This parameter specifies the target qtree associated with the user, group, or tree record. For a user/group quota policy rule at volume level, this parameter is not valid. For a default tree quota policy rule, this parameter is specified as "" or "*". For a tree quota policy rule at qtree level, this parameter specifies a qtree name and a qtree identifier.

Name	Type	Description
_links	_links	
id	integer	The unique identifier for a qtree.
name	string	The name of the qtree.

used

Name	Type	Description
hard_limit_percent	integer	Total space used as a percentage of space hard limit
soft_limit_percent	integer	Total space used as a percentage of space soft limit
total	integer	Total space used

space

Name	Type	Description
hard_limit	integer	Space hard limit in bytes
soft_limit	integer	Space soft limit in bytes
used	used	

svm

Name	Type	Description
_links	_links	

Name	Type	Description
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

users

Name	Type	Description
id	string	Quota target user ID
name	string	Quota target user name

volume

Name	Type	Description
_links	_links	
name	string	The name of the volume.
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

quota_report

Name	Type	Description
_links	_links	
files	files	
group	group	<p>This parameter specifies the target group associated with the given quota report record. This parameter is available for group quota records and is not available for user or tree quota records. The target group is identified by a UNIX group name and UNIX group identifier.</p>

Name	Type	Description
index	integer	Index that identifies a unique quota record. Valid in URL.
qtree	qtree	This parameter specifies the target qtree associated with the user, group, or tree record. For a user/group quota policy rule at volume level, this parameter is not valid. For a default tree quota policy rule, this parameter is specified as "" or "*". For a tree quota policy rule at qtree level, this parameter specifies a qtree name and a qtree identifier.
space	space	
specifier	string	Quota specifier
svm	svm	
type	string	Quota type associated with the quota record.
users	array[users]	This parameter specifies the target user or users associated with the given quota report record. This parameter is available for user quota records and is not available for group or tree quota records. The target user or users are identified by a user name and user identifier. The user name can be a UNIX user name or a Windows user name, and the identifier can be a UNIX user identifier or a Windows security identifier.
volume	volume	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Retrieve a specific quota report record

GET /storage/quota/reports/{volume.uuid}/{index}

Introduced In: 9.6

Retrieves a specific quota report record.

Related ONTAP commands

- `quota report`

Parameters

Name	Type	In	Required	Description
volume.uuid	string	path	True	Volume UUID
index	integer	path	True	Quota report index
fields	array[string]	query	False	Specify the fields to return.

Response

Status: 200, Ok

Name	Type	Description
<code>_links</code>	_links	
<code>files</code>	files	

Name	Type	Description
group	group	This parameter specifies the target group associated with the given quota report record. This parameter is available for group quota records and is not available for user or tree quota records. The target group is identified by a UNIX group name and UNIX group identifier.
index	integer	Index that identifies a unique quota record. Valid in URL.
qtree	qtree	This parameter specifies the target qtree associated with the user, group, or tree record. For a user/group quota policy rule at volume level, this parameter is not valid. For a default tree quota policy rule, this parameter is specified as "" or "*". For a tree quota policy rule at qtree level, this parameter specifies a qtree name and a qtree identifier.
space	space	
specifier	string	Quota specifier
svm	svm	
type	string	Quota type associated with the quota record.
users	array[users]	This parameter specifies the target user or users associated with the given quota report record. This parameter is available for user quota records and is not available for group or tree quota records. The target user or users are identified by a user name and user identifier. The user name can be a UNIX user name or a Windows user name, and the identifier can be a UNIX user identifier or a Windows security identifier.
volume	volume

Manage storage quota policy rules

Storage quota rules endpoint overview

Overview

Quotas are defined in quota rules specific to FlexVol volumes or FlexGroup volumes. Each quota rule has a type. The type can be "user", "group", or "tree".

– User rules must have the user property and qtree property.

– Group rules must have the group property and qtree property.

– Tree rules must have the qtree property and not have the user or group property.

Quota policy rule APIs

The following APIs can be used to perform create, retrieve, modify, and delete operations related to quota policy rules.

– POST /api/storage/quota/rules

– GET /api/storage/quota/rules

– GET /api/storage/quota/rules/{rule-uuid}

– PATCH /api/storage/quota/rules/{rule-uuid}

– DELETE /api/storage/quota/rules/{rule-uuid}

Examples

Retrieving all quota policy rules

This API is used to retrieve all quota policy rules.

The following example shows how to retrieve quota policy rules for FlexVol volumes and FlexGroup volumes.

```
# The API:
GET /api/storage/quota/rules

# The call:
curl -X GET 'https://<mgmt-ip>/api/storage/quota/rules' -H 'accept:
application/hal+json'

# The response:
{
  "records": [
    {
      "svm": {
        "uuid": "038545f8-9ff8-11e8-bce6-005056a73bed",
        "name": "svm1",
```

```

    "_links": {
      "self": {
        "href": "/api/svm/svms/038545f8-9ff8-11e8-bce6-005056a73bed"
      }
    },
    "volume": {
      "uuid": "ab3df793-0f02-43c6-9514-4f142fc8cc92",
      "name": "voll1",
      "_links": {
        "self": {
          "href": "/api/storage/volumes/ab3df793-0f02-43c6-9514-4f142fc8cc92"
        }
      }
    },
    "uuid": "66319cbe-b837-11e8-9c5a-005056a7e88c",
    "_links": {

}

```

Retrieving a specific quota policy rule

This API is used to retrieve a quota policy rule for a specific qtree.

The following example shows how to retrieve a quota policy user rule for a specific qtree.

```

# The API:
GET /api/storage/quota/rules/{uuid}

# The call:
curl -X GET 'https://<mgmt-ip>/api/storage/quota/rules/264a9e0b-2e03-11e9-a610-005056a7b72d' -H 'accept: application/hal+json'

# Response for a user rule at a qtree level:
{
  "svm": {
    "uuid": "fd5db15a-15b9-11e9-a6ad-005056a760e0",
    "name": "svm1",
    "_links": {
      "self": {
        "href": "/api/svm/svms/fd5db15a-15b9-11e9-a6ad-005056a760e0"
      }
    }
  },
  "volume": {
    "uuid": "c1b64eea-ca8b-45ec-9397-ab489830d268",
    "name": "vol1",
    "_links": {

```

```

    "self": {
      "href": "/api/storage/volumes/c1b64eea-ca8b-45ec-9397-

    }
  }
}

```

Creating a quota policy rule

This API is used to create a new quota policy rule. When an explicit rule or a qtree-scoped rule of a type is created on a volume, a default rule of the same type is automatically added if it does not already exist on the volume.

The following example shows how to create a quota policy user rule using POST.

```

# The API:
POST /api/storage/quota/rules

# The call:
curl -X POST 'https://<mgmt-

Updating the quota policy rule

This API is used to update a quota policy rule.

The following example shows how to update a quota policy rule.

```
# The API:
PATCH /storage/quota/rules/{uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/storage/quota/rules/364d38eb-8e87-11e8-a806-005056a7e73a" -H 'accept: application/hal+json' -d
"@test_quota_patch.txt"
test_quota_patch.txt (body):
{
  "space": {
    "hard_limit": 16554,
    "soft_limit": 8192
  },
  "files": {
    "hard_limit": 40,
    "soft_limit": 20
  }
}
```

Deleting the quota policy rule

This API is used to delete a quota policy rule.

The following example shows how to delete a quota policy rule.

```
# The API:
DELETE /storage/quota/rules/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/storage/quota/rules/364d38eb-8e87-11e8-a806-005056a7e73a" -H 'accept: application/hal+json'
```

Retrieve quota policy rules for all FlexVol and FlexGroup volumes

GET /storage/quota/rules

Introduced In: 9.6

Retrieves quota policy rules configured for all FlexVol volumes and FlexGroup volumes.

Related ONTAP commands

- `quota policy rule show`

Parameters

Name	Type	In	Required	Description
uuid	string	query	False	Filter by uuid
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
type	string	query	False	Filter by type
space.soft_limit	integer	query	False	Filter by space.soft_limit
space.hard_limit	integer	query	False	Filter by space.hard_limit
files.soft_limit	integer	query	False	Filter by files.soft_limit
files.hard_limit	integer	query	False	Filter by files.hard_limit
qtree.id	integer	query	False	Filter by qtree.id
qtree.name	string	query	False	Filter by qtree.name
user_mapping	boolean	query	False	Filter by user_mapping
users.id	string	query	False	Filter by users.id
users.name	string	query	False	Filter by users.name
volume.name	string	query	False	Filter by volume.name

Name	Type	In	Required	Description
volume.uuid	string	query	False	Filter by volume.uuid
group.name	string	query	False	Filter by group.name
group.id	string	query	False	Filter by group.id
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

files

Name	Type	Description
hard_limit	integer	This parameter specifies the hard limit for files. This is valid in POST or PATCH.
soft_limit	integer	This parameter specifies the soft limit for files. This is valid in POST or PATCH.

group

This parameter specifies the target group to which the group quota policy rule applies. This parameter takes a group name or identifier. This parameter is only valid for the POST operation of a group quota policy rule. The POST operation will fail with an appropriate error if this parameter is used as an input to create a user or a tree quota policy rule. This input parameter for POST takes either a group name or a group identifier, but not both. For default quota rules, the group name must be chosen and should be specified as "". For explicit group quota rules, this parameter can contain a UNIX group name or a UNIX group identifier.

Name	Type	Description
id	string	Quota target group ID
name	string	Quota target group name

qtree

This parameter specifies the target qtree to which the user/group/tree quota policy rule applies. For a user/group quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST. For a user/group quota policy rule at volume level, this parameter is not valid in GET or POST. For a tree quota policy rule, this parameter is mandatory and is valid in both POST and GET. For a default tree quota policy rule, this parameter needs to be specified as "". For a tree quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST.

Name	Type	Description
_links	_links	
id	integer	The unique identifier for a qtree.
name	string	The name of the qtree.

space

Name	Type	Description
hard_limit	integer	This parameter specifies the space hard limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes. Valid in POST or PATCH. For a POST operation where the parameter is either empty or set to -1, no limit is applied. For a PATCH operation where a limit is configured, use a value of -1 to clear the limit.
soft_limit	integer	This parameter specifies the space soft limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes. Valid in POST or PATCH. For a POST operation where the parameter is either empty or set to -1, no limit is applied. For a PATCH operation where a limit is configured, use a value of -1 to clear the limit.

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

users

Name	Type	Description
id	string	Quota target user ID
name	string	Quota target user name

volume

Name	Type	Description
_links	_links	
name	string	The name of the volume.
uuid	string	Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move. <ul style="list-style-type: none">• example: 028baa66-41bd-11e9-81d5-00a0986138f7• Introduced in: 9.6

quota_rule

Name	Type	Description
_links	_links

space	space	
svm	svm	
type	string	<p>This parameter specifies the quota policy rule type. This is required in POST only and can take either one of the "user", "group" or "tree" values.</p>

Name	Type	Description
user_mapping	boolean	This parameter enables user mapping for user quota policy rules. This is valid in POST or PATCH for user quota policy rules only.
users	array[users]	This parameter specifies the target user to which the user quota policy rule applies. This parameter takes single or multiple user names or identifiers. This parameter is valid only for the POST operation of a user quota policy rule. If this parameter is used as an input to create a group or a tree quota policy rule, the POST operation will fail with an appropriate error. For POST, this input parameter takes either a user name or a user identifier, not both. For default quota rules, the user name must be chosen and specified as "". For explicit user quota rules, this parameter can indicate either a user name or user identifier. The user name can be a UNIX user name or a Windows user name. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash () or an @ sign; user names with these characters are treated as Windows names. The user identifier can be a UNIX user identifier or a Windows security identifier. For multi-user quota, this parameter can contain multiple user targets separated by a comma.
uuid	string	Unique identifier for the quota policy rule. This field is generated when the quota policy rule is created.
volume	volume

Create a quota policy rule for a FlexVol or a FlexGroup volume

POST /storage/quota/rules

Introduced In: 9.6

Creates a quota policy rule for a FlexVol or a FlexGroup volume.

Important notes:

- Unlike CLI/ONTAPI, the `quota_policy` input is not needed for POST.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the qtree.
- `volume.uuid` or `volume.name` - Existing volume in which to create the qtree.
- `type` - Quota type for the rule. This type can be `user`, `group`, or `tree`.
- `users.name` or `user.id` - If the quota type is `user`, this property takes the user name or user ID. For default user quota rules, the user name must be specified as `""`.
- `group.name` or `group.id` - If the quota type is `group`, this property takes the group name or group ID. For default group quota rules, the group name must be specified as `""`.
- `qtree.name` - Qtree for which to create the rule. For default tree rules, the qtree name must be specified as `""`.

Recommended optional properties

- `space.hard_limit` - Specifies the space hard limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes.

- `space.soft_limit` - Specifies the space soft limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes.
- `files.hard_limit` - Specifies the hard limit for files.
- `files.soft_limit` - Specifies the soft limit for files.
- `user_mapping` - Specifies the `user_mapping`. This property is valid only for quota policy rules of type `user`.

Related ONTAP commands

- `quota policy rule create`

Parameters

Name	Type	In	Required	Description
<code>return_timeout</code>	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0

Name	Type	In	Required	Description
return_records	boolean	query	False	<p>The default is false. If set to true, the records are returned.</p> <ul style="list-style-type: none"> • Default value:

Request Body

Error Code	Description
917927	The specified volume was not found.
918232	Either <code>volume.name</code> or <code>volume.uuid</code> must be provided.
918236	The specified <code>volume.uuid</code> and <code>volume.name</code> refer to different volumes.
2621462	The specified SVM does not exist.
2621706	The specified <code>svm.uuid</code> and <code>svm.name</code> do not refer to the same SVM.
2621707	No SVM was specified. Either <code>svm.name</code> or <code>svm.uuid</code> must be supplied.
5308501	Mapping from Windows user to UNIX user for user rule was unsuccessful.
5308502	Mapping from UNIX user to Windows user for user rule was unsuccessful.

Error Code	Description
5308552	Failed to get default quota policy name for SVM.
5308561	Failed to obtain volume quota state or invalid quota state obtained for volume.
5308562	users is a required input for creating a user rule and group is not allowed.
5308563	group is a required input for creating a group rule and users is not allowed.
5308564	qtree.name is a required input for creating a tree rule and users and group are not allowed.
5308565	Only one of name or id is allowed for each entry in the users array.
5308566	Only one of name or id is allowed for group.
5308568	Quota policy rule create operation succeeded, but quota resize failed due to internal error. To activate the rule, disable and enable quotas for this volume.
5308571	Quota policy rule create operation succeeded, but quota resize is skipped. To activate the rule, disable and enable quotas for this volume.
5308573	Input value is greater than limit for field.
5308574	Input value is out of range for field.
5308575	Input value is incorrectly larger than listed field.

files

Name	Type	Description
hard_limit	integer	This parameter specifies the hard limit for files. This is valid in POST or PATCH.
soft_limit	integer	This parameter specifies the soft limit for files. This is valid in POST or PATCH.

group

This parameter specifies the target group to which the group quota policy rule applies. This parameter takes a group name or identifier. This parameter is only valid for the POST operation of a group quota policy rule. The POST operation will fail with an appropriate error if this parameter is used as an input to create a user or a tree quota policy rule. This input parameter for POST takes either a group name or a group identifier, but not both. For default quota rules, the group name must be chosen and should be specified as "". For explicit group quota rules, this parameter can contain a UNIX group name or a UNIX group identifier.

Name	Type	Description
id	string	Quota target group ID
name	string	Quota target group name

qtree

This parameter specifies the target qtree to which the user/group/tree quota policy rule applies. For a user/group quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST. For a user/group quota policy rule at volume level, this parameter is not valid in GET or POST. For a tree quota policy rule, this parameter is mandatory and is valid in both POST and GET. For a default tree quota policy rule, this parameter needs to be specified as "". For a tree quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST.

Name	Type	Description
_links	_links	
id	integer	The unique identifier for a qtree.
name	string	The name of the qtree.

space

Name	Type	Description
hard_limit	integer	This parameter specifies the space hard limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes. Valid in POST or PATCH. For a POST operation where the parameter is either empty or set to -1, no limit is applied. For a PATCH operation where a limit is configured, use a value of -1 to clear the limit.
soft_limit	integer	This parameter specifies the space soft limit, in bytes. If less than 1024 bytes, the value is rounded up to 1024 bytes. Valid in POST or PATCH. For a POST operation where the parameter is either empty or set to -1, no limit is applied. For a PATCH operation where a limit is configured, use a value of -1 to clear the limit.

target	string	The target parameter that caused the error.

Delete a quota policy rule

```
DELETE /storage/quota/rules/{uuid}
```

Introduced In: 9.7

Deletes a quota policy rule.

Related ONTAP commands

- `quota policy rule delete`

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	Rule UUID

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0

Response

Status: 202, Accepted

Update quota policy rule properties

PATCH /storage/quota/rules/{uuid}

Introduced In: 9.7

Updates properties of a specific quota policy rule.

Important notes:

- The quota resize functionality is supported with the PATCH operation.
- Quota resize allows you to modify the quota limits, directly in the filesystem.
- The quota must be enabled on a FlexVol or a FlexGroup volume for `quota resize` to take effect.
- If the quota is disabled on the volume, the quota policy rule PATCH API modifies the rule, but this does not affect the limits in the filesystem.

Related ONTAP commands

- `quota policy rule modify`
- `quota resize`

Parameters

Name	Type	In	Required	Description
uuid	string	path	True	Rule UUID

Name	Type	In	Required	Description
return_timeout	integer	query	False	<p>The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.</p> <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0

_links	_links	
name	string	The name of the volume.
uuid	string	<p>Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.</p> <ul style="list-style-type: none"> • example: 028baa66-41bd-11e9-81d5-00a0986138f7 • Introduced in: 9.6

quota_rule

Name	Type	Description
_links	_links	
files	files	
group	group	<p>This parameter specifies the target group to which the group quota policy rule applies. This parameter takes a group name or identifier. This parameter is only valid for the POST operation of a group quota policy rule. The POST operation will fail with an appropriate error if this parameter is used as an input to create a user or a tree quota policy rule. This input parameter for POST takes either a group name or a group identifier, but not both. For default quota rules, the group name must be chosen and should be specified as "". For explicit group quota rules, this parameter can contain a UNIX group name or a UNIX group identifier.</p>

Name	Type	Description
qtree	qtree	This parameter specifies the target qtree to which the user/group/tree quota policy rule applies. For a user/group quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST. For a user/group quota policy rule at volume level, this parameter is not valid in GET or POST. For a tree quota policy rule, this parameter is mandatory and is valid in both POST and GET. For a default tree quota policy rule, this parameter needs to be specified as "". For a tree quota policy rule at qtree level, this parameter takes a qtree name and is valid in GET or POST.
space	space	
svm	svm	
type	string	This parameter specifies the quota policy rule type. This is required in POST only and can take either one of the "user", "group" or "tree" values.
user_mapping	boolean	This parameter enables user mapping for user quota policy rules. This is valid in POST or PATCH for user quota policy rules only.

Name	Type	Description
users	array[users]	This parameter specifies the target user to which the user quota policy rule applies. This parameter takes single or multiple user names or identifiers. This parameter is valid only for the POST operation of a user quota policy rule. If this parameter is used as an input to create a group or a tree quota policy rule, the POST operation will fail with an appropriate error. For POST, this input parameter takes either a user name or a user identifier, not both. For default quota rules, the user name must be chosen and specified as "". For explicit user quota rules, this parameter can indicate either a user name or user identifier. The user name can be a UNIX user name or a Windows user name. If a name contains a space, enclose the entire value in quotes. A UNIX user name cannot include a backslash () or an @ sign; user names with these characters are treated as Windows names. The user identifier can be a UNIX user identifier or a Windows security identifier. For multi-user quota, this parameter can contain multiple user targets separated by a comma.
uuid	string	Unique identifier for the quota policy rule. This field is generated when the quota policy rule is created.
volume	volume	

job_link

Name	Type	Description
_links	_links	
uuid	string	The UUID of the asynchronous job that is triggered by a POST, PATCH, or DELETE operation.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Manage shelves

Storage shelves endpoint overview

Retrieving storage shelf information

The storage shelf GET API retrieves all of the shelves in the cluster.

Examples

1) Retrieve a list of shelves from the cluster

The following example shows the response with a list of shelves in the cluster:

```
# The API:
/api/storage/shelves

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/shelves" -H "accept:
application/hal+json"

# The response:
{
```

```
"records": [
  {
    "uid": "3109174803597886800",
    "_links": {
      "self": {
        "href": "/api/storage/shelves/3109174803597886800"
      }
    }
  },
  {
    "uid": "9237728366621690448",
    "_links": {
      "self": {
        "href": "/api/storage/shelves/9237728366621690448"
      }
    }
  },
  {
    "uid": "9946762738829886800",
    "_links": {
      "self": {
        "href": "/api/storage/shelves/9946762738829886800"
      }
    }
  },
  {
    "uid": "10318311901725526608",
    "_links": {
      "self": {
        "href": "/api/storage/shelves/10318311901725526608"
      }
    }
  },
  {
    "uid": "13477584846688355664",
    "_links": {
      "self": {
        "href": "/api/storage/shelves/13477584846688355664"
      }
    }
  }
],
"num_records": 5,
"_links": {
  "self": {
    "href": "/api/storage/shelves/"
  }
}
```

```
}  
}  
}
```

2) Retrieve a specific shelf from the cluster

The following example shows the response of the requested shelf. If there is no shelf with the requested uid, an error is returned.

```
# The API:  
/api/storage/shelves/{uid}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/shelves/3109174803597886800" -H  
"accept: application/hal+json"  
  
# The response:  
{  
  "uid": "3109174803597886800",

Manage Snapshot copy policies

Storage snapshot-policies endpoint overview

Overview

In ONTAP, scheduled Snapshot copy creation works based on Snapshot copy policies.

ONTAP provides three cluster-wide Snapshot copy policies: "default", "default-1weekly" and "none".

A Snapshot copy policy can have more than one schedule associated with it.

A Snapshot copy policy can be linked to a storage object and based on the schedule in the policy, Snapshot copies will be created on the object at that interval.

Each schedule in a Snapshot copy policy has a Snapshot copy name prefix attached to it. Every Snapshot copy created using this policy will have this prefix in its name.

There is also a retention count associated with every schedule. This count indicates the maximum number of Snapshot copies that can exist for a given schedule. Once the Snapshot copy count reaches the retention count, on the next create operation, the oldest Snapshot copy is deleted.

Snapshot copy policy APIs

The following APIs are used to perform operations related to Snapshot copy policy information:

– POST /api/storage/snapshot-policies

– GET /api/storage/snapshot-policies

– GET /api/storage/snapshot-policies/{uuid}

– PATCH /api/storage/snapshot-policies/{uuid}

– DELETE /api/storage/snapshot-policies/{uuid}

Examples

Creating a Snapshot copy policy

The POST operation is used to create a Snapshot copy policy with the specified attributes.

```

# The API:
/api/storage/snapshot-policies

# The call:
curl -X POST "https://<mgmt-ip>/api/storage/snapshot-policies" -H
"accept: application/hal+json" -d '{"name": "new_policy", "enabled":
"true", "comment": "policy comment", "copies": [{ "schedule": { "name":
"5min" }, "count": "5", "prefix": "xyz" }], "svm": { "name": "vs0"}}'

# The response:
HTTP/1.1 201 Created
Date: Tue, 12 Mar 2019 21:20:24 GMT
Server: libzapid-httpd

{
  "num_records": 1,
  "records": [
    {
      "uuid": "a69d8173-450c-11e9-aa44-005056bbc848",
      "svm": {
        "name": "vs0"
      },
      "name": "new_policy",
      "comment": "This is a 5min schedule policy",
      "enabled": true,
      "copies": [
        {
          "count": 5,
          "schedule": {
            "name": "5min"
          }
        }
      ]
    }
  ]
}

```

Retrieving Snapshot copy policy attributes

The GET operation is used to retrieve Snapshot copy policy attributes.

```
# The API:
/api/storage/snapshot-policies

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/snapshot-policies/" -H "accept:
application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:17:17 GMT
Server: libzapid-http
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 686
Content-Type: application/json
{

      }
    }
  }
],
"num_records": 4,
"_links": {
  "self": {
    "href": "/api/storage/snapshot-policies/"
  }
}
}
}

```

Retrieving the attributes of a specific Snapshot copy policy

The GET operation is used to retrieve the attributes of a specific Snapshot copy policy.

```

# The API:
/api/storage/snapshot-policies/{uuid}

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/snapshot-policies/3c112527-2fe8-11e9-b55e-005056bbf1c8" -H "accept: application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:24:48 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 381
Content-Type: application/json
{
  "uuid": "3c112527-2fe8-11e9-b55e-005056bbf1c8",
  "name": "default",
  "comment": "Default policy with hourly, daily & weekly schedules.",
  "enabled": true,
  "scope": "cluster",

```

```
"copies": [
  {
    "count": 6,
    "prefix": "hourly",
    "schedule": {
      "name": "hourly"
    }
  },
  {
    "count": 2,
    "prefix": "daily",
    "schedule": {
      "name": "daily"
    }
  },
  {
    "count": 2,
    "prefix": "weekly",
    "schedule": {
      "name": "weekly"
    }
  }
],
"_links": {
  "self": {
    "href": "/api/storage/snapshot-policies/3c112527-2fe8-11e9-b55e-005056bbf1c8"
  }
}
}
```

Updating a Snapshot copy policy

The PATCH operation is used to update the specific attributes of a Snapshot copy policy.

```
# The API:
/api/storage/snapshot-policies/{uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/storage/snapshot-policies/ae9e65c4-4506-11e9-aa44-005056bbc848" -d '{"enabled": "false" }' -H "accept: application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:27:04 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 3
Content-Type: application/json
```

Deleting a Snapshot copy policy

The DELETE operation is used to delete a Snapshot copy policy.

```
# The API:
/api/storage/snapshot-policies/{uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/storage/snapshot-policies/ae9e65c4-4506-11e9-aa44-005056bbc848" -H "accept: application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:19:04 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 3
Content-Type: application/json
```

Retrieve Snapshot copy policies

GET /storage/snapshot-policies

Introduced In: 9.6

Retrieves a collection of Snapshot copy policies.

Related ONTAP commands

Parameters

Name	Type	In	Required	Description
name	string	query	False	Filter by name
scope	string	query	False	Filter by scope
uuid	string	query	False	Filter by uuid
svm.uuid	string	query	False	Filter by svm.uuid
svm.name	string	query	False	Filter by svm.name
comment	string	query	False	Filter by comment
enabled	boolean	query	False	Filter by enabled
copies.snapmirror_label	string	query	False	Filter by copies.snapmirror_label
copies.prefix	string	query	False	Filter by copies.prefix
copies.schedule.name	string	query	False	Filter by copies.schedule.name
copies.count	integer	query	False	Filter by copies.count
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.

Name	Type	In	Required	Description
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none"> • Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none"> • Default value: 1 • Max value: 120 • Min value: 0
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Status: 200, Ok

schedule

Name	Type	Description
name	string	Schedule at which Snapshot copies are captured on the volume. Some common schedules already defined in the system are hourly, daily, weekly, at 15 minute intervals, and at 5 minute intervals. Snapshot copy policies with custom schedules can be referenced.

copies

Name	Type	Description
count	integer	The number of Snapshot copies to maintain for this schedule.
prefix	string	The prefix to use while creating Snapshot copies at regular intervals.
schedule	schedule	
snapmirror_label	string	Label for SnapMirror operations

svm

Name	Type	Description
_links	_links	
name	string	The name of the SVM.
uuid	string	The unique identifier of the SVM.

snapshot_policy

The Snapshot copy policy object is associated with a read-write volume used to create and delete Snapshot copies at regular intervals.

Name	Type	Description
_links	_links	
comment	string	A comment associated with the Snapshot copy policy.
copies	array[copies]	
enabled	boolean	Is the Snapshot copy policy enabled?
name	string	Name of the Snapshot copy policy.
scope	string	Set to "svm" when the request is on a data SVM, otherwise set to "cluster".
svm	svm	
uuid	string	

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code

Name	Type	Description
message	string	Error message
target	string	The target parameter that caused the error.

Create a Snapshot copy policy

POST /storage/snapshot-policies

Introduced In: 9.6

Creates a Snapshot copy policy.

Required properties

- `svm.uuid` or `svm.name` - Existing SVM in which to create the Snapshot copy policy.
- `name` - Name for the Snapshot copy policy.
- `copies.schedule` - Schedule at which Snapshot copies are captured on the volume.
- `copies.count` - Number of Snapshot copies to maintain for this schedule.

Recommended optional properties

- `copies.prefix` - Prefix to use when creating Snapshot copies at regular intervals.

Default property values

If not specified in POST, the following default property values are assigned:

- `enabled` - *true*
- `copies.prefix` - Value of `schedule.name`

Manage Snapshot copy policies and schedules

Storage snapshot-policies snapshot_policy.uuid schedules endpoint overview

Overview

In ONTAP, scheduled Snapshot copy creation works based on the schedules associated with Snapshot copy policies.

ONTAP provides six cluster-wide schedules: "5min", "8hour", "hourly", "daily", "weekly" and "monthly".

A Snapshot copy policy is created using at least one of these schedules and up to 5 schedules can be associated with a Snapshot copy policy.

A Snapshot copy policy can be linked to a storage object and based on the schedule in the policy, Snapshot copies are created on the object at that interval.

Each schedule in a Snapshot copy policy has a Snapshot copy name prefix attached to it. Every Snapshot copy created using this policy has this prefix in its name.

There is also a retention count associated with every schedule. This count indicates the maximum number of Snapshot copies that can exist for a given schedule.

Once the Snapshot copy count reaches the retention count, on the next create operation, the oldest Snapshot copy is deleted.

A schedule can be added, modified or deleted from a Snapshot copy policy.

Snapshot copy policy schedule APIs

The following APIs are used to perform operations related to Snapshot copy policy schedules:

– POST /api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/

– GET /api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/

– GET /api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}

– PATCH /api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}

– DELETE /api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}

Examples

Adding schedule to a Snapshot copy policy

The POST operation is used to create a schedule for a Snapshot copy policy with the specified attributes.

```
# The API:
/api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/

# The call:
curl -X POST "https://<mgmt-ip>/api/storage/snapshot-policies/32a0841a-818e-11e9-b4f4-005056bbab9c/schedules" -H "accept: application/hal+json" -d '{"schedule.uuid": "7c985d80-818a-11e9-b4f4-005056bbab9c", "count": "5", "prefix": "new_hourly" }'

# The response:
HTTP/1.1 201 Created
Date: Wed, 29 May 2019 22:41:33 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff

Content-Type: application/json
{
  "num_records": 1,
  "records": [
    {
      "snapshot_policy": {
        "uuid": "32a0841a-818e-11e9-b4f4-005056bbab9c"
      },
      "schedule": {
        "uuid": "7c985d80-818a-11e9-b4f4-005056bbab9c"
      },
      "count": 5,
      "prefix": "new_monthly"
    }
  ]
}
```

Retrieving Snapshot copy policy schedules

The GET operation is used to retrieve Snapshot copy policy schedules.

```
# The API:
/api/storage/snapshot-policies/{snapshot_policy.uuid}/schedules/

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/snapshot-policies/32a0841a-818e-11e9-b4f4-005056bbab9c/schedules" -H "accept: application/hal+json"
```

```
# The response:
HTTP/1.1 200 OK

      }
    }
  ]
}
```

```
    }  
  ],  
  "num_records": 4  
}
```

Retrieving the attributes of a specific Snapshot copy policy schedule

The GET operation is used to retrieve the attributes of a specific Snapshot copy policy schedule.

```
# The API:  
/api/storage/snapshot-  
policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/snapshot-policies/32a0841a-  
818e-11e9-b4f4-005056bbab9c/schedules/7c985d80-818a-11e9-b4f4-  
005056bbab9c" -H "accept: application/hal+json"  
  
# The response:  
HTTP/1.1 200 OK  
Date: Wed, 29 May 2019 22:54:06 GMT  
Server: libzapid-httpd  
X-Content-Type-Options: nosniff  
Cache-Control: no-cache,no-store,must-revalidate  
Content-Length: 238  
Content-Type: application/json  
{  
  "snapshot_policy": {  
    "uuid": "32a0841a-818e-11e9-b4f4-005056bbab9c"  
  },  
  "schedule": {  
    "uuid": "7c985d80-818a-11e9-b4f4-005056bbab9c",  
    "name": "monthly"  
  },  
  "count": 5,  
  "prefix": "new_monthly",  
  "snapmirror_label": "-"  
}
```

Updating a Snapshot copy policy schedule

The PATCH operation is used to update the specific attributes of a Snapshot copy policy.

```
# The API:
/api/storage/snapshot-
policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/storage/snapshot-policies/32a0841a-
818e-11e9-b4f4-005056bbab9c/schedules/7c985d80-818a-11e9-b4f4-
005056bbab9c" -d '{"count": "10" }' -H "accept: application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Wed, 29 May 2019 23:08:00 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 3
Content-Type: application/json
```

Deleting a Snapshot copy policy

The DELETE operation is used to delete a Snapshot copy policy.

```
# The API:
/api/storage/snapshot-
policies/{snapshot_policy.uuid}/schedules/{schedule.uuid}

# The call:
curl -X DELETE "https://<mgmt-ip>/api/storage/snapshot-policies/32a0841a-
818e-11e9-b4f4-005056bbab9c/schedules/7c985d80-818a-11e9-b4f4-
005056bbab9c" -H "accept: application/hal+json"

# The response:

snapshot_policy_schedule

The Snapshot copy policy schedule object is associated with a Snapshot copy policy and it defines the interval at which Snapshot copies are created and deleted.

Name	Type	Description
_links	_links	

Name	Type	Description
count	integer	The number of Snapshot copies to maintain for this schedule.
prefix	string	The prefix to use while creating Snapshot copies at regular intervals.
schedule	schedule	
snapmirror_label	string	Label for SnapMirror operations
snapshot_policy	snapshot_policy	This is a reference to the Snapshot copy policy.

error_arguments

Name	Type	Description
code	string	Argument code
message	string	Message argument

error

Name	Type	Description
arguments	array[error_arguments]	Message arguments
code	string	Error code
message	string	Error message
target	string	The target parameter that caused the error.

Add a schedule to a Snapshot copy policy

POST /storage/snapshot-policies/{snapshot_policy.uuid}/schedules

Introduced In: 9.8

Adds a schedule to a Snapshot copy policy.

Required properties

- `schedule.uuid` or `schedule.name` - Schedule at which Snapshot copies are captured on the volume.

- `count` - Number of Snapshot copies to maintain for this schedule.

Recommended optional properties

- `prefix` - Prefix to use when creating Snapshot copies at regular intervals.

Default property values

If not specified in POST, the following default property values are assigned:

- `prefix` - Value of `schedule.name`

Related ONTAP commands

- `snapshot policy add-schedule`

- [DOC /storage/snapshot-policies/{snapshot_policy.uuid}/schedules](#)

Parameters

Name	Type	In	Required	Description
<code>snapshot_policy.uuid</code>	string	path	True	Snapshot copy policy UUID
<code>return_records</code>	boolean	query	False	The default is false. If set to true, the records are returned. • Default value:

Request Body

Name	Type	Description
<code>_links</code>	_links	
<code>count</code>	integer	The number of Snapshot copies to maintain for this schedule.
<code>prefix</code>	string	The prefix to use while creating Snapshot copies at regular intervals.
<code>schedule</code>	schedule	
<code>snapmirror_label</code>	string	Label for SnapMirror operations

Name	Type	Description
snapshot_policy	snapshot_policy	This is a reference to the Snapshot copy policy.

Example request

```
{
  "_links": {
    "self": {
      "href": "/api/resourcelink"
    }
  },
  "prefix": "string",
  "schedule": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "weekly",
    "uuid": "1cd8a442-86d1-11e0-ae1c-123478563412"
  },
  "snapshot_policy": {
    "_links": {
      "self": {
        "href": "/api/resourcelink"
      }
    },
    "name": "default",
    "uuid": "1cd8a442-86d1-11e0-ae1c-123478563412"
  }
}
```

Response

Status: 201, Created

Error

Status: Default

ONTAP Error Response Codes

Error Code	Description
1638407	When adding schedule to a Snapshot copy policy, the count for that schedule must be specified.
1638410	Specified schedule already exists in snapshot policy.
1638413	Schedule not found.
1638451	This operation would result in total Snapshot copy count for the policy to exceed maximum supported count.
1638508	Another schedule has the same prefix within this policy.
1638528	This operation is not supported in a mixed-version cluster.
1638531	This operation is not supported because specified policy is owned by the cluster admin.

Name	Type	Description
error	error	

Example error

```
{
  "error": {
    "arguments": {
      "code": "string",
      "message": "string"
    },
    "code": "4",
    "message": "entry doesn't exist",
    "target": "uuid"
  }
}
```

Manage storage switches

Storage switches endpoint overview

Retrieving storage switch information

The storage switch GET API retrieves all of the switches in the cluster.

Examples

1) Retrieves a list of storage switches from the cluster

The following example shows the response with a list of storage switches in the cluster:

```
# The API:
/api/storage/switches
```

```
# The call:
curl -X GET "https://<mgmt-ip>/api/storage/switches" -H "accept:
application/hal+json"

# The response:
{
  "records": [
    {
      "name": "Brocade_10.226.57.206",
      "_links": {
        "self": {
          "href": "/api/storage/switches/Brocade_10.226.57.206"
        }
      }
    },
    {
      "name": "Brocade_10.226.57.207",
      "_links": {
        "self": {
          "href": "/api/storage/switches/Brocade_10.226.57.207"
        }
      }
    },
    {
      "name": "Brocade_10.226.57.208",
      "_links": {
        "self": {
          "href": "/api/storage/switches/Brocade_10.226.57.208"
        }
      }
    },
    {
      "name": "Brocade_10.226.57.209",
      "_links": {
        "self": {
          "href": "/api/storage/switches/Brocade_10.226.57.209"
        }
      }
    }
  ],
  "num_records": 4,
  "_links": {
    "self": {
      "href": "/api/storage/switches/"
    }
  }
}
```

```
}  
}
```

2) Retrieves a specific storage switch from the cluster

The following example shows the response of the requested storage switch. If there is no storage switch with the requested name, an error is returned.

```
# The API:  
/api/storage/switches/{name}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/switches/Brocade_10.226.57.206"  
-H "accept: application/hal+json"  
  
# The response:

Retrieve storage switches

GET /storage/switches

Introduced In: 9.9

Retrieves a collection of storage switches.

Related ONTAP commands

- `storage switch show`

Learn more

- [DOC /storage/switches](#)

Parameters

Name	Type	In	Required	Description
fields	array[string]	query	False	Specify the fields to return.
max_records	integer	query	False	Limit the number of records returned.
return_records	boolean	query	False	The default is true for GET calls. When set to false, only the number of records is returned. <ul style="list-style-type: none">• Default value: 1
return_timeout	integer	query	False	The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached. <ul style="list-style-type: none">• Default value: 1• Max value: 120• Min value: 0

Name	Type	In	Required	Description
order_by	array[string]	query	False	Order results by specified fields and optional [asc

Response

Manage storage tape devices

Storage tape-devices endpoint overview

Retrieving storage tape information

The storage tape GET API retrieves all of the tapes in the cluster.

Examples

1) Retrieving a list of tapes from the cluster

The following example returns the list of tapes in the cluster:

```
# The API:
/api/storage/tape-devices

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/tape-devices" -H "accept:
application/hal+json"

# The response:
{
  "records": [
    {
      "node": {
        "uuid": "4083be52-5315-11eb-a839-00a0985ebbe7",
        "name": "st-8020-1-01",
        "_links": {
          "self": {
            "href": "/api/cluster/nodes/4083be52-5315-11eb-a839-
00a0985ebbe7"
          }
        }
      },
      "device_id": "2d.0",
      "_links": {
        "self": {
          "href": "/api/storage/tape-devices/4083be52-5315-11eb-a839-
00a0985ebbe7/2d.0"
        }
      }
    },
    {
      "node": {
        "uuid": "4083be52-5315-11eb-a839-00a0985ebbe7",
        "name": "st-8020-1-01",
        "_links": {

Manage volume efficiency policies

Storage volume-efficiency-policies endpoint overview

Overview

Volume efficiency policies specify information about efficiency policies that are applied to the volume.

Volume efficiency policy APIs

The following APIs are used to perform operations related to volume efficiency policy information:

- – POST /api/storage/volume-efficiency-policies
- – GET /api/storage/volume-efficiency-policies
- – GET /api/storage/volume-efficiency-policies/{uuid}
- – PATCH /api/storage/volume-efficiency-policies/{uuid}
- – DELETE /api/storage/volume-efficiency-policies/{uuid}

Examples

Creating a volume efficiency policy

The POST operation is used to create a volume efficiency policy with the specified attributes.

```

# The API:
/api/storage/volume-efficiency-policies

# The call:
curl -X POST "https://<mgmt-ip>/api/storage/volume-efficiency-policies"
-H "accept: application/hal+json" -d '{"name": "new_policy", "type":
"scheduled", "schedule": { "name": "daily" }, "duration": "2",
"qos_policy": "best_effort", "enabled": "true", "comment": "schedule-
policy", "svm": { "name": "vs1"}}'

# The response:
HTTP/1.1 201 Created

      "comment": "schedule-policy"
    }
  ]
}

```

Retrieving volume efficiency policy attributes

The GET operation is used to retrieve volume efficiency policy attributes.

```
# The API:
/api/storage/volume-efficiency-policies

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/volume-efficiency-policies" -H
"accept: application/hal+json"

# The response:
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:17:17 GMT
Server: libzapid-http
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 686
Content-Type: application/json

```

Retrieving the attributes of a specific volume efficiency policy

The GET operation is used to retrieve the attributes of a specific volume efficiency policy.

The API:

```
/api/storage/volume-efficiency-policies/{uuid}
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/storage/volume-efficiency-policies/3c112527-2fe8-11e9-b55e-005056bbf1c8" -H "accept: application/hal+json"</mgmt-ip>
```

The response:

```

HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:24:48 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 381
Content-Type: application/json
{
  "uuid": "3c112527-2fe8-11e9-b55e-005056bbf1c8",
  "name": "new_policy",
  "type": "scheduled",
  "schedule": {
    "name": "daily"
  }
  "duration": "2",
  "qos_policy": "best_effort",
  "enabled": "true",
  "comment": "schedule-policy",
  "svm": {
    "name": "vs1"
  }

    "self": {
      "href": "/api/storage/volume-efficiency-policies/3c112527-2fe8-11e9-b55e-005056bbf1c8"
    }
  }
}

```

```
### Updating a volume efficiency policy
The PATCH operation is used to update the specific attributes of a volume
efficiency policy.
```

The API:

```
/api/storage/volume-efficiency-policies/{uuid}
```

The call:

```
curl -X PATCH "https://<mgmt-ip>/api/storage/volume-efficiency-policies/ae9e65c4-4506-11e9-aa44-005056bbc848" -d '{"duration": "3"}' -H "accept: application/hal+json"</mgmt-ip>
```

The response:

```
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:27:04 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 3
Content-Type: application/json
```

```
### Deleting a volume efficiency policy
The DELETE operation is used to delete a volume efficiency policy.
```

The API:

```
/api/storage/volume-efficiency-policies/{uuid}
```

The call:

```
curl -X DELETE "https://<mgmt-ip>/api/storage/volume-efficiency-policies/ ae9e65c4-4506-11e9-aa44-005056bbc848" -H "accept: application/hal+json"</mgmt-ip>
```

The response:

```
HTTP/1.1 200 OK
Date: Tue, 12 Mar 2019 21:19:04 GMT
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate

[[ID1489c3054eea70ab02fc4b30b360df94]]
= Create a volume efficiency policy

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/storage/volume-efficiency-policies`#

*Introduced In:* 9.8

Creates a volume efficiency policy.

== Required properties

```

* `svm.uuid` or `svm.name` - Existing SVM in which to create the volume efficiency policy.

* `name` - Name for the volume efficiency policy.

== Recommended optional properties

* `type` - Type of volume policy.

* `schedule` - Schedule the volume efficiency defined in minutes, hourly, daily and weekly.

* `duration` - Indicates the allowed duration for a session for policy type "threshold" and "auto".

* `start_threshold_percent` - Indicates the start threshold percentage for the policy type "threshold". It is mutually exclusive of the schedule.

* `qos_policy` - QoS policy for the sis operation.

* `comment` - A comment associated with the volume efficiency policy.

* `enabled` - Is the volume efficiency policy enabled?

== Default property values

If not specified in POST, the following default property values are assigned:

* `type` - auto

* `enabled` - true

* `qos_policy` - best_effort

== Related ONTAP commands

* `volume efficiency policy create`

== Learn more

* [xref:{relative_path}storage_volume-efficiency-policies_endpoint_overview.html](#) [DOC /storage/volume-efficiency-policies]

== Parameters

```
== Error
```

Status: Default

ONTAP Error Response Codes

```

|====
| Error Code | Description
| 6881341
| Specified schedule not found.
| 6881344
| Failed to queue specified job.
| 6881345
| This operation is not permitted on a node SVM.

```

```
| 6881349
| Policy name is not valid.

| 6881362
| Threshold percentage cannot be less than 1 percent.

| 6881433
| For "{\{0\}}" type policy, attribute "{\{1\}}" is not supported.

| 6881435
| Only a policy of type "threshold" can set the "start-threshold-percent"
attribute.

| 6881436
| For a policy of type "scheduled", a valid "schedule" is a required
attribute.

| 6881454
| An efficiency policy of type "threshold" requires an effective cluster
version of ONTAP 8.3 or later.

| 6881474
| Duration cannot be null.

| 6881475
| Duration is not valid.

| 6881476
| Duration cannot be less than 1 hour.

| 6881477
| Duration cannot be more than 999 hours.

ONTAP Error Response Code

|====

| Error Code | Description

| 6881341

| Specified schedule not found.

| 6881344

| Failed to queue specified job.

| 6881348

| This operation cannot be performed because the specified policy is owned by the cluster admin.

| 6881349

| Policy name is not valid.

| 6881362

| Threshold percentage cannot be less than 1 percent.

| 6881433

| For "{\{0\}}" type policy, "{\{1\}}" duration is not supported.

| 6881435

| Only a policy of type "threshold" can set the "start-threshold-percent" attribute.

```
| 6881436
| For a policy of type "scheduled", a valid "schedule" is a required
attribute.
```

```
| 6881438
| For "{\{0\}}" policy, modification of attributes is not allowed.
```

```
| 6881474
| Duration cannot be null.
```

```
| 6881475
| Duration is not valid.
```

```
| 6881476
| Duration cannot be less than 1 hour.
```

```
| 6881477
| Duration cannot be more than 999 hours.

= Manage storage volumes

:leveloffset: +1

[[ID9b5be2bd01ad584f3cd49a7467ac8d50]]

= Storage volumes endpoint overview

== Overview

FlexVol volumes are logical containers used by ONTAP to serve data to clients. They contain file systems in a NAS environment and LUNs in a SAN environment.

A FlexGroup volume is a scale-out NAS container that provides high performance along with automatic load distribution and scalability. A FlexGroup volume contains several constituents that automatically and transparently share the traffic.

FlexClone volumes are writable, point-in-time copies of a FlexVol volume. At this time, FlexClones of FlexGroups are not supported.

Volumes with SnapLock type Compliance or Enterprise, are referred to as SnapLock volumes. Volumes with SnapLock type cannot be of FlexGroup style. Once a SnapLock aggregate is created, by default, volumes created inside the aggregate inherit the "snaplock" property from the aggregate. It is possible to create a SnapLock volume by specifying SnapLock parameters. SnapLock parameters are only available at the "advanced" privilege level.

ONTAP storage APIs allow you to create, modify, and monitor volumes and aggregates.

== Storage efficiency

Storage efficiency is used to remove duplicate blocks in the data and to compress the data. Efficiency has deduplication, compression, cross volume deduplication, and compaction options. On All Flash systems, all efficiencies are enabled by default on volume creation. Options such as "background/inline/both" are treated as both, which means both background and inline are enabled for any efficiency option. The option "none" disables both background and inline efficiency.

To enable any efficiency option on all-flash or FAS systems, background deduplication is always enabled.

== Quotas

Quotas provide a way to restrict or track the files and space usage by a user, group, or qtree. Quotas are enabled for a specific FlexVol or a FlexGroup volume.

The following APIs can be used to enable or disable and obtain quota state for a FlexVol or a FlexGroup volume:

– PATCH /api/storage/volumes/{uuid} -d '{"quota.enabled":"true"}'

– PATCH /api/storage/volumes/{uuid} -d '{"quota.enabled":"false"}'

– GET /api/storage/volumes/{uuid}/?fields=quota.state

== File System Analytics

File system analytics provide a quick method for obtaining information summarizing properties of all files within any directory tree of a volume. For more information on file system analytics, see [xref:{relative_path}storage_volumes_volume.uuid_files_path_endpoint_overview.html\[DOC /storage/volumes{volume.uuid}/files/{path}\]](#) . Analytics can be enabled or disabled on individual volumes.

The following APIs can be used to enable or disable and obtain analytics state for a FlexVol volume or a FlexGroup volume:

– PATCH /api/storage/volumes/{uuid} -d '{"analytics.state":"on"}'

– PATCH /api/storage/volumes/{uuid} -d '{"analytics.state":"off"}'

– GET /api/storage/volumes/{uuid}/?fields=analytics

== QoS

QoS policy and settings enforce Service Level Objectives (SLO) on a volume. SLO can be set by specifying `qos.max_throughput_iops` and/or `qos.max_throughput_mbps` or `qos.min_throughput_iops`. Specifying `min_throughput_iops` is only supported on volumes hosted on a node that is flash optimized. A pre-created QoS policy can also be used by specifying `qos.name` or `qos.uuid` property.

== Performance monitoring

Performance of a volume can be monitored by the ``metric.+++`` and ``statistics.+++`` fields. These show the performance of the volume in terms

of IOPS, latency and throughput. The ``metric.*+`` fields denote an average whereas ``statistics.*+`` fields denote a real-time monotonically increasing value aggregated across all nodes.

== Volume APIs

The following APIs are used to perform operations related with FlexVol volumes and FlexGroup volumes:

```
&ndash; POST      /api/storage/volumes
&ndash; GET      /api/storage/volumes
&ndash; GET      /api/storage/volumes/{uuid}
&ndash; PATCH    /api/storage/volumes/{uuid}
&ndash; DELETE   /api/storage/volumes/{uuid}
```

== Examples

=== Creating a volume

The POST request is used to create a new volume and to specify its properties.

The API:

```
/api/storage/volumes
```

The call:

```
curl -X POST "https://<mgmt-ip>/api/storage/volumes" -H "accept:
application/hal+json" -d '{"name": "vol1",
"aggregates":[{"name":"aggr1"}], "svm":{"name" : "vs1"}'}
```

The response:

```
{
  "job": {
    "uuid": "b89bc5dd-94a3-11e8-a7a3-0050568edf84",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/b89bc5dd-94a3-11e8-a7a3-0050568edf84"
      }
    }
  }
}
```

```
==== Creating a SnapLock volume and specifying its properties using POST
```

```
----  
  
# The API:  
/api/storage/volumes
```

```
# The call:  
curl -X POST "https://<mgmt-ip>/api/storage/volumes" -H "accept:  
application/hal+json" -d '{"name": "vol1", "aggregates":[{"name":  
"aggr1"}], "svm":{"name" : "vs1"}, "snaplock":{"retention":{"default":  
"P20Y"}}}'
```

```
# The response:  
{  
"job": {  
  "uuid": "e45b123b-c228-11e8-aa20-0050568e36bb",  
  "_links": {  
    "self": {  
      "href": "/api/cluster/jobs/e45b123b-c228-11e8-aa20-0050568e36bb"  
    }  
  }  
}  
}
```

```
==== Creating a FlexGroup volume and specifying its properties using POST
```

```
----  
  
# The API:  
/api/storage/volumes
```

```
# The call:  
curl -X POST "https://<mgmt-ip>/api/storage/volumes" -H "accept:  
application/hal+json" -d '{"name" : "vol1", "state" : "online", "type" :  
"RW", "aggregates" : [{"name" : "aggr1"}, {"name" : "aggr2"},  
{"name":"aggr3"}], "constituents_per_aggregate" : "1", "svm" : {"name" :  
"vs1"}, "size" : "240MB", "encryption" : {"enabled" : "False"},  
"efficiency" : {"compression" : "both"}, "autosize" : {"maximum" :  
"500MB", "minimum" : "240MB"}}}'
```

```
# The response:  
{  
"job": {
```

```
"uuid": "3cfa38bd-3a78-11e9-ae39-0050568ed7dd",
  "_links": {
    "self": {
      "href": "/api/cluster/jobs/3cfa38bd-3a78-11e9-ae39-0050568ed7dd"
    }
  }
}
}
```

=== Creating a FlexClone and specifying its properties using POST

The API:

/api/storage/volumes

The call:

```
curl -X POST "https://<mgmt-ip>/api/storage/volumes" -H "accept:
application/hal+json" -d '{"name":"voll_clone", "clone": {"parent_volume":
{"name": "voll"}, "is_flexclone": "true"}, "svm":{"name": "vs0"}}'
```

The response:

HTTP/1.1 202 Accepted

Date: Tue, 26 Feb 2019 09:06:22 GMT

Server: libzapid-httpd

X-Content-Type-Options: nosniff

Cache-Control: no-cache,no-store,must-revalidate

Location: /api/storage/volumes/?name=voll_clone

Content-Length: 189

Content-Type: application/hal+json

```
{
  "job": {
    "uuid": "c9ee0040-39a5-11e9-9b24-00a098439a83",
    "_links": {
      "self": {
        "href": "/api/cluster/jobs/c9ee0040-39a5-11e9-9b24-00a098439a83"
      }
    }
  }
}
}
```

== Volumes reported in the GET REST API

=== The following types of volumes are reported:

```
&ndash; RW, DP and LS volumes

&ndash; FlexGroup volume

&ndash; FlexCache volume

&ndash; FlexClone volume

=== The following volumes are not reported:

&ndash; DEL and TMP type volume

&ndash; Node Root volume

&ndash; System Vserver volume

&ndash; FlexGroup constituent

&ndash; FlexCache constituent

== Examples

=== Retrieving the list of volumes

== Updating the attributes of a volume

== Examples

=== Updating the attributes of a volume

The PATCH request is used to update the attributes of a volume.

The API:

/api/storage/volumes/{uuid}

The call:

```

curl -X PATCH "https://<mgmt-ip>/api/storage/volumes/d0c3359c-5448-4a9b-
a077-e3295a7e9057" -d '{ "size": 26214400, "nas": {"security_style":
"mixed"}, "comment": "This is a data volume" }' -H "accept:
application/hal+json"

```

The response:

```

HTTP/1.1 202 Accepted
Date: Tue, 31 Jul 2018 09:36:43 GMT
Server: libzapid-httpd
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 189
Content-Type: application/hal+json

= Retrieve volumes
```

```
[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-  
block]#`/storage/volumes`#
```

```
*Introduced In:* 9.6
```

```
Retrieves volumes.
```

```
== Expensive properties
```

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

|Description
```

```
|scan_progress
```

```
|integer
```

```
a|Percentage of files in the volume that the file system analytics initialization scan has processed. Only returned when the state is `initializing`.
```

```
|state
```

```
|string
```

```
a|File system analytics state of the volume. If this value is "on", ONTAP collects extra file system analytics information for all directories on the volume. There will be a slight impact to I/O performance to collect this information. If this value is "off", file system analytics
```

information is not collected and not available to be viewed. If this value is "initializing", that means file system analytics was recently turned on, and the initialization scan to gather information all all existing files and directories is currently running. If this value is 'unknown' that means there was an internal error when determining the file system analytics state for the volume.

* enum: ["unknown", "initializing", "off", "on"]

* Introduced in: 9.8

|supported

|boolean

a|This field indicates whether or not file system analytics is supported on the volume. If file system analytics is not supported, the reason will be specified in the "analytics.unsupported_reason" field.

|unsupported_reason

|===
```

```
|Name  
|Type  
|Description
```

```
|grow_threshold
```

```
|integer
```

a|Used space threshold size, in percentage, for the automatic growth of the volume. When the amount of used space in the volume becomes greater than this threshold, the volume automatically grows unless it has reached the maximum size. The volume grows when 'space.used' is greater than this percent of 'space.size'. The 'grow_threshold' size cannot be less than or equal to the 'shrink_threshold' size..

```
|maximum
```

```
|integer
```

a|Maximum size in bytes up to which a volume grows automatically. This size cannot be less than the current volume size, or less than or equal to the minimum size of volume.

```
|minimum
```

```
|integer
```

a|Minimum size in bytes up to which the volume shrinks automatically. This size cannot be greater than or equal to the maximum size of volume.

```
|mode
```

```
|string
```

a|Autosize mode for the volume.

grow ‐ Volume automatically grows when the amount of used space is above the 'grow_threshold' value.

grow_shrink ‐ Volume grows or shrinks in response to the amount of space used.

off ‐ Autosizing of the volume is disabled.

```
|shrink_threshold
```

```
|integer
a|Used space threshold size, in percentage, for the automatic shrinkage of
the volume. When the amount of used space in the volume drops below this
threshold, the volume automatically shrinks unless it has reached the
minimum size. The volume shrinks when the 'space.used' is less than the
'shrink_threshold' percent of 'space.size'. The 'shrink_threshold' size
cannot be greater than or equal to the 'grow_threshold' size.

[cols=3*,options=header]
|===
|Name
|Type
|Description

|is_flexclone
|boolean
a|Specifies if this volume is a normal FlexVol or FlexClone. This field
needs to be set when creating a FlexClone. Valid in POST.

|parent_snapshot
|link:#snapshot_reference[snapshot_reference]
a|

|parent_svm
|link:#parent_svm[parent_svm]
a|

|parent_volume
|link:#parent_volume[parent_volume]
a|

|split_complete_percent
|integer
a|Percentage of FlexClone blocks split from its parent volume.

|split_estimate
|integer
a|Space required by the containing-aggregate to split the FlexClone
volume.

|split_initiated
|boolean
a|This field is set when split is executed on any FlexClone, that is when
the FlexClone volume is split from its parent FlexVol. This field needs to
be set for splitting a FlexClone form FlexVol. Valid in PATCH.

```

```
|===
```

```
[#consistency_group]  
[.api-collapsible-fifth-title]  
consistency_group
```

Consistency group the volume is part of.

|integer
```

```
a|Time window in seconds for cutover. The allowed range is between 30 to
```

300 seconds.

|destination_aggregate
|link:#destination_aggregate[destination_aggregate]
a|Aggregate

|percent_complete
|integer
a|Completion percentage

|state
|string
a|State of volume move operation. PATCH the state to "aborted" to abort the move operation. PATCH the state to "cutover" to trigger cutover. PATCH the state to "paused" to pause the volume move operation in progress. PATCH the state to "replicating" to resume the paused volume move operation. PATCH the state to "cutover_wait" to go into cutover manually. When volume move operation is waiting to go into "cutover" state, this is indicated by the "cutover_pending" state. A change of state is only supported if volume movement is in progress.

|tiering_policy
|string
a|Tiering policy for FabricPool

|===

[#logical_space]
[.api-collapsible-fifth-title]
logical_space

[cols=3*,options=header]

|===

|Name
|Type
|Description

|available
|integer
a|The amount of space available in this volume with storage efficiency space considered used, in bytes.

|enforcement

|boolean

a|Specifies whether space accounting for operations on the volume is done along with storage efficiency.

|reporting

|boolean

a|Specifies whether space reporting on the volume is done along with storage efficiency.

|used_by_afs

|integer

a|The virtual space used by AFS alone (includes volume reserves) and along with storage efficiency, in bytes.

|===

[#snapshot]

[.api-collapsible-fifth-title]

snapshot

[cols=3*,options=header]

|===

|Name

|Type

|Description

|autodelete_enabled

|boolean

a|Specifies whether Snapshot copy autodelete is currently enabled on this volume.

|reserve_percent

|integer

a|The space that has been set aside as a reserve for Snapshot copy usage, in percent.

|used

|integer

a|The total space used by Snapshot copies in the volume, in bytes.

|===

[#space]

[.api-collapsible-fifth-title]

space

[cols=3*,options=header]

|===

|Name

|Type

|Description

|afs_total

|integer

a|Total size of AFS, excluding snap-reserve, in bytes.

|available

|integer

a|The available space, in bytes.

|available_percent

|integer

a|The space available, as a percent.

|block_storage_inactive_user_data

|integer

a|The size that is physically used in the block storage of the volume and has a cold temperature. In bytes. This parameter is only supported if the volume is in an aggregate that is either attached to a cloud store or could be attached to a cloud store.

|capacity_tier_footprint

|integer

a|Space used by capacity tier for this volume in the FabricPool aggregate, in bytes.

|footprint

|integer

a|Data used for this volume in the aggregate, in bytes.

|local_tier_footprint

|integer

a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space

|link:#logical_space[logical_space]

a|

|metadata

|integer

a|Space used by the volume metadata in the aggregate, in bytes.

|over_provisioned

|integer

a|The amount of space not available for this volume in the aggregate, in bytes.

|performance_tier_footprint

|integer

a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size

|integer

a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|snapshot

|link:#snapshot[snapshot]

a|

|total_footprint

|integer

a|Data and metadata used for this volume in the aggregate, in bytes.

|used

|integer

a|The virtual space used (includes volume reserves) before storage

efficiency, in bytes.

|used_by_afs

|integer

a|The space used by Active Filesystem, in bytes.

|===

[#constituents]

[.api-collapsible-fifth-title]

constituents

[cols=3*,options=header]

|===

|Name

|Type

|Description

|aggregates

|link:#aggregates[aggregates]

a|

|movement

|link:#movement[movement]

a|Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

|name

|string

a|FlexGroup Constituents name

|space

|link:#space[space]

a|

|===

[#policy]

[.api-collapsible-fifth-title]

policy

[cols=3*,options=header]

|===

|Name

|Type

|Description

|name

|string

a|Specifies the name of the efficiency policy. Valid for PATCH.

|===

[#efficiency]

[.api-collapsible-fifth-title]

efficiency

[cols=3*,options=header]

|===

|Name

|Type

|Description

|application_io_size

|string

a|Block size to use by compression. Valid for POST.

|compaction

|string

a|The system can be enabled/disabled compaction.

inline ‐ Data will be compacted first and written to the volume.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are compaction enabled and some are disabled.

|compression

|string

a|The system can be enabled/disabled compression.

inline ‐ Data will be compressed first and written to the volume.

background ‐ Data will be written to the volume and compressed later.

both ‐ Inline compression compresses the data and write to the

volume, background compression compresses only the blocks on which inline

compression is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are compression enabled and some are disabled.

|cross_volume_dedupe

|string

a|The system can be enabled/disabled cross volume dedupe. it can be enabled only when dedupe is enabled.

inline ‐ Data will be cross volume deduped first and written to the volume.

background ‐ Data will be written to the volume and cross volume deduped later.

both ‐ Inline cross volume dedupe dedupes the data and write to the volume, background cross volume dedupe dedupes only the blocks on which inline dedupe is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are cross volume dedupe enabled and some are disabled.

|dedupe

|string

a|The system can be enabled/disabled dedupe.

inline ‐ Data will be deduped first and written to the volume.

background ‐ Data will be written to the volume and deduped later.

both ‐ Inline dedupe dedupes the data and write to the volume, background dedupe dedupes only the blocks on which inline dedupe is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are dedupe enabled and some are disabled.

|last_op_begin

|string

a|Last sis operation begin timestamp.

|last_op_end

|string

a|Last sis operation end timestamp.

|last_op_err

|string

a|Last sis operation error text.

|last_op_size

|integer

a|Last sis operation size.

|last_op_state

|string

a|Last sis operation state.

|op_state

|string

a|Sis status of the volume.

|path

|string

a|Absolute volume path of the volume.

|policy

|link:#policy[policy]

a|

|progress

|string

a|Sis progress of the volume.

|schedule

|string

a|Schedule associated with volume.

|state

|string

a|Sis state of the volume.

|type

|string

a|Sis Type of the volume.

```

encryption
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|enabled  
|boolean  
a|Creates an encrypted or an unencrypted volume. For POST, when set to  
'true', a new key is generated and used to encrypt the given volume. In  
that case, the underlying SVM must be configured with the key manager.  
When set to 'false', the volume created will be unencrypted. For PATCH,  
when set to 'true', it encrypts an unencrypted volume. Specifying the  
parameter as 'false' in a PATCH operation for an encrypted volume is only  
supported when moving the volume to another aggregate.
```

```
|key_id
|string
a|The key ID used for creating encrypted volume. A new key-id is generated
for creating an encrypted volume. This key-id is associated with the
generated key.

|key_manager_attribute
|string
a|Specifies an additional key manager attribute that is an identifier-
value pair, separated by '='. For example, CRN=unique-value. This
parameter is required when using the POST method and an IBM Key Lore key
manager is configured on the SVM.

|rekey
|boolean
a|If set to 'true', re-encrypts the volume with a new key. Valid in PATCH.

|state
|string
a|Volume encryption state.
encrypted &dash; The volume is completely encrypted.
encrypting &dash; Encryption operation is in progress.
partial &dash; Some constituents are encrypted and some are not.
Applicable only for FlexGroup volume.
rekeying. Encryption of volume with a new key is in progress.
unencrypted &dash; The volume is a plain-text one.

|status
|link:#status[status]
a|

|type
|string
a|Volume encryption type.
none &dash; The volume is a plain-text one.
volume &dash; The volume is encrypted with NVE (NetApp Volume Encryption).
aggregate &dash; The volume is encrypted with NAE (NetApp Aggregate
Encryption).

|===
```

```

[#error_state]
[.api-collapsible-fifth-title]
error_state

[cols=3*,options=header]
|===
|Name
|Type
|Description

|has_bad_blocks
|boolean
a|Indicates whether the volume has any corrupt data blocks. If the damaged
data block is accessed, an IO error, such as EIO for NFS or
STATUS_FILE_CORRUPT for CIFS, is returned.

|is_inconsistent
|boolean
a|Indicates whether the file system has any inconsistencies.
true &dash; File system is inconsistent.
false &dash; File system is not inconsistent.

|===

[#files]
[.api-collapsible-fifth-title]
files

[cols=3*,options=header]
|===
|Name
|Type
|Description

|maximum
|integer
a|The maximum number of files (inodes) for user-visible data allowed on
the volume. This value can be increased or decreased. Increasing the
maximum number of files does not immediately cause additional disk space
to be used to track files. Instead, as more files are created on the
volume, the system dynamically increases the number of disk blocks that
are used to track files. The space assigned to track files is never freed,
and this value cannot be decreased below the current number of files that
can be tracked within the assigned space for the volume. Valid in PATCH.

```

```
|used
|integer
a|Number of files (inodes) used for user-visible data permitted on the
volume. This field is valid only when the volume is online.
```

```
|===
```

```
[#guarantee]
[.api-collapsible-fifth-title]

a|The type of space guarantee of this volume in the aggregate.
```

```
|===
```

```
[#iops]
[.api-collapsible-fifth-title]
iops
```

The rate of I/O operations observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read
|integer
a|Performance metric for read I/O operations.
```

```
|total
|integer
a|Performance metric aggregated over all types of I/O operations.
```

```
|write
|integer
a|Performance metric for write I/O operations.
```

```
|===
```

```
[#latency]
[.api-collapsible-fifth-title]
latency
```

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|other
|integer
a|Performance metric for other I/O operations. Other I/O operations can be
metadata operations, such as directory lookups and so on.
```

```
|read

a|Performance metric for write I/O operations.
```

```
|===
```

```
[#cloud]
[.api-collapsible-fifth-title]
cloud
```

Performance numbers (IOPS and latency) for cloud store. These numbers are relevant only for volumes hosted on FabricPools.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|duration
|string
a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:
```

```
|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.
```

```
|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.
```

```
|status
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===
```

```
[#flexcache]
[.api-collapsible-fifth-title]
flexcache
```

Performance number for FlexCache used to measure cache effectiveness.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|bandwidth_savings
|integer
a|Bandwidth savings denoting the amount of data served locally by the cache, in bytes.
```

```
|cache_miss_percent
|integer
a|Cache miss percentage.
```

```
|duration
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|status

|string

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".

"Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value.

"Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|timestamp

|string

a|The timestamp of the performance data.

|===

```
|gid
|integer
a|The UNIX group ID of the volume. Valid in POST or PATCH.
```

```
|junction_parent
|link:#junction_parent[junction_parent]
a|
```

```
|path
|string
a|The fully-qualified path in the owning SVM's namespace at which the
volume is mounted. The path is case insensitive and must be unique within
a SVM's namespace. Path must begin with '/' and must not end with '/'.
Only one volume can be mounted at any given junction path. An empty path
in POST creates an unmounted volume. An empty path in PATCH deactivates
```

and unmounts the volume. Taking a volume offline removes its junction path. This attribute is reported in GET only when the volume is mounted.

|security_style

|string

a|Security style associated with the volume. Valid in POST or PATCH.

mixed ‐ Mixed-style security

ntfs ‐ NTFS/Windows-style security

unified ‐ Unified-style security, unified UNIX, NFS and CIFS permissions

unix ‐ Unix-style security.

|uid

|integer

a|The UNIX user ID of the volume. Valid in POST or PATCH.

|unix_permissions

|integer

a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write) and 1 (execute). First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file; the third selects permissions for other users in the same group; the fourth for other users not in the group. Valid in POST or PATCH. For security style "mixed" or "unix", the default setting is 0755 in octal (493 in decimal) and for security style "ntfs", the default setting is 0000. In cases where only owner, group and other permissions are given (as in 755, representing the second, third and fourth digit), first digit is assumed to be zero.

|===

[#policy]

[.api-collapsible-fifth-title]

policy

When "min_throughput_iops", "min_throughput_mbps", "max_throughput_iops" or "max_throughput_mbps" attributes are specified, the storage object is assigned to an auto-generated QoS policy group. If the attributes are later modified, the auto-generated QoS policy-group attributes are modified. Attributes can be removed by specifying "0" and policy group by specifying "none". Upon deletion of the storage object or if the

attributes are removed, then the QoS policy-group is also removed.

```
|Description
```

```
|default
```

```
|string
```

```
a|Specifies the default retention period that is applied to files while committing them to the WORM state without an associated retention period. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period and the string "unspecified" to set an unspecified retention period.+++</num>++++++</num>++++++</num>++++++</num>++++++</num>+++
```

|maximum

|string

a|Specifies the maximum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period.+++</num>++++++</num>++++++</num>++++++</num>++++++</num>+++

|minimum

|string

a|Specifies the minimum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, month,s and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period.+++</num>++++++</num>++++++</num>++++++</num>++++++</num>+++

|===

[#snaplock]

[.api-collapsible-fifth-title]

snaplock

[cols=3*,options=header]

|===

|Name

|Type

|Description

|append_mode_enabled

|boolean

a|Specifies if the volume append mode is enabled or disabled. When it is enabled, all the files created with write permissions on the volume are, by default, WORM appendable files. The user can append the data to a WORM appendable file but cannot modify the existing contents of the file nor delete the file until it expires.

|autocommit_period

|string

a|Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater than the autocommit period of the volume are committed to the WORM state. The autocommit period value represents a duration and must be specified in the ISO-8601 duration format. The autocommit period can be in years, months, days, hours, and minutes. A period specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The period string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the autocommit field also accepts the string "none".+++</num>+++++</num>+++++</num>+++++</num>+++++</num>+++

|compliance_clock_time

|string

a|This is the volume compliance clock time which is used to manage the SnapLock objects in the volume.

|expiry_time

|string

a|Expiry time of the volume.

|is_audit_log

|boolean

a|Indicates if this volume has been configured as SnapLock audit log volume for the SVM .

|litigation_count

|integer

a|Litigation count indicates the number of active legal-holds on the volume.

|privileged_delete

|string

a|Specifies the privileged-delete attribute of a SnapLock volume. On a SnapLock Enterprise (SLE) volume, a designated privileged user can selectively delete files irrespective of the retention time of the file. SLE volumes can have privileged delete as disabled, enabled or permanently_disabled and for SnapLock Compliance (SLC) volumes it is always permanently_disabled.

|retention

|link:#retention[retention]

a|

|type

|string

a|The SnapLock type of the volume.

compliance ‐ A SnapLock Compliance(SLC) volume provides the highest level of WORM protection and an administrator cannot destroy a SLC volume if it contains unexpired WORM files.

enterprise ‐ An administrator can delete a SnapLock Enterprise(SLE) volume.

non_snaplock ‐ Indicates the volume is non-snaplock.

|unspecified_retention_file_count

|integer

a|Indicates the number of files with an unspecified retention time in the volume.

tiering
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|min_cooling_days
```

```
|integer
```

a|This parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. Note that this parameter is only used for tiering purposes and does not affect the reporting of inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. This parameter cannot be set when volume tiering policy is either "none" or "all". The default value of this parameter depends on the volume's tiering policy. See the tiering policy section of this documentation for corresponding default values. If the tiering policy on the volume gets changed, then this parameter will be reset to the default value corresponding to the new tiering policy.

```
|object_tags
```

|array[string]

a|This parameter specifies tags of a volume for objects stored on a FabricPool-enabled aggregate. Each tag is a key,value pair and should be in the format "key=value".

|policy

|string

a|Policy that determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud store when they become cold. FabricPool combines flash (performance tier) with a cloud store into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not. Valid in POST or PATCH. all ‐ This policy allows tiering of both Snapshot copies and active file system user data to the cloud store as soon as possible by ignoring the temperature on the volume blocks.

auto ‐ This policy allows tiering of both snapshot and active file system user data to the cloud store

none ‐ Volume blocks will not be tiered to the cloud store.

snapshot_only ‐ This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default tiering policy is "snapshot-only" for a FlexVol and "none" for a FlexGroup. The default minimum cooling period for the "snapshot-only" tiering policy is 2 days and for the "auto" tiering policy is 31 days.

|supported

|boolean

a|This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. Note that in order to tier data, not only does the volume need to support tiering by using FabricPools, the tiering "policy" must not be 'none'. A volume that uses FabricPools but has a tiering "policy" of 'none' supports tiering, but will not tier any data.

|===

[#volume]

|application
|link:#application[application]
a|

|autosize
|link:#autosize[autosize]
a|

|clone
|link:#clone[clone]
a|

|cloud_retrieval_policy
|string
a|This parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier. The available cloud retrieval policies are "default" policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot_only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
```

"on_read" policy retrieves tiered data for all client driven data reads.

"never" policy never retrieves tiered data.

"promote" policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the only data brought back is the data in the AFS. Data that is only in a snapshot copy stays in the cloud and if tiering policy is 'none' then all data is retrieved.

|comment

|string

a|A comment for the volume. Valid in POST or PATCH.

|consistency_group

|link:#consistency_group[consistency_group]

a|Consistency group the volume is part of.

|constituents

|array[link:#constituents[constituents]]

a|

|constituents_per_aggregate

|integer

a|Specifies the number of times to iterate over the aggregates listed with the "aggregates.name" or "aggregates.uuid" when creating or expanding a FlexGroup. If a volume is being created on a single aggregate, the system will create a flexible volume if the "constituents_per_aggregate" field is not specified, and a FlexGroup if it is specified. If a volume is being created on multiple aggregates, the system will always create a FlexGroup.

|is_object_store
|boolean
a|Specifies whether the volume is provisioned for an object store server.
```

```
|is_svm_root
|boolean
a|Specifies whether the volume is a root volume of the SVM it belongs to.
```

```
|language
|string
a|Language encoding setting for volume. If no language is specified, the
volume inherits its SVM language encoding setting.
```

```
|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS, latency and throughput.
```

```
|movement
|link:#movement[movement]
a|Volume movement. All attributes are modify, that is, not writable
through POST. Set PATCH state to destination_aggregate to initiate a
volume move operation. Volume movement on FlexGroup constituents are not
```

supported.

|name

|string

a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

|nas

|link:#nas[nas]

a|

|qos

|link:#qos[qos]

a|QoS information

|queue_for_encryption

|boolean

a|Specifies whether the volume is queued for encryption.

|quota

|link:#quota[quota]

a|Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

|size

|integer

a|Physical size of the volume, in bytes. The minimum size for a FlexVol volume is 20MB and the minimum size for a FlexGroup volume is 200MB per constituent. The recommended size for a FlexGroup volume is a minimum of 100GB per constituent. For all volumes, the default size is equal to the minimum size.

|snaplock

|link:#snaplock[snaplock]

a|

|snapmirror

|link:#snapmirror[snapmirror]

a|Specifies attributes for SnapMirror protection.

|snapshot_policy

|link:#snapshot_policy[snapshot_policy]

a|This is a reference to the Snapshot copy policy.

|space

|link:#space[space]

a|

|state

|string

a|Volume state. A volume can only be brought online if it is offline. Taking a volume offline removes its junction path. The 'mixed' state applies to FlexGroup volumes only and cannot be specified as a target state. An 'error' state implies that the volume is not in a state to serve data.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|status

|array[string]

a|Describes the current status of a volume.

|style

|string

a|The style of the volume. If "style" is not specified, the volume type is determined based on the specified aggregates. Specifying a single aggregate, without "constituents_per_aggregate", creates a flexible volume. Specifying multiple aggregates, or a single aggregate with "constituents_per_aggregate", creates a FlexGroup. Specifying a volume "style" creates a volume of that type. For example, if the style is "flexvol" you must specify a single aggregate. If the style is "flexgroup", the system either uses the specified aggregates or automatically provisions aggregates if there are no specified aggregates.
flexvol ‐ flexible volumes and FlexClone volumes
flexgroup ‐ FlexGroups.

```

|svm
|link:#svm[svm]
a|SVM containing the volume. Required on POST.

|tiering
|link:#tiering[tiering]
a|

|type
|string
a|Type of the volume.
rw &dash; read-write volume.
dp &dash; data-protection volume.
ls &dash; load-sharing `dp` volume. Valid in GET.

|use_mirrored_aggregates
|boolean
a|Specifies whether mirrored aggregates are selected when provisioning a
FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only
mirrored aggregates are used if this parameter is set to 'true' and only
unmirrored aggregates are used if this parameter is set to 'false'.
Aggregate level mirroring for a FlexGroup can be changed by moving all of
the constituents to the required aggregates. The default value is 'true'
for a MetroCluster configuration and is 'false' for a non-MetroCluster
configuration.

|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid
that is exposed in the CLI and ONTAPI. It does not change due to a volume
move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* readOnly: 1
* Introduced in: 9.6

= Create a volume on an SVM and storage aggregates

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/storage/volumes`#

Introduced In: 9.6

Creates a volume on a specified SVM and storage aggregates.

== Required properties

* `svm.uuid` or `svm.name` - Existing SVM in which to create the volume.

* `name` - Name of the volume.

* `aggregates.name` or `aggregates.uuid` - Existing aggregates in which to create the volume.

== Default property values

* `state` - `_online_`

* `size` - `_20MB_`

* `style` - `_flexvol_`

* `type` - `_rw_`

* `encryption.enabled` - `_false_`

* `snapshot_policy.name` - `_default_`

* `guarantee.type` - `_volume_`

== Related ONTAP commands

* `volume create`

* `volume clone create`

== Parameters

[cols=5*,options=header]

```
|===
```

```
|Name  
|Type  
|In  
|Required  
|Description
```

```
|return_timeout  
|integer  
|query  
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1  
* Max value: 120  
* Min value: 0
```

```
|return_records  
|boolean  
|query  
|False
```

a|The default is false. If set to true, the records are returned.

```
* Default value:
```

```

```
[cols=3*,options=header]
```

```
|===  
|Name  
|Type  
|Description
```

```
|_links  
|link:#_links[_links]
```

a|

|access_time_enabled

|boolean

a|Indicates whether or not access time updates are enabled on the volume.

|aggregates

|array[link:#aggregates[aggregates]]

a|Aggregate hosting the volume. Required on POST.

|analytics

|link:#analytics[analytics]

a|

|application

|link:#application[application]

a|

|autosize

|link:#autosize[autosize]

a|

|clone

|link:#clone[clone]

a|

|cloud_retrieval_policy

|string

a|This parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier. The available cloud retrieval policies are "default" policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot_only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.

"on_read" policy retrieves tiered data for all client driven data reads.

"never" policy never retrieves tiered data.

"promote" policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the only data brought back is the data in the AFS. Data that is only in a snapshot copy stays in the cloud and if tiering policy is 'none' then all

data is retrieved.

|comment

|string

a|A comment for the volume. Valid in POST or PATCH.

|consistency_group

|link:#consistency_group[consistency_group]

a|Consistency group the volume is part of.

|constituents

|array[link:#constituents[constituents]]

a|

|constituents_per_aggregate

|integer

a|Specifies the number of times to iterate over the aggregates listed with the "aggregates.name" or "aggregates.uuid" when creating or expanding a FlexGroup. If a volume is being created on a single aggregate, the system will create a flexible volume if the "constituents_per_aggregate" field is not specified, and a FlexGroup if it is specified. If a volume is being created on multiple aggregates, the system will always create a FlexGroup.

|create_time

|string

a|Creation time of the volume. This field is generated when the volume is created.

|efficiency

|link:#efficiency[efficiency]

a|

|encryption

|link:#encryption[encryption]

a|

|error_state

|link:#error_state[error_state]

a|

|files

|link:#files[files]

a|

|flexcache_endpoint_type

|string

a|FlexCache endpoint type.

none ‐ The volume is neither a FlexCache nor origin of any FlexCache.

cache ‐ The volume is a FlexCache volume.

origin ‐ The volume is origin of a FlexCache volume.

|guarantee

|link:#guarantee[guarantee]

a|

|is_object_store

|boolean

a|Specifies whether the volume is provisioned for an object store server.

|is_svm_root

|boolean

a|Specifies whether the volume is a root volume of the SVM it belongs to.

|language

|string

a|Language encoding setting for volume. If no language is specified, the volume inherits its SVM language encoding setting.

|metric

|link:#metric[metric]

a|Performance numbers, such as IOPS, latency and throughput.

|movement

|link:#movement[movement]

a|Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

|name

|string

a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer

characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

```
|nas
|link:#nas[nas]
a|
```

== Error

```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description

| 787140
| One of "aggregates.uuid", "aggregates.name", or "style" must be
provided.

| 787141
| The specified "aggregates.name" and "aggregates.uuid" refer to different
aggregates.

```

| 917526
| The volume name specified is a duplicate.

| 917829
| Volume autosize grow threshold must be larger than autosize shrink threshold.

| 917831
| Volume minimum autosize must be smaller than the maximum autosize.

| 917835
| Maximum allowed snapshot.reserve_percent value during a volume creation is 90. Use PATCH to set it to a higher value after the volume has been created.

| 918191
| Flexvol tiering min cooling days requires an effective cluster version of ONTAP 9.4 or later.

| 918194
| Tiering min cooling days not supported for SVMDR.

| 918195
| Tiering min cooling days not supported for non data volumes.

| 918196
| Tiering min cooling days not allowed for the provided tiering policy.

| 918215
| FlexGroup tiering min cooling days requires an effective cluster version of ONTAP 9.5 or later.

| 918233
| The target field cannot be specified for this operation.

| 918236
| The specified "parent_volume.uuid" and "parent_volume.name" do not refer to the same volume.

| 918240
| The target style is an invalid volume style.

| 918241
| The target style is an unsupported volume style for volume creation.

| 918242

| When creating a flexible volume, exactly one aggregate must be specified via either "aggregates.name" or "aggregates.uuid".

| 918243

| The specified Snapshot copy UUID is not correct for the specified Snapshot copy name.

| 918244

| Invalid "volume.type" for clone volume.

| 918246

| "volume.clone.parent_volume.name" or "volume.clone.parent_volume.uuid" must be provided.

| 918247

| Specifying a value is not valid for a volume FlexClone creation.

| 918252

| "nas.path" is invalid.

| 918290

| cloud retrieval policy requires an effective cluster version of 9.8 or later.

| 918291

| Invalid volume cloud retrieval policy for the provided tiering policy.

| 918292

| cloud retrieval policy not supported for non data volume.

| 918521

| The volume maximum autosize must be smaller than or equal to the maximum volume size.

| 918524

| Volume minimum autosize must be less than or equal to the current volume size.

| 2621706

| The specified "svm.uuid" and "svm.name" do not refer to the same SVM.

| 2621707

| No SVM was specified. Either "svm.name" or "svm.uuid" must be supplied.

| 111411205

| File system analytics requires an effective cluster version of 9.8 or later.

```
| 111411206
| The specified "analytics.state" is invalid.

| 111411207
| File system analytics cannot be enabled on volumes that contain LUNs.

[#analytics]
[.api-collapsible-fifth-title]
analytics

[cols=3*,options=header]
|===
|Name

```

```

|Type
|Description

|scan_progress
|integer
a|Percentage of files in the volume that the file system analytics
initialization scan has processed. Only returned when the state is
`initializing`.

|state
|string
a|File system analytics state of the volume. If this value is "on", ONTAP
collects extra file system analytics information for all directories on
the volume. There will be a slight impact to I/O performance to collect
this information. If this value is "off", file system analytics
information is not collected and not available to be viewed. If this value
is "initializing", that means file system analytics was recently turned
on, and the initialization scan to gather information all all existing
files and directories is currently running. If this value is 'unknown'
that means there was an internal error when determining the file system
analytics state for the volume.

* enum: ["unknown", "initializing", "off", "on"]
* Introduced in: 9.8

|supported
|boolean
a|This field indicates whether or not file system analytics is supported
on the volume. If file system analytics is not supported, the reason will
be specified in the "analytics.unsupported_reason" field.

|unsupported_reason

application

[cols=3*,options=header]
|===

```

|Name
|Type
|Description

|name
|string
a|Name of the application to which the volume belongs. Available only when the volume is part of an application.

|uuid
|string
a|UUID of the application to which the volume belongs. Available only when the volume is part of an application.

|===

[#autosize]
[.api-collapsible-fifth-title]
autosize

[cols=3*,options=header]
|===
|Name
|Type
|Description

|grow_threshold
|integer
a|Used space threshold size, in percentage, for the automatic growth of the volume. When the amount of used space in the volume becomes greater than this threshold, the volume automatically grows unless it has reached the maximum size. The volume grows when 'space.used' is greater than this percent of 'space.size'. The 'grow_threshold' size cannot be less than or equal to the 'shrink_threshold' size..

|maximum
|integer
a|Maximum size in bytes up to which a volume grows automatically. This size cannot be less than the current volume size, or less than or equal to the minimum size of volume.

|minimum

```

|integer
a|Minimum size in bytes up to which the volume shrinks automatically. This
size cannot be greater than or equal to the maximum size of volume.

|mode
|string
a|Autosize mode for the volume.
grow &dash; Volume automatically grows when the amount of used space is
above the 'grow_threshold' value.
grow_shrink &dash; Volume grows or shrinks in response to the amount of
space used.
off &dash; Autosizing of the volume is disabled.

|shrink_threshold
|integer
a|Used space threshold size, in percentage, for the automatic shrinkage of
the volume. When the amount of used space in the volume drops below this
threshold, the volume automatically shrinks unless it has reached the
minimum size. The volume shrinks when the 'space.used' is less than the
'shrink_threshold' percent of 'space.size'. The 'shrink_threshold' size
cannot be greater than or equal to the 'grow_threshold' size.

|Description

|autodelete_enabled

|boolean

a|Specifies whether Snapshot copy autodelete is currently enabled on this volume.

|reserve_percent

|integer

a|The space that has been set aside as a reserve for Snapshot copy usage, in percent.

|used

|integer

a|The total space used by Snapshot copies in the volume, in bytes.

|===

[#space]

[.api-collapsible-fifth-title]

space

[cols=3*,options=header]

|===

|Name

|Type

|Description

|afs_total

|integer

a|Total size of AFS, excluding snap-reserve, in bytes.

|available

|integer

a|The available space, in bytes.

|available_percent

|integer

a|The space available, as a percent.

|block_storage_inactive_user_data

|integer

a|The size that is physically used in the block storage of the volume and has a cold temperature. In bytes. This parameter is only supported if the volume is in an aggregate that is either attached to a cloud store or could be attached to a cloud store.

|capacity_tier_footprint

|integer

a|Space used by capacity tier for this volume in the FabricPool aggregate, in bytes.

|footprint

|integer

a|Data used for this volume in the aggregate, in bytes.

|local_tier_footprint

|integer

a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space

|link:#logical_space[logical_space]

a|

|metadata

|integer

a|Space used by the volume metadata in the aggregate, in bytes.

|over_provisioned

|integer

a|The amount of space not available for this volume in the aggregate, in bytes.

|performance_tier_footprint

|integer

a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size

|integer

a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|snapshot

|link:#snapshot[snapshot]

a|

|total_footprint

|integer

a|Data and metadata used for this volume in the aggregate, in bytes.

|used

|integer

a|The virtual space used (includes volume reserves) before storage efficiency, in bytes.

|used_by_afs

|integer

a|The space used by Active Filesystem, in bytes.

|===

|application_io_size
|string
a|Block size to use by compression. Valid for POST.
```

|compaction

|string

a|The system can be enabled/disabled compaction.

inline ‐ Data will be compacted first and written to the volume.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are compaction enabled and some are disabled.

|compression

|string

a|The system can be enabled/disabled compression.

inline ‐ Data will be compressed first and written to the volume.

background ‐ Data will be written to the volume and compressed later.

both ‐ Inline compression compresses the data and write to the

volume, background compression compresses only the blocks on which inline compression is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are compression enabled and some are disabled.

|cross_volume_dedupe

|string

a|The system can be enabled/disabled cross volume dedupe. it can be enabled only when dedupe is enabled.

inline ‐ Data will be cross volume deduped first and written to the volume.

background ‐ Data will be written to the volume and cross volume deduped later.

both ‐ Inline cross volume dedupe dedupes the data and write to the volume, background cross volume dedupe dedupes only the blocks on which inline dedupe is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are cross volume dedupe enabled and some are disabled.

|dedupe

|string

a|The system can be enabled/disabled dedupe.

inline ‐ Data will be deduped first and written to the volume.

background ‐ Data will be written to the volume and deduped later.

both ‐ Inline dedupe dedupes the data and write to the volume,

background dedupe dedupes only the blocks on which inline dedupe is not run.

none ‐ None

mixed ‐ Read only field for FlexGroups, where some of the constituent volumes are dedupe enabled and some are disabled.

|Type
```

```
|Description
```

```
|enabled
```

```
|boolean
```

a|Creates an encrypted or an unencrypted volume. For POST, when set to 'true', a new key is generated and used to encrypt the given volume. In that case, the underlying SVM must be configured with the key manager. When set to 'false', the volume created will be unencrypted. For PATCH, when set to 'true', it encrypts an unencrypted volume. Specifying the parameter as 'false' in a PATCH operation for an encrypted volume is only supported when moving the volume to another aggregate.

```
|key_id
```

```
|string
```

a|The key ID used for creating encrypted volume. A new key-id is generated for creating an encrypted volume. This key-id is associated with the generated key.

```
|key_manager_attribute
```

```
|string
```

a|Specifies an additional key manager attribute that is an identifier-value pair, separated by '='. For example, CRN=unique-value. This parameter is required when using the POST method and an IBM Key Lore key manager is configured on the SVM.

```
|rekey
```

```
|boolean
```

a|If set to 'true', re-encrypts the volume with a new key. Valid in PATCH.

```
|state
```

```
|string
```

a|Volume encryption state.

encrypted ‐ The volume is completely encrypted.

encrypting ‐ Encryption operation is in progress.

partial ‐ Some constituents are encrypted and some are not.

Applicable only for FlexGroup volume.

rekeying. Encryption of volume with a new key is in progress.

unencrypted ‐ The volume is a plain-text one.

```
|status
|link:#status[status]
a|
```

```
|type
|string
a|Volume encryption type.
none &dash; The volume is a plain-text one.
volume &dash; The volume is encrypted with NVE (NetApp Volume Encryption).
aggregate &dash; The volume is encrypted with NAE (NetApp Aggregate Encryption).

files
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|maximum
```

```
|integer
```

a|The maximum number of files (inodes) for user-visible data allowed on the volume. This value can be increased or decreased. Increasing the maximum number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and this value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume. Valid in PATCH.

```
|used
```

```
|integer
```

a|Number of files (inodes) used for user-visible data permitted on the volume. This field is valid only when the volume is online.

```

```
|string
```

a|The type of space guarantee of this volume in the aggregate.

|===

[#iops]

[.api-collapsible-fifth-title]

iops

The rate of I/O operations observed at the storage object.

[cols=3*,options=header]

|===

|Name

|Type

|Description

|other

|integer

a|Performance metric for other I/O operations. Other I/O operations can be metadata operations, such as directory lookups and so on.

|read

|integer

a|Performance metric for read I/O operations.

|total

|integer

a|Performance metric aggregated over all types of I/O operations.

|write

|integer

a|Performance metric for write I/O operations.

|===

[#latency]

[.api-collapsible-fifth-title]

latency

The round trip latency in microseconds observed at the storage object.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|other

```
|===
```

```
[#cloud]
```

```
[.api-collapsible-fifth-title]
```

```
cloud
```

Performance numbers (IOPS and latency) for cloud store. These numbers are relevant only for volumes hosted on FabricPools.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

|iops

|link:#iops[iops]

a|The rate of I/O operations observed at the storage object.

|latency

|link:#latency[latency]

a|The round trip latency in microseconds observed at the storage object.

|status

|string

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|timestamp

|string

a|The timestamp of the performance data.

|===

[#flexcache]

[.api-collapsible-fifth-title]

flexcache

Performance number for FlexCache used to measure cache effectiveness.

[cols=3*,options=header]

|===

```

|Name
|Type
|Description

|bandwidth_savings
|integer
a|Bandwidth savings denoting the amount of data served locally by the
cache, in bytes.

|cache_miss_percent
|integer
a|Cache miss percentage.

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#throughput]
[.api-collapsible-fifth-title]

```

```
|Name  
|Type  
|Description
```

```
|export_policy  
|link:#export_policy[export_policy]  
a|Export Policy
```

|gid
|integer
a|The UNIX group ID of the volume. Valid in POST or PATCH.

|junction_parent
|link:#junction_parent[junction_parent]
a|

|path
|string
a|The fully-qualified path in the owning SVM's namespace at which the volume is mounted. The path is case insensitive and must be unique within a SVM's namespace. Path must begin with '/' and must not end with '/'. Only one volume can be mounted at any given junction path. An empty path in POST creates an unmounted volume. An empty path in PATCH deactivates and unmounts the volume. Taking a volume offline removes its junction path. This attribute is reported in GET only when the volume is mounted.

|security_style
|string
a|Security style associated with the volume. Valid in POST or PATCH.
mixed ‐ Mixed-style security
ntfs ‐ NTFS/Windows-style security
unified ‐ Unified-style security, unified UNIX, NFS and CIFS
permissions
unix ‐ Unix-style security.

|uid
|integer
a|The UNIX user ID of the volume. Valid in POST or PATCH.

|unix_permissions
|integer
a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write) and 1 (execute). First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file; the third selects permissions for other users in the same group; the fourth for other users not in the group. Valid in POST or PATCH. For security style "mixed" or "unix", the default setting is 0755 in octal (493 in decimal) and for security style "ntfs", the default setting is

0000. In cases where only owner, group and other permissions are given (as in 755, representing the second, third and fourth digit), first digit is assumed to be zero.

```
|===
```

```
[#policy]  
[.api-collapsible-fifth-title]  
policy
```

When "min_throughput_iops", "min_throughput_mbps", "max_throughput_iops" or "max_throughput_mbps" attributes are specified, the storage object is assigned to an auto-generated QoS policy group. If the attributes are later modified, the auto-generated QoS policy-group attributes are modified. Attributes can be removed by specifying "0" and policy group by specifying "none". Upon deletion of the storage object or if the attributes are removed, then the QoS policy-group is also removed.

[#qos]

[.api-collapsible-fifth-title]

qos

QoS information

[cols=3*,options=header]

|===

|Name

|Type

|Description

|policy

|link:#policy[policy]

a|When "min_throughput_iops", "min_throughput_mbps", "max_throughput_iops" or "max_throughput_mbps" attributes are specified, the storage object is assigned to an auto-generated QoS policy group. If the attributes are later modified, the auto-generated QoS policy-group attributes are modified. Attributes can be removed by specifying "0" and policy group by specifying "none". Upon deletion of the storage object or if the attributes are removed, then the QoS policy-group is also removed.

```
|===
```

```
[#quota]  
[.api-collapsible-fifth-title]  
quota
```

Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|enabled
```

```
|boolean
```

a|This option is used to enable or disable the quota for the volume. This option is valid only in PATCH. Quotas are enabled for FlexVols or FlexGroup volumes when the quota state is "on". Quotas are disabled for FlexVols or FlexGroup volumes when the quota state is "off".

```
|state
```

```
|string

```

```
|===
```

```
|Name  
|Type  
|Description
```

```
|default
```

```
|string
```

a|Specifies the default retention period that is applied to files while committing them to the WORM state without an associated retention period. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period and the string "unspecified" to set an unspecified retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|maximum

|string

a|Specifies the maximum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|minimum

|string

a|Specifies the minimum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, month,s and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours

and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|===

[#snaplock]

[.api-collapsible-fifth-title]

snaplock

[cols=3*,options=header]

|===

|Name

|Type

|Description

|append_mode_enabled

|boolean

a|Specifies if the volume append mode is enabled or disabled. When it is enabled, all the files created with write permissions on the volume are, by default, WORM appendable files. The user can append the data to a WORM appendable file but cannot modify the existing contents of the file nor delete the file until it expires.

|autocommit_period

|string

a|Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater than the autocommit period of the volume are committed to the WORM state. The autocommit period value represents a duration and must be specified in the ISO-8601 duration format. The autocommit period can be in years, months, days, hours, and minutes. A period specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The period string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for

example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the autocommit field also accepts the string "none".+++</num>++++</num>++++</num>++++</num>++++</num>+++

|compliance_clock_time

|string

a|This is the volume compliance clock time which is used to manage the SnapLock objects in the volume.

|expiry_time

|string

a|Expiry time of the volume.

|is_audit_log

|boolean

a|Indicates if this volume has been configured as SnapLock audit log volume for the SVM .

|litigation_count

|integer

a|Litigation count indicates the number of active legal-holds on the volume.

|privileged_delete

|string

a|Specifies the privileged-delete attribute of a SnapLock volume. On a SnapLock Enterprise (SLE) volume, a designated privileged user can selectively delete files irrespective of the retention time of the file. SLE volumes can have privileged delete as disabled, enabled or permanently_disabled and for SnapLock Compliance (SLC) volumes it is always permanently_disabled.

|retention

|link:#retention[retention]

a|

|type

|string

a|The SnapLock type of the volume.

compliance ‐ A SnapLock Compliance (SLC) volume provides the highest level of WORM protection and an administrator cannot destroy a SLC volume

if it contains unexpired WORM files.

enterprise ‐ An administrator can delete a SnapLock Enterprise(SLE) volume.

non_snaplock ‐ Indicates the volume is non-snaplock.

|unspecified_retention_file_count

|integer

a|Indicates the number of files with an unspecified retention time in the volume.

[.api-collapsible-fifth-title]

space

[cols=3*,options=header]

|===

|Name

|Type

|Description

|afs_total

|integer

a|Total size of AFS, excluding snap-reserve, in bytes.

|available

|integer

a|The available space, in bytes.

|available_percent

|integer

a|The space available, as a percent.

|block_storage_inactive_user_data

|integer

a|The size that is physically used in the block storage of the volume and has a cold temperature. In bytes. This parameter is only supported if the volume is in an aggregate that is either attached to a cloud store or could be attached to a cloud store.

|block_storage_inactive_user_data_percent

|integer

a|Percentage of size that is physically used in the performance tier of the volume.

|capacity_tier_footprint

|integer

a|Space used by capacity tier for this volume in the FabricPool aggregate, in bytes.

|footprint

|integer

a|Data used for this volume in the aggregate, in bytes.

|fractional_reserve
|integer
a|Used to change the amount of space reserved for overwrites of reserved objects in a volume.

|full_threshold_percent
|integer
a|Volume full threshold percentage at which EMS warnings can be sent.

|local_tier_footprint
|integer
a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space
|link:#logical_space[logical_space]
a|

|metadata
|integer
a|Space used by the volume metadata in the aggregate, in bytes.

|nearly_full_threshold_percent
|integer
a|Volume nearly full threshold percentage at which EMS warnings can be sent.

|over_provisioned
|integer
a|The amount of space not available for this volume in the aggregate, in bytes.

|overwrite_reserve
|integer
a|Reserved space for overwrites, in bytes.

|overwrite_reserve_used
|integer
a|Overwrite logical reserve space used, in bytes.

|percent_used
|integer
a|Percentage of the volume size that is used.

|performance_tier_footprint
|integer
a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size
|integer
a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|size_available_for_snapshots
|integer
a|Available space for Snapshot copies from snap-reserve, in bytes.

|snapshot
|link:#snapshot[snapshot]
a|

|total_footprint
|integer
a|Data and metadata used for this volume in the aggregate, in bytes.

|used
|integer
a|The virtual space used (includes volume reserves) before storage efficiency, in bytes.

|used_by_afs
|integer
a|The space used by Active Filesystem, in bytes.

|===

[#tiering]
[.api-collapsible-fifth-title]
tiering

[cols=3*,options=header]
|===
|Name
|Type
|Description

```

|min_cooling_days

|integer

a|This parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. Note that this parameter is only used for tiering purposes and does not affect the reporting of inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. This parameter cannot be set when volume tiering policy is either "none" or "all". The default value of this parameter depends on the volume's tiering policy. See the tiering policy section of this documentation for corresponding default values. If the tiering policy on the volume gets changed, then this parameter will be reset to the default value corresponding to the new tiering policy.

|object_tags

|array[string]

a|This parameter specifies tags of a volume for objects stored on a FabricPool-enabled aggregate. Each tag is a key,value pair and should be in the format "key=value".

|policy

|string

a|Policy that determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud store when they become cold. FabricPool combines flash (performance tier) with a cloud store into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not. Valid in POST or PATCH.
all ‐ This policy allows tiering of both Snapshot copies and active file system user data to the cloud store as soon as possible by ignoring the temperature on the volume blocks.

auto ‐ This policy allows tiering of both snapshot and active file system user data to the cloud store

none ‐ Volume blocks will not be tiered to the cloud store.

snapshot_only ‐ This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default tiering policy is "snapshot-only" for a FlexVol and "none" for a FlexGroup. The default minimum cooling period for the "snapshot-only" tiering policy is 2 days and for the "auto" tiering policy is 31 days.

|supported

|boolean

a|This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. Note that in order to tier data, not only does the volume need to support tiering by using FabricPools, the tiering "policy" must not be 'none'. A volume that uses FabricPools but has a tiering "policy" of 'none' supports tiering, but will not tier any data.

|===

[#volume]

[.api-collapsible-fifth-title]

volume

[cols=3*,options=header]

|===

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|access_time_enabled

|boolean

a|Indicates whether or not access time updates are enabled on the volume.

|aggregates

|array[link:#aggregates[aggregates]]

a|Aggregate hosting the volume. Required on POST.

|analytics

|link:#analytics[analytics]

a|

|application

|link:#application[application]

a|

```
|autosize
|link:#autosize[autosize]
a|

|clone
|link:#clone[clone]
a|

|cloud_retrieval_policy
|string
a|This parameter specifies the cloud retrieval policy for the volume. This
policy determines which tiered out blocks to retrieve from the capacity
tier to the performance tier. The available cloud retrieval policies are
"default" policy retrieves tiered data based on the underlying tiering
policy. If the tiering policy is 'auto', tiered data is retrieved only for
random client driven data reads. If the tiering policy is 'none' or
'snapshot_only', tiered data is retrieved for random and sequential client
driven data reads. If the tiering policy is 'all', tiered data is not
retrieved.
"on_read" policy retrieves tiered data for all client driven data reads.
"never" policy never retrieves tiered data.
"promote" policy retrieves all eligible tiered data automatically during
the next scheduled scan. It is only supported when the tiering policy is
'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the
only data brought back is the data in the AFS. Data that is only in a
snapshot copy stays in the cloud and if tiering policy is 'none' then all
data is retrieved.

|comment
|string
a|A comment for the volume. Valid in POST or PATCH.

|consistency_group
|link:#consistency_group[consistency_group]
a|Consistency group the volume is part of.

|constituents
|array[link:#constituents[constituents]]
a|

|constituents_per_aggregate
|integer
a|Specifies the number of times to iterate over the aggregates listed with
```

the "aggregates.name" or "aggregates.uuid" when creating or expanding a FlexGroup. If a volume is being created on a single aggregate, the system will create a flexible volume if the "constituents_per_aggregate" field is not specified, and a FlexGroup if it is specified. If a volume is being created on multiple aggregates, the system will always create a FlexGroup.

|create_time

|string

a|Creation time of the volume. This field is generated when the volume is created.

|efficiency

|link:#efficiency[efficiency]

a|

|encryption

|link:#encryption[encryption]

a|

|error_state

|link:#error_state[error_state]

a|

|files

|link:#files[files]

a|

|flexcache_endpoint_type

|string

a|FlexCache endpoint type.

none ‐ The volume is neither a FlexCache nor origin of any FlexCache.
cache ‐ The volume is a FlexCache volume.

origin ‐ The volume is origin of a FlexCache volume.

|guarantee

|link:#guarantee[guarantee]

a|

|is_object_store

|boolean

a|Specifies whether the volume is provisioned for an object store server.

|is_svm_root

|boolean
a|Specifies whether the volume is a root volume of the SVM it belongs to.

|language
|string
a|Language encoding setting for volume. If no language is specified, the volume inherits its SVM language encoding setting.

|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS, latency and throughput.

|movement
|link:#movement[movement]
a|Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

|name
|string
a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

|nas
|link:#nas[nas]
a|

|qos
|link:#qos[qos]
a|QoS information

|queue_for_encryption
|boolean
a|Specifies whether the volume is queued for encryption.

|quota

|link:#quota[quota]

a|Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

|size

|integer

a|Physical size of the volume, in bytes. The minimum size for a FlexVol volume is 20MB and the minimum size for a FlexGroup volume is 200MB per constituent. The recommended size for a FlexGroup volume is a minimum of 100GB per constituent. For all volumes, the default size is equal to the minimum size.

|snaplock

|link:#snaplock[snaplock]

a|

|snapmirror

|link:#snapmirror[snapmirror]

a|Specifies attributes for SnapMirror protection.

|snapshot_policy

|link:#snapshot_policy[snapshot_policy]

a|This is a reference to the Snapshot copy policy.

|space

|link:#space[space]

a|

|state

|string

a|Volume state. A volume can only be brought online if it is offline. Taking a volume offline removes its junction path. The 'mixed' state applies to FlexGroup volumes only and cannot be specified as a target state. An 'error' state implies that the volume is not in a state to serve data.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|status
|array[string]
a|Describes the current status of a volume.

|style
|string
a|The style of the volume. If "style" is not specified, the volume type is determined based on the specified aggregates. Specifying a single aggregate, without "constituents_per_aggregate", creates a flexible volume. Specifying multiple aggregates, or a single aggregate with "constituents_per_aggregate", creates a FlexGroup. Specifying a volume "style" creates a volume of that type. For example, if the style is "flexvol" you must specify a single aggregate. If the style is "flexgroup", the system either uses the specified aggregates or automatically provisions aggregates if there are no specified aggregates.
flexvol ‐ flexible volumes and FlexClone volumes
flexgroup ‐ FlexGroups.

|svm
|link:#svm[svm]
a|SVM containing the volume. Required on POST.

|tiering
|link:#tiering[tiering]
a|

|type
|string
a|Type of the volume.
rw ‐ read-write volume.
dp ‐ data-protection volume.
ls ‐ load-sharing `dp` volume. Valid in GET.

|use_mirrored_aggregates
|boolean
a|Specifies whether mirrored aggregates are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only mirrored aggregates are used if this parameter is set to 'true' and only unmirrored aggregates are used if this parameter is set to 'false'. Aggregate level mirroring for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is 'true'

for a MetroCluster configuration and is 'false' for a non-MetroCluster configuration.

|uuid

|string

a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7

* readOnly: 1

* Introduced in: 9.6

== Parameters
```

```
[cols=5*,options=header]
|===
|Name
|Type
|In
|Required
|Description

|uuid
|string
|path
|True
a|Unique identifier of the volume.

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|===
```

```
== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|access_time_enabled
|boolean
a|Indicates whether or not access time updates are enabled on the volume.

|aggregates
```

```
|array[link:#aggregates[aggregates]]
```

```
a|Aggregate hosting the volume. Required on POST.
```

```
|analytics
```

```
|link:#analytics[analytics]
```

```
a|
```

```
|application
```

```
|link:#application[application]
```

```
a|
```

```
|autosize
```

```
|link:#autosize[autosize]
```

```
a|
```

```
|clone
```

```
|link:#clone[clone]
```

```
a|
```

```
|cloud_retrieval_policy
```

```
|string
```

```
a|This parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier. The available cloud retrieval policies are "default" policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot_only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
```

```
"on_read" policy retrieves tiered data for all client driven data reads.
```

```
"never" policy never retrieves tiered data.
```

```
"promote" policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the only data brought back is the data in the AFS. Data that is only in a snapshot copy stays in the cloud and if tiering policy is 'none' then all data is retrieved.
```

```
|comment
```

```
|string
```

```
a|A comment for the volume. Valid in POST or PATCH.
```

```
|consistency_group
```

```
|link:#consistency_group[consistency_group]
```

```
a|Consistency group the volume is part of.
```

```
|constituents
```

```
|array[link:#constituents[constituents]]
```

```
a|
```

```
|constituents_per_aggregate
```

```
|integer
```

```
a|Specifies the number of times to iterate over the aggregates listed with the "aggregates.name" or "aggregates.uuid" when creating or expanding a FlexGroup. If a volume is being created on a single aggregate, the system will create a flexible volume if the "constituents_per_aggregate" field is not specified, and a FlexGroup if it is specified. If a volume is being created on multiple aggregates, the system will always create a FlexGroup.
```

```
|create_time
```

```
|string
```

```
a|Creation time of the volume. This field is generated when the volume is created.
```

```
|efficiency
```

```
|link:#efficiency[efficiency]
```

```
a|

```
|files
```

```
|link:#files[files]
```

```
a|
```

```
|flexcache_endpoint_type
```

```
|string
```

```
a|FlexCache endpoint type.
```

```
none &dash; The volume is neither a FlexCache nor origin of any FlexCache.  
cache &dash; The volume is a FlexCache volume.
```

```
origin &dash; The volume is origin of a FlexCache volume.
```

|guarantee
|link:#guarantee[guarantee]
a|

|is_object_store
|boolean
a|Specifies whether the volume is provisioned for an object store server.

|is_svm_root
|boolean
a|Specifies whether the volume is a root volume of the SVM it belongs to.

|language
|string
a|Language encoding setting for volume. If no language is specified, the volume inherits its SVM language encoding setting.

|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS, latency and throughput.

|movement
|link:#movement[movement]
a|Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

|name
|string
a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

|nas
|link:#nas[nas]
a|

|qos
|link:#qos[qos]
a|QoS information

|queue_for_encryption
|boolean
a|Specifies whether the volume is queued for encryption.

|quota
|link:#quota[quota]
a|Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

|size
|integer
a|Physical size of the volume, in bytes. The minimum size for a FlexVol volume is 20MB and the minimum size for a FlexGroup volume is 200MB per constituent. The recommended size for a FlexGroup volume is a minimum of 100GB per constituent. For all volumes, the default size is equal to the minimum size.

|snaplock
|link:#snaplock[snaplock]
a|

|snapmirror
|link:#snapmirror[snapmirror]
a|Specifies attributes for SnapMirror protection.

|snapshot_policy
|link:#snapshot_policy[snapshot_policy]
a|This is a reference to the Snapshot copy policy.

|space
|link:#space[space]
a|

|state
|string
a|Volume state. A volume can only be brought online if it is offline. Taking a volume offline removes its junction path. The 'mixed' state

applies to FlexGroup volumes only and cannot be specified as a target state. An 'error' state implies that the volume is not in a state to serve data.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|status

|array[string]

a|Describes the current status of a volume.

|style

|string

a|The style of the volume. If "style" is not specified, the volume type is determined based on the specified aggregates. Specifying a single aggregate, without "constituents_per_aggregate", creates a flexible volume. Specifying multiple aggregates, or a single aggregate with "constituents_per_aggregate", creates a FlexGroup. Specifying a volume "style" creates a volume of that type. For example, if the style is "flexvol" you must specify a single aggregate. If the style is "flexgroup", the system either uses the specified aggregates or automatically provisions aggregates if there are no specified aggregates.
flexvol ‐ flexible volumes and FlexClone volumes
flexgroup ‐ FlexGroups.

|svm

|link:#svm[svm]

a|SVM containing the volume. Required on POST.

|tiering

|link:#tiering[tiering]

a|

|type

|string

a|Type of the volume.

rw ‐ read-write volume.

dp ‐ data-protection volume.

ls ‐ load-sharing `dp` volume. Valid in GET.

```
|use_mirrored_aggregates
```

```
|boolean
```

a|Specifies whether mirrored aggregates are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only mirrored aggregates are used if this parameter is set to 'true' and only unmirrored aggregates are used if this parameter is set to 'false'. Aggregate level mirroring for a FlexGroup can be changed by moving all of the constituents to the required aggregates. The default value is 'true' for a MetroCluster configuration and is 'false' for a non-MetroCluster configuration.

```
|uuid
```

```
|string
```

a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
```

```
* readOnly: 1
```

```
* Introduced in: 9.6
```

```

|Name

|Type

|Description

|scan_progress

|integer

a|Percentage of files in the volume that the file system analytics initialization scan has processed. Only returned when the state is `initializing`.

|state

|string

a|File system analytics state of the volume. If this value is "on", ONTAP collects extra file system analytics information for all directories on the volume. There will be a slight impact to I/O performance to collect this information. If this value is "off", file system analytics information is not collected and not available to be viewed. If this value is "initializing", that means file system analytics was recently turned on, and the initialization scan to gather information all all existing files and directories is currently running. If this value is 'unknown' that means there was an internal error when determining the file system analytics state for the volume.

* enum: ["unknown", "initializing", "off", "on"]

* Introduced in: 9.8

```
|supported
|boolean
a|This field indicates whether or not file system analytics is supported
on the volume. If file system analytics is not supported, the reason will
be specified in the "analytics.unsupported_reason" field.
```

```
|unsupported_reason
|link:#unsupported_reason[unsupported_reason]

[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
```

|Description

|grow_threshold

|integer

a|Used space threshold size, in percentage, for the automatic growth of the volume. When the amount of used space in the volume becomes greater than this threshold, the volume automatically grows unless it has reached the maximum size. The volume grows when 'space.used' is greater than this percent of 'space.size'. The 'grow_threshold' size cannot be less than or equal to the 'shrink_threshold' size..

|maximum

|integer

a|Maximum size in bytes up to which a volume grows automatically. This size cannot be less than the current volume size, or less than or equal to the minimum size of volume.

|minimum

|integer

a|Minimum size in bytes up to which the volume shrinks automatically. This size cannot be greater than or equal to the maximum size of volume.

|mode

|string

a|Autosize mode for the volume.

grow ‐ Volume automatically grows when the amount of used space is above the 'grow_threshold' value.

grow_shrink ‐ Volume grows or shrinks in response to the amount of space used.

off ‐ Autosizing of the volume is disabled.

|shrink_threshold

|integer

a|Used space threshold size, in percentage, for the automatic shrinkage of the volume. When the amount of used space in the volume drops below this threshold, the volume automatically shrinks unless it has reached the minimum size. The volume shrinks when the 'space.used' is less than the 'shrink_threshold' percent of 'space.size'. The 'shrink_threshold' size cannot be greater than or equal to the 'grow_threshold' size.

[#movement]
[.api-collapsible-fifth-title]
movement
```

Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|cutover_window
|integer
```

a|Time window in seconds for cutover. The allowed range is between 30 to 300 seconds.

```
|destination_aggregate
|link:#destination_aggregate[destination_aggregate]
a|Aggregate
```

```
|percent_complete
|integer
a|Completion percentage
```

```
|state
|string
a|State of volume move operation. PATCH the state to "aborted" to abort
the move operation. PATCH the state to "cutover" to trigger cutover. PATCH
the state to "paused" to pause the volume move operation in progress.
PATCH the state to "replicating" to resume the paused volume move
operation. PATCH the state to "cutover_wait" to go into cutover manually.
When volume move operation is waiting to go into "cutover" state, this is
indicated by the "cutover_pending" state. A change of state is only
supported if volume movement is in progress.
```

```

|Name
|Type
|Description
```

```
|available
|integer
a|The amount of space available in this volume with storage efficiency
space considered used, in bytes.
```

```
|enforcement
|boolean
a|Specifies whether space accounting for operations on the volume is done
along with storage efficiency.
```

```
|reporting
|boolean
a|Specifies whether space reporting on the volume is done along with
```

storage efficiency.

|used_by_afs

|integer

a|The virtual space used by AFS alone (includes volume reserves) and along with storage efficiency, in bytes.

|===

[#snapshot]

[.api-collapsible-fifth-title]

snapshot

[cols=3*,options=header]

|===

|Name

|Type

|Description

|autodelete_enabled

|boolean

a|Specifies whether Snapshot copy autodelete is currently enabled on this volume.

|reserve_percent

|integer

a|The space that has been set aside as a reserve for Snapshot copy usage, in percent.

|used

|integer

a|The total space used by Snapshot copies in the volume, in bytes.

|===

[#space]

[.api-collapsible-fifth-title]

space

[cols=3*,options=header]

```

|===
|Name
|Type
|Description

|afs_total
|integer
a|Total size of AFS, excluding snap-reserve, in bytes.

|available
|integer
a|The available space, in bytes.

|available_percent
|integer
a|The space available, as a percent.

|block_storage_inactive_user_data
|integer
a|The size that is physically used in the block storage of the volume and
has a cold temperature. In bytes. This parameter is only supported if the
volume is in an aggregate that is either attached to a cloud store or
could be attached to a cloud store.

|capacity_tier_footprint
|integer
a|Space used by capacity tier for this volume in the FabricPool aggregate,
in bytes.

|footprint
|integer
a|Data used for this volume in the aggregate, in bytes.

|local_tier_footprint
|integer
a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space
|link:#logical_space[logical_space]
a|

```

|metadata
|integer
a|Space used by the volume metadata in the aggregate, in bytes.

|over_provisioned
|integer
a|The amount of space not available for this volume in the aggregate, in bytes.

|performance_tier_footprint
|integer
a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size
|integer
a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|snapshot
|link:#snapshot[snapshot]
a|

|total_footprint
|integer
a|Data and metadata used for this volume in the aggregate, in bytes.

|used
|integer
a|The virtual space used (includes volume reserves) before storage efficiency, in bytes.

|used_by_afs
|integer
a|The space used by Active Filesystem, in bytes.

|Description

|code

|string

a|Encryption progress message code.

|message

|string

a|Encryption progress message.

|===

[#encryption]

[.api-collapsible-fifth-title]

encryption

[cols=3*,options=header]

|===

|Name

|Type

|Description

|enabled

|boolean

a|Creates an encrypted or an unencrypted volume. For POST, when set to 'true', a new key is generated and used to encrypt the given volume. In that case, the underlying SVM must be configured with the key manager. When set to 'false', the volume created will be unencrypted. For PATCH, when set to 'true', it encrypts an unencrypted volume. Specifying the parameter as 'false' in a PATCH operation for an encrypted volume is only supported when moving the volume to another aggregate.

|key_id

|string

a|The key ID used for creating encrypted volume. A new key-id is generated for creating an encrypted volume. This key-id is associated with the generated key.

|key_manager_attribute

|string

a|Specifies an additional key manager attribute that is an identifier-value pair, separated by '='. For example, CRN=unique-value. This

parameter is required when using the POST method and an IBM Key Lore key manager is configured on the SVM.

|rekey

|boolean

a|If set to 'true', re-encrypts the volume with a new key. Valid in PATCH.

|state

|string

a|Volume encryption state.

encrypted ‐ The volume is completely encrypted.

encrypting ‐ Encryption operation is in progress.

partial ‐ Some constituents are encrypted and some are not.

Applicable only for FlexGroup volume.

rekeying. Encryption of volume with a new key is in progress.

unencrypted ‐ The volume is a plain-text one.

|status

|link:#status[status]

a|

|type

|string

a|Volume encryption type.

none ‐ The volume is a plain-text one.

volume ‐ The volume is encrypted with NVE (NetApp Volume Encryption).

aggregate ‐ The volume is encrypted with NAE (NetApp Aggregate Encryption).

|===

[#error_state]

[.api-collapsible-fifth-title]

error_state

[cols=3*,options=header]

|===

|Name

|Type

|Description

|has_bad_blocks

|boolean

a|Indicates whether the volume has any corrupt data blocks. If the damaged data block is accessed, an IO error, such as EIO for NFS or STATUS_FILE_CORRUPT for CIFS, is returned.

|is_inconsistent

|boolean

a|Indicates whether the file system has any inconsistencies.
true ‐ File system is inconsistent.
false ‐ File system is not inconsistent.

|===

[#files]

[.api-collapsible-fifth-title]

files

[cols=3*,options=header]

|===

|Name

|Type

|Description

|maximum

|integer

a|The maximum number of files (inodes) for user-visible data allowed on the volume. This value can be increased or decreased. Increasing the maximum number of files does not immediately cause additional disk space to be used to track files. Instead, as more files are created on the volume, the system dynamically increases the number of disk blocks that are used to track files. The space assigned to track files is never freed, and this value cannot be decreased below the current number of files that can be tracked within the assigned space for the volume. Valid in PATCH.

|used

|integer

a|Number of files (inodes) used for user-visible data permitted on the volume. This field is valid only when the volume is online.

|===

```
[#guarantee]
[.api-collapsible-fifth-title]
guarantee

[cols=3*,options=header]
|===
|Name
|Type
|Description

|honored

```
|===
```

```
|Name  
|Type  
|Description
```

```
|duration
```

```
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
```

```
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
```

```
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
```

```
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok" on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data".

"Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value.

"Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

```
|timestamp
|string
a|The timestamp of the performance data.
```

```
|===

movement
```

Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

```
[cols=3*,options=header]
|===
|Name
|Type
|Description
```

```
|cutover_window
|integer
a|Time window in seconds for cutover. The allowed range is between 30 to
300 seconds.
```

```
|destination_aggregate
|link:#destination_aggregate[destination_aggregate]
a|Aggregate
```

```
|percent_complete
|integer
a|Completion percentage
```

```
|start_time
|string
a|Start time of volume move.
```

```
|state
|string
a|State of volume move operation. PATCH the state to "aborted" to abort
the move operation. PATCH the state to "cutover" to trigger cutover. PATCH
the state to "paused" to pause the volume move operation in progress.
PATCH the state to "replicating" to resume the paused volume move
operation. PATCH the state to "cutover_wait" to go into cutover manually.
When volume move operation is waiting to go into "cutover" state, this is
indicated by the "cutover_pending" state. A change of state is only
supported if volume movement is in progress.
```

```
|tiering_policy
|string
a|Tiering policy for FabricPool
```

```
|===
```

```
[#export_policy]
[.api-collapsible-fifth-title]
export_policy
```

Export Policy

junction_parent

[cols=3*,options=header]
|===
|Name
|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the parent volume that contains the junction inode of this
volume. The junction parent volume must belong to the same SVM that owns
this volume.

|uuid
|string
a|Unique identifier for the parent volume.

```

```

|===

[#nas]
[.api-collapsible-fifth-title]
nas

[cols=3*,options=header]
|===
|Name
|Type
|Description

|export_policy
|link:#export_policy[export_policy]
a|Export Policy

|gid
|integer
a|The UNIX group ID of the volume. Valid in POST or PATCH.

|junction_parent
|link:#junction_parent[junction_parent]
a|

|path
|string
a|The fully-qualified path in the owning SVM's namespace at which the
volume is mounted. The path is case insensitive and must be unique within
a SVM's namespace. Path must begin with '/' and must not end with '/'.
Only one volume can be mounted at any given junction path. An empty path
in POST creates an unmounted volume. An empty path in PATCH deactivates
and unmounts the volume. Taking a volume offline removes its junction
path. This attribute is reported in GET only when the volume is mounted.

|security_style
|string
a|Security style associated with the volume. Valid in POST or PATCH.
mixed &dash; Mixed-style security
ntfs &dash; NTFS/WIndows-style security
unified &dash; Unified-style security, unified UNIX, NFS and CIFS
permissions

```

unix ‐ Unix-style security.

|uid

|integer

a|The UNIX user ID of the volume. Valid in POST or PATCH.

|unix_permissions

|integer

a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write) and 1 (execute). First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file; the third selects permissions for other users in the same group; the fourth for other users not in the group. Valid in POST or PATCH. For security style "mixed" or "unix", the default setting is 0755 in octal (493 in decimal) and for security style "ntfs", the default setting is 0000. In cases where only owner, group and other permissions are given (as in 755, representing the second, third and fourth digit), first digit is assumed to be zero.

|===

[#policy]

[.api-collapsible-fifth-title]

policy

When "min_throughput_iops", "min_throughput_mbps", "max_throughput_iops" or "max_throughput_mbps" attributes are specified, the storage object is assigned to an auto-generated QoS policy group. If the attributes are later modified, the auto-generated QoS policy-group attributes are modified. Attributes can be removed by specifying "0" and policy group by specifying "none". Upon deletion of the storage object or if the attributes are removed, then the QoS policy-group is also removed.

[cols=3*,options=header]

|Name

|Type

|Description

|_links

|link:#_links[_links]

a|

|max_throughput_iops

|integer

a|Specifies the maximum throughput in IOPS, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|max_throughput_mbps

|integer

a|Specifies the maximum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_iops

|integer

a|Specifies the minimum throughput in IOPS, 0 means none. Setting "min_throughput" is supported on AFF platforms only, unless FabricPool tiering policies are set. This is mutually exclusive with name and UUID during POST and PATCH.

|min_throughput_mbps

|integer

a|Specifies the minimum throughput in Megabytes per sec, 0 means none. This is mutually exclusive with name and UUID during POST and PATCH.

|name

|string

a|The QoS policy group name. This is mutually exclusive with UUID and other QoS attributes during POST and PATCH.

|uuid

|string

a|The QoS policy group UUID. This is mutually exclusive with name and other QoS attributes during POST and PATCH.

|===

```

a|Quota state of the volume

|===

[#retention]
[.api-collapsible-fifth-title]
retention

[cols=3*,options=header]

|===

|Name
|Type
|Description

|default

|string

a|Specifies the default retention period that is applied to files while committing them to the WORM state without an associated retention period. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period and the string "unspecified" to set an unspecified retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|maximum

|string

a|Specifies the maximum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M"

respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention

```
period.+++</num>+++++</num>+++++</num>+++++</num>+++++</num>+++
```

|minimum

|string

a|Specifies the minimum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, month,s and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. ```

|===

[#snaplock]

[.api-collapsible-fifth-title]

snaplock

[cols=3*,options=header]

|===

|Name

|Type

|Description

|append_mode_enabled

|boolean

a|Specifies if the volume append mode is enabled or disabled. When it is enabled, all the files created with write permissions on the volume are, by default, WORM appendable files. The user can append the data to a WORM

appendable file but cannot modify the existing contents of the file nor delete the file until it expires.

|autocommit_period

|string

a|Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater than the autocommit period of the volume are committed to the WORM state. The autocommit period value represents a duration and must be specified in the ISO-8601 duration format. The autocommit period can be in years, months, days, hours, and minutes. A period specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The period string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the autocommit field also accepts the string "none".+++</num>++++++</num>++++++</num>++++++</num>++++++</num>+++

|compliance_clock_time

|string

a|This is the volume compliance clock time which is used to manage the SnapLock objects in the volume.

|expiry_time

|string

a|Expiry time of the volume.

|is_audit_log

|boolean

a|Indicates if this volume has been configured as SnapLock audit log volume for the SVM .

|litigation_count

|integer

a|Litigation count indicates the number of active legal-holds on the volume.

|privileged_delete

```

|string
a|Specifies the privileged-delete attribute of a SnapLock volume. On a
SnapLock Enterprise (SLE) volume, a designated privileged user can
selectively delete files irrespective of the retention time of the file.
SLE volumes can have privileged delete as disabled, enabled or
permanently_disabled and for SnapLock Compliance (SLC) volumes it is
always permanently_disabled.

|retention
|link:#retention[retention]
a|

|type
|string
a|The SnapLock type of the volume.
compliance &dash; A SnapLock Compliance(SLC) volume provides the highest
level of WORM protection and an administrator cannot destroy a SLC volume
if it contains unexpired WORM files.
enterprise &dash; An administrator can delete a SnapLock Enterprise(SLE)
volume.
non_snaplock &dash; Indicates the volume is non-snaplock.

|unspecified_retention_file_count
|integer
a|Indicates the number of files with an unspecified retention time in the
volume.

along with storage efficiency.
```

```
|reporting
```

```
|boolean
```

```
a|Specifies whether space reporting on the volume is done along with  
storage efficiency.
```

|used
|integer
a|SUM of (physical-used, shared_refs, compression_saved_in_plane0, vbn_zero, future_blk_cnt), in bytes.

|used_by_afs
|integer
a|The virtual space used by AFS alone (includes volume reserves) and along with storage efficiency, in bytes.

|used_percent
|integer
a|SUM of (physical-used, shared_refs, compression_saved_in_plane0, vbn_zero, future_blk_cnt), as a percentage.

|===

[#snapshot]
[.api-collapsible-fifth-title]
snapshot

[cols=3*,options=header]

|===

|Name
|Type
|Description

|autodelete_enabled
|boolean
a|Specifies whether Snapshot copy autodelete is currently enabled on this volume.

|reserve_percent
|integer
a|The space that has been set aside as a reserve for Snapshot copy usage, in percent.

|reserve_size
|integer

a|Size in the volume that has been set aside as a reserve for Snapshot copy usage, in bytes.

|space_used_percent

|integer

a|Percentage of snapshot reserve size that has been used.

|used

|integer

a|The total space used by Snapshot copies in the volume, in bytes.

|===

[#space]

[.api-collapsible-fifth-title]

space

[cols=3*,options=header]

|===

|Name

|Type

|Description

|afs_total

|integer

a|Total size of AFS, excluding snap-reserve, in bytes.

|available

|integer

a|The available space, in bytes.

|available_percent

|integer

a|The space available, as a percent.

|block_storage_inactive_user_data

|integer

a|The size that is physically used in the block storage of the volume and has a cold temperature. In bytes. This parameter is only supported if the volume is in an aggregate that is either attached to a cloud store or

could be attached to a cloud store.

|block_storage_inactive_user_data_percent

|integer

a|Percentage of size that is physically used in the performance tier of the volume.

|capacity_tier_footprint

|integer

a|Space used by capacity tier for this volume in the FabricPool aggregate, in bytes.

|footprint

|integer

a|Data used for this volume in the aggregate, in bytes.

|fractional_reserve

|integer

a|Used to change the amount of space reserved for overwrites of reserved objects in a volume.

|full_threshold_percent

|integer

a|Volume full threshold percentage at which EMS warnings can be sent.

|local_tier_footprint

|integer

a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space

|link:#logical_space[logical_space]

a|

|metadata

|integer

a|Space used by the volume metadata in the aggregate, in bytes.

|nearly_full_threshold_percent

|integer

a|Volume nearly full threshold percentage at which EMS warnings can be sent.

|over_provisioned

|integer

a|The amount of space not available for this volume in the aggregate, in bytes.

|overwrite_reserve

|integer

a|Reserved space for overwrites, in bytes.

|overwrite_reserve_used

|integer

a|Overwrite logical reserve space used, in bytes.

|percent_used

|integer

a|Percentage of the volume size that is used.

|performance_tier_footprint

|integer

a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size

|integer

a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|size_available_for_snapshots

|integer

a|Available space for Snapshot copies from snap-reserve, in bytes.

|snapshot

|link:#snapshot[snapshot]

```
[#tiering]
[.api-collapsible-fifth-title]
tiering
```

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
|Type
|Description
```

```
|min_cooling_days
```

```
|integer
```

a|This parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. Note that this parameter is only used for tiering purposes and does not affect the reporting of inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. This parameter cannot be set when volume tiering policy is either "none" or "all". The default value of this parameter depends on the volume's tiering policy. See the tiering policy section of this documentation for corresponding default values. If the tiering policy on the volume gets changed, then this parameter will be reset to the default value corresponding to the new tiering policy.

```
|object_tags
```

```
|array[string]
```

a|This parameter specifies tags of a volume for objects stored on a FabricPool-enabled aggregate. Each tag is a key,value pair and should be in the format "key=value".

```
|policy
```

```
|string
```

a|Policy that determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud store when they become cold. FabricPool combines flash (performance tier) with a cloud store into a

single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not. Valid in POST or PATCH. all ‐ This policy allows tiering of both Snapshot copies and active file system user data to the cloud store as soon as possible by ignoring the temperature on the volume blocks.

auto ‐ This policy allows tiering of both snapshot and active file system user data to the cloud store

none ‐ Volume blocks will not be tiered to the cloud store.

snapshot_only ‐ This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default tiering policy is "snapshot-only" for a FlexVol and "none" for a FlexGroup. The default minimum cooling period for the "snapshot-only" tiering policy is 2 days and for the "auto" tiering policy is 31 days.

|supported

|boolean

a|This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. Note that in order to tier data, not only does the volume need to support tiering by using FabricPools, the tiering "policy" must not be 'none'. A volume that uses FabricPools but has a tiering "policy" of 'none' supports tiering, but will not tier any data.

```

= Update volume attributes

```
[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-block]#`/storage/volumes/{uuid}`#
```

Introduced In: 9.6

Updates the attributes of a volume. For movement, use the "validate_only" field on the request to validate but not perform the operation. The PATCH API can be used to enable or disable quotas for a FlexVol or a FlexGroup volume. An empty path in PATCH deactivates and unmounts the volume. Taking a volume offline removes its junction path.

A PATCH request for volume encryption performs conversion/rekey operations asynchronously. You can retrieve the conversion/rekey progress details by calling a GET request on the corresponding volume endpoint.

== Optional properties

* `queue_for_encryption` - Queue volumes for encryption when `encryption.enabled=true`. If this option is not provided or is false, conversion of volumes starts immediately. When there are volumes in the queue and less than four encryptions are running, volumes are encrypted in the order in which they are queued.

* `encryption.action` - You can pause an ongoing rekey/conversion operation or resume a paused rekey/conversion operation using this field. The following actions are supported for this field: ‐

conversion_pause - Pause an encryption conversion operation currently in progress ‐
conversion_resume - Resume a paused encryption conversion operation ‐
rekey_pause - Pause an encryption rekey operation currently in progress ‐
rekey_resume - Resume a paused encryption rekey operation

== Related ONTAP commands

- * `volume unmount`
- * `volume mount`
- * `volume online`
- * `volume offline`
- * `volume modify`
- * `volume clone modify`
- * `volume efficiency modify`
- * `volume quota on`
- * `volume quota off`
- * `volume snaplock modify`
- * `volume encryption conversion start`

```
* `volume encryption rekey start`
```

```
== Parameters
```

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|uuid
```

```
|string
```

```
|path
```

```
|True
```

```
a|Unique identifier of the volume.
```

```
|restore_to.snapshot.uuid
```

```
|string
```

```
|query
```

```
|False
```

```
a|UUID of the Snapshot copy to restore volume to the point in time the Snapshot copy was taken.
```

```
|restore_to.snapshot.name
```

```
|string
```

```
|query
```

```
|False
```

```
a|Name of the Snapshot copy to restore volume to the point in time the Snapshot copy was taken.
```

```
|sizing_method
```

```
|string
```

```
|query
```

```
|False
```

```
a|Represents the method to modify the size of a Flexgroup. The following methods are supported:
```

```
* use_existing_resources - Increases or decreases the size of the FlexGroup by increasing or decreasing the size of the current FlexGroup resources
```

```
* add_new_resources - Increases the size of the FlexGroup by adding new
resources. This is limited to two new resources per available aggregate.
* Default value: 1
* enum: ["use_existing_resources", "add_new_resources"]
```

```
|clone.match_parent_storage_tier
```

```
|boolean
```

```
|query
```

```
|False
```

a|Specifies whether the FlexClone volume splits the data blocks by matching its parent storage tier. This option is applicable only if the tiering policy and the tiering minimum cooling days of the parent volume and the FlexClone volume are the same.

```
* Introduced in: 9.9
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|validate_only
```

```
|boolean
```

```
|query
```

```
|False
```

a|Validate the operation and its parameters, without actually performing the operation.

```

|link:#application[application]
a|

|autosize
|link:#autosize[autosize]
a|

|clone
|link:#clone[clone]
a|

|cloud_retrieval_policy
|string
a|This parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier. The available cloud retrieval policies are "default" policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot_only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not

```

retrieved.

"on_read" policy retrieves tiered data for all client driven data reads.

"never" policy never retrieves tiered data.

"promote" policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the only data brought back is the data in the AFS. Data that is only in a snapshot copy stays in the cloud and if tiering policy is 'none' then all data is retrieved.

|comment

|string

a|A comment for the volume. Valid in POST or PATCH.

|consistency_group

|link:#consistency_group[consistency_group]

a|Consistency group the volume is part of.

|constituents

|array[link:#constituents[constituents]]

a|

|constituents_per_aggregate

|integer

a|Specifies the number of times to iterate over the aggregates listed with the "aggregates.name" or "aggregates.uuid" when creating or expanding a FlexGroup. If a volume is being created on a single aggregate, the system will create a flexible volume if the "constituents_per_aggregate" field is not specified, and a FlexGroup if it is specified. If a volume is being created on multiple aggregates, the system will always create a FlexGroup.

|create_time

|string

a|Creation time of the volume. This field is generated when the volume is created.

|efficiency

|link:#efficiency[efficiency]

a|

|encryption

|link:#encryption[encryption]

```

a|

|error_state
|link:#error_state[error_state]
a|

|files
|link:#files[files]
a|

|flexcache_endpoint_type
|string
a|FlexCache endpoint type.
none &dash; The volume is neither a FlexCache nor origin of any FlexCache.
cache &dash; The volume is a FlexCache volume.
origin &dash; The volume is origin of a FlexCache volume.

|guarantee
|link:#guarantee[guarantee]
a|

|is_object_store
|boolean
a|Specifies whether the volume is provisioned for an object store server.

|is_svm_root
|boolean
a|Specifies whether the volume is a root volume of the SVM it belongs to.

|language
|string
a|Language encoding setting for volume. If no language is specified, the
volume inherits its SVM language encoding setting.

|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS, latency and throughput.

|movement
|link:#movement[movement]
a|Volume movement. All attributes are modify, that is, not writable
through POST. Set PATCH state to destination_aggregate to initiate a

```

volume move operation. Volume movement on FlexGroup constituents are not supported.

|name

|string

a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

|nas

|link:#nas[nas]

a|

|qos

|link:#qos[qos]

a|QoS information

|queue_for_encryption

|boolean

a|Specifies whether the volume is queued for encryption.

|quota

|link:#quota[quota]

a|Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

|size

|integer

a|Physical size of the volume, in bytes. The minimum size for a FlexVol volume is 20MB and the minimum size for a FlexGroup volume is 200MB per constituent. The recommended size for a FlexGroup volume is a minimum of 100GB per constituent. For all volumes, the default size is equal to the minimum size.

|snaplock

|link:#snaplock[snaplock]

a|

|snapmirror

|link:#snapmirror[snapmirror]

a|Specifies attributes for SnapMirror protection.

|snapshot_policy

|link:#snapshot_policy[snapshot_policy]

a|This is a reference to the Snapshot copy policy.

|space

|link:#space[space]

a|

|state

|string

a|Volume state. A volume can only be brought online if it is offline. Taking a volume offline removes its junction path. The 'mixed' state applies to FlexGroup volumes only and cannot be specified as a target state. An 'error' state implies that the volume is not in a state to serve data.

|statistics

|link:#statistics[statistics]

a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase with the uptime of the cluster.

|status

|array[string]

a|Describes the current status of a volume.

|style

|string

a|The style of the volume. If "style" is not specified, the volume type is determined based on the specified aggregates. Specifying a single aggregate, without "constituents_per_aggregate", creates a flexible volume. Specifying multiple aggregates, or a single aggregate with "constituents_per_aggregate", creates a FlexGroup. Specifying a volume "style" creates a volume of that type. For example, if the style is "flexvol" you must specify a single aggregate. If the style is "flexgroup", the system either uses the specified aggregates or automatically provisions aggregates if there are no specified aggregates.
flexvol ‐ flexible volumes and FlexClone volumes
flexgroup ‐ FlexGroups.

```

|svm
|link:#svm[svm]
a|SVM containing the volume. Required on POST.

|tiering
|link:#tiering[tiering]
a|

|type
|string
a|Type of the volume.
rw &dash; read-write volume.
dp &dash; data-protection volume.
ls &dash; load-sharing `dp` volume. Valid in GET.

|use_mirrored_aggregates
|boolean
a|Specifies whether mirrored aggregates are selected when provisioning a
FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only
mirrored aggregates are used if this parameter is set to 'true' and only
unmirrored aggregates are used if this parameter is set to 'false'.
Aggregate level mirroring for a FlexGroup can be changed by moving all of
the constituents to the required aggregates. The default value is 'true'
for a MetroCluster configuration and is 'false' for a non-MetroCluster
configuration.

|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid
that is exposed in the CLI and ONTAPI. It does not change due to a volume
move.

* example: 028baa66-41bd-11e9-81d5-00a0986138f7
* readOnly: 1
* Introduced in: 9.6

== Error

```

Status: Default

ONTAP Error Response Codes

```

|===
| Error Code | Description

| 787141
| The specified "aggregates.name" and "aggregates.uuid" refer to different aggregates.

| 917829
| Volume autosize grow threshold must be larger than autosize shrink threshold.

```

| 917831
| Volume minimum autosize must be smaller than the maximum autosize.

| 918193
| Cannot modify tiering min cooling days when vol move is in progress.

| 918194
| Tiering min cooling days not supported for SVMDR.

| 918195
| Tiering min cooling days not supported for non data volumes.

| 918196
| Tiering min cooling days not allowed for the provided tiering policy.

| 918248
| Specifying a value is not valid for initiating volume FlexClone split operation.

| 918251
| Specifying a value is not valid for a Snapshot copy restore operation.

| 918252
| specified "nas.path" is invalid.

| 918265
| Volume is on the same aggregate.

| 918266
| "movement.destination_aggregate" and "movement.state" are mutually exclusive, unless the state is "cutover-wait".

| 918267
| The specified "movement.destination_aggregate" does not exist.

| 918291
| Invalid volume cloud retrieval policy for the provided tiering policy.

| 918292
| cloud retrieval policy not supported for non data volume.

| 918293
| Cannot modify cloud retrieval policy when vol move is in progress.

| 918521
| The volume maximum autosize must be smaller than or equal to the maximum

volume size.

| 918532

| The FlexClone match-parent-storage-tier option requires an effective cluster version of 9.9.1 or later.

| 918533

| The FlexClone match-parent-storage-tier option not applicable for FlexClone volumes hosted on non-FabricPool storage.

| 918534

| The tiering policy values are different for the FlexClone volume and its parent volume. The match-parent-storage-tier option cannot be set to true.

| 918535

| The tiering minimum cooling day values are different for the FlexClone volume and its parent volume. The match-parent-storage-tier option cannot be set to true.

| 918537

| Could not get the FlexClone volume tiering policy or its parent volume tiering policy. Wait a minute and try again.

| 918538

| The match-parent-storage-tier option is not supported for clone creation.

| 13107404

| When adding new resources to a FlexGroup by specifying "aggregates.name" or "aggregates.uuid", the FlexGroup cannot be resized using "size". These operations must be done separately.

| 13109187

| When adding new resources to a FlexGroup using "sizing_method", "size" must be specified. Neither "aggregates.name" nor "aggregates.uuid" are allowed to be specified, as the aggregates are selected automatically by the system.

| 13109198

| Resizing by adding new resources is only supported for FlexGroups.

| 111411201

| File system analytics cannot be enabled on the target volume because of the specified reason.

| 111411202

| File system analytics cannot be disabled on the target volume because of

the specified reason.

```
| 111411205
| File system analytics requires an effective cluster version of 9.8 or
| later.
```

```
| 111411206
| The specified "analytics.state" is invalid.
```

```
| 111411207
| File system analytics cannot be enabled on volumes that contain LUNs.

[#analytics]
[.api-collapsible-fifth-title]

```

```

analytics

[cols=3*,options=header]
|===
|Name
|Type
|Description

|scan_progress
|integer
a|Percentage of files in the volume that the file system analytics
initialization scan has processed. Only returned when the state is
`initializing`.

|state
|string
a|File system analytics state of the volume. If this value is "on", ONTAP
collects extra file system analytics information for all directories on
the volume. There will be a slight impact to I/O performance to collect
this information. If this value is "off", file system analytics
information is not collected and not available to be viewed. If this value
is "initializing", that means file system analytics was recently turned
on, and the initialization scan to gather information all all existing
files and directories is currently running. If this value is 'unknown'
that means there was an internal error when determining the file system
analytics state for the volume.

* enum: ["unknown", "initializing", "off", "on"]
* Introduced in: 9.8

|supported
|boolean
a|This field indicates whether or not file system analytics is supported
on the volume. If file system analytics is not supported, the reason will
be specified in the "analytics.unsupported_reason" field.

|unsupported_reason

```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|grow_threshold
```

```
|integer
```

```
a|Used space threshold size, in percentage, for the automatic growth of the volume. When the amount of used space in the volume becomes greater than this threshold, the volume automatically grows unless it has reached the maximum size. The volume grows when 'space.used' is greater than this percent of 'space.size'. The 'grow_threshold' size cannot be less than or equal to the 'shrink_threshold' size..
```

```
|maximum
```

```
|integer
```

```
a|Maximum size in bytes up to which a volume grows automatically. This
```

size cannot be less than the current volume size, or less than or equal to the minimum size of volume.

|minimum

|integer

a|Minimum size in bytes up to which the volume shrinks automatically. This size cannot be greater than or equal to the maximum size of volume.

|mode

|string

a|Autosize mode for the volume.

grow ‐ Volume automatically grows when the amount of used space is above the 'grow_threshold' value.

grow_shrink ‐ Volume grows or shrinks in response to the amount of space used.

off ‐ Autosizing of the volume is disabled.

|shrink_threshold

|integer

a|Used space threshold size, in percentage, for the automatic shrinkage of the volume. When the amount of used space in the volume drops below this threshold, the volume automatically shrinks unless it has reached the minimum size. The volume shrinks when the 'space.used' is less than the 'shrink_threshold' percent of 'space.size'. The 'shrink_threshold' size cannot be greater than or equal to the 'grow_threshold' size.

|destination_aggregate
```

```
|link:#destination_aggregate[destination_aggregate]
```

a|Aggregate

```
|percent_complete
```

```
|integer
```

a|Completion percentage

```
|state
```

```
|string
```

a|State of volume move operation. PATCH the state to "aborted" to abort the move operation. PATCH the state to "cutover" to trigger cutover. PATCH the state to "paused" to pause the volume move operation in progress. PATCH the state to "replicating" to resume the paused volume move operation. PATCH the state to "cutover_wait" to go into cutover manually. When volume move operation is waiting to go into "cutover" state, this is indicated by the "cutover_pending" state. A change of state is only supported if volume movement is in progress.

```
|tiering_policy
```

```

|string
a|Tiering policy for FabricPool

|===

[#logical_space]
[.api-collapsible-fifth-title]
logical_space

[cols=3*,options=header]
|===
|Name
|Type
|Description

|available
|integer
a|The amount of space available in this volume with storage efficiency
space considered used, in bytes.

|enforcement
|boolean
a|Specifies whether space accounting for operations on the volume is done
along with storage efficiency.

|reporting
|boolean
a|Specifies whether space reporting on the volume is done along with
storage efficiency.

|used_by_afs
|integer
a|The virtual space used by AFS alone (includes volume reserves) and along
with storage efficiency, in bytes.

|===

[#snapshot]
[.api-collapsible-fifth-title]
snapshot

```

```

[cols=3*,options=header]
|===
|Name
|Type
|Description

|autodelete_enabled
|boolean
a|Specifies whether Snapshot copy autodelete is currently enabled on this
volume.

|reserve_percent
|integer
a|The space that has been set aside as a reserve for Snapshot copy usage,
in percent.

|used
|integer
a|The total space used by Snapshot copies in the volume, in bytes.

|===

[#space]
[.api-collapsible-fifth-title]
space

[cols=3*,options=header]
|===
|Name
|Type
|Description

|afs_total
|integer
a|Total size of AFS, excluding snap-reserve, in bytes.

|available
|integer
a|The available space, in bytes.

```

```
|available_percent
|integer
a|The space available, as a percent.

|block_storage_inactive_user_data
|integer
a|The size that is physically used in the block storage of the volume and
has a cold temperature. In bytes. This parameter is only supported if the
volume is in an aggregate that is either attached to a cloud store or
could be attached to a cloud store.

|capacity_tier_footprint
|integer
a|Space used by capacity tier for this volume in the FabricPool aggregate,
in bytes.

|footprint
|integer
a|Data used for this volume in the aggregate, in bytes.

|local_tier_footprint
|integer
a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space
|link:#logical_space[logical_space]
a|

|metadata
|integer
a|Space used by the volume metadata in the aggregate, in bytes.

|over_provisioned
|integer
a|The amount of space not available for this volume in the aggregate, in
bytes.

|performance_tier_footprint
|integer
a|Space used by the performance tier for this volume in the FabricPool
```

aggregate, in bytes.

|size

|integer

a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|snapshot

|link:#snapshot[snapshot]

a|

|total_footprint

|integer

a|Data and metadata used for this volume in the aggregate, in bytes.

|used

|integer

a|The virtual space used (includes volume reserves) before storage efficiency, in bytes.

|used_by_afs

|integer

a|The space used by Active Filesystem, in bytes.

|application_io_size
|string
a|Block size to use by compression. Valid for POST.

|compaction
|string
a|The system can be enabled/disabled compaction.
inline &dash; Data will be compacted first and written to the volume.
none &dash; None
mixed &dash; Read only field for FlexGroups, where some of the constituent
volumes are compaction enabled and some are disabled.

|compression
|string
a|The system can be enabled/disabled compression.
inline &dash; Data will be compressed first and written to the volume.
background &dash; Data will be written to the volume and compressed later.
both &dash; Inline compression compresses the data and write to the
volume, background compression compresses only the blocks on which inline
compression is not run.
none &dash; None
mixed &dash; Read only field for FlexGroups, where some of the constituent
volumes are compression enabled and some are disabled.

|cross_volume_dedupe
|string
a|The system can be enabled/disabled cross volume dedupe. it can be
enabled only when dedupe is enabled.
inline &dash; Data will be cross volume deduped first and written to the
volume.
background &dash; Data will be written to the volume and cross volume
deduped later.
both &dash; Inline cross volume dedupe dedupes the data and write to the
volume, background cross volume dedupe dedupes only the blocks on which
inline dedupe is not run.
none &dash; None
mixed &dash; Read only field for FlexGroups, where some of the constituent
volumes are cross volume dedupe enabled and some are disabled.

|dedupe
|string
a|The system can be enabled/disabled dedupe.
```

inline ‐ Data will be deduped first and written to the volume.
background ‐ Data will be written to the volume and deduped later.
both ‐ Inline dedupe dedupes the data and write to the volume,
background dedupe dedupes only the blocks on which inline dedupe is not
run.
none ‐ None
mixed ‐ Read only field for FlexGroups, where some of the constituent
volumes are dedupe enabled and some are disabled.

```

[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|enabled
```

```
|boolean
```

a|Creates an encrypted or an unencrypted volume. For POST, when set to 'true', a new key is generated and used to encrypt the given volume. In that case, the underlying SVM must be configured with the key manager. When set to 'false', the volume created will be unencrypted. For PATCH, when set to 'true', it encrypts an unencrypted volume. Specifying the parameter as 'false' in a PATCH operation for an encrypted volume is only supported when moving the volume to another aggregate.

```
|key_id
```

```
|string
```

a|The key ID used for creating encrypted volume. A new key-id is generated for creating an encrypted volume. This key-id is associated with the generated key.

```
|key_manager_attribute
```

```
|string
```

a|Specifies an additional key manager attribute that is an identifier-value pair, separated by '='. For example, CRN=unique-value. This parameter is required when using the POST method and an IBM Key Lore key manager is configured on the SVM.

```
|rekey
```

```
|boolean
```

a|If set to 'true', re-encrypts the volume with a new key. Valid in PATCH.

```
|state
```

```
|string
```

a|Volume encryption state.

encrypted ‐ The volume is completely encrypted.

encrypting ‐ Encryption operation is in progress.

partial ‐ Some constituents are encrypted and some are not.
Applicable only for FlexGroup volume.
rekeying. Encryption of volume with a new key is in progress.
unencrypted ‐ The volume is a plain-text one.

|status
|link:#status[status]
a|

|type
|string
a|Volume encryption type.
none ‐ The volume is a plain-text one.
volume ‐ The volume is encrypted with NVE (NetApp Volume Encryption).
aggregate ‐ The volume is encrypted with NAE (NetApp Aggregate Encryption).

|Type
|Description

|maximum
|integer
a|The maximum number of files (inodes) for user-visible data allowed on
the volume. This value can be increased or decreased. Increasing the
maximum number of files does not immediately cause additional disk space
to be used to track files. Instead, as more files are created on the
volume, the system dynamically increases the number of disk blocks that
are used to track files. The space assigned to track files is never freed,
and this value cannot be decreased below the current number of files that
can be tracked within the assigned space for the volume. Valid in PATCH.

|used
|integer
a|Number of files (inodes) used for user-visible data permitted on the
volume. This field is valid only when the volume is online.

```

|Type
|Description

|duration
|string
a|The duration over which this sample is calculated. The time durations
are represented in the ISO-8601 standard format. Samples can be calculated
over the following durations:

|iops
|link:#iops[iops]
a|The rate of I/O operations observed at the storage object.

|latency
|link:#latency[latency]
a|The round trip latency in microseconds observed at the storage object.

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|timestamp
|string
a|The timestamp of the performance data.

|===

[#flexcache]
[.api-collapsible-fifth-title]
flexcache

```

Performance number for FlexCache used to measure cache effectiveness.

|Type
|Description

|_links
|link:#_links[_links]
a|

|name
|string
a|The name of the parent volume that contains the junction inode of this
volume. The junction parent volume must belong to the same SVM that owns
this volume.

|uuid
|string
a|Unique identifier for the parent volume.

|===

[#nas]
[.api-collapsible-fifth-title]
nas

[cols=3*,options=header]
|===
|Name
|Type
|Description

```

```
|export_policy
|link:#export_policy[export_policy]
a|Export Policy
```

```
|gid
|integer
a|The UNIX group ID of the volume. Valid in POST or PATCH.
```

```
|junction_parent
|link:#junction_parent[junction_parent]
a|
```

```
|path
|string
a|The fully-qualified path in the owning SVM's namespace at which the volume is mounted. The path is case insensitive and must be unique within a SVM's namespace. Path must begin with '/' and must not end with '/'. Only one volume can be mounted at any given junction path. An empty path in POST creates an unmounted volume. An empty path in PATCH deactivates and unmounts the volume. Taking a volume offline removes its junction path. This attribute is reported in GET only when the volume is mounted.
```

```
|security_style
|string
a|Security style associated with the volume. Valid in POST or PATCH.
mixed &dash; Mixed-style security
ntfs &dash; NTFS/WIndows-style security
unified &dash; Unified-style security, unified UNIX, NFS and CIFS
permissions
unix &dash; Unix-style security.
```

```
|uid
|integer
a|The UNIX user ID of the volume. Valid in POST or PATCH.
```

```
|unix_permissions
|integer
a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write) and 1 (execute). First digit selects the set user ID(4), set group ID (2) and sticky (1) attributes. The second digit selects permission for the owner of the file;
```

the third selects permissions for other users in the same group; the fourth for other users not in the group. Valid in POST or PATCH. For security style "mixed" or "unix", the default setting is 0755 in octal (493 in decimal) and for security style "ntfs", the default setting is 0000. In cases where only owner, group and other permissions are given (as in 755, representing the second, third and fourth digit), first digit is assumed to be zero.

```

|Description

|default

|string

a|Specifies the default retention period that is applied to files while committing them to the WORM state without an associated retention period. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period and the string "unspecified" to set an unspecified retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|maximum

|string

a|Specifies the maximum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention period can be in years, months, days, hours, and minutes. A duration specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the duration field also accepts the string "infinite" to set an infinite retention period.+++</num>++++</num>++++</num>++++</num>++++</num>+++

|minimum

|string

a|Specifies the minimum allowed retention period for files committed to the WORM state on the volume. The retention value represents a duration and must be specified in the ISO-8601 duration format. The retention

period can be in years, months, days, hours, and minutes. A duration specified for years, month,s and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The retention string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. ```
[cols=3*,options=header]
```

|===

```
|Name
|Type
|Description
```

```
|append_mode_enabled
```

```
|boolean
```

a|Specifies if the volume append mode is enabled or disabled. When it is enabled, all the files created with write permissions on the volume are, by default, WORM appendable files. The user can append the data to a WORM appendable file but cannot modify the existing contents of the file nor delete the file until it expires.

```
|autocommit_period
```

```
|string
```

a|Specifies the autocommit period for SnapLock volume. All files which are not modified for a period greater than the autocommit period of the volume are committed to the WORM state. The autocommit period value represents a duration and must be specified in the ISO-8601 duration format. The autocommit period can be in years, months, days, hours, and minutes. A period specified for years, months, and days is represented in the ISO-8601 format as "P+++<num>+++Y", "P+++<num>+++M", "P+++<num>+++D" respectively, for example "P10Y" represents a duration of 10 years. A

duration in hours and minutes is represented by "PT+++<num>+++H" and "PT+++<num>+++M" respectively. The period string must contain only a single time element that is, either years, months, days, hours, or minutes. A duration which combines different periods is not supported, for example "P1Y10M" is not supported. Apart from the duration specified in the ISO-8601 format, the autocommit field also accepts the string "none".+++</num>++++</num>++++</num>++++</num>++++</num>+++

|compliance_clock_time

|string

a|This is the volume compliance clock time which is used to manage the SnapLock objects in the volume.

|expiry_time

|string

a|Expiry time of the volume.

|is_audit_log

|boolean

a|Indicates if this volume has been configured as SnapLock audit log volume for the SVM .

|litigation_count

|integer

a|Litigation count indicates the number of active legal-holds on the volume.

|privileged_delete

|string

a|Specifies the privileged-delete attribute of a SnapLock volume. On a SnapLock Enterprise (SLE) volume, a designated privileged user can selectively delete files irrespective of the retention time of the file. SLE volumes can have privileged delete as disabled, enabled or permanently_disabled and for SnapLock Compliance (SLC) volumes it is always permanently_disabled.

|retention

|link:#retention[retention]

a|

|type

```
|string
a|The SnapLock type of the volume.
compliance &dash; A SnapLock Compliance(SLC) volume provides the highest
level of WORM protection and an administrator cannot destroy a SLC volume
if it contains unexpired WORM files.
enterprise &dash; An administrator can delete a SnapLock Enterprise(SLE)
volume.
non_snaplock &dash; Indicates the volume is non-snaplock.
```

```
|unspecified_retention_file_count
|integer
a|Indicates the number of files with an unspecified retention time in the
volume.

|fractional_reserve
|integer
a|Used to change the amount of space reserved for overwrites of reserved objects in a volume.

|full_threshold_percent
|integer
a|Volume full threshold percentage at which EMS warnings can be sent.

|local_tier_footprint
|integer
a|Space used by the local tier for this volume in the aggregate, in bytes.

|logical_space
|link:#logical_space[logical_space]
a|

|metadata
|integer
a|Space used by the volume metadata in the aggregate, in bytes.

|nearly_full_threshold_percent
|integer
a|Volume nearly full threshold percentage at which EMS warnings can be sent.

|over_provisioned
|integer
a|The amount of space not available for this volume in the aggregate, in bytes.

|overwrite_reserve
|integer
a|Reserved space for overwrites, in bytes.

|overwrite_reserve_used
|integer
a|Overwrite logical reserve space used, in bytes.

|percent_used
|integer
a|Percentage of the volume size that is used.

|performance_tier_footprint
|integer
a|Space used by the performance tier for this volume in the FabricPool aggregate, in bytes.

|size
|integer
a|Total provisioned size. The default size is equal to the minimum size of 20MB, in bytes.

|size_available_for_snapshots
|integer
a|Available space for Snapshot copies from snap-reserve, in bytes.

|snapshot
|link:#snapshot[snapshot]
a|

|total_footprint
|integer
a|Data and metadata used for this volume in the aggregate, in bytes.

|used
|integer
a|The virtual space used (includes volume reserves) before storage efficiency, in bytes.

|used_by_afs
|integer
a|The space used by Active Filesystem, in bytes.

|Description

|iops_raw
|link:#iops_raw[iops_raw]
a|The number of I/O operations observed at the storage object. This can be
used along with delta time to calculate the rate of I/O operations per
unit of time.

|latency_raw
|link:#latency_raw[latency_raw]
a|The raw latency in microseconds observed at the storage object. This can
be divided by the raw IOPS value to calculate the average latency per I/O
operation.

|status
|string
a|Errors associated with the sample. For example, if the aggregation of
data over multiple nodes fails, then any partial errors might return "ok"
on success or "error" on an internal uncategorized failure. Whenever a
sample collection is missed but done at a later time, it is back filled to
the previous 15 second timestamp and tagged with "backfilled_data".
"Inconsistent_delta_time" is encountered when the time between two
collections is not the same for all nodes. Therefore, the aggregated value
might be over or under inflated. "Negative_delta" is returned when an
expected monotonically increasing value has decreased in value.
"Inconsistent_old_data" is returned when one or more nodes do not have the
latest data.

|timestamp
|string
a|The timestamp of the performance data.

|Name

|Type

|Description

|min_cooling_days

|integer

a|This parameter specifies the minimum number of days that user data blocks of the volume must be cooled before they can be considered cold and tiered out to the cloud tier. Note that this parameter is only used for tiering purposes and does not affect the reporting of inactive data. The value specified should be greater than the frequency with which applications in the volume shift between different sets of data. This parameter cannot be set when volume tiering policy is either "none" or "all". The default value of this parameter depends on the volume's tiering policy. See the tiering policy section of this documentation for corresponding default values. If the tiering policy on the volume gets changed, then this parameter will be reset to the default value corresponding to the new tiering policy.

|object_tags

|array[string]

a|This parameter specifies tags of a volume for objects stored on a FabricPool-enabled aggregate. Each tag is a key,value pair and should be in the format "key=value".

|policy

|string

a|Policy that determines whether the user data blocks of a volume in a FabricPool will be tiered to the cloud store when they become cold. FabricPool combines flash (performance tier) with a cloud store into a single aggregate. Temperature of a volume block increases if it is accessed frequently and decreases when it is not. Valid in POST or PATCH.
all ‐ This policy allows tiering of both Snapshot copies and active file system user data to the cloud store as soon as possible by ignoring the temperature on the volume blocks.
auto ‐ This policy allows tiering of both snapshot and active file system user data to the cloud store
none ‐ Volume blocks will not be tiered to the cloud store.
snapshot_only ‐ This policy allows tiering of only the volume Snapshot copies not associated with the active file system. The default tiering policy is "snapshot-only" for a FlexVol and "none" for a FlexGroup. The default minimum cooling period for the "snapshot-only" tiering policy is 2 days and for the "auto" tiering policy is 31 days.

```
|supported
|boolean
a|This parameter specifies whether or not FabricPools are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only FabricPool aggregates are used if this parameter is set to true and only non FabricPool aggregates are used if this parameter is set to false. Tiering support for a FlexGroup can be changed by moving all of the constituents to the required aggregates. Note that in order to tier data, not only does the volume need to support tiering by using FabricPools, the tiering "policy" must not be 'none'. A volume that uses FabricPools but has a tiering "policy" of 'none' supports tiering, but will not tier any data.
```

```
|clone
```

```
|link:#clone[clone]
```

```
a|
```

```
|cloud_retrieval_policy
```

```
|string
```

```
a|This parameter specifies the cloud retrieval policy for the volume. This policy determines which tiered out blocks to retrieve from the capacity tier to the performance tier. The available cloud retrieval policies are "default" policy retrieves tiered data based on the underlying tiering policy. If the tiering policy is 'auto', tiered data is retrieved only for random client driven data reads. If the tiering policy is 'none' or 'snapshot_only', tiered data is retrieved for random and sequential client driven data reads. If the tiering policy is 'all', tiered data is not retrieved.
```

```
"on_read" policy retrieves tiered data for all client driven data reads.
```

```
"never" policy never retrieves tiered data.
```

```
"promote" policy retrieves all eligible tiered data automatically during the next scheduled scan. It is only supported when the tiering policy is 'none' or 'snapshot_only'. If the tiering policy is 'snapshot_only', the only data brought back is the data in the AFS. Data that is only in a snapshot copy stays in the cloud and if tiering policy is 'none' then all data is retrieved.
```

```
|comment
```

```
|string
```

```
a|A comment for the volume. Valid in POST or PATCH.
```

```
|consistency_group
```

```
|link:#consistency_group[consistency_group]
```

```
a|Consistency group the volume is part of.
```

```
|constituents
```

```
|array[link:#constituents[constituents]]
```

```
a|
```

```
|constituents_per_aggregate
```

```
|integer
a|Specifies the number of times to iterate over the aggregates listed with
the "aggregates.name" or "aggregates.uuid" when creating or expanding a
FlexGroup. If a volume is being created on a single aggregate, the system
will create a flexible volume if the "constituents_per_aggregate" field is
not specified, and a FlexGroup if it is specified. If a volume is being
created on multiple aggregates, the system will always create a FlexGroup.

|create_time
|string
a|Creation time of the volume. This field is generated when the volume is
created.

|efficiency
|link:#efficiency[efficiency]
a|

|encryption
|link:#encryption[encryption]
a|

|error_state
|link:#error_state[error_state]
a|

|files
|link:#files[files]
a|

|flexcache_endpoint_type
|string
a|FlexCache endpoint type.
none &dash; The volume is neither a FlexCache nor origin of any FlexCache.
cache &dash; The volume is a FlexCache volume.
origin &dash; The volume is origin of a FlexCache volume.

|guarantee
|link:#guarantee[guarantee]
a|

|is_object_store
|boolean
a|Specifies whether the volume is provisioned for an object store server.
```

|is_svm_root
|boolean
a|Specifies whether the volume is a root volume of the SVM it belongs to.

|language
|string
a|Language encoding setting for volume. If no language is specified, the volume inherits its SVM language encoding setting.

|metric
|link:#metric[metric]
a|Performance numbers, such as IOPS, latency and throughput.

|movement
|link:#movement[movement]
a|Volume movement. All attributes are modify, that is, not writable through POST. Set PATCH state to destination_aggregate to initiate a volume move operation. Volume movement on FlexGroup constituents are not supported.

|name
|string
a|Volume name. The name of volume must start with an alphabetic character (a to z or A to Z) or an underscore (_). The name must be 197 or fewer characters in length for FlexGroups, and 203 or fewer characters in length for all other types of volumes. Volume names must be unique within an SVM. Required on POST.

|nas
|link:#nas[nas]
a|

|qos
|link:#qos[qos]
a|QoS information

|queue_for_encryption
|boolean
a|Specifies whether the volume is queued for encryption.

|quota
|link:#quota[quota]
a|Quotas track the space or file usage of a user, group, or qtree in a FlexVol or a FlexGroup volume.

|size
|integer
a|Physical size of the volume, in bytes. The minimum size for a FlexVol volume is 20MB and the minimum size for a FlexGroup volume is 200MB per constituent. The recommended size for a FlexGroup volume is a minimum of 100GB per constituent. For all volumes, the default size is equal to the minimum size.

|snaplock
|link:#snaplock[snaplock]
a|

|snapmirror
|link:#snapmirror[snapmirror]
a|Specifies attributes for SnapMirror protection.

|snapshot_policy
|link:#snapshot_policy[snapshot_policy]
a|This is a reference to the Snapshot copy policy.

|space
|link:#space[space]
a|

|state
|string
a|Volume state. A volume can only be brought online if it is offline. Taking a volume offline removes its junction path. The 'mixed' state applies to FlexGroup volumes only and cannot be specified as a target state. An 'error' state implies that the volume is not in a state to serve data.

|statistics
|link:#statistics[statistics]
a|These are raw performance numbers, such as IOPS latency and throughput. These numbers are aggregated across all nodes in the cluster and increase

with the uptime of the cluster.

|status
|array[string]
a|Describes the current status of a volume.

|style
|string
a|The style of the volume. If "style" is not specified, the volume type is determined based on the specified aggregates. Specifying a single aggregate, without "constituents_per_aggregate", creates a flexible volume. Specifying multiple aggregates, or a single aggregate with "constituents_per_aggregate", creates a FlexGroup. Specifying a volume "style" creates a volume of that type. For example, if the style is "flexvol" you must specify a single aggregate. If the style is "flexgroup", the system either uses the specified aggregates or automatically provisions aggregates if there are no specified aggregates.
flexvol ‐ flexible volumes and FlexClone volumes
flexgroup ‐ FlexGroups.

|svm
|link:#svm[svm]
a|SVM containing the volume. Required on POST.

|tiering
|link:#tiering[tiering]
a|

|type
|string
a|Type of the volume.
rw ‐ read-write volume.
dp ‐ data-protection volume.
ls ‐ load-sharing `dp` volume. Valid in GET.

|use_mirrored_aggregates
|boolean
a|Specifies whether mirrored aggregates are selected when provisioning a FlexGroup without specifying "aggregates.name" or "aggregates.uuid". Only mirrored aggregates are used if this parameter is set to 'true' and only unmirrored aggregates are used if this parameter is set to 'false'.
Aggregate level mirroring for a FlexGroup can be changed by moving all of

the constituents to the required aggregates. The default value is 'true' for a MetroCluster configuration and is 'false' for a non-MetroCluster configuration.

```
|uuid
|string
a|Unique identifier for the volume. This corresponds to the instance-uuid that is exposed in the CLI and ONTAPI. It does not change due to a volume move.
```

```
* example: 028baa66-41bd-11e9-81d5-00a0986138f7
```

```
* readOnly: 1
```

```
* Introduced in: 9.6

```
= Storage volumes volume.uuid files path endpoint overview
```

```
== Overview
```

This API is used to read a file, write to a file, retrieve a list of files and directories, and retrieve or modify certain properties of files and directories. The path field is used to specify the path to the directory or file to be acted on. The path field requires using "%2E" to represent "." and "%2F" to represent "/" for the path provided.

```
== File data
```

Read and write data from/to a named file. To read a file, the Accept request HTTP header must be specified as multipart/form-data, and a value for the `length` query property, which represents the number of bytes to be read, must be specified. The API will fail if the length of data being read/written exceeds 1 MB. This API should only be used on normal files or streams associated with files. The results for other file types, such as LUNs is undefined.

The following APIs are used to read or write data to a file:

```
&ndash; GET
```

```
/api/storage/volumes/{volume.uuid}/files/{path}?byte_offset=0&length=40
```

```
-H "Accept: multipart/form-data"
```

```
&ndash; POST /api/storage/volumes/{volume.uuid}/files/{path} -H
```

```
"Content-Type: multipart/form-data" --form "file=the data to be written to
the new file"
```

```
&ndash; PATCH
```

```
/api/storage/volumes/{volume.uuid}/files/{path}?byte_offset=10 -H
"Content-Type: multipart/form-data" --form "file=the new data to be
written or overwritten to the existing file starting at byte_offset"
```

```
== Listing directories and files
```

A list of files and directories and their properties can be retrieved for a specified path.

The following APIs are used to view a list of files and directories:

```
&ndash; GET      /api/storage/volumes/{volume.uuid}/files
```

```
&ndash; GET      /api/storage/volumes/{volume.uuid}/files/{path}
```

```
&ndash; GET
```

```
/api/storage/volumes/{volume.uuid}/files/{path}?fields=*
```

```
== File information
```

The metadata and detailed information about a single directory or file can be retrieved by setting the `return_metadata` query property to `true`. The information returned includes `type`, `creation_time`, `modified_time`, `changed_time`, `accessed_time`, `unix_permissions`, `owner_id`, `group_id`, `size`, `hard_links_count`, `inode_number`, `is_empty`, `bytes_used`, `unique_bytes`, `inode_generation`, `is_vm_aligned`, `is_junction`, `links`, and `analytics` (if requested).

The following API is used to view the properties of a single file or directory:

```
&ndash; GET
```

```
/api/storage/volumes/{volume.uuid}/files/{path}?return_metadata=true
```

```
== File usage
```

Custom details about the usage of a file can be retrieved by specifying a value for the `byte_offset` and `length` query properties.

The following API is used to view the unique bytes, and bytes used, by a file based on the range defined by `byte_offset` and `length`:

```
&ndash; GET
```

```
/api/storage/volumes/{volume.uuid}/files/{path}?return_metadata=true&byte_offset={int}&length={int}
```

== Create a directory

The following API is used to create a directory:

```
&ndash; POST    /api/storage/volumes/{volume.uuid}/files/{path} -d '{"type" : "directory", "unix-permissions" : "644"}'
```

== Delete an entire directory

A directory can be deleted. The behavior of this call is equivalent to `rm -rf`.

The following API is used to delete an entire directory:

```
&ndash; DELETE    /api/storage/volumes/{volume.uuid}/files/{path}?recurse=true
```

== Delete a file or an empty directory

The following API is used to delete a file or an empty directory:

```
&ndash; DELETE    /api/storage/volumes/{volume.uuid}/files/{path}
```

```
&ndash; DELETE    /api/storage/volumes/{volume.uuid}/files/{path}?recurse=false
```

== File system analytics

File system analytics provide a quick method for obtaining information summarizing properties of all files within any directory tree of a volume. When file system analytics are enabled on a volume, ``analytics.+++`` fields may be requested, and will be populated in the response records corresponding to directories. The API does not support file system analytics for requests that are made beyond the boundary of the specified ``volume.uuid``.

The following APIs are used to obtain analytics information for a directory:

```
&ndash; GET    /api/storage/volumes/{volume.uuid}/files/{path}?fields=analytics
```

```
&ndash; GET    /api/storage/volumes/{volume.uuid}/files/{path}?fields=**
```

== QoS

QoS policies and settings enforce Service Level Objectives (SLO) on a file. A pre-created QoS policy can be used by specifying the `qos.name` or `qos.uuid` properties.

The following APIs are used to assign a QoS policy to a file:

```
&ndash; PATCH /api/storage/volumes/{volume.uuid}/files/{path} -d '{
"qos_policy.name" : "policy" }'
```

```
&ndash; PATCH /api/storage/volumes/{volume.uuid}/files/{path} -d '{
"qos_policy.uuid" : "b89bc5dd-94a3-11e8-a7a3-0050568edf84" }'
```

== Symlinks

The following APIs are used to create a symlink and read the contents of a symlink:

```
&ndash; POST /api/storage/volumes/{volume.uuid}/files/{path} -d '{
"target" : "directory2/file1" }'
```

```
&ndash; GET
/api/storage/volumes/{volume.uuid}/files/{path}?return_metadata=true&fields=target
```

== Rename a file or a directory

The following API can be used to rename a file or a directory. Note that you need to provide the path relative to the root of the volume in the `path` body parameter.

```
&ndash; PATCH /api/storage/volumes/{volume.uuid}/files/{path} -d '{
"path" : "directory1/directory2" }'
```

```
&ndash; PATCH /api/storage/volumes/{volume.uuid}/files/{path} -d '{
"path" : "directory1/directory2/file1" }'
```

== Examples

=== Writing to a new file

The API:

```
POST /api/storage/volumes/{volume.uuid}/files/{path}
```

```
# The call:
curl -X POST "https://<mgmt-ip>/api/storage/volumes/54c06ce2-5430-11ea-90f9-005056a73aff/files/aNewFile" -H "Content-Type: multipart/form-data"
--form "file=the data to be written to the new file"
-----

=== Writing to an existing file

-----

# The API:
PATCH /api/storage/volumes/{volume.uuid}/files/{path}

# The call:
curl -X PATCH "https://<mgmt-ip>/api/storage/volumes/54c06ce2-5430-11ea-90f9-005056a73aff/files/aNewFile?byte_offset=39" -H "Content-Type: multipart/form-data" --form "file=*here is a little more data"
-----

=== Reading a file

-----

# The API:
GET /api/storage/volumes/{volume.uuid}/files/{path}

# The call:
curl -X GET "https://<mgmt-ip>/api/storage/volumes/54c06ce2-5430-11ea-90f9-005056a73aff/files/aNewFile?byte_offset=0&length=100" -H "Accept: multipart/form-data"

# Response for file data:
--ec51b3541741ade7
Content-Disposition: form-data; name="bytes_read"
Content-Type: text/plain
66
--ec51b3541741ade7
Content-Disposition: form-data; filename="aNewFile"
Content-Type: application/octet-stream
the data to be written to the new file*here is a little more data
--ec51b3541741ade7--
-----

=== Creating a directory

You can use the POST request to create a directory.
```

```
-----  
  
# The API:  
POST /api/storage/volumes/{volume.uuid}/files/{path}  
  
# The call:  
curl -X POST "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-  
b926-05056aca658/files/dir1" -H 'accept: application/hal+json' -d '{  
"type" : "directory", "unix_permissions" : "644" }'  
  
# The response:  
{  
"num_records": 1,  
"records": [  
  {  
    "path": "dir1",  
    "type": "directory",  
    "unix_permissions": 644  
  }  
]  
}
```

```
-----  
  
=== Creating a stream on a file  
  
-----
```

```
# The API:  
POST /api/storage/volumes/{volume.uuid}/files/{path}?overwrite=true  
  
# The call:  
curl -X POST "https://<mgmt-ip>/api/storage/volumes/54c06ce2-5430-11ea-  
90f9-005056a73aff/files/aNewFile?overwrite=true&byte_offset=-  
1&stream_name=someStream" -H "Content-Type: multipart/form-data" --form  
"file=the data to be written to the new file"
```

```
-----  
  
=== Retrieving the list of files in a directory  
  
-----
```

```
# The API:  
GET /api/storage/volumes/{volume.uuid}/files/{path}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-  
b926-05056aca658/files/d1%2Fd2%2Fd3"
```

```

# Response for file records:

    }
  }
}
-----

```

=== Retrieving a list of files based on file type

You can filter the list of files you retrieve based on multiple file types by including a query parameter in the following format
type="file|symlink"

The API:

```
GET /api/storage/volumes/{volume.uuid}/files/{path}
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-
b926-05056aca658/files/d1%2Fd2%2Fd3?type=file%124;directory"
```

Response for file records:

```
{
  "records": [
    {
      "path": "d1/d2/d3",
      "name": ".",

```

```
"type": "directory",
  "_links": {
    "self": {
      "href": "/api/storage/volumes/cb6b1b39-8d21-11e9-b926-005056aca658/files/d1%2Fd2%2Fd3%2F%2E"
    },
    "metadata": {
      "href": "/api/storage/volumes/e8274d79-3bba-11ea-b780-005056a7d72a/files/d1%2Fd2%2Fd3%2F%2E?return_metadata=true"
    }
  }
},
{
  "path": "d1/d2/d3",
  "name": "..",
  "type": "directory",
  "_links": {
    "self": {
      "href": "/api/storage/volumes/cb6b1b39-8d21-11e9-b926-005056aca658/files/d1%2Fd2%2Fd3%2F%2E%2E"
    },
    "metadata": {
      "href": "/api/storage/volumes/e8274d79-3bba-11ea-b780-005056a7d72a/files/d1%2Fd2%2Fd3%2F%2E%2E?return_metadata=true"
    }
  }
},
{
  "path": "d1/d2/d3",
  "name": "f1",
  "type": "file",
  "_links": {
    "metadata": {
      "href": "/api/storage/volumes/e8274d79-3bba-11ea-b780-005056a7d72a/files/d1%2Fd2%2Fd3%2Ffile1?return_metadata=true"
    }
  }
},
{
  "path": "d1/d2/d3",

        "unix_permissions": 644,
        "owner_id": 54738,
        "group_id": 30,
        "size": 200,
        "hard_links_count": 1,
        "inode_number": 1233,
    }
]
}

```

```
    "bytes_used": 4096,
    "unique_bytes": 4096,
    "inode_generation": 214488325,
    "is_vm_aligned": false,
    "is_junction": false
  }
],
"num_records": 1,
"_links": {
  "self": {
    "href": "/api/storage/volumes/da8bb06c-823e-11e9-b790-005056acdc0/files/d1%2Fd2%2Fd3%2Ff1?return_metadata=true"
  }
}
}
-----
```

=== Creating a symlink to a relative path

You can use the POST request to create a symlink.

The API:

POST /api/storage/volumes/{volume.uuid}/files/{path}

The call:

```
curl -X POST "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-b926-05056aca658/files/symlink1" -H 'accept: application/hal+json' -d '{"target" : "d1/f1"}'
```

The response:

```
{
  "num_records": 1,
  "records": [
    {
      "path": "symlink1",
      "target": "d1/f1"
    }
  ]
}
```

=== Retrieving the target of a symlink

You can use the GET request to view the target of a symlink.

```
-----  
  
# The API:  
GET /api/storage/volumes/{volume.uuid}/files/{path}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-  
b926-05056aca658/files/symlink1?return_metadata=true&fields=target"  
  
# The response:  
{  
  "records": [  
    {  
      "path": "symlink1",  
      "target": "d1/f1"  
    }  
  ],  
  "num_records": 1,  
  "_links": {  
    "self": {  
      "href": "/api/storage/volumes/54c06ce2-5430-11ea-90f9-  
005056a73aff/files/symlink1?return_metadata=true&fields=target"  
    }  
  }  
}
```

```
==== Retrieving the usage information for a file
```

You can use the GET request to retrieve the unique bytes held in a file with or without specifying the offset.

```
-----  
  
# The API:  
GET /api/storage/volumes/{volume.uuid}/files/{path}  
  
# The call:  
curl -X GET "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-  
b926-05056aca658/files/f1?return_metadata=true&byte_offset=100&length=200"  
  
# The response:  
{  
  "records": [  
    {  
      "path": "d1/d2/d3/f1",
```

```

    "type": "file",
    "creation_time": "2019-06-12T21:27:28-04:00",
    "modified_time": "2019-06-12T21:27:28-04:00",
    "changed_time": "2019-06-12T21:27:28-04:00",
    "accessed_time": "2019-06-12T21:27:28-04:00",
    "unix_permissions": 644,
    "owner_id": 54738,
    "group_id": 30,
    "size": 200,
    "hard_links_count": 1,
    "inode_number": 1233,
    "bytes_used": 4096,
    "unique_bytes": 4096,
    "inode_generation": 214488325,
    "is_vm_aligned": false,
    "is_junction": false
  }
],
"num_records": 1,
"_links": {
  "self": {
    "href": "/api/storage/volumes/cb6b139-8d21-11e9-b926-05056aca658/files/f1?return_metadata=true&byte_offset=100&length=200"
  }
}
}
-----

```

=== Retrieving all information (including analytics) for a directory

The API:

```
GET /api/storage/volumes/{volume.uuid}/files/{path}
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/storage/volumes/1ef5d1b2-f9d7-11e9-8043-00505682f860/files/d1?return_metadata=true&fields=**"
```

Response for all fields of the directory:

```

{
  "records": [
    {
      "svm": {
        "uuid": "58a996a2-f9d5-11e9-8043-00505682f860",
        "_links": {

```

```
    "self": {
      "href": "/api/svm/svms/58a996a2-f9d5-11e9-8043-00505682f860"
    }
  },
  "volume": {

=== Identifying the largest subdirectories

The API:

```
GET /api/storage/volumes/{volume.uuid}/files/{path}
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/storage/volumes/1ef5d1b2-f9d7-11e9-
8043-
00505682f860/files/d1?fields=analytics.bytes_used&type=directory&order_by=
analytics.bytes_used%20desc"
```

Response with the largest subdirectories sorted by their usage:

```
{
  "records": [
    {
      "path": "d1",
      "name": "..",
      "type": "directory",
      "analytics": {
        "bytes_used": 56623104
      }
    },
    {
      "path": "d1",
      "name": ".",
      "type": "directory",
      "analytics": {
        "bytes_used": 35651584
      }
    }
  ]
}
```

```

},
{
  "path": "d1",

```

=== Assigning a QoS policy to a file

You can use the PATCH request to assign a QoS policy to a file.

The API:

```
PATCH /api/storage/volumes/{volume.uuid}/files/{path}
```

```
# The call:
curl -X PATCH "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-
b926-05056aca658/files/directory1%2Ffile1" -d '{ "qos_policy": { "name":
"policy" } }'
```

```
# The response:
```

```
{}
```

```
----
```

```
=== Retrieving QoS information for a file
```

You can use the GET request for all fields with `return_metadata="true"` to retrieve QoS information for the file.

```
----
```

```
# The API:
```

```
GET /api/storage/volumes/{volume.uuid}/files/{path}
```

```
# The call:
```

```
curl -X GET "https://<mgmt-ip>/api/storage/volumes/cb6b1b39-8d21-11e9-
b926-05056aca658/files/file?return_metadata=true&fields=**"
```

```

= Delete an existing file or directory
```

```
[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-  
block]#`/storage/volumes/{volume.uuid}/files/{path}`#
```

```
*Introduced In:* 9.8
```

Deletes an existing file or directory. Query-based DELETE operations are not supported.

```
== Parameters
```

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|volume.uuid
```

```
|string
```

```
|path
```

```
|True
```

```
a|Volume UUID
```

```
|path
```

```
|string
```

```
|path
```

```
|True
```

a|The relative path of a directory in the volume. The path field requires using "%2E" to represent "." and "%2F" to represent "/" for the path provided.

```
|recurse
```

```
|boolean
```

```
|query
```

```
|False
```

a|Delete an entire directory. The behaviour of this call is equivalent to `rm -rf`.

* Default value:

|throttle_deletion

|integer

|query

|False

a|The maximum number of directory delete operations per second. A valid throttle_deletion number is an integer from 10 to 100000.

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

|analytics.histogram_by_time_labels
|array[string]
|query
|False
a|Request that returned
xref:{relative_path}analytics_histogram_by_time.html[analytics_histogram_b
y_time] objects including values associated with the specified labels.

As described in the object description, the labels may take the following forms:
partial-date

```
+++<tt>+++--+++</tt>+++ _partial-date_
_partial-date_ +++<tt>+++--+++</tt>+++
_partial-date_ +++<tt>+++--+++</tt>+++- _partial-date_
+++<tt>+++unknown+++</tt>+++
```

Intervals that the system would not normally return may be specified. In this case, the appropriate values and percentages summarizing all files with a time-based attribute within the indicated period of time are calculated and returned in the response. However, there are some restrictions:

Any `_partial-date_` specified as the beginning or end of an interval must be tracked by the system. Valid `__partial-date__s` may be determined by making an OPTIONS request to the

```
+++<tt>+++/storage/volumes/{volume.uuid}/files/{path}+++</tt>+++
endpoint.
```

Intervals may not mix week-based `__partial-date__s` in the form `__yyyy_-W__ww__` with other types of `__partial-date__s`.

* Introduced in: 9.8

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

- * Default value: 1
- * Max value: 120
- * Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

|Name

|Type

|Description

|labels

|array[string]

a|Labels for this histogram

|newest_label

|string

a|Each label indicates the period of time the corresponding data is associated with. A label can take one of the following forms:

- a partial date in an extended ISO8601 representation
- an interval between partial dates in an extended ISO8601 representation, where "--" is used to separate the beginning and end of the interval
- the string literal "unknown"

For partial dates and partial date intervals where components of a date are unspecified, the label allows for any valid normalized values the unspecified components might take. For example, the label "2017" allows for any time within the year 2017. Essentially, this is the fully specified interval 2017-01-01T00:00:00--2017-12-31T23:59:59. Similarly, the interval "2018-05--2018-07" allows for any time within the months of May, June, and July in 2018, corresponding to the fully specified interval 2018-05-01T00:00:00--2018-07-31T23:59:59.

The following extensions to ISO8601 are used:

Quarters may be specified. The form `__yyyy_-Q__q__` is used to represent the `__q__`th quarter of the year `__yyyy_`. Q1 consists of the months January, February, and March; Q2 consists of April, May, and June; Q3 consists of July, August, and September; Q4 consists of October, November, and December. For example, the label "2019-Q2" represents the second quarter of the year 2019, which corresponds to the interval 2019-04-01T00:00:00--2019-06-30T23:59:59.

Either the beginning or end of an interval may be omitted. When the beginning is omitted, the interval includes points in time arbitrarily far in the past. When the end is omitted, the interval includes points in time through the end of the current week.

The "unknown" label tracks data that could not be associated with any other time period. This usually occurs when the data was at some point associated with a time in the future.

|oldest_label

|string

a|Each label indicates the period of time the corresponding data is associated with. A label can take one of the following forms:

- a partial date in an extended ISO8601 representation

The following extensions to ISO8601 are used:

Quarters may be specified. The form `__yyyy_-Q__q__` is used to represent the `__q__`th quarter of the year `__yyyy_`. Q1 consists of the months January, February, and March; Q2 consists of April, May, and June; Q3 consists of July, August, and September; Q4 consists of October, November, and December. For example, the label "2019-Q2" represents the second quarter of the year 2019, which corresponds to the interval 2019-04-01T00:00:00--2019-06-30T23:59:59.

Either the beginning or end of an interval may be omitted. When the beginning is omitted, the interval includes points in time arbitrarily far in the past. When the end is omitted, the interval includes points in time through the end of the current week.

The "unknown" label tracks data that could not be associated with any other time period. This usually occurs when the data was at some point associated with a time in the future.

```
[#analytics]
[.api-collapsible-fifth-title]
analytics
```

Additional file system analytics information summarizing all descendents of a directory.

This property is only populated if file system analytics is enabled on the containing volume.

In the context of the `records` property of a `xref:{relative_path}file-info-response(#model-file-info-response)`, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the `file-info-response(#model-file-info-response)`. This avoids an excessive amount of duplicated information when a `get-storage-volumes-files-.html<<model-file_info_response,file_info_response>>`, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the `<<model-file_info_response,file_info_response>>`. This avoids an excessive amount of duplicated information when a `[GET /storage/volumes/{volume.uuid}/files/{path}]` call returns a large collection.

This avoids an excessive amount of duplicated information when a `[GET /storage/volumes/{volume.uuid}/files/{path}]` call returns a large collection.

|bytes_used

|integer

a|The actual number of bytes used on disk by this file. If `byte_offset` and `length` parameters are specified, this will return the bytes used by the file within the given range.

|changed_time

|string

a|Last time data or attributes changed on the file in date-time format.

|creation_time

|string

a|Creation time of the file in date-time format.

|fill_enabled

|boolean

a|Returns "true" if the space reservation is enabled. The field `overwrite_enabled` must also be set to the same value as this field.

|group_id
|integer
a|The integer ID of the group of the file owner.

|hard_links_count
|integer
a|The number of hard links to the file.

|inode_generation
|integer
a|Inode generation number.

|inode_number
|integer
a|The file inode number.

|is_empty
|boolean
a|Specifies whether or not a directory is empty. A directory is considered empty if it only contains entries for "." and "..". This element is present if the file is a directory. In some special error cases, such as when the volume goes offline or when the directory is moved while retrieving this info, this field might not get set.

|is_junction
|boolean
a|Returns "true" if the directory is a junction.

|is_snapshot
|boolean
a|Returns "true" if the directory is a Snapshot copy.

|is_vm_aligned
|boolean
a|Returns true if the file is vm-aligned. A vm-aligned file is a file that is initially padded with zero-filled data so that its actual data starts at an offset other than zero. The amount by which the start offset is adjusted depends on the vm-align setting of the hosting volume.

```
|modified_time
|string
a|Last data modification time of the file in date-time format.

|name
|string
a|Name of the file.

|overwrite_enabled
|boolean
a|Returns "true" if the space reservation for overwrites is enabled. The
field fill_enabled must also be set to the same value as this field.

|owner_id
|integer
a|The integer ID of the file owner.

|path
|string
a|Path of the file.

|qos_policy
|link:#qos_policy[qos_policy]
a|The QoS policy for the file. Both traditional and adaptive QoS policies
are supported. If both `qos_policy.uuid` and `qos_policy.name` properties
are specified in the same request, they must refer to the same QoS policy.
To remove the file from a QoS policy, set the property `qos_policy.name`
in a PATCH request to an empty string "" or "none".

NOTE: Files which are in use as a LUN cannot be assigned to a QoS policy,
instead use PATCH on /storage/luns to assign a QoS policy for such files.

Note that a QoS policy can be set on a file, or a file's volume, but not
on both.

|size
|integer
a|The size of the file, in bytes.

|target
```

|string
a|The relative or absolute path contained in a symlink, in the form
+++<some>+++ /+++<path>+++ .+++</path>+++++</some>+++

|type
|string
a|Type of the file.

|unique_bytes
|integer
a|Number of bytes uniquely held by this file. If byte_offset and length parameters are specified, this will return bytes uniquely held by the file within the given range.

|unix_permissions
|integer
a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write), and 1 (execute). The first digit selects the set user ID(4), set group ID (2), and sticky (1) attributes. The second digit selects permissions for the owner of the file; the third selects permissions for other users in the same group; the fourth selects permissions for other users not in the group.

```
|labels
|array[string]
```

a|Labels for this histogram

|newest_label

|string

a|Each label indicates the period of time the corresponding data is associated with. A label can take one of the following forms:

a partial date in an extended ISO8601 representation

an interval between partial dates in an extended ISO8601 representation, where "--" is used to separate the beginning and end of the interval

the string literal "unknown"

For partial dates and partial date intervals where components of a date are unspecified, the label allows for any valid normalized values the unspecified components might take. For example, the label "2017" allows for any time within the year 2017. Essentially, this is the fully specified interval 2017-01-01T00:00:00--2017-12-31T23:59:59. Similarly, the interval "2018-05--2018-07" allows for any time within the months of May, June, and July in 2018, corresponding to the fully specified interval 2018-05-01T00:00:00--2018-07-31T23:59:59.

The following extensions to ISO8601 are used:

Quarters may be specified. The form `__yyyy_-Q__q__` is used to represent the `__q__`th quarter of the year `__yyyy_`. Q1 consists of the months January, February, and March; Q2 consists of April, May, and June; Q3 consists of July, August, and September; Q4 consists of October, November, and December. For example, the label "2019-Q2" represents the second quarter of the year 2019, which corresponds to the interval 2019-04-01T00:00:00--2019-06-30T23:59:59.

Either the beginning or end of an interval may be omitted. When the beginning is omitted, the interval includes points in time arbitrarily far in the past. When the end is omitted, the interval includes points in time through the end of the current week.

The "unknown" label tracks data that could not be associated with any other time period. This usually occurs when the data was at some point associated with a time in the future.

|oldest_label

|string

a|Each label indicates the period of time the corresponding data is associated with. A label can take one of the following forms:

a partial date in an extended ISO8601 representation

an interval between partial dates in an extended ISO8601 representation, where "--" is used to separate the beginning and end of the interval

the string literal "unknown"

For partial dates and partial date intervals where components of a date are unspecified, the label allows for any valid normalized values the unspecified components might take. For example, the label "2017" allows for any time within the year 2017. Essentially, this is the fully specified interval 2017-01-01T00:00:00--2017-12-31T23:59:59. Similarly, the interval "2018-05--2018-07" allows for any time within the months of May, June, and July in 2018, corresponding to the fully specified interval 2018-05-01T00:00:00--2018-07-31T23:59:59.

The following extensions to ISO8601 are used:

Quarters may be specified. The form `_yyyy_-Q_q` is used to represent the `q`th quarter of the year `_yyyy_`. Q1 consists of the months January, February, and March; Q2 consists of April, May, and June; Q3 consists of July, August, and September; Q4 consists of October, November, and December. For example, the label "2019-Q2" represents the second quarter of the year 2019, which corresponds to the interval 2019-04-01T00:00:00--2019-06-30T23:59:59.

[#analytics]
[.api-collapsible-fifth-title]
analytics
```

Additional file system analytics information summarizing all descendants of a directory.

This property is only populated if file system analytics is enabled on the containing volume.

In the context of the `records` property of a `xref:{relative_path}file-info-response(#model-file-info-response)`, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the `file-info-response(#model-file-info-response)`. This avoids an excessive amount of duplicated information when a `get-storage-volumes-files-.html<<model-file_info_response,file_info_response>>`, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the `<<model-file_info_response,file_info_response>>`. This avoids an excessive amount of duplicated information when a `[GET /storage/volumes/{volume.uuid}/files/{path}]` call returns a large collection.

[#qos_policy]
[.api-collapsible-fifth-title]
qos_policy
```

The QoS policy for the file. Both traditional and adaptive QoS policies are supported. If both ``qos_policy.uuid`` and ``qos_policy.name`` properties are specified in the same request, they must refer to the same QoS policy. To remove the file from a QoS policy, set the property ``qos_policy.name`` in a PATCH request to an empty string "" or "none".

NOTE: Files which are in use as a LUN cannot be assigned to a QoS policy,

instead use PATCH on /storage/luns to assign a QoS policy for such files.

Note that a QoS policy can be set on a file, or a file's volume, but not on both.

a|Last access time of the file in date-time format.

|analytics

|link:#analytics[analytics]

a|Additional file system analytics information summarizing all descendents of a directory.

This property is only populated if file system analytics is enabled on the containing volume.

In the context of the `records` property of a xref:{relative_path}file-

info-response(#model-file-info-response), analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the file-info-response(#model-file-info-response). This avoids an excessive amount of duplicated information when a get-storage-volumes-files-.html<<model-file_info_response,file_info_response>>, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the <<model-file_info_response,file_info_response>>. This avoids an excessive amount of duplicated information when a [GET /storage/volumes/{volume.uuid}/files/{path}] call returns a large collection.

|bytes_used

|integer

a|The actual number of bytes used on disk by this file. If byte_offset and length parameters are specified, this will return the bytes used by the file within the given range.

|changed_time

|string

a|Last time data or attributes changed on the file in date-time format.

|creation_time

|string

a|Creation time of the file in date-time format.

|fill_enabled

|boolean

a|Returns "true" if the space reservation is enabled. The field overwrite_enabled must also be set to the same value as this field.

|group_id

|integer

a|The integer ID of the group of the file owner.

|hard_links_count
|integer
a|The number of hard links to the file.

|inode_generation
|integer
a|Inode generation number.

|inode_number
|integer
a|The file inode number.

|is_empty
|boolean
a|Specifies whether or not a directory is empty. A directory is considered empty if it only contains entries for "." and "..". This element is present if the file is a directory. In some special error cases, such as when the volume goes offline or when the directory is moved while retrieving this info, this field might not get set.

|is_junction
|boolean
a|Returns "true" if the directory is a junction.

|is_snapshot
|boolean
a|Returns "true" if the directory is a Snapshot copy.

|is_vm_aligned
|boolean
a|Returns true if the file is vm-aligned. A vm-aligned file is a file that is initially padded with zero-filled data so that its actual data starts at an offset other than zero. The amount by which the start offset is adjusted depends on the vm-align setting of the hosting volume.

|modified_time
|string
a|Last data modification time of the file in date-time format.

|name
|string
a|Name of the file.

|overwrite_enabled
|boolean
a|Returns "true" if the space reservation for overwrites is enabled. The field fill_enabled must also be set to the same value as this field.

|owner_id
|integer
a|The integer ID of the file owner.

|path
|string
a|Path of the file.

|qos_policy
|link:#qos_policy[qos_policy]
a|The QoS policy for the file. Both traditional and adaptive QoS policies are supported. If both `qos_policy.uuid` and `qos_policy.name` properties are specified in the same request, they must refer to the same QoS policy. To remove the file from a QoS policy, set the property `qos_policy.name` in a PATCH request to an empty string "" or "none".

NOTE: Files which are in use as a LUN cannot be assigned to a QoS policy, instead use PATCH on /storage/luns to assign a QoS policy for such files.

Note that a QoS policy can be set on a file, or a file's volume, but not on both.

|size
|integer
a|The size of the file, in bytes.

|target
|string
a|The relative or absolute path contained in a symlink, in the form +++<some>+++ /+++<path>+++ .+++</path>++++++</some>+++

|type
|string
a|Type of the file.

|unique_bytes
|integer
a|Number of bytes uniquely held by this file. If byte_offset and length parameters are specified, this will return bytes uniquely held by the file within the given range.

|unix_permissions
|integer
a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write), and 1 (execute). The first digit selects the set user ID(4), set group ID (2), and sticky (1) attributes. The second digit selects permissions for the owner of the file; the third selects permissions for other users in the same group; the fourth selects permissions for other users not in the group.

```

```
|True
```

```
a|Volume UUID
```

```
|path
```

```
|string
```

```
|path
```

```
|True
```

a|Relative path of a new file, directory or symlink. The path field requires using "%2E" to represent "." and "%2F" to represent "/" for the path provided.

```
|byte_offset
```

```
|integer
```

```
|query
```

```
|False
```

a|How many bytes into the file to begin writing. Use -1 to append (default).

```
|overwrite
```

```
|boolean
```

```
|query
```

```
|False
```

a|If false, and the file exists, the write will fail. Default is false.

|stream_name

|string

|query

|False

a|Name of stream associated with the file to write data to.

|data

|string

|formData

|False

a|Data to write to the file.

a|Last access time of the file in date-time format.

|analytics

|link:#analytics[analytics]

a|Additional file system analytics information summarizing all descendents of a directory.

This property is only populated if file system analytics is enabled on the containing volume.

In the context of the `records` property of a `xref:{relative_path}file-info-response(#model-file-info-`

response), analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the file-info-response (#model-file-info-response). This avoids an excessive amount of duplicated information when a get-storage-volumes-files-.html<<model-file_info_response,file_info_response>>, analytics objects will only include properties that may vary between elements within the collection. For example, the analytics objects will not contain histogram labels, since the same histogram labels are used for all elements within the collection. The invariant information is instead available via the analytics property of the <<model-file_info_response,file_info_response>>. This avoids an excessive amount of duplicated information when a [GET /storage/volumes/{volume.uuid}/files/{path}] call returns a large collection.

|bytes_used

|integer

a|The actual number of bytes used on disk by this file. If byte_offset and length parameters are specified, this will return the bytes used by the file within the given range.

|changed_time

|string

a|Last time data or attributes changed on the file in date-time format.

|creation_time

|string

a|Creation time of the file in date-time format.

|fill_enabled

|boolean

a|Returns "true" if the space reservation is enabled. The field overwrite_enabled must also be set to the same value as this field.

|group_id

|integer

a|The integer ID of the group of the file owner.

|hard_links_count

|integer
a|The number of hard links to the file.

|inode_generation
|integer
a|Inode generation number.

|inode_number
|integer
a|The file inode number.

|is_empty
|boolean
a|Specifies whether or not a directory is empty. A directory is considered empty if it only contains entries for "." and "..". This element is present if the file is a directory. In some special error cases, such as when the volume goes offline or when the directory is moved while retrieving this info, this field might not get set.

|is_junction
|boolean
a|Returns "true" if the directory is a junction.

|is_snapshot
|boolean
a|Returns "true" if the directory is a Snapshot copy.

|is_vm_aligned
|boolean
a|Returns true if the file is vm-aligned. A vm-aligned file is a file that is initially padded with zero-filled data so that its actual data starts at an offset other than zero. The amount by which the start offset is adjusted depends on the vm-align setting of the hosting volume.

|modified_time
|string
a|Last data modification time of the file in date-time format.

|name

```
|string
a|Name of the file.

|overwrite_enabled
|boolean
a|Returns "true" if the space reservation for overwrites is enabled. The
field fill_enabled must also be set to the same value as this field.

|owner_id
|integer
a|The integer ID of the file owner.

|path
|string
a|Path of the file.

|qos_policy
|link:#qos_policy[qos_policy]
a|The QoS policy for the file. Both traditional and adaptive QoS policies
are supported. If both `qos_policy.uuid` and `qos_policy.name` properties
are specified in the same request, they must refer to the same QoS policy.
To remove the file from a QoS policy, set the property `qos_policy.name`
in a PATCH request to an empty string "" or "none".

NOTE: Files which are in use as a LUN cannot be assigned to a QoS policy,
instead use PATCH on /storage/luns to assign a QoS policy for such files.

Note that a QoS policy can be set on a file, or a file's volume, but not
on both.

|size
|integer
a|The size of the file, in bytes.

|target
|string
a|The relative or absolute path contained in a symlink, in the form
+++<some>+++ /+++<path>+++ .+++</path>++++++</some>+++

|type
```

|string

a|Type of the file.

|unique_bytes

|integer

a|Number of bytes uniquely held by this file. If `byte_offset` and `length` parameters are specified, this will return bytes uniquely held by the file within the given range.

|unix_permissions

|integer

a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write), and 1 (execute). The first digit selects the set user ID(4), set group ID (2), and sticky (1) attributes. The second digit selects permissions for the owner of the file; the third selects permissions for other users in the same group; the fourth selects permissions for other users not in the group.

```
|labels
|array[string]
a|Labels for this histogram
```

```
|newest_label
|string
```

a|Each label indicates the period of time the corresponding data is associated with. A label can take one of the following forms:
a partial date in an extended ISO8601 representation
an interval between partial dates in an extended ISO8601 representation, where "--" is used to separate the beginning and end of the interval
the string literal "unknown"

For partial dates and partial date intervals where components of a date are unspecified, the label allows for any valid normalized values the unspecified components might take. For example, the label "2017" allows for any time within the year 2017. Essentially, this is the fully specified interval 2017-01-01T00:00:00--2017-12-31T23:59:59. Similarly, the interval "2018-05--2018-07" allows for any time within the months of

May, June, and July in 2018, corresponding to the fully specified interval 2018-05-01T00:00:00--2018-07-31T23:59:59.

The following extensions to ISO8601 are used:

Quarters may be specified. The form `__yyyy_-Q__q__` is used to represent the `__q__`th quarter of the year `__yyyy_`. Q1 consists of the months January, February, and March; Q2 consists of April, May, and June; Q3 consists of July, August, and September; Q4 consists of October, November, and December. For example, the label "2019-Q2" represents the second quarter of the year 2019, which corresponds to the interval 2019-04-01T00:00:00--2019-06-30T23:59:59.

Either the beginning or end of an interval may be omitted. When the beginning is omitted, the interval includes points in time arbitrarily far in the past. When the end is omitted, the interval includes points in time through the end of the current week.

The "unknown" label tracks data that could not be associated with any other time period. This usually occurs when the data was at some point associated with a time in the future.

|oldest_label

|string

[#analytics]
[.api-collapsible-fifth-title]
analytics

Additional file system analytics information summarizing all descendents
of a directory.

This property is only populated if file system analytics is enabled on the
containing volume.

In the context of the `records` property of a xref:{relative_path}file-
info-response(#model-file-info-
response), analytics objects will only include properties that may vary between eleme
ntswithinthecollection. for example, the analytics objects will not contain histogr
amlabels, sincethesamehistogramlabelsareusedforall elements within the collecti
on. the invariant information is instead available via the analytics property of the fi
le-info-response(#model-file-info-
response). this avoids an excessive amount of duplicated information whenaget-
```

```
storage-volumes-files-.html<<model-  
file_info_response,file_info_response>>, analytics objects will only  
include properties that may vary between elements within the collection.  
For example, the analytics objects will not contain histogram labels,  
since the same histogram labels are used for all elements within the  
collection. The invariant information is instead available via the  
analytics property of the <<model-file_info_response,file_info_response>>.  
This avoids an excessive amount of duplicated information when a [GET  
/storage/volumes/{volume.uuid}/files/{path}] call returns a large  
collection.

This avoids an excessive amount of duplicated information when a `[GET /storage/volumes/{volume.uuid}/files/{path}]` call returns a large collection.

```
|bytes_used
|integer
a|The actual number of bytes used on disk by this file. If byte_offset and
length parameters are specified, this will return the bytes used by the
file within the given range.

|changed_time
|string
a|Last time data or attributes changed on the file in date-time format.

|creation_time
|string
a|Creation time of the file in date-time format.

|fill_enabled
|boolean
a|Returns "true" if the space reservation is enabled. The field
overwrite_enabled must also be set to the same value as this field.

|group_id
|integer
a|The integer ID of the group of the file owner.

|hard_links_count
|integer
a|The number of hard links to the file.

|inode_generation
|integer
a|Inode generation number.

|inode_number
|integer
a|The file inode number.

|is_empty
|boolean
a|Specifies whether or not a directory is empty. A directory is considered
empty if it only contains entries for "." and "..". This element is
```

present if the file is a directory. In some special error cases, such as when the volume goes offline or when the directory is moved while retrieving this info, this field might not get set.

|is_junction

|boolean

a|Returns "true" if the directory is a junction.

|is_snapshot

|boolean

a|Returns "true" if the directory is a Snapshot copy.

|is_vm_aligned

|boolean

a|Returns true if the file is vm-aligned. A vm-aligned file is a file that is initially padded with zero-filled data so that its actual data starts at an offset other than zero. The amount by which the start offset is adjusted depends on the vm-align setting of the hosting volume.

|modified_time

|string

a|Last data modification time of the file in date-time format.

|name

|string

a|Name of the file.

|overwrite_enabled

|boolean

a|Returns "true" if the space reservation for overwrites is enabled. The field fill_enabled must also be set to the same value as this field.

|owner_id

|integer

a|The integer ID of the file owner.

|path

|string

a|Path of the file.

|qos_policy

|link:#qos_policy[qos_policy]

a|The QoS policy for the file. Both traditional and adaptive QoS policies are supported. If both `qos_policy.uuid` and `qos_policy.name` properties are specified in the same request, they must refer to the same QoS policy. To remove the file from a QoS policy, set the property `qos_policy.name` in a PATCH request to an empty string "" or "none".

NOTE: Files which are in use as a LUN cannot be assigned to a QoS policy, instead use PATCH on /storage/luns to assign a QoS policy for such files.

Note that a QoS policy can be set on a file, or a file's volume, but not on both.

|size

|integer

a|The size of the file, in bytes.

|target

|string

a|The relative or absolute path contained in a symlink, in the form +++<some>+++ /+++<path>+++ .+++</path>++++++</some>+++

|type

|string

a|Type of the file.

|unique_bytes

|integer

a|Number of bytes uniquely held by this file. If byte_offset and length parameters are specified, this will return bytes uniquely held by the file within the given range.

|unix_permissions

|integer

a|UNIX permissions to be viewed as an octal number. It consists of 4 digits derived by adding up bits 4 (read), 2 (write), and 1 (execute). The first digit selects the set user ID(4), set group ID (2), and sticky (1) attributes. The second digit selects permissions for the owner of the file; the third selects permissions for other users in the same group; the

fourth selects permissions for other users not in the group.

|query
|False
a|The time range for the data. Examples can be 1h, 1d, 1m, 1w, 1y.
The period for each time range is as follows:

* 1h: Metrics over the most recent hour sampled over 15 seconds.
* 1d: Metrics over the most recent day sampled over 5 minutes.
* 1w: Metrics over the most recent week sampled over 30 minutes.
* 1m: Metrics over the most recent month sampled over 2 hours.
* 1y: Metrics over the most recent year sampled over a day.
* Default value: 1
* enum: ["1h", "1d", "1w", "1m", "1y"]

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.

```

Default direction is 'asc' for ascending.

```
|return_records  
|boolean  
|query  
|False  
a|The default is true for GET calls. When set to false, only the number  
of records is returned.
```

* Default value: 1

```

```

```
|duration
|string
```

a|The duration over which this sample is calculated. The time durations are represented in the ISO-8601 standard format. Samples can be calculated over the following durations:

```
|iops
|link:#iops[iops]
```

a|The rate of I/O operations observed at the storage object.

```
|latency
|link:#latency[latency]
```

a|The round trip latency in microseconds observed at the storage object.

```
|status
|string
```

a|Errors associated with the sample. For example, if the aggregation of data over multiple nodes fails, then any partial errors might return "ok"

on success or "error" on an internal uncategorized failure. Whenever a sample collection is missed but done at a later time, it is back filled to the previous 15 second timestamp and tagged with "backfilled_data". "Inconsistent_delta_time" is encountered when the time between two collections is not the same for all nodes. Therefore, the aggregated value might be over or under inflated. "Negative_delta" is returned when an expected monotonically increasing value has decreased in value. "Inconsistent_old_data" is returned when one or more nodes do not have the latest data.

|throughput

|link:#throughput[throughput]

a|The rate of throughput bytes per second observed at the storage object.

|timestamp

|string

a|The timestamp of the performance data.

:leveloffset: -1

= Manage volume Snapshot copies

:leveloffset: +1

[[ID62275704a4cfd856bf4d4d870e204ce3]]
```

= Storage volumes volume.uuid snapshots endpoint overview

== Overview

A Snapshot copy is the view of the filesystem as it exists at the time when the Snapshot copy is created.

In ONTAP, different types of Snapshot copies are supported, such as scheduled Snapshot copies, user requested Snapshot copies, SnapMirror Snapshot copies, and so on.

ONTAP Snapshot copy APIs allow you to create, modify, delete and retrieve Snapshot copies.

== Snapshot copy APIs

The following APIs are used to perform operations related to Snapshot copies.

–	POST	/api/storage/volumes/{volume.uuid}/snapshots
–	GET	/api/storage/volumes/{volume.uuid}/snapshots
–	GET	/api/storage/volumes/{volume.uuid}/snapshots/{uuid}
–	PATCH	/api/storage/volumes/{volume.uuid}/snapshots/{uuid}
–	DELETE	/api/storage/volumes/{volume.uuid}/snapshots/{uuid}

== Examples

=== Creating a Snapshot copy

The POST operation is used to create a Snapshot copy with the specified attributes.

The API:

/api/storage/volumes/{volume.uuid}/snapshots

The call:

```
curl -X POST "https://<mgmt-  
ip>/api/storage/volumes/{volume.uuid}/snapshots" -H "accept:  
application/hal+json" -d '{"name": "snapshot_copy", "comment": "Store this
```

```
copy." }'
```

```
# The response:
```

```
HTTP/1.1 202 Accepted
```

```
Date: Wed, 13 Mar 2019 22:43:34 GMT
```

```
Server: libzapid-httpd
```

```

=== Retrieving Snapshot copy attributes

The GET operation is used to retrieve Snapshot copy attributes.

The API:

```
/api/storage/volumes/{volume.uuid}/snapshots
```

The call:

```
curl -X GET "https://<mgmt-
ip>/api/storage/volumes/{volume.uuid}/snapshots" -H "accept:
application/hal+json"
```

The response:

```
HTTP/1.1 200 OK
Date: Wed, 13 Mar 2019 21:14:06 GMT
Server: libzapid-httpd

    }
  }
}
-----

```

=== Retrieving the attributes of a specific Snapshot copy

The GET operation is used to retrieve the attributes of a specific Snapshot copy.

The API:

```
/api/storage/volumes/{volume.uuid}/snapshots/{uuid}
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/storage/volumes/0353dc05-405f-11e9-acb6-005056bbc848/snapshots/402b6c73-73a0-4e89-a58a-75ee0ab3e8c0" -H "accept: application/hal+json"
```

The response:

```
HTTP/1.1 200 OK
```

```
Date: Wed, 13 Mar 2019 22:39:26 GMT
```

```
Server: libzapid-httpd
X-Content-Type-Options: nosniff
Cache-Control: no-cache,no-store,must-revalidate
Content-Length: 308
Content-Type: application/json
{
  "volume": {

a|Filter by expiry_time
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

```
* Default value: 1
```

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```

a|
```

```
|comment
```

```
|string
```

```
a|A comment associated with the Snapshot copy. This is an optional attribute for POST or PATCH.
```

```
|create_time
```

```
|string
```

```
a|Creation time of the Snapshot copy. It is the volume access time when the Snapshot copy was created.
```

```
|expiry_time
```

```
|string
```

```
a|The expiry time for the Snapshot copy. This is an optional attribute for POST or PATCH. Snapshot copies with an expiry time set are not allowed to be deleted until the retention time is reached.
```

```
|name
```

```
|string
```

```
a|Snapshot copy. Valid in POST or PATCH.
```

```
|owners
```

```
|array[string]
```

```
a|
```

|size
|integer
a|Size of the active file system at the time the Snapshot copy is captured. The actual size of the Snapshot copy also includes those blocks trapped by other Snapshot copies. On a Snapshot copy deletion, the "size" amount of blocks is the maximum number of blocks available. On a Snapshot copy restore, the "afs-used size" value will match the Snapshot copy "size" value.

|snaplock_expiry_time
|string
a|SnapLock expiry time for the Snapshot copy, if the Snapshot copy is taken on a SnapLock volume. A Snapshot copy is not allowed to be deleted or renamed until the SnapLock ComplianceClock time goes beyond this retention time.

|snapmirror_label
|string
a|Label for SnapMirror operations

|state
|string
a|State of the Snapshot copy. There are cases where some Snapshot copies are not complete. In the "partial" state, the Snapshot copy is consistent but exists only on the subset of the constituents that existed prior to the FlexGroup's expansion. Partial Snapshot copies cannot be used for a Snapshot copy restore operation. A Snapshot copy is in an "invalid" state when it is present in some FlexGroup constituents but not in others. At all other times, a Snapshot copy is valid.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|The UUID of the Snapshot copy in the volume that uniquely identifies the Snapshot copy in that volume.

|volume
|link:#volume[volume]

[[ID3a1e501ea09fd76ed6eca5a25f3fc82a]]
= Create a volume Snapshot copy
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/storage/volumes/{volume.uuid}/snapshots`#
```

Introduced In: 9.6

Creates a volume Snapshot copy.

== Required properties

* `name` - Name of the Snapshot copy to be created.

== Recommended optional properties

* `comment` - Comment associated with the Snapshot copy.

* `expiry_time` - Snapshot copies with an expiry time set are not allowed to be deleted until the retention time is reached.

* `snapmirror_label` - Label for SnapMirror operations.

== Related ONTAP commands

* `snapshot create`

|integer
```

```
|query
```

```
|False
```

```
a|The number of seconds to allow the call to execute before returning.
```

```
When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is
```

```
started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH,
```

```
or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|return_records

= Delete a volume Snapshot copy

[.api-doc-operation .api-doc-operation-delete]#DELETE# [.api-doc-code-
block]#`/storage/volumes/{volume.uuid}/snapshots/{uuid}`#

*Introduced In:* 9.6

Deletes a Volume Snapshot copy.

== Related ONTAP commands

* `snapshot delete`

== Learn more

*
xref:{relative_path}storage_volumes_volume.uuid_snapshots_endpoint_overvie
w.html[DOC /storage/volumes/{volume.uuid}/snapshots]

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In

```

```

|Required
|Description

|volume.uuid
|string
|path
|True
a|Volume UUID

|uuid
|string
|path
|True
a|Snapshot copy UUID

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When doing a POST, PATCH, or DELETE operation on a single record, the
default is 0 seconds. This means that if an asynchronous operation is
started, the server immediately returns HTTP code 202 (Accepted) along
with a link to the job. If a non-zero value is specified for POST, PATCH,
or DELETE operations, ONTAP waits that length of time to see if the job
completes so it can return something other than 202.

* Default value: 1
* Max value: 120
* Min value: 0

```
|string
```

```
a|Snapshot copy. Valid in POST or PATCH.
```

|owners
|array[string]
a|

|size
|integer
a|Size of the active file system at the time the Snapshot copy is captured. The actual size of the Snapshot copy also includes those blocks trapped by other Snapshot copies. On a Snapshot copy deletion, the "size" amount of blocks is the maximum number of blocks available. On a Snapshot copy restore, the "afs-used size" value will match the Snapshot copy "size" value.

|snaplock_expiry_time
|string
a|SnapLock expiry time for the Snapshot copy, if the Snapshot copy is taken on a SnapLock volume. A Snapshot copy is not allowed to be deleted or renamed until the SnapLock ComplianceClock time goes beyond this retention time.

|snapmirror_label
|string
a|Label for SnapMirror operations

|state
|string
a|State of the Snapshot copy. There are cases where some Snapshot copies are not complete. In the "partial" state, the Snapshot copy is consistent but exists only on the subset of the constituents that existed prior to the FlexGroup's expansion. Partial Snapshot copies cannot be used for a Snapshot copy restore operation. A Snapshot copy is in an "invalid" state when it is present in some FlexGroup constituents but not in others. At all other times, a Snapshot copy is valid.

|svm
|link:#svm[svm]
a|

|uuid
|string
a|The UUID of the Snapshot copy in the volume that uniquely identifies the

Snapshot copy in that volume.

```

```
= Support overview
```

```
== Overview
```

You can use ONTAP support APIs to manage configuration backups, autosupport settings, and event handling.

```
=== Configuration backups
```

Configuration backups are copies of node and cluster settings saved to an external server.

Single-node clusters must have configuration backups as protection against corruption of the configuration database. Multi-node clusters back up the configuration automatically between the nodes in the cluster.

```
= Manage AutoSupport configuration
```

```
:leveloffset: +1
```

```
[[ID99b0845f76222c92a1c30f60762797d0]]
```

```
= Support AutoSupport endpoint overview
```

```
== Overview
```

AutoSupport is the NetApp `_call home_` mechanism. AutoSupport sends configuration details, status details, and error reporting details to NetApp.

This endpoint supports both GET and PATCH calls. GET is used to retrieve AutoSupport configuration details for the cluster and PATCH is used to modify the AutoSupport configuration of the cluster. You can also use GET calls to check AutoSupport connectivity.

```
'''
```

```
== Examples
```

```
=== Configuring 'to' addresses
```

The following example configures AutoSupport to send emails to 'to' addresses.

```
[,JSON]
```

```
----
```

```
# The API:
```

```
PATCH /support/autosupport
```

```
# The call:
```

```
curl -X PATCH "https://<mgmt-ip>/api/support/autosupport" -H "accept: application/hal+json" -H "Content-Type: application/json" -d "{ \"to\": [ \"abc@netapp.com\", \"xyz@netapp.com\" ] }"
```

```
# The response:
```

```
200 OK
```

```

{}
----

'''

=== Configuring 'SMTP' transport

The following example configures AutoSupport to use 'SMTP' transport. The
default transport is 'HTTPS'.

[,JSON]
----

# The API:
PATCH /support/autosupport

# The call:
curl -X PATCH "https://<mgmt-ip>/api/support/autosupport" -H "accept:
application/hal+json" -H "Content-Type: application/json" -d "{
\"transport\": \"smtp\"}"

# The response:
200 OK
{}
----

'''

=== Retrieving the AutoSupport configuration

The following example retrieves AutoSupport configuration for the cluster.

[,JSON]
----

# The API:
GET /support/autosupport

# The call:
curl -X GET "https://<mgmt-ip>/api/support/autosupport" -H "accept:
application/hal+json"

# The response:
200 OK
{
"enabled": true,
"mail_hosts": [

```

```

    "mailhost"
  ],
  "from": "Postmaster",
  "to": [
    "abc@netapp.com",
    "xyz@netapp.com"
  ],
  "contact_support": true,
  "transport": "smtp",
  "proxy_url": "",
  "is_minimal": false,
  "_links": {
    "self": {
      "href": "/api/support/autosupport"
    }
  }
}

```

...

=== Retrieving AutoSupport connectivity issues

The following example retrieves AutoSupport connectivity issues for the cluster. The `fields=issues` parameter must be specified, for the response to return connectivity issues. The `corrective_action` section might contain commands which needs to be executed on the ONTAP CLI.

Note that the connectivity check can take up to 10 seconds to complete.

[,JSON]

The API:

```
GET /support/autosupport
```

The call:

```
curl -X GET "https://<mgmt-ip>/api/support/autosupport?fields=issues" -H
"accept: application/hal+json"
```

The response:

```
200 OK
```

```
{
```

```
"issues": [
```

= Retrieve the AutoSupport configuration

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-block]#`/support/autosupport`#

Introduced In: 9.6

Retrieves the AutoSupport configuration of the cluster and if requested, returns connectivity issues with the AutoSupport configuration.

Important note:

* The *issues* field consists of a list of objects containing details of the node that has a connectivity issue, the issue description, and corrective action you can take to address the issue. When not empty, this indicates a connection issue to the *HTTP/S*, *SMTP*, or *AutoSupport On Demand* server.

== Expensive properties

There is an added cost to retrieving values for these properties. They are not included by default in GET results and must be explicitly requested using the `fields` query parameter. See [xref:{relative_path}getting_started_with_the_ontap_rest_api.html#Requesting_specific_fields\[Requesting specific fields\]](#) to learn more.

* `issues`

== Related ONTAP commands

* `system node autosupport show -instance`

* `system node autosupport check show-details`

== Learn more

* [xref:{relative_path}support_autosupport_endpoint_overview.html\[DOC /support/autosupport\]](#)

== Parameters

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|max_records
```

```
|integer
```

```
|query
```

```
|False
```

```
a|Limit the number of records returned.
```

```
|return_records
```

```
|boolean
```

```
|query
```

```
|False
```

```
a|The default is true for GET calls. When set to false, only the number of records is returned.
```

```
* Default value: 1
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

```
a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|order_by
```

```
|array[string]
```

```
|query
```

```
|False
```

```
a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|===
```

```
== Response
```

Status: 200, Ok

```
[cols=3*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|Description
```

```
|contact_support
```

```
|boolean
```

```
a|Specifies whether to send the AutoSupport messages to vendor support.
```

```
|enabled
```

```
|boolean
```

```
a|Specifies whether the AutoSupport daemon is enabled. When this setting is disabled, delivery of all AutoSupport messages is turned off.
```

```
|from
```

```
|string
```

```
a|The e-mail address from which the AutoSupport messages are sent. To generate node-specific 'from' addresses, enable '-node-specific-from' parameter via ONTAP CLI.
```

```
* example: postmaster@example.com
```

```
* format: email
```

```
* Introduced in: 9.6
```

```
|is_minimal
```

```
|boolean
```

```
a|Specifies whether the system information is collected in compliant form, to remove private data or in complete form, to enhance diagnostics.
```

|issues
|array[link:#autosupport_issues[autosupport_issues]]
a|A list of nodes in the cluster with connectivity issues to HTTP/SMTP/AOD AutoSupport destinations along with the corresponding error descriptions and corrective actions.

|mail_hosts
|array[string]
a|The names of the mail servers used to deliver AutoSupport messages via SMTP.

|partner_addresses
|array[string]
a|The list of partner addresses.

|proxy_url
|string
a|Proxy server for AutoSupport message delivery via HTTP/S. Optionally specify a username/password for authentication with the proxy server.

|to
|array[string]
a|The e-mail addresses to which the AutoSupport messages are sent.

|transport
|string
a|The name of the transport protocol used to deliver AutoSupport messages.

|is_minimal
|boolean
a|Specifies whether the system information is collected in compliant form, to remove private data or in complete form, to enhance diagnostics.

|issues
|array[link:#autosupport_issues[autosupport_issues]]
a|A list of nodes in the cluster with connectivity issues to HTTP/SMTP/AOD AutoSupport destinations along with the corresponding error descriptions and corrective actions.

|mail_hosts
|array[string]
a|The names of the mail servers used to deliver AutoSupport messages via SMTP.

|partner_addresses
|array[string]
a|The list of partner addresses.

```

|proxy_url
|string
a|Proxy server for AutoSupport message delivery via HTTP/S. Optionally
specify a username/password for authentication with the proxy server.

|to
|array[string]
a|The e-mail addresses to which the AutoSupport messages are sent.

|transport
|string
a|The name of the transport protocol used to deliver AutoSupport messages.

[[IDce9805264594bb76dd156f259bd48336]]
= Support AutoSupport messages endpoint overview

== Overview

```

Use this API to invoke and retrieve AutoSupport messages from the nodes in the cluster.

This API supports POST and GET calls. Use a POST call to invoke AutoSupport and a GET call to retrieve AutoSupport messages.

'''

== Examples

=== Invoking an AutoSupport on all nodes in the cluster

The following example invokes an AutoSupport on every node in the cluster. Note that AutoSupport is invoked on all nodes in the cluster if the ``node`` parameter is omitted. Also, note that the ``subject`` line is the same when invoking on all nodes.

By default, the response is an empty object. If ``return_records=true`` is passed in the request, the response includes information about the node and the index of the invoked AutoSupport message.

[,JSON]

The API:

POST /support/autosupport/messages

The call:

```
curl -X POST "https://<mgmt-  
ip>/api/support/autosupport/messages?return_records=true" -H "accept:  
application/hal+json" -H "Content-Type: application/json" -d "{  
  \"message\": \"test_msg\", \"type\": \"all\"}"
```

The response:

201 CREATED

```

```

=== Invoking an AutoSupport on a single node

The following examples invoke an AutoSupport on a single node in the cluster.

Note that AutoSupport is invoked on all nodes in the cluster if the `node`

parameter is omitted. You can specify the node-name with either ``node`` or ``node.name`` parameter. You can also specify UUID of the node with the ``node.uuid`` parameter.

By default, the response is an empty object. If ``return_records=true`` is passed in the request, the response includes information about the node and the index of the invoked AutoSupport message.

The API:

POST /support/autosupport/messages

The call:

```
curl -X POST "https://<mgmt-  
ip>/api/support/autosupport/messages?return_records=true" -H "accept:  
application/hal+json" -H "Content-Type: application/json" -d "{  
  \"message\": \"test_msg\", \"type\": \"test\", \"node\": { \"name\":  
  \"node1\" }}"
```

The response:

=== Retrieving AutoSupport messages from a specific node and has 'sent_succesful' state

The following example retrieves AutoSupport messages from a specific node in the cluster.

Note that if the `fields=*` parameter is not specified, only node, index, and destination fields are returned.

This example uses a filter on the `node.name` and `state` fields. You can add filters to any fields in the response.

[,JSON]

= Retrieve AutoSupport message history

[.api-doc-operation .api-doc-operation-get]#GET# [.api-doc-code-
block]#`/support/autosupport/messages`#

*Introduced In:* 9.6

Retrieves AutoSupport message history from all nodes in the cluster.

There can be a short delay on invoked AutoSupport messages showing in
history, dependent on processing of other AutoSupports in the queue.

== Related ONTAP commands

* `system node autosupport history show`

= Create and send an AutoSupport message
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/support/autosupport/messages`#
```

Introduced In: 9.6

Creates and sends an AutoSupport message with the provided input parameters.

Important note:

* By default, the response is an empty object. If ``return_records=true`` is passed in the request, the response includes information about the node and the index of the invoked AutoSupport message.

== Recommended optional properties

* ``message`` - Message included in the AutoSupport subject. Use this to identify the generated AutoSupport message.

== Default property values

If not specified in POST, the following are the default property values:

- * `type` - `_all_`
- * `node.name` or `node.uuid` - Not specifying these properties invokes AutoSupport on all nodes in the cluster.

== Related ONTAP commands

- * `system node autosupport invoke``

== Learn more

- *
`xref:{relative_path}support_autosupport_messages_endpoint_overview.html[DOC /support/autosupport/messages]`

== Parameters

= Manage cluster configuration backup information

:leveloffset: +1

[[ID345b5179186cb8dc551b955195cce264]]
= Support configuration-backup endpoint overview

== Overview

This API retrieves the current settings for the configuration and updates
configuration backup settings. The GET operation retrieves the current
settings for the configuration and the PATCH operation updates the
configuration backup settings.

== Examples

These examples show how to retrieve and update the configuration backup
settings.

=== Retrieving the configuration backup settings

'''

-----

# The API:
/api/support/configuration-backup

# The call:
curl -X GET "https://<mgmt-ip>/api/support/configuration-backup" -H
"accept: application/hal+json"

# The response:

```

```

{
  "url": "http://10.224.65.198/backups",
  "username": "me",
  "_links": {
    "self": {
      "href": "/api/support/configuration-backup"
    }
  }
}
-----

'''

=== Updating the configuration backup settings

'''

-----

# The API:
/api/support/configuration-backup

# The call:
curl -X PATCH "https://<mgmt-ip>/api/support/configuration-backup" -H
"accept: application/hal+json"

# The body:
{
  "url": "https://10.224.65.198/new_backups",
  "username": "new_me",
  "password": "new_pass",
  "validate_certificate": "true"
}

# The response header:
HTTP/1.1 200 OK
Date: Tue, 05 Jun 2018 18:17:48 GMT
Server: libzapid-httpd
Cache-Control: no-cache,no-store,must-revalidate

= Manage configuration backups

:leveloffset: +1

[[ID1274d0918cabae97c0f9c7d627a8ec82]]
= Support configuration-backup backups endpoint overview

== Overview

This API supports creating, deleting and retrieving configuration backup files.
Configuration backups can be 'cluster' or 'node' type. A 'cluster' backup contains cluster-wide configuration in addition to the configuration of each node in the cluster. A 'node' backup contains only node-specific configuration such as configuration files on the root volume and the boot variables. For creating a cluster backup, a cluster-wide job is queued. For creating a node backup, a private job local to the node is queued. In addition to the backups created using this API, ONTAP creates configuration backups automatically based on job schedules. This API supports creating configuration backups on demand only. It supports deleting and retrieving configuration backups that are created automatically or on demand.
For information on configuration backup settings for automatically created backups, see xref:{relative_path}support_configuration-

```

```

```
|node.uuid  
|string  
|query  
|False  
a|Filter by node.uuid
```

```
|max_records  
|integer  
|query  
|False  
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```

[[ID6386fd392213f461f047866b4668bd71]]
= Create a configuration backup

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
```

```
block]#`/support/configuration-backup/backups`#
```

```
*Introduced In:* 9.7
```

Creates a configuration backup. The required backup file name must end with .7z extension.

```
== Required properties
```

```
* `node.uuid` or `node.name` - The node UUID or node name on which the configuration backup will be created.
```

```
* `name` - The backup file name
```

```
== Related ONTAP commands
```

```
* `system configuration backup create`
```

```
== Parameters
```

```
[cols=5*,options=header]
```

```
|===
```

```
|Name
```

```
|Type
```

```
|In
```

```
|Required
```

```
|Description
```

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

```
a|The number of seconds to allow the call to execute before returning.
```

```
When doing a POST, PATCH, or DELETE operation on a single record, the
```

```
default is 0 seconds. This means that if an asynchronous operation is
```

```
started, the server immediately returns HTTP code 202 (Accepted) along
```

```
with a link to the job. If a non-zero value is specified for POST, PATCH,
```

```
or DELETE operations, ONTAP waits that length of time to see if the job
```

```
completes so it can return something other than 202.
```

```
* Default value: 1
```

```
* Max value: 120
```

```
* Min value: 0
```

```
|return_records
```

```
|boolean
|query
|False
a|The default is false. If set to true, the records are returned.
```

* Default value:

= Support EMS endpoint overview
```

```
== Overview
```

The Event Management System (EMS) collects and processes events, and sends notification of the events through various reporting mechanisms. The following endpoints defined under '/support/ems', allow you to query a list of observed events, and configure which events you handle and how you are notified:

- * /support/ems
- * /support/ems/events
- * /support/ems/messages
- * /support/ems/filters
- * /support/ems/filters/{name}/rules
- * /support/ems/filters/{name}/rules/{index}
- * /support/ems/destinations
- * /support/ems/destinations/{name}

```
== Examples
```

```
=== Configuring an email destination
```

The following example configures EMS to send a support email when a WAFL event is observed with an error severity.

```
==== Configure the system-wide email parameters
```

```

= Manage event destinations

:leveloffset: +1

[[IDb760a361f4a2b5bd12c4b6d048283dd6]]

```

= Support EMS destinations endpoint overview

== Overview

Manages the list of destinations. A destination is defined by a type and a place to which an event's information is transmitted.

== Destination Types

An EMS destination is defined by a single type, which is one of the following:

- * email
- * syslog
- * rest_api
- * snmp

=== Email

The 'email' type allows you to define a mailbox where information about an observed event is sent by SMTP. Enter the address in the destination field in a valid format.

For example: administrator@mycompany.com

=== Syslog

The 'syslog' type allows you to specify a remote syslog server that can receive information about an observed event. Enter the hostname or IP address in the destination field.

For example: syslog.mycompany.com, 192.168.1.1

=== Rest API

The 'rest_api' type allows you to define a URL where information about an observed event is sent using the REST protocol. Enter the URL in the destination field.

The URL must contain a valid transmission schema which can be one of the following:

- * http
- * https

Using the 'https' schema, you can configure a client-side certificate for mutual authentication.

For example: http://rest.mycompany.com, https://192.168.1.1

=== SNMP

The 'snmp' type describes addresses where information about an observed event is sent using SNMP traps. The system defines a default instance of this type and it is restricted to read-only.

This type has the following limitations:

- * Cannot create new destinations of type 'snmp'
- * Cannot modify the default 'snmp' destination

SNMP trap host details need to be configured through one of the following:

```
|===  
| Type | Command / API  
  
| CLI  
| 'system snmp traphost'  
  
| ZAPI  
| 'snmp-traphost-add' / 'snmp-traphost-delete'  
|===
```

== Examples

=== Retrieving the list of active destinations

```
[,JSON]  
-----  
  
# API  
GET /api/support/ems/destinations  
  
# Response  
200 OK  
  
# JSON Body

  "records": [  
    {  
      "name": "snmp-traphost",  
      "_links": {  
        "self": {  
          "href": "/api/support/ems/destinations/snmp-traphost"  
        }  
      }  
    }  
  ]  
},  
],
```

```
"num_records": 1,
"_links": {
  "self": {
    "href": "/api/support/ems/destinations"
  }
}
}
```

=== Creating a new 'email' destination

[,JSON]

API

POST /support/ems/destinations

JSON Body

```
{
"name": "Technician_Email",
"type": "email",
"destination": "technician@mycompany.com",
"filters": [
  { "name" : "critical-wafl" }
]
}

[[ID0e460d82c3ef251a8b42640cfc0afbbe]]
= Create an event destination

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/support/ems/destinations`#

```

Introduced In: 9.6

Creates an event destination.

== Required properties

* `name` - String that uniquely identifies the destination.

* `type` - Type of destination that is to be created.

* `destination` - String that identifies the destination. The contents of this property changes depending on type.

== Recommended optional properties

* `filters.name` - List of filter names that should direct to this destination.

* `certificate` - When specifying a rest api destination, a client certificate can be provided.

== Related ONTAP commands

* `event notification destination create`

* `event notification create`

== Parameters

[cols=5*,options=header]

|===

|Name

|Type

|In

|Required

|Description

|return_records

|boolean

|query

|False

a|The default is false. If set to true, the records are returned.

* Default value:

:leveloffset: -1

= Manage an event destination instance

:leveloffset: +1

[[ID245d515d54ae2f56874644472f8e1de6]]
= Support EMS destinations name endpoint overview

== Overview

Manages a specific instance of a destination. There are limits to the
information that you can modify after a destination is created. For
example, you cannot change a destination's type, but you can modify the
underlying details of the type.
See the documentation for
<</docs/support/support_ems_destinations,/support/ems/destinations>> for
details on the various properties in a destination.

== Examples

=== Retrieving a specific destination instance

[,JSON]
-----

# API
GET /api/support/ems/destinations/snmp-traphost

```

```
# Response
200 OK

# JSON Body
{
  "name": "snmp-traphost",
  "type": "snmp",
  "destination": "",
  "filters": [
    {
      "name": "default-trap-events",
      "_links": {
        "self": {
          "href": "/api/support/ems/filters/default-trap-events"
        }
      }
    }
  ],
  "_links": {
    "self": {
      "href": "/api/support/ems/destinations/snmp-traphost"
    }
  }
}
-----
```

=== Updating an existing destination (change of email address)

```
[,JSON]
-----
```

```
# API
PATCH /api/support/ems/destinations/test-destination
```

```
# JSON Body
{
  "destination": "support@mycompany.com"
}
```

```
# Response
200 OK
-----
```

=== Deleting an existing destination

```
[,JSON]
```

```
-----  
# API  
DELETE /api/support/ems/destinations/test-destination
```

```
# Response  
200 OK  
-----
```

```
[[ID40ec4f240240a1f1a4928c6ab340c282]]

= Update an event destination

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/support/ems/destinations/{name}`#

```

Introduced In: 9.6

Updates an event destination.

== Recommended optional properties

* `filters.name` - New list of filters that should direct to this destination. The existing list is discarded.

* `certificate` - New certificate parameters when the destination type is `rest api`.

== Related ONTAP commands

* `event notification destination modify`

* `event notification modify`

== Parameters

ONTAP Error Response Codes

|===

| Error Code | Description

| 983088

| The destination name provided cannot be empty

| 983089
| The destination name provided cannot contain spaces

| 983094
| The destination name provided is invalid. The destination name must contain between 2 and 64 characters and start and end with an alphanumeric symbol or _(underscore). The allowed special characters are _(underscore) and -(hyphen)

| 983104
| The syslog destination provided is invalid

| 983116
| The number of notifications has reached maximum capacity

| 983117
| The number of destinations has reached maximum capacity

| 983129
| The rest-api destination must contain a valid scheme, such as http// or https//

| 983130
| The rest-api destination provided contains an invalid URL

| 983131
| The rest-api destination provided contains an invalid IPv6 URL

| 983142
| The security certificate provided does not exist

| 983143
| The private security key provided does not exist

| 983144
| The security certificate information provided is incomplete. Provide the certificate and serial number

| 983145
| The rest-api destination provided has an 'http://' scheme. It is invalid to provide certificate information

| 983150
| The type of an existing destination cannot be changed

| 983151
| A property provided cannot be configured on the requested destination

```

|string
|query
|False
a|Filter the collection returned using an event filter
```

* Introduced in: 9.8

```
|fields
|array[string]
|query
|False
a|Specify the fields to return.
```

```
|max_records
|integer
|query
|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
```

a|The default is true for GET calls. When set to false, only the number of records is returned.

* Default value: 1

|return_timeout

|integer

|query

|False

a|The number of seconds to allow the call to execute before returning. When iterating over a collection, the default is 15 seconds. ONTAP returns earlier if either max records or the end of the collection is reached.

* Default value: 1

* Max value: 120

* Min value: 0

|order_by

|array[string]

|query

|False

a|Order results by specified fields and optional [asc|desc] direction. Default direction is 'asc' for ascending.

:leveloffset: +1
```

```
[[ID3ae6773f4c58be2256bd64e7760e768e]]
```

```
= Support EMS filters endpoint overview
```

```
== Overview
```

Manages the list of available filters. A filter is a named collection of rules that enable the system to identify events that require additional handling. A filter is linked with a destination to which the system sends specific events.

When EMS processes an event, each filter is evaluated for a match. More than one filter can handle a single event.

```
=== Filter rule position
```

A filter's rules are evaluated sequentially, according to their position index. When a rule is added or modified, the position can be set to customize the filter's logic. If no position is specified, a new rule is appended to the end of the list.

```
=== Filter rule types
```

A filter rule can be one of two types: 'include' or 'exclude'.
If an event matches the criteria of the rule, the type dictates whether it should be forwarded to the destination or ignored.

=== Filter rule matching criteria

A valid filter rule must contain at least one set of criteria.

==== Name pattern

A name pattern is matched against an event's name. Multiple characters can be matched using the wildcard character '*'.

==== Severity

The severity pattern is matched against an event's severity. Multiple severities can be specified in a comma separated list. A single wildcard '*' will match all severities. Valid values are:

- * emergency
- * alert
- * error
- * notice
- * informational
- * debug

==== SNMP trap type

The SNMP trap type pattern is matched against an event's trap type. Multiple trap types can be specified in a comma separated list. A single wildcard '*' matches all trap types. Valid values are:

- * standard
- * built_in
- * severity_based

== Examples

|False
a|Limit the number of records returned.
```

```
|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.
```

* Default value: 1

```
|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.
```

* Default value: 1

* Max value: 120

* Min value: 0

```
|order_by
|array[string]
|query
|False
a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.
```

= Update an event filter

[.api-doc-operation .api-doc-operation-patch]#PATCH# [.api-doc-code-
block]#`/support/ems/filters/{name}`#

*Introduced In:* 9.6

Updates an event filter.

== Recommended optional properties

* `new_name` - New string that uniquely identifies a filter.
* `rules` - New list of criteria used to match the filter with an event.
The existing list is discarded.

== Related ONTAP commands

* `event filter create`
* `event filter delete`
* `event filter rename`
* `event filter rule add`
* `event filter rule delete`
* `event filter rule reorder`

== Parameters

[cols=5*,options=header]
|===

|Name
|Type
|In
|Required
|Description

```

```
|name
|string
|path
|True
a|Filter name
```

```
|new_name
|string
|query
|False
a|New filter name for renames. Valid in PATCH.
```

```
|===
```

:leveloffset: -1

= Create or retrieve filter rules

:leveloffset: +1

[[ID0f37749ce51e4c5dd5986b40bd85634c]]
= Support EMS filters name rules endpoint overview

== Overview
```

Manages the list of rules associated with a specific filter. A filter contains a list of rules that are evaluated to determine whether an event matches the filter. When a rule matches an event, the filter is considered

a match.

See the documentation for

<</docs/support/support_ems_filters,/support/ems/filters>> for details on the various properties in a rule.

== Examples

=== Retrieving the collection of rules connected to a filter

[,JSON]

API

GET /api/support/ems/filters/no-info-debug-events/rules

Response

200 OK

JSON Body

```

= Manage event filter rules

:leveloffset: +1

[[ID6b16a17d4f20025a5c8e2a4a10544fef]]
= Support EMS filters name rules index endpoint overview

== Overview

Manages a specific instance of a rule within a filter.
See the documentation for

```

<</docs/support/support_ems_filters,/support/ems/filters>> for details on the various properties in a rule.

== Examples

=== Retrieving a single instance of a rule

[,JSON]

API

GET /api/support/ems/filters/no-info-debug-events/rules/1

Response

200 OK

JSON Body

```
{
  "name": "no-info-debug-events",
  "index": 1,
  "type": "include",
  "message_criteria": {
    "name_pattern": "*",
    "severities": "emergency,alert,error,notice",
    "snmp_trap_types": "*",
    "_links": {
      "self": {
        "href":
"/api/support/ems/messages?name=*&severity=emergency,alert,error,notice&snmp_trap_type="
      }
    }
  },
  "_links": {
    "self": {
      "href": "/api/support/ems/filters/no-info-debug-events/rules/1"
    }
  }
}
```

=== Updating an existing rule to use severity emergency

[,JSON]

API

```
PATCH /api/support/ems/filters/test-filter/rules/1
```

```
# JSON Body
```

```
{  
  "message_criteria": {  
    "severities": "emergency"  
  }  
}
```

```
# Response
```

```
200 OK
```

```
----
```

```
=== Deleting a rule from an existing filter
```

```

```

```
[[ID33e6d144b02d2095698d7c8a28e1eac7]]
```

```
= Support SNMP traphosts endpoint overview
```

```
== Overview
```

This SNMP endpoint is used to retrieve, configure and reconfigure SNMP traphosts. An SNMP traphost is a host machine that is configured to receive SNMP traps from ONTAP. An SNMP traphost can be an SNMPv1/SNMPv2c traphost or an SNMPv3 traphost. ONTAP sends SNMPv1/SNMPv2c traps to an SNMPv1/SNMPv2c traphost over the SNMPv1/SNMPv2c protocol. Similarly, it

sends SNMPv3 traps to an SNMPv3 traphost over the SNMPv3 protocol.

== Examples

=== Retrieves a list of SNMP traphosts in the cluster, sorted by IP address

The API:

```
GET "/api/support/snmp/traphosts"
```

The call:

```
curl -H "accept: application/hal+json" -X GET "https://<mgmt-ip>/api/support/snmp/traphosts?order_by=ip_address"
```

The response:

```
{
  "records": [
    {
      "host": "scspr0651011001.gdl.englab.netapp.com",
      "ip_address": "10.235.36.62",
      "_links": {
        "self": {
          "href":
"/api/support/snmp/traphosts/scspr0651011001.gdl.englab.netapp.com"
        }
      }
    },
    {
      "host": "scspr0647726006.gdl.englab.netapp.com",
      "ip_address": "10.235.36.139",
      "_links": {
        "self": {
          "href":

a|Filter by host

|user.name

|string

|query

|False

a|Filter by user.name

|ip_address

|string

```
|query
|False
a|Filter by ip_address

|fields
|array[string]
|query
|False
a|Specify the fields to return.

|max_records
|integer
|query
|False
a|Limit the number of records returned.

|return_records
|boolean
|query
|False
a|The default is true for GET calls. When set to false, only the number
of records is returned.

* Default value: 1

|return_timeout
|integer
|query
|False
a|The number of seconds to allow the call to execute before returning.
When iterating over a collection, the default is 15 seconds. ONTAP
returns earlier if either max records or the end of the collection is
reached.

* Default value: 1
* Max value: 120
* Min value: 0

|order_by
|array[string]
|query
|False
```

a|Order results by specified fields and optional [asc|desc] direction.
Default direction is 'asc' for ascending.

= Create SNMP traphosts
```

```
[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-
block]#`/support/snmp/traphosts`#
```

```
*Introduced In:* 9.7
```

Creates SNMP traphosts. While adding an SNMPv3 traphost, an SNMPv3 user configured in ONTAP must be specified. ONTAP uses this user's credentials to authenticate and/or encrypt traps sent to this SNMPv3 traphost. While adding an SNMPv1/SNMPv2c traphost, SNMPv1/SNMPv2c user or community need not be specified.

```
== Required properties
```

* `host` - Fully Qualified Domain Name (FQDN), IPv4 address or IPv6 address of SNMP traphost.

```
== Recommended optional properties
```

* If `host` refers to an SNMPv3 traphost, the following field is required:

*** `user` - SNMPv3 or User-based Security Model (USM) user.

* For an SNMPv1/SNMPv2c traphost, ONTAP automatically uses 'public' if 'public' is configured or no community is configured. Otherwise, ONTAP uses the first configured community.

== Related ONTAP commands

|name
|string
a|Optional SNMPv1/SNMPv2c or SNMPv3 user name. For an SNMPv3 traphost, this object refers to an SNMPv3 or User-based Security Model (USM) user. For an SNMPv1 or SNMPv2c traphost, this object refers to an SNMP community. For an SNMPv3 traphost, this object is mandatory and refers to an SNMPv3 or User-based Security Model (USM) user. For an SNMPv1 or SNMPv2c traphost, ONTAP automatically uses "public", if the same is configured, or any other configured community as user. So, for an SNMPv1 or SNMPv2c traphost, this property should not be provided in the "POST" method. However, the configured community for the SNMPv1/SNMPv2c traphost is returned by the "GET" method.

```
= Retrieve and create SNMP users
```

```
:leveloffset: +1
```

```
[[IDe2f151531b9755af39caf7b514170612]]
= Support SNMP users endpoint overview
```

```
== Overview
```

Defines, retrieves and adds new SNMP users. An SNMP user can be an SNMPv1/SNMPv2c user or an SNMPv3 user. SNMPv1/SNMPv2c user is also called a "community" user. Use a "community" user to query ONTAP SNMP server over SNMPv1/SNMPv2c protocol. An SNMPv3 user, also called a User-based Security Model (USM) user, can be a local SNMPv3 user or a remote SNMPv3 user. Use a local SNMPv3 user to query ONTAP SNMP server over SNMPv3 and/or to send SNMPv3 traps. A remote SNMPv3 user is configured in ONTAP as well as on a remote switch. ONTAP SNMP client uses a remote SNMPv3 user to query the switch over SNMPv3.

```
== Examples
```

```
=== Retrieves a list of SNMP users in the cluster, sorted by SVM UUID

snmp_user
```

An SNMP user can be an SNMPv1/SNMPv2c user or an SNMPv3 user.

SNMPv1/SNMPv2c user is also called a "community" user. An SNMPv3 user,

also called a User-based Security Model (USM) user, can be a local SNMPv3

user or a remote SNMPv3 user. A local SNMPv3 user can be used for querying ONTAP SNMP server over SNMPv3 and/or for sending SNMPv3 traps. The local SNMPv3 user used for sending SNMPv3 traps must be configured with the same authentication and privacy credentials on the traphost receiver as well. A remote SNMPv3 user is also configured on a remote switch and used by ONTAP SNMP client functionality to query the remote switch over SNMPv3. An SNMP user is scoped to its owning Storage Virtual Machine (SVM). Owing SVM could be a data SVM or the administrative SVM.

```

a|Optional comment text.
```

```
|engine_id
```

```
|string
```

```
a|Optional SNMPv3 engine identifier. For a local SNMP user belonging to the administrative Storage Virtual Machine (SVM), the default value of this parameter is the SNMPv3 engine identifier for the administrative SVM. For a local SNMP user belonging to a data SVM, the default value of this parameter is the SNMPv3 engine identifier for that data SVM. For an SNMPv1/SNMPv2c community, this parameter should not be specified in "POST" method. For a remote switch SNMPv3 user, this parameter specifies the SNMPv3 engine identifier for the remote switch. This parameter can also optionally specify a custom engine identifier.
```

```
|name
```

```
|string
```

```
a|SNMP user name.
```

```

|owner
|link:#owner[owner]
a|Optional name and UUID of owning Storage Virtual Machine (SVM).

|scope
|string
a|Set to "svm" for data Storage Virtual Machine (SVM) SNMP users and to
"cluster" for administrative SVM SNMP users.

|snmpv3
|link:#snmpv3[snmpv3]
a|Optional parameter that can be specified only for an SNMPv3 user i.e.
when 'authentication_method' is either 'usm' or 'both'. This parameter
defines the SNMPv3 credentials for an SNMPv3 user.

|switch_address
|string
a|Optional remote switch address. It can be an IPv4 address or an IPv6
address. A remote switch can be queried over SNMPv3 using ONTAP SNMP
client functionality. Querying such a switch requires an SNMPv3 user
(remote switch user) to be configured on the switch. Since ONTAP requires
remote switch user's SNMPv3 credentials (to query it), this user must be
configured in ONTAP as well. This parameter is specified when configuring
such a user.

* example: 10.23.34.45

= Create a cluster-scoped or an SVM-scoped SNMP user

[.api-doc-operation .api-doc-operation-post]#POST# [.api-doc-code-block]#`/support/snmp/users`#

Introduced In: 9.7

Creates either a cluster-scoped or an SVM-scoped SNMP user. This user can be an SNMPv1 or SNMPv2c community user or an SNMPv3 user. An SNMPv3 user can be a local SNMPv3 user or a remote SNMPv3 user.

== Required properties

- * `owner` - Name and UUID of owning SVM.
- * `engine_id` - Engine ID of owning SVM or remote switch.
- * `name` - SNMP user name
- * `authentication_method` - Authentication method

== Optional properties

- * `switch_address` - Optional remote switch address
- * `snmpv3` - SNMPv3-specific credentials
- * `comment` - Comment text

== Default property values

- * `snmpv3.authentication_protocol` - none
- * `snmpv3.privacy_protocol` - none

== Related ONTAP commands

- * `security login create`
- * `system snmp community add`

== Learn more

* xref:{relative_path}support_snmp_users_endpoint_overview.html [DOC /support/snmp/users]

== Parameters

```

```
|return_records
```

```
|boolean
```

```
|query
```

```
|False
```

a|The default is false. If set to true, the records are returned.

* Default value:

```
|return_timeout
```

```
|integer
```

```
|query
```

```
|False
```

a|The number of seconds to allow the call to execute before returning. When doing a POST, PATCH, or DELETE operation on a single record, the default is 0 seconds. This means that if an asynchronous operation is started, the server immediately returns HTTP code 202 (Accepted) along with a link to the job. If a non-zero value is specified for POST, PATCH, or DELETE operations, ONTAP waits that length of time to see if the job completes so it can return something other than 202.

* Default value: 1

* Max value: 120

* Min value: 0

For a local SNMP user belonging to the administrative Storage Virtual Machine (SVM), the default value of this parameter is the SNMPv3 engine identifier for the administrative SVM. For a local SNMP user belonging to a data SVM, the default value of this parameter is the SNMPv3 engine identifier for that data SVM. For an SNMPv1/SNMPv2c community, this parameter should not be specified in "POST" method. For a remote switch SNMPv3 user, this parameter specifies the SNMPv3 engine identifier for the remote switch. This parameter can also optionally specify a custom engine identifier.
```

```
|name
```

```
|string
```

```
a|SNMP user name.
```

```
|owner
```

```
|link:#owner[owner]
```

```
a|Optional name and UUID of owning Storage Virtual Machine (SVM).
```

```
|scope
```

```
|string
```

```
a|Set to "svm" for data Storage Virtual Machine (SVM) SNMP users and to "cluster" for administrative SVM SNMP users.
```

```
|snmpv3
```

```
|link:#snmpv3[snmpv3]
```

```
a|Optional parameter that can be specified only for an SNMPv3 user i.e. when 'authentication_method' is either 'usm' or 'both'. This parameter defines the SNMPv3 credentials for an SNMPv3 user.
```

```
|switch_address
|string
```

a|Optional remote switch address. It can be an IPv4 address or an IPv6 address. A remote switch can be queried over SNMPv3 using ONTAP SNMP client functionality. Querying such a switch requires an SNMPv3 user (remote switch user) to be configured on the switch. Since ONTAP requires remote switch user's SNMPv3 credentials (to query it), this user must be configured in ONTAP as well. This parameter is specified when configuring such a user.

```
* example: 10.23.34.45
* Introduced in: 9.7
* readCreate: 1
```

== Error

```

Status: Default

ONTAP Error Response Codes

```

|====
| Error Code | Description

```

| 2621475
| This operation is not allowed on a node SVM.

| 2621601
| This operation is not permitted on a system SVM.

| 5636101
| One role for all applications and authentication methods is recommended for a user account.

| 5636106
| Engine ID starting with first bit set as 1 in first octet should have a minimum of 5 or maximum of 32 octets.

| 5636107
| Engine ID specified is based on an IP address, and must therefore be 9 octets in length.

| 5636108
| Engine ID specified is based on an IPv6 address, and must therefore be 21 octets in length.

| 5636109
| Engine ID specified is based on a MAC address, and must therefore be 11 octets in length.

| 5636110
| Engine ID starting with first bit set as 0 in the first octet needs to be 12 octets in length.

| 5636111
| Engine ID cannot have all zeroes.

| 5636112
| Invalid Engine ID specified.

| 5636113
| Cannot enable SNMP user capability for data SVM.

| 5636116
| Cannot read SNMP user capability for data SVM.

| 5636121
| User account name is reserved for use by the system.

| 5636123
| Cannot create an SNMP user with a role other than readonly, none, or

admin.

| 5636124

| Cannot create an SNMP user with a role other than vsadmin-readonly, none, or vsadmin.

| 5636126

| Cannot create a user with the user name, group name, or role "autosupport" because it is reserved by the system.

| 5636148

| Failed to discover SNMPv3 engine ID of remote SNMP agent.

| 5636150

| The switch_address parameter can be specified only for administrative SVMs.

| 5636152

| 0.0.0.0 cannot be specified as the IP Address for the switch_address parameter.

| 5636153

| Engine ID is already associated with user.

| 5832711

| The only application permitted for user "diag" is "console."

| 7077897

| Invalid character in username. Valid characters:" A-Z, a-z, 0-9, ".", "_", and "-". Note that the user name cannot start with "-".

| 7077898

| The username must contain both letters and numbers.

| 7077899

| Username does not meet length requirements.

| 7077906

| Cannot use given role with this SVM because a role with that name has not been defined for the SVM.

| 9043995

| Failed to create SNMP community. Reason:" SNMPv1 and SNMPv2c are not supported when cluster FIPS mode is enabled.

| 9043999

| ONTAP failed to create an SNMPv3 user because SNMPv3 is disabled in the

```

cluster.

[#snmp_user]
[.api-collapsible-fifth-title]
snmp_user
```

An SNMP user can be an SNMPv1/SNMPv2c user or an SNMPv3 user. SNMPv1/SNMPv2c user is also called a "community" user. An SNMPv3 user, also called a User-based Security Model (USM) user, can be a local SNMPv3 user or a remote SNMPv3 user. A local SNMPv3 user can be used for querying ONTAP SNMP server over SNMPv3 and/or for sending SNMPv3 traps. The local SNMPv3 user used for sending SNMPv3 traps must be configured with the same authentication and privacy credentials on the traphost receiver as well. A remote SNMPv3 user is also configured on a remote switch and used by ONTAP SNMP client functionality to query the remote switch over SNMPv3. An SNMP user is scoped to its owning Storage Virtual Machine (SVM). Owing SVM could be a data SVM or the administrative SVM.

a|Optional name and UUID of owning Storage Virtual Machine (SVM).

|scope
|string
a|Set to "svm" for data Storage Virtual Machine (SVM) SNMP users and to "cluster" for administrative SVM SNMP users.

|snmpv3
|link:#snmpv3[snmpv3]
a|Optional parameter that can be specified only for an SNMPv3 user i.e. when 'authentication_method' is either 'usm' or 'both'. This parameter defines the SNMPv3 credentials for an SNMPv3 user.

|switch_address
|string
a|Optional remote switch address. It can be an IPv4 address or an IPv6 address. A remote switch can be queried over SNMPv3 using ONTAP SNMP client functionality. Querying such a switch requires an SNMPv3 user (remote switch user) to be configured on the switch. Since ONTAP requires remote switch user's SNMPv3 credentials (to query it), this user must be configured in ONTAP as well. This parameter is specified when configuring such a user.

* example: 10.23.34.45

|authentication_method
|string
a|Optional authentication method.

|comment
|string
a|Optional comment text.

|engine_id
|string
a|Optional SNMPv3 engine identifier. For a local SNMP user belonging to
the administrative Storage Virtual Machine (SVM), the default value of
this parameter is the SNMPv3 engine identifier for the administrative SVM.
For a local SNMP user belonging to a data SVM, the default value of this
parameter is the SNMPv3 engine identifier for that data SVM. For an
SNMPv1/SNMPv2c community, this parameter should not be specified in "POST"
method. For a remote switch SNMPv3 user, this parameter specifies the
SNMPv3 engine identifier for the remote switch. This parameter can also
optionally specify a custom engine identifier.

|name
|string
a|SNMP user name.

|owner
|link:#owner[owner]
a|Optional name and UUID of owning Storage Virtual Machine (SVM).

|scope
|string
a|Set to "svm" for data Storage Virtual Machine (SVM) SNMP users and to
"cluster" for administrative SVM SNMP users.

```

```
|snmpv3
|link:#snmpv3[snmpv3]
a|Optional parameter that can be specified only for an SNMPv3 user i.e.
when 'authentication_method' is either 'usm' or 'both'. This parameter
defines the SNMPv3 credentials for an SNMPv3 user.
```

```
|switch_address
|string
a|Optional remote switch address. It can be an IPv4 address or an IPv6
address. A remote switch can be queried over SNMPv3 using ONTAP SNMP
client functionality. Querying such a switch requires an SNMPv3 user
(remote switch user) to be configured on the switch. Since ONTAP requires
remote switch user's SNMPv3 credentials (to query it), this user must be
configured in ONTAP as well. This parameter is specified when configuring
such a user.

[#snmp_user]
[.api-collapsible-fifth-title]
snmp_user
```

An SNMP user can be an SNMPv1/SNMPv2c user or an SNMPv3 user. SNMPv1/SNMPv2c user is also called a "community" user. An SNMPv3 user, also called a User-based Security Model (USM) user, can be a local SNMPv3 user or a remote SNMPv3 user. A local SNMPv3 user can be used for querying ONTAP SNMP server over SNMPv3 and/or for sending SNMPv3 traps. The local SNMPv3 user used for sending SNMPv3 traps must be configured with the same authentication and privacy credentials on the traphost receiver as well. A remote SNMPv3 user is also configured on a remote switch and used by ONTAP SNMP client functionality to query the remote switch over SNMPv3. An SNMP user is scoped to its owning Storage Virtual Machine (SVM). Owing SVM could be a data SVM or the administrative SVM.

```

|comment
|string
a|Optional comment text.

|engine_id
|string
a|Optional SNMPv3 engine identifier. For a local SNMP user belonging to the administrative Storage Virtual Machine (SVM), the default value of this parameter is the SNMPv3 engine identifier for the administrative SVM. For a local SNMP user belonging to a data SVM, the default value of this parameter is the SNMPv3 engine identifier for that data SVM. For an SNMPv1/SNMPv2c community, this parameter should not be specified in "POST" method. For a remote switch SNMPv3 user, this parameter specifies the SNMPv3 engine identifier for the remote switch. This parameter can also optionally specify a custom engine identifier.

|name
|string
a|SNMP user name.

|owner
|link:#owner[owner]
a|Optional name and UUID of owning Storage Virtual Machine (SVM).

|scope
|string
a|Set to "svm" for data Storage Virtual Machine (SVM) SNMP users and to "cluster" for administrative SVM SNMP users.

|snmpv3
|link:#snmpv3[snmpv3]
a|Optional parameter that can be specified only for an SNMPv3 user i.e. when 'authentication_method' is either 'usm' or 'both'. This parameter defines the SNMPv3 credentials for an SNMPv3 user.

|switch_address
|string
a|Optional remote switch address. It can be an IPv4 address or an IPv6 address. A remote switch can be queried over SNMPv3 using ONTAP SNMP

client functionality. Querying such a switch requires an SNMPv3 user (remote switch user) to be configured on the switch. Since ONTAP requires remote switch user's SNMPv3 credentials (to query it), this user must be configured in ONTAP as well. This parameter is specified when configuring such a user.
