. SAN administrators may find it easier to identify Fibre Channel initiators using an alias, especially in larger SANs.

The WWPN alias REST API allows you to create, delete and discover aliases for WWPNs.

`=== Services`

A Fibre Channel Protocol (FCP) service defines the properties of the Fibre Channel Protocol target for an SVM. There can be at most one FCP service for a given SVM. An SVM's FCP service must be created before FCP initiators can login to the SVM.

The Fibre Channel Protocol (FCP) service REST API allows you to create, update, delete, and discover Fibre Channel Services for SVMs. Fibre Channel interfaces are the logical endpoints for Fibre Channel

network connections to an SVM.

'''

== iSCSI

=== Credentials

An iSCSI credentials object defines the authentication credentials to be used between an iSCSI initiator and ONTAP. It identifies an authentication type, user names, and the passwords that must be used to authenticate a specific initiator.

The iSCSI credentials REST API allows you to create, update, delete, and discover iSCSI credential objects.

=== Services

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can login to the SVM.

The iSCSI service REST API allows you to create, update, delete, and discover iSCSI services for SVMs.

=== Sessions

An iSCSI session consists of one or more TCP connections that link an iSCSI initiator with an iSCSI target. TCP connections can be added and removed from an iSCSI session by the iSCSI initiator. Across all TCP connections within an iSCSI session, an initiator sees one and the same target. After the connection is established, iSCSI control, data, and status messages are communicated over the session.

The iSCSI sessions REST API provides information about iSCSI initiators that have successfully logged in to ONTAP.

=== Learn More

* `_IP Interfaces_` found in the `_networking_` section. IP interfaces are the logical endpoints for iSCSI network connections to an SVM.

'''

== Initiator Groups

An initiator group (igroup) is a collection of Fibre Channel WWPNS (world

wide port names), iSCSI IQNs (qualified names), iSCSI EUIs (extended unique identifiers), or any combination of these, that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, a network administrator creates an initiator group containing the hosts' initiator names, and then creates a LUN map that associates the initiator group with the LUN.

The initiator group REST API allows you to create, update, delete, and discover initiator groups. It also enables you to add and remove initiators that can access the target and associated LUNs.

== LUN Maps

A LUN map is an association between a LUN and an initiator group. When a LUN is mapped to an initiator group, the group's initiators are granted access to the LUN. The relationship between an initiator group and a LUN is many initiator groups to many LUNs.

The LUN map REST API allows you to create, delete, and discover LUN maps.

== LUNs

A LUN is the logical representation of storage in a storage area network (SAN).

The LUN REST API allows you to create, update, delete, and discover LUNs.

= Retrieve FC port information

:leveloffset: +1

[[ID3e56848fcb887a7e31015876d0ec4989]]
= Network FC logins endpoint overview

== Overview

Fibre Channel (FC) logins represent connections formed by FC initiators that have successfully logged in to ONTAP. This represents the FC login on

which higher-level protocols such as Fibre Channel Protocol and NVMe over FC (NVMe/FC) rely.

The Fibre Channel logins REST API provides information about active FC logins.

== Examples

=== Retrieving all FC logins

The API:

GET /api/network/fc/logins

The call:

curl -X GET "https://<mgmt-ip>/api/network/fc/logins" -H "accept: application/hal+json"

The response:

[cols=5*,options=header]

|==

|Name

|Type

|In

```

|Required
|Description

|protocol
|string
|query
|False
a|Filter by protocol

|interface.uuid
|string
|query
|False
a|Filter by interface.uuid

|interface.name
|string
|query
|False
a|Filter by interface.name

|interface.wwpn
|string
|query
|False
a|Filter by interface.wwpn

|initiator.wwpn
|string
|query
|False
a|Filter by initiator.wwpn

|initiator.wwnn
|string
|query
|False
a|Filter by initiator.wwnn

|initiator.aliases
|string

```

```
|query
|False
a|Filter by initiator.aliases

|initiator.port_address
|string
|query
|False
a|Filter by initiator.port_address

|svm.uuid
|string
|query
|False
a|Filter by svm.uuid

|svm.name
|string
|query
|False
a|Filter by svm.name

|igroups.uuid
|string
|query
|False
a|Filter by igroups.uuid

|igroups.name
|string
|query
|False
a|Filter by igroups.name

|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID55e709da8cc3a49e20c8bb55acdedcf3]]
```

```
= Network FC wwpn-aliases endpoint overview
```

```
== Overview
```

A worldwide port name (WWPN) is a unique 64-bit identifier for a Fibre Channel (FC) initiator. It is displayed as a 16-character hexadecimal value. SAN administrators might find it easier to identify FC initiators using an alias, especially in larger SANs.

The WWPN alias REST API allows you to create, delete, and discover aliases for WWPNS.

Multiple aliases can be created for a WWPN, but you cannot use the same alias for multiple WWPNS.

An alias can consist of up to 32 characters. Valid characters are:

- * A through Z
- * a through z
- * numbers 0 through 9
- * hyphen ("-")
- * underscore ("_")
- * left and right braces ("{" , "}")
- * period (".")

```
== Examples
```

```
=== Creating a WWPN alias
```

```
----
```

```

# The API:
POST /api/network/fc/wwpn-aliases

# The call:
curl -X POST "https://<mgmt-ip>/api/network/fc/wwpn-aliases" -H "accept:
application/json" -d '{ "svm": { "name": "svm1" }, "wwpn":
"50:0a:09:82:b4:30:25:05", "alias": "alias3" }'
-----

=== Retrieving all properties of all WWPN aliases

The `fields` query parameter is used to request that all properties be
returned.

-----

# The API:
GET /api/network/fc/wwpn-aliases

# The call:
curl -X GET "https://<mgmt-ip>/api/network/fc/wwpn-aliases?fields=*" -H
"accept: application/hal+json"

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "68589d3d-7efa-11e8-9eed-005056b43025",

```
[[ID239e9a75ade8c8b22072a15d57185469]]
```

```
= Protocols SAN fcp services endpoint overview
```

```
== Overview
```

A Fibre Channel Protocol (FC Protocol) service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM FC Protocol service must be created before FC Protocol initiators can log in to the SVM.

The FC Protocol service REST API allows you to create, update, delete, and discover FC services for SVMs.

```
== Performance monitoring
```

Performance of the SVM can be monitored by the `metric.+++` and

`statistics.+++` properties. These show the performance of the SVM in terms of IOPS, latency, and throughput. The `metric.+++` properties denote an average whereas `statistics.+++` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an FC Protocol service for an SVM

The simplest way to create an FC Protocol service is to specify only the SVM, either by name or UUID. By default, the new FC Protocol service is enabled.

In this example, the `return_records` query parameter is used to retrieve the new FC Protocol service object in the REST response.

The API:

POST /api/protocols/san/fcp/services

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/fcp/services?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" } }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"  
          }  
        }  
      },  
      "enabled": true,  
      "target": {  
        "name": "20:00:00:50:56:bb:b2:4b"  
      },  
      "_links": {  
        "self": {
```

```

        "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b"
    }
}
]
}
----

'''

=== Retrieving FC Protocol services for all SVMs in the cluster

----

# The API:
GET /api/protocols/san/fcp/services

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services' -H 'accept: application/hal+json'

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
        "name": "svm1",
        "_links": {
          "self": {
            "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
          }
        }
      },
      "_links": {
        "self": {
          "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b"
        }
      }
    },
    {
      "svm": {
        "uuid": "6011f874-c01a-11e8-88ed-005056bbb24b",

      }
    }
  ],
  "num_records": 2,
  "_links": {
    "self": {
      "href": "/api/protocols/san/fcp/services"
    }
  }
}
----

'''

```

=== Retrieving details for a specific FC Protocol service

The FC Protocol service is identified by the UUID of its SVM.

The API:

GET /api/protocols/san/fcp/services/{svm.uuid}

The call:

curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json'

The response:

```

{
  "svm": {
    "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
      }
    }
  }
}

```

```

    }
  }
},
"enabled": true,
"target": {
  "name": "20:00:00:50:56:bb:b2:4b"
},
"_links": {
  "self": {
    "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b"
  }
}
}
}

```

'''

=== Disabling an FC Protocol service

Disabling an FC Protocol service shuts down all active FC Protocol logins for the SVM and prevents new FC Protocol logins.

The FC Protocol service to update is identified by the UUID of its SVM.

The API:

PATCH /api/protocols/san/fcp/services/{svm.uuid}

The call:

```

curl -X PATCH 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json' -d '{"enabled": "false"}'

```

You can retrieve the FC Protocol service to confirm the change.

In this example, the `fields` query parameter is used to limit the response to the `enabled` property and FC Protocol service identifiers.

The API:

GET /api/protocols/san/fcp/services/{svm.uuid}

The call:

```
curl -X GET 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-
c01a-11e8-88ed-005056bbb24b?fields=enabled' -H 'accept:
application/hal+json'
```

The response:

```
{
  "svm": {
    "uuid": "5c659d90-c01a-11e8-88ed-005056bbb24b",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/5c659d90-c01a-11e8-88ed-005056bbb24b"
      }
    }
  },
  "enabled": false,
  "_links": {
    "self": {
      "href": "/api/protocols/san/fcp/services/5c659d90-c01a-11e8-88ed-
005056bbb24b"
    }
  }
}
```

'''

=== Deleting an FC Protocol service

The FC Protocol service must be disabled before it can be deleted.

The FC Protocol service to delete is identified by the UUID of its SVM.

The API:

```
DELETE /api/protocols/san/fcp/services/{svm.uuid}
```

The call:

```
curl -X DELETE 'https://<mgmt-ip>/api/protocols/san/fcp/services/5c659d90-
c01a-11e8-88ed-005056bbb24b' -H 'accept: application/hal+json'
```

```
[[IDa55d2f043943c5726213a2b9792ba510]]
```

= Retrieve FC protocol services

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/protocols/san/fcp/services`#
```

Introduced In: 9.6

Retrieves FC Protocol services.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `statistics.+++`

* `metric.+++`

|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.
```

```
|throughput
|link:#throughput[throughput]

target

[cols=3*,options=header]

|===

|Name

|Type

|Description

|name

|string

a|The target name of the FC Protocol service. This is generated for the SVM during POST.

The FC Protocol target name is a world wide node name (WWNN).

If required, the target name can be modified using the ONTAP command line.

- * example: 20:00:00:50:56:bb:b2:4b
- * maxLength: 128
- * minLength: 1
- * readOnly: 1
- * Introduced in: 9.6

|===

```
[#fcp_service]
[.api-collapsible-fifth-title]
fcp_service
```

A Fibre Channel (FC) Protocol service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM's FC Protocol service must be created before FC Protocol initiators can login to the SVM.

A FC Protocol service is identified by the UUID of its SVM.

```

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|duration

|string

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops

|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

```
|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

statistics

[cols=3*,options=header]
|===
|Name
|Type
|Description

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This should
be used along with delta time to calculate the rate of I/O operations per
unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time

```

between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used
along with delta time to calculate the rate of throughput bytes per unit
of time.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```

target

[cols=3*,options=header]

|===

|Name

|Type

|Description

|name

|string

a|The target name of the FC Protocol service. This is generated for the SVM during POST.

The FC Protocol target name is a world wide node name (WWNN).

If required, the target name can be modified using the ONTAP command line.

* example: 20:00:00:50:56:bb:b2:4b

* maxLength: 128

* minLength: 1

* readOnly: 1

* Introduced in: 9.6

|===

[#fcp_service]

[.api-collapsible-fifth-title]

fcp_service

A Fibre Channel (FC) Protocol service defines the properties of the FC Protocol target for an SVM. There can be at most one FC Protocol service for an SVM. An SVM's FC Protocol service must be created before FC Protocol initiators can login to the SVM.

A FC Protocol service is identified by the UUID of its SVM.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|enabled

|boolean

a|The administrative state of the FC Protocol service. The FC Protocol service can be disabled to block all FC Protocol connectivity to the SVM.

This is optional in POST and PATCH. The default setting is `_true_` (enabled) in POST.

|integer  
|query  
|False  
a|Filter by latency.write
```

```
|status  
|string  
|query  
|False  
a|Filter by status
```

```
|iops.total
|integer
|query
|False
a|Filter by iops.total
```

```
|iops.read
|integer
|query
|False
a|Filter by iops.read
```

```
|iops.other
|integer
|query
|False
a|Filter by iops.other
```

```
|iops.write
|integer
|query
|False
a|Filter by iops.write
```

```
|svm.uuid
|string
|path
|True
a|The unique identifier of the SVM.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.

```

* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

```

```

* Default value: 1
* Max value: 120
* Min value: 0

```

```

|fields
|array[string]
|query
|False
a|Specify the fields to return.

```

```

|max_records
|integer
|query
|False
a|Limit the number of records returned.

```

```

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

```

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

```

* Default value: 1

:leveloffset: -1

= Manage SAN igroups

:leveloffset: +1

[[ID26f0f42530d9df890f2a43ea11dd3ee8]]
= Protocols SAN igroups endpoint overview

== Overview

```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPNs), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the host initiator names, then create a LUN map that associates the initiator group with the LUN.

The initiator group REST API allows you to create, update, delete, and discover initiator groups, and add and remove initiators that can access the target and associated LUNs.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once.

All initiators in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the ``protocol`` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`).

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See [xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html](#)<</SAN/igroup_initiator_create,POST `/protocols/san/igroups/{igroup.uuid}/initiators>>` and `[DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more details.

An FC WWPN consist of 16 hexadecimal digits grouped as 8 pairs separated by colons. The format for an iSCSI IQN is `_iqn.yyyy-mm.reverse_domain_name:any_`. The iSCSI EUI format consists of the `_eui._` prefix followed by 16 hexadecimal characters.

== Examples

=== Creating an initiator group with no initiators

The example initiator group is for Linux iSCSI initiators only. Note that

the `return_records` query parameter is used to obtain the newly created initiator group in the response.

The API:

POST /api/protocols/san/igroups

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/igroups?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name": "igroup1",  
"os_type": "linux", "protocol": "iscsi" }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "02b0dfff-aa28-11e8-a653-005056bb7072",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/02b0dfff-aa28-11e8-a653-005056bb7072"  
          }  
        }  
      },  
      "uuid": "8f249e7d-ab9f-11e8-b8a3-005056bb7072",  
      "name": "igroup1",  
      "protocol": "iscsi",  
      "os_type": "linux",  
      "_links": {  
        "self": {  
          "href": "/api/protocols/san/igroups/8f249e7d-ab9f-11e8-b8a3-  
005056bb7072"  
        }  
      }  
    }  
  ]  
}
```

'''

=== Creating an initiator group with initiators

The example initiator group is for Windows. FC Protocol and iSCSI initiators are allowed. Note that the `return_records` query parameter is used to obtain the newly created initiator group in the response.

The API:

POST /api/protocols/san/igroups

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/igroups?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name": "igroup2",  
"os_type": "windows", "protocol": "mixed", "initiators": [ { "name":  
"20:01:00:50:56:bb:70:72" }, { "name": "iqn.1991-05.com.ms:host1" } ] }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "02b0dfff-aa28-11e8-a653-005056bb7072",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/02b0dfff-aa28-11e8-a653-005056bb7072"  
          }  
        }  
      },  
      "uuid": "abf9c39d-ab9f-11e8-b8a3-005056bb7072",  
      "name": "igroup2",  
      "protocol": "mixed",  
      "os_type": "windows",  
      "initiators": [  
        {  
          "name": "20:01:00:50:56:bb:70:72",  
          "_links": {  
            "self": {  
              "href": "/api/protocols/san/igroups/abf9c39d-ab9f-11e8-b8a3-

= Retrieve initiator groups

```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/san/igroups`#
```

Introduced In: 9.6

Retrieves initiator groups.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `lun_maps.+++`

== Related ONTAP commands

* `lun igroup show`

* `lun mapping show`

== Learn more

* [xref:{relative_path}protocols_san_igroups_endpoint_overview.html\[DOC /protocols/san/igroups\]](#)

== Parameters

```
[cols=5*,options=header]

```
|name
|string
|query
|False
a|Filter by name
```

```
|protocol
```

```
|string
|query
|False
a|Filter by protocol
```

```
|os_type
|string
|query
|False
a|Filter by os_type
```

```
|uuid
|string
|query
|False
a|Filter by uuid
```

```
|initiators.name
|string
|query
|False
a|Filter by initiators.name
```

```
|initiators.igroup.uuid
|string
|query
|False
a|Filter by initiators.igroup.uuid
```

```
|svm.uuid
|string
|query
|False
a|Filter by svm.uuid
```

```
|svm.name
|string
|query
|False
a|Filter by svm.name
```

```
|delete_on_unmap
|boolean
|query
|False
a|Filter by delete_on_unmap
```

```
|lun_maps.lun.node.name
|string
|query
|False
a|Filter by lun_maps.lun.node.name
```

```
|lun_maps.lun.node.uuid
|string
|query
|False
a|Filter by lun_maps.lun.node.uuid
```

```
|lun_maps.lun.name
|string
|query
|False
a|Filter by lun_maps.lun.name
```

```
|lun_maps.lun.uuid
|string
|query
|False
a|Filter by lun_maps.lun.uuid
```

```
|lun_maps.logical_unit_number
|integer
|query
|False
a|Filter by lun_maps.logical_unit_number
```

```
|fields
|array[string]
|query
|False
```

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

[#igroup]
[.api-collapsible-fifth-title]
igroup
```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPN), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the hosts' initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once.

All initiators in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`).

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See [xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html](#)<</SAN/igroup_initiator_create,POST `/protocols/san/igroups/{igroup.uuid}/initiators``>> and `[DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more

details.

= Create an initiator group

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/san/igroups`#

*Introduced In:* 9.6

Creates an initiator group.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the initiator
group.
* `name` - Name of the initiator group.
* `os_type` - Operating system of the initiator group's initiators.

== Recommended optional properties

* `initiators.name` - Name(s) of initiator group's initiators. This
property can be used to create the initiator group and populate it with
initiators in a single request.

== Default property values

If not specified in POST, the following default property values are
assigned.

* `protocol` - _mixed_ - Data protocol of the initiator group's
initiators.

== Learn more

* xref:{relative_path}protocols_san_igroups_endpoint_overview.html[DOC
/protocols/san/igroups]

== Parameters

[cols=5*,options=header]
|==
```

```
|Name
|Type
|In
|Required
|Description

|return_records

igroup

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPN), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the hosts' initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once.

All initiators in an initiator group must be from the same operating

system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the ``protocol`` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`).

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See [xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\)anddelete-protocols-san-igroups-initiators-.html](#)<</SAN/igroup_initiator_create,POST /protocols/san/igroups/{igroup.uuid}/initiators>> and [DELETE /protocols/san/igroups/{igroup.uuid}/initiators/{name}] for more details.

|Required

```

```

|Description

|igroup.uuid
|string
|path
|True
a|The unique identifier of the initiator group.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

```

```

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

Status: Default

ONTAP Error Response Codes

|===

| Error Code | Description

| 1254193

| Adding an initiator would cause the initiator to be mapped to the same LUN more than once.

| 1254324

| Adding an initiator would cause the initiator to have the same logical unit identifier for multiple LUN maps.

| 5373969

| A supplied initiator name looks like an iSCSI IQN initiator, but the portions after the prefix are missing.

| 5373971

| A supplied initiator name looks like an iSCSI IQN initiator, but the date portion is invalid.

| 5373972

| A supplied initiator name looks like an iSCSI IQN initiator, but the naming authority portion is invalid.

| 5373977

| A supplied initiator name looks like an iSCSI EUI initiator, but the length is invalid.

| 5373978

| A supplied initiator name looks like an iSCSI EUI initiator, but the format is invalid.

| 5373992

| A supplied initiator name was too long to be valid.

| 5373993

| A supplied initiator name did not match any valid format.

| 5374033

| Initiators must be supplied.

| 5374035

| A supplied initiator is already in the initiator group.

| 5374038

```

| An invalid Fibre Channel WWPN was supplied.

| 5374039
| An invalid iSCSI initiator name was supplied.

| 5374734
| An initiator is already in another initiator group with a conflicting
operating system type.

| 5374852
| The initiator group specified in the URI does not exist.

| 5374853
| You can add initiators to an initiator group using the `records`
property, or the `name` property, but you cannot use both in the same
request.

| 5374854
| Only `records` property elements should be populated with the `name`
property values.

= Retrieve an initiator group

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/protocols/san/igroups/{uuid}`#

Introduced In: 9.6

Retrieves an initiator group.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `lun_maps.+++`

== Related ONTAP commands

* `lun igroup show`
* `lun mapping show`

== Learn more

* [xref:{relative_path}protocols_san_igroups_endpoint_overview.html\[DOC /protocols/san/igroups\]](#)

== Parameters

[cols=5*,options=header]
|===

|Name

```

|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|The unique identifier of the initiator group.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===

== Response

```

Status: 200, Ok

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|delete_on_unmap
|boolean
a|An option that causes the initiator group to be deleted when the last
LUN map associated with it is deleted. Optional in POST and PATCH. This
property defaults to _false_ when the initiator group is created.

|initiators
|array[link:#igroup_initiator_no_records[igroup_initiator_no_records]]
a|The initiators that are members of the group. Optional in POST.

Zero or more initiators can be supplied when the initiator group is

```

created. After creation, initiators can be added or removed from the initiator group using the `/protocols/san/igroups/{igroup.uuid}/initiators` endpoint. See xref:{relative_path}post-protocols-san-igroups-initiators\(#-san-igroup-initiator-create\) and delete-protocols-san-igroups-initiators-.html` `<</SAN/igroup_initiator_create,POST` `/protocols/san/igroups/{igroup.uuid}/initiators>>` and `[DELETE` `/protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more details.

`|lun_maps`
`|array[link:#lun_maps[lun_maps]]`
`a|All LUN maps with which the initiator is associated.`

If the requested igroup is part of a remote, non-local, MetroCluster SVM, the LUN maps are not retrieved.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

`|name`
`|string`
`a|The name of the initiator group. Required in POST; optional in PATCH.`

Note that renaming an initiator group must be done in a PATCH request separate from any other modifications.

`|os_type`
`|string`
`a|The host operating system of the initiator group. All initiators in the group should be hosts of the same operating system. Required in POST; optional in PATCH.`

`|protocol`
`|string`
`a|The protocols supported by the initiator group. This restricts the type of initiators that can be added to the initiator group. Optional in POST; if not supplied, this defaults to _mixed_.`

The protocol of an initiator group cannot be changed after creation of the group.

```
|svm
|link:#svm[svm]
a|

|uuid
|string
a|The unique identifier of the initiator group.

|===

[#igroup]
[.api-collapsible-fifth-title]
igroup
```

An initiator group (igroup) is a collection of Fibre Channel (FC) world wide port names (WWPN), and/or iSCSI Qualified Names (IQNs), and/or iSCSI EUIs (Extended Unique Identifiers) that identify host initiators.

Initiator groups are used to control which hosts can access specific LUNs. To grant access to a LUN from one or more hosts, create an initiator group containing the hosts' initiator names, then create a LUN map that associates the initiator group with the LUN.

An initiator can appear in multiple initiator groups. An initiator group can be mapped to multiple LUNs. A specific initiator can be mapped to a specific LUN only once.

All initiators in an initiator group must be from the same operating system. The initiator group's operating system is specified when the initiator group is created.

When an initiator group is created, the `protocol` property is used to restrict member initiators to Fibre Channel (`_fcp_`), iSCSI (`_iscsi_`), or both (`_mixed_`).

Zero or more initiators can be supplied when the initiator group is created. After creation, initiators can be added or removed from the initiator group using the ``/protocols/san/igroups/{igroup.uuid}/initiators`` endpoint. See `xref:{relative_path}post-protocols-san-igroups-initiators(#-san-igroup-initiator-create)anddelete-protocols-san-igroups-initiators-.html<</SAN/igroup_initiator_create,POST` `/protocols/san/igroups/{igroup.uuid}/initiators>>` and `[DELETE` `/protocols/san/igroups/{igroup.uuid}/initiators/{name}]` for more details.

:leveloffset: -1

= Manage iSCSI credentials

:leveloffset: +1

[[ID0ba261ad2d4612c686ef6ea765d6334f]]

= Protocols SAN iSCSI credentials endpoint overview

== Overview

An iSCSI credentials object defines authentication credentials to be used between an initiator and ONTAP. It identifies an authentication type, user names, and passwords that must be used to authenticate a specific initiator.

The iSCSI credentials REST API allows you to create, update, delete, and discover iSCSI credentials.

== How iSCSI authentication works

An iSCSI credentials object defines the authentication credentials to be used between an initiator and ONTAP. While establishing an iSCSI connection, the initiator sends a login request to ONTAP to begin an iSCSI session. ONTAP then either permits or denies the login request, or determines that a login is not required.

For an initiator, you can specify an authentication type, user names and passwords, and a whitelist of optional network addresses from which the initiator is allowed to connect.

== iSCSI authentication methods

* Challenge-Handshake Authentication Protocol (CHAP) - The initiator logs in using a CHAP user name and password. There are two types of CHAP user names and passwords:

** Inbound - ONTAP authenticates the initiator. Inbound settings are required if you are using CHAP authentication.

** Outbound - These are optional credentials to enable the initiator to authenticate ONTAP. You can use credentials only if inbound credentials are also being used.

* deny - The initiator is denied access to ONTAP.

* none - ONTAP does not require authentication for the initiator.

The CHAP inbound/outbound password can be any valid string or an even number of valid hexadecimal digits preceded by '0X' or '0x'.

== Initiator address list

The initiator address list is a way to specify valid IP addresses from which the initiator is allowed to connect. If the list is specified and the source address of an iSCSI connection is not in the list, the connection is rejected. Initiator addresses can be specified in either IPv4 or IPv6 format and in one of two forms:

* Range

```
----  
{  
  "start": "192.168.0.0",  
  "end": "192.168.0.255"  
}  
----
```

* Mask

```
----  
{  
  "address": "192.168.0.0",  
  "netmask": "24"  
}  
----
```

== Initiator "default"

The default iSCSI authentication definition is created when the iSCSI service is created. An iSCSI credentials object with `_default_` as the initiator name identifies the default authentication for an SVM. The default credentials are used for any initiator that does not have specific

iSCSI credentials. The default iSCSI authentication method is `_none_`, but can be changed to `_deny_` or `_CHAP_`. The default credentials object does not support an initiator address list.

== Examples

=== Creating iSCSI credentials requiring no authentication

The API:

POST /api/protocols/san/iscsi/credentials

The call:

```
curl -X POST 'https://<mgmt-ip>/api/protocols/san/iscsi/credentials' -H
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" },
"initiator": "iqn.1992-08.com.netapp:initiator1", "authentication_type":
"none" }'
```

'''

=== Creating iSCSI credentials using CHAP inbound authentication

The API:

POST /api/protocols/san/iscsi/credentials

The call:

```
curl -X POST 'https://<mgmt-ip>/api/protocols/san/iscsi/credentials' -H
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" },
"initiator": "iqn.1992-08.com.netapp:initiator2", "authentication_type":
"CHAP", "chap": { "inbound": { "user": "user1", "password": "password1" }
} }'
```

'''

=== Retrieving all properties of all iSCSI credentials

The ``fields`` query parameter is used to request all iSCSI credentials properties.

Passwords are not included in the GET output.

```

# The API:
GET /api/protocols/san/iscsi/credentials

# The call:
curl -X GET 'https://<mgmt-
ip>/api/protocols/san/iscsi/credentials?fields=*' -H 'accept:
application/hal+json'

# The response:

Creates iSCSI credentials.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the iSCSI
credentials.
* `initiator` - Initiator for which the iSCSI credentials are to be
created.

```

* `authentication_type` - Type of authentication to use for the credentials.

== Recommended optional properties

* `chap.inbound.user` - In-bound CHAP authentication user name.

* `chap.inbound.password` - In-bound CHAP authentication password.

* `chap.outbound.user` - Out-bound CHAP authentication user name.

* `chap.outbound.password` - Out-bound CHAP authentication password.

== Error

```

Status: Default

ONTAP Error Response Codes

|===

| Error Code | Description

| 2621462

| An SVM with the specified UUID does not exist.

| 2621706

| Both the SVM UUID and SVM name were supplied, but they do not refer to the same SVM.

| 2621707

| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.

| 5373969

| A non-empty qualifier is required after the prefix. An example of a valid IQN is `_iqn.1995-08.com.example:string_`.

| 5373970

| The IQN prefix is invalid. The correct IQN prefix is `_iqn_`. An example of a valid IQN is `_iqn.1995-08.com.example:string_`.

| 5373971

| The date field is invalid. A valid date field is `_yyyy-mm_`. An example of a valid IQN is `_iqn.1995-08.com.example:string_`.

| 5373972

| The naming authority and string fields can contain only the characters `_a-z_`, `_0-9_`, `_.`, `_:`, and `_-`.

| 5373977

| The EUI-64 identifier field must be exactly 16 hexadecimal digits.

| 5373978

| The EUI formatted initiator name supplied is invalid. A valid EUI format is `_eui.XXXXXXXXXXXXXXXXXX_`, where X is a hexadecimal digit.

| 5373997

| The initiator name supplied is invalid. The valid initiator name formats are `_iqn.1995-08.com.example:string_` or `_eui.0123456789abcdef_`.

| 5374078

| The iSCSI service does not exist.

| 5374142

| An iSCSI security credential already exists for the specified initiator.

| 5374145
 | The iSCSI security password must contain an even number of valid hex digits.

| 5374147
 | The CHAP inbound and outbound passwords must be different.

| 5374149
 | The inbound user and password properties are required for CHAP authentication.

| 5374150
 | Outbound CHAP authentication requires an outbound password.

| 5374855
 | The value for property `initiator_address.ranges.start` is greater than the value for property `initiator_address.ranges.end`.

| 5374856
 | The value for property `initiator_address.ranges.start` does not belong to the same IP address family as the value for property `initiator_address.ranges.end`.

| 5374900
 | Setting the CHAP authentication properties are not supported with authentication types `_none_` or `_deny_`.

ONTAP Error Response Codes

|===

| Error Code | Description

| 2621462

| An SVM with the specified UUID does not exist.

| 2621706

| Both the SVM UUID and SVM name were supplied, but they do not refer to the same SVM.

| 2621707

| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.

| 5374145

| The iSCSI security password must contain an even number of valid hex digits.

| 5374147

| The CHAP inbound and outbound passwords must be different.

| 5374149

| The inbound user and password properties are required for CHAP authentication.

| 5374150

| Outbound CHAP authentication requires an outbound password.

| 5374155

| The functionality is not supported for the default security credential.

| 5374855

| The value for property `initiator_address.ranges.start` is greater than the value for property `initiator_address.ranges.end`.

| 5374856

| The value for property `initiator_address.ranges.start` does not belong to the same IP address family as the value for property `initiator_address.ranges.end`.

```
| 5374895
| The iSCSI security credential does not exist on the specified SVM.

| 5374900
| Setting the CHAP authentication properties are not supported with
authentication types _none_ or _deny_.

```
= Protocols SAN iSCSI services endpoint overview
```

```
== Overview
```

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can log in to the SVM.

The iSCSI service REST API allows you to create, update, delete, and discover iSCSI services for SVMs.

== Performance monitoring

Performance of the SVM can be monitored by the ``metric.++`` and ``statistics.++`` properties. These show the performance of the SVM in terms of IOPS, latency and throughput. The ``metric.++`` properties denote an average whereas ``statistics.++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating an iSCSI service for an SVM

The simplest way to create an iSCSI service is to specify only the SVM, either by name or UUID. By default, the new iSCSI service is enabled and uses the SVM name as its target alias.

In this example, the ``return_records`` query parameter is used to retrieve the new iSCSI service object in the REST response.

The API:

POST /api/protocols/san/iscsi/services

The call:

```
curl -X POST 'https://<mgmt-  
ip>/api/protocols/san/iscsi/services?return_records=true' -H 'accept:  
application/hal+json' -d '{ "svm": { "name": "svm1" } }'
```

The response:

```
{  
  "num_records": 1,  
  "records": [  
    {  
      "svm": {  
        "uuid": "19d04b8e-94d7-11e8-8370-005056b48fd2",  
        "name": "svm1",  
        "_links": {  
          "self": {  
            "href": "/api/svm/svms/19d04b8e-94d7-11e8-8370-005056b48fd2"  
          }  
        }  
      },  
      "enabled": true,  
      "target": {
```

```

    "name": "iqn.1992-
08.com.netapp:sn.19d04b8e94d711e88370005056b48fd2:vs.4",
    "alias": "svm1"
  },
  "_links": {
    "self": {
      "href": "/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-
8370-005056b48fd2"
    }
  }
}
]
}
-----
'''

```

"num_records": 2,
"_links": {
  "self": {
    "href": "/api/protocols/san/iscsi/services"
  }
}
}
}
-----
'''

```

=== Retrieving details for a specific iSCSI service

The iSCSI service is identified by the UUID of its SVM.

The API:

GET /api/protocols/san/iscsi/services/{svm.uuid}

The call:

curl -X GET 'https://<mgmt-ip>/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-005056b48fd2' -H 'accept: application/hal+json'

The response:

{

```

"svm": {
  "uuid": "19d04b8e-94d7-11e8-8370-005056b48fd2",
  "name": "svm1",
  "_links": {
    "self": {
      "href": "/api/svm/svms/19d04b8e-94d7-11e8-8370-005056b48fd2"
    }
  }
},
"enabled": true,
"target": {
  "name": "iqn.1992-
08.com.netapp:sn.19d04b8e94d711e88370005056b48fd2:vs.4",
  "alias": "svm1"
},
"_links": {
  "self": {
    "href": "/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-
005056b48fd2"
  }
}
}
}

```

'''

=== Disabling an iSCSI service

Disabling an iSCSI service shuts down all active iSCSI sessions for the SVM and prevents the creation of new iSCSI sessions.

The iSCSI service to update is identified by the UUID of its SVM.

The API:

PATCH /api/protocols/san/iscsi/services/{svm.uuid}

The call:

```

curl -X PATCH 'https://<mgmt-
ip>/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-005056b48fd2'
-H 'accept: application/hal+json' -d '{ "enabled": "false" }'

```

You can retrieve the iSCSI service to confirm the change.

In this example, the `fields` query parameter is used to limit the response to the `enabled` property and iSCSI service identifiers.

The API:

```
GET /api/protocols/san/iscsi/services/{svm.uuid}
```

The call:

```
curl -X GET 'https://<mgmt-ip>/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-005056b48fd2?fields=enabled' -H 'accept: application/hal+json'
```

The response:

```
{
  "svm": {
    "uuid": "19d04b8e-94d7-11e8-8370-005056b48fd2",
    "name": "svml",
    "_links": {
      "self": {
        "href": "/api/svm/svms/19d04b8e-94d7-11e8-8370-005056b48fd2"
      }
    }
  },
  "enabled": false,
  "_links": {
    "self": {
      "href": "/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-005056b48fd2"
    }
  }
}
```

'''

=== Deleting an iSCSI service

The iSCSI service must be disabled before it can be deleted.

The iSCSI service to be deleted is identified by the UUID of its SVM.

The API:

```
DELETE /api/protocols/san/iscsi/services/{svm.uuid}
```

```

# The call:
curl -X DELETE 'https://<mgmt-
ip>/api/protocols/san/iscsi/services/19d04b8e-94d7-11e8-8370-005056b48fd2'
-H 'accept: application/hal+json'
----

[[IDf23b292db681a49c7675fd8c8fe48112]]
= Retrieve iSCSI services

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/protocols/san/iscsi/services`#

*Introduced In:* 9.6

Retrieves iSCSI services.

== Expensive properties

There is an added cost to retrieving values for these properties. They are
not included by default in GET results and must be explicitly requested
using the `fields` query parameter. See
xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin
g_specific_fields[Requesting specific fields] to learn more.

* `statistics.+++`

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#target]
[.api-collapsible-fifth-title]
target

[cols=3*,options=header]

|===

|Name
|Type
|Description

|alias
|string

a|The iSCSI target alias of the iSCSI service.

The target alias can contain one (1) to 128 characters and feature any printable character except space (" "). A PATCH request with an empty alias ("") clears the alias.

Optional in POST and PATCH. In POST, this defaults to the name of the SVM.

|name
|string

a|The iSCSI target name of the iSCSI service. This is generated for the SVM during POST.

If required, the target name can be modified using the ONTAP command line.

- * example: iqn.1992-08.com.netapp:sn.574caf71890911e8a6b7005056b4ea79:vs.2
- * maxLength: 128
- * minLength: 1
- * readOnly: 1
- * Introduced in: 9.6

|===

[#iscsi_service]
[.api-collapsible-fifth-title]
iscsi_service

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can log in to the SVM.

An iSCSI service is identified by the UUID of its SVM.

a|The raw latency in microseconds observed at the storage object. This
should be divided by the raw IOPS value to calculate the average latency
per I/O operation.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

```

```
|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This should be used
along with delta time to calculate the rate of throughput bytes per unit
of time.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|Name
```

|Type
|Description

|alias
|string

a|The iSCSI target alias of the iSCSI service.

The target alias can contain one (1) to 128 characters and feature any printable character except space (" "). A PATCH request with an empty alias ("") clears the alias.

Optional in POST and PATCH. In POST, this defaults to the name of the SVM.

|name
|string

a|The iSCSI target name of the iSCSI service. This is generated for the SVM during POST.

If required, the target name can be modified using the ONTAP command line.

- * example: iqn.1992-08.com.netapp:sn.574caf71890911e8a6b7005056b4ea79:vs.2
- * maxLength: 128
- * minLength: 1
- * readOnly: 1
- * Introduced in: 9.6

|===

[#iscsi_service]
[.api-collapsible-fifth-title]
iscsi_service

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can log in to the SVM.

An iSCSI service is identified by the UUID of its SVM.

[cols=3*,options=header]
|===

|Name
|Type
|Description

|enabled
|boolean
a|The administrative state of the iSCSI service. The iSCSI service can be disabled to block all iSCSI connectivity to the SVM.

Optional in POST and PATCH. The default setting is `_true_` (enabled) in POST.

|Type
|Description

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Any errors associated with the sample. For example, if the aggregation
of data over multiple nodes fails then any of the partial errors might be
returned, "ok" on success, or "error" on any internal uncategorized
failure. Whenever a sample collection is missed but done at a later time,
it is back filled to the previous 15 second timestamp and tagged with
"backfilled_data". "Inconsistent_delta_time" is encountered when the time
between two collections is not the same for all nodes. Therefore, the
aggregated value might be over or under inflated. "Negative_delta" is
returned when an expected monotonically increasing value has decreased in
value. "Inconsistent_old_data" is returned when one or more nodes do not
have the latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===

```

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This should be used along with delta time to calculate the rate of I/O operations per unit of time.

|Description
```

```
|alias
|string
a|The iSCSI target alias of the iSCSI service.
```

The target alias can contain one (1) to 128 characters and feature any printable character except space (" "). A PATCH request with an empty alias ("") clears the alias.

Optional in POST and PATCH. In POST, this defaults to the name of the SVM.

```
|name
|string
a|The iSCSI target name of the iSCSI service. This is generated for the
SVM during POST.
```

If required, the target name can be modified using the ONTAP command line.

```
* example: iqn.1992-08.com.netapp:sn.574caf71890911e8a6b7005056b4ea79:vs.2
* maxLength: 128
* minLength: 1
* readOnly: 1
* Introduced in: 9.6
```

```
|===
```

```
[#iscsi_service]
[.api-collapsible-fifth-title]
iscsi_service
```

An iSCSI service defines the properties of the iSCSI target for an SVM. There can be at most one iSCSI service for an SVM. An SVM's iSCSI service must be created before iSCSI initiators can log in to the SVM.

An iSCSI service is identified by the UUID of its SVM.

```

a|The unique identifier of the SVM.
```

```
|interval  
|string  
|query
```

```

|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

```

|return_records
|boolean
|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

:leveloffset: -1

= View iSCSI sessions

```

```
:leveloffset: +1
```

```
[[ID9f2feddc450d80924f4d9b98ceb08f20]]  
= Protocols SAN iSCSI sessions endpoint overview
```

== Overview

An iSCSI session is one or more TCP connections that link an iSCSI initiator with an iSCSI target. TCP connections can be added and removed from an iSCSI session by the iSCSI initiator. Across all TCP connections within an iSCSI session, an initiator sees one and the same target. After the connection is established, iSCSI control, data, and status messages are communicated over the session.

The iSCSI sessions REST API provides information about iSCSI initiators that have successfully logged in to ONTAP.

== Examples

=== Retrieving all iSCSI sessions

```
----
```

```
# The API:
```

```
GET /api/protocols/san/iscsi/sessions
```

```

```

```
|string
|query
|False
a|Filter by igroups.uuid
```

```
|igroups.name
|string
|query
|False
a|Filter by igroups.name
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[#iscsi_session]
```

```
[.api-collapsible-fifth-title]
```

```
iscsi_session
```

An iSCSI session is one or more TCP connections that link an iSCSI initiator with an iSCSI target. TCP connections can be added and removed from an iSCSI session by the iSCSI initiator. Across all TCP connections within an iSCSI session, an initiator sees one and the same target. After the connection is established, iSCSI control, data, and status messages are communicated over the session.

```
= Manage SAN LUN maps
```

```
:leveloffset: +1
```

```
[[IDd63792c9ccfde6f752e52da511dbd45a]]
= Protocols SAN lun-maps endpoint overview
```

```
== Overview
```

A LUN map is an association between a LUN and an initiator group. When a LUN is mapped to an initiator group, the initiator group's initiators are granted access to the LUN. The relationship between an initiator group and a LUN is many initiator groups to many LUNs.

The LUN map REST API allows you to create, delete, and discover LUN maps.

```
== Examples
```

```
=== Creating a LUN map
```

```
----
```

```
# The API:
POST /api/protocols/san/lun-maps
```

```
# The call:
```

```

curl -X POST 'https://<mgmt-ip>/api/protocols/san/lun-maps' -H 'accept:
application/hal+json' -d '{ "svm": { "name": "svm1" }, "igroup": { "name":
"igroup1" }, "lun": { "name": "/vol/vol1/lun1" } }'
----

'''

=== Retrieving all of the LUN maps

----

# The API:
GET /api/protocols/san/lun-maps

# The call:
curl -X GET 'https://<mgmt-ip>/api/protocols/san/lun-maps' -H 'accept:
application/hal+json'

# The response:
{
"records": [
  {

== Parameters

[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|lun.node.name
|string
|query
|False
a|Filter by lun.node.name

```

```
|lun.node.uuid  
|string  
|query  
|False  
a|Filter by lun.node.uuid
```

```
|lun.name  
|string  
|query  
|False  
a|Filter by lun.name
```

```
|lun.uuid  
|string  
|query  
|False  
a|Filter by lun.uuid
```

```
|svm.uuid  
|string  
|query  
|False  
a|Filter by svm.uuid
```

```
|svm.name  
|string  
|query  
|False  
a|Filter by svm.name
```

```
|igroup.protocol  
|string  
|query  
|False  
a|Filter by igroup.protocol
```

```
|igroup.name  
|string  
|query  
|False
```

```

a|Filter by igroup.name

|igroup.uuid
|string
|query
|False
a|Filter by igroup.uuid

|igroup.os_type
|string
|query
|False
a|Filter by igroup.os_type

|igroup.initiators
|string
|query
|False
a|Filter by igroup.initiators

|logical_unit_number
|integer
|query
|False
a|Filter by logical_unit_number

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean

```

```

|query
|False
a|The default is true for GET calls.  When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds.  ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

[[ID88275bf66e015e67d980d3e9ae2ed639]]
= Create a LUN map
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/protocols/san/lun-maps`#
```

Introduced In: 9.6

Creates a LUN map.

== Required properties

- * `svm.uuid` or `svm.name` - Existing SVM in which to create the LUN map.
- * `igroup.uuid` or `igroup.name` - Existing initiator group to map to the specified LUN.
- * `lun.uuid` or `lun.name` - Existing LUN to map to the specified initiator group.

== Default property values

If not specified in POST, the following default property values are assigned.

- * `logical_unit_number` - If no value is provided, ONTAP assigns the lowest available value.

== Related ONTAP commands

- * `lun mapping create`

== Learn more

- * xref:{relative_path}protocols_san_lun-maps_endpoint_overview.html[DOC

:leveloffset: -1

= Manage LUNs

:leveloffset: +1

[[IDf72d1b9e16c0a62a4511d305a6eb8456]]
= Storage luns endpoint overview

== Overview

```

A LUN is the logical representation of storage in a storage area network (SAN).

The LUN REST API allows you to create, update, delete, and discover LUNs.

In ONTAP, a LUN is located within a volume. Optionally, it can be located within a qtree in a volume.

A LUN can be created to a specified size using thin or thick provisioning. A LUN can then be renamed, resized, cloned, and moved to a different volume. LUNs support the assignment of a quality of service (QoS) policy for performance management or a QoS policy can be assigned to the volume containing the LUN. See the LUN object model to learn more about each of the properties supported by the LUN REST API.

A LUN must be mapped to an initiator group to grant access to the initiator group's initiators (client hosts). Initiators can then access the LUN and perform I/O over a Fibre Channel (FC) fabric using the FC Protocol or a TCP/IP network using iSCSI.

== Performance monitoring

Performance of a LUN can be monitored by observing the ``metric.++`` and ``statistics.++`` properties. These properties show the performance of a LUN in terms of IOPS, latency and throughput. The ``metric.++`` properties denote an average whereas ``statistics.++`` properties denote a real-time monotonically increasing value aggregated across all nodes.

== Examples

=== Creating a LUN

This example creates a 300 gigabyte, thin-provisioned LUN in SVM `_svm1_`, volume `_voll_`, configured for use by `_linux_` initiators. The ``return_records`` query parameter is used to retrieve properties of the newly created LUN in the POST response.

The API:

POST /api/storage/luns

The call:

```
curl -X POST 'https://<mgmt-ip>/api/storage/luns?return_records=true' -H
'accept: application/hal+json' -d '{ "svm": { "name": "svm1" }, "os_type":
"linux", "space": { "size": "300G" }, "name" : "/vol/voll/lun1" }'
```

```
# The response:

```

=== Updating a LUN

This example sets the `comment` property of a LUN.

```

-----

# The API:
PATCH /api/storage/luns/{uuid}

# The call:
curl -X PATCH 'https://<mgmt-ip>/api/storage/luns/5a24ae5b-28af-47fb-b129-5adf6cfba0a6' -H 'accept: application/hal+json' -d '{ "comment": "Data for the finance department." }'
-----

'''

```

=== Retrieving LUNs

This example retrieves summary information for all online LUNs in SVM `_svm1_`. The `svm.name` and `status.state` query parameters are used to find the desired LUNs.

```

-----

# The API:
GET /api/storage/luns

# The call:
curl -X GET 'https://<mgmt-ip>/api/storage/luns?svm.name=svm1&status.state=online' -H 'accept: application/hal+json'

# The response:
{

```

```

'''

=== Retrieving details for a specific LUN

In this example, the ``fields`` query parameter is used to request all fields, including advanced fields, that would not otherwise be returned by default for the LUN.

The API:

GET /api/storage/luns/{uuid}

The call:

curl -X GET 'https://<mgmt-ip>/api/storage/luns/5a24ae5b-28af-47fb-b129-5adf6cfba0a6?fields=**' -H 'accept: application/hal+json'

The response:

```

{
  "uuid": "5a24ae5b-28af-47fb-b129-5adf6cfba0a6",
  "svm": {
    "uuid": "6bf967fd-2a1c-11e9-b682-005056bbc17d",

== Cloning LUNs

A clone of a LUN is an independent "copy" of the LUN that shares unchanged data blocks with the original. As blocks of the source and clone are modified, unique blocks are written for each. LUN clones can be created quickly and consume very little space initially. They can be created for the purpose of back-up, or to replicate data for multiple consumers.

Space reservations can be set for the LUN clone independent of the source LUN by setting the ``space.guarantee.requested`` property in a POST or PATCH request.

A LUN clone can also be set to auto-delete by setting the ``auto_delete`` property. If the LUN's volume is configured for automatic deletion, LUNs that have auto-delete enabled are deleted when a volume is nearly full to reclaim a target amount of free space in the volume.

== Examples

=== Creating a new LUN clone

You create a new LUN clone as you create any LUN - a POST request to `xref:{relative_path}getting_started_with_the_ontap_rest_api.html#/SAN/lun_create[/storage/luns]`. Set ``clone.source.uuid`` or ``clone.source.name`` to identify the source LUN from which the clone is created. The LUN clone and its source must reside in the same volume.

The source LUN can reside in a Snapshot copy, in which case the ``clone.source.name`` field must be used to identify it. Add ``/.snapshot/<snapshot_name>`` to the path after the volume name to identify the Snapshot copy. For example ``/vol/vol1/.snapshot/snap1/lun1``.

By default, new LUN clones do not inherit the QoS policy of the source LUN; a QoS policy should be set for the clone by setting the ``qos_policy`` property.

The API:

POST /api/storage/luns

The call:

```
curl -X POST 'https://<mgmt-ip>/api/storage/luns' -H 'accept:
application/hal+json' -d '{ "svm": { "name": "svm1" }, "name":
"/vol/vol1/lun2clone1", "clone": { "source": { "name": "/vol/vol1/lun2" }
}, "qos_policy": { "name": "qos1" } }'
```

=== Over-writing an existing LUN's data as a clone of another

You can overwrite an existing LUN as a clone of another, using a PATCH request to

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#/SAN/lun_modify[/storage/luns/{uuid}]. Set the ``clone.source.uuid`` or ``clone.source.name`` property to identify the source LUN from which the clone data is taken. The LUN clone and its source must reside in the same volume.

When used in a PATCH request, the patched LUN's data is overwritten as a clone of the source. The following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the updated LUN are also preserved.

The API:

PATCH /api/storage/luns/{uuid}

The call:

```
curl -X PATCH 'https://<mgmt-ip>/api/storage/luns/5a24ae5b-28af-47fb-b129-
5adf6cfba0a6' -H 'accept: application/hal+json' -d '{ "clone": { "source":
{ "name": "/vol/vol1/lun2" } } }'
```

...

== Moving LUNs between volumes

You move a LUN between volumes by using a PATCH request to

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#/SAN/lun_

modify[/storage/luns/{uuid}]. Set the volume portion of the fully qualified LUN path `name` property, `path.volume.uuid`, or `path.volume.name` property to a different volume than the LUN's current volume. Moving a LUN between volumes is an asynchronous activity. A successful request returns a response of 200 synchronously, which indicates that the movement has been successfully queued. The LUN object can then be further polled with a GET request to <<lun_get,`+/storage/luns/{uuid}+`>> to monitor the status of the movement.

The `movement` sub-object of the LUN object is populated while a LUN movement is in progress and for two minutes following completion of a movement.

== Examples

=== Starting a LUN movement

The API:

PATCH /api/storage/luns/{uuid}

The call:

```
curl -X PATCH 'https://<mgmt-ip>/api/storage/luns/7faf0a9e-0a47-4876-8318-3638d5da16bf' -H 'accept: application/hal+json' -d '{ "name": "/vol/vol1/lun3" }'
```

=== Checking on the status of the LUN movement

The API:

GET /api/storage/luns/{uuid}

The call:

```
curl -X GET 'https://<mgmt-ip>/api/storage/luns/7faf0a9e-0a47-4876-8318-3638d5da16bf?fields=movement' -H 'accept: application/hal+json'
```

The response:

```
{
  "uuid": "7faf0a9e-0a47-4876-8318-3638d5da16bf",
  "name": "/vol/vol1/lun3",
  "movement": {
    "paths": {
      "destination": "/vol/vol1/lun3",
```

```

    "source": "/vol/vol2/lun3"
  },
  "progress": {
    "elapsed": 1,
    "percent_complete": 0,
    "state": "preparing",
    "volume_snapshot_blocked": false
  }
},

    "href": "/api/storage/luns/7faf0a9e-0a47-4876-8318-3638d5da16bf"
  }
}
}
}
----

'''

=== Deleting a LUN

----

# The API:
DELETE /api/storage/luns/{uuid}

# The call:
curl -X DELETE 'https://<mgmt-ip>/api/storage/luns/c903a978-9bac-4ce9-8237-4a3ba8b13f08' -H 'accept: application/hal+json'
----

'''

[[ID8a3107483485c625e0da2487fdf904fb]]
= Retrieve LUNs

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/storage/luns`#

*Introduced In:* 9.6

Retrieves LUNs.

```

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```

|False
a|Filter by lun_maps.igroup.uuid

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.

```

Default direction is 'asc' for ascending.

[#source]
[.api-collapsible-fifth-title]
source

The source LUN for a LUN clone operation. This can be specified using property ``clone.source.uuid`` or ``clone.source.name``. If both properties are supplied, they must refer to the same LUN.

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

[#clone]
[.api-collapsible-fifth-title]
clone

This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: ``auto_delete``, ``qos_policy``, and ``space.guarantee.requested``.

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

[#qtree]
[.api-collapsible-fifth-title]
qtree

The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties ``name`` and ``location.qtree.name`` and/or ``location.qtree.uuid`` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

|===
```

```
|Name
|Type
|Description
```

```
|logical_unit
|string
a|The base name component of the LUN. Valid in POST and PATCH.
```

If properties `name` and `location.logical_unit` are specified in the same request, they must refer to the base name.

A PATCH that modifies the base name of the LUN is considered a rename operation.

```
|qtree
|link:#qtree[qtree]
a|The qtree in which the LUN is optionally located. Valid in POST and
PATCH.
```

If properties `name` and `location.qtree.name` and/or
`location.qtree.uuid` are specified in the same request, they must refer
to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename
operation.

```
|volume
|link:#volume[volume]
a|The volume in which the LUN is located. Valid in POST and PATCH.
```

If properties `name` and `location.volume.name` and/or
`location.volume.uuid` are specified in the same request, they must refer
to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN
movement operation.

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status

```

```
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.
```

```
|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#paths]
[.api-collapsible-fifth-title]
paths
```

The fully qualified LUN path names involved in the LUN movement.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|destination
|string
a|The fully qualified path of the LUN movement destination composed of a
"/vol" prefix, the volume name, the (optional) qtree name, and base name
of the LUN.
```

```
|source
|string
a|The fully qualified path of the LUN movement source composed of a "/vol"
prefix, the volume name, the (optional) qtree name, and base name of the
LUN.
```

```
|===
```

```
[#failure]
[.api-collapsible-fifth-title]
failure
```

Error information provided if the asynchronous LUN movement operation fails.

[.api-collapsible-fifth-title]
progress
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

|elapsed
|integer
a|The amount of time, in seconds, that has elapsed since the start of the LUN movement.

|failure
|link:#failure[failure]
a|Error information provided if the asynchronous LUN movement operation fails.

|percent_complete
|integer
a|The percentage complete of the LUN movement.

|state
|string
a|The state of the LUN movement.

Valid in PATCH when an LUN movement is active. Set to `_paused_` to pause a LUN movement. Set to `_replicating_` to resume a paused LUN movement.

|volume_snapshot_blocked
|boolean
a|This property reports if volume Snapshot copies are blocked by the LUN movement. This property can be polled to identify when volume Snapshot copies can be resumed after beginning a LUN movement.

|===

[#movement]
[.api-collapsible-fifth-title]
movement

This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH

request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The `movement` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the `movement` properties. The LUN movement operation can be further modified using a PATCH on the properties on the `movement` sub-object.

There is added cost to retrieving property values for `movement`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|max_throughput
```

```
|string
```

a|The maximum data throughput that should be utilized in support of the LUN movement. This property can be used to throttle a transfer and limit its impact on the performance of the source and destination nodes. The specified value will be rounded up to the nearest megabyte.

If this property is not specified in a POST that begins a LUN movement, throttling is not applied to the data transfer.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

This property is valid only in a POST that begins a LUN movement or a PATCH when a LUN movement is already in process.

* Introduced in: 9.6

```
|paths
```

```
|link:#paths[paths]
```

a|The fully qualified LUN path names involved in the LUN movement.

```
|progress
|link:#progress[progress]
a|
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property ``qos_policy.uuid`` and ``qos_policy.name`` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property ``qos_policy.name`` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|name
|string
a|The name of the QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set this property to an empty string ("") in a PATCH request. Valid in POST and PATCH.
```

```
|uuid
|string
a|The unique identifier of the QoS policy. Valid in POST and PATCH.
```

```
|===
```

```
[#guarantee]
[.api-collapsible-fifth-title]
guarantee
```

Properties that request and report the space guarantee for the LUN.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|requested
|boolean
```

a|The requested space reservation policy for the LUN. If `_true_`, a space reservation is requested for the LUN; if `_false_`, the LUN is thin provisioned. Guaranteeing a space reservation request for a LUN requires that the volume in which the LUN resides is also space reserved and that the fractional reserve for the volume is 100%. Valid in POST and PATCH.

```
|reserved
|boolean
```

a|Reports if the LUN is space guaranteed.

If `_true_`, a space guarantee is requested and the containing volume and aggregate support the request. If `_false_`, a space guarantee is not requested or a space guarantee is requested and either the containing volume or aggregate do not support the request.

```
|===
```

```
[#space]
[.api-collapsible-fifth-title]
space
```

The storage space related properties of the LUN.

```
[cols=3*,options=header]
|===
|Name
|Type
```

|Description

|guarantee

|link:#guarantee[guarantee]

a|Properties that request and report the space guarantee for the LUN.

|size

|integer

a|The total provisioned size of the LUN. The LUN size can be increased but not be made smaller using the REST interface.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The actual minimum and maximum sizes vary depending on the ONTAP version, ONTAP platform and the available space in the containing volume and aggregate.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* example: 1073741824

* Max value: 140737488355328

* Min value: 4096

* Introduced in: 9.6

|used

|integer

a|The amount of space consumed by the main data stream of the LUN.

This value is the total space consumed in the volume by the LUN, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways SAN filesystems and applications utilize blocks within a LUN, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the LUN blocks are utilized outside of ONTAP, this property should not be used as an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* readOnly: 1

* Introduced in: 9.6

|===

```
[#iops_raw]
[.api-collapsible-fifth-title]
iops_raw
```

The number of I/O operations observed at the storage object. This can be used along with delta time to calculate the rate of I/O operations per unit of time.

```

a|The number of I/O operations observed at the storage object. This can be
used along with delta time to calculate the rate of I/O operations per
unit of time.
```

```
|latency_raw
```

```
|link:#latency_raw[latency_raw]
```

a|The raw latency in microseconds observed at the storage object. This can be divided by the raw IOPS value to calculate the average latency per I/O operation.

```
|status
```

```
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".

"Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value.

"Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput_raw
```

status

Status information about the LUN.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

|Description

|container_state

|string

a|The state of the volume and aggregate that contain the LUN. LUNs are only available when their containers are available.

|mapped

|boolean

a|Reports if the LUN is mapped to one or more initiator groups.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|read_only

|boolean

a|Reports if the LUN allows only read access.

|state

|string

a|The state of the LUN. Normal states for a LUN are `_online_` and `_offline_`. Other states indicate errors.

|===

[#svm]

[.api-collapsible-fifth-title]

svm

The SVM in which the LUN is located.

```
[#lun]
```

```
[.api-collapsible-fifth-title]
```

```
lun
```

A LUN is the logical representation of storage in a storage area network (SAN).

In ONTAP, a LUN is located within a volume. Optionally, it can be located within a qtree in a volume.

A LUN can be created to a specified size using thin or thick provisioning. A LUN can then be renamed, resized, cloned, and moved to a different volume. LUNs support the assignment of a quality of service (QoS) policy for performance management or a QoS policy can be assigned to the volume containing the LUN. See the LUN object model to learn more about each of the properties supported by the LUN REST API.

A LUN must be mapped to an initiator group to grant access to the initiator group's initiators (client hosts). Initiators can then access the LUN and perform I/O over a Fibre Channel (FC) fabric using the Fibre Channel Protocol or a TCP/IP network using iSCSI.

```

```
|Name
```

```
|Type
```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

a|

|auto_delete

|boolean

a|This property marks the LUN for auto deletion when the volume containing the LUN runs out of space. This is most commonly set on LUN clones.

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|class

|string

a|The class of LUN. Only `_regular_` LUNs can be created using the REST API.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the LUN was created.

|enabled

|boolean

a|The enabled state of the LUN. LUNs can be disabled to prevent access to the LUN. Certain error conditions also cause the LUN to become disabled. If the LUN is disabled, you can consult the ``state`` property to determine if the LUN is administratively disabled (`_offline_`) or has become disabled as a result of an error. A LUN in an error condition can be brought online by setting the ``enabled`` property to `_true_` or brought administratively offline by setting the ``enabled`` property to `_false_`. Upon creation, a LUN

is enabled by default. Valid in PATCH.

```
|location
|link:#location[location]
a|The location of the LUN within the ONTAP cluster. Valid in POST and
PATCH.
```

* Introduced in: 9.6

```
|lun_maps
|array[link:#lun_maps[lun_maps]]
a|The LUN maps with which the LUN is associated.
```

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS latency and throughput.
```

```
|movement
|link:#movement[movement]
a|This sub-object applies to LUN movement between volumes. A LUN can be
moved to a new volume with a PATCH request that changes either the volume
portion of property `name`, `location.volume.uuid`, or
`location.volume.name`. If the volume is changed using more than one of
these properties, the supplied properties used must refer to the same
volume.
```

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for `movement`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|name

|string

a|The fully qualified path name of the LUN composed of a `"/vol"` prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an asynchronous LUN movement operation.

|os_type

|string

a|The operating system type of the LUN.

Required in POST when creating a LUN that is not a clone of another. Disallowed in POST when creating a LUN clone.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property ``qos_policy.uuid`` and ``qos_policy.name`` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property ``qos_policy.name`` to an empty string (`""`) in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number

|string

a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

```
* maxLength: 12
* minLength: 12
* readOnly: 1
* Introduced in: 9.6
```

```

= Create a LUN

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/storage/luns`#

Introduced In: 9.6

Creates a LUN.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the LUN.

* `name`, `location.volume.name` or `location.volume.uuid` - Existing volume in which to create the LUN.

* `name` or `location.logical_unit` - Base name of the LUN.

* `os_type` - Operating system from which the LUN will be accessed.

Required when creating a non-clone LUN and disallowed when creating a clone of an existing LUN. A clone's `os_type` is taken from the source LUN.

* `space.size` - Size of the LUN. Required when creating a non-clone LUN and disallowed when creating a clone of an existing LUN. A clone's size is taken from the source LUN.

== Recommended optional properties

* `qos_policy.name` or `qos_policy.uuid` - Existing traditional or adaptive QoS policy to be applied to the LUN. All LUNs should be managed by a QoS policy at the volume or LUN level.

== Default property values

If not specified in POST, the follow default property values are assigned.

* `auto_delete` - `__false__`

== Related ONTAP commands

* `lun create`

* `volume file clone autodelete`

* `volume file clone create`

== Learn more

* xref:{relative_path}storage_luns_endpoint_overview.html[DOC

* Default value:

|===

== Request Body

[cols=3*,options=header]

|===

|Name

|Type

|Description

|auto_delete

|boolean

a|This property marks the LUN for auto deletion when the volume containing the LUN runs out of space. This is most commonly set on LUN clones.

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume

containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|class
|string
a|The class of LUN. Only _regular_ LUNs can be created using the REST API.
```

```
|clone
|link:#clone[clone]
a|This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: `auto_delete`, `qos_policy`, and `space.guarantee.requested`.
```

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

```
|comment
|string
a|A configurable comment available for use by the administrator. Valid in POST and PATCH.
```

```
|create_time
|string
a|The time the LUN was created.
```

```
|location
|link:#location[location]
```

a|The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

* Introduced in: 9.6

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|The LUN maps with which the LUN is associated.

There is an added cost to retrieving property values for `lun_maps`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|movement

|link:#movement[movement]

a|This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property `name`, `location.volume.uuid`, or `location.volume.name`. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The `movement` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the `movement` properties. The LUN movement operation can be further modified using a PATCH on the properties on the `movement` sub-object.

There is added cost to retrieving property values for `movement`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|name

|string

a|The fully qualified path name of the LUN composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an asynchronous LUN movement operation.

|os_type

|string

a|The operating system type of the LUN.

Required in POST when creating a LUN that is not a clone of another.

Disallowed in POST when creating a LUN clone.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property `qos_policy.uuid` and `qos_policy.name` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number

|string

a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

* maxLength: 12

* minLength: 12

* readOnly: 1

* Introduced in: 9.6

|space

|link:#space[space]

a|The storage space related properties of the LUN.

```
|status
|link:#status[status]
a|Status information about the LUN.
```

```
|svm
|link:#svm[svm]
a|The SVM in which the LUN is located.
```

```
|uuid
|string
a|The unique identifier of the LUN. The UUID is generated by ONTAP when
the LUN is created.
```

```
* example: 1cd8a442-86d1-11e0-ae1c-123478563412

Status: Default

ONTAP Error Response Codes

|===

| Error Code | Description

| 917927

| The specified volume was not found.

| 918236

| The specified `location.volume.uuid` and `location.volume.name` do not refer to the same volume.

| 2621462

| The specified SVM does not exist.

| 2621706

| The specified `svm.uuid` and `svm.name` do not refer to the same SVM.

| 2621707

| No SVM was specified. Either `svm.name` or `svm.uuid` must be supplied.

| 5242927

| The specified qtree was not found.

| 5242950

| The specified `location.qtree.id` and `location.qtree.name` do not refer to the same qtree.

| 5374121

| A LUN name can only contain characters A-Z, a-z, 0-9, "-", ".", "_", "{" and "}".

| 5374123

| A negative size was provided for the LUN.

| 5374124

| The specified size is too small for the LUN.

| 5374125

| The specified size is too large for the LUN.

| 5374129

| LUNs cannot be created on a load sharing mirror volume.

| 5374130

| An invalid size value was provided.

| 5374237
| LUNs cannot be created on an SVM root volume.

| 5374238
| LUNs cannot be created in Snapshot copies.

| 5374241
| A size value with invalid units was provided.

| 5374242
| A LUN or NVMe namespace already exists at the specified path.

| 5374352
| An invalid name was provided for the LUN.

| 5374707
| Creating a LUN in the specific volume is not allowed because the volume is reserved for an application.

| 5374858
| The volume specified by `name` is not the same as that specified by `location.volume`.

| 5374859
| No volume was specified for the LUN.

| 5374860
| The qtree specified by `name` is not the same as that specified by `location.qtree`.

| 5374861
| The LUN base name specified by `name` is not the same as that specified by `location.logical_unit`.

| 5374862
| No LUN path base name was provided for the LUN.

| 5374863
| An error occurred after successfully creating the LUN. Some properties were not set.

| 5374874
| The specified `clone.source.uuid` and `clone.source.name` do not refer to the same LUN.

| 5374875
| The specified `clone.source` was not found.

```

| 5374876
| The specified `clone.source` was not found.

| 5374883
| The property cannot be specified when creating a LUN clone. The `target`
property of the error object identifies the property.

| 5374884
| The property is required except when creating a LUN clone. The `target`
property of the error object identifies the property.

| 5374886
| An error occurred after successfully creating the LUN preventing the
retrieval of its properties.

| 5374899
| The `clone.source.uuid` property is not supported when specifying a
source LUN from a Snapshot copy.

| 13565952
| The LUN clone request failed.

_links
[#source]
[.api-collapsible-fifth-title]
source
```

The source LUN for a LUN clone operation. This can be specified using property ``clone.source.uuid`` or ``clone.source.name``. If both properties are supplied, they must refer to the same LUN.

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|name
|string
a|The fully qualified path name of the clone source LUN composed of a
"/vol" prefix, the volume name, the (optional) qtree name, and base name
of the LUN. Valid in POST and PATCH.
```

```
|uuid
|string
a|The unique identifier of the clone source LUN. Valid in POST and PATCH.
```

```
|===
```

```
[#clone]
[.api-collapsible-fifth-title]
clone
```

This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN:

``auto_delete`, `qos_policy`, and `space.guarantee.requested`.`

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|source
```

```
|link:#source[source]
```

a|The source LUN for a LUN clone operation. This can be specified using property ``clone.source.uuid`` or ``clone.source.name``. If both properties are supplied, they must refer to the same LUN.

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

```
|===
```

```
[#qtree]
```

```
[.api-collapsible-fifth-title]
```

qtree

The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties ``name`` and ``location.qtree.name`` and/or ``location.qtree.uuid`` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
|Description
```

```
|id
|integer
```

```
a|The identifier for the qtree, unique within the qtree's volume.
```

```
|name
|string
```

```
a|The name of the qtree.
```

```
|===
```

```
[#volume]
[.api-collapsible-fifth-title]
volume
```

The volume in which the LUN is located. Valid in POST and PATCH.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN movement operation.

```
[cols=3*,options=header]
|===
```

```
|Name
|Type
|Description
```

```
|name
|string
```

```
a|The name of the volume.
```

```
|uuid
|string
```

```
a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.
```

* example: 028baa66-41bd-11e9-81d5-00a0986138f7

* Introduced in: 9.6

|===

[#location]

[.api-collapsible-fifth-title]

location

The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|logical_unit

|string

a|The base name component of the LUN. Valid in POST and PATCH.

If properties `name` and `location.logical_unit` are specified in the same request, they must refer to the base name.

A PATCH that modifies the base name of the LUN is considered a rename operation.

|qtree

|link:#qtree[qtree]

a|The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

|volume

|link:#volume[volume]

a|The volume in which the LUN is located. Valid in POST and PATCH.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN movement operation.

```
|Name
```

```
|Type
```

```
|Description
```

```

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|throughput
|link:#throughput[throughput]
a|The rate of throughput bytes per second observed at the storage object.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#paths]

```

[.api-collapsible-fifth-title]

paths

The fully qualified LUN path names involved in the LUN movement.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|destination

|string

a|The fully qualified path of the LUN movement destination composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN.

|source

|string

a|The fully qualified path of the LUN movement source composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN.

|===

[#failure]

[.api-collapsible-fifth-title]

failure

Error information provided if the asynchronous LUN movement operation fails.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|code

|string

a|The error code.

```
|message
|string
a|The error message.
```

```
|===
```

```
[#progress]
[.api-collapsible-fifth-title]
progress
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|elapsed
```

```
|integer
```

```
a|The amount of time, in seconds, that has elapsed since the start of the
LUN movement.
```

```
|failure
```

```
|link:#failure[failure]
```

```
a|Error information provided if the asynchronous LUN movement operation
fails.
```

```
|percent_complete
```

```
|integer
```

```
a|The percentage complete of the LUN movement.
```

```
|volume_snapshot_blocked
```

```
|boolean
```

```
a|This property reports if volume Snapshot copies are blocked by the LUN
movement. This property can be polled to identify when volume Snapshot
copies can be resumed after beginning a LUN movement.
```

```
|===
```

```
[#movement]
```

[.api-collapsible-fifth-title]

movement

This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for ``movement``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|max_throughput

|string

a|The maximum data throughput that should be utilized in support of the LUN movement. This property can be used to throttle a transfer and limit its impact on the performance of the source and destination nodes. The specified value will be rounded up to the nearest megabyte.

If this property is not specified in a POST that begins a LUN movement, throttling is not applied to the data transfer.

For more information, see `_Size properties_` in the `_docs_` section of the

ONTAP REST API documentation.

This property is valid only in a POST that begins a LUN movement or a PATCH when a LUN movement is already in process.

* Introduced in: 9.6

```
|paths
|link:#paths[paths]
a|The fully qualified LUN path names involved in the LUN movement.
```

```
|===
```

```
[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property ``qos_policy.uuid`` and ``qos_policy.name`` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property ``qos_policy.name`` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|name
|string
a|The name of the QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set this property to an empty string ("" ) in a PATCH request. Valid in POST and PATCH.
```

```
|uuid
|string
a|The unique identifier of the QoS policy. Valid in POST and PATCH.
```

|===

```
[#guarantee]
[.api-collapsible-fifth-title]
guarantee
```

Properties that request and report the space guarantee for the LUN.

```
[cols=3*,options=header]
```

|===

```
|Name
|Type
|Description
```

```
|requested
```

```
|boolean
```

a|The requested space reservation policy for the LUN. If `_true_`, a space reservation is requested for the LUN; if `_false_`, the LUN is thin provisioned. Guaranteeing a space reservation request for a LUN requires that the volume in which the LUN resides is also space reserved and that the fractional reserve for the volume is 100%. Valid in POST and PATCH.

```
|reserved
```

```
|boolean
```

a|Reports if the LUN is space guaranteed.

If `_true_`, a space guarantee is requested and the containing volume and aggregate support the request. If `_false_`, a space guarantee is not requested or a space guarantee is requested and either the containing volume or aggregate do not support the request.

|===

```
[#space]
[.api-collapsible-fifth-title]
space
```

The storage space related properties of the LUN.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|guarantee
```

```
|link:#guarantee[guarantee]
```

```
a|Properties that request and report the space guarantee for the LUN.
```

```
|size
```

```
|integer
```

```
a|The total provisioned size of the LUN. The LUN size can be increased but not be made smaller using the REST interface.
```

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The actual minimum and maximum sizes vary depending on the ONTAP version, ONTAP platform and the available space in the containing volume and aggregate.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

```
* example: 1073741824
```

```
* Max value: 140737488355328
```

```
* Min value: 4096
```

```
* Introduced in: 9.6
```

```
|used
```

```
|integer
```

```
a|The amount of space consumed by the main data stream of the LUN.
```

This value is the total space consumed in the volume by the LUN, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways SAN filesystems and applications utilize blocks within a LUN, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the LUN blocks are utilized outside of ONTAP, this property should not be used as an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

```
* readOnly: 1
```

```
* Introduced in: 9.6
```

```

[#lun]
[.api-collapsible-fifth-title]
lun
```

A LUN is the logical representation of storage in a storage area network (SAN).

In ONTAP, a LUN is located within a volume. Optionally, it can be located within a qtree in a volume.

A LUN can be created to a specified size using thin or thick provisioning. A LUN can then be renamed, resized, cloned, and moved to a different volume. LUNs support the assignment of a quality of service (QoS) policy for performance management or a QoS policy can be assigned to the volume containing the LUN. See the LUN object model to learn more about each of the properties supported by the LUN REST API.

A LUN must be mapped to an initiator group to grant access to the initiator group's initiators (client hosts). Initiators can then access the LUN and perform I/O over a Fibre Channel (FC) fabric using the Fibre Channel Protocol or a TCP/IP network using iSCSI.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|auto_delete
|boolean
```

a|This property marks the LUN for auto deletion when the volume containing the LUN runs out of space. This is most commonly set on LUN clones.

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|class
|string

a|The class of LUN. Only `_regular_` LUNs can be created using the REST API.

|clone
|link:#clone[clone]

a|This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: ``auto_delete``, ``qos_policy``, and ``space.guarantee.requested``.

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

|comment
|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time
|string

a|The time the LUN was created.

|location

|link:#location[location]

a|The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

* Introduced in: 9.6

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|The LUN maps with which the LUN is associated.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|movement

|link:#movement[movement]

a|This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for ``movement``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requestin](#)

g_specific_fields[Requesting specific fields] to learn more.

|name

|string

a|The fully qualified path name of the LUN composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an asynchronous LUN movement operation.

|os_type

|string

a|The operating system type of the LUN.

Required in POST when creating a LUN that is not a clone of another. Disallowed in POST when creating a LUN clone.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property `qos_policy.uuid` and `qos_policy.name` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number

|string

a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

* maxLength: 12

* minLength: 12

* readOnly: 1

* Introduced in: 9.6

```
|space
|link:#space[space]
a|The storage space related properties of the LUN.
```

```
|status
|link:#status[status]
a|Status information about the LUN.
```

```
|svm
|link:#svm[svm]
a|The SVM in which the LUN is located.
```

```
|uuid
|string
a|The unique identifier of the LUN. The UUID is generated by ONTAP when
the LUN is created.
```

```
* example: 1cd8a442-86d1-11e0-ae1c-123478563412
* readOnly: 1
* Introduced in: 9.6

= Delete a LUN

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
```

```
block]#`/storage/luns/{uuid}`#
```

Introduced In: 9.6

Deletes a LUN.

== Related ONTAP commands

* `lun delete`

== Learn more

* xref:{relative_path}storage_luns_endpoint_overview.html[DOC
/storage/luns]

== Parameters

```
[cols=5*,options=header]  
|===
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|uuid  
|string  
|path  
|True  
a|The unique identifier of the LUN.
```

```
|allow_delete_while_mapped  
|boolean  
|query  
|False
```

a|Allows deletion of a mapped LUN.

A mapped LUN might be in use. Deleting a mapped LUN also deletes the LUN map and makes the data no longer available. This might cause a disruption in the availability of data.

This parameter should be used with caution.

* Default value:

|link:#_links[_links]
```

```
a|
```

```
|auto_delete
```

```
|boolean
```

a|This property marks the LUN for auto deletion when the volume containing the LUN runs out of space. This is most commonly set on LUN clones.

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|class

|string

a|The class of LUN. Only `_regular_` LUNs can be created using the REST API.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the LUN was created.

|enabled

|boolean

a|The enabled state of the LUN. LUNs can be disabled to prevent access to the LUN. Certain error conditions also cause the LUN to become disabled. If the LUN is disabled, you can consult the ``state`` property to determine if the LUN is administratively disabled (`_offline_`) or has become disabled as a result of an error. A LUN in an error condition can be brought online by setting the ``enabled`` property to `_true_` or brought administratively offline by setting the ``enabled`` property to `_false_`. Upon creation, a LUN is enabled by default. Valid in PATCH.

|location

|link:#location[location]

a|The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

* Introduced in: 9.6

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|The LUN maps with which the LUN is associated.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS latency and throughput.

|movement

|link:#movement[movement]

a|This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for ``movement``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|name

|string

a|The fully qualified path name of the LUN composed of a `"/vol"` prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an

asynchronous LUN movement operation.

|os_type
|string
a|The operating system type of the LUN.

Required in POST when creating a LUN that is not a clone of another.
Disallowed in POST when creating a LUN clone.

|qos_policy
|link:#qos_policy[qos_policy]
a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property `qos_policy.uuid` and `qos_policy.name` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number
|string
a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

- * maxLength: 12
- * minLength: 12
- * readOnly: 1
- * Introduced in: 9.6

|space
|link:#space[space]
a|The storage space related properties of the LUN.

|statistics
|link:#statistics[statistics]
a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

```

|status
|link:#status[status]
a|Status information about the LUN.

|svm
|link:#svm[svm]
a|The SVM in which the LUN is located.

|uuid
|string
a|The unique identifier of the LUN. The UUID is generated by ONTAP when
the LUN is created.

* example: 1cd8a442-86d1-11e0-ae1c-123478563412
* readOnly: 1
* Introduced in: 9.6

[#source]
[.api-collapsible-fifth-title]
source
```

The source LUN for a LUN clone operation. This can be specified using property ``clone.source.uuid`` or ``clone.source.name``. If both properties are supplied, they must refer to the same LUN.

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

```
[#clone]
[.api-collapsible-fifth-title]
clone
```

This sub-object is used in POST to create a new LUN as a clone of an

existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: `auto_delete`, `qos_policy`, and `space.guarantee.requested`.

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: `class`, `auto_delete`, `lun_maps`, `serial_number`, `status.state`, and `uuid`.

Persistent reservations for the patched LUN are also preserved.

```
[#qtree]
[.api-collapsible-fifth-title]
qtree
```

The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

|name
|string
a|The name of the qtree.
```

```
|===
```

```
[#volume]
[.api-collapsible-fifth-title]
volume
```

The volume in which the LUN is located. Valid in POST and PATCH.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN movement operation.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|_links
|link:#_links[_links]
a|
```

```
|name
|string
a|The name of the volume.
```

```
|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.
```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* Introduced in: 9.6
```

```
|===
```

```
[#location]
[.api-collapsible-fifth-title]
location
```

The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|logical_unit
```

```
|string
```

a|The base name component of the LUN. Valid in POST and PATCH.

If properties ``name`` and ``location.logical_unit`` are specified in the same request, they must refer to the base name.

A PATCH that modifies the base name of the LUN is considered a rename operation.

```
|qtree
```

```
|link:#qtree[qtree]
```

a|The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties ``name`` and ``location.qtree.name`` and/or ``location.qtree.uuid`` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

```
|volume
```

```
|link:#volume[volume]
```

a|The volume in which the LUN is located. Valid in POST and PATCH.

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN movement operation.

```
|===
```

```
[#igroup]
[.api-collapsible-fifth-title]
igroup
```

The initiator group to which the LUN is mapped.

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|_links
```

```
|link:#_links[_links]
```

```
a|
```

```
|duration
```

```
|string
```

```
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
```

```
|link:#iops[iops]
```

```
a|The rate of I/O operations observed at the storage object.
```

```
|latency
```

```
|link:#latency[latency]
```

```
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
```

```
|string
```

```
a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.
```

```
|throughput
```

```
|link:#throughput[throughput]
```

```
a|The rate of throughput bytes per second observed at the storage object.
```

```
|timestamp
```

```
|string
```

```
a|The timestamp of the performance data.
```

```
|===
```

```
[#paths]
[.api-collapsible-fifth-title]
paths
```

The fully qualified LUN path names involved in the LUN movement.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|destination
```

```
|string
```

```
a|The fully qualified path of the LUN movement destination composed of a
"/vol" prefix, the volume name, the (optional) qtree name, and base name
of the LUN.
```

```
|source
```

```
|string
```

```
a|The fully qualified path of the LUN movement source composed of a "/vol"
prefix, the volume name, the (optional) qtree name, and base name of the
LUN.
```

```
|===
```

```
[#failure]
```

```
[.api-collapsible-fifth-title]
```

```
failure
```

Error information provided if the asynchronous LUN movement operation fails.

```

```
|Description
```

```
|code
```

```
|string
```

a|The error code.

|message

|string

a|The error message.

|===

[#progress]

[.api-collapsible-fifth-title]

progress

[cols=3*,options=header]

|===

|Name

|Type

|Description

|elapsed

|integer

a|The amount of time, in seconds, that has elapsed since the start of the LUN movement.

|failure

|link:#failure[failure]

a|Error information provided if the asynchronous LUN movement operation fails.

|percent_complete

|integer

a|The percentage complete of the LUN movement.

|state

|string

a|The state of the LUN movement.

Valid in PATCH when an LUN movement is active. Set to `_paused_` to pause a LUN movement. Set to `_replicating_` to resume a paused LUN movement.

|volume_snapshot_blocked

```
|boolean
a|This property reports if volume Snapshot copies are blocked by the LUN
movement. This property can be polled to identify when volume Snapshot
copies can be resumed after beginning a LUN movement.
```

```
|===
```

```
[#movement]
[.api-collapsible-fifth-title]
movement
```

This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for ``movement``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|max_throughput
|string
```

a|The maximum data throughput that should be utilized in support of the LUN movement. This property can be used to throttle a transfer and limit its impact on the performance of the source and destination nodes. The specified value will be rounded up to the nearest megabyte.

If this property is not specified in a POST that begins a LUN movement, throttling is not applied to the data transfer.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

This property is valid only in a POST that begins a LUN movement or a PATCH when a LUN movement is already in process.

* Introduced in: 9.6

|paths

|link:#paths[paths]

a|The fully qualified LUN path names involved in the LUN movement.

|progress

|link:#progress[progress]

a|

|===

[#qos_policy]

[.api-collapsible-fifth-title]

qos_policy

The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property ``qos_policy.uuid`` and ``qos_policy.name`` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property ``qos_policy.name`` to an empty string (`""`) in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

[cols=3*,options=header]

|===

|Name

```

|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the QoS policy. To remove the QoS policy from a LUN, leaving
it with no QoS policy, set this property to an empty string ("") in a
PATCH request. Valid in POST and PATCH.

|uuid
|string
a|The unique identifier of the QoS policy. Valid in POST and PATCH.

|===

[#guarantee]
[.api-collapsible-fifth-title]
guarantee

Properties that request and report the space guarantee for the LUN.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|requested
|boolean
a|The requested space reservation policy for the LUN. If _true_, a space
reservation is requested for the LUN; if _false_, the LUN is thin
provisioned. Guaranteeing a space reservation request for a LUN requires
that the volume in which the LUN resides is also space reserved and that
the fractional reserve for the volume is 100%. Valid in POST and PATCH.

|reserved
|boolean
a|Reports if the LUN is space guaranteed.

```

If `_true_`, a space guarantee is requested and the containing volume and aggregate support the request. If `_false_`, a space guarantee is not requested or a space guarantee is requested and either the containing volume or aggregate do not support the request.

|===

[#space]
[.api-collapsible-fifth-title]
space

The storage space related properties of the LUN.

[cols=3*,options=header]

|===

|Name
|Type
|Description

|guarantee

|link:#guarantee[guarantee]

a|Properties that request and report the space guarantee for the LUN.

|size

|integer

a|The total provisioned size of the LUN. The LUN size can be increased but not be made smaller using the REST interface.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The actual minimum and maximum sizes vary depending on the ONTAP version, ONTAP platform and the available space in the containing volume and aggregate.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* example: 1073741824

* Max value: 140737488355328

* Min value: 4096

* Introduced in: 9.6

|used

|integer

a|The amount of space consumed by the main data stream of the LUN.

This value is the total space consumed in the volume by the LUN, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways SAN filesystems and applications utilize blocks within a LUN, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the LUN blocks are utilized outside of ONTAP, this property should not be used as an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* readOnly: 1

* Introduced in: 9.6

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This can be used along with delta time to calculate the rate of I/O operations per unit of time.

[cols=3*,options=header]

|===

|Name

|Type

|Description

[[ID8357d5137a41f2a4042e3e40f208f1a4]]

= Update an existing LUN

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/storage/luns/{uuid}`#

Introduced In: 9.6

Updates the properties of a LUN. A PATCH request can also be used to overwrite the contents of a LUN as a clone of another, to begin movement of a LUN between volumes, and to pause and resume the movement of a LUN between volumes.

== Related ONTAP commands

- * `lun modify`
- * `lun move modify`
- * `lun move pause`
- * `lun move resume`
- * `lun move start`
- * `lun resize`
- * `volume file clone autodelete`

== Learn more

* xref:{relative_path}storage_luns_endpoint_overview.html[DOC /storage/luns]

== Parameters

[cols=5*,options=header]

|==

Name
Type
In
Required
Description

uuid
string
path

```
|True
a|The unique identifier of the LUN to update.
```

```
|===
```

```
== Request Body
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|auto_delete
```

```
|boolean
```

```
a|This property marks the LUN for auto deletion when the volume containing
the LUN runs out of space. This is most commonly set on LUN clones.
```

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|class
```

```
|string
```

```
a|The class of LUN. Only _regular_ LUNs can be created using the REST API.
```

```
|clone
```

```
|link:#clone[clone]
```

```
a|This sub-object is used in POST to create a new LUN as a clone of an
existing LUN, or PATCH to overwrite an existing LUN as a clone of another.
Setting a property in this sub-object indicates that a LUN clone is
desired. Consider the following other properties when cloning a LUN:
`auto_delete`, `qos_policy`, and `space.guarantee.requested`.
```

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the LUN was created.

|enabled

|boolean

a|The enabled state of the LUN. LUNs can be disabled to prevent access to the LUN. Certain error conditions also cause the LUN to become disabled. If the LUN is disabled, you can consult the ``state`` property to determine if the LUN is administratively disabled (`_offline_`) or has become disabled as a result of an error. A LUN in an error condition can be brought online by setting the ``enabled`` property to `_true_` or brought administratively offline by setting the ``enabled`` property to `_false_`. Upon creation, a LUN is enabled by default. Valid in PATCH.

|location

|link:#location[location]

a|The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

* Introduced in: 9.6

|lun_maps

|array[link:#lun_maps[lun_maps]]

a|The LUN maps with which the LUN is associated.

There is an added cost to retrieving property values for ``lun_maps``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See

xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|movement

|link:#movement[movement]

a|This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property `name`, `location.volume.uuid`, or `location.volume.name`. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The `movement` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the `movement` properties. The LUN movement operation can be further modified using a PATCH on the properties on the `movement` sub-object.

There is added cost to retrieving property values for `movement`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields[Requesting specific fields] to learn more.

|name

|string

a|The fully qualified path name of the LUN composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an asynchronous LUN movement operation.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property `qos_policy.uuid` and `qos_policy.name` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number

|string

a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

* maxLength: 12

* minLength: 12

* readOnly: 1

* Introduced in: 9.6

|space

|link:#space[space]

a|The storage space related properties of the LUN.

|status

|link:#status[status]

a|Status information about the LUN.

|svm

|link:#svm[svm]

a|The SVM in which the LUN is located.

|uuid

|string

a|The unique identifier of the LUN. The UUID is generated by ONTAP when the LUN is created.

* example: 1cd8a442-86d1-11e0-ae1c-123478563412

* readOnly: 1

* Introduced in: 9.6

```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description
| 917927
| The specified volume was not found.

```

| 918236
| The specified `location.volume.uuid` and `location.volume.name` do not refer to the same volume.

| 5242927
| The specified qtree was not found.

| 5242950
| The specified `location.qtree.id` and `location.qtree.name` do not refer to the same qtree.

| 5374124
| The specified LUN size is too small.

| 5374125
| The specified LUN size is too large.

| 5374130
| An invalid size value was provided.

| 5374241
| A size value with invalid units was provided.

| 5374480
| Modifying the LUN is not allowed because it is in a foreign LUN import relationship.

| 5374858
| The volume specified by `name` is not the same as that specified by `location.volume`.

| 5374860
| The qtree specified by `name` is not the same as that specified by `location.qtree`.

| 5374861
| The LUN base name specified by `name` is not the same as that specified by `location.logical_unit`.

| 5374864
| An error occurred after successfully overwriting data for the LUN as a clone. Some properties were not modified.

| 5374865
| The LUN's aggregate is offline. The aggregate must be online to modify or remove the LUN.

| 5374866
| The LUN's volume is offline. The volume must be online to modify or remove the LUN.

| 5374874
| The specified `clone.source.uuid` and `clone.source.name` do not refer to the same LUN.

| 5374875
| The specified LUN was not found. This can apply to `clone.source` or the target LUN. The `target` property of the error object identifies the property.

| 5374876
| The specified LUN was not found. This can apply to `clone.source` or the target LUN. The `target` property of the error object identifies the property.

| 5374885
| An error occurred after successfully modifying some of the properties of the LUN. Some properties were not modified.

| 5374889
| An invalid value was specified for `movement.progress.state`. Active LUN movement operations can be PATCHed to only `_paused_` or `_replicating_`.

| 5374892
| An attempt was made to reduce the size of a LUN.

| 5374904
| The destination volume is not online.

| 13565952
| The LUN clone request failed.

_links
[#source]
[.api-collapsible-fifth-title]
source
```

The source LUN for a LUN clone operation. This can be specified using property ``clone.source.uuid`` or ``clone.source.name``. If both properties are supplied, they must refer to the same LUN.

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|name
|string
a|The fully qualified path name of the clone source LUN composed of a
"/vol" prefix, the volume name, the (optional) qtree name, and base name
of the LUN. Valid in POST and PATCH.
```

```
|uuid
|string
a|The unique identifier of the clone source LUN. Valid in POST and PATCH.
```

|===

```
[#clone]
[.api-collapsible-fifth-title]
clone
```

This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: ``auto_delete``, ``qos_policy``, and ``space.guarantee.requested``.

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: ``class``, ``auto_delete``, ``lun_maps``, ``serial_number``, ``status.state``, and ``uuid``.

Persistent reservations for the patched LUN are also preserved.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|source
|link:#source[source]
a|The source LUN for a LUN clone operation. This can be specified using
property `clone.source.uuid` or `clone.source.name`. If both properties
are supplied, they must refer to the same LUN.
```

Valid in POST to create a new LUN as a clone of the source.

Valid in PATCH to overwrite an existing LUN's data as a clone of another.

|===

```
[#qtree]
[.api-collapsible-fifth-title]
qtree
```

The qtree in which the LUN is optionally located. Valid in POST and PATCH.

If properties `name` and `location.qtree.name` and/or `location.qtree.uuid` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

```

```

```
|Name
```

```
|Type
```

```
|Description
```

```
|name
|string
a|The name of the volume.
```

```
|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid
that is exposed in the CLI and ONTAPI. It does not change due to a volume
move.
```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* Introduced in: 9.6
```

```
|===
```

```
[#location]
[.api-collapsible-fifth-title]
location
```

The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|logical_unit
|string
a|The base name component of the LUN. Valid in POST and PATCH.
```

If properties `name` and `location.logical_unit` are specified in the same request, they must refer to the base name.

A PATCH that modifies the base name of the LUN is considered a rename operation.

```
|qtree
|link:#qtree[qtree]
a|The qtree in which the LUN is optionally located. Valid in POST and
PATCH.
```

If properties ``name`` and ``location.qtree.name`` and/or ``location.qtree.uuid`` are specified in the same request, they must refer to the same qtree.

A PATCH that modifies the qtree of the LUN is considered a rename operation.

```
|volume
|link:#volume[volume]
a|The volume in which the LUN is located. Valid in POST and PATCH.
```

If properties ``name`` and ``location.volume.name`` and/or ``location.volume.uuid`` are specified in the same request, they must refer to the same volume.

A PATCH that modifies the volume of the LUN begins an asynchronous LUN movement operation.

```
|===
```

```
[#igroup]
[.api-collapsible-fifth-title]
igroup
```

The initiator group to which the LUN is mapped.

```

```

a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#latency]
[.api-collapsible-fifth-title]
latency
```

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#throughput]
[.api-collapsible-fifth-title]
throughput
```

The rate of throughput bytes per second observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|other
```

```

a|Performance metric for write I/O operations.

```
|===
```

```
[#metric]
[.api-collapsible-fifth-title]
metric
```

Performance numbers, such as IOPS latency and throughput.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.
```

```
|throughput
|link:#throughput[throughput]
```

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#paths]

[.api-collapsible-fifth-title]

paths

The fully qualified LUN path names involved in the LUN movement.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|destination

|string

a|The fully qualified path of the LUN movement destination composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN.

|source

|string

a|The fully qualified path of the LUN movement source composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN.

|===

[#failure]

[.api-collapsible-fifth-title]

failure

Error information provided if the asynchronous LUN movement operation fails.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|code
```

```
|string
```

```
a|The error code.
```

```

[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|elapsed
```

```
|integer
```

```
a|The amount of time, in seconds, that has elapsed since the start of the LUN movement.
```

```
|failure
```

```
|link:#failure[failure]
```

```
a|Error information provided if the asynchronous LUN movement operation fails.
```

```
|percent_complete
```

```
|integer
```

```
a|The percentage complete of the LUN movement.
```

```
|state
|string
a|The state of the LUN movement.
```

Valid in PATCH when an LUN movement is active. Set to `_paused_` to pause a LUN movement. Set to `_replicating_` to resume a paused LUN movement.

```
|volume_snapshot_blocked
|boolean
a|This property reports if volume Snapshot copies are blocked by the LUN
movement. This property can be polled to identify when volume Snapshot
copies can be resumed after beginning a LUN movement.
```

```
|===
```

```
[#movement]
[.api-collapsible-fifth-title]
movement
```

This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property ``name``, ``location.volume.uuid``, or ``location.volume.name``. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The ``movement`` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the ``movement`` properties. The LUN movement operation can be further modified using a PATCH on the properties on the ``movement`` sub-object.

There is added cost to retrieving property values for ``movement``. They are not populated for either a collection GET or an instance GET unless explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|max_throughput
```

```
|string
```

a|The maximum data throughput that should be utilized in support of the LUN movement. This property can be used to throttle a transfer and limit its impact on the performance of the source and destination nodes. The specified value will be rounded up to the nearest megabyte.

If this property is not specified in a POST that begins a LUN movement, throttling is not applied to the data transfer.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

This property is valid only in a POST that begins a LUN movement or a PATCH when a LUN movement is already in process.

* Introduced in: 9.6

```
|paths
```

```
|link:#paths[paths]
```

a|The fully qualified LUN path names involved in the LUN movement.

```
|progress
```

```
|link:#progress[progress]
```

```
a|
```

```
|===
```

```
[#qos_policy]
```

```
[.api-collapsible-fifth-title]
```

```
qos_policy
```

The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property ``qos_policy.uuid`` and ``qos_policy.name`` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set

property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|name
```

```
|string
```

a|The name of the QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set this property to an empty string ("") in a PATCH request. Valid in POST and PATCH.

```
|uuid
```

```
|string
```

a|The unique identifier of the QoS policy. Valid in POST and PATCH.

```
|===
```

```
[#guarantee]
```

```
[.api-collapsible-fifth-title]
```

guarantee

Properties that request and report the space guarantee for the LUN.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|requested
```

```
|boolean
```

a|The requested space reservation policy for the LUN. If `_true_`, a space reservation is requested for the LUN; if `_false_`, the LUN is thin provisioned. Guaranteeing a space reservation request for a LUN requires that the volume in which the LUN resides is also space reserved and that

the fractional reserve for the volume is 100%. Valid in POST and PATCH.

|reserved
|boolean
a|Reports if the LUN is space guaranteed.

If `_true_`, a space guarantee is requested and the containing volume and aggregate support the request. If `_false_`, a space guarantee is not requested or a space guarantee is requested and either the containing volume or aggregate do not support the request.

|===

[#space]
[.api-collapsible-fifth-title]
space

The storage space related properties of the LUN.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|guarantee
|link:#guarantee[guarantee]
a|Properties that request and report the space guarantee for the LUN.

|size
|integer
a|The total provisioned size of the LUN. The LUN size can be increased but not be made smaller using the REST interface.

The maximum and minimum sizes listed here are the absolute maximum and absolute minimum sizes in bytes. The actual minimum and maximum sizes vary depending on the ONTAP version, ONTAP platform and the available space in the containing volume and aggregate.
For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* example: 1073741824

* Max value: 140737488355328

* Min value: 4096

* Introduced in: 9.6

|used

|integer

a|The amount of space consumed by the main data stream of the LUN.

This value is the total space consumed in the volume by the LUN, including filesystem overhead, but excluding prefix and suffix streams. Due to internal filesystem overhead and the many ways SAN filesystems and applications utilize blocks within a LUN, this value does not necessarily reflect actual consumption/availability from the perspective of the filesystem or application. Without specific knowledge of how the LUN blocks are utilized outside of ONTAP, this property should not be used as an indicator for an out-of-space condition.

For more information, see `_Size properties_` in the `_docs_` section of the ONTAP REST API documentation.

* readOnly: 1

* Introduced in: 9.6

|===

[#iops_raw]

[.api-collapsible-fifth-title]

iops_raw

The number of I/O operations observed at the storage object. This can be used along with delta time to calculate the rate of I/O operations per unit of time.

[cols=3*,options=header]

|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#statistics]  
[.api-collapsible-fifth-title]  
statistics
```

These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|iops_raw
```

```
|link:#iops_raw[iops_raw]
```

a|The number of I/O operations observed at the storage object. This can be used along with delta time to calculate the rate of I/O operations per unit of time.

```
|latency_raw
```

```
|link:#latency_raw[latency_raw]
```

a|The raw latency in microseconds observed at the storage object. This can be divided by the raw IOPS value to calculate the average latency per I/O operation.

```
|status
```

```
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|throughput_raw
|link:#throughput_raw[throughput_raw]
a|Throughput bytes observed at the storage object. This can be used along
with delta time to calculate the rate of throughput bytes per unit of
time.
```

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#status]
[.api-collapsible-fifth-title]
status
```

Status information about the LUN.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|container_state
|string
a|The state of the volume and aggregate that contain the LUN. LUNs are
only available when their containers are available.
```

```
|mapped
|boolean
a|Reports if the LUN is mapped to one or more initiator groups.
```

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|read_only
```

```
|boolean
a|Reports if the LUN allows only read access.
```

```
|state
|string
a|The state of the LUN. Normal states for a LUN are _online_ and
_offline_. Other states indicate errors.
```

```
|===
```

```
[#svm]
[.api-collapsible-fifth-title]
svm
```

The SVM in which the LUN is located.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|name
|string
a|The name of the SVM.
```

```
|uuid
|string
a|The unique identifier of the SVM.
```

```
|===
```

```
[#lun]
[.api-collapsible-fifth-title]
lun
```

A LUN is the logical representation of storage in a storage area network (SAN).

In ONTAP, a LUN is located within a volume. Optionally, it can be located

within a qtree in a volume.

A LUN can be created to a specified size using thin or thick provisioning. A LUN can then be renamed, resized, cloned, and moved to a different volume. LUNs support the assignment of a quality of service (QoS) policy for performance management or a QoS policy can be assigned to the volume containing the LUN. See the LUN object model to learn more about each of the properties supported by the LUN REST API.

A LUN must be mapped to an initiator group to grant access to the initiator group's initiators (client hosts). Initiators can then access the LUN and perform I/O over a Fibre Channel (FC) fabric using the Fibre Channel Protocol or a TCP/IP network using iSCSI.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|auto_delete
```

```
|boolean
```

a|This property marks the LUN for auto deletion when the volume containing the LUN runs out of space. This is most commonly set on LUN clones.

When set to `_true_`, the LUN becomes eligible for automatic deletion when the volume runs out of space. Auto deletion only occurs when the volume containing the LUN is also configured for auto deletion and free space in the volume decreases below a particular threshold.

This property is optional in POST and PATCH. The default value for a new LUN is `_false_`.

There is an added cost to retrieving this property's value. It is not populated for either a collection GET or an instance GET unless it is explicitly requested using the ``fields`` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|class
```

```
|string
```

a|The class of LUN. Only `_regular_` LUNs can be created using the REST API.

```
|clone
```

|link:#clone[clone]

a|This sub-object is used in POST to create a new LUN as a clone of an existing LUN, or PATCH to overwrite an existing LUN as a clone of another. Setting a property in this sub-object indicates that a LUN clone is desired. Consider the following other properties when cloning a LUN: `auto_delete`, `qos_policy`, and `space.guarantee.requested`.

When used in a PATCH, the patched LUN's data is over-written as a clone of the source and the following properties are preserved from the patched LUN unless otherwise specified as part of the PATCH: `class`, `auto_delete`, `lun_maps`, `serial_number`, `status.state`, and `uuid`.

Persistent reservations for the patched LUN are also preserved.

|comment

|string

a|A configurable comment available for use by the administrator. Valid in POST and PATCH.

|create_time

|string

a|The time the LUN was created.

|enabled

|boolean

a|The enabled state of the LUN. LUNs can be disabled to prevent access to the LUN. Certain error conditions also cause the LUN to become disabled. If the LUN is disabled, you can consult the `state` property to determine if the LUN is administratively disabled (`_offline_`) or has become disabled as a result of an error. A LUN in an error condition can be brought online by setting the `enabled` property to `_true_` or brought administratively offline by setting the `enabled` property to `_false_`. Upon creation, a LUN is enabled by default. Valid in PATCH.

|location

|link:#location[location]

a|The location of the LUN within the ONTAP cluster. Valid in POST and PATCH.

* Introduced in: 9.6

|lun_maps

```
|array[link:#lun_maps[lun_maps]]
```

a|The LUN maps with which the LUN is associated.

There is an added cost to retrieving property values for `lun_maps`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|movement
```

```
|link:#movement[movement]
```

a|This sub-object applies to LUN movement between volumes. A LUN can be moved to a new volume with a PATCH request that changes either the volume portion of property `name`, `location.volume.uuid`, or `location.volume.name`. If the volume is changed using more than one of these properties, the supplied properties used must refer to the same volume.

Moving a LUN between volumes is an asynchronous activity begun by a PATCH request. The data for the LUN is then asynchronously copied from the source volume to the destination volume. The time required to complete the move depends on the size of the LUN and the load on the cluster. The `movement` sub-object is populated while a LUN movement is in progress and for two (2) minutes following completion of a movement.

While the LUN is being moved, the status of the LUN movement operation can be obtained using a GET for the LUN that requests the `movement` properties. The LUN movement operation can be further modified using a PATCH on the properties on the `movement` sub-object.

There is added cost to retrieving property values for `movement`. They are not populated for either a collection GET or an instance GET unless explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

```
|name
```

```
|string
```

a|The fully qualified path name of the LUN composed of a "/vol" prefix, the volume name, the (optional) qtree name, and base name of the LUN. Valid in POST and PATCH.

A PATCH that modifies the qtree and/or base name portion of the LUN path is considered a rename operation.

A PATCH that modifies the volume portion of the LUN path begins an asynchronous LUN movement operation.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the LUN. Both traditional and adaptive QoS policies are supported. If both property `qos_policy.uuid` and `qos_policy.name` are specified in the same request, they must refer to the same QoS policy. To remove the QoS policy from a LUN, leaving it with no QoS policy, set property `qos_policy.name` to an empty string ("") in a PATCH request. Valid in POST and PATCH.

Note that a QoS policy can be set on a LUN, or a LUN's volume, but not both.

|serial_number

|string

a|The LUN serial number. The serial number is generated by ONTAP when the LUN is created.

* maxLength: 12

* minLength: 12

* readOnly: 1

* Introduced in: 9.6

|space

|link:#space[space]

a|The storage space related properties of the LUN.

|status

|link:#status[status]

a|Status information about the LUN.

|svm

|link:#svm[svm]

a|The SVM in which the LUN is located.

|uuid

|string

a|The unique identifier of the LUN. The UUID is generated by ONTAP when the LUN is created.

```
* example: 1cd8a442-86d1-11e0-ae1c-123478563412
* readOnly: 1
* Introduced in: 9.6

= Retrieve historical performance metrics for a LUN

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/storage/luns/{uuid}/metrics`#

*Introduced In:* 9.7

Retrieves historical performance metrics for a LUN.

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

|throughput.total
|integer

```

```
|query
|False
a|Filter by throughput.total

|throughput.read
|integer
|query
|False
a|Filter by throughput.read

|throughput.other
|integer
|query
|False
a|Filter by throughput.other

|throughput.write
|integer
|query
|False
a|Filter by throughput.write

|duration
|string
|query
|False
a|Filter by duration

|timestamp
|string
|query
|False
a|Filter by timestamp

|iops.total
|integer
|query
|False
a|Filter by iops.total
```

```
|iops.read
|integer
|query
|False
a|Filter by iops.read
```

```
|iops.other
|integer
|query
|False
a|Filter by iops.other
```

```

|integer
|query
|False
a|Filter by iops.write
```

```
|status
|string
|query
|False
a|Filter by status
```

```
|latency.total
|integer
|query
|False
a|Filter by latency.total
```

```
|latency.read
|integer
|query
|False
a|Filter by latency.read
```

```
|latency.other
|integer
|query
|False
a|Filter by latency.other
```

```
|latency.write
|integer
|query
|False
a|Filter by latency.write
```

```
|uuid
|string
|path
|True
a|Unique identifier of the LUN.
```

```
|interval
|string
|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:
```

- * 1h: Metrics over the most recent hour sampled over 15 seconds.
- * 1d: Metrics over the most recent day sampled over 5 minutes.
- * 1w: Metrics over the most recent week sampled over 30 minutes.
- * 1m: Metrics over the most recent month sampled over 2 hours.
- * 1y: Metrics over the most recent year sampled over a day.
- * Default value: 1
- * enum: ["1h", "1d", "1w", "1m", "1y"]

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

- * Default value: 1
- * Max value: 120
- * Min value: 0

```
|fields
```

```
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

[[ID96bb38a8d9c792b4d88f22c7fd0422a5]]
= SVM overview
```

```
== Overview
```

Storage Virtual Machine (SVM) APIs enable you to manage SVMs and their attributes, including the configuration of the CIFS and NFS protocols, export policies, name mappings between CIFS and NFS users, and network services.

SVMs contain data volumes and one or more network interfaces through which they serve data to the clients. SVMs securely isolate the shared virtualized data storage and network, and each SVM appears as a single dedicated server to the clients. Each SVM has a separate administrator authentication domain, and each SVM can be managed independently by its SVM administrator.

In a cluster, SVMs facilitate data access. A cluster must have at least one SVM to serve data. Multiple SVMs can coexist in a single cluster without being bound to any particular node in the cluster. However, they are bound to the physical cluster on which they exist.

SVMs with volumes can contain files and LUNs. They provide file-level data access by using NFS and CIFS protocols for the NAS clients, and block-level data access by using iSCSI and Fibre Channel (FC) (FCoE included) for SAN hosts. The volumes within each NAS SVM are related to each other through junctions and they are mounted on junction paths. These junctions present the file system in each volume. The root volume of the SVM resides at the top level of the namespace hierarchy; additional volumes are mounted to the SVM root volume to extend the namespace. As volumes are created for the SVM, the root volume of the SVM contains junction paths.

The ONTAP REST APIs only expose data SVMs as an SVM. The information and configuration associated with the cluster and nodes are exposed from REST, but the cluster and nodes are not treated as if they are a type of SVM from REST APIs. Some APIs that expose both cluster-owned resources and SVM-owned resources from the same endpoint only return and support the "svm" sub-object for the resources that are within a data SVM. In those endpoints, the resources that are not in a data SVM do not return the "svm" sub-object. Generally, such endpoints have a "scope" attribute that returns either "svm" or "cluster" to identify the resource as either a cluster-level resource or one that is completely contained in a data SVM.

= Manage SVM peer permissions

:leveloffset: +1

[[IDe2cbb316ae8a0691b49d39de8b48e7ba]]

= SVM peer-permissions endpoint overview

== Managing SVM peer permissions

A cluster administrator can provide permissions for use during intercluster SVM peer relationship creation. Once this permission exists for a local SVM and peer cluster combination on a local cluster, no explicit SVM peer accept (or REST PATCH) API is required for any incoming SVM peer relationship creation requests from a remote cluster for that local SVM. Peer relationship directly changes the state to peered on both clusters. Use an SVM name as "*" to create permissions that apply to all local SVMs.

=== SVM peer permission APIs

The following APIs are used to manage SVM peer permissions:

- * GET /api/svm/peer-permissions
- * POST /api/svm/peer-permissions
- * GET /api/svm/peer-permissions/{cluster_peer.uuid}/{svm.uuid}
- * PATCH /api/svm/peer-permissions/{cluster_peer.uuid}/{svm.uuid}
- * DELETE /api/svm/peer-permissions/{cluster_peer.uuid}/{svm.uuid}

[[ID762ffb4d80cbfdd44c991400d1ee0bb0]]

= Retrieve SVM peer permissions

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/svm/peer-permissions`#

Introduced In: 9.6

Retrieves the list of SVM peer permissions.

== Related ONTAP commands

* `vserver peer permission show`

== Examples

The following examples show how to retrieve a collection of SVM peer permissions based on a query.

. Retrieves a list of SVM peer permissions of a specific local SVM

GET "/api/svm/peer-permissions/?svm.name=VS1"

. Retrieves a list of SVM peer permissions of a specific cluster peer

GET "/api/svm/peer-permissions/?cluster_peer.name=cluster2"

a|Filter by svm.name

|fields

|array[string]

|query

|False

a|Specify the fields to return.

|max_records

|integer

|query

|False

a|Limit the number of records returned.

|return_records

|boolean

|query

|False

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

= Create an SVM peer permission
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/svm/peer-permissions`#
```

```
*Introduced In:* 9.6
```

Creates an SVM peer permission.

== Required properties

- * `svm.name` or `svm.uuid` - SVM name
- * `cluster_peer.uuid` or `cluster_peer.name` - Peer cluster name or peer cluster UUID
- * `applications` - Peering applications

== Related ONTAP commands

- * `vserver peer permission create`

== Examples

The following examples show how to create SVM peer permissions.

. Creates an SVM peer permission entry with the local SVM and cluster peer names

```
-----
POST "/api/svm/peer-permissions" '{"cluster_peer":{"name":"cluster2"},
"svm":{"name":"VS1"}, "applications":["snapmirror"]}'
-----
```

. Creates an SVM peer permission entry with the local SVM and cluster peer UUID

```
POST "/api/svm/peer-permissions" '{"cluster_peer":{"uuid":"d3268a74-ee76-11e8-a9bb-005056ac6dc9"}, "svm":{"uuid":"8f467b93-f2f1-11e8-9027-005056ac81fc"}, "applications":["snapmirror"]}'
```

. Creates an SVM peer permission entry with all SVMs and the cluster peer name

```
POST "/api/svm/peer-permissions" '{"cluster_peer":{"name":"cluster2"}, "svm":{"name":"*"}, "applications":["snapmirror"]}'
```

= SVM peers endpoint overview
```

```
== Managing SVM peers
```

The SVM peer commands allow you to create and manage SVM peering relationships.

```
=== SVM peer APIs
```

The following APIs are used to manage SVM peers:

```
* GET /api/svm/peers
* POST /api/svm/peers
* GET /api/svm/peers/{uuid}
* PATCH /api/svm/peers/{uuid}
* DELETE /api/svm/peers/{uuid}
```

```
[[IDb971aeaa2b78d3bca2f04612fff5ecc8]]
```

= Retrieve SVM peer relationships

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/svm/peers`#
```

Introduced In: 9.6

Retrieves the list of SVM peer relationships.

== Related ONTAP commands

* `vserver peer show`

== Examples

The following examples show how to retrieve a collection of SVM peer relationships based on a query.

. Retrieves a list of SVM peers of a specific local SVM

```
GET "/api/svm/peers/?svm.name=VS1"
```

. Retrieves a list of SVM peers of a specific cluster peer

```
GET "/api/svm/peers/?peer.cluster.name=cluster2"
```

== Learn more

[[ID6564d8c5883c6b5cc11090270e02528c]]
= Create a new SVM peer relationship

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/svm/peers`#

*Introduced In:* 9.6

Creates a new SVM peer relationship.

== Important notes

*** The create request accepts peer SVM name as input instead of peer SVM
UUID as the local cluster cannot validate peer SVM based on UUID.

*** The input parameter `name` refers to the local name of the peer SVM.
The `peer cluster name` parameter is optional for creating intracluster
SVM peer relationships.

```

== Required properties

- * `svm.name` or `svm.uuid` - SVM name or SVM UUID
- * `peer.svm.name` or `peer.svm.uuid` - Peer SVM name or Peer SVM UUID
- * `peer.cluster.name` or `peer.cluster.uuid` - Peer cluster name or peer cluster UUID
- * `applications` - Peering applications

== Related ONTAP commands

- * `vserver peer create`

== Example

Creates a new SVM peer relationship.

```
-----  
POST "/api/svm/peers" '{"svm":{"name":"vs1"},  
"peer.cluster.name":"cluster2", "peer.svm.name":"VS1",  
"applications":["snapmirror"]}'  
-----
```

== Learn more

- * [xref:{relative_path}svm_peers_endpoint_overview.html](#)[DOC /svm/peers]

== Parameters

```
[cols=5*,options=header]  
|===
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|return_timeout  
|integer  
|query  
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH,

or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

* Default value:

= Update an SVM peer relationship

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/svm/peers/{uuid}`#

*Introduced In:* 9.6

Updates the SVM peer relationship.

== Related ONTAP commands

```

* `vserver peer modify`

== Examples

The following examples show how to update an SVM peer relationship. The input parameter 'name' refers to the local name of the peer SVM.

. Accepts an SVM peer relationship

```
PATCH "/api/svm/peers/d3268a74-ee76-11e8-a9bb-005056ac6dc9"
'{"state":"peered"}'
```

. Updates the local name of an SVM peer relationship

```
PATCH "/api/svm/peers/d3268a74-ee76-11e8-a9bb-005056ac6dc9"
'{"name":"vs2"}'

:leveloffset: -1

= Manage SVMs

```

```
:leveloffset: +1
```

```
[[IDa125addf1709a0dd76dbba162e362f21]]  
= SVM svms endpoint overview
```

== Managing SVMs

Cluster administrators can manage any SVM bound to the cluster. In addition, SVMs can also be managed by their SVM administrators. The SVM administrator manages the SVM resources, such as volumes, protocols and services, depending on the capabilities assigned by the cluster administrator. SVM administrators cannot create, modify, or delete SVMs. The cluster administrator manages SVM create, modify, or delete operations.

While configuring CIFS, you must also configure IP interfaces and DNS. No other protocol configuration is allowed when configuring NVMe. NFS, FCP, CIFS and iSCSI protocols can be configured together.

SVM administrators might have all or some of the following administration capabilities:

- . Data access protocol configuration

Configures data access protocols, such as NFS, CIFS, iSCSI, and Fibre Channel (FC) protocol (Fibre Channel over Ethernet included).

- . Services configuration

Configures services such as LDAP, NIS, and DNS.

- . Monitoring SVM

Monitors jobs, network connections, network interfaces, and SVM health.

- . Updating the TLS certificate for this SVM.

```
[[ID0aab82f414295ad97374a4a9c7d393c9]]  
= Retrieve SVMs and SVM properties
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/svm/svms`#
```

Introduced In: 9.6

Retrieves a list of SVMs and individual SVM properties. This includes

protocol configurations such as CIFS and NFS, export policies, name service configurations, and network services.

== Important notes

* The SVM object includes a large set of fields and can be expensive to retrieve. Use this API to list the collection of SVMs, and to retrieve only the full details of individual SVMs as needed.

* It is not recommended to create or delete more than five SVMs in parallel.

* REST APIs only expose a data SVM as an SVM.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `snapmirror.+*+`

== Related ONTAP commands

* `vserver show`

== Examples

. Retrieves a list of SVMs in the cluster sorted by name

```
GET "/api/svm/svms?order_by=name"
```

. Retrieves a list of SVMs in the cluster that have the NFS protocol enabled

```
GET "/api/svm/svms?nfs.enabled=true"
```

. Retrieves a list of SVMs in the cluster that have the CIFS protocol enabled

```
GET "/api/svm/svms?cifs.enabled=true"
```

. Retrieves a list of SVMs in the cluster that have the S3 protocol enabled

GET "/api/svm/svms?s3.enabled=true"

a|Limit the number of records returned.
```

```
|return_records
```

```

|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

```

```
|certificate
|link:#certificate[certificate]
```

a|Specifies the certificate that will be used for creating HTTPS connections to the S3 server.

|enabled

|boolean

a|Specifies whether or not to enable S3. Setting this value to true creates a service if one is not yet created.

|is_http_enabled

|boolean

a|Specifies whether HTTP is enabled on the S3 server. By default, HTTP is disabled on the S3 server.

|is_https_enabled

|boolean

a|Specifies whether HTTPS is enabled on the S3 server. By default, HTTPS is enabled on the S3 server.

|name

|string

a|Specifies the name of the S3 server. A server name length can range from 1 to 15 characters and can only contain the following combination of characters 0-9, A-Z, a-z, ".", and "-".

|port

|integer

a|Specifies the HTTP listener port for the S3 server. By default, HTTP is enabled on port 80.

|secure_port

|integer

a|Specifies the HTTPS listener port for the S3 server. By default, HTTPS is enabled on port 443.

|===

[#snapmirror]

[.api-collapsible-fifth-title]

snapmirror

Specifies attributes for SVM DR protection.

```

= Create and provision an SVM

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/svm/svms`#
```

Introduced In: 9.6

Creates and provisions an SVM. If no IPspace is provided, then the SVM is created on the `Default` IPspace.

* The number of parallel SVMs that can be created must not be greater than five.

* If a sixth SVM POST request is issued, the following error message is generated: "Maximum allowed SVM jobs exceeded. Wait for the existing SVM jobs to complete and try again."

== Required properties

* `name` - Name of the SVM to be created.

== Recommended optional properties

* `ipspace.name` or `ipspace.uuid` - IPspace of the SVM

* `ip_interfaces` - If provided, the following fields are required:

* `ip_interfaces.name` - Name of the interface

* `ip_interfaces.ip.address` - IP address

* `ip_interfaces.ip.netmask` - Netmask length or IP address

* `ip_interfaces.location.broadcast_domain.uuid` or

`ip_interfaces.location.broadcast_domain.name` - Broadcast domain name or UUID belonging to the same IPspace of the SVM.

* `routes` - If provided, the following field is required:

*** `routes.gateway` - Gateway IP address

* `cifs` - If provided, interfaces, routes and DNS must be provided. The following fields are also required:

*** `cifs.name` - Name of the CIFS server to be created for the SVM.

*** `cifs.ad_domain.fqdn` - Fully qualified domain name

*** `cifs.ad_domain.user` - Administrator username

*** `cifs.ad_domain.password` - User password

* `ldap` - If provided, the following fields are required:

```

*** `ldap.servers` or `ldap.ad_domain` - LDAP server list or Active
Directory domain

*** `ldap.bind_dn` - Bind DN

*** `ldap.base_dn` - Base DN

* `nis` - If provided, the following fields are required:

*** `nis.servers` - NIS servers

*** `nis.domain` - NIS domain

* `dns` - If provided, the following fields are required:

*** `dns.servers` - Name servers

*** `dns.domains` - Domains

* `fc_interfaces` - If provided, the following fields are required:

*** `fc_interfaces.name` - Fibre Channel interface name

*** `fc_interfaces.data_protocol` - Fibre Channel interface data protocol

*** `fc_interfaces.location.port.uuid` or
`fc_interfaces.location.port.name` and
`fc_interfaces.location.port.node.name` - Either port UUID or port name
and node name together must be provided.

* `s3` - If provided, the following field should also be specified:

*** `s3.name` - Name of the S3 server. If ``s3.name` is not specified
while ``s3.enabled` is set to 'true', the S3 server will be created with
the default name '+++<svm.name>+++_S3Server'.+++</svm.name>+++

```

== Default property values

If not specified in POST, the following default property values are assigned:

```

* `language` - _C.UTF-8_
* `ipspace.name` - _Default_
* `snapshot_policy.name` - _Default_
* `subtype` - _Default_ ( _sync-source_ if MetroCluster configuration )

```

== Related ONTAP commands

```
* `vserver create`
* `vserver add-aggregates`
* `network interface create`
* `network route create`
* `vserver services name-service dns create`
* `vserver nfs create`
* `vserver services name-service ldap client create`
* `vserver cifs create`
* `vserver services name-service nis-domain create`
* `vserver iscsi create`
* `vserver nvme create`
* `vserver fcp create`
* `vserver services name-service ns-switch create`
* `vserver object-store-server create`
```

== Examples

. Creates an SVM with default "snapshot_policy"

```
-----
POST "/api/svm/svms" '{"name":"testVs",
"snapshot_policy":{"name":"default"}}'
-----
```

. Creates an SVM and configures NFS, ISCSI and FCP

```
-----
POST "/api/svm/svms" '{"name":"testVs", "nfs":{"enabled":"true"},
"fcp":{"enabled":"true"}, "iscsi":{"enabled":"true"}}'
-----
```

. Creates an SVM and configures NVMe

```
-----
POST "/api/svm/svms" '{"name":"testVs", "nvme":{"enabled":"true"}}'
-----
```

. Creates an SVM and configures LDAP

```
-----
POST "/api/svm/svms" '{"name":"testVs",
"snapshot_policy":{"name":"default"},
"ldap":{"servers":["10.140.101.1","10.140.101.2"], "ad_domain":"abc.com",
"base_dn":"dc=netapp,dc=com", "bind_dn":"dc=netapp,dc=com"}}'
-----
```

. Creates an SVM and configures NIS

```
POST "/api/svm/svms" '{"name":"testVs",
"snapshot_policy":{"name":"default"}, "nis":{"enabled":"true",
"domain":"def.com","servers":["10.224.223.130", "10.224.223.131"]}]}'
```

. Creates an SVM and configures DNS

```
POST "/api/svm/svms" '{"name":"testVs",
"snapshot_policy":{"name":"default"},
"dns":{"domains":["abc.com","def.com"], "servers":["10.224.223.130",
"10.224.223.131"]}]}'
```

. Creates an SVM and configures a LIF

```
POST "/api/svm/svms" '{"name":"testVs", "ip_interfaces":
[{"name":"lif1", "ip":{"address":"10.10.10.7", "netmask":
"255.255.255.0"}, "location":{"broadcast_domain":{"name":"bd1"},
"home_node":{"name":"node1"}}, "service_policy": "default-management"]}]'
```

. Creates an SVM and configures a LIF with IPV6 address

```
POST "/api/svm/svms" '{"name":"testVs", "ip_interfaces":
[{"name":"lif2", "ip":{"address":"fd22:8b1e:b255:202:2a0:98ff:fe01:7d5b",
"netmask":"24"}, "location":{"broadcast_domain":{"name":"bd1"},
"home_node":{"name":"node1"}}, "service_policy": "default-management"]}]'
```

. Creates an SVM and configures CIFS

```
POST "/api/svm/svms" '{"name":"testVs", "cifs":{"name":"CIFDOC",
"ad_domain":{"fqdn":"abc.def.com", "organizational_unit":"CN=Computers",
"user":"cif_admin", "password":"abc123"}},
"ip_interfaces":[{"name":"lif1", "ip":{"address":"10.10.10.7", "netmask":
"255.255.255.0"}, "location":{"broadcast_domain":{"name":"bd1"},
"home_node":{"name":"node1"}}, "service_policy": "default-
management"}], "routes": [{"destination": {"address": "0.0.0.0", "netmask":
```

```
"0"}, "gateway": "10.10.10.7"}], "dns":{"domains":["abc.def.com",
"def.com"], "servers":["10.224.223.130", "10.224.223.131"]}}'
----

. Creates an SVM and configures an S3 server

----

POST "/api/svm/svms" '{"name":"svm5", "s3":{"name":"s3-server-1",
"enabled":true}}'
----

== Learn more

* xref:{relative_path}svm_svms_endpoint_overview.html[DOC /svm/svms]
```

== Parameters

```
[cols=5*,options=header]
|===
```

```
|Name
|Type
|In
|Required
|Description
```

```
|return_records
|boolean
|query
|False
```

a|The default is false. If set to true, the records are returned.

* Default value:

```
|return_timeout
|integer
|query
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
* Max value: 120
* Min value: 0
```

```

ONTAP Error Response Codes

```

|===
| Error codes | Description

| 2621580
| Cannot specify options other than SVM name, comment and ipspace for a
Vserver that is being configured as the destination for SVM DR.

| 2621634
| "sync-source" SVM can only be created in a MetroCluster configuration.

| 2621657
| "sync-destination" SVM can only be created by the system.

```

| 13434884
| Cannot create an SVM because of incorrect fields.

| 13434885
| Non-UTF8 language(s) not supported.

| 13434888
| IPspace UUID and IPspace name mismatch.

| 13434889
| Internal Error. Wait and retry.

| 13434894
| Maximum allowed SVM jobs exceeded. Wait for the existing SVM jobs to complete and try again.

| 13434908
| Invalid SVM name. The name is already in use by another SVM, IPspace or cluster.

| 13434909
| Internal Error. Failed to identify the aggregate to host SVM root volume.

| 13434910
| Internal Error. Failed to allocate new SVM ID.

| 13434911
| Invalid SVM name. Maximum supported length is 41 if SVM is of type \"sync-source\", otherwise 47.

| 13434912
| Failed to find IPspace.

| 13434913
| Internal error: Failed to check if an SVM create operation is in progress. Contact technical support for assistance.

| 13434914
| Request to create the root volume of the SVM failed because there is not enough space in specified aggregate.

| 13434915
| Failed to unlock the SVM because SVM create or delete job is in progress. Wait a few minutes, and then try the command again.

| 13434916

```
| SVM is in the process of being created. Wait a few minutes, and then try  
the command again.
```

```
| 13434917  
| SVM creation successful.
```

```
| 13434918  
| IPspace name not provided for creating an SVM.

```

```
|name
|string
a|The name of the node on which the FC port is located.
```

```
|===
```

```
[#fc_port_reference]
[.api-collapsible-fifth-title]
fc_port_reference
```

An FC port is the physical port of an FC adapter on a cluster node that can be connected to an FC network.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|name
|string
a|The name of the FC port.
```

```
|node
|link:#node[node]
a|The node on which the FC port is located.
```

```
|uuid
```

```
|string
a|The unique identifier of the FC port.
```

```
|===
```

```
[#location]
[.api-collapsible-fifth-title]
location
```

The location of the Fibre Channel interface is defined by the location of its port.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|port
|link:#fc_port_reference[fc_port_reference]
a|An FC port is the physical port of an FC adapter on a cluster node that can be connected to an FC network.
```

```
|===
```

```
[#fc_interface_svm]
[.api-collapsible-fifth-title]
fc_interface_svm
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|data_protocol
|string
a|The data protocol for which the Fibre Channel interface is configured.
```

```
|location
|link:#location[location]
```

a|The location of the Fibre Channel interface is defined by the location of its port.

|name

|string

a|The name of the Fibre Channel interface.

|uuid

|string

a|The unique identifier of the Fibre Channel interface.

|===

[#fcp]

[.api-collapsible-fifth-title]

fcp

[cols=3*,options=header]

|===

|Name

|Type

|Description

|enabled

|boolean

a|Enable Fiber Channel Protocol (FCP)? Setting to true creates a service if not already created.

|===

[#ip]

[.api-collapsible-fifth-title]

ip

IP information

[cols=3*,options=header]

|===

|Name

|Type

```

|Description

|address
|string
a|IPv4 or IPv6 address

|netmask
|string
a|Input as netmask length (16) or IPv4 mask (255.255.0.0).

|===

[#broadcast_domain]
[.api-collapsible-fifth-title]
broadcast_domain

Broadcast domain UUID along with a readable name.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|Name of the broadcast domain, scoped to its IPspace

|uuid
|string
a|Broadcast domain UUID

|===

[#home_node]
[.api-collapsible-fifth-title]
home_node

[cols=3*,options=header]
|===

```

```
|Name
|Type
|Description
```

```
|name
|string
a|
```

```
|uuid
|string
a|
```

```
|===
```

```
[#location]
[.api-collapsible-fifth-title]
location
```

Home_node is optional.

```
[cols=3*,options=header]
|===
```

```
|Name
|Type
|Description
```

```
|broadcast_domain
|link:#broadcast_domain[broadcast_domain]
a|Broadcast domain UUID along with a readable name.
```

```
|home_node
|link:#home_node[home_node]
a|
```

```
|===
```

```
[#ip_interface_svm]
[.api-collapsible-fifth-title]
ip_interface_svm
```

Interface parameters. Name and home_node are optional.

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|ip
|link:#ip[ip]
a|IP information

|location
|link:#location[location]
a|Home_node is optional.

|name
|string
a|The name of the interface (optional).

|service_policy
|string
a|Built-in service policies for SVMs.

|services
|array[string]
a|The services associated with the interface.

|uuid
|string
a|The UUID that uniquely identifies the interface.

|===

[#ipspace]
[.api-collapsible-fifth-title]
ipspace

Either the UUID or name may be supplied on input.

[cols=3*,options=header]

```

```

|===
|Name
|Type
|Description

|name
|string
a|IPspace name

|uuid
|string
a|IPspace UUID

|===

[#iscsi]
[.api-collapsible-fifth-title]
iscsi

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Enable iSCSI? Setting to true creates a service if not already created.

|===

[#ldap]
[.api-collapsible-fifth-title]
ldap

[cols=3*,options=header]
|===
|Name
|Type
|Description

|ad_domain

```

```

|string
a|This parameter specifies the name of the Active Directory domain
used to discover LDAP servers for use by this client.
This is mutually exclusive with `servers` during POST.

|base_dn
|string
a|Specifies the default base DN for all searches.

|bind_dn
|string
a|Specifies the user that binds to the LDAP servers. SVM API supports
anonymous binding. For Simple and SASL LDAP binding, use the LDAP API
endpoint.

|enabled
|boolean
a|Enable LDAP? Setting to true creates a configuration if not already
created.

|servers
|array[string]
a|

|===

[#nfs]
[.api-collapsible-fifth-title]
nfs

[cols=3*,options=header]
|===
|Name
|Type
|Description

|enabled
|boolean
a|Enable NFS? Setting to true creates a service if not already created.

|===

```

```

[#nis]
[.api-collapsible-fifth-title]
nis

[cols=3*,options=header]
|===
|Name
|Type
|Description

|domain
|string
a|The NIS domain to which this configuration belongs.

|enabled
|boolean
a|Enable NIS? Setting to true creates a configuration if not already
created.

|servers
|array[string]
a|A list of hostnames or IP addresses of NIS servers used
by the NIS domain configuration.

|===

[#nsswitch]
[.api-collapsible-fifth-title]
nsswitch

Name service switch configuration

[cols=3*,options=header]
|===
|Name
|Type
|Description

|group
|array[string]

```

```
a|Group sources
```

```
|hosts
```

```
|array[string]
```

```
a|Host sources
```

```
|namemap
```

```
|array[string]
```

```
a|NameMap sources
```

```
|netgroup
```

```
|array[string]
```

```
a|NetGroup sources
```

```
|passwd
```

```
|array[string]
```

```
a|Password sources
```

```
|===
```

[.api-collapsible-fifth-title]
```

```
nvme
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|enabled
```

```
|boolean
```

```
a|Enable NVMe? Setting to true creates a service if not already created.
```

```
|===
```

```
[#ip_info]
```

```
[.api-collapsible-fifth-title]
```

```
ip_info
```

IP information

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|address
```

```
|string
```

```
a|IPv4 or IPv6 address
```

```
|netmask
```

```
|string
```

```
a|Input as netmask length (16) or IPv4 mask (255.255.0.0). For IPv6, you  
must set the netmask length. The default value is 64. Output is always  
netmask length.
```

```
|===
```

```
[#network_route_for_svm]
```

```
[.api-collapsible-fifth-title]
```

```
network_route_for_svm
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|destination
```

```
|link:#ip_info[ip_info]
```

```
a|IP information
```

```
|gateway
```

```
|string
```

```
a|The IP address of the gateway router leading to the destination.
```

```
|===
```

```
[#certificate]
[.api-collapsible-fifth-title]
certificate
```

Specifies the certificate that will be used for creating HTTPS connections to the S3 server.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|name
|string
a|Certificate name
```

```
|uuid
|string
a|Certificate UUID
```

```
|===
```

```
[#s3]
[.api-collapsible-fifth-title]
s3
```

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|certificate
|link:#certificate[certificate]
a|Specifies the certificate that will be used for creating HTTPS
connections to the S3 server.
```

```
|enabled
|boolean
a|Specifies whether or not to enable S3. Setting this value to true
```

creates a service if one is not yet created.

|is_http_enabled

|boolean

a|Specifies whether HTTP is enabled on the S3 server. By default, HTTP is disabled on the S3 server.

|is_https_enabled

|boolean

a|Specifies whether HTTPS is enabled on the S3 server. By default, HTTPS is enabled on the S3 server.

|name

|string

a|Specifies the name of the S3 server. A server name length can range from 1 to 15 characters and can only contain the following combination of characters 0-9, A-Z, a-z, ".", and "-".

|port

|integer

a|Specifies the HTTP listener port for the S3 server. By default, HTTP is enabled on port 80.

|secure_port

|integer

a|Specifies the HTTPS listener port for the S3 server. By default, HTTPS is enabled on port 443.

|===

[#snapmirror]

[.api-collapsible-fifth-title]

snapmirror

Specifies attributes for SVM DR protection.

[cols=3*,options=header]

|===

|Name

```

|Type
|Description

|is_protected
|boolean
a|Specifies whether the SVM is a SnapMirror source SVM, using SnapMirror
to protect its data.

|protected_volumes_count
|integer
a|Specifies the number of SVM DR protected volumes in the SVM.

|===

[#snapshot_policy]
[.api-collapsible-fifth-title]
snapshot_policy

This is a reference to the Snapshot copy policy.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|

|uuid
|string
a|

|===

[#volume_efficiency_policy]
[.api-collapsible-fifth-title]
volume_efficiency_policy

This is a reference to the volume efficiency policy.

```

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|name
|string
a|Name of the volume efficiency policy

|uuid
|string
a|Unique identifier of the volume efficiency policy.

|===

[#svm]
[.api-collapsible-fifth-title]
svm

[cols=3*,options=header]
|===
|Name
|Type
|Description

|aggregates
|array[link:#aggregates[aggregates]]
a|List of allowed aggregates for SVM volumes. An administrator is allowed
to create volumes on these aggregates.

|aggregates_delegated
|boolean
a|This property is true when the administrator has delegated the
aggregates for the SVM volumes.

|cifs
|link:#cifs[cifs]
a|

|comment

```

```

|string
a|Comment

|dns
|link:#dns[dns]
